The project consists of three stages:

1. Investment stage in which farmers could buy equipment necessary for small scale processing, e.g. cheese caldron, the purchase was financed in 50% from the project, however, at the moment of a purchase the farmers had to pay the whole sum.
2. Construction of a quality system, creation of an internal control system which.
3. Active sale, launch of a sales platform.

It is assumed that transport of food to a group of customers will be carried out once a week. Orders will be placed through a sales platform from Sunday to Wednesday. A car and a sales platform will be purchased partly from the project funds. In the beginning, the enterprise will be a part of the project. Then, the costs connected with a distribution of products will be borne by the manufacturers proportionally to the sales volume. Therefore, an association was created in 2020 which will continue common distribution, when the project funds get exhausted.
The goal of this association is to support, promote and develop the idea of short food delivery through (Stowarzyszenie…2020):

1. Supporting Kujawsko-Pomorskie farmers who are involved in food manufacturing as part of: agricultural retail trade, marginal, local limited operation, direct sales, direct deliveries as well as micro and small agricultural -food companies from the Kujawsko Pomorskie voivodeship (referred to as local food manufacturers) as well as economic entities and persons that plan to take up such economic activity.
2. Development of a cooperation net between farmers, producers, processors and local leaders for purpose of common sale and product promotion.
3. Extension of the cooperation net through engaging in actions aiming at increasing the number of food manufacturers.
4. Supporting a development of entrepreneurship, agriculture and traditional and organic processing.
5. Encouraging exchange of experiences and opinions on the subject of sustainable development of trade and production.
6. Support for alternative forms of contact between individual customers and small manufacturers.
7. Organization, creation and promotion of places, processing and trade of traditional and organic products.
8. Attention to high quality of products, maintenance of high sanitary-veterinary standards.
9. Implementation of new technologies in the field of food production while maintaining the Polish tradition.
10. Development of the consumer awareness of high quality of food produced by local manufacturers in favor of consumer patriotism development.

A number of promotion actions have already been taken as part of the project such as creation of a website including address data to be used for information purposes. There is a possibility to order products and collect them on the farm or in the company. Products can also be purchased at fairs. There are action taken PR, including meeting in the Marshal's Office in Toruń**, or** in the Province Governor's Office in Bydgoszcz (April 2020). Organizers participated in a conference on analyses, chances and threats to rural areas on the territory of Kujawsko-Pomorskie Province. A presentation was prepared for the conference participants.

The project 'Rural e-box' differs significantly from other projects of this type, eg. farmers come from the whole province which generates problems of logistic nature due to the distance and scatter of the suppliers. There are also problems connected with different requirements concerning transport conditions of so diversified products. It seems that systematic analyses of costs, analysis of the net geography, and analysis of the role of particular manufacturers in the delivery chain will make optimization of the operation easier. The interviews with the Internet users indicate that there is a demand for such a distribution of agricultural products.

Conclusions

It was found that a vast number of the Polish Internet users (85%) and Poles (acc. to different studies 53%, 48%) do used the Internet for shopping. However, as compared to other countries, Poles use this form of sale much more rarely (19 position among 29 European countries in 2020). The dynamics of changes in the period from 2002 to 2020 has been high which suggests that its further development can be expected in the next few years with particular growth in the interest in such products as clothes, shoes (almost four times). Purchasing food via the Internet is not yet very popular among the Internet users (7% of Internet users), though it is worth noting that for the last year it has gained in importance (in 2020 in relation to 2019 1,3 times). In the opinion of the Internet users it was caused by a wider assortment of products offered by online stores and manufactures and better equipment and access to the Internet and the pandemic. It seems that the concepts of the type of *Rural e-box* which are of regional character with the use of modern internet, informatic technologies, modern management methods reduce the concerns about the food quality and its delivery time, are very likely to find followers in Poland**.**

Abstract

Studies have shown that human nature is continuously evolving and it generally affects consumers when adopting a new set of consumption behaviour. In the recent event of a global coronavirus pandemic (termed COVID 19), consumers are forced to depend on new technological methods of payment in pursuit of a safer method to purchase goods and services. Following this concern, this study was conducted to investigate the extent to which perceived usefulness, perceived ease of use, social influence, trust, convenience, and fear affect consumers' attitude towards the use of contactless payment. It also aims to examine whether attitude influences consumers' intention towards the use of contactless transactions. Using a non-probability sampling technique, data were collected from 200 respondents via online questionnaire survey distribution. A total of 185 usable data were analysed using Smart PLS 3.0 statistical software package. Several findings were established and discussed further.

Keywords: Contactless e wallet payment, Intention, Attitude, Technology Acceptance Model, Trust, Fear, COVID 19 pandemic

Introduction

Past studies have shown that an evolution of human behaviour occurs over a period of time. The need to adopt a particular set of planned behaviour arises as a result of the propensity to fulfil psychological and social needs (Ajzen and Fishbein, 2000). In a technological system's adoption, Davis (1989) stated that perceived usefulness, perceived ease of use may affect one's intention. This study attempts to investigate the extent to which socio-psychological related factors affect consumers' attitude and intention to use contactless payment transactions of goods and services amidst the current global pandemic.

An Empirical Perspective amidst COVID 19 Pandemic" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

Contactless payments have proven to provide benefits to both businesses and consumers alike, in terms of higher levels of control and convenience for consumers, and higher return on investment (ROI) for business merchants (Brett, 2017). Essentially, it is an act of financial transactions for goods and services without any physical need to exchange cash, write a cheque or enter a Personal Identification Number or PIN (Brett 2017; Joifin, 2018). The contactless payment's existence comes in many forms, most commonly as credit and debit cards, key fobs, smart cards and other similar devices that allow secure payment by near field communication (NFC). Nagashree, Rao and Aswini, (2014) stated that NFC has evolved from a combination of radio-frequency identification (RFID) to other non-contact inter-connection technologies. The relative simplicity of NFC combined with its compatibility, with existing Bluetooth and Wi-Fi standards, presents an advantageous solution for facilitating any contactless transactions (Balachandran, 2015).

From a consumer's perspective, this latest technology allows for fast, easy and secure payments for purchases and has increased convenience for consumers when making everyday transactions such as transportation tolls, parking facilities, food shopping and petrol stations (Mokhtar, 2019). Perhaps, the potential increased acceptance of contactless payments is also due to fear of the ongoing global disease outbreak, namely corona virus or COVID 19 (The Star Online, 2020). Although there seems to be a decline in corona virus infection rates and plans are in place to begin easing lockdown measures in some parts of the developed world, it has provided a hint of hope after weeks of unrelenting gloom (Mohamad, 2020).

Nevertheless, it is not the case for many developing countries (Mohamed, 2020) who cautioned that the crisis may barely have begun, and the human toll of a major COVID-19 outbreak would be much larger than in any advanced economy. In addition to fear of any microbial infections (Lee, Mathis, Jobe & Pappalardo, 2020), many consumers fear shopping physically and to adhere instead, towards practicing extreme social distancing and other relevant hygienic measures in ensuring transfer avoidance of such infections. There is also a potential opportunity to explore alternative forms of shopping and payment mechanisms in light the rising concern of COVID 19 pandemic (Star Online, 2020; Chin, 2020). In view of the above, this study examines the socio-psychological related factors that may affect consumers' attitude and intention to fully adopt contactless payment transactions of goods and services during the current global pandemic situation.

Literature Review

Drawing from the Technological Acceptance Model (TAM) (Davis, 1989) and Protection Motivation Theory (Rogers, 1975), other earlier seminal works and relevant constructs from literature are also justifiably warranted to further understand intention and actual behavioural adoption. Theory of Planned Behaviour, for one, proposes that intention is a proximal predictor to actual behaviour (Ajzen, 1991) while Theory of Reasoned Action by Fishbein & Ajzen (1975) further explain that intentions and behaviour are considered to be strongly related when they are measured at an equal level of specificity. Following these concerns, several predicting factors are further explored in this study. These factors may determine the extent to which there will likely be a subtle shift in consumers' propensity to use contactless payment transactions in light of COVID19 pandemic situation.

Behavioural Intention

In understanding the mechanics of adoption, any usage of product and services can be explained in terms of its execution, habit, application, or fulfilment (Liu & Gong, 2008). Many researchers found that actual adoption is difficult to be measured accurately on its own (Schuitema, Anable, Skippon, & Kinnear, 2013). Most of the studies related to the technology or innovation have investigated behavioural intention as a predictor of adoption (Irani, Gunsegaran & Dwivedi, 2010). It is considered as an indicator of actual behaviour; and actual behaviour is found to be directly and closely affected by behavioural intention (Fishbein & Ajzen, 1975).

According to Ajzen (1991), intention is likely to play a crucial role in controlling the motivational factors that will be contributing to the actual behaviour. If the intention to deal with behaviour is stronger, there will be a higher possibility that an actual behaviour will be performed. Putit, Nurhani, Suki, Afiqah, Nurul & Nurul Amirah (2020) and Putit & Muhammad (2015) for example, focused on the need to investigate the web-based travel transaction intention and loyalty behaviour while Mutahar, Norzaidi, Ramayah, & Putit (2017) used intention to study on the mobile banking adoption amongst consumers in Yemen. These studies found that intentions play significant roles in the actual adoption of technology-related behaviours. Jusoh & Teng (2019) further found that an intention to adopt e-payment has a strong positive effect on the actual usage of e-payment. In view of the above, intention is looked into as a measure to examine potential acceptance and usage of such contactless payment transactions.

Attitude

Attitude towards usage has been recognized as a factor that guides future behaviour. In TAM, attitude towards usage is referred to as an evaluative impact of an individual's positive or negative sentiment when displaying a specific

behaviour (Ajzen & Fishbein, 2000). Singh, Sinha & Liébana-Cabanillas (2020) found that a user's positive attitude towards e-wallet will improve behavioural intention. This study has the comparative outcomes to which attitude towards behaviour influences intention to use SakuKu, a form of e-wallet contactless payment amongst Generation Y consumers in Indonesia (Jerry & Maulana, 2017). On the other hand, Shroff, Deneen & Ng (2011) found that attitude and behavioural intention has a non-significant relationship.

Teoh, Hoo & Lee (2020) however, found that Malaysians have positive attitudes and are ready to use mobile cashless payment transaction services, given that this strategy improves payment speed just as it is simpler to utilize. Nonetheless, the study was not generalizable since it only specified certain sampled population of interest that were not representative. The Technology Acceptance Model by Venkatesh and Davis (1996) stated that both perceived usefulness and perceived ease of use were found to impact behavioural intention, but at the same time, highlighting the need to develop an attitudinal construct. As mentioned by Nidhi et al (2020), positive attitude may influence intention to adopt e wallet payment transactions. In view of these contentions, it is postulated that attitude can influence the adoption of contactless payment.

Perceived usefulness and perceived ease of use

Perceived usefulness (PU) reflects the degree to which an individual regards a specific framework to support their activity performance (Mathwick, 2001). Perceived ease of use (PEOU) is referred to as the degree to which a particular conversion is considered straightforward (Davis 1989). As stated by Venkatesh and Davis (2000), attitude towards information system is affected by both of these variables. Alaeddin, Altounjy, Zainudin & Kamarudin (2018) supported the contention, to which PEOU and PU significantly affect attitude towards technology usage. Further to that, Wijayanthi (2019) asserted that perceived helpfulness also impacted attitude toward technology utilization, and was supported by Jin, Seong & Khin (2020). Isrososiawan, Hurriyati, & Dirgantari (2019) also found that PEOU has a positive and significant impact on the use of mobile payment.

Nevertheless, prior research considers perceived ease of use as a basic requirement for system design and should not have an influence on attitude in the later stages of adoption (e.g. Agarwal and Prasad, 1998; Chau and Hu, 2002; Davis et al., 1989). This is further supported by Ajibade (2018) who stated that the association between attitude towards using innovation and genuine use can also be influenced by factors that are not controllable by the likely users such as other facilitating conditions involving knowledge, money, time and effort. In this study, PU and PEOU are still worthy of investigation on its potential influence on attitude, which is posited to also influence consumers' intention to adopt contactless payment.

Trust

Trust is an outcome of both social and financial collaborative significance, to which vulnerability is available (Pavlou, 2003). Social influence and trust were referenced in TAM2 and TAM3 individually. Past research by Jin et al., (2020) have shown that there is significant positive relationship between social and behavioural influences to accept mobile wallets. Lai (2017) has inferred that TAM2 and TAM3 were not positively significant in determining innovation of a single-stage e-payment System. Aslam, Ahmad, Akhtar & Maqbool (2017) indicated that consumers are not confident enough to use cashless payments. Nonetheless, Jerry & Maulana (2017) suggested that trust be explored in determining its influence on cashless payment usage. In view of this, it is postulated that trust influences customers' attitude towards technological usage of cashless payments in their business transactions.

Convenience

Convenience refers to an individual's assessment of service encounters that provide easy access to products and services (Hsu & Chang, 2013). A study on English learning through PDAs by Chang, Mokhtar, Majid, Luyt & Theng (2012) revealed significant impact of perceived convenience on attitude toward using PDAs. Hsu & Chang, (2013) also demonstrated that perceived convenience clearly influences attitude toward using Moodle. Moreover, Cristobal, Flavián & Guinalíu (2018) found that mobile payment application is convenient to use and both genders concurred about the convenience of using the mobile phones for making payment. Lee & Jun (2007) contended that TAM should consider investigating factors influencing selection goals in addition to convenience and usefulness. In any case, Lai & Zainal (2015) mentioned that convenience is useful in determining the use of a single-stage e-payment system. In fact, convenience was an extension of TAM for the novel innovation of a single-stage e-payment system (Lai, 2017). In this study, it postulates that convenience affects customers' attitude to use contactless payment in their business transactions.

Fear

Fear has been long recognized as a powerful motivator that educates humans on how to react towards dangerous situations as a matter of survival. It is viewed as an extrinsic motivator considering that fear is created by environmental incentives; specifically, threat. In most psychology studies, this phenomenon is explicated through the Protection Motivation Theory (PMT) developed by Rogers (1975). The PMT model attempts to explain people's motivation for a particular behaviour based on the perceived threat encountered. Drawing from this assumption, both businesses and consumers alike may find that their anxiety towards microbial infections are effective motivators for them to be proactively involved in hygienic practices in their daily activities. These activities include self-grooming, eating, socializing, travelling, and interestingly, making payments in the retail setting.

Despite the fact that Covid19 pandemic has affected global economy through social clampdowns and business closures, essential services including the retail marketing sector are very much active in terms of the number of visits by consuming patrons (Bernama, 2020). Apart from wearing face mask, a customer could still be infected through contact with contaminated surfaces that include card terminals and banknotes during the check-out process. Hence, customers who are fearful of the risk of infection, and highly cognizant of this threat during COVID 19 pandemic (Lee, Jobe & Mathis, 2020; Lee et al, 2020), are motivated to consider contactless form of payment that prevent physical exposure to these contact surfaces (The Star Online, 2020).

Following the above review of extant literature, several hypotheses are developed for this study.

H1 - Perceived usefulness affects attitude towards contactless payment transactions

H2 - Perceived ease of use affects attitude towards contactless payment transactions

H3 – Social Influences affect attitude towards contactless payment transactions

H4 - Trust affects attitude towards contactless payment transactions

H5 - Convenience affects attitude towards contactless payment transactions

H6 – Fear affects attitude towards contactless payment transactions

H7 – Attitude influences intention to adopt contactless payment transactions

Figure 1.0 – Conceptual Framework

Methodology

The targeted population of this study were generally retail customers who carried out transactions of goods and services via offline and online retail outlets. Hair et al., (2010) stated that sample sizes that are within the range of 100 and 200 would be fitting and adequate. Consequently, the target population size in this study was 200 respondents, but only 185 usable feedbacks were used for further data analyses. This study adopted quota sampling from a non-probability sampling technique, to which a population is segmented into fundamentally unrelated sub-groups dependent on a specified proportion (Brick, 2011). In this study, the sample is obtained by segregating the respondents as per diverse ethnicities into identified sampled size ratio. The research instruments used to measure all items are adopted from previous researches and adapted to this study. Data analyses were carried out using both SPSS Version 26.0 and Smart PLS version 3.0 software respectively.

Finding and Discussion

Descriptive Statistics

From the 200 survey distribution, only 185 usable data were collected and analysed to determine the demographic characteristics of targeted respondents and their usage patterns of contactless payment transactions. Table 1 shows the demographic profile of the respondents who had participated in this study. For gender, the highest percentage was female at 68.1% (n=126) and male respondents made up 31.9% (n= 59). Therefore, the highest number respondents of the study are female compared to male. The age group ranged from below 18 years old until 41 years old and above age group. The highest age range for this study was those between 18 to 25 years old at 71.9% (n=133). The analysis is based on 185 online respondents as shown in Table 1 below

Table 1: Demographic Profile

Profile	Descriptive Profile	Percent	Frequency (n=185)
Gender	**Female**	**68.1**	**126**
	Male	31.9	59
Age	Below 18 years old	2.2	4
	18 - 25 years old	**71.9**	**133**
	26 – 30 years old	13	24
	31 – 35 years old	4.3	8
	36 – 40 years old	5.4	10
	Above 41 years old	3.2	6
Education	Postgraduate Degree	1.1	2
	Bachelor Degree	**60.5**	**112**

	Sabah	5.9	11
	Sarawak	11.4	21
	W.P. Kuala Lumpur & W.P. Labuan	7.0	13

Table 2 shows the target respondents' general usage characteristics of contactless payment. Generally, all respondents were aware of the contactless e-wallet payment application system. In terms of usage, majority have experienced using it at 78.9% (n=146) as compared to the non-users at 21.1% (n=39). In terms of the types of contactless payment cards, most respondents were using Touch n GO e- wallet system at 48.6% (n=90), followed by Maybank QR Pay system at 16.8% (n=31) and others at 5% (n=1). However, 20% (n=37) were still not using the e wallet payment system. Most respondents have used the e-wallet payment system for less than 1 year at 61.6% (n=114), while 17.8% (n= 33) have used it for nearly 2 to 3 years, and 5% have used it for more than 5 years. 20 %(n=37) of the respondents have not used this system before.

Table 2: Usage Characteristics of Contactless e-Wallet Payment

Profile	Descriptive Profile	Percent	Frequency (n=185)
Awareness	**Yes**	**100**	**185**
	No	0	0
Usage	**Yes**	**78.9**	**146**
	No	21.1	39
Types	**Touch n Go**	**48.6**	**90**

	More than 5 years	0.5	1
	Not Using	20	37

Inferential Statistics

Partial Least Square – Structural Equation Modelling

By using the partial least square–structural equation modelling techniques, the convergent validity and discriminant validity testing were subsequently used in measuring the model. Convergent validity of the measurement are usually ascertained by reviewing the loadings, average variance extracted (AVE) and composite reliability (CR). The results in this study showed all loadings to be above 0.7; CR were all higher than 0.7, and the AVE were also greater than 0.5 as shown in Table 3 below.

Table 3: Convergent Validity

Construct	Item	Loadings	CR	AVE
Perceived Usefulness	PU1	0.910	0.922	0.822
	PU3	0.908		
	PU5	0.903		
Perceived Ease of Use	PEOU1	0.914	0.931	0.819
	PEOU2	0.887		
	PEOU5	0.914		
Social Influence	SI1	0.925	0.922	0.855
	SI3	0.924		
Trust	T1	0.913	0.949	0.824
	T3	0.903		
	T4	0.924		
	T5	0.890		
Convenience	C2	0.930	0.932	0.872
	C4	0.938		
Fear	F1	0.793	0.859	0.605
	F2	0.730		
	F3	0.803		
	F5	0.783		
Attitude	AT1	0.899	0.951	0.794
	AT2	0.890		
	AT3	0.890		
	AT4	0.899		
	AT5	0.876		
Intention	CI2	0.905	0.928	0.810
	CI3	0.895		
	CI4	0.900		

Note: *Item C5, C15, F4 were deleted due to low loadings, meanwhile item C1, C3, CI1, PEOU3, PEOU4, PU2, PU4, SI1, SI2, SI4 and T2 were deleted due to cross loadings.*

Using Fornell and Larcker (1981), discriminant validity of the measurement criteria was used in comparing the correlations between constructs and the average variance extracted (AVE) from that construct. Table 4 below shows that all values of the square root of AVE were greater, thus indicating that the measures were discriminant.

Table 4: Discriminant Validity

	CV	ATT	INTN	FEAR	PEOU	PU	SI	TRUST
CV	**0.934**							
ATT	0.886	**0.891**						
INTN	0.808	0.896	**0.900**					
FEAR	0.713	0.770	0.768	**0.778**				
PEOU	0.877	0.869	0.811	0.654	**0.905**			
PU	0.860	0.877	0.826	0.670	0.904	**0.907**		
SI	0.748	0.731	0.670	0.601	0.732	0.756	**0.925**	
TRUST	0.878	0.876	0.807	0.717	0.893	0.890	0.736	**0.907**

Note: Values on the diagonal (bolded) are square root of the AVE while the off-diagonals are correlations

Further data analyses were then undertaken to test the relationship between independent, mediator and dependent variables. The result revealed that four out of seven tested hypotheses were accepted. H1, H5, H6, and H7 were accepted, to which convenience served as the strongest predictor ($\beta = 0.279$, $p< 0.05$), followed by perceived usefulness ($\beta = 0.526$, $p< 0.05$) and fear ($\beta = 0.222$, $p< 0.05$) indicating a significant relationship with consumer attitude towards intention. The R^2 values of 0.869 (or 80% variance in attitude) were above the 0.26 value as suggested by Cohen (1988) indicating a solid model.

Next, the predictive construct of attitude towards intention was further analysed. The results indicated that attitude ($\beta = 0.896$, $p< 0.05$) had a significant relationship with customer intention. The R^2 values explained 80 % of the variance in customer intention. Table 5 illustrates the overall hypothesis testing of the said relationships.

Table 5: Hypothesis Testing

Hypothesis	Relationship	Std Beta(β)	t-value*	R^2	f2	Decision
H1	Perceived Usefulness > Attitude	0.241	3.196		0.061	Accepted
H2	Perceived Ease of Use > Attitude	0.154	1.636		0.024	Rejected
H3	Social Influence > Attitude	0.013	0.214	0.869	0.000	Rejected
H4	Trust > Attitude	0.111	1.151		0.013	Rejected
H5	Convenience > Attitude	0.279	3.394		0.098	Accepted
H6	Fear > Attitude	0.222	4.718		0.169	Accepted
H7	Attitude > Customer Intention	0.896	37.175	0.803	4.080	Accepted

*$p< 0.05$

Figure 2.0: Inferential Findings

From the above analyses and findings, several discussions were generated. Firstly, the effect of perceived usefulness on customer attitude was significant in this study, hence accepting H1. This is concurrent with Wijayanthi (2019) who found the significant influence of perceived usefulness on attitude toward using e-wallets as a payment method for services. For instance, Touch n Go e-wallet payment permits the users to utilize them at anytime and anywhere. In this study, it was revealed that many respondents liked to use the Touch n Go's e-wallet payment applications at Tealive Sdn. Bhd. retail outlet because they can get special discounted rates on any beverage purchases.

Secondly, perceived ease of use was found to have an insignificant effect on customer attitude towards contactless payment usage, thus rejecting H2. This finding confirms prior research that considers perceived ease of use as a basic requirement for system design and should not have an influence on attitude in the later stages of adoption (Agarwal and Prasad, 1998; Chau and Hu, 2002; Davis et al., 1989). It further supports Ajibabe's (2018) contention that perceived ease of use's impact on attitude towards using technology is weak because other facilitating factors beyond user's control could also influence attitude. Another plausible explanation for this finding could be due to respondents' familiarity with Internet and mobile phone usage that may increase their expectancies of service usefulness rather than influencing their attitudes toward the service. (Agarwal and Prasad, 1999; Liaw, 2002).

Thirdly, social influence and trust were also found to have no significant influence on customer attitude towards the use of contactless payment. Hence, H3 and H4 are rejected. This study aligns with Lai (2017) who stated that TAM2 and TAM3 were not worthy of investigation in relation to the innovation of single-stage e-payment systems. Being seasoned Internet users, the need for trusted and reliable business merchants and other social influences on this contactless payment usage is minimal since experience has played a major part in reducing trust and risk issues and social references (Lai, 2017; Pavlov, 2003.).

Further to that, convenience was found to have a significant effect on attitude towards the use of contactless payment, hence H5 is supported. This finding supports past research by (e.g. Lai & Zainal, 2015), who stated that convenience is crucial in determining the use of single-stage e-payment system. E-wallet gives convenience to the customers because the customers do not have to queue at the bank or any automated teller machines (ATM) kiosks. With an e-wallet usage, customers simply need to display the scanner tag given from the e-wallet system application in making a payment offline or via online.

Fear was further revealed to significantly affect attitude towards the use of contactless e-wallet payment during the COVID-19 pandemic, thus accepting H6. The findings support past research (e.g. Lee, et al, 2020; Lee et al, 2020) showing significant effects of fear and anxiety on attitude across different age, gender, and racial groups. With an increased number of COVID 19 medical cases, many individuals fear of going to crowded places to avoid potential infection of such disease, and in turn, such fear may influence their attitude towards use of contactless payment systems for consumption transaction activities (The Star Online, 2020).

Finally, the relationship between customer's attitude and customer's intention towards the use of e-wallet payment was also found to have a significant effect ($\beta = 0.881$, $t = 25.218$, sig. = 0.000). Hence, H7 is accepted. This finding was consistent with Nidhi et al., (2020) who stated that a user's positive attitude towards e-wallet will improve their behavioural intention. This study demonstrated that customers' attitudes can influence their intention towards the use of e-wallet payment particularly during the recent development of the COVID-19 pandemic. Customer attitude fundamentally contain beliefs, emotions, and goals towards certain objects.

Conclusion

In essence, the study has warranted continuous attention towards examining consumers' behaviour in relation to adopting and using contactless payment solutions, particularly during the current global COVID 19 pandemic outbreak. Most of the hypotheses were tested; perceived usefulness, convenience and fear were found to have significant effects on attitude. In turn, a favourable attitude towards such payment solutions has a significant influence on consumers' intention to undertake contactless payment transaction activities. The findings have managerial implications. It can assist the business practitioners to develop better marketing strategies in order to create more awareness, and also highlight potential benefits of using these alternative payment solutions within the B2B and B2C markets. Several limitations were observed. In terms of sampling design, only younger sampled population were targeted as compared to other older age group. Also, a qualitative research method approach could be undertaken for future research in an attempt to potentially generate richer data with regards to the study.

Acknowledgement

The authors would like to acknowledge Miss Nur Faatihah Muhammad Salh from the Faculty of Business Management, Universiti Teknologi MARA for her invaluable assistance towards undertaking data collection for this study.

Abstract

The current social and economic context is characterized by totally new challenges and difficult to foresee changes. The evolution of the international epidemiological situation caused by the pandemic situation significantly affects most businesses and subjects them to increasing disruption. Therefore, organizations need a proactive approach equipped with framework to protect themselves against the outcomes of disruptive events. In this context, the purpose of this research paper is to explore the benefits of business continuity management and to highlight the organization's gains by applying the provisions of subject matter international standards. The analysis of the main benefits of business continuity management indicate that by implementing the business continuity management system the organizations can minimize the disruptions of the business activities and maintain their performance level.

Keywords*:* business continuity, business continuity management, benefits of business continuity.

Introduction

The current socio-economic context created by pandemic situation highlights the vital need for business continuity in many fields of activity. The rapid evolution of the pandemic and associated governmental response measures led to fast and unexpected occurrences that surprised many organizations, mostly the Small and Medium Enterprises (SMEs). The efficient management of unexpected occurrences requires companies to thoroughly and continuously analyze their internal resources and capabilities to maximize the rendered output.

The most influential international organizations and national governments advise businesses to develop and maintain specific capabilities in order to detect, prepare and respond to crises situations (Filipović et al., 2018).

If we analyze the exposure of the organizations to risk, we can observe that this may disrupt operations, disaffect customers and compromise business credibility and revenue streams. The management of risks supposes a large range of defined and performed activities, which helps with the identification and the analyze of risks, as well as with the definition of measures needed to manage its possible effects, such as elimination, reduction, etc. (Bitan et al., 2020). Risks could arise in the form of disruptions, both from external (such as disaster, crisis, malware, etc.) and internal threats (such as human error, utility disruptions, etc.) (Fani and Subriadi, 2019).

In order for organizations to become more successful in responding to a complex, uncertain and full of risks and threats business environment, they are progressively considering developing and maintain a business continuity management (BCM) plan (Maier et al., 2014). The primary goal of the business continuity management discipline is to attempt to discern risks that would provide catastrophic for the organization and require it to put an end to

operations and thereafter prepare proactive risk mitigation plans and reactive risk response plans while focusing also on likely steps necessary for business recovery once the impact of the threat has stopped (Ionescu et al., 2019).

Business Continuity Management (BCM) principles are commonly known as one of the most effective programs to use in relation to crisis, (incidents, disasters, etc.) specifically for organizations to continue or resume their operations. Over time, the concept has gained popularity and has developed into one of the pillars of a resilience plan (Charoenthammachoke et al., 2020). Business continuity management is defined as the advanced planning and preparation of an organization to maintain business functions and/or quickly resume activity after a disaster has occurred. It also involves defining potential risks including fire, flood or cyber-attacks (Dobran, 2019).

The main goal of this paper is to explore and analyze the main benefits of business continuity management by reviewing the studies published in global crisis periods. The paper is structured in three main parts, a first part to briefly define the concept of BCM, a second part for presenting the international standard of business continuity management and a third part for the benefits of the business continuity management system. The paper ends with the conclusions sections where we highlighted the main findings of our research.

The concept of business continuity management

The constantly changing threats in the business environment led to the emergence of business continuity management in many industries as a systematic process to foresee, prepare for and counter the effects of crises and interruptions, although its potential to play a more strategic role is still largely under-used (Maier, 2018). The concept of business continuity management has appeared in the scientific literature rather recently as an evolution of the disaster recovery approach in an organization.

It seems that the roots of business continuity management are connected to the Information Systems protection activities (Supriadi and Sui Pheng, 2018) but the concept developed and gained more importance since then. The concept of business continuity management evolved from a technical focus to a more boarder strategic requirement (Elliott et al. 2010).

The terrorist attack from September 11 2001 at World Trade Centers in New York City, USA was identified as the main trigger point for developing more thorough business continuity plans (Foster and Dye, 2005). Soon after these tragic events, many organizations realized that the business environment is full of many unknown threats and, in order to answer to these threats, the business continuity plans must play a more important role than in the past. If we add to that point the current pandemic situation, it is clear that threats are not only related to fire, natural disasters or some infrastructure breakdown, but rather they have a large degree of unknown and uncertainties therefore, the business continuity planning should be in the priority efforts of the business recovery.

Business continuity management is not only about recovery from a disaster. It should also be a driven business process that unifies a large spectrum of management disciplines (Smith & Fischbacher, 2009). The main disciplines that are integrated in the BCM are the Business Continuity (organizational/operational relocation), Emergency Response, Disaster Recovery (technology continuity) and Crisis Management.

Developing an integrated business continuity management plan to facilitate the perpetuation and resumption of activities in safe conditions, both for people and the environment, by integrating management system models defined by international standards is an approach that can be applied in any organization, but the priorities may be different, depending on the field in which the organization operates. (Bițan et al., 2020). Also, organizations should focus on some security aspects. Investing in security related to the usage of technology and Internet might be less expensive than the payment of charges due to malfunctions of the IT department (Ionescu et al., 2020).

In this context, researchers worldwide tried to show and emphasize the importance of the concept. The willingness of organizations to respond to unsystematic and crisis situations depends on the management involvement in and commitment to business continuity planning. Business continuity planning refers to the identification and protection of critical business processes and compulsory resources in order to maintain the anticipated level of performance by preparing processes that enable survival in times of business disturbances (Sui et al., 2010).

From a different angle, we can stress out that the main purpose of business continuity planning is to keep an organization running even if a high impact risk occurs. To achieve this, a plan must be created so that it addresses the recovery of key business functions in case of an incident or a disaster. Thus, the business continuity plan allows an organization to resume operations as soon as possible, without further consequences. The business continuity planning process includes risk identification, risk assessment, risk ranking and risk management (Gilbert and Gips, 2000).

The importance of the BCM is highlighted also by a series of nonprofit organizations that dedicate their time to popularize and flourish the concept among practitioners. One organization is The Business Continuity Institute (The business continuity institute, 2005) which defines business continuity management as ”an act of anticipating incidents that will affect mission-critical functions and processes for the organization, and ensuring that it responds to any incident in a planned and rehearsed manner” (The Business Continuity Institute, 2005) .

Other nonprofit organization, the Disaster Recovery Institute International (DRII), define the concept of BCM in their Internationally Glossary for Resiliency as: ”Holistic management process that is able to identify potential threats to an organization and their impact on the business operations which also provides a framework for building organizational resilience with the capability of an effective response that safeguards the interests of its key stakeholders, reputation, brand and value-creating activities” (DRII, 2018).

Considering the above approaches, we can observe that the business continuity management is a tool that can be used to provide greater confidence so the organization can deliver its products or services even if a certain risk occurs (Gibb and Buchanan, 2006). Business management activities deliver a framework for the decision-making and actions to avoid, confront and recover from a disruptive crisis consistent with strategic intent (Shaw and Harrald, 2003. Business continuity strategy characteristics are high-value and high-maintenance. Business continuity includes different technologies, from older to newer, from physical to computerized, from singular to cohesive ones (Maitra et al., 2013).

At some point, any company could suffer an outage or face a crisis, because there is no way to control the entire operating environment (Smith, 2012). Managing business continuity is the act of predicting adverse situations which will distress critical functions and processes in the organization and ensure that the reaction to any adverse situation is planned and well-rehearsed. Clearly, innovation may help companies in managing business continuity. A few years ago, innovation was only at a discovery stage. Though, today technology passed to the next step, meaning implementation, practice and improvement (Fogoros et al., 2020). In order to maintain its market position, an organization should adopt an innovative strategy, by digitalizing its management strategies and its business models.

Managing business continuity is not just about recovering from disasters such as fire, flood or information system failure, but also about problems regarding crucial suppliers or customers, frauds, unethical operations and organizational reputation (Gallagher, 2003).

The business continuity management system based on the international standards

Even if the concept of business continuity management is relatively recent in literature, its importance for organizations is highlighted by the development of international standards that provide a systematic approach to setting up internal processes for ensuring business continuity. Thus, the International Organization for Standardization (ISO), through Working Group ISO / TC 292, has developed a wide range of standards on Security and Resilience, of which 9 standards are for Business Continuity (6 of them are already published and 3 standards are under development) (www.iso.org). Following these standards can help mitigate the negative effects of a global crisis. Business continuity management system supports the preparation of organizations for better management of crisis situations or to cope with the negative effects of a crisis (Bițan et al., 2020).

To support the global effort of the organizations in combating the actual pandemic crisis, ISO has made available, free of charge, several medical and business standards, including the standards for Business Continuity (ISO, 2020).

One of the most important standards of this series is ISO 22301:2019 Security and resilience – Business continuity management systems – Requirements that provide guidance to organizations regarding how to ensure the continuing operation of their essential functions during and after a disaster or crisis.

The standard is written by leading experts in business continuity management and it provides a framework for a better management of the business continuity on the organization level (Kosutic, 2020).

This standard has been issued for the first time in 2012. In 2019 ISO published a revision of the standard, the content of which being in accordance with the "High-Level Structure" HLS, promoted by ISO. According to HLS, all the management systems standards (for quality, environment, food safety, occupational health and safety, information security, anti-bribery, energy, etc.) are structured in the same way. Having the same structure, when using another management system standard for the first time, users who are familiar with a management system standard will immediately feel at ease with the new one (Bițan et al., 2020).

If we analyze the ISO 22301 standard, we can identify that its implementation in an organization will highlight the importance of understanding continuity needs, it shows that is important to implement and operate the measures to control the continuity risk on the organization level. Another important aspect underlined by the ISO 22301 is that managers have the possibility to monitor and evaluate the effectiveness and performances of the system of business continuity management. Lastly, the managers can have a base for continual improvement formed on objective measurements.

A business continuity management system developed according to the ISO 22301 standard helps the organization understand how it can fight and protect against disruptive incidents, recover from hazardous disruptions when they arise and to reduce the likelihood of their occurrence. The purpose of ISO 22301 standard is to give insurance that business will continue to deliver products and services in case of disruptive events. The main ways how the standard responds to these requirements is: by making a business impact analysis and in this way it can identify the business continuity priorities; by taking risk assessment that will offer data regarding the potential disruptive events that can affect the business operations; by defining the action plans to prevent such events from happening or to reduce their impact on operations. Covering all of this aspects the provisions from the standard can indicate how to recover in the shortest time possible (Kosutic, 2020).

The strategies and solutions that are to be implemented are usually in the form of policies, procedures, and technical/physical implementation. In most cases, organizations do not have all the facilities, hardware, and software in place, therefore, ISO 22301 implementation will involve not only to set organizational processes but also to develop plans and to allocate technical and other resources to make the continuity and recovery of business activities possible. Business continuity is part of overall risk management in a company, with areas that overlap with information security management and IT management (Figure 1).

The benefits of Business Continuity Management

The changes faced by the global business environment, translated into stronger competition, emphasis on knowledge and materialization of business threats exert a great pressure on organizations and force them to establish key directions of action and essential activities to be performed. In this context we want to highlight the main benefits of the business continuity management as found in the literature.

Possible serious disruptions, as natural disasters (floods or earthquakes), blackouts and fires, disruptions and damage to the infrastructure, social and political upheavals (unrest and political upheavals), local and global health issues (epidemics or pandemics), personnel or material losses due to attacks or accidents, can have the effect of business interruption. In order to reduce the risks of any kind of business interruption and to take the best possible precautions in the event of serious disruptions, ISO 22301 should be used (Lampe et al., 2020).

Table 1: Advantages of the business continuity management in a Pandemic situation

No. Crt.	Advantages of the business continuity management
1.	Development of a clear action plan, well-structured and interlinked for a good response to disruptive events
2.	Ensuring that all vital and key processes are available as a result of a proactive management system
3.	Prioritization of necessary activities and clear specification of areas used for the recovery process this permit that the main activities of the organization can be maintained
4.	An approach of the business continuity management processes in a systematic and concept-based manner
5.	Possibility to be prepared to face severe situations by identification of risk areas and possible impacts
6.	Getting the management support for the all the business continuity activities
7.	Clear allocation of tasks and responsibilities in a crisis, detailed documentation of emergency management
8.	Respecting the requirements of an international regulatory and audit
9.	In case when interruptions occur in business some financial losses can be avoided
10.	Performance targeted to the clients can bring business benefits

Source: Authors' own research based on the literature review.

If we consider the specification of the ISO 22301 standard, we can observe in Figure 2 four essential business benefits for organizations arising from implementing the standard (Kosutic, 2020).

A first benefit is the **compliance with legal requirements.** There are more and more countries defining laws and regulations requiring business continuity compliance. And beyond government interests, private businesses are also requiring their suppliers and partners to implement business continuity solutions.

The second benefit is related to the **achievement of marketing advantage.** The marketing advantage is in the customer perception of the certified organizations that offers credibility in the continuity of their operations, and the delivery of their products and services. Additionally, such certification can help the organization get new customers, by making it easier to demonstrate that they are among the best in the industry, leading to increased market share and higher profits.

The third benefit is the **reduce dependence on individuals.** In many cases a lot of organization rely their critical actives on a small group of people and a painful situation is when some of these peoples need to leave. In the same time managers, who are aware of this phenomenon, can use the practices of business continuity management to find ways of becoming less dependent on a certain person. In this way managers can avoid many unpleased situations when someone leaves the organization.

The fourth benefit is **preventing large-scale damage.** In a world of real-time services and transactions, every minute of down service has significant financial and reputational consequences. By implementing business continuity practices, the organization will have a sort of insurance policy and thus, the company will save money.

Fig. 2. Standard implementation's essential business benefits
Source: Kosutic, D. (2020) The basics of ISO 22301. Available at: https://advisera.com/27001academy/what-is-iso-22301/

As any other management system, Business Continuity Management System can be certified by a Certification Body. The main benefits of ISO 22301 certification of an organization identified by ***P**rofessional **E**valuation and **C**ertification **B**oard* (PECB) (Professional Evaluation and Certification Board, 2020) are referring to expand the organization's knowledge on how a Business Continuity Management System will help meet business objectives, strengthen the reputation management and protecting the brand, reduce the risks of business interruption by identifying risks and minimize the impact, greater resilience against disruptions, quicker recovery from interruption and overall the organization can achieve international recognition.

The PECB (Professional Evaluation and Certification Board, 2020) highlights the main reasons why implementing the ISO 22301 standard is a necessity for organization. In crisis context, many businesses are affected and some of the small one is closing, that why PECB consider that assurance of the continued service is the most important reason to implement a Business Continuity Management System, followed by reducing risk of business interruption. The level of benefits gained, however, may differ from organization to organization (Sharp, 2009).

The companies tend to use the business continuity management only for reducing the effects of interruptions or crises and don't take in consideration that the potential and its strategic role is far greater and is still largely unexplored (Maier, 2014).

It is obvious that BCM can offer a lot of benefits to organizations, but we need to consider also that there are a series of counterarguments related to these concepts. In their work, the researchers Urbanec and Urbancová (Urbanec and Urbancová, 2015) argue that in order to implement BCM standards, organizations need to take into account higher costs and also that it is a time-consuming process. Other aspects refer to the fact that BCM has higher requirements from specialists in a certain field and stricter demands for local rules change implementation. In the case of employees, they need to be informed in advance about the implementation of BCM, and they also need to be informed about the main threats of the organization and how to be eliminated or limited. All of these can mean that only those employees who can understand the reasons why implementing BCM is a good thing may accept it (Urbanec and Urbancová, 2015).

Conclusions

Now, in the pandemic situation, more than ever, the international business environment is facing tremendous threats, numerous unknowns and uncertainties. In this context it becomes more and more important the development of business continuity plans as well as proactive management and readiness to handle incidents of any kind. The whole process starts with a good understanding of the organization, followed by determination of the business continuity management strategy, development and implementation of the BCM response, exercise, preservation and review of the BCM arrangements, and concluding with embedding the BCM in the organization's culture. Business impact analysis is the most relevant element in understanding how an organization functions, together with risk assessment. Business continuity management is key to ensuring that an enterprise can protect

itself against the risks which are inherent in its environment. Enterprises are increasingly reliant on the availability of information in order to provide services to customers.

The purpose of this paper was to increase awareness of the BCM benefits for organization. When implementing a Business Continuity Management System, a company can have better financial stability, can improve the organizational climate, can develop new business segments and can improve the crisis management. The employees' awareness of risks, the strengthening of a competitive advantage and the enhancement of the organization's prestige are some other benefits of conducting a business based on a Business Continuity Management System.

Also, we wanted to highlight that, when dealing with a crisis the role of a business tool is not to improve the organization performance, but rather to minimize the performance drop. As the first step in business continuity planning is to predict the crisis situation we can observe that active enterprises predict and prevent the crisis situations, while, in passive ones, establishment of business continuity management model is mediated by the intensity of crisis situation recurrence. In this case, the business continuity management develops, when the likelihood of crisis recurrence comes to a critical level. The benefits of the BCM are felt also at the employees' level. They become more aware of its impact and in the improvement of their crisis management. Considering all the benefits of the BCM there is a need for future research to explore the concept of business continuity for building resilient organizations.

Evidence That Romanian Entrepreneurs Are Opportunity-Driven, Rather Than Necessity-Driven: A Macroeconomic Spatial Analysis

Horia TIGAU

mihai.antonia@gmail.com

Abstract

The purpose of our study is to investigate the macroeconomic factors influencing new firm formation in Romania, using a spatial panel framework. Entrepreneurship and macroeconomic factors influence each other in various ways, as there are many determinants of regional entrepreneurship dynamics in contemporary Romania. The main hypothesis of this paper tries to indicate whether the Romanian Entrepreneur is opportunity-driven or necessity-driven. Several other papers have shown that the entrepreneurial attitude differs by country, due to the business framework or to cultural aspects. The other tested hypothesis is whether there exist spatial spillover effects between Romanian counties with respect to the ratio of new businesses to active business population. The paper develops a holistic conceptualization of the spatial variation of start-ups in Romania and empirically investigates determinants of the birth of new firms, using data over the period 2008-2018 at the NUTS 3 level. The results suggest that the unemployment rate, the resource utilization rate and the number of active firms per thousand inhabitants have a significant influence on the proportion of newly created firms in the total number of active firms. Returning to the hypotheses, the authors conclude that Romanian entrepreneurs in the aforementioned period have been more opportunity-driven, while spatial spillover effects have shown to be significant.

Keywords: Entrepreneurship, Unemployment Rate, Spatial Panel, Macroeconomic Factors.

Introduction

Entrepreneurship has a decisive contribution to employment and economic growth, in any country on the globe, at any level of economic development (Carree & Thurik, 2003). In the globalization context, politicians, economists and researchers consider entrepreneurship dynamics as an important contribution to sustainable economic development. Failing start-ups lead to increases in innovation due to entrepreneurs' will to further explore the creative process (Nanda & Rhodes-Kropf, 2017). Therefore, the Europe 2020 Strategy considers entrepreneurship as a main tool in reaching the EU's agenda for growth and jobs for the 2010 - 2020 decade. The European Commission sees entrepreneurship as acting upon opportunities and ideas and transforming them into value for others, which can be financial, cultural, or social. EU created an environment where entrepreneurs can flourish and grow and, as a citizen of EU, starting a business is quite easy. You can set up your own business (even as a sole trader) in any EU country, Iceland, Norway or Liechtenstein, with less than 100 Euro in just 3 days.

Entrepreneurship is still in its early stages in Romania, but in a continuous expansion. The political factors see the opportunity in entrepreneurship development and therefore, consistent with the EU's agenda, Romanian's Government developed in 2014 the Government Strategy for Developing SMEs and improving the business environment in Romania – "Orizont 2020" (H.G. 859/2014). A series of measures have been proposed for the development of entrepreneurship in Romania, so that to reach 35 SMEs per thousand inhabitants with an increase of 3 million employees. Romania launched in 2017 a governmental program named Start-Up Nation (OUG-3, 2017) inspired by the successful program Israel Start-Up Nation. The program has brought credits of up to 200,000 RON (almost 40,000 Euros) to 8,600 new firms. The budget for the second year of implementation, 2018, had shrank and only 4.684 new businesses received funding.

Even stimulated by the political measures, in the end, the final decision of starting a business is still a personal choice. The literature's position in human capital theory is that people invest in themselves through education, training and experiences, expecting higher earnings. Investments in human capital have a positive impact over labour productivity,

which transferred to the entrepreneurial field promotes start-up success. Early studies found a strong positive correlation between human capital and new business formation (Armington & Acs, 2002).

In this study we focus our attention on how does the birth rate of new firms depend on several regional macroeconomic factors in Romania. Our main hypothesis suggests that Romanian entrepreneurs are rather opportunity-driven, than necessity-driven (Ross et al., 2015). The innovation in this paper is given by the use of a spatial panel regression model with data available at the NUTS3 level for Romanian counties; the model's dependent variable, the ratio between the number of new firms formed in the specific year and the number of total active firms in that year, is also lagged one year forward to the explanatory variables – this strategy was employed to reduce the endogeneity in the data, as well as to portray new firm creation as a response to regional macroeconomics characteristics. Our study presents a framework for other researchers that wish to analyse how unemployment affect entrepreneurship, either in the case of Romania, taking into account other explanatory variables as well, or in the case of their chosen country. Different results might be obtained, depending on the entrepreneurial culture defined in specific cases or on geographical properties of the respective countries.

Literature Review

Entrepreneurship and the birth of new firms are substantial elements in economic growth because they influence the composition of firm dynamics, which is an important predictor of growth and performance between regions (Audretsch & Feldman, 2004). It is clear from the previous studies that macroeconomic factors influence the entrepreneurial activity. The regional variation of start-ups is explained by the differences between regions in: population growth, economic growth, wages, unemployment and entrepreneurial density (Keeble & Walker, 1994 ; Audretsch & Fritsch, 1994 ; Armington & Acs, 2002 ; Tamasy, 2006).

Another effect on economic development of new firm formation is that thet may displace incumbents (Aghion, Howitt, & Mayer-Foulkes, 2005). On the other hand, incumbents may also benefit from the knowledge spillovers and creativity of the newcommers (Fritsch & Changoluisa, 2017). Inovative start-ups can exert considerable competitive pressure, Changoluisa & Fritsch (2019) investigate the relationship between new business formation and the level of competitive pressure that is perceived by manufacturing incumbent establishments. Competitiveness has a positive impact because it leads to better and cheaper products in the market. A positive impact of new business formation on incumbent performance is improved productivity (Fritsch & Changoluisa, 2017).

Entrepreneurship aroused interest of few romanian reasearchers: Păunescu, Popescu, & Duennweber (2018) studied the desirability of entrepreneurship and how different factors affect the desire to become an entrepreneur and found that social stability and feasibility are the most important factors. Pop (2018) was intrested in evolution of the Romanian SMEs after Romania's integration in the European Union. Tigau (2019) measured the impact of FDI and other macroeconomic factors on new firms survival rate and results discovered that FDI has a significant positive effect on the survival of startups. Goschin (2020) explored the impact of actual economic crisis on the surviving rate and the results suggests that entrepreneurship resilience is influenced by FDI per capita and the agglomeration of active firms.

Although few studies exist on new business formation in Romania, the conceptual framework adopted in this study is inspired from other spatial studies (Audretsch & Fritsch, 1992 ; Audretsch & Fritsch, 1994 ; Keeble & Walker, 1994 ; Tamasy & Le Heron, 2008 ; Gaygisiz & Koksal, 2003 ; Ross, 2011 ; Ross et al., 2015 ; Ghani, Kerr, & O'Connell, 2014). In previous studies, a variety of country-level measures of entrepreneurial activity and new firm formation was developed. In a study over the geography of firm birth in Germany, the birth rates were measured in two different ways: the *ecological approach,* that standardizes the number of entrants relative to the number of active firms and the *labour market approach*, that standardizes the number of new firms with respect to the size of the workforce (Audretsch & Fritsch, 1992 ; Keeble & Walker, 1994 ; Armington & Acs, 2002,). In other studies the following variables were used: *new business density,* defined as new registrations per thousand inhabitants between ages 15-64 (Khader, Rajan, & Sen, 2014); *nascent entrepreneur* - the exact number of start-up activities (Tamasy, C., 2006); *VAT Registrations* (data from the Value Added Tax register in Scotland) per thousand of working age population (Ross, A., 2011; Ross, A. et.al, 2015). Ultimately, since people and not establishments start businesses, for our study we have chosen the *ecological approach* that standardizes the number of entrants relative to the number of active firms.

It is valuable to understand the macroeconomic conditions in the economy because they also affect the survival and profitability of companies. Numerous factors drive the creation of new businesses or start-ups in the economy. Entrepreneurship and *macroeconomic factors* influence each other in various ways. Literature in this field is rich, but

studies investigating the determinants of new firm formation seem to have contradictory results depending on the period being examined and, in some cases, geographical factors might play a role as well.

The most commonly used determinant of start-ups in studies is economic growth. Higher firm birth rates are associated with higher subsequent growth rates within regions of the United States (Reynolds & Maki, Regional Characteristics Affecting Business Growth: Assessing Strategies for Promoting Regional Economic Well-Being, 1991), explained by the fact that new economic activity tends to locate in those regions where production convexities yield the greatest returns to that activity. However, an early study for West Germany suggests the contrary (Audretsch & Fritsch, 1992). In 1994, same authors David B. Audretsch and Michael Fritsch suggested that birth rates tend to be higher in regions where gross value added per person is greater. Few years later, a positive relation between GDP per capita and entrepreneurship was found in several studies (Audretsch D. , 2007 ; Baumol & Strom, 2007). In low GDP level countries, starting a business provides a path to avoid unemployment and is often seen as an effective poverty escape route. Studies have shown negative empirical evidence between entrepreneurship and GDP per capita for poor countries and positive relations or less significant for rich countries (Amoros & Bosma, 2014). There are also studies, which state that GPD per capita is statistically insignificant in new firm formation (Keeble & Walker, 1994).

Spatial variation of average wage is likely to influence the demand of goods, which means an increase in personal income may positively influence the creation of new firm formation (Reynolds et al., 1994). Wage growth, which also acts as a proxy for demand, was not found to influence entrepreneurial activity in the study conducted by Andrew Ross in 2011. The coefficient was negative and not statistically significant (Ross, A., 2011). The same author, in 2015, discovers a positive relationship between wages and entrepreneurial activity: income levels proxied by regional wage rates were significant at the Scottish level and within urban regions, highlighting that increasing disposable incomes imply increased purchasing power, generating growth opportunities for existing businesses (Ross et.al, 2015). Another positive dependence was found on a paper that presented the results of an empirical investigation into regional differences in the formation of new firms in West Germany. High wage level, associated with high level of skills, seems to stimulate the creation of start-ups - analyses strongly indicate that founders of new businesses tend to have a high skill level and it is well known that such persons normally face a relatively low danger of being unemployed (Fritsch M. , 1992). Variations in the firm birth rates are substantially explained by regional differences in population growth and income growth, which in this case is the average annual rate of increase in personal income (Armington & Acs, 2002).

Employment in small businesses tend to have a positive impact in new firm formation. (Fritsch, 1992). Small firms may be considered as 'incubators' for new firm founders (Keeble & Walker, 1994). To test that hypothesis in Romania's case we want to determine if there is any correlation between new firm birth rates and average number of employees per economic establishment.

Krugman's theory (Krugman, 1991a ; Krugman, 1991b) can be adapted to link firm births to the degree to which three types of spillovers occur within a region. Krugman's model points to the importance of agglomerations in generating convexities in production within a spatial unit and it can be considered the pioneering theory of spatial variation of entrepreneurship. After that there is a growing literature identifying the determinants of new businesses on a regional basis (Audretsch & Fritsch, 1992 ; Audretsch & Fritsch, 1994; Reynolds & Storey, 1992 ; Fritsch, M., 1992). Later on, even after studies concluded that the subject of regional entrepreneurship turned to be more complex and a significant number of independent variables as well as dependent variables interact, influencing the entrepreneurial processes, this theory still stands (Malecki, 2009) (Audretsch & Link, 2017) (Iftikhar, Ahmad, & Audretsch, 2020; Sunny & Shu, 2019). Location chosen for start-up activity is influenced by the presence of agglomeration economies, especially in cities where people and firms' density can influence the search costs for workforce and suppliers (Reynolds et al., 1994).

It is well known that starting a new business requires capital, and usually, in Romania's situation, it may come from own funds, debt or European funds. In a study about optimism and entrepreneurship (Meza & Southey, 1996) we found an interesting observation about the relationship between entrepreneurial ability and debt – when financed with debt, entrepreneurs make safer choices. Lending rates are the interest rates banks provide to the private sector for loans, and it was hypothesized that high rates lead to low ease of business because of unwillingness to take out loans. In Romania's case, a survey-based study named "Barometer of start-ups from Romania 2019" indicated that in 79% of the cases, own funds are the primary source of financing for a new business. Deposit interest rates are more likely to stimulate savings in detriment of entrepreneurship and start-ups, especially when future profits tend to be lower. Following resource-based theory, which says that an entrepreneur will start a business when he has enough capital to do so (Braunerhjelm, 2007), we want to put this to test and find if there is any relation between new firm birth rate and deposit interest rate.

Higher rate of unemployment could lead to new firm formation, due to difficulty in finding a job.

Many studies investigating the unemployment and its relationship with new business formation seem to be contradictory and dependent on the time period or geographical factor. For instance, the unemployment rate was found to be strongly negative and statistically significant at the Scottish level and in rural regions indicating that continuing entrepreneurial activity in Scotland is opportunity- driven and the effect of a given business cycle is greater than any unemployment push effect (Ross et al . 2015). A prevision study in Romania confirms the existence of a strong relationship between unemployment and entrepreneurship (Sipos-Gug & Badulescu, 2015). On short term the relationship is negative - an increase of unemployment predicts, for instance, a decrease of entrepreneurial activity in the following months, explained by difficulties at the level of the nation economy and social aid for the unemployed. On the long term, the relationship is positive, an increase in unemployment predicting an increase in entrepreneurial activity, which may be explained by "push effect". Higher rates of unemployment could lead to new firm formation and a negative change in labour market conditions and the limited availability of waged employment may push individuals into entrepreneurial activity.

Macroeconomic factors are not the only determinants of new firm formation - social trust also plays an important role in the birth of new firms. In a study across nine EU countries Corradini (2020) suggests that social trust may facilitate the flow of information and knowledge exchange across spatially embedded institutions, firms and people, thereby fostering entrepreneurial processes. Social trust turns to be a more important factor in countries with lower level of economic development and diminishes in countries or regions with higher GDP and stronger quality of governance (Audretsch, Seitz, & Rouch, 2018).

Methodology

Our study is intended to reveal how several macroeconomic indicators (which were reviewed in the previous section) can influence the birth rate of new firms in a spatial panel framework. In particular, we wish to verify the following two main hypotheses:

H1: A developed entrepreneurial culture (variable encapsulated in the ratio of new firms to active firms) is significantly related to a low unemployment rate.

H2: There is a significant spatial dependence between regions in the dependent variable.

The model chosen to verify these hypotheses is a spatial panel regression model with data from the 41 Romanian counties and the municipality of Bucharest (NUTS 3 level) in the period 2008-2018. The following table offers a description of the variables used in the model. The fourth variable acts as a dependent variable, while all the subsequent ones are explanatory.

Table 1: Variables used in the model

No.	Name	Description	Source
1	*Number of new firms**	The total number of firms registered only during the specified year.	National Trade Register Office
2	*Number of active firms**	The total number of firms active during the specified year.	Romanian National Statistics Institute
3	*Number of employees**	The total number of persons hired with a labor contract or service report, on a determined or undetermined period, whose contract/report was not suspended in the specified year.	Romanian National Statistics Institute
4	*New firms to active firms ratio*	Ratio between the number of new firms and the number of active firms.	Authors' own computation
5	*Average number of employees per firm*	Ratio between the number of employees and the number of active firms.	Authors' own computation
6	*Unemployment rate*	Ratio between the number of unemployed persons (registered at employment agencies) and the active civilian population.	Romanian National Statistics Institute

7	*Average net salary*	The monthly average salary gain, computed by dividing the net sum payed by economic agents to their employees to the number of employees.	Romanian National Statistics Institute
8	*Resource utilization rate*	The ratio between the active civilian population and the work resources (which includes persons in the age group that is fit to work and persons which fall outside of this category, which are active).	Romanian National Statistics Institute
9	*Active firm density*	Ratio between the number of active firms and the population (measured at 1st of January) multiplied by 1000.	Authors' own computation
10	*GDP growth rate*	Ratio between specified year's GDP and previous year's GDP.	Romanian National Statistics Institute
11	*Interest rate*	Interest rate for new term deposits of households; initial maturity between 1 and 2 years.	Romanian National Bank

**N.B. : These variables are not used in the model, but are used to compute variables that are present in the model.*

When performing a spatial analysis, a frequent issue that appears is that of endogeneity. A solution for this issue is using valid instrumental variables (Barros et al., 2020). However, finding such variables represents a challenging task, as most economic indicators are extremely correlated to each other. To avoid simultaneity, several other papers have adopted a common approach to reduce endogeneity: using one year lagged data for the dependent variable (Baccini & Urpelainen, 2014 ; Steinerg & Malhotra, 2014 ; Memili, et al., 2015 ; Goschin, Druica, & Valsan, 2020). We have also adopted this method. The lagged data model offered much more significant results than the usual model that uses simultaneous variables, hence indicating the presence of endogeneity in the initial data. When testing for multicollinearity, no correlation between two explanatory values was higher (in absolute value) than 0.65. According to the literature, variables that show correlations higher than 0.8 should be removed from the model (Berry WD, 1985). Therefore, we did not eliminate any variables based on this standard procedure in literature.

As it is the case with spatial analysis, we have used a spatial weight matrix to describe the proximity of counties. Several measures are used in the literature (Elhorst, 2014). We have chosen to represent the matrix based on binary contiguity, i.e. if $\boldsymbol{W} = (w_{ij}) \in \mathbb{R}^{n\times n}$ is the weight matrix, with n being the number of counties (42, in our case), then $w_{ij} = 1$ if the region i shares a border with region j , and $w_{ij} = 0$ otherwise. This matrix, with zeros on its main diagonal is then row standardized, such that each obtained number represents a spatial weight in the regression. The work that follows is done by using the statistical software R.

In order to determine the appropriate form of the regression equation, several statistical tests were employed. The SLM1 marginal test (Baltagi, Song, & Koh, 2003) pointed towards using random effects (p-value < 0.001), instead of fixed effects, result which was strengthened by the Hausman test (p-value = 0.999) (Pace & LeSage, 2008). When using the spatial dependence Lagrange multiplier test (Anselin, Bera, Florax, & J., 1996), results indicate the presence of spatial lag dependence (p-value = 0.003) and spatial error dependence (p-value = 0.012). The model is described by the following equations:

$$\boldsymbol{y} = \lambda(I_T \otimes W)\boldsymbol{y} + X\boldsymbol{\beta} + \boldsymbol{u} \qquad (\mathbf{1})$$
$$\boldsymbol{u} = \rho(I_T \otimes W)\boldsymbol{u} + \boldsymbol{\varepsilon} \qquad (\mathbf{2})$$
$$\boldsymbol{\varepsilon} = (\boldsymbol{\iota_T} \otimes I_N)\mu + \boldsymbol{\nu} \qquad (\mathbf{3})$$

, where **y** is the NT×1 vector of observations for the dependent variable, $I_T$is the T×T identity matrix, W is the spatial weight matrix illustrated before, λ is the spatial dependence parameter, X is the NT×k matrix of explanatory variables, **u** is the disturbance term, composed of an autoregressive error part whose effects are described by ρ, and an error part $\boldsymbol{\varepsilon}$**,** which is also split in a specific effects part $\boldsymbol{\mu}$ with $\mu_i \sim IID(0, \sigma_\mu^2)$ related to each region and a novelty part $\boldsymbol{\nu}$ with $\nu_{it} \sim IID(0, \sigma_\nu^2)$ that accounts for both changes in time and regions; $\boldsymbol{\iota_T}$ is a vector of T ones. In this study, N=42, T=10 and k is 7. For the dependent variable **y**, the observed period is 2009-2018, while for the explanatory variables the observed period is 2008-2017.

The direct (equation 4) and indirect (equation 5) impacts of every variable in each region are estimated as follows:

$$S_k(W)_{ii} = \frac{\partial y_i}{\partial x_{ki}} \qquad (4)$$

$$S_k(W)_{ij} = \frac{\partial y_i}{\partial x_{kj}} \qquad (5)$$

Averaging these impacts across all regions will yield the mean direct and indirect impacts for each explanatory variable (LeSage & Pace, 2009).

Results and Discussions

Based on the methodology described above, the following regression parameters have been estimated, together with their level of significance:

Table 2: Regression results

Name	Model 1 (Full Model)
Intercept	0.772 (<0.001) ***
Average number of employees per firm	0.013 (0.269)
Unemployment rate	-0.019 (<0.001) ***
Average net salary	4×10^{-5} (0.528)
Resource utilization rate	-0.003 (0.018) *
Active firm density	-0.006 (0.034) *
GDP growth rate	-0.039 (0.532)
Interest rate	0.002 (0.658)
λ	-0.615 (<0.001) ***
ρ	0.671 (<0.001) ***
ϕ	2.236 (<0.001) ***

N.B. : p-values are in parentheses. The ϕ parameter is equal to $\sigma_\mu^2/\sigma_\varepsilon^2$. If ϕ=0 at a significant level, then we can reject the hypothesis that random effects describe the data better than fixed effects.

Based on the results described above, we can confirm the hypotheses: the unemployment rate significantly influences the new firms birth rate and there is a significant spatial dependence in the dependent variable.

Recalling that the dependent variable is delayed by a period of 1 year, we can interpret that more new firms are created in response to a lower unemployment rate, which might mean that people start a business due to opportunity-driven reasons, instead of necessity-driven reasons (Albulescu & Tamasila, 2014). This result was also observed in previous literature, for the case of Scotland (Ross et al., 2015). Another interpretation of this relationship's sign could be given by a decrease in entrepreneurship due to situational, period-specific characteristics of the economy that also result in a high unemployment rate (Sipos-Gug & Badulescu, 2015). Due to the difficulty of providing robust instrumental variables to test this hypothesis, it is hard to tell if this was indeed the case in our study. We also observed that two more variables present a significant influence on the dependent variable: the resource utilization rate and the active firm density. The negative signs for these two variables can also be explained as an entrepreneurial response to low-performance economic indicators. By creating new jobs, entrepreneurs offer more available spots for the workforce to occupy. A lower active firm density means that entrepreneurs have smaller barriers to enter the market, as competition (represented by a higher firm density) is lower, hence more new firms are created. This result is somehow contradictory to what the literature says, in which birth rate is higher in agglomerations (Reynolds et al., 1994), due to the availability of suppliers, workforce and a well-defined market. Moreover, this result further strengthens the

point that the Romanian Entrepreneur is opportunity-driven, as more new firms appear in regions where there is a lack of existing firms. Regarding the second hypothesis, the result shows that the spatial model was appropriate for our analysis, and that spatial spillover effects exist, as we have already enconuntered in the literature (Krugman P. , 1991a ; Krugman, 1991b).

Contrary to what was discovered in the literature, average net salary, interest rate and the GDP growth rate did not show a significative influence on the dependent variable.

The following table shows the mean impacts for each explanatory variable:

Table 3: Direct, indirect and total impacts of the explanatory variables

Name	Direct impact	Indirect impact	Total impact
Average number of employees per firm	0.014 (0.261)	-0.006 (0.305)	0.008 (0.273) ***
Unemployment rate	-0.020 (<0.001) ***	0.008 (0.024) *	-0.011 (0.001) ***
Average net salary	4×10^{-5} (0.443)	2×10^{-5} (0.437)	2×10^{-5} (0.471)
Resource utilization rate	-0.003 (0.020) *	0.001 (0.060) .	-0.002 (0.030) *
Active firm density	-0.006 (0.017) *	0.002 (0.060) .	-0.003 (0.021) *
GDP growth rate	-0.042 (0.542)	-0.018 (0.580)	-0.024 (0.556)
Interest rate	0.002 (0.684)	-0.001 (0.693)	0.001 (0.689)

N.B. : p-values are in parentheses.

The table above shows significant impacts for the same three explanatory variables discussed earlier. Direct impacts are similar to the regression coefficients and offer similar explanations. The indirect impacts, which are significant (at a 0.06 level), show a positive sign, meaning that an increase in unemployment rate, resource utilization rate or active firm density in one county can lead to an increase of new firm formation in neighbouring counties. This result might suggest that unemployed persons might seek a job in the region, outside her own county or competition in the county might influence the entrepreneur to start her enterprise somewhere else in the region. The magnitude of indirect impacts, being smaller than that of the direct ones might suggest that there is a decay due to distance.

Conclusion

The present study's goal was to analyse how do macroeconomic indicators influence the birth rate of new firms (standardized to the total number of active enterprises) in a spatial setting. We have discovered that three of our chosen explanatory variables present a significant influence to the dependent one. The unemployment rate presents a negative relation, suggesting that entrepreneurship in Romania in the observed period might be more opportunity-driven than necessity-driven. The resource utilisation rate also negatively influences the new firm birth rate, as entrepreneurs seek to create new jobs, while the low active firm density means less competitions and smaller barriers to entry for new firms. From the spatial point of view, there was significant evidence that there exist spillover effects across the 42 regions.

There are however some limitations to the study: first of all, choosing the one year lagged dependent variable to reduce endogeneity is a "quick fix" solution, which might not offer the most accurate results – better ways to deal with endogeneity are to employ a dynamic spatial panel model, in which time lags are introduced, or using strong instrumental variables; secondly, entrepreneurial success and innovation are heavily linked to the entrepreneur's own skills, attitudes and behaviours, characteristics which were not present in this study.

As for further research, we recommend the use of better instrumental variables, as well as a dynamic regression model, together with questionnaire-generated data, similar to data available from the Global Entrepreneurship

Monitor (Amoros & Bosma, 2014). We encourage other researchers to replicate our study in the case of their countries of choice, as well as for the Romanian case, using other explanatory variables which better fit the model.

To conclude, the present study has confirmed what the authors have proposed as hypothesis: the Romanian entrepreneur tends to be opportunity-driven. This attitude towards entrepreneurship suggests that Romania's development level is behind that of Western states, which are frequently pointed out as reference points for Eastern economies. It is optimistic that Romanians see this gap as an opportunity to develop new businesses, offer jobs, invest in innovation and create value. We hope that this study offers good insights to why this attitude of Romanian entrepreneurs is beneficial and that it should continue. For our own future research, we want to study several years from now if that gap had gotten smaller and that entrepreneurship had played an important role in the result.

Abstract

This study analyzes the factors that determine financial inclusion in Simeulue Regency, Aceh Province, using household survey data with a sample of 383 households. There are two methods of analysis used in this study, namely factor analysis and cross-tabulation. The estimation results show that the variables that influence financial inclusion are gender, education level, and employment status. Meanwhile, employment status, poor status, and education level have a significant effect on financial inclusion. Furthermore, women have more influence than men. Financial institutions and banks need to take advantage of women's influence in increasing financial inclusion in this area.

JEL: G4, G5, I3, R2

Introduction

Simeulue Island is a remote area located in the Indian Ocean with the closest distance from Sumatra Island to 86 miles (Figure 1). This island consists of 147 large and small islands. The island can be accessed by sea and air routes. Because this area is far from Sumatra Island, the economy of this area is relatively very limited. The poor population in Simeulue Regency was 19.78 percent in 2018 of 89,059 people (BPS Simeulue, 2019).

The high number of poor people impacts financial and banking access, so it is feared that the penetration of inclusive finance will be relatively low compared to other regions. The results of empirical studies prove that the poor have somewhat limited access to financial inclusion (Lyons, Grable, & Joo, 2018). However, this empirical evidence is mostly done in other countries with different Simeulue Regency conditions, so it is necessary to study the factors that determine financial inclusion in this area.

A Special Case Study of Simeulue Regency" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

Figure 1: Map of Aceh Province and Simeulue Regency

Source: UNEP (2007).

Table 1 shows some of the socio-economic indicators of Simuelue Regency and Aceh Province. The poverty rate in Simeulue Regency is still substantial and above the poverty rate of Aceh Province. This data confirms that economic development in Simeulue Regency is still not optimal. Another indicator, the per capita income of Simuelue Regency is still far below Aceh Province. The income per capita in Simeulue Regency is only USD 1,147, and per capita income in Aceh Province USD 1,639.

Meanwhile, public spending in Simeulue Regency is only USD 445.13 and Aceh Province USD 597.13. This expenditure is deficient and cannot be separated from low income because the poverty rate is still very high. Even though the income and expenditure per capita are low, the economic growth of Simeulue Regency (4.75 percent) is higher than that of Aceh Province (4.15 percent). High economic growth has not provided more significant benefits for the community because there are still many poor people. The last indicator is the Simeulue Regency of Human Development Index (HDI) 64.41, far below Aceh Province's 70.60.

Table 1: Socio-economic Indicators of Simeulue Regency and Aceh Province, 2019

Indicators	Simeulue Regency	Aceh Province
Poverty (%)	18.99	15.32
The income per capita (USD)	1,147	1,639
Expenditure (USD)	445.13	597.13
Human Development Index	64.41	70.60

Source: BPS Aceh (2020).

Based on several socio-economic indicators, the remote location of Simeulue Regency has resulted in the low economic achievement of Simeulue Regency. Although some hands are soft, there is hope for profitable economic growth. This economic growth is expected to affect financial inclusion. Kim, Yu, & Hassan (2018) found that economic development involves developing financial inclusion, and financial inclusion affects economic growth. The result of inclusive finance cannot be separated from digital banking development (Ozili, 2018). Given the geographic location of Simeulue Regencysome socio-economic indicators that are still below the Aceh Province average, determining financial inclusion in Simeulue Regency is one of the empirical studies that can add empirical evidence in the field. Financial inclusion because there are no studies about this in Simeulue Regency.

This research is fundamental because empirical evidence shows that financial inclusion affects reducing poverty in several countries. Li (2018) found that financial inclusion has a positive and significant effect on lowering the poor population. Boukhatem (2016) documents evidence that economic progress has a considerable impact on reducing the poor. Another

study shows that financial inclusion significantly affected the poor population in Aceh Province (Aliasuddin, Dawood, & Rahmi, 2020).

Literature Review

Financial and banking advances have affected financial inclusion in both developed and developing countries. This progress is supported by developments in information technology and the internet so that banking services are not only in conventional forms but transform digital banking. Mushtaq & Bruneau (2019) found that the role of information technology (ICT) is enormous in increasing financial inclusion in 62 countries. The progress of this financial inclusion is inseparable from the technological aspect, but in this study, the technical factor is not included in the analysis model.

Apart from technological factors, other factors influence the development of this financial inclusion. A study conducted by Kabakova & Plaksenkov (2018), for example, find that several socio-demographic variables affect financial inclusion in 43 countries using the fuzzy-set qualitative comparative analysis approach. Meanwhile, Li (2018) household survey data in China find that income is an essential factor for poor households' financial inclusion. Grohmann, Klühs, & Menkhoff (2018) document that the factors that play a significant role in financial inclusion are economic infrastructure and financial literacy.

Ayllón & Fusco (2017) find that households with low incomes tend not to use banking services or low financial inclusion. Meanwhile, Zins & Weill (2016) conducted a study on the determinants of financial inclusion in 37 countries in Africa using a probit model. They find that males, wealthier, more educated, older were essential factors that determined financial inclusion.

Iqbal & Sami (2017) examine financial inclusion in India using a multiple regression model and found that financial institutions influence financial inclusion. Tchamyou, Erreygers, & Cassimon (2019) use the generalized method of moments in analyzing ICT on inequality through economic development in 48 African countries. They found that financial depth affects reducing poverty in 48 African countries.

Swamy (2014) analyzes gender roles on financial inclusion panels least squares and generalized moments with a sample of poor people in India. This study indicates that the part of women is greater than that of men in financial inclusion in India. This study forms the basis that gender has a significant effect on financial inclusion.

Lyons, Grable, & Joo (2018) find that older people have a subordinate role in financial inclusion and get the most significant financial inclusion effect. Furthermore, they found that low education and low income had the most significant vulnerability in financial inclusion.

Research Method

Sampling Method

This research was conducted on household respondents in Simeulue Regency and especially the East Simeulue Subdistrict. The number of households in the East Simeulue Subdistrict was 6,987 households (BPS Simeulue, 2019). Determination of the number of samples is conducted using the formula (Tejada & Punzola, 2012):

$$n = \frac{N}{1+Ne^2} \tag{1}$$

N is the population (6,987 households), *e* is the error, and *n* are samples. According to Tejada & Punzola (2012), equation (1) is valid if *e* must be 5 percent to meet large sample properties' requirements. Based on these considerations, the number of samples in this study was at least 378 households. Fortunately, the number of samples in this study was 383, so it was eligible for large sample properties. Sampling from households was done by simple random sampling. All households had the same opportunity to be selected as samples.

Model Analysis

There are two main models and approaches to data set analysis. First, a data set that has a distribution from a randomly drawn population and tries to study the data set. This approach is known as the statistical model approach. The second model is a geometric form approach model from the data set with a deterministic model. This second model can be in the form of subspace, manifold, and topology. This second approach model is known as the geometric model (Vidal, Ma, & Sastry, 2016: 4).

The model used in this study is the second approach model, namely the geometric model. Although in the geometric model, it is stated that the number of samples used is not sufficient and the population distribution is unknown, in this study, the geometric model is used because the model is suitable for this analysis. This geometric model approach uses a classical principal component analysis (PCA) to analyze the topological model (Vidal, Ma, & Sastry, 2016: 5). The most suitable nonparametric research is to use the factor analysis approach to identify the essential variables that affect a variable.

Based on these considerations, the model used in this study is stated (Vidal, Ma, & Sastry, 2016: 5):

$$x_j = y_1\mu_1 + y_2\mu_2 + \cdots + y_{dj}\mu_d + \varepsilon_j \qquad \forall x_j \in x \qquad (2)$$

Where $d < D$, $y_{ij} \epsilon R$ with $i = 1, \ldots, d$ and $\mu_1, \mu_2, \ldots, \mu_d \epsilon R$ are unknown model parameters that need to be determined. Furthermore, $\varepsilon_j \epsilon R^D$ is the error term between sample *j*th in the model.

Findings and Discussion

Household choice of financial inclusion is determined by selecting eight variables that are considered necessary. There are economic variables, and there are also demographic variables and banking service system variables. The variables used in determining this financial inclusion are income per capita, working status, educational level, banking services, ATM card holding, number of bank accounts, and gender. The discussion on determining the selection of financial inclusion was analyzed by assessing the estimates' robustness.

Robustness of the Estimates

Analysis of the selection of factors that determine financial inclusion is carried out using a factor analysis approach. In theory, a factor value greater than 1 is a dominant factor in determining financial inclusion selection. For this analysis to be more valid, it is necessary to carry out repeated estimates four times to obtain the robustness of the research results. The extraction method used in estimating this coefficient is the principal component, alpha factoring, generalized least square, and maximum likelihood.

The estimation results using these four extraction approaches can show no change in the eigenvalues coefficient of the variables used in determining the selection of this financial inclusion. Figure 2 shows the extraction results in deciding the eigenvalues coefficient of the variables used in this study, which consists of four panels (a), (b), (c), and (d).

The estimates for all extraction models gave the same eigenvalues coefficients. Only the positions of each variable were different. Figure 2 panel (a) is the extraction result using the principle component approach where the educational level variable's place is other than the panel (b), which results from extraction using the alpha factoring method. The same results are also shown by the panel (c) of the extraction results using the generalized least squares method and panel (d) of the maximum likelihood method's extraction results.

Table 2: The goodness of fit Test

Extraction Method	Chi-squares	df	Significant
Generalized Least Squares	52,651	7	0.000
Maximum Likelihood	39,634	7	0.000

Source: Estimated Results, 2020.

Panel (a) to the panel (d) also shows the position of each different variable according to other extraction methods. Confirmation that this model is very valid is also demonstrated by the goodness of fit test of the last two approaches, namely generalized least squares and maximum likelihood.

The statistical results of these two extractions have a probability value smaller than zero, with each chi-squares statistic shown in Table 2. Table 2 shows that the two extraction approaches have very significant chi-squares values indicating that the model is perfect to use as material for analysis. Based on these results, the factor analysis method is the most appropriate in this study, and the consequences of this study are valid.

(a) (b)

(b) (d)

Figure 2: Extraction Results of Estimates

Determinants of Selection of Financial Inclusion

Testing the analysis model in the previous section shows that the method used in this study is excellent. The analysis can be carried out to determine financial inclusion selection by including economic and demographic variables. Table 3 shows that of the eight variables used to determine financial inclusion, three main variables play a significant role in determining financial inclusion.

The first variable that determines financial inclusion is gender, with an eigenvalue coefficient of 2.155 and the variance of this variable of 26.94 percent. These results indicate that gender is a very dominant determinant in choosing financial inclusion. The results of field data show that the number of female respondents in this study is 78 people and the male respondents are 199 from the total respondents are 277 people. Although the number of male respondents is more than female, female respondents' role in determining the selection of financial inclusion is relatively good. This result proves that the role of women in developing financial inclusion is critical. This study's results are in line with research conducted by Swamy (2014) and Zins & Weill (2016), who find that gender plays a role in the development of financial inclusion.

The second variable that determines financial inclusion is the educational level with an eigenvalue coefficient of 1.435 and the variance of this variable of 17.93 percent. This academic level variable is significant in determining the selection of respondents' financial inclusion in this study even though many respondents are of low education. The data of this study indicate that the number of respondents from low education is 211 households (55.1 percent) and higher education is 172 (44.9 percent). Even though household respondents have low education, they understand that financial inclusion is an important variable in supporting productive activities and smooth daily household transactions. However, this study's results are different from research conducted by Lyons, Grable, & Joo (2018) that low education has a greater risk of vulnerability in financial inclusion. The government should place greater emphasis on social support for financial inclusion.

Working status is the third variable that plays a crucial role in choosing financial inclusion in this study. This variable has an eigenvalue essential and variance of 14,654 percent. There is a working status that is a long-term working contract, and there is a non-contract working status with 187 households (48 percent) and 196 (51.2 percent), respectively. This data shows that the respondents in this study were mostly workers without a contract. These results indicate that employment status from work without a contract also has financial inclusion. According to Lyons, Grable, & Joo (2018), this working status is included in the social factors, should receive greater attention in financial inclusion because non-contract workers face a greater risk of losing their income so that access to financial inclusion is lower.

Table 3: Eigenvalues of Principle Components

Component	Eigenvalues Extraction		
	Total	**Percent Variance**	**Cumulative**
Gender	2.155	26.940	26.940
Educational Level	1.435	17.933	44.873
Working Status	1.172	14.654	59.527
Poor Status	0.965	12.058	71.585
Income Per Capita	0.911	11.387	82.972
Banking Services	0.613	7.662	90.634
Holding ATM Card	0.477	6.343	96.977
Number of Bank Account	0.272	3.023	100.000

Source: Estimated Results, 2020.

Table 3 shows that five other variables do not affect determining the choice of financial inclusion. The variables are poor status, income per capita, banking services, holding ATM cards, and several bank accounts. The income per capita does not affect the selection of financial inclusion. This result illustrates that even low income will still be interested in having access to banking services (financial inclusion). The research results by Ayllón & Fusco (2017) found that low income tends to have an intense desire for financial inclusion. But this result is different from a study conducted by Li (2018), which documents that income influences the development of financial inclusion in China.

Effects of Socio-economic Variables

The subsequent analysis is the influence of socio-economic variables on financial inclusion in this area, with the control variable being gender. Gender selection is significant to see the effect of gender on financial inclusion. The determination of the socio-economic influence of this variable was carried out using cross-tabulation. There are three variables selected

to analyze the effect of these socio-economic variables on financial inclusion. These variables are working status, poor status, and educational level.

Working status is very influential on financial inclusion. Only lazy people have a very significant effect with a statistical value of 30,967 and a p-value of 0,000, while the female statistic is 3,825 with a p-value for 2-sided of 0.067 and 1-sided of 0.039 (Table 4). These results indicate that men who work will choose financial inclusion, while women do not necessarily. This is very rational because most of the financial transactions in this area are mostly carried out by males compared to females.

Table 4: The Effect of Working Status on Financial Inclusion

Gender	Chi-square	df	2-sided	1-sided
Female	3.825	1	0.067	0.039
Male	30.967	1	0.000	0.000
Total	37.369	1	0.000	0.000

Source: Estimated Results, 2020.

There are two working statuses: working with long-term contracts and without contracts, which have two different conditions. Working with a contract has guaranteed long-term employment, whereas, without a contract, there is no guarantee whatsoever. The estimation results show no difference in influence between workers with long-term contracts and workers without contracts, both for males and females. The estimation results in Table 5 show that women's effect is relatively more significant than that of men because the female statistical value is greater and more significant than that of men. Overall, male and female influence is very substantial, which illustrates that job status has no difference with financial inclusion. Workers with contracts and workers without contracts share a desire for financial inclusion.

Table 5: The Effect of Poor Status on Financial Inclusion

Gender	Chi-square	df	2-sided	1-sided
Female	5.791	1	0.025	0.021
Male	4.563	1	0.043	0.028
Total	6.961	1	0.013	0.008

Source: Estimated Results, 2020.

The effect of female education is greater than that of males on financial inclusion. Statistics for females and males were 29,028 and 13,635, respectively, and significant at the 1 percent level (Table 6). This estimation result shows that women are more concerned about financial inclusion than men. The results of this estimate can serve as a reference for financial institutions and banks in increasing banking market penetration in the community. Approach to female will have a more significant effect than male.

Table 6: The Effect of Educational Level on Financial Inclusion

Gender	Chi-square	df	2-sided	1-sided
Female	29.028	1	0.000	0.000
Male	13.635	1	0.000	0.000
Total	37.313	1	0.000	0.000

Source: Estimated Results, 2020.

Conclusion

Several conclusions can be summarized from the estimation results and the discussion in the previous section. First, three variables significantly influence the choice of financial inclusion, namely gender, educational level, and working status. The variable of gender has a more significant effect on financial selection in this study, whereas the academic class

variable has the second more significant magnitude coefficient. The third bigger coefficient is the variable of working status.

Other results show that the socio-economic variables on financial inclusion are significant by using cross-tabulation extractions. The variables of working status, poor status, and educational level significantly affect financial inclusion. The influence of women is more significant than that of men. These results indicate that the role of women is enormous in society in this research area.

Abstract

On the one hand, the long-term growth of tourism leads to the development of the environment. The mass nature of tourism in recent years has created negative pressures on the social and natural environment. For these reasons, development needs to be geared towards sustainability. Creating an environment in which social, economic and environmental areas are consistent. Measuring the sustainability of tourism in the EU is based on the methodology of European indicators for assessing sustainable development. The article deals with the comparison of sustainable tourism of EU countries on the basis of selected indicators from individual areas of sustainability year-on-year comparison of 2012 and 2017 through machine learning methods and comparative analysis. The results show that there are countries that are still lagging behind in achieving sustainability goals in terms of renewables or waste production.

Keywords: Sustainable, tourism, environment, European Union.

Introduction

Liberalization of the tourism market, shortening of distances, digitization of supply, this is only a small list of factors that have caused the dynamic growth of tourism in recent decades. The tourism industry has been and still is considered an efficient pole of development. Many authors agree that tourism is a rapidly developing sector, there is a link between economic development and the development of tourism and it is also a sector with a positive impact on employment, to reduce poverty (Oh, 2005). For example, Manzoor (2018) demonstrated a positive relationship between tourism growth, economic development and employment using bivariate regression. The dynamic development of tourism, also due to the "aggressive" targeted marketing strategy of the destination (DMOs), which is intended to attract as many tourism clients as possible, has become unbearable in many cases. The excessive influx of tourists itself has all the negative effects, such as rising inflation, rising prices for residential housing, rising harmful emissions (Oklevik, 2019) and non-planned tourism growth brings with it the degradation, fragmentation of natural, social and economic environments (Davenport, 2006). Many authors deal with the issue of sustainable tourism, there are many definitions of sustainable tourism. According to Pásková, (2014), it is such tourism, *"when the services provided to visitors and the visitors' own activities affect the natural and anthropogenic environment, the local community and the biosphere as a whole only to such an extent and quality that environment, the local community and the biosphere as a whole, thus not restricting the possibility of using tourism and other anthropogenic use of the destination in the future"*. According to UNEP (2005), it is defined sustainable tourism as *"… tourism that takes full account of its current and future economic, social and environmental impacts, addressing the needs of visitors, industry, the environment and host communities"*. Although there is no uniform definition of sustainable tourism, uniform elements can be found in them. A uniform feature of sustainable tourism is the preservation of cultural heritage for future generations and the definition of some of the areas of interest (pillars). Butler (2006)

defines the development of tourism with the intentions of maintaining the community and the environment, Richards (2000) as the integration of accommodation facilities into the environment. Great part of the literature identifies three basic pillars of sustainability: economic, social and environmental (Cantu- Martinez, 2018). In order to create sustainable space, the pillars must be integrated with each other. According to Šimková (2013), however, there are more dimensions. It considers it positive to extend the area of sustainability to include a political, institutional and technological pillar. The technological pillar is associated with the use of technological progress, the implementation of the 4 Industrial Revolution, which is an essential part of the development of each sector. Similarly, Fernandez and Rivero (2009) define the scope of the pillars. These authors define the pillars of sustainability as economic, social, natural sustainability and extend the pillars to include the political and regulatory environment and the travel and tourism industries. The political pillar represents the interaction between residents and public administration. As far as psychological sustainability is concerned, the author is inclined to define the satisfaction of local communities and visitors to the destination, but the question is whether this issue is no longer part of the socio-cultural indicators. The need for the concept of sustainable tourism is based on the argument that, like any development, the development of tourism has certain social and biophysical limits.

Tourism Sustainability Assessment Methodology

The individual pillars are characterized by a set of criteria. Exist a number of benchmarks that determine the sustainability of tourism. In the past, the selection of indicators was carried out mainly on an ad hoc basis, without a specific theoretical or conceptual framework for the system in place. The development of tourism was comparation in connection with quantitative indicators of tourist movement, for example, the research Kostková (2017) or Vorontsova (2016) who which dealt with the issue of incoming and outgoing tourism in Russia. Many authors have argued that ad hoc approaches lead to a number of dangers in the selection of indicators (eg Bossel, 1999). Other authors discuss about appropriate roles of science, policy and the public in the indicator selection process (McCool and Stankey, 2004). At present, there is a methodology on the basis of which the sustainability of tourism in a destination or region EU, the so-called European system of indicators (ETIS, MRD, 2013) in the field of tourism, is assessed. Based on a set of 34 indicators, it describes developments in the three pillars of sustainable development. The WTO Key Indicators for Sustainable Development (ETIS) are an example of a top-down approach that Twining-Ward and Butler (2002) consider a "useful starting point", but further point out that this approach is too narrowly focused and ignores the specific conditions of destination. However, Tudorache (2017) considers the ETIS system to be a sustainable tourist destination management system based on a number of indicators, which offers an innovative approach to tourism planning. The individual indicators defined in ETIS copy the Global Sustainable Development Goals (Department of Economic and Social Affairs Sustainable Development, 2020) and are part of many other indices (TTCI index, Beynod GDP method). In general, sustainable tourism one of the global goals SDGs (Goal 8.9), an indicator of this goal is the share of tourism in GDP and the contribution to employment in the economy. Summary indicators of sustainable development of the region were issued by UNWTO (Publications Office of the EU, 2014), it is a set of 17 goals of sustainable development of the region in general, it is not defined by sector, it is a targeting from the whole-society perspective, on which the sustainability of tourism is based ((more details of sustainability indicators on the website www.

Database and Methods

This paper analyses the economic-socio-environmental diversity of regions EU27. For the sustainability analysis, we chose a selection of factors (see Table 1). This contribution presents the geographical distribution of sustainable tourism in the regions of the European Union the year-on-year dynamics of the development of the years 2012 and 2017 based on selected sustainability indicators. The comparison of the two periods makes it possible to objectively assess the efforts that individual regions make in sustainability policy. Individual studies consist of analyses and evaluations based on selected indicators of sustainable tourism development. The paper is based on a search of professional literature and databases of Eurostat, UNWTO or the Czech Statistical Office. Map visualizations were performed in MS Excel. Comparative analysis and clustering method using machine reading were used to analyze the development of the dynamics of selected indicators. Data were evaluated by cluster analysis using machine learning. Machine learning is a specific sub-area of artificial intelligence, which contains algorithms to learn from the data provided. Machine learning is currently one of the fastest growing areas of computer science, and it is difficult to find an industry or research field, including tourism, in which machine learning methods are not applied. In most cases, the methods of comparison, the method of multi-criteria decision-making are used in the analysis of tourism flows, the development trends of tourism are in most cases solved at the level of regression analysis or development of time series. Methods based on machine learning algorithms and text data are relatively rare in tourism, this method used by Feng (2019) or Zou (2019), who used data from Google and predicted trends and flows in tourism based on the Radon Forest (RF) model.

Table 1: Indicator sustainable tourism (UNEP 2005, CSU 2020)

Pillar	Group	Indicator
Economic	C1	Number of tourist/100 inhabitants
	C2	Number of commercial establishments/100 inhabitants
	C3	The share of women and men in employment in tourism (%)
Social	B1	Number of tourist nights
	B2	Average length of stay
	B3	Share of tourism employment in total employment (year 15 - 64)
Environmental	D1	Share of the use of renewable resources (%)
	D2	Recycling of municipal waste in EU countries (%)
	D3	Waste volume per capita (in thousands of tonnes)

The machine reading method enables the application of cluster analysis, which is a commonly used method in regional analyses. Used cluster analysis (K-Means algorithm) is a non-teacher learning method. It is used to classify objects, and the goal is to find subsets or clusters of objects in a given set of objects, and objects can contain multiple different unrelated data. It tries to find objects in a cluster that are more similar to each other and yet sufficiently different from objects outside the cluster. The K-means algorithm uses the Euclidean distance as the main criterion for the classification of points into clusters, where μj is the arithmetic mean of the points in the cluster (middle value in the class; (1)) - the standard. In the K-means algorithm it is necessary to specify the required number of clusters K: C_1, C_2, C_3, ..., C_k.

The method is advantageous due to its speed and simplicity, it can also work with a large number of input data in a finite number of iterations. The disadvantage is the need to determine a predetermined number of clusters. K-means is negatively affected by the existence of isolated and distant objects (affecting the average). Different initial locations of cluster centroids can lead to different results. The method is unit-sensitive, if the input indicators are different or s In our case, it is not necessary to perform data standardization (all values are in%) trongly variable, it is better to perform standardization, for example z-score. (Kelbel and Šilhán, 2019).

Development of selected economic pillar indicators

Economy Pillar

The density of tourists is expressed as a ratio of the number of tourists, both domestic and incoming tourism. The indicator we use is calculated as the number of tourists staying in collective accommodation establishments and subsequently related to one hundred inhabitants living in the given territory on 1st of January of the given year. High tourist density is a generator of both positive and negative impacts on the destination. On the one hand, intensive attendance brings the economic and social development of the population in the form of increasing employment, GDP growth, etc. On the other hand, mass tourism, so-called "over tourism", entails clashes with local people, suppression of local cultures and ecological damage to the landscape. The factor "density of tourists" is used and recommended by several authors, e.g. Zou (2019), who uses the machine learning method in analyzes just like us. None of the EU regions has seen a decline in tourist density, suggesting the continuous development of tourism. The highest year-on-year increase in 2012/2017 was recorded in Portugal (dynamics 171.47 %), Latvia (164.31 %), the dynamic increase was supported by a decline in the population. Another region is Romania (161.15 %), the main reason for the increase in Romanian tourism was a 1.5-fold increase in attendance and a minority decrease in population. Croatia (155.24 %) and Lithuania (153.29 %) also rank among the most dynamic five. The lowest increases occurred in Luxembourg (100.5 %), Ireland (101.56 %), Finland (106.35 %), but also in France, which is among the top 10 regions in attendance (109.51 %), where it was growth was dampened mainly by the increase in the number of residents. The Czech Republic is just above the EU average and median (EU average 131.25 %; median EU 129.67 %; Czech Republic 131.55 %). In 2017, more than 50 % of regions were below average, in 2012 it was 13 of the total.

Sustainability Indicator of Tourism Development “Density of commercial facilities” or else “Equipment density” represents the amount of land occupied by tourism infrastructure per 100 inhabitants. This indicator is statistically reported by the Czech Statistical Office (CSO, 2012), but in world research it is used in various forms (for example,

in research into the impact of floods on infrastructure in Venice or Miami (Molinaroli, 2019)), or in assessing the importance of construction in protected areas (Clements, 2018). Expansion of tourism infrastructure (construction of hotels, water parks, golf courses, etc.) leads to land seizure, ecosystem damage, reduction of ecological stability of the territory, etc. This indicator is not one of the ETIS indicators, it belongs to the set of CZSO indicators. The ratio of the number of facilities to the number of inhabitants is suitable for territorial comparison. Portugal was the most active in building accommodation between 2012 and 2017 (dynamic 2017/2012 250 %), followed by Lithuania, Latvia and Belgium (dynamics 2017/2012 200 %) The decrease in accommodation facilities showed in the year-on-year comparison in the Czech Republic (dynamics 90 %), Germany (85.71 %), Luxembourg (77.78 %) and Ireland (38.89 %).

There are many research studies to explore the trend towards gender equality in the tourism sector, especially in China or the Arab countries (generally in countries with unequal status of women). The results show that women do not have a favourable view of tourism's economic impacts and that several barriers exist to their employment in the tourism sector (Alrwajfah, 2020). Nevertheless, women make up a significant proportion of those involved in tourism (employed or otherwise involved). Gender balance is expressed by the ratio of women and men employed in tourism. In general, there is a trend in developed and democratic countries, that in the tourism sector, the majority of the female population is represented. According to statistics, it is clear that in most EU regions (24) the share of women in tourism employment is over 50 %. The highest share of women in 2017 was in Latvia (74.2%), Lithuania (73.7%) and Estonia (72.8%). A higher proportion of men in the tourism sector is in Greece, Cyprus and Malta. The higher proportion of men working in Malta is also a reflection of the higher proportion of men in the total population. In the EU-15 regions, the proportion of women employed in the tourism sector has been reduced, suggesting a growing interest of men in the tourism sector. The year-on-year increase (2017/2012) of the share of men employed in tourism in regions with a relatively high proportion of women in 2017 occurred in Sweden (dynamics 91.61 %), Estonia (dynamics 91.8 %) and Latvia (dynamics 92.94 %), followed by Cyprus (94.27 %). The share of women employed in tourism increased in Malta, where men were predominantly employed in 2012 (dynamics 113.52 %, women's share in tourism employment 37.50 %). In Croatia, despite a relatively high proportion of women in 2012 (52.20 %), there was a further increase in the proportion of women and a deepening of the feminization of the sector. Gender imbalances can be observed in Luxembourg, where there has been an increase in women, in 2012 there was a predominance of men (46.60 % of women), and in 2017, women already prevail (54.7 %).

Social Pillar

The number of overnight stays is given as overnight stays in all accommodation facilities. The following two factors, "Average number of overnight stays" and "Average length of stay (overnight stays)" are among the frequently used factors. For example, according to Matijova (2019), these factors are one of the important indicators of tourism capacity and performance on the socio-economic development of the national economy quantified by the registered unemployment rate. Many studies show a link between these factors and the average price of accommodation, Matijova, (2019) argues that as the average price of an overnight stay increases, the unemployment rate decreases. Our research shows that this fact must be supported by lucrativeness and a specific environment (for example, the sea - Portugal, Spain, etc.). Other studies also emphasize that there is a significant correlation between GDP and physical volume of activity expressed in nights spent (Petcu, 2019).

The most dynamically developed tourism in the number of overnight was in Portugal (dynamics 2017/2012 153.98 %). In Romania, Latvia and Greece, the year-on-year growth in 2017/2012 was in the range of 138-140 %. The lowest increases were recorded in Ireland (107.69 %), Finland (107.86 %), France (108.12 %) and Italy (110, 49 %). Of the total of 27 EU regions analysed, compared to 2017 and 2012, 18 regions recorded a decrease in the average number of days spent. This trend is generally a global trend, decreasing the length of stay, increasing the number of trips. In general, people go more often to shorter periods of time. The average length of nights increased dynamically in Greece (131. 20 % (from 7.55 to 9.91 nights), 126.75 % in Sweden from 4.12 nights to 5.22 nights, and in Croatia from 5.11 nights to 6.42 (dynamics 2017/2012 125.56 %) The most noticeable decrease in the length of stay was recorded in the year 2017/2002 in Slovakia (dynamics 75.46 %). Also, guests in Estonia shortened the length of their stay year-on-year (dynamics 82.86 % 2017: 3.31 nights, 2012: 4 nights). The popular Malta recorded a decrease between 2017 and 2012 (dynamics 85.84 %, 5.76 nights to 4.94 nights in 2017.

Tourism is a catalyst for economic prosperity, for valorization and protection of the environment, for equity and social cohesion. Its contribution has now reached 10.4% of GDP at the world level, which gives it an important role in the EU's sustainable development strategy (Petcu, 2019). From this point of view, "Direct employment in tourism" is also a very important factor. In 2017, the share of tourism employment increased the most in Croatia (with 122.06 %), Estonia (133.36 %) and Greece (136.93 %). Luxembourg had the largest decline (77 % dynamics).

Environmental Pillar

The indicator "Share of energy from renewable sources" was selected as an indicator of progress towards the objectives of the EU Sustainable Development Strategy (SDGs) and thus of sustainable tourism. Hungary was the only region among the 27 EU countries where in 2017 (compared to 2012) the share of the use of renewable energy sources decreased (dynamics 85.87 %). Malta (245.08 %) recorded a high increase in the use of renewable energy sources, using 2.82 % in 2012 and 7.17 % in 2017. and Luxembourg (dynamics 203.18 %, 2012 3.42 %, 2017 6.38 %). Thus, a high increase was recorded in those regions with otherwise low share of OEZ. Ireland also had a dynamic year-on-year growth rate (of 150.10 %). Climate change, increasing dependence on fossil fuels and rising energy prices are the cause of the increasing need for renewable energy. Renewable energy sources are based on domestic sources, their use contributes to alleviating dependence on external sources. With regard to EU renewable energy sources, it set targets for the use of OEZ at 17.5% by 2017 and at 20 % by 2020 and at 32 % by 2030. EU targets are not set uniformly for all regions, each EU country sets its own targets, which they are always obliged to revise in EU reports (**Error! Reference source not found.**). In 2017, 11 of the 27 countries already reached the 2020 targets. Portugal can be expected to meet the 2020 targets, while Lithuania, Cyprus and Greece reached the 2020 targets in 2018.

Fig. 1: Goals 2020 and status 2017 share of renewable energy sources in EU, Eurostat (2020)

Studies of factors influencing the amount of waste generated in tourist destinations are relatively common. Tourism contributes significantly to the production of municipal waste. Factors influencing the amount of waste generated in tourist destinations are the number of tourists and excursionists, GDP per capita, population (Iuras, 2020). Regions such as Poland (dynamics 281.67 %), Slovakia (224.06 %) or Lithuania (204.68 %) recorded a large increase between 2017 and 2012. On the other hand, a considerable decrease of municipal waste recycling occurred in Malta (65.98 %), Romania (93.92 %) and Sweden (98.94 %). Austria is stagnating between 2017 and 2012. Other EU countries showed growth in recycling. In the 13 EU countries out of the 27 analysed, the amount of waste generated per head decreased, namely Belgium (92 % dynamics), Luxembourg (93.10 % dynamics) and the Netherlands (93.44 % dynamics). The growth of waste generation per capita was reflected in Estonia (139.29 %), Latvia (135.60 %) and Slovenia (130.11 %), which are among the leading representatives of recycling.

Evaluation Using Machine Learning

The K-Means method with the ScikitLearn function library (Machine Learning in Python, https://scikit-learn.org/) implemented in Python was used for clustering itself. The metric in function was the Euclidean distance, the number of iterations of 300, and the required number of clusters of four. The analysis of the programming language - clustering method led to the grouping of the region into four clusters on the basis of selected indicators. A graphical heuristics, called the Elbow method, is used to estimate the optimal number of clusters. This method is based on the graphical assessment and search for “break, elbow” **Error! Reference source not found.**. It can be seen from **Error! Reference source not found.** the correlation heat map shows the relationships between the individual characteristics (Principal Component Analysis (PCA) was used to reduce the number of characteristics prior to data Classification.

Fig. 2*:* Correlation heat map for 2012/2017 and Elbow diagrams for 2017/2012

The individual clusters are divided according to the colour key, see the picture (
Fig. **3**). The first cluster (orange) represents the regions that implement steps to growth in the individual pillars (for more details see comparisons). Cluster 2 (red) recorded a high increase in the use of renewable resources, on the contrary with a low dynamics of waste recycling. The decline in the share of tourism in the employment of men in tourism, as well as the low dynamics of commercial facilities. According to Figure 3, it is clear that the land in cluster 3 (green colour) excels in dynamics in the recycling of municipal waste, with a relatively high increase in the density of tourists. The fourth cluster (purple) represents regions with a relatively high dynamics of tourist density, a dynamic increase in accommodation facilities relative to the population and a relatively high number of overnight stays (for more details, see the distribution of average values).

Fig. 3: Resulting cluster (shluk) by country in 2017/2012 (proměnné: value, shluk: cluster)

Conclusion

World research shows that Tourism is an important tool in the international strategy for sustainable development. Nevertheless, it is pointed out that the main goals of the sustainable development of tourism are: increasing the number of jobs in tourist destinations; providing safe and comfortable tourism; respect for the historical heritage, culture, traditions of nations; conservation of the natural landscape and biodiversity; minimizing the use of non-renewable resources in the development of tourism; development of "green" tourism; and the transformation of ecological tourism to the dominant one in the future (Kotlyarov, 2017), the results of our work demonstrate the need to monitor other factors, such as gender factors in connection with the change in employment in the tourism segment, furthermore, our analyzes demonstrate the importance of research into the environmental aspects and impacts of environmental pollution through waste produced by the tourism segment.

Forecasts of further development of tourism outline a scenario based on mutual satisfaction of needs and wishes "*Do you want to come? So, in return, help us with something*". A similar project is already being implemented in Norway. All regions are environmentally friendly. It seeks to meet the goals of renewables. From the point of view of environmental indicators, regions such as Sweden, Romania and Malta should in the future focus on the share of municipal waste recycling, and Hungary should also focus on the share of renewable resources. Slovakia and Slovenia

generation waste, which is growing year-on-year 2017/2012. From the social indicators, there is a decrease in the share of women and employees in tourism, declining feminization may be a reflection of the attractiveness of work in the sector. In the case of Malta, this phenomenon is not a negative phenomenon (see above). In general, there is a trend of shorter stays, but the higher frequency causes a carbon footprint due to the increase in traffic flows. The intensity (density) of tourism is increasing in all EU regions.

Abstract

The aim of this article is to discuss contemporary perceptions of international aspects of harmony from the Chinese, Malaysian, Belarusian, Polish and Portuguese perspectives, as well as to define the relationship between pro-harmoniousness and economic sciences.

The objective of this study was to answer the following questions: How does the international community perceive the concept of harmony? Is harmony important in interpersonal communication? What values favour harmony and what factors disrupt harmonious relations? What areas of economic sciences are related to harmony? Can pro-harmoniousness be considered an international competence or is it rather a traditional Chinese concept? The results provide the definition of harmony as balance and cooperation, as well as identify pro-harmoniousness as an important element of interpersonal communication among international competencies.

Keywords: Harmony, Sustainability, Competence, International Competence

Introduction

Harmony is considered to be an "obvious" concept which is commonly well understood. However, its definition may range broadly from the realm of music to a feature of a mature person, inner peace, even distribution of forces/elements, interpersonal relationships, compatibility, balance, order, or a peaceful attitude towards others and/or the natural environment. The idea of harmony permeates the entirety of human life, including its professional aspects. Harmonious relationships in a workspace translate into professional effectiveness and thus may be considered as a professional competence. Therefore, they show the human ability to effectively integrate with the environment (Sternal E., 2014) leading to great professional performance in line with a company's strategic goals (Sienkiewicz Ł. et.al., 2013). Pro-harmoniousness may be identified as one of the 'soft skills', which are acquired along with experience and are explicitly related to the personality and the attitude of a particular employee. Even though as such pro-harmony is not considered a soft competence, it may be associated with the most common soft competencies, such as: high personal culture, kindness, honesty, communicativeness, positive attitude towards others, the ability to work in a team, solving conflicts, empathy, care for a good atmosphere, or patience. Although researchers have outlined the theoretical background for it, pro-harmoniousness has not been examined in the context of national culture. Therefore, an attempt was made to investigate the concept of harmony/pro-harmoniousness in the light of international culture. The aim of this research was to answer the following questions:

Q1: How does the international community (the research included representatives of China, Malaysia, Belarus, Poland, and Portugal) perceive the concept of harmony, what terms are associated with it, and how is harmony defined?
Q2: Is harmony important in terms of interpersonal communication?
Q3: What values seem to favour harmony and what factors disrupt harmonious relations?
Q4: What areas of the economic sciences are related to harmony?
Q5: Can pro-harmoniousness be considered an international competence or rather a traditional Chinese concept?

The research results of this study may be useful not only in promoting the importance of sustainability and economic culture in a business environment but also in developing the 'One Belt One Road Initiative'. Since countries selected

in this study are spread along the line of this project, the research may support the improvement of intercultural communication and as a result, improve business communication along this route.

Material and Methods

The research consists of two parts: the literature review of the subject and the questionnaire which refers to the perception of harmony in general – interpersonally, as well as regarding the economic environment.

Review of recent literature on the subject and existing research

The literature review was based on an examination of several scientific articles and research reports on harmony available in Polish, English, and Chinese. This part of the research revealed a significant imbalance between the number of studies specifically discussing the role of harmony in Chinese culture and the studies of harmony in other cultures selected for this research. Therefore, this study also includes information published online in journal articles.

For this reason, the following study is not final and requires more extensive investigation in the future. The results of the literature review were used to develop the questionnaire. They are discussed further in subsection 2.3. of this paper.

Survey

The survey was conducted between the years 2017 and 2019, among 867 representatives of young people from China, Malaysia, Belarus, Poland, and Portugal. The research was conducted at universities among: 197 Chinese students, who studied at the University of International Business and Economics in Beijing, 220 Malaysian students, who represented the Universiti Teknologi Mara, 150 Belarusian students from Vitebsk State Technological University, 150 Polish students, who represented the Opole University of Technology and 150 Portuguese students, who studied at Instituto Politécnico de Tomar. The research group was defined based on the following features:

1. Selected countries:

– Are located along the route of the One Belt One Road Initiative introduced in 2013, therefore, the results of the research may become useful in maintaining business relationships under this initiative;
– Are not neighbouring countries and are located in various regions of Asia and Europe;
– Represent a diverse level of economic development;
– Can be classified under diverse national cultures. They are characterized by various religions/philosophical trends, historical traditions, political systems, and other cultural manifestations that have shaped current attitudes and patterns of civil behaviour, norms, values, symbolism, and language, which strengthen a sense of connection and belonging. According to Table 1 which presents the classification of cultures represented by the research group based on the typology suggested by Geert Hoefstede, Richard R. Gesteland, and Richard Lewis, it becomes evident that these countries represent different dimensions of culture.

Table 1: Typology of cultures

	Country				
Typology of cultures	China	Malaysia	Belarus	Poland	Portugal
G. Hoefstede					
Power distance	80	100	95	68	63
Individualism	20	26	25	60	27
Masculinity	66	50	20	64	31
Uncertainty avoidance	30	36	95	93	99
Long term orientation	87	41	81	38	28
Indulgence	24	57	15	29	33

R. R. Gesteland *					
Monochrome / polychrome	moderate monochrome	polychrome	polychrome	polychrome	differentiated approach to time

Formal/ informal	formal	formal	formal	formal	formal
Relationship focused/ Deal-focus	relationship focused	relationship focused	moderate relationship-focused	moderate relationship-focused	moderate deal-focused
R.D. Lewis **					
Multi-active/ linear-active/ re-active	re-active	moderate reactive	multi-active	moderate linear-active, moderate multi-active	multi-active

*Notes: * Belarus has been classified in the group of countries with similar cultural characteristics as: Russia, Poland and Romania. Portugal, on the other hand, was classified into the same cultural group as: France, Belgium, Italy, Spain and Hungary.; ** Belarus has been classified in the group of countries with similar cultural characteristics as: Russia, Slovakia, Croatia and Romania.*

Source: own elaboration based on: Hofstede Insights, www.hofstede-insights.com/product/compare-countries/ , Access: 04.11.2020; Hofstede G., Kultury i organizacje, Polskie Wydawnictwo Ekonomiczne, Warszawa 2000; Gesteland R.R., Różnice kulturowe a zachowania w biznesie, Wydawnictwo Naukowe PWN, Warszawa 2000; Lewis R.D., When Cultures Collide. Leading across Culture, Nicholas Brealey International, Boston, London 2006.

2. Age group:
– Students represent the young generation of citizens, who constitute a group of potential future managers, therefore, their opinions may indicate future behaviours of the management staff.

In each of the above-mentioned countries, the survey was carried out once and in direct contact with respondents, in Chinese, English, Russian, Polish, and Portuguese, respectively. Despite the survey itself, it was also possible to collect additional comments and answers to questions in Chinese, English, German, or Polish. The study was conducted in each of the countries among the same number of respondents. Unfortunately, not all returned questionnaires were of full research value. This affected the number of questionnaires qualified for the analysis.

The results of this part of the research are presented further in this article.

Research and Discussion

Review of recent literature on the subject and existing research

The review of recent literature on the subject and existing research allowed to compile information about the concept of harmony in selected countries. As a result, the following was concluded:

– there is a large discrepancy in the number of publications on harmony between China and the other countries selected for this study;

– the existence of the concept of harmony in the following areas: philosophy/religious trends, aesthetics, nature, health, cuisine, architecture, tourism, symbolism, the broadly understood economic sciences, politics, implemented projects, and music;

– common areas, i.e. areas in which harmony slogans exist in all five surveyed countries: aesthetics, architecture, nature, and terminology of launched projects;

– topics related to harmony and economic sciences were mainly related to China, Malaysia, and Poland.

Details of the analysis are presented in Table 2.

Table 2: Areas in which harmony occurs.

	Country				
Aspect of harmony	**China**	**Malaysia**	**Belarus**	**Poland**	**Portugal**
Philosophy / religious movements	- Taoism - Confucianism - Buddhism	- religious harmony			
Aesthetics	- *Fengshui* - experiencing music, painting, and calligraphy	- sacral housing	- paintings of Sergej Shemet - the exhibition ***Harmony of Contrasts*** **hold by the members** of the creative association ***Artel***	- proposals - an exhibition of photographs	- natural landscape
Nature	- sustainable development - farming calendar - *Fengshui*	- coexistence of indigenous peoples of Cameron Highlands with the natural environment - sustainable development	- development of energy sources - linen sheets	- sustainable development - natural environment	- vineyards - forests of cork oaks - olive groves - fields sown with grain
Health	- Chinese medicine - *taijiquan* - *qigong*			- human internal environment	
Cuisine	- 5 elements cuisine - tea infusion	- a variety of flavours of Arab, Chinese and Indian cuisine			- fortified wines – Porto
Architecture	- *Fengshui* (geomancy) - temple architecture - architecture of imperial buildings - park architecture	- architecture of religious buildings (mosques, Chinese and Hindu temples) - between traditional (sacred) and modern buildings - the buildings of the city of Kuala Lumpur	- streets in the city of Minsk	- name of the urban estate	- buildings of the city of Lisbon - development of religious buildings
Tourism		-street of Harmony in the city of Malacca - *Street of Harmony* in the city of Georgetown - names of travel agencies - names of apartments and hotels	- the richness of fauna and flora - names of apartments, hotels, and manors		
Symbolism	- Chinese signs - *ying-yang* - crane - crab	- Petronas Towers which in cross-section resemble eight-pointed stars, referring to: *unity, harmony, stability,* and *rationality*		- Greek mythology	- country flag, white/silver coat of arms, referring to balance and peace
Economic sciences	- sustainable development - conflict resolution in the workspace	- multiculturalism of co-workers - teamwork - disproportion in earnings between:	Projects: - construction of the countryside of the future - *Water Harmony*	- sustainable development - the law of harmonisation - work-life balance Projects:	Projects: - Erasmus +, harmonisation of comprehensive internationalisation strategies in the

	- book titles on business management issues Projects: - innovative, "green" solutions - One Belt One Road Initiative	inhabitants of the eastern and western parts of the country, inhabitants of towns and villages, women and men, people of various ethnic origins Projects: - implementation of development programs, which counteract the marginalization and ethnic imbalances in the economic environment		- Erasmus +, harmonisation of comprehensive internationalisation strategies in the EU higher education - promotion strategy of Opole city for 2017-2022 - research grant for financing research projects	EU higher education
Politics	- the concept of a harmonious society - the value of a socialist society - social posters - statements by politicians (among others: Jiang Zenmin, Hu Jintao, Wen Jiabao, Xi Jinping - so*ft power*	- ethnically diverse society (including Malaysians, Chinese, Hindus, indigenous people) - Swedish World Peace Prize for Teo Choo Guan	- the need to move towards achieving peace and social harmony - the protest "races of harmony" regarding the disputed presidential elections - denominational policy – development of inter-ethnic and inter-religious relationships		
Other	- *China Railways Harmony* - Sun Tzu "The Art of War" - music		- music (including ritual songs, language melody) - a musical instrument - name of the band and choir - meditation poetry by Jan Czykwin - borderland culture	- music - a musical instrument - harmonious development of the child - the cause of happiness - harmony within the family	- combination of modernity and tradition, the past and the present

Source: own elaboration.

Survey

Based on the review of the literature the following list of synonyms for harmony was compiled: *order, orderliness, mathematics, symmetry, aesthetics, change, complementation, music, nature, non-conflict, fairness/justice, cooperation/collaboration, balance, opposition,* and *subordination*. Respondents were asked to select three words from this list, which, in their opinion, best defined the meaning of harmony. The words selected in a majority of surveyed countries included: *balance* (in 4 out of 5 countries) and *collaboration/cooperation* (in 3 out of 5 countries). However, the results differed among individual national groups. According to the Chinese participants, the main synonyms of harmony were: *balance* (63% of responses), *collaboration/cooperation* (58%), and *order* (50%). Malaysian respondents indicated: *non-conflict* (81% of responses), *nature* (50%) and *collaboration/cooperation* (40%). The Belarusian group selected: *balance* (58%) and *complementation* (41%). Members of the Polish group chose: *balance* (58%), *orderliness* (56%), and *order* (51%) whereas representatives of the Portuguese group selected: *balance* (96%), *cooperation/collaboration* (46%), and *fairness* (41%). Details are presented in Figure 1.

Figure 1: Defining harmony [%].

Source: own elaboration.

According to representatives of all groups, harmony is an important element of interpersonal communication. This has been reflected in the number of provided affirmative responses "definitely yes" and "yes". The majority of participants, who agreed with this statement were from Malaysia (94% of answers). Participants who agreed with this statement the least were from Poland (79%). Details are shown in Figure 2.

Figure 2: Perception of harmony as an important value in interpersonal communication [%].
Source: own elaboration.

According to the respondents, behaviours that promote harmony include: *courtesy/kindness, establishing group rules and rules of conduct, fairness, showing respect to people with more experience and knowledge*, and *knowing one's place in the social hierarchy*. Over 80% of participants indicated *kindness/friendliness* as the behaviour which favours harmony the most. According to 88% of Chinese responders, *collective rules and principles of conduct* are essential in enhancing harmony. Among Malaysian respondents, the concept of *fairness* was also rated highly (83%). According to respondents from Belarus, harmony may be synonymous with *showing respect to people with more knowledge and experience* (87%). Participants from Poland associated harmony with *establishing rules and principles of conduct* (88% of responses) and *knowing one's place in the social hierarchy* (86%). Portuguese respondents believed that *kindness/friendliness* is equally important as *respect to people with more knowledge and experience* (91% of responses). Nevertheless, most often, they defined harmony as a synonym for *establishing group rules and principles of conduct* (94%).

Based on the selected categories (which favour harmony) it may be concluded that:

– *courtesy/friendliness* was most often selected by the respondents from Belarus (99% of responses), and the least by the Chinese participants (86%);
– *establishing group rules* and *rules of conduct* was most often selected by the Chinese and Polish respondents (88% each), and it was the least selected value among Belarusian participants (76%);
– *fairness/justice* was most often indicated by Polish respondents (85%) and the least by the Chinese participants (73%);
– *showing respect to people with more experience and knowledge* was most often selected by the Portuguese participants (91%), and the least by Polish students (72%);
– *knowing one's place in the social hierarchy* was most often chosen by respondents from Poland (86%) and least by respondents from Malaysia (60%).

Details are shown in Figure 3.

Figure 3: Factors favourable to harmonious interpersonal relationships [%].

Source: own elaboration.

Among the behaviours unfavourable to harmonious interpersonal relationships, the following categories were selected: *disrespecting the elderly, deliberate misinformation, expressing opinions different from the opinion set by a group to which one belongs, and strong standing out from a group*. According to the respondents' harmonious interpersonal relations are most often undermined by *disrespecting the elderly*. This was indicated by respectively: 77% of Chinese respondents, 89% of Malaysian responders, 82% of Belarusian respondents, 83% of Polish respondents, and 88% of Portuguese respondents. According to the Chinese participants, harmonious interpersonal relations may also be undermined by: a *strong standing out from a group* (73% of responses) and *deliberate misinformation* (53%). According to Malaysian and Belarusian participants, these factors were: a *strong standing out from a group* (56% and 51% respectively).

In terms of factors which undermine the pursuit of harmonious interpersonal relationships:

– *disrespecting the elderly*, was essential for Malaysian respondents (89%), and the least important for Chinese students (77%);
– *deliberate misinformation* was essential for the Chinese participants (54%), and the least significant for the Polish respondents (29%);
– *expressing opinions different from the opinion set by a group to which one belongs* was most significant among Malaysian participants (44%) and the least important among the Chinese respondents (42%);
– *a strong standing out from a group* (both in a positive and negative sense) was most often selected by the Chinese respondents (73%), and least often by the Portuguese participants (40%). Details are shown in Figure 4.

Figure 4: Factors unfavourable to harmonious interpersonal relationships [%].

Source: own elaboration.

Discussion - the importance of harmony in China and the world

The issues of harmony in the international perspective have been addressed mainly by researchers who represent the social sciences (the study has not included articles about harmony in art). The above-mentioned issues have been discussed in: psychology, sociology, religious studies, political science, pedagogy, economics, and administration and management. The categories related to harmony include: internal harmony, interpersonal harmony, family harmony, harmonious communication, social harmony, work-life balance, sustainable enterprise management, and industrial harmony. They were explored by: Romuald Jaworski (2004), Anselm Grün (2008), Max Lüscher (1987), Melvyn Kinder (1997), Rohit Dhankar (2020), Julian W. Korab-Karpowicz (2017), Keith Davis and Robert L. Blomstrong (1975), Archie B. Caroll (1993), Chinonye C. Wobodo (2019), John Child and Malcolm Warner (2003), Katarzyna Mazur-Kajta (2018; 2019). They were also discussed in Green Paper: Promoting a European framework for Corporate Social Responsibility (2001).

The way in which researchers define harmony depends on the discipline they represent, their perception of the world, and the key aspects they take into account. However, the literature review has shown that a majority of papers about harmony are mainly related to Asia, most often China, or provide a comparative analysis.

In the economic sciences, these references can be found in research conducted by: Xue Yang (2016), Robert J. Taormina (2003), Ip Po-Keung (2014), Kylie Heffernan and John Crawford (2001), Monoj Khakhlary (2019), Imtiyaz Yusuf (2018), Sylvia Xiaohua Chen et.al. (2009), Siddappa Naragatti et. al. (2019), Shukui Tan et.al. (2014), Kalpathy Ramaiyer Subramanian et.al. (2015), Sara Bigazzi et.al. (2019), Matthew Adekunle Abioro et.al. (2019), Joshua N. Hook et.al. (2009), Linus Hagstrom and Astrid H.M. Nordin (2019), Virginia S.Y. Kwan et. al. (1997), Katarzyna Mazur-Kajta and Paula Lipińska (2018) as well as Kwok Leung et. al. (2002). This indicates the importance of the international aspect of harmony not only in China but also worldwide. The connection between harmony, the natural environment, and the economic sciences implies sustainable development. This has been confirmed by the results of the author's research. Surprisingly, topics related to harmony and the economic sciences were not discussed with the same incidence in the surveyed countries but appeared mainly in articles about/from China, Malaysia, and Poland. This does not mean that in other countries the issue of harmony or striving for it in the business environment is not discussed, however, such articles are not easily accessible. Furthermore, it becomes evident that media attention has also been focused on harmony. It is reflected in the fact that this concept has been used to name various projects, including those in tourism (naming hotels and apartments). Although projects which indirectly use harmony "in the background" are quite diverse, all of them refer to sustainable development and offer pro-ecological "green" solutions which counteract marginalization and create a modern environment for human life by improving the living conditions of present and future generations, the internationalization of education and financing of scientific research.

This survey also showed that the concept of harmony was highly valued by all surveyed groups of respondents. This not only suggests that the concept of harmony is important in terms of interpersonal communication but also indicate similar categories of values which favour or disrupt harmonious relationships.

Conclusion

The results of the conducted research provided answers to the research questions which referred to the selected research group:

Q1: Among Portuguese, Chinese, Belarusian, and Polish respondents, harmony was most often described as balance, whereas Malaysian participants defined it as non-conflict. Despite slight percentage differences in defining synonyms of harmony, it can be concluded that in the examined international environment, harmony was mainly associated with balance and cooperation.

Q2: Harmony has been recognized as an important factor of interpersonal communication. Q3.1: The values which favour harmony include: courtesy/kindness, establishing group rules and rules of conduct, fairness, showing respect to people with more experience and knowledge, and knowing one's place in the social hierarchy.

Q3.2: The values which disrupt harmonious relationships include: not showing respect to the elderly, deliberate misinformation, expressing opinions different from the opinion set by a group to which one belongs and a strong standing out from a group (both in a positive and negative sense).

Q4: With regard to issues which refer to the economic sciences and are related to the concept of harmony the following may be concluded:

– In management: Literature on business management, conflict resolution in a workspace, cooperation in a multicultural environment, teamwork, preventing unjustified differences in earnings and other inequalities in the economic environment, developing solutions which enhance work-life balance and developing urban strategy;
– In economics: Assumptions of the One Belt One Road Initiative, the essence of the law of harmonisation and sustainable development – pro-ecological projects and modern solutions, financing research projects and projects which enable internationalization.

Q5: Despite the large disproportion in the number of Chinese and non-Chinese articles about harmony, pro-harmoniousness may be regarded as an international competence, and thus, it is not related only to Chinese culture.

Abstract

In the context of the analysis of the various methodical approaches to the assessment of the subjects of technology transfer, it can be stated that there is no uniform methodology for assessing such effectiveness. The global scientific community recognizes that it is necessary to establish common methodological standards for the analysis of technology transfer processes in order to understand current trends and development potentials in the areas of technology transfer, but this has not yet been achieved. For Russia, this means that, in the absence of a single standard, the Russian innovation community can develop its national standards for evaluating the effectiveness of the technology transfer process, taking into account the national specificities of the process of commercializing innovation. The authors of this paper hold the view that the efficiency of the innovation process is determined by the efficiency of the technology transfer as its main instrument.

Keywords: Innovation, technology transfer, efficiency, technologies, Russian economy, economic efficiency, technology transfer entities, TT.

Introduction

It is obvious that the aim of the technological policy of the company is the realization of such projects which prove their efficiency from the financial, technological and strategic points of view. A system of indicators is used to measure it, which generally consists of five structural blocks: basic and portfolio financial, technological, project and government indicators. Depending on the specificity of the technology strategy, the composition of the indicators used varies.

In this regard, two important points need to be emphasized. First, an important feature of a technology transfer is the difficulty of valuation because there is no direct relationship between the cost of innovation development and the costs of its transfer, deployment and absorption. Unlike the value of an ordinary commodity (whose price may vary as a result of market conditions), the cost of technology is difficult to predict and depends on the expectations of scientific and technological actors.

Relevance of the subject area

In order to determine the possible impact of the introduction of innovative technology, it is important to objectively perform an assessment of the usefulness of the technology, which consists in identifying the degree of novelty, which is determined by a set of characteristics which substantially differ from the previous technology, the evaluation of its characteristics as an asset of a company to understand the options and the amount of profit and

Cite this Article as: Olga PYATAEVA, Alexander ANISIMOV, Artyom GAVRILYUK, Elena BORISOVA and Oleg SKRYABIN " Assessment of the Effectiveness of Technology Transfer Entities " Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

includes a) marketing studies, b) evaluation of the patent and legal situation, c) analysis of the technology and intellectual property market.

Second, the cost-effectiveness of technology transfer is demonstrated over a sufficiently long period of time when products produced under the technology are marketed; In this regard, technology transfer can be considered as an investment project with the possibility of using an appropriate assessment and analysis methodology.

The main indicator of the efficiency of the transfer as an investment project should be the positive value of the net present value of all transactions. Since net present value is an additive criterion (the developer and user in technology transfer process have their own economic objectives) and the positive outcome of the investment is important for each party, net present value should be achieved for both parties participating in technology transfer.

In the technology transfer relationship system, the efficiency of the investment can be significantly increased for both parties involved as a result of the effect of a technological lever resulting from the intensive use of the technology being the subject of the transfer.

Technological level as a main idea

The concept of a technological lever has been developed by a number of Russian and foreign researchers to establish a link between technological efficiency and the efficiency of the operational and financial activities of the enterprise. The technology lever can be defined as a measure of an enterprise's ability to diffuse the advanced knowledge and technology acquired through primary innovation to multiple end-user products.

The total effect (power) of a technological lever (TL) is considered to be a function of the effect of three components: the technological lever (TL), whose value on the basis of the formula is greater than or equal to one; the price lever (PL) arising from the fact that: that the developer can set higher prices for its products at the first stage and thus obtain higher margin margins; the developer lever (DL) arising from the knowledge gained from the development of the BIT, can be used in the manufacture of improved or derived «resulting technologies».

Since there can be substantial savings in R&D costs, the value of the developer's leverage is always positive. The developer has the most significant last component of the technological lever.

Due to the action of the developer lever, the second element of the formula will be reduced at each new TT operation, which will be reflected in the increase of operating profit.

A user can also derive additional benefits from the action of a technological lever from TT if, on the basis of the acquired technology, he can and intends to develop several modifications of the final product. In this case, the cost of acquiring the technology can be considered as a one-time thing, and the cost of implementing it will be reduced with more intensive use of the technology and the growth of the resulting end products.
In such a situation, all three components of the technological lever are possible.

Components of the technological lever

The technology lever approach provides greater justification for the competitiveness and market value effects of TT, as it asserts that, when technology is used intensively, the profit and value of the net assets of the participants increases. In addition, participants may obtain competitive advantages by imposing monopoly prices for both the technology itself and the products it generates for a period of time.

In general, the following provisions are proposed for use by all participants in the TT process:

1. The net discounted value method is the main method for technology assessment in the TT phases.
2. The return-on-investment method is used as an additional method to quickly assess the suitability of the project to participants.
3. In order to take into account the strategic value of the project, it is advisable to use the method of estimation of real options, which, with well-organized interaction of the parties involved, allows to «highlight» and assess the synergistic effect of investment in innovative technologies.
4. In enterprises where new management technologies have already been introduced, additional or alternative use of economic value added and a balanced scorecard may be made.

Key Performance Indicators for technology transfer entities

Indicators for assessing the performance of technology transfer entities (e.g. the technoparks, technopoles, business incubators, etc.) should be

1. Patent/innovation activity indicators:

- The number of inventions submitted by inventors to the technology transfer office to assess whether a security result has been obtained;
- Number of agreements on transfer of innovative technologies;
- Number of innovative companies established;
- Number of commercialized IS facilities;
- Number of patent applications;
- Number of patents obtained;
- Number of jobs created on the basis of the constituent entity;
- Number of jobs in the real economy created through the TTC on the basis of transferred, introduced and mastered technologies
- Number of trained staff/students in the fundamentals of commercialization (protection of intellectual property, etc. Number of students);
- Consultancy services provided to developers (hours or number of people);
- Number of valid licences;
- Number of licences sold to local companies;
- Number of new licences, options or other agreements;
- Amount of R&D done for local companies;
- Number of partnerships established (which include cooperation and joint projects);
- Number of international contracts;
- Number of new spin-off companies established;
- Number of new Iips created;
- Number of innovative projects brought to the final stage of implementation with the support of the Centre;
- Number of projects identified; number of business plans prepared, etc.

2. Aggregate values of innovation:

- International transfer of innovative technologies (volume of exports/imports);
- Output and sales of finished products created on the basis of transfer of innovative technology;
- The amount of tax revenue to the budget from technology transfer, deployment and absorption;
- Income from commercialization (by type of income);
- Net profit from commercialization;
- Volume of investment attracted for high-tech projects;

3. Innovation performance ratios:

- Profitability of investment in innovation;
- Revenue from commercialization per unit of technology development costs;
- Profitability of investment in research and development: the value of income derived from different types of commercialization in relation to the research budget;
- Ratio of own, debt and leveraged financing, etc.

4. Additional indicators:

- Quantitative indicators of environmental improvement through transfer, introduction and mastery of innovative development.

A complete set of evaluation criteria for the various actors involved in the transfer is planned for the next stages of the implementation of the IND. This will allow not only to determine the current status of the transfer, but also to monitor structural.

Thus Key Performance Indicators is a tool for monitoring a company's technological performance, allowing for the targeted selection of projects, the evaluation of their progress and the analysis of the results achieved. An integrated approach to the development of such a system should aim not only at the immediate objective of improving the technological portfolio of the organization, but also at achieving the ultimate objectives of its activities - enhancing competitiveness, profitability, market stability and, in some cases, development of the national industry as a whole.

Abstract

The Brexit is the exit of the United Kingdom from the Europen Union. After a transitional period, as of January 1st, 2021, a new set of rules will apply. Still, there are several open issues which need to be addressed. The present paper analyses the impact of the Brexit on taxes, which is going to affect the international business for organizations operating both in the European Union territory and in the United Kingdom.

Keywords: Brexit, European Union, International Business, Taxes.

The Brexit is the withdrawal of the United Kingdom (UK) from the European Union (EU). The Brexit happened with the referendum of June, 23rd, 2016, in which 52% of voters were in favour of the UK leaving the EU. Since then, long debates happened to study and forecast the changes affecting the relations between the UK and the EU members, with huge impacts on workers, travellers, and businesses. This paper aims at identifying the main consequences that the Brexit is going to produce for economic operators, from a tax perspective.

The political earthquake following the summer of 2016 referendum saw the resignation of the premier Cameron, opposed to Brexit, and the appointment of May as premier. After a complex internal process passed for the parliamentary vote, on March, 29th, 2017, the process provided by art. 50 of the Treaty on European Union (TEU) started.

Subsequently - after the Tory leadership passed to Johnson, who was appointed as the new UK premier - the Withdrawal Agreement was reached, ratified by the UK on January, 23rd, and by the EU on January, 30th, and entered into force on February, 1st 2020 (from now on, "Agreement").

The signed Agreement, however, is not decisive. The Agreement has started a transition period, which will end on December, 31st, 2020. During the period ending by 2020, the UK remains subject to the EU law and remains part of the EU customs union and market. The other EU countries, for their part, must interpret their legislation as if the UK was still a member of the EU. By contrast, the UK is no longer part of the EU's political bodies or institutions during the transitional period.

For the economic operators, therefore, in the transitional period, nothing substantially changes for the purposes of income taxes, VAT, and customs duties.

Until December, 31st, 2020, the following rules apply:

- for income tax purposes, the UK is considered an EU member by the other EU countries;
- for VAT purposes, transactions with the UK are still considered as intra-EU transactions;

Cite this Article as: Ernesto Marco BAGAROTTO and Francesca DAL MAS "International Business after Brexit: The Impact on Taxes" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

- for customs duties purposes, the UK is part of the customs union. Transactions between the UK and EU countries cannot, therefore, be subject to customs duties and the UK is required to apply EU customs legislation in operations with non-EU countries.

The transitional period was provided to allow the parties (the EU and the UK) to the Agreement to negotiate their future relations, subsequent to the conclusion of the transitional period.

The Agreement, in fact, despite being very massive, leaves many options open, first of all, that of the No Deal. There are many open issues: fishing, competition, access to databases, the role of the Court of Justice, just to mention a few.

The debate is still open. Herewith, we try to forecast what will happen from a fiscal perspective at the end of the transitional period.

With regard to income taxes, unless specific agreements, it must first be considered that, although the UK will no longer be part of the EU, the UK will continue:

- to be linked to other countries of the EU by double taxation treaties;
- to be bounded by the previously signed international treaties, such as those on the exchange of information (the 1988 Strasbourg Convention and the Isle of Man, Guersney and Jersey TIEAs);
- to be part of the OECD (Freedman, 2017).

On the income tax side, the main impacts will be on multinationals and groups that include UK subsidiaries or parent company (Müller and Berens, 2018).

First of all, the applicability of the advantageous provisions contained in the parent/subsidiaries directive (Directive July, 23rd, 1990, no. 435) and interest/royalties directive (Directive June, 3rd, 2003, no. 2003/49 / EC) will no longer apply.

In particular, it will not be possible to obtain the exemption form the outgoing withholding taxes on dividends paid by UK companies to EU companies and vice versa; on interests paid by UK companies to EU companies and reverse; on royalties paid by UK companies to EU companies and conversely.

Nevertheless, the provisions stated by the double taxation treaties agreed by the UK will still apply to the payments of dividends, interests, and royalties between UK companies and EU companies and reverse.

However, the double taxation treaties do not systematically establish the exemption form withholding taxes but provide maximum thresholds for withholdings applicable in the country of the payer.

Another negative aspect resulting from the Brexit is represented by no longer benefiting from the tax neutrality regimes established for extraordinary transnational transactions, as by Directive October, 26th, 2005, no. 2005/56 / EC.

Again, in the case of transfer of the headquarters of an EU company to the UK, it will no longer be possible to invoke the application of the tax breaks introduced by various EU countries. The tax breaks consist in the possibility of suspending the payment or paying in tranches, in implementation of the jurisprudence of the EU Court of Justice to protect the freedom of establishment (judgment November, 29th, 2011, C-371/10, National Grid Indus BV).

More generally, as a result of the Brexit, EU subjects wishing to carry out business activities in the UK will no longer be able to invoke the freedom of establishment protected by the Treaty on the Functioning of the European Union (TFEU).

These are only a few of the main consequences that international businesses will need to face, as the 2021 approaches.

As mentioned, the UK may try to become more attractive from a fiscal point of view (Cape, 2019). For example, the UK could consider issuing rulings in favour of multinational companies that have their headquarters in its

territory. To date, in fact, from an EU perspective, the main obstacles to the granting of rulings is that of the ban on state aid, established by the TFEU. With the exit of the UK from the EU, the ban on state aid provided by the TUFE will disappear (Kotsonis, 2019; Segura, Olafsson and Clayton, 2019; Nicolaides, 2020).

However, the UK will suffer more significant risks of being considered a tax haven by the laws of EU countries. This, in particular, could result in the subjecting to unfavourable regulations of dividends from UK companies and capital gains realized through the sale of shares in UK companies. As evidenced by Freedman (2017) “Brexit offers some opportunities but also dangers.”

As for VAT and customs duties, the question may look simple. The UK will go from being an EU country to being a non-EU country. Therefore, supplies of goods between the UK and the EU will be treated as imports and exports and no longer as intra-EU transactions (Cape and Schofield, 2018). Consequently, the transactions relating to goods from the EU to the UK will be non-taxable export sales, while the supplies from the UK to the EU will be imports, subject to the payment of VAT and duties, when due.

Other changes will occur concerning the impossibility of applying specific preferential regimes, such as that on consignment stock, remote sales to individuals, and triangular transactions.

Some issues may arise in the period around December 31st, 2020. However, art. 51 has provided for "transitional" rules for the abandonment of the transitional period.

In particular:

- paragraph 1 states the application of VAT rules “in respect of goods dispatched or transported from the territory of the United Kingdom to the territory of a Member State, and vice versa, provided that the dispatch or transport started before the end of the transition period and ended thereafter”;
- paragraph 2 states the application of VAT rules “until 5 years after the end of the transition period with regard to the taxable person's rights and obligations in relation to transactions with a cross-border element between the United Kingdom and a Member State that took place before the end of the transition period and with regard to transactions covered by paragraph 1”;
- paragraph 3 states “refund applications that relate to VAT which was paid in a Member State by a taxable person established in the United Kingdom, or which was paid in the United Kingdom by a taxable person established in a Member State, shall be submitted under the conditions of that Directive at the latest on 31 March 2021>”.

The thorniest issue that has implications for VAT and duties concerns the great land border between the UK and the EU, namely the physical border between Ireland and Northern Ireland. Strictly speaking, in fact, it would be necessary to establish a fence and a customs between the two countries and consider the operations to and from Northern Ireland as imports and exports (Morchid and O’Mahony, 2019).

The creation of a physical border, however, stands as a very delicate aspect from a political point of view. It would indeed challenge one of the cornerstones of the peace agreements that put an end to the conflict between Catholic and Protestant groups (so-called Good Friday agreements of 1998), namely the creation of an open and easy to cross border.

Now, in the Agreement, there is a special protocol dedicated to Northern Ireland, which states that one of the objectives to be pursued is to avoid a physical border, thus protecting the 1998 agreement in all its dimensions. The idea is, therefore, to create a so-called backstop, and continue to apply the EU internal VAT and customs legislation to Northern Ireland, with a system that should, in fact, move the border between the EU and the UK for VAT and customs purposes in the channel between the UK and Ireland. This should mean that goods entering Northern Ireland from the rest of the UK should be checked and verified to ensure compliance with EU sanitary and phytosanitary measures. Customs duties under EU law should be applied to goods entering the territory of Northern Ireland only where there is a risk that such goods will enter the EU. On the other hand, no customs duties would be levied on goods arriving in Northern Ireland from the rest of the UK, where there is no risk of them entering the EU single market.

Beyond the technical difficulty of putting in place such controls, it remains understood that the customs formalities and procedures of the European Union will apply to goods brought into Northern Ireland from outside the EU or exported from Northern Ireland beyond outside the EU. This is a result that is not shared by UK Brexit supporters, as it would lead to the violation of the UK's unity and sovereignty over Northern Ireland.

The question is, therefore, still uncertain. What is certain, on the other hand, is that for operators in EU countries, relations with UK-based companies will be more complicated. For multinationals divided between EU countries and the UK, less favourable tax rules will apply.

El Uso De La Web En La Difusión De La Misión Y Visión De Las Facultades De Derecho De Universidades Latinoamericanas

The Use Of The Web In The Diffusion Of Mission And Vision Of Law Faculties From Latin American Universities

Hugo GONZÁLEZ[1]

Universidad Autónoma del Perú, Lima, Perú

hugo_augencio@hotmail.com

Resumen

El presente estudio analiza el uso de las páginas web en la difusión de la misión y visión de las facultades de derecho de las universidades latinoamericanas, según el ranquin Scimago (2019). De las 25 universidades, 10 han difundido la misión y 7 la visión a través de su portal y enfatizan en el desarrollo de la formación profesional, la proyección social, creación de conocimiento, el liderazgo (académico), las alianzas, y el uso específico de las TIC. La mayoría de universidades utiliza las redes de Facebook y Twitter, pero tienen reducida interacción y las actividades que difunden son diversas: diplomados, seminarios, publicaciones científicas.

Palabras clave: Web, misión, visión, red social, derecho, Scimago, ranquin.

Summary

The present study analyzes the use of the web pages in the diffusion of the mission and vision of Latin American law faculties according to ranquin Scimago (2019). From 25 faculties, 10 have disseminated the mission and 7 have disseminated the vision throughout the website and emphasize the development of the professional training, social projection, creation of knowledge, academic leadership, alliances, and the use of specific use of IT. Most universities use the social media from Facebook and Twitter, but they have reduced the interaction and activities which they disseminate are diverse: graduate degrees, seminaries, scientific publications.

Keywords: Web, misión, visión, red social, derecho, Scimago, ranquin.

Introducción

El presente estudio analiza el uso de la web para difundir la misión y la visión de las facultades de derecho de Latinoamérica[1]. Se seleccionó a las universidades que hayan explicitado su misión y visión a través de su página web. La misión de las facultades de derecho está centrada en la creación de conocimiento, formación, alianzas, liderazgo académico, proyección social, resolución de problemas, enfoque interdisciplinar y uso de TIC. La visión, en cambio se centra en liderazgo, calidad de la investigación, también en alianzas, contribución a la diversidad, proyección social, formación profesional y reconocimiento.

Asimismo, se analizó el uso de las redes sociales en la difusión de la información de las facultades, entre las más representativas se encuentran Facebook y Twitter por medio de las cuales se difunden una diversidad de temas: foros, diplomados, publicaciones científicas, etc. Dentro de este contexto las TIC están consideradas como herramientas que permiten desarrollar la comunicación del conocimiento, la información y la integración (Salas-Rueda et al., 2019), de las instituciones. Estas plataformas son herramientas fundamentales para el desarrollo y difusión de las actividades educativas dentro de un contexto de hipermediación (Sabich, 2017), en la que no solo predomina el texto, también la imagen y sonido.

Estudios Previos

Algunos estudios previos sobre la misión y visión de las universidades resaltan la adecuada utilización de los planes estratégicos, el plan de la comunicación estratégica (Ciancio, 2018; Yusof, Awang, Valdez y Yaacob, 2018); en función de la calidad de la planeación estratégica se logra la misión y visión institucional (Soares y Setyohady, 2017).

Otros estudios enfatizan en que el logro de los planes estratégicos permite la internacionalización de las instituciones y al acceso al conocimiento (Popescu, 2017; Grieves, 2018). Pero la planificación no puede estar aislada de la tecnología ya que debe utilizarla como un medio para difundirse y llegar de manera efectiva al beneficiario o beneficiarios.

Las redes sociales tienen diversos usos en las disciplinas, por ejemplo, se está estudiando en el campo médico a través de las redes sociales, aunque todavía reducido, para obtener información de manera rápida a través de WhatsApp, Facebook, Twitter para la elaboración de trabajos científicos (Araújo, et al., 2019); en el campo de la Documentación específicamente en el análisis de la co-citación y co-palabras en una base de 383 publicaciones científicas (Gálvez, 2018); en el ámbito de la producción científica en la universidad (Corchuelo, 2018) donde se ha estudiado la visibilidad de las publicaciones científicas a través de la web o internet, pero se ha encontrado que existe una participación reducida de los investigadores; en el ámbito jurídico como acceso al uso de redes para expresar su derecho a la libertad de expresión, caso específico a los criminales sexuales a quienes se prohibió o se restringió el uso de las redes sociales (Herrán, 2018); asimismo, De La Hoz, Acevedo y Torres (2015) estudiaron el uso de las redes sociales por estudiantes y docentes, concluyeron que su uso es aceptable pero debe existir una tendencia creciente y generar política institucional en el desarrollo de estas.

De los estudios previos se colige que las TIC, específicamente, a través de las redes sociales son transversales, debido a sus diversos usos en las actividades humanas: médica, educativa, investigativa, etc. que permiten una mejor comunicación, comprensión y por consiguiente optimizar las condiciones de vida.

Fundamentación

La misión y la visión institucional forman parte de la gestión o planificación estratégica que implica una serie de procesos, entre ellos su aseguramiento inicial, antes de que se implemente y luego se controle. Para ello requiere contar con recurso humano, diseño de estrategias (Abesada y Almuiñas, 2016) para desarrollarlo de manera eficiente y efectiva.

El cumplimiento de la misión y visión depende la organización de la institución universitaria, pero también del contexto, teniendo en cuenta que muchas veces este es determinante, sobre todo cuanto existen crisis económicas, financieras, conflictos sociales que imposibilitan a las instituciones a cumplir sus objetivos y por ende su misión y visión.

Lo previo se concatena con la web o los portales que son medios o plataformas que permiten una mayor y mejor comunicación entre los miembros de las organizaciones, en este caso específico entre los miembros de las comunidades universitarias. En este proceso se difunden una serie de informaciones que brindan las instituciones de educación superior desde su misión, visión, objetivos, servicios educativos que brindan (desde pregrado hasta postgrado), actividades de investigación, proyección a la comunidad, etc.

Las TIC son herramientas que permiten centralizar el proceso formativo y el centro de aprendizaje del estudiante (García y González, 2017), también sirven de instrumento para que las universidades difundan sus funciones, su organización y de manera concreta que lo realicen a través de su misión y visión; es decir qué son y qué aspiran lograr dentro del corto, mediano o largo plazo.

En este sentido la misión de la universidad es dar a conocer su estructura, su organización, su esencia; pero también su proyección, sus aspiraciones en función de la formación de sus profesionales y de su impacto en la sociedad, que son algunos criterios del ranquin Scimago, incluyendo la investigación, para la jerarquización de universidades y de facultades de las universidades en el mundo.

En este sentido las universidades para comunicarse con sus miembros o con la sociedad recurren a la web, a internet, específicamente a través de las redes sociales (Linkedln, You Tube, Twitter, Facebook) y académicas (Google Scholar, Medeley, Academia.edu, ResearhGate), para desarrollar o difundir la ciencia de la universidad (Corchuelo, 2018), pero también las primeras (redes sociales) sirven para difundir los propósitos o los objetivos de las universidades.

Las redes sociales poseen un gran impacto en la formación universitaria a través del uso de las redes sociales (Hermann-Acosta, Apolo Molano-Camargo, 2019) que se han generado como espacios que permiten una constante comunicación o interrelación, reduciendo el lugar y sobre todo el tiempo. Estas están siendo utilizadas por las universidades para dar a conocer los programas o servicios que ofrece a sus estudiantes o potenciales estudiantes.

En este proceso, existen una serie de beneficios de las instituciones que utilizan la web, como la comunicación efectiva entre las universidades, creación de espacios flexibles de trabajo, aprendizaje, adquisición y difusión del conocimiento, mejorar la organización o estructura de las universidades (Orgaz-Agüera, Moral-Cuadra y Domínguez, 2018) y dar a conocer por este medio sus funciones, su misión, visión y otras actividades que realizan.
La Unesco, a través de Valencia-Molina et al. (2016), ha establecido ciertos parámetros para la adquisición y la aplicación de ciertas competencias de las TIC que también son utilizadas por las universidades. En el nivel de apropiación se tiene conocimiento sobre esta y su uso; en la de integración se presentan los contenidos, la comunicación y la transmisión de información; en el nivel de reorientación se aplica la tecnología que involucra la participación activa de sus miembros o participantes.

A pesar de que existe una diversidad de herramientas tecnológicas, sin embargo, la web o los portales resultan ineficientes porque les falta estructurar, organizar eficientemente los recursos de las plataformas virtuales (Sabich, 2015).

Método

El presente estudio es de carácter cualitativo. Se base en análisis de contenido, en base a las páginas web por medio de las cuales las Facultades de Derecho de las Universidades de Latinoamérica han difundido su misión y visión, según el ranquin de Scimago de 2019.

Las Facultades de Derecho que están en el ranquin Scimago (2019) son 25, pero de estas 10 han explicitado su misión y 7 su visión en su portal o web: La Pontificia Universidad Católica de Chile (primer lugar, solo ha explicitado su misión), La Universidad Nacional Autónoma de México (tercer lugar), La Universidad de Chile (quinto lugar), Universidad los Andes de Colombia (sexto lugar), Pontificia Universidad Católica de Valparaíso (octavo lugar), Pontificia Universidad Católica del Perú (noveno lugar), Universidad de Rosario (décimo tercer lugar), Universidad Diego Portales de Chile (décimo cuarto lugar, ha difundido solo su misión), Universidad de Antioquía (décimo noveno lugar, solo ha expresado misión) y Universidad los Andes de Chile (vigésimo lugar).

El análisis se ha realizado por categorías, tanto de la misión y visión: la formación profesional, proyección social, las alianzas, el liderazgo académico, enfoque interdisciplinar, proyección, etc.

Respecto al uso de las redes sociales: presentación de la misión-visión, el tipo de redes sociales, las temáticas que difunden en las redes y la cantidad de usuarios e interacciones.

Resultados

La misión de las facultades de derecho

Tabla 1: La misión de las facultades de derecho

Nro.	Categorías	Universidades
1	Formación profesional	Pontificia U. Católica de Chile, Pontificia Universidad Católica de Valparaíso, Pontificia Universidad Católica del Perú, Universidad de Chile, U. Diego Portales de Chile, Universidad los Andes de Chile, U. los Andes de Colombia, Universidad N. Autónoma de México.
2	Proyección o servicio social	Pontificia U. Católica de Chile, Pontificia Universidad Católica de Valparaíso, Universidad de Antioquía, Universidad del Rosario, Universidad los Andes de Chile, U. los Andes de Colombia, U. los Andes de Colombia, Universidad N. Autónoma de México.
3	Creación de conocimiento	Pontificia U. Católica de Chile, Pontificia Universidad Católica de Valparaíso, Universidad de Antioquía, U. Diego Portales de Chile, Universidad los Andes de Chile, U. los Andes de Colombia.
4	Liderazgo (académico)	Pontificia U. Católica de Chile, Universidad de Chile, Universidad del Rosario.
5	Resolución de problemas	Universidad de Antioquía.
6	Enfoque interdisciplinar	Universidad de Antioquía, Universidad de Chile, U. los Andes de Colombia, U. los Andes de Colombia, Universidad N. Autónoma de México.
7	Alianzas	U. los Andes de Colombia.
8	Uso de TIC	Universidad N. Autónoma de México.

Nota: Elaborado por el autor en base a los datos difundidos por las universidades

De las categorías, las que tienen mayor énfasis se enfocan en la formación profesional que están referidas a la integridad, ética (la explicitan 8 universidades), sobre la proyección o servicio social el cual implica que la universidad se involucra con su entorno (también lo han expresado 8 universidades), respecto a la creación del conocimiento que es la esencia o una de las principales funciones de la universidad (la han difundido 6 facultades), en liderazgo académico (han explicitado 3 universidades), sobre resolución de problemas (ha explicitado la Universidad de Antioquía), en el desarrollo del el enfoque interdisciplinar que implica la integración de varias disciplinas lo han difundido 5 universidades, sobre alianzas una universidad y el uso de TIC solamente la Universidad Nacional Autónoma del México.

La visión de las facultades de derecho

Tabla 2: La visión de las facultades de derecho

Nro.	Categorías	Universidades
1	Formación profesional	Pontificia Universidad Católica de Valparaíso, Universidad de Chile.
2	Proyección o servicio social	Pontificia Universidad Católica de Valparaíso, Universidad de Chile, Universidad los Andes de Chile.
3	Reconocimiento (internacional)	Pontificia Universidad Católica de Valparaíso, Pontificia Universidad Católica del Perú, Universidad los Andes de Colombia, Universidad N. Autónoma de México.
4	Contribución a la diversidad	Pontificia Universidad Católica de Valparaíso, Universidad los Andes de Chile.
5	Calidad de la investigación	Universidad del Rosario.
6	Alianzas	Universidad de Chile, Universidad los Andes de Chile, Universidad los Andes de Colombia.
7	Liderazgo	Universidad los Andes de Colombia, Universidad N. Autónoma de México.

Nota: Elaborado por el autor en base a los datos difundidos por las universidades

En la visión también se han explicitado una serie de categorías: la formación profesional 2 universidades, la proyección social 3 instituciones, el reconocimiento internacional 4, contribución a la diversidad que implica respetar los derechos, opiniones de los demás lo han explicitado 2 facultades, sobre las alianzas 3 facultades y respecto a liderazgo 2, respectivamente, según el ranquin de 2019.

El uso de redes sociales de las facultades de derecho de las universidades

Tabla 3: El uso de las redes sociales

Universidad	Tipos de redes
Pontificia Universidad Católica de Chile	Twitter, Facebook, Linkedin, Flickr, YouTube.
Universidad del Rosario	Twitter, YouTube, Instagram, Linkedin, Facebook
Universidad Nacional Autónoma de México	Facebook
Universidad Diego Portales de Chile	Facebook, Twitter, Instagram
Pontificia Universidad Católica del Perú	Facebook, Twitter
Pontificia Universidad Católica de Valparaíso	Twitter
Universidad de Antioquía	Facebook, Linkedin, Twitter, YouTube.
Universidad de Chile	Facebook, Twitter

Nota: Elaborado con base a los datos de las universidades que han publicado en su web

Las redes sociales están insertadas o agregadas en la página web donde se difunde la misión y visión de las facultades de derecho y por tanto esta información se puede difundir a través de las redes que se especifican en la tabla precedente. Las redes más usadas corresponden a Facebook y Twitter. Las instituciones que usan más cantidad de estas: la Universidad del Rosario, la Pontificia Universidad Católica de Chile y la Universidad de Antioquía.

En la difusión de la misión y visión de las universidades, se evidencia predominio de texto sobre la imagen.

Uso de las redes sociales: Facebook

Tabla 4: Facebook: gustos, seguidores y visitas

Universidad	Gustos	Seguidores	Visitas
Diego Portales	5 655	5 815	182
Católica de Valparaíso	5 279	5 376	192
Pontificia Universidad Católica de Chile	10 938	11 118	1 959
Pontificia Universidad Católica del Perú	674		5 073
Universidad Nacional Autónoma de México	123 954	126 634	
Universidad los Andes de Colombia	16 466	17 848	283
Universidad de Chile	3 568	3 668	
Universidad de Antioquía	20 160	20 661	496
Universidad los Andes de Chile	1 486	1 515	30

Nota: Obtenido de las redes de las universidades consultadas (entre enero y febrero de 2019)

La UNAM cuenta con más personas a quienes les gusta la página: 123 954, seguido de la Universidad de Antioquía con 20 160, la Universidad los Andes de Colombia con 16 466, la Pontificia U. Católica de Chile con 10 938, las demás oscilan entre 674 (Católica del Perú) a 5 655 (Diego Portales); la misma jerarquía se mantiene para los que siguen la página de Facebook.

Los temas que se difunden a través de Facebook son diversos: democracia universitaria, Diplomado en Derecho Empresarial (UNAM), Cambio de Constitución, convocatorias, seminarios, foros.

Uso de las redes sociales: Facebook: cantidad de comentarios

Tabla 5: Comentarios en Facebook

Universidad	Comentario	Compartido
Universidad de Antioquía	1	34
Universidad Nacional Autónoma de México	1	8
Universidad los Andes de Colombia	1	3
Pontificia Universidad Católica del Perú		
Universidad de Chile		4
Diego Portales	2	3
Pontificia Universidad Católica de Chile		1
Universidad los Andes de Chile		
Católica de Valparaíso	2	1

Nota: Obtenido de las redes de las universidades consultadas (entre enero y febrero de 2019)

Las redes sociales, por su naturaleza, generan mayor interacción, sin embargo, en las páginas o publicaciones se evidencia que no existe tal interacción en Facebook. Algunas publicaciones no cuentan con comentarios (U. de Chile, U. los Andes de Chile, Pontificia Católica de Chile, Católica del Perú) y otras solo uno (UNAM, U. los Andes de Colombia) o dos (Pontificia U. Católica de Valparaíso, Diego Portales). Se evidencia que existe reducida interacción en Facebook.

Uso de las redes sociales: estadística de Twitter

Tabla 6: El uso de Twitter

Universidad	Siguiendo	Seguidores
Pontificia Universidad Católica de Chile	822	11 600
Universidad Nacional Autónoma de México	526	41 000
Universidad del Rosario	1 121	66 100
Universidad de Chile	1 387	20 000
Diego Portales	91	6 394
Católica de Valparaíso	156	1 295
Pontificia Universidad Católica del Perú	295	3 716

Nota: Obtenido de las redes de las universidades consultadas (entre enero y febrero de 2019)

Se evidencia que existe una diversidad de seguidores en la red de Twitter con más prevalencia, respecto a los seguidores, en las universidades del Rosario, Autónoma de México, Universidad de Chile.

Las temáticas que se difunden en Twitter son diversas y en algunos casos coinciden con los mismos tópicos expresados en Facebook: diplomados, publicaciones, foros, seminarios, etc.

Respecto a los comentarios en Twitter, de las universidades seleccionadas, no se han realizado en esta red, esto demuestra que la participación es menor que en Facebook.

Discusión

Respecto a los resultados obtenidos, sobre la misión y visión, se basan en las categorías principales relacionadas con la formación profesional, la creación del conocimiento científico, la proyección social, el liderazgo, el enfoque interdisciplinar, las alianzas, el reconocimiento internacional, están concatenados con la planificación estratégica (Ciancio, 2018; Yusof, Awang, Valdez y Yaacob, 2018), también con los planteamientos de Soares y Setyohady (2017) porque la realización de la planificación conlleva al logro de la misión y visión institucional. Asimismo, están relacionados con la internacionalización de las instituciones y el acceso al conocimiento que propone Popescu (2017) y Grieves (2018).

Sin embargo, en la propuesta sobre el desarrollo de las TIC, en la misión y visión de las facultades de derecho, solo lo explicita la UNAM, aspecto que no se especifican en las demás facultades. No obstante, las universidades analizadas, sí usan redes sociales: Facebook y Twitter con más frecuencia con relación a las demás redes, como se verifica en su mismo portal.

En el portal de las facultades predomina el uso de texto, en vez de imagen o video; asimismo, sobre el uso de las redes sociales por las facultades de derecho de las universidades, en la red de Facebook, Twitter, se evidencia que no han ordenado adecuadamente los símbolos e imágenes, aspecto que coindice con el planteamiento de Sabich (2015) quien considera que las webs son ineficaces porque no se ha estructurado adecuadamente los recursos de las plataformas virtuales.

Sobre la interacción o participación, tanto en Facebook como en Twitter, no se evidencia que exista una participación activa entre la universidad y los usuarios, como lo establece Valencia-Molina et al (2016) en el nivel de reorientación que implica la participación activa entre los miembros o participantes; se puede apreciar que los comentarios en las redes sociales analizadas de las facultades son escasas por parte de los usuarios.

Conclusiones

La misión y la visión de las facultades de derecho de las universidades de Latinoamérica enfatizan en la formación profesional íntegra, la proyección o servicio social, creación de conocimiento, liderazgo y reconocimiento internacional.

Existe predominio de texto frente a imagen en los portales de las facultades de derecho donde han expresado su misión y visión.

El uso de las TIC en la misión y visión de las facultades de derecho es escaza, solo la UNAM la ha difundido en su misión.

El uso de las redes sociales no evidencia participación activa entre las facultades de derecho y los estudiantes o usuarios.

Resumen

El presente estudio analiza algunas tendencias sobre el proceso de enseñanza-aprendizaje del derecho en artículos de revistas indizadas en Scopus y Web of Science. Se realizó un estudio documental en una muestra cualitativa homogénea de 46 manuscritos. Los artículos estudian el enfoque por competencias relacionados con la formación integral del estudiante. Las estrategias metodológicas están referidas a la resolución de problemas, aspectos lúdicos, la conferencia trascendente, la investigación como estrategia de aprendizaje, el trabajo colaborativo. El rol del docente es de orientador, planificador; y del estudiante de protagonista respecto a su proceso de aprendizaje.

Palabras clave: Enseñanza-aprendizaje; paradigma; currículo; evaluación; docente; estudiante.

Abstract

This study analyzes some trends on the teaching-learning process of law in articles of journals indexed in Scopus and Web of Science. A desk study was performed in a homogeneous and qualitative sample of 46 manuscripts. The articles study the competency-based approach in relation to the comprehensive education of the student. The methodological strategies refer to problem solving, playful aspects, transcendent conference, research as a learning strategy, collaborative work. The role of the teacher is to be an advisor and planner; and the student is the protagonist in terms of his/her learning process.

Keywords: Teaching-learning; paradigm; curriculum; evaluation; teacher; student.

Introducción

El presente artículo analiza los aportes de algunas investigaciones jurídicas de revistas indizadas en Scopus y Web of Science (2014-2018) en la formación de los estudiantes del ámbito jurídico.

Permite comprender el sistema de aprendizaje del estudiante, quien se ha convertido en protagonista principal del proceso formativo que responde al enfoque por competencias (Ramírez-García, González-Fernández y Salcines-Talledo, 2018; Sanroman y Morales, 2016). Exige enseñar, aprender, diseñar estrategias metodológicas, planificar la formación integral del profesional que responda a las exigencias actuales. Este proceso requiere una actuación interdisciplinar como una necesidad para responder a la realidad compleja desde un abordaje de varias disciplinas (Llano, Gutiérrez, Stable, Núñez, Masó y Rojas, 2016).

El trabajo se ha establecido en los siguientes apartados: estudios previos, fundamentación, análisis de los artículos por categorías, discusión, conclusiones, referencias y apéndice (donde se registra la relación de artículos que se han analizado con Atlas ti). Las categorías están relacionadas con paradigma, currículo, estrategias metodológicas, estudiante, docente, relación estudiante-docente-comunidad y sistema de evaluación.

---

1 El presente trabajo forma parte de la línea de investigación: enfoque interdisciplinario de la ciencia jurídica de la Universidad Autónoma del Perú.

Cite this Article as: Hugo GONZÁLEZ and Aracelly RUBIO "Algunas Tendencias Sobre El Proceso De Enseñanza-Aprendizaje En Derecho Some Trends On The Teaching-Learning Process In Law" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

Estudios previos, congresos y revistas

La didáctica estudia el proceso de enseñanza-aprendizaje, equilibra el enseñar y el aprender (Abreu, Rhea, Arciniegas y Rosero, 2018; Mora y Pujal, 2017; Abreu, Gallegos, Jácome y Martínez, 2017), a través de un enfoque interdisciplinario que integra el derecho y la didáctica. Desarrolla el cómo y el qué; es decir qué estrategias, formas y medios se deben emplear en la formación de los profesionales del derecho.

Aparte de las investigaciones sobre didáctica, son relevantes los aportes de la Universidad Nacional Autónoma de México (Cáceres, 2016)2, sobre la enseñanza del derecho a través del "Congreso Internacional sobre Investigación en Pedagogía y Didáctica del Derecho", difundidos virtualmente. Sus temáticas son diversas: el papel de la psicología en el fortalecimiento de la actividad del docente, las competencias blandas, la solución de problemas, el desarrollo de competencias, nuevos enfoques en la enseñanza, la enseñanza creativa y constructiva, la neurociencia en relación con la enseñanza del derecho, el método dialéctico, la enseñanza centrada en juicios orales, la investigación en la enseñanza del derecho, los diseños curriculares en postgrado, el enfoque intercultural, la clínica jurídica, aprendizaje por módulos, el paradigma de la complejidad, el cine en el derecho, estudios interdisciplinarios (poesía y derecho), evaluación jurídica, etc.

Otras fuentes especializadas, sobre la enseñanza del derecho, son las revistas científicas. En Latinoamérica la "Revista Pedagogía Universitaria y Didáctica del Derecho"3, que se encuentra indizada en las principales bases de datos: Web of Science y últimamente en Scopus, difunde publicaciones sobre la enseñanza y la investigación en derecho. Se puede acceder a sus textos electrónicamente desde las publicaciones del 2014. Investiga diversos temas, entre los más relevantes: estrategias colaborativas, formación por competencias, la investigación jurídica, aprendizaje colaborativo o cooperativo, cambio curricular, experiencias didácticas, la literatura en la investigación y la enseñanza, el aspecto lúdico, el cine, estrategias metacognitivas, el método de casos, el aprendizaje basado en problemas, las TIC en la enseñanza, el sistema de evaluación, proyecto pedagógico, etc.

La revista "Academia. Revista sobre Enseñanza del Derecho"4, una de las primeras revistas en Latinoamérica, también investiga sobre la enseñanza del derecho. Difunde sus publicaciones en línea desde el 2003, cuyas temáticas más relevantes, en los tres últimos años (2016, 2017 y 2018), se enfocan en innovación didáctica, planificación de la enseñanza, enfoque por competencias, planes de estudios jurídicos, estrategias para aprender textos en inglés, maneras de enseñar o aprender Derecho Administrativo, la enseñanza del lenguaje jurídico, etc.

En esta línea, la "Revista de Educación y Derecho"5 de la Universidad de Barcelona estudia aspectos relacionados con la enseñanza del derecho desde el 2009 hasta el presente (2019). Las temáticas más representativas están referidas a los desafíos de la enseñanza del derecho en Europa; estrategias y metodologías en la formación de jueces y magistrados; pedagogía, cine, literatura y derecho; las clínicas jurídicas; la evaluación de la docencia superior.

Los eventos y/o publicaciones (congresos y revistas especializadas) permiten fundamentar y orientar los procesos formativos de los futuros abogados tomando en cuenta el diseño del currículo, las estrategias metodológicas, la inclusión de las TIC, la interacción con otras disciplinas como la literatura, la inserción de la investigación, la mejora de los sistemas de evaluación.

Fundamentación

Las tendencias, el contexto actual y los paradigmas

El contexto actual, de la educación superior, específicamente la universitaria, está orientada a la internacionalización (Tünnermann, 2018; Unesco, 2009) basada en la integración solidaria, la interculturalidad, el respeto a la identidad de los países, de los espacios académicos universitarios; el aumento de la enseñanza superior, los cambios en la investigación.

Otra tendencia es la masificación (Guzmán-Valenzuela, 2017) que ha ampliado la oferta educativa y ha permitido que más personas tengan acceso a la educación superior de manera efectiva y permanente (Ramos y López, 2018). Esta transformación exige que el estudiante aprenda a aprender, aprenda a hacer, aprenda a convivir y aprenda a ser (Delors, 1994); aprenda a desaprender, aprenda la comprensión humana (Morin, 1999); aprenda a liberarse (Freire, 2005), a desarrollar su pensamiento crítico y creativo en la formación de abogados (Camilloni, 2019) para transformar su entorno, el uso de las TIC (Espinosa-Munguía, 2018)

La formación profesional debe estar relacionada o ser coherente con el desempeño laboral o empresarial (Bartual y Turmo, 2016). Las universidades deben establecer sus currículos donde precisen las competencias generales y específicas que respondan a las exigencias de las empresas o las instituciones donde se desempeñarán los futuros abogados.

Las tendencias se relacionan con los paradigmas que imperan en la enseñanza actual. Desde el ámbito de la pedagogía, se habla de un paradigma centrado en la innovación a través del uso de la tecnología que se desarrolla en los procesos educativos a través de la interacción entre docentes y estudiantes (Aguiar, Velásquez y Aguiar, 2019), estos últimos participan de manera comunicativa y creativa en el proceso formativo (Roa, 2017).

Otra dimensión de los paradigmas está orientada a indagar y resolver problemas que se encuentran pendientes en la ciencia (Bravo, 2018), en este caso los problemas están centrados aún en el protagonismo principal del docente, con menor actuación del estudiante; otro problema es el aislamiento de la formación universitaria frente a los problemas sociales; todavía la universidad se encuentra desvinculada de la sociedad, de la empresa, del mundo laboral.

Los paradigmas tienen una implicancia con la responsabilidad ética y moral (Ortega y Romero, 2018), en este sentido se pretende mejorar no solo el aprendizaje de los estudiantes, sino conocer los problemas sociales para resolverlos y mejorar las condiciones de vida de la población, por eso se requiere la formación de profesionales que transformen su realidad o contexto desde su área o especialidad, acercar los conocimientos jurídicos para que las personas conozcan sus derechos y los ejerzan. El derecho no puede ser una ciencia que se divorcie de la sociedad, sino que debe integrarse con el desarrollo de esta.

Otras posturas establecen el paradigma emergente centrado en un rol transformador que valora el saber, al mismo nivel que el ser con su comprensión multidimensional y su carácter transformador (Rodríguez, Trujillo, Vargas, Corredor y Gallego, 2018) que no es ajeno al proceso formativo del derecho.

La enseñanza del derecho, en este marco, no es ajena ya que ha sufrido cambios desde la concepción romanista (Witker, 1985) hasta el enfoque interdisciplinar, que se nutre de otras ciencias: económicas, históricas, sociológicas y el enfoque por competencias. Lamentablemente, como lo menciona Witker (1985), existe un paradigma "parroquial" que imposibilita la apertura, la polémica en la que predomina una enseñanza libresca, normativa, con mayor protagonismo del docente.

Frente a este problema, desde la década del 70 se inicia lo que Witker (1985) denomina una concepción dinámica del derecho orientada a la producción de conocimientos, para desarrollar el espíritu crítico y creativo de los estudiantes, como protagonistas de su aprendizaje donde impere el diálogo, la controversia. En este contexto, el docente es un guía, un instructor; y el estudiante un ente activo que logra aprendizajes significativos (Sanromán y Morales, 2016).

El currículo, pedagogogía y didáctica

Orienta la formación del ser humano, la educación, el proceso de aprendizaje. Ha ido cambiando desde el tradicional, hasta el currículo por competencias y el socioformativo que resuelve problemas reales, del contexto, en equipo (Tobón, 2017).

El currículo tiene una base filosófica que permite fundamentar qué se va a enseñar, cómo y por qué (Gil, 2018); responde al contenido, a los procesos metodológicos o estrategias y a un propósito. En el derecho se deben aprender contenidos actualizados y relevantes, que respondan a los intereses de los estudiantes y sociales con el fin de resolver problemas y tener una sociedad más justa, equitativa.

En los últimos años ha sido impulsado y consolidado el currículo por competencias a través de varias instituciones, desde la Unesco a través de Delors (1994) quien propone que las competencias deben estar orientadas al conocer, hacer, ser y convivir. Otros autores establecen que permite la formación integral del estudiante, consolida los procesos de aprendizaje, gestiona adecuadamente recursos, metodologías, trabaja en base a problemas y proyectos, etc. (Moreno, Casanova, Martell, Álvarez y Tabares, 2019).

El currículo, como planificación de experiencias, propone objetivos orientados a la formación del estudiante; es el punto de encuentro entre la pedagogía y la didáctica, está entre la frontera de estas dos disciplinas (Ortiz, 2014). Es una construcción social, que organiza todos los medios, instrumentos para formar integralmente al estudiante, teniendo en cuenta su contexto, realidad y pensamiento complejo. Se relaciona con los procesos jurídicos ya que responde a realidades complejas y diversas que requieren la interacción con otras disciplinas.

La pedagogía se encarga del proceso formativo como una categoría mayor en el ámbito educativo que integra todas las acciones educativas o institucionales tomando en cuenta el contexto en cuyo seno se desarrolla el proceso de enseñanza-aprendizaje y otros procesos que permiten la formación del estudiante (Ramos, Rhea, Pla y Abreu, 2017). En ese sentido, la pedagogía tiene un propósito formativo, institucional, cristaliza el proceso formativo o educativo en función de los propósitos de la institución, integrando a la comunidad y a la familia, funciona como un eje articulador de estos; planifica cómo debe desarrollarse la organización educativa.

El propósito de la pedagogía se orienta al desarrollo cognitivo e intelectivo para la formación íntegra de los educandos como un proceso de humanización que tiende a su transformación individual y colectiva (Pallarès y Traver, 2017). En este sentido estudia y comprende el proceso educativo o formativo de la persona para que tenga una sociedad más equitativa, más justa, que permita interactuar al sujeto con su contexto para comprenderlo, pero también para transformarlo. Coadyuva a las transformaciones sociales que son trascendentes para los aprendices (Pallarès, Unda, Traver y Lozano, 2018). Por ello, desarrolla experiencias de aprendizajes significativos que se apliquen a la práctica real y concreta.

La didáctica estudia el proceso de enseñanza-aprendizaje (Abreu, Gallegos, Jácome y Martínez, 2017; Ramos, Rhea, Pla y Abreu, 2017). En su desarrollo histórico ha variado su objeto de estudio: desde la enseñanza hasta la concepción curricular y su alcance que va más allá de la didáctica (Abreu, Rhea, Arciniegas y Rosero, 2018).

Existen coincidencias con otros autores, al establecer que la didáctica requiere de estrategias óptimas para que el estudiante cumpla con los propósitos planteados en el currículo. Por ello estudia la relación del docente con el estudiante para que interactúen y logren los aprendizajes planificados. En este contexto esta disciplina con la pedagogía y el currículo se interrelacionan e intervienen en la planificación y la consolidación o construcción del conocimiento del estudiante (Rodríguez-Pérez, 2019). Los resultados permiten una formación competente del discente para que se desempeñe de manera eficiente en la sociedad.

Sin embargo, no se puede hablar de didáctica en términos generales, requiere precisarla según el contexto y pertinencia; en este caso se trata de una didáctica universitaria (Zabalza, 2011) que permita a los docentes universitarios demostrar sus competencias en la formación de los estudiantes de manera eficiente, eficaz, etc.

La didáctica comprende el siguiente procedimiento: planteamiento del problema, logro del objetivo, despertar la motivación, presentar el contenido, actuación del estudiante, construcción de la actividad o producto y evaluación (Ortiz, 2014). Este proceso permite una participación activa del estudiante para reconstruir el conocimiento y luego pueda aplicarlo para simular o resolver algún problema. Se relaciona con otras propuestas o procesos: interrogación, desarrollo, consolidación (Fabres, 2016); permiten que el estudiante participe activamente tomando decisiones e interactuando con el docente o sus compañeros, demostrando sus competencias. También es pertinente que en este proceso se incluyan el uso de las TIC, de las redes sociales como medio didáctico, el uso de la investigación como recurso para aprender mejor, la relación o actuación del estudiante con su entorno para que conozca de manera directa la realidad, los problemas y luego proponga soluciones.

El enfoque por competencias debe complementarse con el paradigma socioformativo (Tobón, 2017, 2018), que propone un currículo contextualizado según la realidad, en la que el estudiante y el docente tienen mayor interacción; utiliza estrategias metodológicas que promueven la participación del estudiante, a través de una didáctica centrada en la persona donde el estudiante es atendido de manera individual, según el caso (Mora y Pujal, 2017); el sistema de evaluación se realiza a través de rúbricas con criterios específicos y definidos. El estudiante participa activamente no solo en el aula, sino en actividades académicas y otras que generan vínculo de la universidad con las demás instituciones nacionales o internacionales.

En consecuencia, debe existir una lógica y coherencia, según el paradigma, desde el currículo hasta la evaluación; si se ha optado por un enfoque por competencias se debe evaluar los desempeños del estudiante a través de evidencias, resultados concretos.

En suma, el proceso de enseñanza-aprendizaje requiere de una serie de componentes para su realización como el enfoque o paradigma en el que se fundamenta, la concepción curricular, el uso específico de estrategias metodológicas o recursos didácticos, los tipos de saberes o conocimientos que debe desarrollar el estudiante y el

sistema de evaluación que se utiliza o aplica para evidenciar o comprobar los aprendizajes; asimismo, tener en cuenta el contexto o la realidad donde se desarrolla la actividad pedagógica o didáctica en interacción con su medio local con proyección a nivel internacional; en interacción permanente con otras disciplinas científicas.

Método

Se seleccionaron 46 manuscritos sobre la enseñanza del derecho de revistas indizadas en las bases de Scopus y Web of Science publicados entre el 2014 y el 2018.

El propósito no es cuantificar, sino interpretar o reflexionar, en torno al contenido de los documentos (Díaz Herrera, 2018), en este caso sobre los artículos seleccionados en los que se han identificado las categorías que responden al proceso formativo del estudiante. Se ha considerado como criterios de inclusión: artículos publicados en las bases de Scopus y Web of Science y que traten sobre la enseñanza jurídica.

Se ha considerado una muestra cualitativa homogénea (Hernández-Sampieri y Mendoza, 2018) ya que se trata de documentos que comparten una temática central: la enseñanza del derecho, con diversas formas o enfoques. La búsqueda se realizó en las bases de datos y en las revistas de acceso abierto, a través de palabras clave: enseñanza, derecho, enseñanza del derecho.

Las estrategias que se utilizaron para la búsqueda en Scopus en castellano fueron: TITLE-ABS-KEY ((enseñanza AND derecho AND universidad)); y en inglés: TITLE-ABS-KEY ((teaching AND law AND university) next).

Sobre el análisis se ha realizado por categorías: paradigma, currículo, estrategias metodológicas, estudiante, docente, relación estudiante-docente-comunidad, sistema de evaluación a través del programa Atlas ti.

Tabla 1: Artículos por año y bases de datos

Año	Cantidad	Scopus	Web of Science	Scopus y Web of Science
2014	8	0	6	2
2015	8	1	7	0
2016	13	1	12	0
2017	5	1	4	0
2018	12	4	5	3

Nota: Elaborado en base a las revistas indizadas en Scopus y Web of Science

Análisis por categorías

Figura 1: Categorías según artículos de Scopus y Web of Science 2014-2018

Nota: Elaborada por lo autores con base a los artículos analizados

En la figura 1 se precisan las categorías principales que tratan los artículos científicos, con mayor predominio en estrategias metodológicas. En el proceso formativo del estudiante de derecho intervienen varios aspectos: la concepción de paradigma, el tipo de currículo, el sistema pedagógico y didáctico; de manera específica las estrategias, los medios o materiales, los sistemas de evaluación, las relaciones o convenios de las universidades con otras instituciones que generen espacios o escenarios donde complemente su formación el futuro profesional y relacione la teoría con la práctica.

El tratamiento de los paradigmas según los artículos analizados

La concepción de paradigma tiene diversos tratamientos que se establecen a parir de los artículos científicos (figura 2), que se han especificado en los documentos procesados en el programa Atlas ti

Figura 2: La concepción de paradigma según artículos de Scopus y Web of Science 2014-2018
Nota: Elaborada por lo autores con base a los artículos analizados

El paradigma se conceptualiza como una realidad científica que permite el estudio de los problemas y la formulación de su solución (Khun, 2004); en el ámbito jurídico responde a cómo entendemos el derecho y cómo lo desarrollamos a través de la enseñanza o la educación jurídica que no debe ser elitista, sino de acceso universal, un derecho con carácter práctico, que promueva la crítica, el desarrollo de competencias teniendo como base la ética y el uso de las TIC que coadyuven a su eficacia.

El paradigma de acceso universal a la educación universitaria (Benfeld, 2017) ha permitido la mayor inclusión de estudiantes al sistema universitario, ha generado el cambio del currículo y los procesos didácticos; es valorado positivamente por los actores educativos sobre la diversidad social que se ha creado. Este acceso permite al futuro profesional tener un ascenso social, en base a los derechos humanos (Verdan Rangel, 2016), y permiten la

construcción de una convivencia democrática (Ronconi, 2017), la práctica de una educación inclusiva (Vasconcelos Silva, 2016). Concatenante con la propuesta freireana que los hombres se educan en comunión (Swensson, 2016).

El paradigma constitucional (Pazos y Fabara, 2018) promueve el desarrollo de la actitud crítica y habilidades en la formación de los estudiantes, opuesto al sistema tradicional que es acrítico, pasivo. Se concatena con el enfoque por competencias porque este promueve la actividad práctica del estudiante y no se limita solamente a lo cognitivo, opuesto al paradigma tradicional donde impera la clase expositiva (Pérez, 2014).

El paradigma actual está infuenciado por lo tecnológico que permite una alta cualificación del abogado en la realización de sus actividades profesionales (Álvarez, 2014), por ello dota al estudiante de herramientas para que se desempeñe eficientemente y le permita cooperar y movilizarse en un contexto tecnológico para cumplir los retos que exige el ámbito laboral (Antúnez, 2018), que ha permitido cambiar el pardigma tradicional, el rol del estudiante: de oyente a un rol creativo (Cicero, 2018).

El paradigma también debe estar ligado a la Bioética o Bioderecho (Catellanelli, 2015) desde un estudio interdisciplinar ya que el derecho no está aislado de otras disciplinas. Este proceso no solo debe implicar su enseñanza en el derecho sino a través de otras disciplinas que formen íntegramente al futuro abogado para que se desenvuelva de manera responsable en la solución de problemas sociales. Requiere de competencias técnicas y éticas (Silva Mariosa y Dos Santos, 2015), que le permitan ser un modelo moral y ético (Prado-Carrera, 2016).

El tratamiento del currículo en los artículos analizados

El proceso formativo implica una serie de aspectos, como el enfoque o paradigma, también un plan u orientación curricular (figura 3)

Figura 3: El currículo según artículos de Scopus y Web of Science 2014-2018

Nota: Elaborada por lo autores con base a los artículos analizados

Se propone un currículo relacionado con la realidad, pertinente y adecuado al contexto; que tome en cuenta la complejidad y lo interdisciplinar (Silvera, Garcés y Pineda, 2018; Castellanelli, 2015). Incluye la realidad compleja, que es estudiada en interrelación con las demás ciencias como la medicina, contabilidad, economía, ecología, porque el derecho no solo estudia o aplica normas o jurispudencia, sino que su acción la realiza en interacción con otras ciencias.

El currículo es el núcleo de la enseñanza-aprendizaje de la disciplina jurídica y su importancia en la comunidad académica de la universidad (Pezzetta, 2017). Desarrolla las competencias que están centradas en el estudiante, por eso precisa y selecciona los contenidos, metodologías, la planificación del tiempo, sistema de evaluación y el uso de las TIC (Gregorio y Casas, 2014; Aedo, 2014; Becerra y Salas, 2015).

Se propone un currículo sistemático que integre aspectos metodológicos, práticas, evaluaciones, la inclusión de estrategias o habilidades jurídicas o pragmáticas (Benfeld, 2017). También se incluye a las TIC como apoyo al desarrollo de competencias que permitan la formación integral y eficiente de los estudiantes (Becerra y Salas, 2015; Aedo, 2014).

Asimismo, se propone un currículo en la que se incluyan cursos básicos o clásicos que han cimentado la base del derecho: la enseñanza del derecho romano (Oyarce, 2018); también asignaturas que permiten la solución de problemas actuales de manera rápida, sin recurrir a la justicia tradicional: negociación, conciliación, etc. (Bonett Y Meyer-Pflug, 2016).

El tratamiento de las estrategias en los artículos analizados

En este proceso formativo, también juegan un papel fundamental las estrategias (figura 4).

Figura 4: Estrategias metodológicas (1) según artículos de Scopus y Web of Science 2014-2018
Nota: Elaborado por los autores con base a los artículos analizados

Los artículos analizados estudian con mayor énfasis las estrategias metodológicas. Entre estas, se analiza a la vinculación como proceso o estrategia que establece una relación entre las instituciones de formación profesional y el poder legislativo que involucra al estudiante con la entidad y comprenda su funcionamiento, las normas o actividades que se desarrollan (Díaz, 2015). Se concatena con la clínica jurídica que desarrolla el trabajo en equipo y la litigación como actividades fundamentales del abogado en el ejercicio de la profesión (Londoño-Toro y Torres-Villarreal, 2018).

La estrategia de la clase magistral trascendente promueve el aprendizaje del estudiante y le permite reflexionar, crear; no es la clase tradicional que mantiene al estudiante en un estado pasivo (Elgueta y Palma, 2014). Se complementa con las estrategias metacognitivas que desarrollan la formación jurídica autónoma, crítica (Massimino y Colombo, 2016).

La investigación como estrategia consolida el proceso de enseñanza-aprendizaje jurídico (Álvarez, 2014). En este caso la investigación es importante porque promueve la enseñanza (Piazza y Volpato, 2016). Por ello, se requiere de un proceso de aprendizaje que contextualice y problematice los cursos jurídicos (Lázaro Castro De Lima, 2015) que se imparten en la universidad.

Se proponen otras estrategias, como la gamificación que permite el desarrollo del aprendizaje a través del juego (Morales, 2016) que genenera mayor motivación en los estudiantes y por consiguiente repercute en su aprendizaje.

También, la propuesta didáctica interdisciplinar que implica el mejoramiento de la formación en las ciencias jurídicas (Silvera, Garcés, Pineda, 2018). Con ello se deja la concepción clásica monodisciplinar; el derecho no puede aislarse de otras ciencias para resolver los problemas complejos.

Figura 5. Estrategias metodológicas (2) según artículos de Scopus y Web of Science 2014-2018

Nota: Elaborado por los autores con base a los artículos analizados

La simulación jurídica fomenta el aprendizaje en equipo, la crítica, la creatividad (Consolo, 2015); el proyecto pedagógico permite desarrollar la actitud crítica del estudiante y esto compromete a los docentes y a la institución (Klotz, 2018). Ambas propuestas desarrollan en pensamiento crítico del estudiante, además de generar la integración. Se complementa con el aprendizaje cooperativo que está orientado a desarrollar la responsabilidad individual, la interacción directa que permite trabajar en forma efectiva a través de pequeños grupos (Pinto, 2014).
Otro aspecto relevante es la relación del arte (cine, literatura) con el derecho. El cineclubismo se ha utlizado como un instrumento didáctico en el desarrollo de la educación de los derechos humanos a través de la proyección de películas que desarrollan el debate o la controversia (Marchiori y Vaz, 2016); la literatura como estrategia mejora el aprendizaje de la ciencia jurídica (Cardinaux, 2014), asimismo, el conocimiento y la relación con otras culturas (Muñoz, 2018); permite el desarrollo de la ciencia interdisciplinar.

La popularización del derecho como propuesta didáctica permite el diálogo con la comunidad acercando el lenguaje jurídico a las demás personas que no tienen cultura jurídica, se establece una relación entre la universidad y la

comunidad rural (Duque, Quintero, Duque, 2016). Se concatena con el estudio de caso que toma en cuenta situaciones de la realidad para ser analizados en las actividades académicas (Sanchez, Capella y De Castro, 2016). Las estrategias, no están ailadas, sino en interrelación con otros elementos didácticos, como los medios y materiales; en uno de los artículos analizados se enfatiza en el uso del manual como herramienta necesaria para la enseñanza constitucional (Murillo de la Cueva, 2018).

El tratamiento de la concepción de estudiante en los artículos analizados

Figura 6: La concepción del estudiante según artículos de Scopus y Web of Science 2014-2018
Nota: Elaborado por los autores con base a los artículos analizados

Con las nuevas concepciones o paradigmas educativos, el rol del estudiante se empodera. Dialoga, transmite el derecho y sabe comprender a los demás, genera que el conocimiento jurídico traspase las aulas, asumiendo una actitud crítica, reflexiva (Duque, Quintero, Duque, 2016; Baraona, Cádiz, Villanueva, 2015); cumple un rol activo en la interpretación y aplicación del derecho que permita una transformación de su entorno (Illera, 2017); el estudiante identifica y resuelve problemas, casos concretos que tienen trascendencia social, política, desde el ámbito local y regional (en caso de Latinoamérica) a través de la clínica jurídica (Londoño-Toro y Torres-Villarreal, 2018); como actor del proceso de aprendizaje se enfrenta a un mundo complejo (Álvarez, 2014); su actuación se funda en el modelo por competencias que le permite acercar la formación universirsitaria a la actividad práctica, al mundo laboral concreto (Pinto, 2014; Baraona, Cádiz y Villanueva, 2015)

El estudiante se responsabiliza de su propio aprendizaje o de su formación académica, consolidando un aprendizaje perdurable, innovador (Becerra y Salas, 2015; Pérez, 2014; Cicero, 2018); esta actuación se complementa con el uso de la tecnología que permite o promueve su aprendizaje (Antúnez, 2018).

El protagonismo del estudiante no solo implica partipación activa en las aulas o en su entorno, sino también en la universidad actuando en el cogobierno de esta (Pezzetta, 2017) porque en la mayoría de ocasiones no es considerado en el gobierno de las instituciones superiores; también es relevante su actividad como investigador porque mejora su actuación en actividades jurídicas, en intervenciones orales que le permiten una actuación en el poder judicial que está directamente relacionado con su carrera (Cázares, 2017; Consolo, 2015; Díaz, 2015). En este sentido, también se debe involucrar en actividades académicas, específicamente en las conferencias sobre el Derecho Internacional Humanitario (Bashiriva, Mammadov y Ibragimov, 2018).

El tratamiento de la concepción del docente en los artículos analizados

Figura 7: La concepción del docente según artículos de Scopus y Web of Science 2014-2018
Nota: Elaborado por los autores con base a los artículos analizados

En la figura 7, se evidencia que la responsabilidad del docente es orientar al estudiante para que aprenda por sí mismo, perdure en el tiempo y logre un aprendizaje efectivo (Pérez, 2014; Becerra y Salas, 2015); debe impatir su clase con actitud creativa para lograr la participación de los estudiantes, convertirse en un guía (Consolo, 2015; Pinto, 2014).

Debe aplicar una serie de estrategias metodológicas que le permitan formar con efectividad, también dominar pertinentemente las TIC o web 2.0 (Baraona, Cádiz y Villanueva, 2015; Antúnez, 2018); la actividad docente debe responder a un contexto diverso y complejo, que permita al estudiante acercarlo a su mundo real, más allá de las aulas universitarias (Ribero y Buzzi, 2018; Torres, 2016; Illera, 2017); también, recurrir a la investigación para desarrollar un aprendizaje acivo en el estudiante (Álvarez, 2014).

El tratamiento de la relación estudiante-docente-comunidad en los artículos analizados

Figura 8: La concepción estudiante-docente-comunidad según artículos de Scopus y Web of Science 2014-2018

Nota: Elaborado por los investigadores con base a los artículos analizados

Existe una interrelación entre estudiante-docente-comunidad o contexto a través del diálogo para integrar y compartir el lenguaje jurídico; nutrirse o enriquecer su formación desde la experiencia del docente (Duque, Quintero y Duque, 2016); asimismo, es relevante la relación con estudiantes de otras universidades con el fin de fortalecer las relaciones interinstitucionales (Consolo, 2015), así como también permita optimizar los nexos con sus futuros centros laborales.

Otra relación relevante es el vínculo entre la teoría que se imparte en las aulas y la práctica jurídica (Pérez Hurtado, 2018); resuelve el problema o el divorcio de la universidad con el ejercicio de la profesión, el contexto; aunque en los últimos años, la universidad sigue desvinculada de la empresa, del mundo laboral, por eso existe una serie de profesionales sin empleo.

El tratamiento de la concepción de evaluación en los artículos analizados

Figura 9: La concepción del sistema de evaluación en artículos de Scopus y WOS 2014-2018
Nota: Elaborado por los autres con base a los artículos analizados

La evaluación se enfoca como un sistema que establece una adecuada gestión y optimización en la formación del abogado (Silvera, Garcés y Pineda, 2018); se utiliza como un medio para realimentar o reforzar los aspectos que aún no ha comprendido el estudiante y que se debe establecer en base a criterios y objetivos a valorar (Gregorio Y Casas, 2014). La evaluación debe responder o concordar con cada tipo de estrategia o metodología (Vasconcelos, 2016).

Se propone una evaluación externa realizada por organismos confiables, preparados; otros sistemas de avaluación integral comprenden varios aspectos: la autoevaluación, la interna y externa con el propósito de mejorar la formación jurídica (Álvarez, 2014). También existen ciertas modalidades de la evaluación (por rúbricas) que no solamente analizan los resultados individuales, sino de grupo que valoran el aprendizaje colaborativo (Pérez, 2014; Antúnez, 2018); asi mismo, implica una reflexión grupal sobre la evaluación de proceso y de resultados (Pinto, 2014).

En el caso de la popularización del derecho se propone una evaluación cualitativa-formativa que promueve una formación jurídica íntegra, no solo se encarga de medir o valorar resultados sino de una interacción o diálogo de saberes, de experiencias (Duque, Quintero y Duque, 2016).

Discusión

Sobre Paradigmas

La temática, desarrollada en los artículos analizados, tiene correspondencia con otros planteamientos teórico-científicos; por ejemplo, Benfeld (2017) refiere el paradigma del acceso universal a la educación universitaria, se relaciona con los planteamientos de Guzmán-Valenzuela (2017), Ramos y López (2018) quienes establecen que la masificación ha ampliado la oferta, el acceso a la eduación superior. Se trata de una oportunidad que tienen las personas para educarse y mejorar sus condiciones de vida y de su entorno.

Otros resultados, que resaltan la importancia de las TIC en la educación jurídica (Álvarez, 2014; Cicero, 2018; Antúnez, 2018), se concatenan con las investigaciones de Espinosa-Munguía (2018), Aguiar, Velásquez y Aguiar (2019) al considerar que estas forman parte del desarrollo global centrado en la innovación, pero no solamente ello, sino que sirve de instrumento para realizar eficazmente procesos formativos y de investigación, por ejemplo, los programas para procesar datos científicos.

El paradigma sobre el desarrollo de las competencias propuesta por Pérez (2014), en el ámbito jurídico, tiene su correlato con el trabajo de Mesa (2018) quien estudia las competencias y su impacto internacional; es una tendencia global que implica aprender para hacer y demostrar a través de evidencias o resultados.

Sobre la concepción ética, en el ámbito jurídico, planteada por Catellanelli (2015), coincide con estudios recientes de Ortega y Romero (2018) quienes establecen no solo la ética, sino la responsabilidad ética y moral enfocada a resolver los problemas y mejorar las condiciones de vida.

Sobre currículo

Los resultados sobre el currículo, de los artículos analizados, estudian la pertinencia de este con la realidad, el logro de las competencias, el aporte de otras disciplinas, incluye en el proceso formativo a las TIC (Silvera, Garcés y Pineda, 2018; Gregorio y Casas, 2014; Benfeld, 2017; Castellanelli, 2015; Becerra y Salas, 2015; Aedo, 2014). Concuerdan con los estudios de Tobón (2017) quien argumenta que el currículo dede solucionar problemas concretos del entorno; los alcances de Delors (1994) quien considera que las competencias se orientan a saber hacer; los aportes de Llano, Gutiérrez, Stable, Núñez, Masó y Rojas (2016) que proponen la interdisciplinariedad para el estudio de una realidad compleja.

Sobre estrategias

Los resultados se correlacionan con los estudios o investigaciones desarrolladas en el "Congreso Internacional sobre Investigación en Pedagogía y Didáctica de Derecho" de la Universidad Nacional Autónoma de México, específicamente lo relacionado con la enseñanza creativa y constructiva que se concatena con la propuesta de Elgueta y Palma (2014) quienes proponen una clase magistral innovadora, creativa; en otros artículos del Congreso se enfatiza en la clínica jurídica que también ha sido desarrollada por Londoño-Toro y Torres-Villarreal (2018); otros estudios del Congreso enfatizan en la investigación en la enseñanza del derecho, propuesta que ha sido fundamentada por Álvarez (2014); las estrategias metacognitivas que permiten un aprendizaje reflexivo en el estudiante, también han sido desarrollados en investigaciones del Congreso y que tienen su correlato o parangón con el estudio de Massimino y Colombo (2016).

Otros resultados, se relacionan con los estudios publicados en la revista "Academia. Revista sobre Enseñanza del Derecho" y la "Revista de Educación y Derecho" donde se enfatiza en la enseñanza del derecho, por ejemplo, a través la literatura, el cine desde una perspectiva interdisciplinaria que tienen correlato con las propuestas desarrolladas por Marchiori y Vaz (2016) a través de su propuesta de cineclubismo; la propuesta de Cardinaux (2014) propone la lieratura como estrategia de enseñanza del derecho.

Sobre la concepión del estudiante, docente y su relación con el contexo

En el proceso de aprendizaje el estudiante tiene un rol preponderante con la orientación del docente. El estudiante debe aprender a aprender, aprender hacer, a convivir y a ser (Delors, 1996), aprender a resolver problemas de su entorno o contexto, el cual tiene correlato con los resultados o propuestas fundadas por Illera (2017) quien sostiene que el estudiante cumple un rol activo en la aplicación del derecho para transformar su entorno. También resuleve problemas (Londoño-Toro y Torres-Villarreal, 2018); se debe responsabilizar de su aprendizaje que sea perdurable

e innovador (Becerra y Salas, 2015; Pérez, 2014; Cicero, 2018); debe tener una actuación en el poder judicial (Cázares, 2017; Consolo, 2015; Díaz, 2015). Para que el estudiante logre un apredizaje efectivo, el docente debe responsabilizarse en la orientación del estudiante que aprenda por sí mismo (Pérez, 2014; Becerra y Salas, 2015).

Sobre la concepción de la evaluación

La evaluación es un sistema de verificación de los logros del estudiante, las evidencias de lo que conoce y de lo que aplica. En los estudios previos se ha estudiado la evaluación jurídica (en los documentos del "Congreso de la UNAM"), el sistema de evaluación desarrollada en manuscritos de la "Revista Pedagogía Universitaria y Didáctica del Derecho"; asimismo, la "Revista de Educación y Derecho" que ha difundido manuscritos referentes a la evalaución de la docencia superior. Estos alcances se concatenan con los resultados de los artículos analizados (Silvera, Garcés y Pineda, 2018) quienes establecen que la evaluación requiere una adecuada gestión y optimización en la formación del profesional en derecho. También se utiliza como un sistema para realiementar sobre lo que aún no ha compredido el estudiante (Gregorio y Casas, 2014). La evaluación no solo verifica el aprendizaje, sino que también permite hacer mejoras en el el proceso formativo (Álvarez, 2014) que involucre el diálogo, las experiencias (Duque, Quintero y Duque, 2016).

Conclusiones

Los artículos analizados enfatizan en el enfoque por competencias relacionado con la formación práctica del futuro profesional en derecho Las estrategias metodológicas, que más predominan en los artículos científicos, están referidas a la resolución de problemas, aspectos lúdicos, la conferencia trascendente, la investigación como estrategia de aprendizaje, el trabajo cooperativo o colaborativo.

El rol del docente está centrado en la planificación, orientación; el del estudiante, en mayor actividad o protagonismo y en permanente actividad o relación entre la teoría y la práctica que le permita comprender y transformar la realidad compleja.

El rol del docente es la de orientar al estudiante para que aprenda por sí mismo; en cambio, el estudiante debe tener un rol activo en su formación profesional para generar cambios o transformaciones en su entorno a través de la resolución de problemas.

El sistema de evaluación no solo valora o mejora el aprendizaje de los estudiantes, sino que optimiza su proceso formativo.

Los artículos analizados aportan desde la formación por competencias, la aplicación de estrategias activas, la actividad planificadora del docente, el protagonismo del estudiante, hasta la evaluación de los resultados de los estudiantes de derecho.

Abstract

L'absorption des connaissances permet aux organisations à balancer l'exploitation de connaissances existantes et l'exploration de nouvelles connaissances. Cette capacité organisationnelle est appelée l'ambidextrie dans la littérature. L'objet de cette étude est d'expliquer le rôle que l'absorption des connaissances joue dans le développement de l'ambidextrie. Pour ceci, nous distinguons entre la capacité d'absorption potentielle (CAP) et la capacité d'absorption réalisée (CAR). Les participants à notre étude sont des acteurs travaillant pour des compagnies d'assurances. Un questionnaire fût développé. Notre échantillon s'est élevé à n=288 répondants. Des analyses ont été effectuées à l'aide du logiciel SPSS. Les résultats confirment l'existence de communautés de connaissances dans le domaine de l'assurance. L'étude identifie aussi des facteurs qui favorisent la relation entre la capacité d'absorption et l'ambidextrie. Finalement, nos analyses révèlent que la CAP a un effet modérateur sur la relation positive entre la CAR et l'ambidextrie. Ceci est suivi d'une discussion des résultats.

Mots clés: Connaissances; Communauté de connaissance; Capacité d'absorption; Ambidextrie.

Introduction

Aujourd'hui, l'avantage concurrentielle et la survie d'une entreprise dépend des compétences et du savoir des acteurs qui y travaillent, de leur capacité à produire des connaissances individuelles, de leur collaboration dans la co-création de nouvelles connaissances et de l'exploitation de ces connaissances par l'intermédiaire d'un processus efficace de diffusion et de partage (Lu & Ramamurthy, 2011; Wilden, Gudergan, Nielsen & Lings, 2013; Mikalef & Pateli, 2017). En effet, le savoir-faire des acteurs travaillant dans l'entreprise permet de développer simultanément le processus de la capacité d'absorption. L'absorption des connaissances est la capacité organisationnelle à transférer, intégrer et utiliser de nouvelles connaissances (David, Keupp & Mermoud, 2020). L'absorption des connaissances améliore l'ambidextrie organisationnelle. Le terme 'ambidextrie' décrit le pouvoir d'utiliser les deux mains de façon efficace. Dans un contexte organisationnel, cela représente l'habilité d'une organisation à balancer deux capacités apparemment opposées; l'exploitation et l'exploration des connaissances (van Sandwijk, 2018). L'ambidextrie des connaissances est soutenue par la stratégie des entreprises qui sont toujours à la recherche de moyens à combattre la concurrence (Sambamurthy, Bharadwaj & Grover, 2003; Mikalef et al., 2016).

Nous choisissons la *communauté de connaissance* comme un contexte favorable au développement de la connaissance de type exploratoire et à la connaissance basée sur l'exploitation. Les travaux récents distinguent deux formes de

communautés de connaissance; (a) les communautés de pratique et (b) les communautés épistémiques. Chacune de ces formes de communauté se mobilise suivant le processus de la capacité d'absorption; capacité d'absorption potentielle et capacité d'absorption réalisée. Celles-ci favorisent l'ambidextrie basée sur l'exploitation des connaissances existantes et sur l'exploration de nouvelles solutions. L'objet de cette recherche est de déterminer les facteurs qui génèrent la capacité d'absorption et d'expliquer le rôle que cette dernière joue dans le développement de l'ambidextrie (exploration/exploitation) dans les communautés de connaissance et ce à travers la réalité du domaine des assurances. La question principale soulevée dans cette étude est la suivante :

Quels sont les facteurs qui favorisent la relation entre la capacité d'absorption et l'ambidextrie dans les communautés des connaissances?

Pour répondre à cette question, nous allons:

- Analyser et décrire les phases de la capacité d'absorption que nous conceptualisons comme une trajectoire dynamique qui réunit un ensemble hétérogène de deux composantes; les connaissances d'exploration et les connaissances d'exploitation générées au sein de chaque type de communauté, et…
- Déterminer les facteurs d'influence qui favorisent la relation entre la capacité d'absorption et l'ambidextrie.

Communautés des Connaissances, Logique de la Capacité d'Absorption, et Ambidextrie: Une Dualité Cognitive entre l'Exploration et l'Exploitation des Connaissances

Dans une économie basée sur la connaissance, il est nécessaire de penser à de nouvelles formes de coordination des connaissances dispersées (Cohendet, 2014; Cohendet et Llerena, 1998). Selon Diani (2002), la forme de coordination appelée *communauté de connaissance* est considérée comme un mécanisme de coordination des connaissances dispersées qui permet leur transformation en connaissances partagées et échangées entre les individus de l'organisation (Cohendet et al. 2002). C'est de la communauté qu'émerge la connaissance et où sont développés de nouvelles informations.

En effet, Cohendet et al.(2006, p.22) définissent les communautés de connaissances comme « *des lieux d'apprentissage actif et délibéré »*. Ceci les distinguent des *« groupes fonctionnels* (qui) *sont essentiellement des lieux d'apprentissage passif, favorisant par exemple, l'apprentissage par l'usage et le 'learning by doing'»*. L'émergence de la communauté de connaissances se fonde sur *« la volonté des individus d'interagir pour transmettre, améliorer et/ou créer de nouvelles connaissances, et l'apprentissage qui constitue le fondement de ces modes d'interactions sociales»* (Merindool, 2007, p5).

Il existe deux formes des communautés des connaissances; (a) les communautés épistémiques et (b) les communautés de pratique. Selon Cohendet et al. (2006, p 36) *« (l)es communautés épistémiques sont des groupes d'agents partageant à la fois un but de création de connaissances et un cadre commun permettant l'appréhension collective de cette activité »*. En s'inspirant de travaux de Lave et Wenger (1991, p.98), Davel et Tremblay (1991), Goury et Spalanzani (2010) définissent les communautés de pratique comme *« un système d'activité sur lequel les participants partagent des compréhensions sur ce qu'ils font et sur ce que cela signifie dans leur vie et pour leur communauté. Ainsi, ils sont unis dans l'action et dans la signification que cette action a, aussi bien pour eux-mêmes que pour une collectivité plus large »*.

La contribution des communautés de connaissance à l'ambidextrie des connaissances

Selon Adler et Heckscher (2011), les communautés de connaissance apparaissent comme un mécanisme de coordination et de collaboration entre personnes désireuses de s'engager ensemble dans la réalisation d'un objectif cognitif spécifique par le biais de conventions pour un meilleur partage de connaissances. L'analyse de deux principales formes de communautés autonomes et séparés a pour fonction principale l'exploration et l'exploitation des connaissances. Ainsi, la façon de gérer simultanément l'exploitation et l'exploration au sein de l'entreprise renvoie à la notion d'ambidextrie organisationnelle (O'Reilly & Tushman, 2013; Boumgarden et al., 2012; Junni et al., 2013; Birkinshaw & Gupta, 2013; Blindenbach-Driessen & Ende, 2014; Popadic, Cerne & Milohnic, 2015).

Dans le champ de la gestion des connaissances, les deux pratiques d'exploration et d'exploitation sont liées à la génération de la connaissance. Elles sont considérées comme deux activités typiques de recherche de la connaissance où l'exploitation réfère au meilleur usage de connaissances existantes alors que l'exploration renvoie à l'acquisition de nouvelles connaissances (Li et al,. 2006). L'exploitation représente l'innovation qui est liée aux actifs déjà existants

de l'organisation et se concentre principalement sur l'amélioration et l'efficience de processus existants. L'exploitation des connaissances est menée pour mieux répondre aux besoins des clients et des marchés actuels et cherche à améliorer les produits et services existants. L'exploration, quant à elle, est un type d'innovation qui demande à l'organisation d'examiner de nouvelles manières de faire les choses, de nouveaux marchés, nouveaux produits et des nouveaux modèles d'affaires qui ne lui sont pas familiers. D'un point de vue gestion, l'exploration représente un plus grand défi car ce type d'innovation oblige les gestionnaires à s'aventurer sur un territoire qui lui est largement inconnu). L'exploration inclue le développement et l'acquisition de nouvelles technologies et ressources et vise à générer de la variation. Elle requière de la recherche, de la prise de risques, de l'expérimentation et de la flexibilité organisationnelle (O'Reilly & Tushman, 2013; Gonzalez & Massaroli de Melo, 2018).

L'ambidextrie des connaissances fait référence au fait que les organisations doivent être capable de combiner ces deux types d'apprentissage organisationnel. Ceci est un défi car l'exploration et l'exploitation nécessitent des structures et cultures organisationnelles différentes. L'exploration requiert de l'improvisation et de l'adaptation et est donc associée à une structure plus organique et des systèmes qui ne sont pas rigides. Comparativement, l'exploitation est plus souvent associée à des structures mécaniques, à de la routine, au contrôle et à de la bureaucratie (Gonzalez & Massaroli de Melo, 2018).

Le recours aux communautés de pratique et épistémiques en tant qu'espèces d'action collective enrichit la réflexion sur l'intérêt apporté par ces dernières en matière de transfert des connaissances par le mécanisme de la capacité d'absorption qui se situe au cœur de l'activité collective, ainsi que celui apporté par la capacité d'absorption en matière d'ambidextrie. De ce fait, l'accent est mis sur le rôle de la capacité d'absorption comme un mécanisme essentiel de coordination dans les communautés de connaissance qui favorise l'ambidextrie des connaissances à travers un processus de transfert des connaissances.

La capacité d'absorption : un processus à la base de l'exploitation et de l'exploration des connaissances

La définition de Zahra et George (2002) ouvre une voie intéressante sur ce qu'est la capacité d'absorption. Ces derniers reformulent le modèle d'origine de Cohen et Levinthal (1989) et définissent la capacité d'absorption comme « the ability of a firm to recognise the value of new external information, assimilate it, and apply it to capabilities » (p. 128).

Selon Van Den Bosch et al. (2005), la capacité d'absorption d'une organisation est constituée de trois composantes; (a) son aptitude à reconnaître la valeur de la connaissance externe, (b) son aptitude à l'assimiler, et (c) son aptitude à capitaliser sur ces connaissances pour des fins commerciales. Zahra et George (2002) proposent une re-conceptualisation de la capacité d'absorption selon un modèle dynamique à travers lequel les entreprises acquièrent, assimilent, transforment et appliquent les connaissances (Camisón et Forés 2010). Ils proposent une conceptualisation de la capacité d'absorption en distinguant la capacité d'absorption potentielle (CAP) et la capacité d'absorption réalisée (CAR).

La capacité d'absorption potentielle (CAP) regroupe les dimensions de l'acquisition de connaissances telles que la capacité à valoriser les connaissances (comme le soulignent Cohen et Levinthal, 1990) et la capacité d'acquérir et d'assimiler des connaissances. La capacité d'absorption réalisée (CAR), quant à elle, consiste en la transformation et l'application des nouvelles connaissances avec des connaissances déjà existantes (Andrawina et al., 2008; Camisón & Forés, 2010; Koubaa & Amamou, 2010)).

Selon Cohendet et al. (2006), le processus de la capacité d'absorption est produit de manière croissante dans les communautés des connaissances à travers la génération, l'accumulation et la distribution des connaissances. « L'ensemble des communautés du savoir peut être ainsi vu comme des sources d'unités d'absorption diverses qui forment la base de la capacité d'absorption de la firme et permettent à cette dernière d'exploiter et de bénéficier de la diversité des connaissances ». Il convient de souligner que le processus de la capacité d'absorption par ses différentes étapes d'acquisition, d'assimilation, d'exploitation, et d'exploitation favorise les connaissances à travers l'exploration et l'exploitation des connaissances (Cohendet et al., 2006, p.163).

CA potentielle et exploration des connaissances

Pour Zahra et George (2002), la capacité d'absorption potentielle renvoie à l'acquisition et l'assimilation. Ce processus de la capacité d'absorption, selon Lane et al. (2006) se réfère spécifiquement à l'exploration des connaissances. Cette dernière consiste en la recherche d'un nouvel ensemble d'activités et va essentiellement conduire au développement de nouvelles compétences qui n'existaient pas précédemment dans l'organisation (Daghfous,

2004). Pour ce faire, en partant des travaux d'Arbussa et Coenders (2007), l'exploration des connaissances dans le cadre de la capacité d'absorption potentielle comprend deux étapes essentielles: reconnaître les connaissances externes et les assimiler.
Szulanski (1996) donne importance à la connaissance antérieure et déjà existante. Cette dernière est nécessaire pour créer des nouvelles connaissances. En effet, les organisations ont préalablement besoin des deux composantes de la connaissance : les connaissances acquises pour une application particulière et les connaissances technologiques pour reconnaître les sources des connaissances externes et les assimiler (Zahra & George, 2002; Lavie et al., 2010; Narasimhan et al., 2006).

Cassiman et Veugelers (2006), soulignent que l'exploration des connaissances par l'acquisition de la connaissance externe nécessite moins de ressources. Ainsi, la recherche des nouvelles connaissances externes d'après Lichtenthaler (2009) et Gupta et al. (2006), réduit la rareté des ressources internes et facilite l'analyse des contraintes imposées.

CA réalisée un processus d'exploitation des connaissances

La capacité d'absorption réalisée se réfère au processus de transformation et d'exploitation de connaissances (Zahra & George, 2002). En partant de l'idée de March (1991), la conception de l'exploitation repose sur l'utilisation continuelle des connaissances et des compétences existantes dans des processus de production existants. Ainsi, la connaissance doit être transformée, maintenue et réactivée entre les membres puis intériorisée à nouveau par leurs expériences pour être exploitée par la suite (March & Stock, 2006; Lichtenthaler, 2009). En somme, le processus de transformation de la capacité d'absorption renvoie à deux étapes essentielles. Il s'agit, à la fois, de maintenir les connaissances assimilées et de réactiver ces connaissances par la pratique (Lane et al., 2006; March & Stock, 2006). La connaissance par exploitation consiste à transformer et à mettre en pratique des connaissances assimilées qui peuvent être maintenue pendant des années jusqu'à ce qu'elle soit finalement appliquée de nouveau (March, 1991; Lane et al., 2006; Todorova & Durisin, 2007).

La Relation de la Capacité d'Absorption avec l'Ambidextrie et ses Facteurs de Génération dans les Communautés du Savoir

La capacité d'absorption et l'ambidextrie des connaissances

Il existe une relation directe et significative entre la capacité d'absorption et l'ambidextrie des connaissances (Jansen, 2005; Huany, 2008; Datta, 2009; 2010). Jansen (2005) explique que la capacité d'absorption affecte l'ambidextrie car c'est un moyen qui favorisant l'équilibre entre l'exploration et l'exploitation. Il décrit la capacité d'absorption selon deux dimensions : (a) la capacité d'absorption potentielle et (b) la capacité d'absorption réalisée. Les entreprises qui se concentrent sur l'acquisition et l'assimilation de nouvelles connaissances provenant de l'externe (*c.-à-d.*, la capacité d'absorption potentielle) sont capables de renouveler leur stock de connaissances. Malheureusement, ceci engendre souvent des coûts d'acquisition (Zahra & George, 2002) ce qui peut décourager certaines entreprises à s'y investir significativement. En revanche, les entreprises qui se concentrent principalement sur la transformation et l'exploitation des connaissances déjà acquises (*c.-à-d.*, la capacité d'absorption réalisée) peuvent souvent réaliser des profits à court terme grâce à une exploitation plus efficace des connaissances acquises mais ces entreprises risquent de tomber dans un piège car elles ne développent pas suffisamment de nouvelles compétences pour répondre aux changements environnementaux lorsque ceux-ci se présentent (Ahuja & Lampert, 2001).

La capacité d'absorption réalisée joue un rôle important pour favoriser l'interaction de l'ambidextrie au niveau de l'exploration et de l'exploitation (Jansen, 2005; Jansen et al, 2005; Todorova & Durisin, 2007; Zahra & George, 2002). En effet, la capacité d'absorption réalisée est susceptible d'influencer la performance grâce à l'innovation. Todorova et Durisin (2007) ont montré que la transformation des connaissances existantes, facilite la combinaison de connaissances et le développement de nouveaux schémas de perception et des propositions de changements à des connaissances existantes, aux processus, et même aux technologies (voir aussi Van den Bosch et al, 1999). L'exploitation est alors à la base de la capacité d'absorption réalisée et celle-ci sert à améliorer les connaissances existantes (Van den Bosch et al, 1999; Jansen, 2005; Jansen et al, 2005; Todorova & Durisin, 2007; Datta, 2009; 2010). La capacité d'absorption réalisée est essentielle dans le processus d'innovation. De plus, la transformation et l'exploitation des connaissances peuvent approfondir les connaissances et les compétences existantes, et améliorer l'efficacité de l'exploitation à l'avenir (Datta, 2009; Lane & Lubatkin, 1998; Jansen, 2005).

Zahra et George (2002) démontre que la capacité d'absorption réalisée permet de filtrer à travers les connaissances existantes et ainsi diminuer les coûts qui leurs sont associés (voir aussi Jansen, 2005; Jansen, et al, 2005). La capacité

d'absorption réalisée peut aussi aider à développer et traiter plus efficacement les connaissances acquises nouvellement de l'extérieure, permetant ainsi à l'organisation de poursuivre l'exploration. Dans cette optique, Datta (2009; 2010) démontre que l'exploration est améliorée par une combinaison d'une meilleure interprétation des connaissances existantes et ainsi que des connaissances acquises nouvellement de l'extérieur.

La capacité d'absorption réalisée est associée positivement à l'équilibre entre l'exploration et l'exploitation. D'où l'hypothèse H1 suivante :

H1 : La capacité d'absorption réalisée agit positivement sur l'ambidextrie des connaissances.

Un parcours de la littérature de Levinthal et March (1993) permet d'affirmer que le déroulement de l'exploitation des connaissances nécessite de la recherche et le développement des nouvelles connaissances. L'acquisition et l'assimilation des connaissances externes est un attribut de la capacité d'absorption potentielle se basant sur des connaissances existantes (Datta, 2009).

La capacité d'absorption potentielle est essentielle pour renouveler les stocks de connaissances d'une entreprise, ainsi que pour développer des résultats novateurs qui diffèrent sensiblement de connaissances existantes (Van den Bosch, et al, 1999; Jansen, 2005; Jansen et al, 2005; Todorova & Durisin, 2007). L'exploration qui provient de l'externe nécessite l'acquisition et l'assimilation des connaissances externes (Jansen, 2005; Jansen et al. 2005). Ces dernières, à leur tour, contribuent à une nouvelle capacité pour poursuivre l'exploration des connaissances (Datta, 2009; 2010). En revanche, Jansen et al, (2005), Van den Bosch et al, (1999) et Zahra et George (2002) soulignent tous que les entreprises qui ne sont pas en mesure de poursuivre avec succès l'exploration sont celles qui ont une difficulté à acquérir et à absorber de nouvelles connaissances externes (Datta, 2009; 2010).

De cette littérature, on peut retenir que la capacité d'absorption potentielle modère positivement l'impact de la capacité d'absorption réalisée sur l'ambidextrie (Datta, 2009). Bien que, la capacité d'absorption potentielle augmente les connaissances acquises, l'exploitation reste basée sur les connaissances actuelles. Par conséquent, il y a un approfondissement et élargissement des connaissances et des compétences qui se réalisent (Van den Bosch et al., 1999; Zahra & George, 2002; Jansen, 2005; Jansen et al., 2005).

D'un point de vue intra-organisationnel, le développement de la capacité d'absorption potentielle est susceptible de borner la transformation et l'exploitation des connaissances (Datta, 2009; 2010). Les travaux de Jansen (2005), Jansen et al. (2005), Van den Bosch et al. (1999) ainsi que de Zahra et George (2002) démontrent l'importance des différents aspects de la capacité de coordination, le système et la capacité de socialisation (la capacité combinatoire). Ces derniers permettent d'augmenter la capacité d'absorption potentielle, contrairement à la capacité d'absorption réalisée. C'est pourquoi, les organisations ont besoin d'une faible formalisation et de divers réseaux avec une certaine centralité modérée pour augmenter la capacité d'absorption potentielle. Alors que, pour la capacité d'absorption réalisée, les organisations ont besoin de divers réseaux avec une formalisation et une centralisation élevée (Datta, 2009; 2010).

L'acquisition et l'assimilation de nouvelles connaissances nécessitent la recherche des nouvelles ressources (Jansen, 2005; Jansen et al., 2005). Ces ressources sont différentes des ressources mobilisées pour l'exploitation où l'on a besoin de ressources pour améliorer des produits, des services et des technologies. Ainsi, pour accroître leur capacité d'absorption potentielle, les entreprises sont susceptibles d'entraver des tâches ou des opérations dans l'organisation pour développer efficacement l'exploitation.

Par conséquent, la capacité d'absorption potentielle modère négativement la relation entre la capacité d'absorption réalisée et l'ambidextrie (Datta, 2009; 2010). D'où la combinaison de l'effet de modération de la capacité d'absorption potentielle sur l'effet de la capacité d'absorption réalisé (Datta, 2009; 2010) dans l'exploration et l'exploitation. On obtient ainsi l'hypothèse H2 suivante :

H2 : La capacité d'absorption potentielle modère la relation entre la capacité d'absorption réalisée et l'ambidextrie des connaissances.

Facteurs de générations de la capacité d'absorption dans les communautés du savoir

Nous cernons le concept de la capacité d'absorption dans un contexte communautaire. Sur la base de la littérature, nous avons déterminé les facteurs qui favorisent le processus de la capacité d'absorption dans les communautés du savoir pour développer l'ambidextrie. Conformément à la littérature, nous avons trouvé deux facteurs principaux.

Ces deux facteurs nous ont permis de décrire et d'expliquer la manière dont les communautés du savoir explorent, absorbent et exploitent les connaissances à travers la confiance relationnelle et l'interaction sociale. Ces deux facteurs peuvent aider au développement de la capacité d'absorption. Nous explorons ces facettes dans les sections suivantes.

La Confiance Relationnelle

La confiance a été un sujet de débat et d'intérêt dans la philosophie et les sciences sociales. Fukuyama (1995), dans son *bestseller* intitulé *« Trust : The Social Virtues and the Creation of Prosperity »*, affirme que « la confiance représente les attentes qui se constituent, au sein d'une communauté régie par un comportement régulier, honnête et coopératif, fondé sur des normes habituellement partagées, de la part des autres membres de cette communauté. » (p. 26).

Gubbins et Mac Curtain (2008) soulignent le débat existant quant à la définition du rôle de la confiance dans le capital social. Celle-ci semble être un élément principal pour la coopération et un mode principal de coordination des relations. Sans confiance, la coopération est limitée aux activités qui sont faciles à surveiller simultanément. En outre, les gens qui travaillent ensemble, se font plus facilement confiance et vont plus facilement échanger avec les autres (Gubbins et MacCurtain, 2008).

De nombreuses études (Luo, 2008; Liu 2012) fournissent des conceptualisations de la confiance et ses conséquences sur l'échange en tant que mécanisme puissant pour toute relation interne et externe de l'organisation. Pour Certains auteurs la confiance est définie comme l'ensemble des croyances que le collaborateur d'échange possède au sujet de la crédibilité et de la bienveillance des autres collaborateurs (Cavusgil et al., 2004). L'accent est mis sur l'aspect de la crédibilité de la confiance et de la bienveillance en tant que deux dimensions importantes. Des résultats empiriques dévoilent les avantages de la perception de la bienveillance lors des échanges commerciaux (Kong et al., 2014). Conséquemment, la confiance facilite les collaborations efficaces dans les relations entre les parties concernées pour créer une ambiance favorable d'apprentissage (Dyer et Singh, 1998; Dodgson, 1993). En effet, la création d'un climat de confiance favorable, améliore l'efficacité organisationnelle interne et facilite la poursuite de bonnes relations inter-organisationnelles. Les niveaux et la nature des relations de confiance entre les membres orientent ainsi l'attention sur la collaboration, l'échange d'informations entre les membres, l'acquisition des connaissances nouvelles et l'exploitation des connaissances existantes (Dodgson, 1993). La confiance favorise donc le développement des transactions entre les parties et encourage la collaboration ouverte. Elle facilite l'interaction entre les membres pour une meilleure accumulation et partage des connaissances ainsi que l'apprentissage inter- et intra-organisationnel à travers l'instauration d'un climat d'échange social favorable. Ceci améliore le rendement collectif et réduit la dépendance des organisations envers des ressources externes dans lesquels l'organisation a possiblement moins confiance (Luo, 2008).

Nahapiet et Ghoshal (1998) font valoir que la confiance intragroupe est un facteur important dans l'échange et la combinaison d'informations. Ces mêmes auteurs affirment que la confiance crée l'anticipation de la valeur par l'interaction sociale avec les autres, et donc, motive les personnes à approfondir leurs relations par la poursuite d'interactions (Moran, 2005). Lorsque les niveaux de confiance sont élevés, les gens sont généralement plus susceptibles de s'engager dans l'échange social et l'interaction coopérative (Nielsen, 2002; 2007). La confiance augmente la coopération, améliore la flexibilité, réduit le coût de la coordination des activités et fait augmenter le niveau de transfert des connaissances, stimulant ainsi l'échange et l'apprentissage (Nielsen, 2007).

Nielsen (2002; 2007) souligne que c'est à cause de l'importance des relations de confiance personnelles que, les idées partagées et les expériences continuent à jouer un rôle important dans la collaboration. Dans le cas d'apprentissage relationnel collectif, il est également possible que la confiance soit une condition préalable nécessaire pour le partage de connaissances. Elle influe le processus de partage des connaissances en faisant augmenter le transfert de connaissances du fait que les membres sont prêts à partager les informations avec seulement ceux en qui ils font confiance et qu'ils utilisent les informations d'une manière digne de confiance (Gubbins & MacCurtain, 2008; Li, 2005).

Par conséquent, la confiance facilite le développement des relations sociales qui réduisent, par conséquent, l'incertitude lors de nouvelles transactions. En tant que telle, la confiance augmente l'accès de l'entreprise à la connaissance externe et renforce sa capacité à la collaboration avec son réseau de partenaires pour créer de nouvelles connaissances et combiner ces capacités avec les ressources existantes (Gubbins & MacCurtain, 2008).

Des interactions fréquentes intra- et inter-organisationnelles aident également l'organisation à augmenter leur capacité d'absorption en promouvant la création et le transfert de connaissances tacites. De plus, la confiance relationnelle est

considérée comme ayant un effet important et efficace à faire augmenter l'impact de la capacité d'absorption sur l'ambidextrie, car elle renforce la relation pour la création de nouvelles connaissances et l'exploitation des connaissances existantes (Liu 2012; Luo, 2008; Gubbins & MacCurtain, 2008; Nielsen, 2007; Li, 2005; Nahapiet & Ghoshal, 1998). Ainsi, nous émettons les deux hypothèses H3a et H3b suivantes **:**

H3a: La confiance relationnelle agit positivement sur la capacité d'absorption potentielle pour favoriser l'ambidextrie.

H3b: La confiance relationnelle agit positivement sur la capacité d'absorption réalisée pour favoriser l'ambidextrie.

L'interaction Sociale

Selon Tsai et Ghoshal (1998), les interactions sociales ou les liens sociaux sont des canaux pour obtenir des flux d'information et échanger des ressources. Grâce aux interactions sociales, un acteur peut avoir l'accès aux ressources d'autres acteurs. Pour Wei, Zheng et Zhang (2011), les liens d'interaction sociale représentent la force des relations, la quantité de temps passé, et la fréquence de communication entre les membres. L'interaction sociale joue un rôle essentiel dans la définition des objectifs communs et de valeurs et aussi dans le partage de ces objectifs et des valeurs entre les membres d'une organisation (Chang & Chuang, 2011). La littérature sur la socialisation organisationnelle de Tsai et Ghoshal (1998) souligne l'importance de l'interaction sociale informelle pour aider les individus à apprendre les valeurs de l'organisation. Grâce au processus de l'interaction sociale, les acteurs se rendent compte et adoptent les langues, les codes, les valeurs et les pratiques de leurs organisations. Dans ces acteurs socialisés peuvent également créer de nouveaux ensembles de valeurs ou de nouvelles visions sur la base de leurs intérêts communs et la compréhension mutuelle.

L'intensification de l'interaction sociale entre les membres en interne ou externe de l'organisation fait accroître les connaissances acquises en renforçant la capacité de l'entreprise à reconnaître, acquérir et évaluer les connaissances pertinentes (Lane & Lubatkin, 1998; Sui-Hua, 2013), et par extension, les transformer, les échanger et les absorber tout au long du processus de transfert des connaissances (Renko et al., 2001).

L'approche basée sur la connaissance considère les organisations comme des communautés sociales spécialisées dans la création et le transfert de connaissances. La cohésion sociale autour d'une relation a une influence sur la volonté et la motivation des individus à investir du temps, de l'énergie et de l'effort dans le partage des connaissances avec les autres. En effet, l'apprentissage et la capacité d'absorption sont fréquemment cités comme des explications effectives de transfert de connaissances, tout en mettant l'emphase sur le rôle de la connaissance commune, et le rapprochement relationnel, et soulignant l'importance de la force des liens (Reagans & McEvily, 2003). Par l'interaction sociale, une connaissance commune facilite le transfert des connaissances dans le processus de capacité d'absorption. Les individus apprennent de nouvelles idées, et les associent avec celles déjà acquises. Les origines de la connaissance et de l'expérience commune peuvent ainsi varier. Les individus trouvent plus facile d'absorber de nouvelles idées dans les domaines où ils ont une certaine expertise, et ont plus de difficultés d'absorber de nouvelles idées en dehors de leur zone de compétences immédiates. Par conséquent, la connaissance est plus susceptible d'être transférée entre les personnes ayant des caractéristiques similaires de formation (Reagans & McEvily, 2003).

Chang et Chuang (2011) notent que les interactions sociales émergent, évoluent, se développent et se débouclent au fil du temps. En outre, les relations sociales fournissent des canaux de communications qui permettent de réduire le temps et les efforts nécessaires pour recueillir des informations. Le partage des connaissances est relativement facile à atteindre et à maintenir lorsque les réseaux ont des liens solides et directs entre leurs membres (Chang & Chuang, 2011; Suseno et al., 2006). L'interaction sociale lie les membres d'une communauté et fournit un moyen rentable de partage de connaissances (Chang & Chuang, 2011). Plus les interactions sociales se construisent et se développent, plus l'intensité, la fréquence et l'étendue des connaissances échangées va se développer.

La connaissance observable ou explicite est relativement facile à obtenir par des efforts passifs tel que, l'apprentissage interactif qui permet à une entreprise de s'approcher suffisamment de la source pour acquérir les composantes les plus profondes des connaissances (Lane & Lubatkin, 1998). En substance, l'interaction sociale facilite l'acquisition de connaissances et l'apprentissage relationnel par la création intense, et l'interaction répétée. Elle renforce la capacité des individus à reconnaître et à évaluer les connaissances externes pertinentes, pour les transformer et les exploiter (Yli-Renko et al, 2001). Plus l'interaction sociale est développée, plus elle offre un terrain propice basée sur des systèmes de technologie spécialisés, des résultats en matière d'information spécialisée, et du savoir-faire (Lane et Lubatkin, 1998).

En intensifiant la fréquence, l'étendue et la profondeur de l'échange d'informations, l'interaction sociale augmente la relation spécifique de la connaissance commune. La connaissance commune, à son tour, augmente la capacité d'absorption parce que la capacité d'une entreprise à acquérir de nouvelles connaissances dépend de la possession préalable de connaissances liées (Cohen & Levinthal, 1998). Ainsi, la capacité de chaque membre à absorber les connaissances apprises et communiquées est renforcée par l'interaction sociale répétée. Cette dernière fournit un meilleur accès et une meilleure compréhension des activités et offre des moyens plus efficaces de communication. Les individus sont relativement plus motivés à investir dans le partage des connaissances incarnées dans des routines. Ainsi, en amplifiant les activités de partage des connaissances, l'interaction sociale sert à augmenter la capacité relative des connaissances externes et l'efficacité de l'individu pour apprendre et absorber ces connaissances externes de manière efficace (Reagans & McEvily, 2003; Yli-Renko et al., 2001; Lane & Lubatkin, 1998).

À la lumière de cette analyse nous émettons les hypothèses H4a et H4b suivantes :

> H4a: L'interaction sociale agit positivement sur la capacité d'absorption potentielle pour favoriser l'ambidextrie.
>
> H4b: L'interaction sociale agit positivement sur la capacité d'absorption réalisée pour favoriser l'ambidextrie.

Le modèle de recherche proposé (voir Fig 1) illustre nos hypothèses. Il montre que l'impact de la capacité d'absorption des connaissances sur la capacité d'absorption réalisée est modéré par l'activation de la capacité d'absorption potentielle. Ainsi, des facteurs de génération de la capacité d'absorption peuvent favoriser le développement de transfert des connaissances au sein des communautés (voir annexe).

Méthode de Recherche

Notre travail se situe dans un paradigme positiviste selon une logique hypothético-déductive. Il a pour objet l'explication du fonctionnement des capacités d'absorption en tant que mécanisme de coordination et de collaboration basé sur le transfert des connaissances qui favorise l'ambidextrie au niveau de l'exploration et d'exploitation des connaissances dans les communautés du savoir.

Nous avons développé un questionnaire qui est l'outil le plus fréquemment utilisé pour la collecte des données dans la recherche en sciences de la gestion. Les items sont tous de type Likert (Usunier et al., 2000). Nous avons choisi les compagnies d'assurance comme terrain d'investigation. Ce choix est justifié par des résultats découlant d'une première étude exploratoire effectuée en 2014. Cette étude exploratoire avait démontré l'existence réelle de communautés de connaissances dans le domaine de l'assurance. Nos répondants sont des acteurs qui travaillent dans les compagnies d'assurances offrant des protections contre les dommages. La taille de l'échantillon s'est ainsi élevée à n=288 membres.

Mesure des variables et validation des échelles de mesure (AFE, AFC)

Pour valider notre modèle de recherche, nous avons utilisé en premier lieu des instruments de mesure qui ont été construits et préalablement validés par d'autres chercheurs. Après la détermination de la définition opérationnelle et des items de mesure, une purification des données collectées par l'analyse factorielle exploratoire (AFE) a été exécutée et une analyse de la fiabilité a été réalisée grâce au logiciel SPSS.

Par la suite, une analyse factorielle confirmatoire (AFC) est nécessaire pour compléter l'analyse factorielle exploratoire (AFE). Cette étape est nécessaire pour l'ajustement du modèle complet et la vérification des hypothèses par la méthode des équations structurelles. Les résultats de l'AFC seront présentés en cohérence avec nos deux niveaux d'analyse correspondant chacune à un sous-modèle. Le premier sous-modèle **(M1)** regroupe les relations causales entre les facteurs de génération de la capacité d'absorption potentielle et réalisée au sein des communautés du savoir. Il s'agit de la confiance relationnelle et l'interaction sociale. Pour les analyses, plusieurs indices d'ajustement ont été utilisés. Les valeurs présentées dans la table 1 (en annexe) montrent que la qualité d'ajustement du sous-modèle M1 est satisfaisante.

Le sous-modèle **(M2)** regroupe l'ensemble des relations directes et indirectes entre la capacité d'absorption réalisée et l'ambidextrie des connaissances, modéré de la capacité d'absorption potentielle. Les valeurs présentées dans la table 2 (en annexe) montrent que la qualité d'ajustement du sous-modèle M2 est satisfaisante.

Fiabilité et validité des échelles de mesure des sous-modèles (M1) et (M2)

Tous les coefficients du sous-modèle (M1 et M2) sont positivement corrélés à la variable latente à laquelle ils contribuent et aucune valeur relative aux variances des erreurs de mesure des items n'est négative ou supérieure à 0,8. Une analyse factorielle confirmatoire de second-ordre (AFC) est lancée sur les items relatifs à toutes les variables qui composent notre modèle de recherche. Par ailleurs, le calcul de la valeur du Rhô de Jöreskog et celle du Rhô de validité convergente (Rhô de vc aussi appelé *Average Variance Extracted* ou *AVE* en anglais) indique que cette échelle présente une forte fiabilité (voir table 3). De plus, la validité discriminante est établie car les valeurs des Rhô de validité convergente (Rhô de vc) sont presque toutes supérieures à 0,5.

Tests des hypothèses de recherche

Test des effets des facteurs de génération de la capacité d'absorption (M1)

Les résultats de l'analyse de données empiriques (table 4) montrent un effet positif de la confiance relationnelle sur la capacité d'absorption (potentielle et réalisée). La valeur-t supérieur à 1,96 démontre que la relation est significative.

Au terme de cette présentation des résultats des tests des hypothèses relatives au premier sous-modèle (M1), il apparait que les hypothèses **H3a, H3b, H4a et H4b** de l'effet des deux facteurs (confiance relationnelle et interaction sociale) sur la capacité d'absorption potentielle et réalisée sont totalement confirmées.

Test de l'effet direct de la CAR sur l'ambidextrie des connaissances et rôle modérateur de la CAP (M2)

Il existe un effet direct positif de la capacité d'absorption réalisée sur l'ambidextrie des connaissances (table 5). D'où la confirmation de l'hypothèse **H1**.

L'hypothèse H2 indique que la relation causale entre la capacité d'absorption réalisée (CAR) et l'ambidextrie des connaissances change en fonction de la variable de modération (CAP). En somme, la capacité d'absorption potentielle (CAP) affecte la force de la relation entre la CAR et ambidextrie.

Le coefficient de régression de l'ambidextrie des connaissances ($R^2 = 0,55$) a augmenté par rapport à l'effet direct de capacité d'absorption réalisée sur l'ambidextrie des connaissances ($R^2 = 0,36$) suite à l'intervention de la capacité d'absorption potentielle. Ce qui démontre le pouvoir explicatif de la modération par la capacité d'absorption potentielle de la relation entre la capacité d'absorption réalisée et l'ambidextrie des connaissances. Nous pouvons ainsi avancer que lorsque la CAP augmente (diminue), l'effet positif de la CAR sur l'ambidextrie des connaissances lui aussi augmente (diminue) de manière proportionnelle (table 6). À la lumière de ces résultats, nous pouvons conclure que la capacité d'absorption potentielle modère la relation entre la capacité d'absorption réalisée et l'ambidextrie des connaissances. D'où la confirmation de l'hypothèse **H2.**

Discussion des Principaux Résultats de la Recherche

Comme le stipule la littérature, nous présentons également les rôles des principaux facteurs dans la réalité du domaine des assurances. La confiance, une caractéristique relationnelle des processus cognitifs sociaux, est à la base du développement des communautés de connaissances dans le domaine des assurances. La présence de liens de confiance entre les membres améliore la qualité du climat de travail au sein de l'industrie des assurances. Ce climat explique la présence d'un dialogue culturel, qui a un effet positif sur le renforcement de la confiance relationnelle, il permet aux individus de s'exprimer à travers l'échange, de développer leurs interrelations pour accroître leurs connaissances. Il permet un rapprochement entre les membres, favorise la créativité, l'initiative personnelle et l'esprit d'équipe.

D'après les recommandations de plusieurs auteurs (par ex., Liu, 2012; Luo, 2008; Gubbins & MacCurtain, 2008; Nielsen, 2007; Li, 2005; Nahapiet & Ghoshal. 1998), le travail en équipe au sein des assurances favorise l'entente entre les individus. Le travail en équipe augmente le degré de confiance qui représente un repère collectif pour mettre des lois nouvellement créées pour les adapter et les appliquer à la vie quotidienne des parties concernées. Avoir confiance entre les membres dans les assurances c'est pouvoir se réunir ensemble, partager volontairement ses acquis

et travailler avec sincérité et transparence pour favoriser le transfert des connaissances. Cela rend le climat agréable au sein des groupes communautaire pour propose des lois et des règles et discute avec le siège.

Le facteur confiance relationnelle apparait comme déterminant et est considéré comme étant relié à l'ouverture d'esprit des individus. Les résultats empiriques convergent avec les travaux de Liu (2012) pour laquelle la confiance est un mode principal de coordination des relations. Elle est nécessaire pour gérer efficacement le transfert des connaissances et rendre les communautés au sein des assurances plus performantes en stimulant le processus de la capacité d'absorption.

Un manque de confiance amène à l'absence d'un dialogue culturel et un blocage d'échanger les connaissances entre les membres cela peut détruire la relation car la confiance est la base des relations humaines fortes. Sans confiance, il n'y a pas d'interaction ni de regroupement. Les relations par le biais d'intra personnelles font partie de la vie quotidienne de toutes les assurances, la confiance caractérise les relations entre les individus, aucun membre du groupe ne peut créer une loi non institutionnalisée d'autrui, cela permet de faciliter la communication et favoriser l'efficacité.

L'analyse du deuxième facteur d'influence fait ressortir le fait que l'interaction sociale affecte positivement la capacité d'absorption potentielle et réalisée. Ce résultat rejoint les analyses de Chang et Chuang (2011), Sui-Hua (2013) et Wei, Zheng et Zhang (2011). Ces chercheurs ont constaté que l'intégration de l'interaction sociale dans le processus de transfert de connaissances, joue un rôle primordial dans le développement et le maintien de la capacité d'absorption potentielle et réalisée.

La confiance est à la base des interactions sociales. Le développement des interactions sociales est dépendant de la volonté des acteurs de s'impliquer dans un processus de socialisation par le biais des interactions inter personnelles. L'interaction est une opportunité pertinente pour communiquer entre les membres, échanger leurs connaissances et exploiter celles créées par les autres membres de la communauté.

L'existence de la communauté des connaissances au sein des assurances prouve l'existence des interactions sociales à travers lesquels elles vont s'influencer les unes avec les autres pour améliorer des relations interpersonnelles et favoriser le développement cognitif lors de transfert des connaissances. D'après les témoignages avancés, l'interaction est une forte cohésion sociale qui permet à ses membres au sein des assurances de collaborer pour accroître les connaissances acquises en renforçant la capacité de l'entreprise . à reconnaître, acquérir et évaluer les connaissances pertinentes. La qualité des connaissances crées dépend de la variété des expériences individuelles mises en interaction (Cohendet et al, 2006).

Les résultats empiriques sont consistants avec les recommandations de Reagans et McEvily (2003), Renko et al. (2001) et Lane et Lubatkin (1998). L'interaction et la collaboration entre les membres au sein des assurances représentent une source de création des connaissances nouvelles et l'exploitation des connaissances déjà existantes. L'atteinte d'un objectif commun ou spécifique est plus susceptible de se produire lorsque les membres sont bien réunis ensemble. Les membres au sein des assurances mettent l'accent sur l'importance de développer leur vision. Ils fournissent un effort pour changer les valeurs et les croyances qui marquent leur contexte en cherchant potentiellement à s'engager mutuellement, plutôt que de chercher l'intérêt personnel.

Dans le domaine des assurances, l'accent est mis sur l'importance de partage qui est basé sur des interactions et des échanges fréquents entre les membres, ce qui facilite le travail collectif. Ce dernier permet d'améliorer le processus de collecte des connaissances et de développer la capacité d'acquérir, d'assimiler, de transformer et d'exploiter la connaissance chez chaque employé afin d'en tirer profit dans le cadre d'une collaboration communautaire bien organisée.

L'effet direct de la capacité d'absorption réalisée sur l'ambidextrie des connaissances

À la lumière des résultats empiriques obtenus, nous rejoingnons les travaux de Jansen (2005), Huany (2008), Datta (2009; 2010) et Lavie et al. (2010) quant à l'effet positif de la capacité d'absorption réalisée sur l'ambidextrie des connaissances. En effet, les résultats obtenus montrent que la réalité des compagnies d'assurance coïncide avec le point de vue de ces auteurs. Ces derniers montrent que les connaissances qui proviennent de l'extérieur se transforment par les membres, en facilitant la combinaison des connaissances et le développement de nouvelles idées et des propositions de changements des connaissances déjà existantes.

L'effet modérateur de la capacité d'absorption potentielle sur la relation directe entre la capacité d'absorption réalisée et l'ambidextrie des connaissances

Après vérification de la validité du lien directe entre la capacité d'absorption réalisée (CAR) et l'ambidextrie des connaissances, les résultats empiriques obtenus concordent avec les travaux des plusieurs auteurs (par ex., Jansen, 2005; Huany, 2008; Datta, 2009; 2010 et Lavie et al., 2010). La capacité d'absorption potentielle (CAP) joue un rôle modérateur. Elle renforce/affaiblit la relation directe entre la capacité d'absorption réalisée (CAR) et l'ambidextrie des connaissances (AC). Lorsque la capacité d'absorption réalisée agit sur l'ambidextrie de connaissances, en privilégiant l'exploration, la capacité d'absorption potentielle renforce cette relation. L'acquisition et l'assimilation des connaissances externes (qui sont des attributs de la capacité d'absorption potentielle) jouent le rôle du renforçateur et s'intègrent pour améliorer les connaissances existantes (CAR) en créant des connaissances nouvelles. Dans le cas où la capacité d'absorption réalisée agit sur l'ambidextrie des connaissances en privilégiant l'exploitation, la capacité d'absorption potentielle affaiblie la relation. En effet, l'exploitation des connaissances absorbe des connaissances déjà existantes, quand la CAP s'intègre, elle affaiblie la relation, car l'ambidextrie des connaissances dans l'exploitation absorbe directement les connaissances qui sont nouvellement créées.

Conclusion

L'objet de la présente recherche consistait à analyser le processus de la capacité d'absorption à travers lequel deux formes de communautés de connaissances favorisent différemment l'ambidextrie des connaissances en mettant l'accent sur la logique d'exploitation et d'exploration. À travers une revue de la littérature, nous avons envisagé que la capacité d'absorption réalisée (CAR) favorise le développement de la connaissance d'exploitation destiné à générer de simples améliorations dans l'offre existante et que la capacité d'absorption potentielle, par le développement de la connaissance exploratoire, conduisent à l'exploration de nouvelles solutions. Nous avons aussi expliqué que le développement de la capacité d'absorption dans les communautés du savoir est associé à la confiance relationnelle adoptée par l'entreprise, et le degré de développement des interactions sociales. L'analyse de la réalité dans le domaine des assurances nous a permis de retenir les quatre hypothèses théoriques préalablement élaborées**.**

Les caractéristiques dégagées sont les suivantes : à travers la confiance relationnelle et l'interaction sociale, la capacité d'absorption est jugée cruciale pour développer l'ambidextrie des connaissances selon deux logiques. L'exploitation et l'exploration conduisent nécessairement à l'exploration de nouvelles offres et certainement à l'amélioration de l'existant.

Content Marketing in The Context of Brand Building

Lubica GAJANOVA

University of Zilina, Faculty of Operation and Economics of Transport and Communications,
Department of Economics, Univerzitna 1, Zilina, Slovakia, lubica.gajanova@uniza.sk

Abstract

The development of technologies and the Web 2.0 environment have influenced the behavior of content producers and consumers as well and made it necessary to change marketing concepts. Content marketing is a current trend that brings benefits to companies and their clients, moving in a digital world flooded with redundant information. It does not force products or praise the seller, but focuses on the needs and interests of (potential) customers. Content marketing can be a useful tool for a brand building or strengthening. The aim of the paper is to focus on the concept of content marketing and examining its link to the brand building process. The paper presents a summary and analysis of various secondary data of scientific as well as practical nature. The results of the analysis clearly show that a well-designed brand-driven content strategy achieves the goals set naturally and so we can consider the use of content marketing in the context of brand building as justified.

Keywords: Content Marketing, Brand Building, Brand-Driven Content Strategy.

Introduction

The theme of content marketing is very topical nowadays. However, it is important to realize that this is not a completely new thing, on the contrary, this concept goes back a long way. The famous phrase "content is the king", spoken by Bill Gates in 1998, is familiar to almost every marketer who is interested in this field. The goal of content marketing is to create valuable and relevant content for customers, thus increasing their loyalty and trust (Valaskova and Krizanova, 2008). In general, content marketing is used to achieve marketing goals through unsaleable content, which is based on a strategy stem from detailed definition of the target audience. In today's risky world (Buc et al, 2013; Olah et al., 2019), characterized by digitization and new technologies (Mihăilă et al., 2018), this concept is taking on new dimensions and there are more and more opportunities to use it effectively to educate customers, build relationships and trust, and increase brand authority.

Brand-driven Content Strategy

Bloomstein (2012) presents a simple Venn diagram as the starting point for the concept of a brand-driven content strategy. This contrasts “Brand Values” on the one hand and “Audience Needs” on the other. The interface forms the “added value” and at the same time describes the communication goals of a brand-driven content strategy.

While brand values can easily be defined from an inside-out perspective, the situation is different with target group needs. Bloomstein (2012) thinks that these could be based on baseline user (customer) research. From the author's point of view, this kind of research is not an option in this context, but rather a critical success factor. Furthermore, these user research should go fundamentally beyond baseline and provide detailed information about the points at which so-called "moments of truth" occur within a customer journey. Kalbach (2017) describes it latter aptly: They are critical, emotionally charged interactions, and usually occur when someone has invested a high degree of energy in a desired outcome. Moments of truth either make or break a relationship.

Simmons et al. (2007) very similarly identified four pillars of Brand-driven Content Strategy: (1) understanding customers; (2) marketing communications; (3) customer interactions; (4) valuable content.

Cite this Article as: Lubica GAJANOVA “Content Marketing in The Context of Brand Building” Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

Understanding customers as the first pillar can be identify with personalization and adaptation to their needs. Marketing communication is a desirable element for strengthening the brand's position in the market. In this concept, it deviates from one-sided communication and prefers dialogue (interaction) with customers. However, when creating brand equity, Simmons et al. (2007) emphasize the last of the four pillars and argue that valuable and relevant content can help companies build a strong brand, develop unique positioning, and maintain relationships based on trust and loyalty.

Brand-driven Content Strategy Framework

A brand-driven content strategy helps increase brand equity with the help of communication content and defines the framework for the communicative management of a brand. It also has the task of bringing together the content needs of the user (outside-in) and the interests of the brand (inside-out) so that relevant business goals (such as increasing brand equity) can be achieved. The model developed by Sommer (2017) defines the scope of a brand-driven content strategy, building on the one hand on existing theories of leading brand experts such as Keller (2013), Simmons et al. (2007) and on the other hand on the existing model from Bloomstein (2012). This approach should make it possible to better combine the two disciplines of brand management and content strategy and to create a mutual understanding of the existing interactions.

The model is based on the two terms "Points of Difference" and "Points of Parity" established in scientific brand literature (Keller et al., 2011; Kotler, 2009; de Chernatony, 2011) and links them to Bloomstein's Venn diagram (Bloomstein, 2012). Points of parity embody the expectations of the economically relevant target group (right-hand circle segment without the "added value"). Points of Difference (overlapping area of brand characteristics and target group needs), on the other hand, represent relevant, beneficial differentiating features of a brand. These are benefits of a brand, which go beyond the expectations of the target group and must be reflected in the core and in the communication of the brand. “Added Value” (points of difference) arises where brand characteristics and target group needs overlap. This goes beyond the expectations of the target group (points of parity) and is divided into functional and emotional benefits. At the same time, the added value also forms the basis for the communication goals (successful communication of differentiating features) of a brand-driven content strategy and marks the area in which people and brands can resonate with one another and where a “Shared Mental Model” can develop (de Chernatony, 2010; Champniss and Vila, 2011).

In order to systematically integrate the added value presented in the brand-driven content strategy framework into the communicative management of a brand, the tools of various brand and content strategy experts can be applied and combined. In the following, the most useful tools of implementing a brand-driven content strategy are described that can create and maintain a state of resonance between people and brands and thereby contribute to relevant corporate goals.

Tools of implementing a brand-driven content strategy

To strengthen market positioning, the goal of every marketer should be to combine brand perception with a strong and compelling story. Storytelling can express brand positioning in a way that can engage customers in person and arouse emotions in them (Samuel, 2015). This method can be applied across all content marketing tools and its use is preceded by a process of understanding and defining of the target audience (Zak, 2014).

Content on a blog is one of the most effective content marketing tactics in building customer loyalty and trust and strengthening brand positioning. It can include articles, surveys, interviews, reviews, case studies or even graphic, video or other interactive content. A study by Impact Branding & Design states that for almost 50% of marketers, content on a blog is a key content tool. At the same time, it states, blogs are among the five most trusted sources of online information for users. However, for a successful blog, it is important to know your customers (Sukhraj, 2017). Similar conclusions are drawn from the HubSpot study, which emphasizes the following: (1) a blog increases website traffic if it is properly optimized for search engines; (2) a blog contributes to the transformation of website visitors into potential customers if it satisfies their needs; (3) a blog builds a company's authority and credibility (Wainwright, 2018). Another study talks about the importance of linking the blog with other content marketing tactics, especially video. It argues that placing video in blog articles will make posts more dynamic and involve more people (Gotter, 2017).

Thanks to the video, it is easier for consumers to remember the brand and remember it even after a long time. The study concludes that videos strengthen brand positioning and allow repeatability and continuity (eg in the form of podcasts). They also increase web traffic and work well on all personal devices (Bowman, 2017). The importance of video as a content marketing tool is growing. According to a HubSpot study (2020), a video will account for 80% of all web traffic in two years. Adding a video to a newsletter or blog article will increase your click-through rate by

up to 300%. The 90% of consumers say that demo videos of products have helped them with their purchasing decisions. According to the Ascend2 study (2015), up to 51% of marketers rated testimony and tutorials as the most effective for building a brand. The mentioned demo videos are also considered highly effective (49%) (Griwert, 2015).

Social networks can be considered a distribution channel for content marketing. The second view emphasizes the possibility of understanding specially adapted content on social networks as one of the possible tactics of content marketing. The conclusions of the Content Marketing Institute (2020) study, according to which social networks are one of the most used content marketing tools to build brand awareness, also correspond to this concept. The effectiveness of content on the social networks within a brand building was examined by Gunelius (2011). He found that it is a more economical way of marketing than traditional marketing. It enables direct communication, audience involvement and effectively builds brand awareness. According to him, most marketers use the golden 80/20 rule when creating content on social networks, where about 80% of the content has a non-sales character, while offering additional value for the customer. Additionally, another study shows that user-generated content on social networks causes 6.9 times more involvement than corporate content (Gottbrecht, 2017).

Unlike social networks, email newsletters serve as a support tool for other content tactics and their distribution. According to a CMI study, an email newsletter can build an audience, gaining and deepening better customer engagement and long-term brand loyalty (Harris, 2016).

The goal of infographics that relates to product or service is both the education of readers and the transmission of useful information or building brand awareness on multiple platforms (CMEX, 2014). Researches have shown that visual data is absorbed faster than an ordinary text data and that is why infographic has 45% effectiveness as a content marketing tactic (Lasquite, 2015).

Conclusion

The aim of the paper was to examine the connection between content marketing and the brand building process. The paper presents a summary and analysis of various scientific sources that have demonstrated content marketing as a strategic marketing activity based on the creation of valuable relevant non-sales content for a well-defined audience. At the same time, the Brand-driven Content Strategy Framework was emphasized, explaining the combination of brand management and content strategy, which represents a mutual understanding of the existing interactions. The paper also devoted space to the description of secondary data of practical nature, which presents the most useful tools of implementing a brand-driven content strategy, which can create and maintain a state of resonance between people and brands and thereby contribute to relevant corporate goals. Therefore, in the brand building process, content is considered an important component of the whole process. Valuable and relevant content can help companies create a strong brand through stories, develop and strengthen unique positioning, and maintain relationships based on trust and loyalty. An important condition for effective brand building with the help of content marketing is a compelling story built around the brand and consistency in the content created, which is based on this story.

Abstract

Society in one country consists of three sectors - private, public and non-profit coexist and influence and complement each other. We include in the private sector all companies and various companies established for the purpose of making a profit. The non-profit sector is usually referred to as the third sector. It represents the part of the company that controls the activities not offered or insufficiently prepares the first two sectors. The tertiary sector has an irreplaceable function in every state. The very functioning of non-profit organizations that operate in the market will be long-term. Only in this way can they fulfil their purpose in society. For this reason, we focused on the strategic management of these companies, in order to create a conceptual proposal for strategic management for non-profit organizations. We used the methods of analysis, synthesis and interrogation for the chosen goal. We consider the most important benefit of the proposed concept of strategic management for non-profit organizations to be a real opportunity to put their strategy into practice and thus support their successful fulfilment of their mission and vision.

Keywords: Management, Strategic Management, Non-Profit Organization.

Introduction

The mission of non–profit sector is fulfilling tangible and intangible needs of society, that state and business sector is not able to, or cannot fulfil. It points out problems in society, which are important for society-wide changes. The mission of tertiary sector is perceived from multiple views. Economists perceive tertiary sector as an institutional solution to deficiencies in state and market, political scientists rather emphasize the mediatorial function of tertiary sector between state and market and neo-corporatist theories perceive tertiary sector as a border between state and society that relieves tension and political conflicts. Tertiary sector has an irreplaceable function in every state. The actual functioning of non-profit organisations suggests that their function in market will be long-lasting. Only then can they fulfil their purpose in society. For this very reason, we focused our efforts on strategic management of these companies and based on interviews with managers of selected non-profit organisations, we have devised a concept design of strategic management for non-profit organisations.

Specifics of strategic management in non-profit organisations in Slovak Republic

According to Gavurova, we differentiate five basic functions in non-profit organisations. The first is advocacy function that formulates and interpret political requests of citizens, which enforces and defends rights and interests of citizens and individual interest groups (Gavurová, B. 2011). Expressive function of non-profit organisations points out, defends and strengthens cultural, ethnical, religious and linguistic differences of individual interest groups. The community building function provides an opportunity for individuals to participate in social life and thus build the natural responsibility of citizens for life in village, neighbourhood or city. Non-profit organisations provide services and public goods that are not provided by state. These are mainly social, educational, humanitarian and legal services. In Slovakia, about one third of all organisations perform this function, within the EU, it is about two thirds. We refer to this as a service function. The innovative function of non-profit organisations is very

important. The third sector is an environment in which social innovations and social experiments, that there is no place in state and business environment for, are conducted. From them, the state can then choose the ones it considers to be the most promising. From the state's point of view, the opinion forming function is very important. Non-profit organisations are usually a great source of thoughts, new procedures and ideas. They offer new, more flexible ways of solving social problems, but they also create moral or ideological visions that prevent new social changes. Non-profit organisations also fulfil the function of political socialisation, because they are a kind of training field in which people learn democratic principles, learn to motivate, lead people, discuss and train in the roles of "homo politicus". They encourage the creation of a new legislative environment adds 3 more functions to these basic functions. He attributes to non-profit organisations the role of so-called "watch-dogs", which together with the media and political parties oversee compliance with democratic rules and thus assigns them the so-called control function. Non-profit organisations provide feedback and make it possible to correct mistakes in society (Mason, D. et al., 2018). They resolve conflicts and fulfil the function of prevention, especially in ethnic and racial areas. They also contribute to conflict prevention trough international programs focused on cooperation and understanding. The last function of non-profit sector is the reproduction of social wealth (Ansoff, 1976). Therefore the non-profit organisations are necessary for the government of each state.

However, strategic management is closely related to the concept of management. Strategic management is the process of specifying the goals of the organisation, developing policies and plans to achieve these goals and allocating resources to implement the plans. It provides the overall direction of the whole enterprise. Good strategy and strategic management should integrate goals, policies and sequences of the organisation into a coherent unit. (Akingbora, 2006).

Every non-profit organisation must define its goals, where the company wants to be in the future. Each company must objectively evaluate its current position as must the company decide how to get, where it wants, considering the possibilities, alternatives, available resources and necessary changes. This process is called strategic management. (Alvarez-González, l. i., et. al., 2017)

According to Beard, strategic management is a process of creation and implementation of long-term plans, which is of fundamental importance and its implementation will give the company a comparative advantage. Efficiency strategies are dominant in management (Beard, F. D. 2015).

Strategic management is a complex process that aims to develop and maintain consistency between the goals and resources of the company on the one hand and changing market conditions on the other. Strategic management includes the identification of opportunities and subsequent strategic decisions regarding the redistribution of resources and ways to use them. The strategic management process also helps the company identify and maintain a competitive advantage (Agostino, D., Arnaboldi, M. 2012).

Management generally follows standard process and procedure. However, the modern world is constantly changing. Every day, new opportunities and problems appear. Any traditional management policy cannot cope with new situations and cannot solve new problems. In order to cope with new situations, a company can use new tools and methods that help in specifying goals, vision, strategy and the like (Gajanova, L., Nadanyiova, M. and Moravcikova, D., 2019)

The foundation of every success of a non-profit organisation is the correct definition of vision, mission, goals, appropriate choice of strategy and effective and correct management. Strategic management has long-term consequences for the non-profit organisations and has a broad-spectrum focus that will affect the entire company, and therefore falls within the competencies of the top management of the non-profit organisation (Ližbetinová, L., Hitka, M. 2016.)

We tried to find out in our survey directly focused on non-profit organisations in Slovakia, how do they use or do not use various methods and procedures of strategic management. The survey period was from March to June of 2020. However, this period was marked by the Covid-19 pandemic, which changed the "normal" functioning of a huge number of companies. Help-focused non-profit organisations did much more work during this period than in the past. In addition, our survey from 2019 was confirmed. In this survey, we found out that the tools of the marketing mix, so necessary for the development of work in the online environment, are in non-profit organisations in the Slovak Republic only at an average level.

During this period, more than 300 online questionnaires were sent out, but none returned. We managed to directly address 50 non-profit organisations with which an interview was conducted on the topic of strategic management of a non-profit organisation. However, for the purposes of this post, we had to exclude all the answers that were

realised with the volunteers. After this selection, we were left with 50% of interviews, which served as the foundation for creating a concept of strategic management for non-profit organisations in the Slovak Republic.

Concept design of strategic management for non – profit organization in Slovakia

In addressing the issue of streamlining the strategic management of bus companies using the BSC concept, we propose to create an effective strategy management system. This system consists of 6 phases that run in a constant cycle:

Fig. 1 Concept design of strategic management for non–profit organization in

Slovak Republic, source: own design

We consider the first phase to be the phase of elaboration of the vision and mission of the non-profit organisation. Based on interviews with managers of non-profit organisations, we found out that almost 50% of non-profit organisations do not have a clearly defined and formulated vision and mission, and up to 70% of them could not answer the question of what their mission and vision is. It is necessary to realise that even the non-profit organisations must have their basic goals clearly defined and then plan the way to achieve them in the form of attainable strategy. Such process is demanding and is the responsibility of top management. It is necessary to pay increased attention to it. The next phase of strategy management consists of transforming plans into specific objectives, measuring instruments, their target values and strategic actions. Internal fine-tuning of organisation and subsequent planning of operational activities is the next step of great importance. An essential tool used in these phases is the strategic map, which represents a logical and comprehensive architecture for displaying a specific strategy.

Kaplan and Norton claim that for a non-profit organisation to improve its activities, processes and results, it must be able to measure them. For this reason, it is necessary to assign appropriate indicators, their target values and the actions leading to the fulfilment of set objectives (Kaplan, R., Norton, D. 2001). For each strategic objective shown in the strategy map, it is necessary to determine at least one measuring instrument that will allow you to measure and evaluate the success of the selected strategy. However, it should be borne in mind that these are not only financial measuring instruments, but also non-financial, which are often difficult to quantify, so the selection of appropriate measuring instruments requires due attention.

Target values are the values of selected indicators, the real achievement of which is expected in the future in order to fulfil the intended mission of the company. When identifying them, we consider the current state of selected indicators and the complexity of set goals.

After the successful identification of strategic goals, measuring instruments and their target values, it is necessary to determine the activities, by which the non-profit organisation will get on the right path to implement its strategy and fulfil its mission. These strategic actions determine the way in which the company wants to achieve the set values of the strategic objectives. In order to ensure the implementation and reassessment of the identified strategic actions, a person responsible for its progress is allocated to each strategic action.

In the next step, the strategy management system is harmonised with individual organisational units and individual employees, which is critical for the successful implementation of the strategy. In the process of harmonising individual employees with the company's strategy, their awareness is of key importance. Unless all employees know and understand the company´s strategy, the success of implementation is very unlikely. A suitable mean of communication to help achieve this requirement is organisation of meetings.

According to Agostino by formulating the strategy and elaborating the plan of operational activities, the non-profit organisation is embarking on the path of implementing a strategy that should lead it to fulfil its vision and mission in the coming years. However, a well-formulated strategy and its perfect implementation may not guarantee the achievement of the desired mission of the company (Agostino, D., Arnaboldi, M. 2012). The reason is the dynamic development in the macroeconomic, competitive and technological environment of the company, which may be the cause of an outdated or even unrealisable strategy. The final phase of the strategy management system is therefore its verification and adaptation. It is also a phase followed by the initial phase of strategy implementation, because in case of undesired direction of the company or significant changes in the company´s environment, the strategic analysis is re-implemented and new strategy is formulated.

Model of strategic map for non-profit organisations in Slovak republic

To create a strategic map for non-profit organisations, it is necessary to define four basic perspectives, namely financial perspective, customer perspective, perspective of internal processes and the perspective of learning and growth.

In the case of non-profit organisations, after consultation with the managers of non-profit organisations, a slight modification is needed, which depends on the specific conditions in the non-profit organisation as follows:

- The strategic map will reflect 4 perspectives
- The mission of the organisation is heading to the top of the model, while the strategy is still at the core
- The customer perspective determines the term “customer”- someone who is the recipient of the aid, and how the organisation can produce value for these “customers”; the customer perspective is located at the top of the strategic map behind the mission of the company and is divided into 2 groups – persons who contribute (donors, taxpayers, etc.) and persons who receive a service or goods (beneficiaries)
- The financial perspective is slightly changed to the perspective of financial sustainability, the aim is not to maximise profits, but to find an answer to the question of how to add value for “customers” while controlling costs and thus ensure long-term sustainability
- Perspectives for internal business processes are focused on satisfying the beneficiaries in compliance with the budget
- On the other hand, the emphasis on the learning and growth perspective is shifted to ensure the organisation´s ability to improve, grow and change

We based our assumptions on interviews with managers of non-profit organisations in the Žilina Region. The following figure also considers the factors that, according to the managers of the non-profit organisations, are of the utmost importance in individual perspectives.

Fig. 2: Model of a strategic map for non-profit organisation in Slovak Republic, Source: own design

Conclusion

Every change made in a non-profit organisation is expected to have a positive impact on its current performance. For the implemented measures to bring the desired effect to the non-profit organisation, it is necessary to improve them regularly and adjust according to the changing needs of the environment and the company itself. The key benefit of our proposed concept of strategic management for non-profit organisations is the real possibility of enforcing their strategy in practice and with the help of appropriately selected strategic goals, measuring instruments and actions, the successful fulfilment of the mission and vision of non-profit companies. Thanks to this concept, the non-profit organisation will achieve success in financial and non-financial indicators. However, the concept of strategic management is also associated with certain risks that may hinder its effective use. The biggest risks include incorrectly set measuring instruments, the monitoring of which may not signal the fulfilling of strategic goals. The non-profit organisation will then focus on the wrong activities that are not in compliance with its mission and vision. The concept proposed by us may be a suitable foundation for the strategic management of non-profit organisations, but its benefits and risks will ultimately be in the "hands" if the managers and their decisions.

Abstract

Recently, societal and global interest as well as the need and necessity of solving environmental problems are also reflected in marketing, namely by a gradual transition to the application of green marketing. If a company wants to be successful, competitive and ultimately popular with customers, it has to adapt to this trend. In this reason, many business managers in various industries see green marketing as a significant competitive advantage, investing in the future, or building a good image in the eyes of customers. Based on this, the article is aimed on the analysis of the green marketing in the automotive industry and its application in Slovak conditions. This includes providing the theoretical background and analysis of the green marketing from the viewpoint of Slovak and foreign authors. The important source for secondary data was scientific researches, annual company reports, statistical databases, published professional publications. Based on the analysis results, benefits of the green marketing are highlighted such as gaining competitive advantage, improving company's image, increasing customer's loyalty and brand value.

Keywords: Green Marketing, Automotive Industry, Corporate Social Responsibility, Sustainability.

Introduction

Nowadays, the social and environmental consequences of rapid economic growth are becoming increasingly apparent (Hardingham et al., 2018). More industrial greenhouse gases, the enlargement of the ozone hole, climate change, the destruction of forests, the disappearance of animal species and ecosystems are all a manifestation of the rapidly deteriorating environmental situation on our planet. Thus, environmental problems and their growing intensity force people to seek new and rational ways of producing, consuming and disposing of products. Governments and various institutions are examining the negative effects of the functioning of society and, based on research conducted, are issuing regulations and recommendations that global corporations and companies should orientate (Poliak et al., 20104). Respect for the environment is a very current social phenomenon today. Companies have begun to take global threats seriously (Valaskova & Kramarova, 2015). Socially responsible behaviour towards the environment is becoming not only a modern business concept, but also an important factor in the competitiveness of companies. Social responsibility is becoming an integral part of corporate strategies. Consumer preferences are also changing, and interest in environmentally friendly products is growing (Krizanova et al., 2014; Majerova, 2015). More and more consumers want to know if the products are really environmentally friendly, not been tested on animals and if it was not produced by children and adults in a poor working environment. People are beginning to realize the environmental impact of their actions.

In this reason, the main goal of the paper is to analyse the green marketing in the automotive industry in the case of Slovak conditions. Based on the analysis results, benefits of the green marketing are highlighted such as gaining competitive advantage, improving company's image, increasing customer's loyalty and brand value.

Literature Review

Green marketing is a relatively new issue; it only appeared at the end of the 20th century. It can be understood not only as the promotion or advertising of products with environmental characteristics, it is a much broader marketing concept, which also includes product modifications, changes in the production process, and packaging and advertising modifications. Green marketing contributes to environmental protection by trying to minimize the harmful impact of products on the environment (Polonsky, 1994).

The first experts to define green marketing include Henion and Kinnear, who emphasize that green marketing deals with all activities that provide support in the emergence of environmental problems, as well as their subsequent elimination (Henion & Kinnear, 1976). This definition of green marketing also had a few opponents. For example, Polonsky consider it necessary to extend the definition to a wider range of activities that fall under the concept of green marketing. On this basis, he claims, that green marketing consists of all activities designed to create and facilitate any exchanges designed to meet human needs or desires, in order when meet those needs and desires to minimize adverse effects on the natural environment (Polonsky, 1994).

Lieskovská (2010) defines green marketing as a tool for promoting ecological trends in the sets of activities of individual companies, organizations but also individuals. The range of green marketing processes is quite extensive, from responsible behaviour to the environment, through the production of products that include eco-dimension and eco-requirements, to the consumption of individual products, where their environmentally responsible life cycle also affects the quality of everyday life and health of society.

Green marketing is often referred to as modern marketing. Thanks to its environmental orientation, it represents a part of environmental management. Green marketing is enriched with the so-called the green dimension, which offers the opportunity to create a competitive advantage. The environment where it can be applied varies depending on customer demand, regulations and the opportunity to gain a credibility advantage. Companies face positive pressure to achieve environmental efficiency, which contributes to their higher profitability, but also to their overall economic stability. Many companies are implementing green marketing, especially for reasons of opportunity, social and environmental responsibility, pressure from government and competition, and cost reduction (Moravcikova et al., 2017).

According to Krizanova et al. (2013), the primary goal of green marketing is to make the consumer aware of its impact on the environment through purchasing decisions including the possibilities of nature protection and at the same time build a long-term relationship through socially responsible communication. Green marketing was thus based on the principles of corporate social responsibility, which defines green marketing as marketing promoting environmentally responsible products.

Also, consumer's behaviour underwent a significant change in the last decade (Lizbetinova & Weberova, 2016). The environment is becoming one of their priorities, and they are therefore considering the environmental aspect in their purchasing decisions. Consumers are also increasingly interested in the environment when it comes to thinking about future generations. This trend has supported the emergence of environmental initiatives in various areas such as green energy consumption, zero packaging waste or environmentally sound usability (Amberg & Fogarassy, 2019).

Nowadays, there is no universal definition of green marketing. McDaniel and Rylander (1993) use this term for consumer and environmental marketing strategies. Baker (2003) defines green marketing as a holistic management process responsible for identifying, anticipating and meeting the needs of consumers and society in an efficient and sustainable way. According to Juraskova et al. (2012), green marketing focuses on all activities aimed at satisfying human needs or desires, but with minimal impact on the natural environment.

The American Marketing Association defines green marketing in several ways (White et al., 2011; American Marketing Association):

- Sales definition – sales of products that are environmentally friendly.
- Socio-marketing definition – development of products that have a minimal negative impact on the environment or improve its quality.
- Environmental definition – production promotion and packaging of products in a way that respects environmental protection and responds to environmental issues.

Grant (2007) points out that the responsibility for environmental protection lies not only with the government, large corporations and nongovernmental organizations, but with the responsibility of the whole society and seeks to incorporate green behaviour into the normal life of every consumer. He characterizes green marketing as a set of five features called "5 I", including (Grant, 2007):

1. Intuitive – changing the perception of green products. It is very difficult for most people to change their normal activities, such as work, travel or shopping, to sustainable ones. The task of green marketing is to facilitate the adoption of environmentally friendly products so that consumers buy these products intuitively.
2. Integrative – improving the quality of life of current and future generations through a combination of economic, social and environmental developments.
3. Innovative – creating new environmental products and new lifestyle.
4. Inviting – green products are often better, more durable, healthier and more effective. Therefore, new, fun concepts should be created for them that can be easily incorporated into culture.
5. Informed – the ordinary brand is chosen by those consumers who do not pay enough attention to individual products and have little orientation in the particular industry. Green products are little associated with a guaranteed brand, but their choice is strongly linked to consumer education.

Methodology

The main aim of the article is to analyse the green marketing in the automotive industry and its application in Slovak conditions. This includes providing the theoretical background and analysis of the green marketing from the viewpoint of Slovak and foreign authors. Based on the analysis results, benefits of the green marketing are highlighted such as gaining competitive advantage, improving company's image, increasing customer's loyalty and brand value.

The important source for secondary data was scientific researches, annual company reports, statistical databases, published professional publications.

General scientific methods were applied for the processing of the data, such as data collection, excerption, description, comparative analysis, deduction, induction, analysis and synthesis.

Results and Discussion

Recently, we have seen relatively significant changes in the quality of life in Slovakia. This was largely conditioned by a change in the lifestyle of people and quality of their life. People's quality of life is the result of the interaction of the social, health, economic and environmental conditions that affect human and social development. The topic of environmental protection has become more important in the value ranking of society, where it is increasingly becoming part of the public debate and even the political agenda (Gal et al., 2003).

Regarding environmental situation, in Slovakia it can be seen positive changes in recent times. Before 1989, Slovakia still as a part of Czechoslovakia, was considered a country where one of the largest pollutants was achieved on a global scale. Unfortunately, the next decade, which represented an improvement in the environmental protection, was not due to sensible measures and effective action. A reduction in the quality of the environment has been considered to be a reduction in industrial and agricultural production. It was not until the transition to the new millennium that successful steps to protect the environment were recorded for the first time. In the mentioned change, the technological progress is very important, such as increase of the share of cleaner and more efficient technologies as well as successful changes in environmental legislation.

Currently, we can observe positive trends in environmental protection. One example is the fulfillment of the goal set by the European Union to reduce greenhouse gas emissions by 20% by 2020 compared to 1990. This goal was already met in 2017, when the value of emissions was lower by 21%. The current pandemic around the COVID-19, which has seen a huge slowdown in the economy, will also play a significant role in reducing emissions. Slovakia achieved very successful values when it managed to reduce the volume of produced emissions by almost 41%, which represents in absolute terms the value of 43.5 tons of produced emissions. In this respect, Slovakia has the fifth position in the European Union Member State in terms of the number of reduced emissions. Even when looking at the ratio of emissions per capita, Slovakia is on a relatively successful eleventh position in the European Union, where it has managed to overtake countries such as Germany, Czech Republic, Denmark and others (Drapakova & Geist, 2019).

Unfortunately, Slovak forests did not help to reduce these emissions due to the excessive logging as well as natural disasters. In Slovakia, there is logging more wood due to the total area of forests, with greater intensity and lower added value than in other OECD countries as well as in comparison with other Visegrad countries (Palus et al., 20104).

Except the fact, that reducing emissions have a positive impact on our environment, the positive effect was also reflected in the reduction of the costs of air pollution and thus in reduced costs of health care, which arose due to poor air quality (Jurkovic et al., 2019; Krizanova, 2008).

The COVID-19 pandemic has caused a huge slowdown in the global economy, which will most likely border on the economic crisis. Many companies have to cut excess costs in order to be able to operate with the highest degree of efficiency. In some companies, it may include costs of green marketing activities. At a time when people are suffering from uncertainty, whether from a pandemic or an economic crisis, their shopping behaviour is greatly affected by the price and not as well by environmental aspects of the product (Massey et al., 2018).

Application of the green marketing in automotive industry is analysed in the case of the Kia Motors Slovakia. Kia Motors Slovakia is a production plant based in Zilina and belonging to the European division of Kia Motors Europe. It is the most modern production plant in Europe, which will cover up to 54% of European demand with its production. In 2003, sales of Kia in Europe covered only 35% of the market segment. At present, demand has grown and up to 80% of sales will take place on the European market.

Kia Motors Slovakia is aware of the green marketing importance and therefore strives to be involved in environmental protection. The company has participated on the 2020 strategy, which consists of three main pillars:

- environmental awareness, management and cooperation,
- saving energy and reducing emissions,
- waste as a resource.

Another tool used to protect the environment is the ISO 14 001 certificate, the purpose of which is to effectively manage and meet requirements and to constantly improve environmental protection. With such a large plant, efficient energy use is also required. Therefore, regular monitoring and evaluation of the efficiency of energy consumption, media and materials, as well as the amount of waste, wastewater and emissions per vehicle included, was included in the system.

Kia Motors Slovakia is focused not only on the gentle production of the vehicles, but also on their lifecycle. For this reason, it manufactures models based on the certificate according to ISO 14 040 and also according to the ISO 14 062 certificate by integrating environmental aspects into product design and development.

Kia Motors Slovakia has five main goals for the future:

- reduction of emissions and risk of environmental damage,
- reducing the amount of waste produced and increasing the rate of its recycling and recovery,
- reducing the number of raw materials, energy and chemicals per vehicle and engine produced,
- increasing the level of emergency preparedness,
- development of Chemicals Management and raising awareness among employees.

Kia Motors Slovakia considers waste as the raw material and energy of the future. Therefore, it has shifted its priority from trying to get rid of waste to trying to find ways to reuse waste, whether through recycling or other energy recovery. At the same time, the circular economy was supported, the main purpose of which was to minimize waste by preserving the value of products and materials for as long as possible.

Environmental protection also takes place during the development of vehicles. In addition to the traditional ways of developing new technologies, it is also necessary to set certain limits that must be observed in the automotive industry. One of the ways to move production more towards environmental responsibility is to comment on the planned legislation. Kia Motors Slovakia can also use this option due to the fact that it is located in several supranational and international environmental groups, such as the legislative commission of the Association of the Automotive Industry of the Slovak Republic and others.

Kia Motors Slovakia is also active in philanthropy. Despite the fact, that this activity falls under the social pillar of the corporate social responsibility, it represents the way to maintain good relations with the surroundings where Kia Motors Slovakia is based as well as support the protection and cleanliness of the environment through specific projects. To support the Zilina self-governing region, the Kia Motors Slovakia Foundation implemented a total of 157 projects in 2019, to which it provided financial support in the final amount of 1.3 million euro. At the same time, the foundation has established new partnerships with the aim of becoming a responsible partner in the Zilina region in terms of social responsibility as well as environmental responsibility. The primary areas that received support were education, sports, reconstruction of medical facilities, as well as the development of bicycle transport in the region and the revitalization of urban greenery.

A significant part of corporate philanthropy at Kia Motors Slovakia is also made up of volunteering in more than 70 non-profit organizations. A significant part of the activities of non-profit organizations is the cleaning of public areas. This also includes the revitalization of greenery or the planting of trees.

Green marketing activities of Kia Motors Slovakia also includes a project called BikeKia. It is a modern bike sharing system, which aims to increase mobility around the city. It is one of the more ecological options for relocation and at the same time the health support. Overall, the project has been very popular, even by the end of the first month since its launch, and a European record has been set in the number of borrowings of one bicycle per day, namely 25 times. The BikeKie project includes not only public bicycle rental, but also the construction of cycle paths. The Kia Motors Slovakia Foundation contribute a significant amount to their construction.

In 2009, Kia Motors launched its own brand ECO Dynamics, which was to represent a public commitment to zero emissions. In 2012, Kia Motors made progress and launched the new brand ECO Green, which included vehicles with a futuristic design and an ecological image. With the dynamic changes in market demand, Kia's focus is also changing. Its goal is to take the place of the market leader in eco-friendly cars of the new generation. Kia Motors currently offers some types of eco-friendly vehicles, such as hybrid vehicle (e.g. Kia Niro Hybrid 1.6 GDI), electric vehicle (e.g. Kia Soul EV), Plug-in hybrid model (e.g. Kia Optima Plug-in Hybrid 2.0 GDI).

In 2014, Kia Motors ranked 35th in the list of green brands. Currently, there are only two carmakers in the list of TOP 100 green brands - Tesla (ranked 74th) and Toyota Motor Corporation (ranked 92nd).

Conclusion

Based on the above mentioned, we can claim, that the green marketing is gradually implemented by every successful company even in Slovakia. This includes companies in automotive industry, which are trying to compensate the negative effects caused by emissions from manufactured vehicles. By changing the production portfolio, they responded flexibly to the change in requirements and launched the first hybrid vehicles and later also electric cars. It is also worth mentioning the effective optimization of production, where in recent years the analysed car plants have significantly reduced the consumption of energy and waste produced. In addition to the classic production, the carmakers are also implementing other projects aimed at protecting the environment, which can attract new customers.

In these reasons, the analysis results show that Kia Motors Slovakia can definitely be considered environmentally responsible. It has made huge strides in optimizing production, which has been reflected in lower emissions as well as lower energy consumption. The company also operates according to strict environmental management standards.

The efficient application of the green marketing in automotive industry (not only) in the case of Kia Motors Slovakia has many benefits such as gaining competitive advantage, improving company's image, increasing customer's loyalty and brand value.

It follows from the above, the issue of green marketing in automotive industry not only in Slovak conditions has the great potential for the further research in deeper qualitative and quantitative level. It would be appropriate to do comparative analysis of green marketing in automotive industry between Slovakia and other European countries. The next investigation could be also aimed at improving knowledge of the perception of green marketing in automotive industry by consumers. Another possibility includes determination of how the green marketing in automotive industry affects the brand loyalty.

Commercialization as a Factor Influencing Economic Science

Jan KOMOROWSKI
Warsaw School of Economics, Warsaw, Poland
jkomoro@sgh,waw,pl

Abstract

Commercialization as a factor influencing the economic science
When searching for threats to research at the interface between theory and practice in the modern world, we may not overlook commercialization. Research commercialization is part of the current surveys devoted to the conditions of the evolution of modern science. Typically, commercialization is seen positively, as a main factor, which improves economic growth. Market mechanism is believed to have the power to boost research development by adapting it to market needs and opportunities, better use of research benefits and gains, mobilizing investment, etc. The impact of market mechanism is also used to provide adequate valuation and allocation of resources. We must bear in mind that the impact of commercialization on research is much deeper and multilateral and it produces much more complex consequences to research and economy.

Keywords: Commercialization of research, evaluation of intellectual value, utility gap, privatization of scientific knowledge.

Introduction

One can easily notice the impact of commercialization on research. As a process, commercialization turns various forms of human activity into market products and places them within the competition framework. Usually commercialization is perceived as something positive. It is believed that by adding on dynamics to diverse areas of human activity it brings concrete economic benefits which are sources of wealth. This way the market-theory-based mechanism of commercialization impacts business practice, shapes relationships and institutional arrangements that are brought together into an economic system. As a result, commercialization becomes the key to explain the world around; it impacts people thinking and determines advances in economics. Yet, what is good for the economy is not always good for knowledge, which is why we need to take a closer look on how commercialization impacts research.

Commercialization of university-based research, and especially its impact on the stock of economic knowledge, boils down to the assessment of how market mechanism influences research and what are the effects of the process. It is assumed that the market mechanism helps to correctly estimate the value of resources and contributes to rational allocation thereof. Against this background, we can ask if commercial aspects should decide on the choice of scientific interests, distribution of funds for research, sharing of benefits, using research results, etc. In fact, the impact of commercialization on research is deeper and more complex. All of the above mentioned aspects make commercialization one of the most interesting occurrences that influence modern research, change its functions, lead to the emergence of a new sector of modern economy but also generate some threats.

The substance of commercialization of research

Commercialization is the sign of times that embodies the impact of market economy on diverse forms of human activity. Market value and sales have become almost the only measures, against which goods are assessed. Market rules have dominated human thinking so much that we cannot stop seeing public goods as products, we attribute behavior guided by market principles to independent subjects, build interpersonal relations on competition, etc. Also, typically of the market economy, laws of supply and demand have broadly invaded the sector of public services and commercialized education, healthcare, culture, arts, information media, security systems and other areas, which until recently had been excluded from the impact of market mechanisms because of the functions they perform in society.

Nowadays, commercialization is also present in university research so intensely that one cannot possibly draw a line between research activities and aspects of trade and competition. Market mechanism promotes original solutions and mobilizes cognitive capabilities; it is result-oriented, improves research infrastructure and accelerates the implementation of research achievements, etc. To some commercialization of research proceeds too slowly, to others it goes too fast but ultimately the process is seen as inevitable.

Cite this Article as: Jan KOMOROWSKI " Commercialization as a Factor Influencing Economic Science" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

Such approach to the world of science and research is the most visible in economics, the field of science which explains how business is run. The conviction has got reinforced due to strong correlation between economic growth and commercial applications of scientific knowledge. It is a two-way relationship meaning commercialization of research fuels the economy while strong economy stimulates research. Dilemmas, problems and threats stemming from the application of market mechanism to research are realized much less frequently.

Colloquially, commercialization means seeing research as a commercial product. Its substance consists in treating effects of science and research as **commodities** at a disposal of individual entrepreneurs. Instead of performing the cognitive function, commercialized research is organized around the vision of benefits and gains that it can produce at the marketplace. These benefits are not limited to the repayment of resources invested in research but they include gains from trade, speculation, intermediary services, processing, appropriation (theft) of patents, utility designs, and inventions. It means that similarly to other commercial industries, scientific knowledge subjected to the market mechanism is brought into the area of **private business activity,** while benefits from research are appropriated by market players.

Trade in knowledge-based products stirs up competition, business strategies, and conflicting interests. Inventions, discoveries, patents, and scientific publications can be turned into profit. New forms of business activity emerge while research and knowledge become increasingly more dependent on marketing, promotion and sales. Taking over innovative businesses, acquisition of patents, know-how, brain drain, intelligence and previously unknown forms of intellectual property crimes are deployed to achieve business goals. Against this background, it seems little realistic to put aside potential benefits of research and assuming that scientific effort is motivated by altruistic reasons is naïve.

Universities and R&D centers, so far financed from public coffers, may be an attractive and highly profitable investment targets, which is why we may expect that sooner or later research and knowledge will cease being universally accessible **public goods** expected to meet general social objectives. Actions aimed to enhance the efficiency of scientific institutions will fuel the interest of capital holders in research. It is not by chance that the richest multinational companies take over innovative businesses, buy the most promising patents, inventions, technological solutions, and utility designs, establish *start-ups*, etc.

By unleashing commercial motivation we distort the **autonomy of research;** approach to scientific problems, the choice of direction of research, etc. are mainly dictated by economic criteria. If we consider benefits and conflicts of interest, the market is far from transparent. Attention should be paid to the relative nature of the value of research, which depends on economic advancement, openness of the economy, freedom of trade, control over the carriers of knowledge, etc. **Valuation of intellectual property**, asset productivity - including the specificity of estimating the value of goodwill - generate a number of difficulties. The same can be said about the **protection of goods that contain intellectual property.** All of the above obscure the course of acquisition, transaction, and exploitation of effects.

This specific market should be seen from the viewpoint of interests of individual entities and in the context of general economic policy of a respective country. Already at the first glance we can see that when market becomes a fetish, in the environment filled with competitive pressure and correctness, research is faced with hard tests. The market of goods produced by research is far from being transparent. The vision of benefits encourages to compromise on ethics and scientific methodology. Striving for profit, domination, violence, injustice means research becomes instrumental, which leads to the misappropriation of truth and social mission and, consequently, to the loss of trust in those who manage it.

Also in Poland commercialization has pervaded the scientific community. Universities, their attractiveness and courses they offer are judged based on rankings, which also decide about funds allocated to research or the promotion of researchers. Reforms, expectations vis-à-vis research and the teaching content do not provide simple definitions of goals and values. The Ministry of Higher Education is obsessed with international rankings, Journal Citation Reports and other gadgets of the science market just like a housewife with the thought of having a one-million-dollar handbag being unable to grasp a wider context of the phenomenon or give it any critical consideration. The “Shanghai ranking” (Academic Ranking of World Universities) is very much appreciated although the “Bologna system” introduces identical unified teaching standards at all universities.

The impact of commercialization can be observed in research policy. Funding research through competitive biddings, tenders and participation in business projects as well as teaching students skills currently needed at corporations are popular ways of pumping funds into research driven by commercial considerations which signal the absence of any long-term vision of how university research and its ties with the economy should develop. We forget about the mission universities have vis-à-vis their graduates, which in simple words can be expressed as teaching them how to manage their self-development and be able to use knowledge throughout their professional lives until they retire. These contradictions resonate in the debate over the reform of education and restoration of trust in economics as a field of science.

Commercialization manifests itself in the cost of research. Trends that can be observed suggest that science and research should be cheap. In a growth-oriented country, researchers’ salaries remain below national average and are

lower than the remuneration of most professionals. Independently of long-term effects for the quality of education, universities reduce the number of classes and seminars, cut funds for students most of whom work instead of studying. Pauperization among young researchers is especially dramatic as it drives down market attractiveness of this profession. Apparently, we are not fully aware of the consequences of making research market-driven and shaping it based on foreign patterns.

Commercialized research as a sector of modern economy

Commercialization of research has got far-reaching economic consequences. At empirical level, we can see that by commercializing research we exert a significant impact on the economy and society, enrich economic activities with academic knowledge, foster entrepreneurship, etc. Major effects of commercialization include:

1. stimulating business demand for university knowledge;
2. focusing research on market and competition;
3. transmitting competition from market to research;
4. transforming scientific accomplishments into tradable economic assets;
5. research driven by economic interests;
6. approaching research as a modern branch of market economy.

Commercialization of research and university curricula leads to privatization. From this point on the problem of funding, use of knowledge resources, exchange of storage devices, dissemination of results, division of benefits, development of research staff, education, infrastructure, etc. make part of business relations. Whether they should be developed is judged by the outlays and effects judged against investment effectiveness measures. Expected outcomes of staff training, patent protection, trade in *know-how,* scientific publications, promotion of research, etc. are seen through business models, identification of competitors, building strategic alliances and making money.

It is generally believed that countries which privatized their research centers at earlier stages, engaged capital, attracted investments, offered financial incentives for researchers, recruited specialists, commercialized inventions, etc. grow faster because they have developed a separate industry referred to as the ***research industry.*** The role of this new industry in the economy consists in acting as leverage for growth, building the competitive advantage and an instrument of economic expansion.

Utility, as a feature that generates financial gains, links research with the economy. We may expect that commercialization helps research develop faster. The inflow of private capital mobilizes R&D centers, fuels investment, dictates directions of research, stimulates exploitation of outcomes, impacts researchers' salaries, determines the creation of new jobs, etc. By introducing knowledge from research into the economic bloodstream we may successfully solve the problem of funding, division of resources for research, dissemination of results, and maximization of effects in commercialized world.

Economic benefits make scientific knowledge similar to capital and drag research into the business cycle, stir up investor interest, obscure ties between knowledge generation and commercialization, decouple trade in knowledge from researchers and scientists, and as a result globalize research. Commercialization weakens the power of scientific arguments and intensifies the impact of business. In the long-term perspective, giving up autonomy in order to attract the interest of business deprives of the power to decide about the future of research and about civilization changes induced by research in the times when making money and striving for being rich is becoming central to any transformation in modern economy and culture. From this point on, the development of scientific knowledge has been dictated not so much by the importance of new discoveries but by the vision of economic gains. This is why scientific circles are thrilled about the potential graphene applications while other achievements of human intellect remain unnoticed.

Effects of the commercialization of research are similar to the impact of market mechanism on education, culture, media, healthcare and other social services. They result from turning the above mentioned areas into business activities driven by market mechanism and competitive struggle. Aided by commercialism, the new content injected into the economic bloodstream creates new entities. The vision of benefits shaped by fashion, rankings and models to be followed not necessarily serves the advancement of knowledge or helps in resolving civilization problems.

The impact of commercialized knowledge on economy can be best portrayed using numerical relationships. Cost-effectiveness criterion is connected with financial engagement and risk assessment. Higher level of commercialization helps reap additional benefits because at this stage projects which do not offer return on investment have already been eliminated. We can observe it in practice in more developed countries where interest is focused on the implementation stage and on the exploitation of benefits rather than on conducting basic research, where businesses want to acquire inventions rather than develop ideas or recruit specialists working for competitors rather than spend time on educating their own staff. Commercialization of research is guided by benefits, while the interest shown by capital helps develop

business relations. At lower levels possibilities to raise funds for research and capitalize its results are limited. For the same reason it is believed that humanistic disciplines more often experience financial hardships because people think they produce losses.

Bearing in mind difficulties in objective evaluation of the effects of research on economy, it is assumed that they are proportional to outlays meaning the higher the outlays the higher the expected effects. Hence, direct expenditure on research in individual countries is the basic measure of economic effects. Despite simplifications of such approach, the value of research outlays is huge. According to American researchers, the total value of the global research market exceeds USD 2 trillion a year and is higher than any other cost item including military ones.[1]

The scale of global research expenditure offers exorbitant possibilities, yet it not necessarily brings us closer to the resolution of major problems. The lack of adequate progress suggests that financial resources are used in an inefficient manner. The material structure of R&D expenditure is very telling. Better use of funds allocated to research is inhibited mainly by the diversity of goals and preferences, the need to maintain massive administrative infrastructure and the dispersion of research funds. The list of countries - top global R&D spenders for years includes the United States, China and Russia. The vision of unilateral investor benefits is the main reason behind the lack of will to make joint efforts and assist the weakest economies. Commercialization reduces the readiness to cooperate and fosters rivalry amongst the main centers even when they work towards the same goals.

The share of R&D expenditure in the GDP is a relative measure informing about funds allocated to research. It adopts the highest values in the most advanced economies (e.g., Norway, Israel – 3.4%). Contrary to popular belief, high R&D outlays and the expansion of the research sector in most Western countries do not directly translate into higher GDP. The relationship is also blurred by business relationships, transfers of profits, tax evasion, etc. At international scale these relationships are very diverse due to differences in the income, economic imbalances or underdevelopment in particular when the cost of debt servicing is higher than research-related expenditure.

The pattern of R&D expenditure broken down by industry is much more interesting as it informs about what research is used for, what goals it pursues in a longer-term perspective, how competitive advantage and dominance are built. Similarly to universities and R&D centers, fixed costs consume the biggest portion of R&D funds, which is why it is hard to estimate the value of "research goods" that have been produced. Information about direct R&D outlays could better show the **research potential** of a given country. In the absence of such data, reliable calculation of expenditure efficiency is rather difficult.

According to UNESCO statistics, Poland allocates as little as ca. 1% GDP (2015) on R&D. Considering low GDP of the country and a low share of outlays on research in it, Poland ranks at the bottom of EU rankings. Paradoxically, despite low R&D expenditure, GDP growth rate in Poland has for many years been amongst the highest in the EU economies. This phenomenon challenges the significance of the correlation between R&D outlays and GDP dynamics and, at the same time, reveals the imperfectness of this very measure. Undoubtedly, expenditure does matter for the prestige and working conditions ensured to the research community, their remuneration, mobility, including being able to attract top people from the country or from abroad but it does not correctly reflect the outcomes of research and their effect on GDP in a given year. With diverse scale of income in mind, the number of researchers and the share of population with higher education would possibly be much better indicators of R&D impact on the economy. For some reasons R&D expenditure accumulates in countries like China and India where salaries are low and R&D results quickly get globalized.

Thus the impact of research on economy could be better expressed in the number of scientific and R&D workers and as a share of this professional group in total employment. Such data better illustrate scientific potential of individual countries than allocated funds. The fact that effects in the field of research depend on the number of scientists and researchers rather than on expenditure encourages reflecting on how, by pursuing the right carrier development policy in the knowledge and R&D sector aimed to improve researchers' productivity, we could intensify economic effects of research.

In the case of the Polish "research industry" a number of simple improvements could be put in place. Mobility and concentration of researchers in top R&D centers are a derivative of salaries offered in the research sector. Low salaries do not encourage employees to move from one scientific institution to another within the same country but certainly make young researchers seek more attractive jobs in other industries or abroad. It implies huge losses in staff and "brain drain" as international corporations and R&D centers continue recruiting specialists from different countries. The impact of big migration flows, which since the early 1990s have drained several millions of engineers, IT specialists, medical doctors and other young specialists, is difficult to estimate. Astonishingly, in Poland where outlays on science are relatively low (0.74% GDP) similarly to researchers' salaries and migration index among young

[1] "Global Investments in R&D" (2020), Fact Sheet No 59, UNESCO Institute for Statistics. Published in June 2020, http://uis.unesco.org/sites/default/files/documents/fs59-global-investments-rd-2020-en.pdf

well educated people is high, the share of population with higher education is also high (5.1% above the EU average). Yet, well educated society is not enough to build an innovative economy.[2]

Comparative analysis might be helpful in finding out to what extent scientific development is favored by increases in expenditure as well as by the cooperation amongst R&D centers, concentration and coordination of research, etc. High positions in innovation rankings of the biggest corporations from a couple of industries testify to links between innovation and opportunities of financial accumulation. It means that in individual institutions, scientific knowledge produces effects relative to the possibilities of investment merging, R&D outlays and increased organizational and technological innovation. Speaking of commercialization, attention should be paid to proportions in which R&D expenditure is shared among the public sector, research establishments, and private companies. Concentration of expenditure on research may also mean active involvement of the government, which decides on goals to be accomplished in the research sector and on "how much research there is in research." We need to bear in mind that innovation in business covers not only own accomplishments but also progress achieved through trade in intellectual property goods, acquiring patents and inventions, taking over companies, etc., which explains a lot when it comes to the creative use of scientific knowledge.

According to *Forbes* magazine, ca. 44% of the total expenditure of private companies goes to R&D. The remaining part is financed by the central budget and R&D institutions. In fact, the impact of private operators on research is much bigger as it encompasses supervision over the use of a substantial portion of budget expenditure, projects carried out within the framework of public and private partnerships and spending made by universities, which in Western countries are mostly private. Estimates show **that the private sector controls on average around 70%** of all R&D outlays while its own capital involvement is much smaller.[3]

Problems and threats of commercialization of research

Looking at how research develops one may not overlook the threats of commercialization. Imperfections of the market mechanism leave visible traces. The point is that if we take market efficiency for granted, we get an ideal model that does not fit the reality. Trade in knowledge is usually hindered by regulated access to market, control of market flows, inadequate valuation, and other limitations that undermine the functioning of market forces. All of the above distort market balance and conclusions that flow from it for research. Premises of short-term balance provide little solid ground for the identification of fields of research, in which resources should be invested. Problems and threats in the research market can be boiled down to the following issues:

-- social conflict between the ethos of university research and consequences of its commercialization,

- adequacy of market valuation of carriers of scientific knowledge,

- impact of profitability on directions of resource allocation,

- making research development dependent on the interest exhibited by the capital market.

When it comes to effects of commercialization, it is worth noting that the *modus operandi* of the world of university research is far from the principles of perfect competition and of an efficient market. On the contrary, distorted transparency of the market mechanism hinders the adequacy of the structure of prices, costs and funds allocation. Monopoly in the field of knowledge carriers and concentration of funding activate factors from outside of the economic realm. Moreover, being a stakeholder, the government may restrict its control and coordination functions, as a result of which tasks that research is supposed to accomplish become the resultant of a combination of diverse external factors.

Deficit and information asymmetry are symptoms of monopolistic nature of trade in research achievements. Under such circumstances, owners of scientific knowledge use the advantage they get to maximize benefits, dominate and achieve other goals, which usually leads to **inflated prices and restricted access** to the most advanced research. The resulting low adequacy of prices translates into the shortcomings of the value chain. Starting from the research idea up to the distribution of benefits, these relationships are **infinitesimal by nature** and increase to a certain limit meaning we cannot reach high level of innovations without increasing the outlays on capital intensive projects and higher salaries. Then, the market mechanism triggers the spiral of costs and capital engagement, which considerably

[2] Author's compilation of the Polish State Statistics GUS) "Global Investments in R&D" (2020), Fact Sheet No 59, UNESCO Institute for Statistics. Published in June 2020, http://uis.unesco.org/sites/default/files/documents/fs59-global-investments-rd-2020-en.pdf

[3] Muszyński M., (2015) „Coraz więcej wydajemy na naukę, ale ciągle mało", Published on May 3, 2015, https://www.forbes.pl/technologie/naklady-na-badania-i-rozwoj-wydajemy-coraz-wiecej-ale-malo/tnt8h17

increases the valuation of effects. That is reflected in almost prohibitive prices of new inventions in the most commercialized sectors, such as, e.g., electronics or pharmacology.

Long-term effects of market-orientation in research are equally clear. Since benefits expressed in concrete sums have become the key driver of growth and allocation of research funds is dictated by the size of potential profits, university research has been losing its **elitist mission** of altruistic knowledge development, the perspective of scientific interests has changed while research has been emerging as the most profitable sector of economy. Research cannot develop outside of the economic context, which is why politicians' appeals are ineffective as long as business operators, especially those with substantial capital resources, exhibit little interest.

An active **research development policy** needs to be oriented at placing innovative products in the market and consists in the concentration of investment aimed to change the proportions between innovative and traditional sectors of economy. A knowledge-based economy translates into higher R&D outlays in enterprises and their higher international competitiveness. That is why it is worth taking care of enterprises which need knowledge and R&D efforts as much as we are trying to avoid investment projects that are too capital-intensive.

Stimulating research concurs with the country's competitiveness policy. The latter does not depend on the positions of the country's universities in international rankings, but directly derives from the achievements that enhance market **attractiveness of products.** Investment in research should not be dispersed. In leading economies outlays impact the structure of exports because economy is a self-regulating system. It is not accidental that research fuels the exports in industries, such as defense, aircraft, pharmaceutical, telecommunication, electronics, etc. This is how demand for knowledge and research generated by the fastest developing industries becomes the driving force of the economy

Research produces benefits, improves attractiveness of the economy, modernizes technology, creates new jobs, mobilizes public resources for research, etc., which is why **it requires cooperation between public authorities and business,** including international corporations, geared towards supporting knowledge-intensive modern industries and international expansion. Public expenditure on research is commercialized when advanced technologies are implemented. One can easily realize that the private sector is the biggest beneficiary of such commercialization.[4]

Observations confirm that countries whose policy promotes international economic expansion and the fostering of the market position are in favor of giving active support to economic operators capable of exploiting commercialized research. This is because the **"pull" strategy** which engages research in the development of expansive sectors of economy, **is more effective than the "*push*" strategy,** which motivates research institutions to make bigger efforts, which at a later stage get exposed to the penetration of foreign capital.

Difficulties with adequate valuation of carriers of scientific knowledge

At the heart of the problems arising from commercialization of research lies adequate valuation of the carriers of research value because we are dealing with goods protected by intellectual property laws which contain a substantial portion of original solutions. There are many indications that carriers of scientific knowledge are **sources of exceptional gains,** because their market valuation differs a lot from real expenses. Inadequate valuation **calls into question the assumption of market efficiency,** which questions the deployment of market mechanism to research outcomes. Exceptional gains are boosted by two parallel tendencies:

a) – overpricing of knowledge-based goods,

b) – restricting the utility of research by its owners.

High prices of products-carriers of scientific knowledge are caused by several factors connected with legal and patent protection of intellectual property, which gives intellectual property owners control over its trade. As a result, the adequacy with which the market value of research goods reflects their utility depends on monopolistic position of their owners. High prices of research-intensive products are also caused by some objective reasons, such as, e.g., total outlays made over a long period of funding the research, development, and implementation phases, remuneration paid to outstanding specialists, long time of return on investment, the risk of failure, etc. On top of that, advanced specialization ensures advantage over one's competitors and gives certain freedom to impose higher prices for exclusive knowledge obtained from research.

Secondly, we can easily realize that in the absence of close substitutes, prices of such products are based on the **cost formula** and cover not only justified costs but also all other costs which a monopolistic operator wishes to include. Low price elasticity of such products additionally encourages high margins. High **costs of research** reduce the population of those who wish to conduct it while, on the other hand, return on investment higher than the average attracts capital. It means that goods which carry scientific knowledge ensure above-average profitability, while the

[4] Błoński M., (2018), „Chiny prześcignęły USA w liczbie publikacji naukowych, Retrieved on January18, 2018, www.fleshbay.pl.

propensity to overestimate costs and apply high margins on goods which do not have close substitutes provide foundations of the pricing strategy.

For the same reasons, unlike for other goods in the market, when calculating return on investment on research-based products we consider all costs of research although they are not always fully justified. Monopolistic advantage secured by the research component allows using the cost formula that sometimes takes unit prices of products to unimaginable levels. Companies which carry out research willingly overestimate expenses and margins. That is confirmed by outrageously high prices of products that require multiple certifications to confirm that they are based on top notch technologies, contain components of advanced material engineering, pharmaceuticals, military and optical equipment, products for the aircraft industry, space sector and other special use products. It is not a secret that products for the military, telecommunication, mining, air transport, and other special use industries are even ten times more expensive than the same products in a regular market exchange.

It is worth noting that hand in hand with imposing high prices on such products goes a tendency to restrict access to knowledge, which in terms of market mechanism categories means **decreasing its social utility.** The phenomenon consists in rationing the use of knowledge and research by their owners. That is a reflection of supply restricting strategy aimed at maximizing gains of knowledge and research owners who exercise their monopolistic control. The use of privately owned knowledge is restricted in many ways. Privatization of intellectual property ensures legal protection to the most valuable components, control of trade and the scope of use. High unit prices and restricted access may produce exceptional gains.

We may conclude that exceptional gains, which have become a rule in the research market, also reveal the dysfunction in valuation and low market efficiency in this product category. Privately owned scientific knowledge boosts individual gains and reduces potential economic and social effects. The above described effect of commercialization, i.e., overestimating of costs and charging high unit prices in this category of goods, on the one hand delays the use and, on the other hand, restricts the group of beneficiaries of scientific achievements. This occurrence may be referred to as a **social utility gap of scientific knowledge**.

Growing discrepancy between increasing unit prices and decreasing utility makes adequate valuation even more difficult. The gap provides a wide framework within which market value of research goods oscillates at circumstances of controlled supply. As a result, **the efficient market hypothesis is challenged** for goods-carriers of scientific knowledge, the most attractive and modern products that bring exceptional profits and guarantee above-average financial gains to their manufacturers. It means that in the market economy commercialization of research offers the possibility to obtain exceptional gains from trade in goods, whose value is enhanced by the research and innovation component.

Looking at the valuation of research we may also observe that high outlays on research not always translate into productivity. Decreasing utility may signal the risk of capital invested in research being wasted when outlays cannot be recovered in the market. Ultimately, market mechanism in this area is far from perfect while research directly generates costs. International corporations teach us how we can benefit from knowledge and research. They are particularly interested in inventions that are covered with patent protection already at early stages of development as in their case further outlays on development and implementation works offer possibilities to leverage future gains. This is why top-notch photovoltaic and laser technologies, Internet apps, autonomous vehicles or graphene have relatively quickly got under the control of corporations.

Global corporations want their products to contain as much intellectual capital as possible. The point is not to reduce costs or offer cheaper products but to diversify and individualize them to achieve the longest possible advantage and monopolistic position, which bring **exceptional gains.** This is the operating pattern of the largest corporations, such as Google, Apple, Uber, Microsoft, etc. This approach finds empirical confirmation in high valuation of brands, trademarks, copyrights, inventions and other intellectual property carriers.

Commercialization of scientific knowledge in combination with limited public control triggers threats of **globalization.** The concentration of intellectual property in the hands of the most powerful corporations may expose mid-sized economies to painful effects of foreign capital penetration, drain the market from intellectual potential, and induce the transfer of intellectual property abroad while on the other hand it encourages monopolistic control over prices of knowledge-based goods, which limits the purchasing power of local communities. Weaknesses of "exceptional gains strategy" pursued by global corporations have been noticed and exploited by companies from the Far East, which opt for multi-stage expansion, mass production, cost reduction, and global distribution.

Commercialization and utilitarianism of scientific knowledge

Commercial funding increasingly more often decides on the choice of research interests and the allocation of funds for research. Profitability argument delineates goals and strategies in the field of research. It is expressed in the shifting of research interest from basic research to applications oriented at discounting benefits and highlighting factors leading to commercial applications of scientific knowledge in individual sectors of economy. A particularly sensitive area within this strategy is the one of development investment.

Above-average returns boost the **attractiveness of investment, yet they do not translate into the increase of social capital generated by research.** High-budget programs attract private capital seeking exceptional financial gains. There is a belief that investing in research unlocks growth dynamics and testifies to the modernity and innovation of economy. By treating research as a source of financial benefits we generate a powerful pressure on being successful. Examples can be found in the earlier mentioned industries, in which research programs are worth tens or even hundreds of millions of dollars. Protected by the government, their investment quickly translates into enhanced market value and high dividends. Irrespectively of whether financial engagement of the private sector is driven by the wish to participate in gains or by the control of access to scientific knowledge, such research projects pose the risk of reduced social utility of research outlays and turn into a financial pyramid. Although effects of the impact of science are well examined it is surprising that for over a decade the growth of countries with big capital resources, which are considered the richest, the most modern and innovative has been very low, especially when compared to economic growth leaders.

By making gains a priority, we naturally eliminate projects, which are interesting knowledge-wise but economically ineffective. Risk may be posed by central administration's impact on the allocation of public resources. The proportion, in which public funds are allocated in accordance with the needs declared by research community and to what extent they cater to commercial projects of private market players is crucial. From this point of view, giving support to private initiatives seems the most effective although such preferences are not always relevant for research.

Research whose results cannot be easily exploited is less interesting, which is why business actively uses marketing to create the vision of benefits irrespective of the value of knowledge. For instance, commercials that promote pharmaceuticals or financial products use attractive presentation formats, contexts, emotions, etc. to highlight the attractiveness of these products, suggest benefits intended to radically transform the life of those who buy them even though artificially generated fascination usually leads to disappointment. As a result, research projects carried out on a commercial basis do not always produce effects meeting high methodological and ethical standards. Final market valuation dictated by the scale of economic benefits differs from the real value of scientific knowledge. Business-oriented research leads to **instrumental treatment** of issues that it addresses. We may expect that creative marketing goes beyond conventional solutions deployed in advertising of certain goods and takes the target audiences outside of boarders of risk acceptable in a given market, by which it infringes rules of business ethics.

When the success of business projects is decided in a competitive struggle, the so called scientific arguments can be used rather freely. Instrumental approach to research that consists in the subordination of scientific argumentation to business rules gives **priority** to gains over the development of scientific knowledge and is a sign of **utilitarianism**, which undermines trust in research, truth and teaching, its originality and novelty.

Instrumental approach to research sends the **research community into the arms of conformism.** The phenomenon is rather widely present in the world of knowledge and research. We can speak of information conformism, which consists in manipulating information and communicating imprecise content. More dangerous consequences can be caused by cases of **normative conformism** that infringes the standards of conclusion drawing methodology and disseminates views that have not been properly validated. It produces schematic thinking, uncritical deduction and sometimes dogmatizing. Normative conformism **erodes the credibility** of research entities, media and research community. As an example we can give the belief in market balance and efficiency, adequacy of market price and value, etc. Thinking of the relevance and reasons behind such approach we may conclude that its presence in science is indicative of ties between the assumptions of scientific theories, i.e., paradigms of science, with ideology.

The loss of credibility combined with instrumental approach may suggest we are at odds with ethical requirements expected of researchers. In research the phenomenon is manifested by **ethical relativism,** which ignores moral norms and poses threats to the economy and civilization that are difficult to predict; the better perspective for gains, the higher the risk of negative effects of commercialization. Under a powerful impact of business, politics and ideology, ethical relativism in research may lead to manipulation, injustice, and destruction. Research gets engaged into ideological and commercial issues. Remarkably, market theory is dismissive of public goods and responsibilities of the state while it highlights the interest of private corporations. State aid granted to banks which triggered the crisis was justified at scientific grounds along the same lines while the victims of crisis, including Polish shipyards, were refused any support.

Conformism and utilitarianism in research may help us explain low growth dynamics in countries whose knowledge-related expenditure is relatively high and which we see as innovative, pursuing knowledge-based growth with modern economic infrastructure, rich in capital resources, making high research outlays, etc. For many years in this group of countries we have been observing stagnation, indebtedness, and other reflections of economic imbalances. To certain extent, utilitarian and conformist approach to knowledge and research triggers the concentration of wealth leaving civilization problems of underdevelopment, ecology, demography, and poverty unresolved. It means that by turning knowledge into a market asset we privatize gains and restrict social function of commercialized research. Thus,

despite huge research outlays at a global scale, there is no progress in solving the most acute economic problems and securing sustainable growth.[5]

Conclusions

We should be concerned about commercialization, as it turns knowledge and research against their substance, makes them market assets and treats effects of research as goods. Privatization of scientific knowledge leads to its instrumental treatment, sees resolving social and research problems in the light of gains, and stirs up competitive struggle that produces deep divisions. Priorities of scientific cognition are replaced with economic goals and change the relationships in the world of research. A new industry has emerged, in which research interests are subordinated to the availability of funds and accountability for effects. Knowledge, which gives control over the use and multiplication of effects through marketing activities, is considered the top scientific achievement.

By subjecting research to economic interests we make directions of research directly dependent on capital engagement. This is why the conviction that scientific knowledge is a form of capital and a source of wealth while economic performance depends on market domination and competitive advantage has become so common. Considering the substance of commercialization of knowledge, it is easy to note that economic efficiency depends also on the skillfulness with which we use market and business cycle mechanisms. At the same time expectations that problems depending on the progress in science will get resolved are ungrounded unless they produce commercial benefits.

Considering knowledge as a form of capital is the source of numerous misunderstandings. In fact, such approach boils down to seeing research as commodity and reduces the relevance of creative thinking, a factor critical for the creative potential of knowledge and research, which capital does not have. Perhaps this is why in highly developed economies unlimited access to capital and huge research outlays do not produce satisfactory growth. Apparently, achieving effects that derive from scientific knowledge depends on something more than capital. Research as an area of human intellectual activity merits more attention than investment outlays and competitive efforts.

Thus mechanisms of research differ from the mechanisms of trade in goods or services. Researchers may not be blamed for tasks they may not accomplish within commercialized knowledge and research. The efficiency of market mechanism and privatization of gains arise some concerns. Attention should be paid to these arguments when we evaluate research outlays and the distribution of economic effects since unilateral benefits may lead to unfavorable use of funds for research and unfair sharing of its effects based on the market mechanism.

Once again we should take a closer look at the mechanism that shapes the price and utility of knowledge when gains from it are privatized. In this area attention should be paid to the distortions of market mechanism. They inform about above-average returns on investment in research and downwards trend of the social utility of research outcomes. These occurrences confirm that a concrete owner in control of research-based products may shift demand and supply curves by inducing market mechanism to change the economic equilibrium price. Such a shifting to the new equilibrium sends false information to the market. As a result, owners of scientific knowledge may unduly increase prices and reap extraordinary benefits.

The possibility to achieve above-average return on investment consists in securing monopolistic position for knowledge-based products. By protecting intellectual property, through patents or other methods, one may take control over the supply and prices. Monopolistic position allows taking market valuation of knowledge carriers to higher levels; the same happens to anything that in commercials is presented as original, attractive, and desired. Above-average gains in this category of products are also achievable as a result of overestimated costs and distorted market transparency and transaction equivalence. Monopolistic position of a market leader comes as a result of mergers and acquisitions, trade in patents, as well as unlawful use of intellectual property. Being aware of obvious economic benefits of trade in carriers of intellectual property we may not remain uncritical about commercialization as a process that concurs with research development. These occurrences call for the awareness and responsible agency of researchers.

Abstract

Aspects related to the country of origin of the brand are traditionally identified with cultural identity, political climate, language, history, landscape relief, economic and technical development, as well as religiosity and population. Based on these elements, the country's image can also be understood as an essential element of a marketing strategy forming a dynamic holistic system, a complex of penetration of business and consumer expectations as well as a holistic attitude construct. Thus, the aim of our paper is to provide a contextually wide introduction into further own research of the phenomenon "national branding" and its incorporation into managerial theory and practice. The paper is divided into two parts. The first part deals with the theoretical background of the topic. Subsequently, in the second part of the paper, own analysis of secondary data is provided. The outcomes of the research and subsequently formulated conclusions provide the understanding of overall complexity of national brand and its incorporation into management processes.

Keywords: Brand, Branding, National Brand, National Branding, Country of Origin, Simon Anholt.

Introduction

The professional literature currently identifies several levels of further development of brand management, depending on which of the fundamental attributes of its value will be emphasized. At the same time, it maintains a sectoral approach to modifications of brand management concepts as a possible way to eliminate the shortcomings of uniformly conceived theoretical models of building and managing brand value (Valaskova & Krizanova, 2008; Palus et al., 2014; Kunter, 2016). Thus, in accordance with the latest knowledge in the researched area, the following sources of brand value come into consideration: 1) the social influence of the brand, its status dimension and the symbolism of belonging to an aspiration group (Krizanova et al., 2014); 2) the qualitative dimension of branded production, innovation and technological leadership (Girard et al., 2017); 3) socially responsible brand management and an emphasis on sustainable development (Butt et al., 2017; Lin et al., 2017) and 4) the contribution of the brand to the national economy and the convergence of its identity with the national brand identity of the country of origin (Garrett et al., 2017; Kim et al., 2017). It is the latter view of the issue of sources of brand value that has significant competitive potential on a global scale. Despite its growing regional fragmentation, the global market is a constant economic reality, and abstraction from international economic interdependence is not possible. The need for goal-oriented brand management thus even shifts from the B2C level to the B2B levels to the B2G level. At the same time, the brand acquires the character of an essential geopolitical stabilizer of social events. Its international implications are a balanced mechanism for balancing regional economic disparities (dislocation of production to regions with higher availability of production factors) to a facilitator of security policy (see the impact of the "Olympic Games" on events in the Korean Peninsula region). The regional origin of production became economic as early as 1887, when the British government, in an effort to restrict the sale of non-English products to English consumers, passed a law requiring the labelling of products made outside England with their country of origin (Oberecker et al., 2008). However, the psychological dimension of the country of origin effect (COE) began to be discussed only in the 1970s (Krizanova et al., 2013). Traditionally, a CEO is defined as a psychological effect describing how consumers' attitudes, product perceptions, and resulting consumer behaviour frameworks are affected

by the product's place of origin (Herz & Diamantopoulos, 2013). The term "origin of the brand" was defined by Thakor and Kohli (1996) as the place, region or country in relation to which the brand is perceived by its consumers. Lampert and Jaffe (1998) later stated that a country's image could be considered an asset in this context if it had a positive connotation, while it represented a societal commitment to the brand if there were negative associations.

Literature Review

Aspects related to the country of origin of the brand Kaynak et al. (2000) identified with cultural identity, political climate, language, history, landscape relief, economic and technical development, as well as religiosity and population. Based on these elements, the country's image can also be understood as an essential element of a marketing strategy forming a dynamic holistic system, a complex of penetration of business and consumer expectations as well as a holistic attitude construct (Parobek et al., 2016b). Consumer sensitivity to the country of origin aspect has been shown to vary by product category - strongest for consumer durables and luxury goods brands (Bitzios et al., 2017) and weakest for low consumer engagement product brands such as shampoos, candies, light bulbs, toilet paper and sports shoes (Aichner, 2014). In other times, in addition to the indication of the country of origin of the brand, the indication of the country of production of the product also comes to the fore in terms of terminology. However, research to date suggests that this aspect does not have a significant impact on consumer behaviour (Nguyen & Nguyen, 2017).

From the point of view of the company's decision-making on the development of its activities on foreign markets, consumer affinity, resp. animosity in relation to the brand's country of origin. The extent of consumers' tendency to prefer brands depending on the country of origin varies depending on the degree of individualism, resp. collectivism, which characterizes the socio-cultural profile of the consumer country. It is true that countries with a higher degree of collectivism are more ethnocentric in consumption, i.e. they prefer domestic brands to foreign ones and, conversely, countries with a higher degree of individualism are more open to foreign brands. With the mean value of this dimension in the Hofsted model, Slovakia belongs to the so-called indifferent countries. One of the biggest challenges in this area is faced by Asian brands, which subconscious consumers generally associate with low quality, even life- and health-threatening externalities of their consumption and use. Exceptions are brands from the electronics and automotive industries (which, however, are also very cautious in declaring their country of origin if they are not countries with explicitly positive associations - such as Samsung and Daewoo brands, which are active in declaring their origin up to in the context of the country's economic development). On the contrary, strong positive associations are associated with brands of wine from France, cars from Germany, electrical engineering from Japan, coffee from Colombia, fashion from Italy and chocolate from Switzerland. Some brands have even gone so far as to base their competitive advantage on creating the illusion of nationality (for example, the American ice cream brand Häagen-Dazs has thus created the impression of Scandinavian origin to convey an aura of old world traditions and crafts) (Moravcikova & Krizanova, 2016; Yang et al., 2018; Hussein & Fraser, 2018).

A properly communicated type of link between the country of origin and the product category of the brand is thus demonstrably a source of competitive advantage, which, however, is not sufficiently used in practice. An example is Turkey, which has a strong tradition in carpet production but is not presented externally in the context of international trade, so that the term "Turkish carpet" becomes a brand added value and not just an indication of the standard quality of this product category (Morgan et al., 2004). In connection with the term 'country of origin branding', in our view, given its importance for the development of the market on an international scale, two other related terms need to be defined terminologically, namely 'national brand' and 'national producer brand'. With a certain degree of abstraction, a national brand can be described as synonymous with the brand of the country of origin (macro-dimension). The national manufacturer's brand then represents a specific product brand managed in such a way as to maximize the synergetic effect resulting from the value of the national brand (micro-dimension) in building and managing its value. The relationship between these two dimensions of the brand is synalagmatic. This means that not only the national brand has the potential to positively affect the consumer-perceived value of the brand of the national producer, but also vice versa - a valuable brand of the national producer has the potential to positively affect the value of the national brand and accelerate foreign direct investment, respectively development of tourism in the country. In the context of the national manufacturer's brand management from the point of view of corporate governance, the key phase is its positioning in accordance with the existing value of the national brand. Brand positioning is traditionally defined as the act of designing a product's product and communication policy so that the brand occupies a distinct place in the mind of the consumer (Krizanova, 2008).

Through this process, brand management offers added value to the consumer based on the creation of their own competitive uniqueness. Already Dib et al. (Cristea et al., 2015), however, stated in 1997 that positioning, the essence of which is the perception of the brand by consumers, is not completely under the control of the company, but it is also influenced by environmental factors. The resulting positioning of the national manufacturer's brand may therefore differ in practice from the original intention of its management (Blankson, 2004). The explanatory variables of this

phenomenon are the personality characteristics of the consumer, his value system, established patterns of consumer behaviour and his own past experience (Schiffman & Kanuk, 2007).

In addition, in the context of corporate marketing management in the international market, brand positioning is exposed to new challenges related to the effects of consumer subjectively perceived national brand value, which can cause significant oscillation of product brand value (Baack et al., 2013). Parobek et al. (2016a) state that when entering a foreign market, it is necessary to pay primary attention to the creation of the so-called consumer familiarity with the brand. The affective dimension of brand positioning in foreign markets is given by the consumer's need to express themselves (Munteanu & Pagalea, 2014). Such a self-expressing potential is also available to the brand of the national producer, which on the outside reflects the value orientation of the consumer, his (anti) globalization attitudes, lifestyle, etc. The normative level of positioning is manifested by different degrees of preference, respectively. rejection of the brand of the national producer caused by consumer ethnocentrism, resp. national disidentification, which were profiled on the basis of the personal characteristics of the consumer with regard to his past experience with the country of origin as such, resp. with competing brands of national producers. Jimenez and San Martin (2010) defined consumer ethnocentrism as a way of seeing processes and phenomena characterized by egocentrism and scaling of the attributes of their surroundings depending on the degree of their conformity with their own perception of social and moral norms.

This creates a precondition for optimal positioning of domestic brands as well as brands of national products of countries with a convergent socio-cultural profile (Josiassen et al., 2011). National disintegration, on the other hand, represents an animated attitude towards national product brands due to their connection with national brands, thus creating space on the domestic market for favourable acceptance of foreign brands from countries with a divergent socio-cultural profile. The level of ethnocentrism and national disidentification in the target markets is a relevant segmentation variable and it is necessary for the company to take it into account when creating a reference framework for positioning in its strategic management. The tool for detecting convergences and divergences of national brand profiles is the so-called The National Brand Index (NBI) compiled by the GfK consulting group in cooperation with S. Anholt and the so-called The Good Country Index (GCI), in the development of which S. Anholt also participated.
The National Brand Index is based on six basic parameters, which are:

- export - the influence of the country's image on the commercial success of its exported production,
- model of government - perception of the capabilities and possibilities of the form of government and the current political situation to ensure sustainable development and respect for human rights,
- culture - presentation of the landscape in the artistic sphere and its success and knowledge in sports, literature, music, cinematography, architecture, etc.,
- population - friendliness and hospitality in relation to tourists as well as the degree of friendship formation at the international level,
- tourism - the attractiveness of the country in terms of its natural beauty, history and social life,
- immigration and investment - attractiveness for talents and capital in terms of interest in studying, working and living as well as in the development of business activities.

The most valuable national brands according to this index in 2019 are Germany, France, Great Britain, Canada, Japan, USA, Italy, Switzerland, Australia and Sweden. The Slovak Republic is not evaluated in this ranking. Within the region of Central and Eastern Europe, only the Czech Republic, Hungary, Poland, Russia, Turkey and Ukraine are considered. Within the Good Country Index, the benefits of countries in seven basic dimensions are assessed in terms of selected criteria. However, the disadvantage of this model related to its global dimension is that it does not take into account the country's commitments to its own citizens, but only the country's contribution to societal sustainable development, which slightly limits its usability for brand management in terms of corporate governance in foreign markets.

Results and Discussion

The profiles of national brands of OECD countries according to S. Anholt are found in Table 1, where: 1) S&T is a science and technology; 2) C is a culture; 3) IP&S is international peace & security; 4) WO is a world order; 5) P&C is a planet & climate; 6) P&E is prosperity and equality and 7) H&W is health & wellbeing.

Table 1: Profiles of national brands of OECD countries

OECD countries	Dimensions						
	S&T	C	IP&S	WO	P&C	P&E	H&W
Australia	20	48	54	6	50	102	13
Austria	20	48	54	6	50	102	13
Belgium	9	1	109	13	22	7	16

The scores of countries acquired in individual dimensions are quantified as a ratio indicator of their individual contribution to the global dimension of a given dimension, while the result also takes into account the level of GDP of a given country. Based on the values of individual dimensions, it is also possible to determine the total value of IGC (it is true that the lower the value of the score, the more valuable the national brand is perceived as valuable within the dimension). However, this data has a lower usability in terms of marketing implications than knowledge of the values acquired within the individual dimensions. The reason is that the mutual similarity of countries in terms of their attributes involved in the perception of the value of the national brand is an essential factor in the decision on the positioning of the national manufacturer's brand in the context of identified consumer ethnocentrism, respectively national disintegration. OECD countries are thus grouped as follows, based on the similarity of their national brand profiles, as follows:

- Cluster 1: Australia, Chile, Japan, Korea, Austria, Turkey, USA,
- Cluster 2: Denmark, Finland, France, the Netherlands, Ireland, Hungary, Canada, New Zealand, Germany, Norway, Spain, Sweden, Italy, United Kingdom,
- Cluster 3: Mexico, Switzerland,
- Cluster 4: Belgium, Luxembourg, Poland, Portugal, Slovenia,

- Cluster 5: Czech Republic, Estonia, Greece, Iceland, Israel, Latvia, Slovak Republic.

The cluster analysis consists of following steps 1) selection of input database; 2) selection of parameters; 3) name of the object; 4) choice of clustering technique; 5) choice of using distance; 6) placing in clusters; 7) choice of distances in Dendrogram; 8) selection of appropriate techniques for creation of Dendrogram; 9) an explanation of the best Dendrogram similarities of objects and variables. Input for clustering in terms of data analysis is data matrix. Data matrix contains variables (in our case the attributes of the socio-cultural profile) in m columns and n rows (in our case OECD countries) on which these characters are measured. Every object it means the row of data matrix, that is, $x_{iT} = (x_{i,1}, ...x_{i,j},... x_{i,m})$ is characterized by its characteristics. The performed cluster analysis showed that clusters 4 (Belgium, Luxembourg, Poland, Portugal, Slovenia) and 5 (Czech Republic, Estonia, Greece, Iceland, Israel, Latvia, Slovak Republic) are the most similar, while the largest degree of differences was found between these clusters and cluster 2 (Denmark, Finland, France, the Netherlands, Ireland, Hungary, Canada, New Zealand, Germany, Norway, Spain, Sweden, Italy, the United Kingdom). It is in cluster 2 that the most brands among the TOP 10 most valuable according to the NBI index for 2019 (France, Canada, Germany, Sweden, Italy, Great Britain) are grouped. Other of these brands are in cluster 1 (Australia, Japan, USA) and 3 (Switzerland). The position of the Slovak Republic in cluster 5, together with knowledge of the value of the "masculinity" dimension in Hofstede's model of socio-cultural profiles, indicates the consumer ethnocentrism of its population, characterized by the importance of innovation as a possible source of weakening the value of national producers' brands in favour of foreign producers (Kliestikova & Janoskova, 2017). In the sense of the above, it should be true that in the context of brands of national producers, their national brand is an advantage in the conditions of the Slovak Republic only if they come from clusters 4, respectively. 5 (case, from clusters 1-3, assuming their innovativeness). However, this is a presumption concerning consumer decision - making in conditions of the same price level - i. e. that in this way the Slovak consumer will make a choice when choosing between brands without taking into account the criteria of their price. Consumer ethnocentrism in this case is also caused by the existence of a stereotype of distrust in relation to the real quality of foreign brands of consumer products on the Slovak market. This fact is given not only by historical experience, but also by current cases questioning the quality of branded production allocated on our market (ad case of dual quality of food on the Slovak and Austrian market from 2019). The importance of the national brand in the context of building the competitive advantage of national manufacturers' brands also follows from Table 2, which shows the representation of the countries of origin of the world's most valuable brands in 2019 according to Interbrand.

Table 2: Countries of origin of the most valuable brands according to Interbrand 2019

Country	Brands in the Interbrand 2019 ranking	Number of brands
Canada	Thomson Reuters	1
China	Huawei, Lenovo	2
Denmark	Lego	1

An example of systematic managerial work with knowledge of consumer ethnocentrism and its specifics in the conditions of the Slovak Republic is the Rajo brand, which, despite belonging to the German concern Meggle AG since 2003, does not communicate this fact externally in its marketing activities and continues to identify its identity with consumers of perceived Slovak origin. From the previous text of this chapter, in accordance with the results of the cluster analysis, it could appear that in the Slovak market, consumers in the absence of Slovak, resp. Czech brands prefer brands from Estonia, Greece, Iceland, Israel, Latvia, Belgium, Luxembourg, Poland, Portugal and Slovenia. However, reality proves that this assumption is wrong. The cluster arrangement of OECD countries must be perceived on two basic levels, which are equivalent to each other. One of them is the already mentioned level of brand perception on the Slovak market, which is characterized by shopping ethnocentrism and a tendency to innovation.

Conclusion

The aim of our paper was to provide a contextually wide introduction into further own research of the phenomenon "national branding" and its incorporation into managerial theory and practice. The aim of the paper has been accomplished by analysing the evolution of relevant publications in reputable databases as well as by providing brief own analysis of secondary data which are publically available. The outcomes of the research and subsequently formulated conclusions provide the understanding of overall complexity of national brand and its incorporation into management processes. These findings have already been partially outlined by various authors, but no clear and uniform statement has been formulated so far. However, it is important to highlight the fact that presented research outcomes form platform for erudite managerial decision making when entering either operating on foreign market.

Unification of The Law of Carriage of Passengers in The European Union - Myth or Reality?

Dorota AMBROZUK

ORCID 0000-0003-2828-2049

University of Szczecin, Szczecin, Poland, dorota.ambrozuk@usz.edu.pl

Abstract

Under a common transport policy and consumer policy, beginning in the 1990s, European Union's bodies have been issuing regulations governing the subject-matter of the carriage of passengers. Their aim was to uniform the rules applicable in this scope in European Union Member States, and at the same time to raise the level of passenger protection with regard to regulations already included in international carriage conventions and domestic laws in individual Member States (cf. Gospodarek, 2011, pp. 55-68; see also Kersten, 2007, pp. 117-136). Solutions that were more favourable to passengers compared to the existing ones have been introduced. Issues not previously legislated have been regulated. The Union's legislator maintained at that (modelled on international carriage conventions) the branch-like nature of these regulations (cf. Ambrożuk, 2014, pp. 11-24).

Even though provisions of individual carriage regulations address an array of issues, they still do not comprehensively regulate problems that a passenger may face while travelling. Certain issues are still not standardised and Member States were left with considerable freedom when it comes to other matters.

In this state of facts, it is reasonable to ask whether unification of the law of carriage of passengers has indeed been achieved.

The aim of this paper is to provide an answer to this question. The author presents issues which need to be regulated at the Union level to bring about full, or at least further reaching, unification.

The author analyses legislation and judicial decisions, including those of the CJEU, and reviews the literature.

Keywords: European Union law, carriage of passengers, unification of regulation

Introduction

The process of unification of the law of carriage of passengers in the European Union initiated in 1990s has certainly contributed to the reinforcement of protection of passengers as the weaker party to the contract for the carriage of passengers. The level of this protection could not be raised quickly in the pan-national scale by introducing changes to existing international carriage conventions relating to individual branches of transport due to the length of processes of negotiation and renegotiation of international agreements. Such processes often take a good few years (see Ambrożuk, Dąbrowski, Wesołowski, 2019, pp. 15-52). This is caused by discrepancies in the interests of individual countries, differences in legal systems (the common law system, the continental system) and the related conceptual grid and established tradition. Moreover, even if changes in individual conventions that would be favourable to passengers were brought about relatively quickly, there still would be no guarantee that all states-parties to the convention would adopt these amendments in the current shape, which is seen in the example of the so-called PAL 2002 Protocol to the 1974 Athens convention relating the carriage of passengers and their luggage by sea. As a result, they could lead to the emergence of problems greater than the existing ones. A passenger wanting to pursue his claims under a contract for international carriage by a given means of transport would have to establish not only whether a carriage convention applies to the given carriage (that is establish the scope of application of the convention) but also the version that should be applied (original or as amended; and if there have been multiple amendments, which amendments). Moreover, successful changes at the level of international law (international conventions) does not solve the issue of introducing relevant changes in domestic laws of individual Member States. This is why the EU legislator resorted to the furthest-reaching unification measure under EU secondary legislation, that is a regulation. Regulations are in force and applied in Member States directly which means they do not require any activity on the side of Member States, they do need implementing rules.

This concerns the following regulations:

1) Regulation (EC) No 2027/97 on air carrier liability in the event of accidents, amended by Regulation (EC) No 889/2002 of the European Parliament and of the Council of 13 May 2002,
2) Regulation (EC) No 261/2004 of the European Parliament and of the Council of 11 February 2004 establishing common rules on compensation and assistance to passengers in the event of denied boarding and of cancellation or long delay of flights, and repealing Regulation (EEC) No 295/91, (the so-called air regulation),
3) Regulation (EC) No 1107/2006 of the European Parliament and of the Council of 5 July 2006 concerning the rights of disabled persons and persons with reduced mobility when travelling by air,
4) Regulation (EC) No 1371/2007 of the European Parliament and of the Council of 23 October 2007 on rail passengers' rights and obligations, (the so-called rail regulation) (see Stec, 2010, pp. 969-985),
5) Regulation (EC) No 392/2009 of the European Parliament and of the Council of 23 April 2009 on the liability of carriers of passengers by sea in the event of accidents, (the so-called sea regulation),
6) Regulation (EU) No 1177/2010 of the European Parliament and of the Council of 24 November 2010 concerning the rights of passengers when travelling by sea and inland waterway and amending Regulation (EC) No 2006/2004, (the so-called waterways regulation),
7) Regulation (EU) No 181/2011 of the European Parliament and of the Council of 16 February 2011 concerning the rights of passengers in bus and coach transport and amending Regulation (EC) No 2006/2004, (the so-called bus regulation), (see Stec, 2012, pp. 433-450).

The EU legislator has built within the European Union framework a system of legal norms concerning the carriage of persons maintaining separation of individual branches of transport. In each of the individual branches of transport (transport by air, sea, inland waterways, rail and road), under one or more regulations, it has regulated similar issues such as:

- liability for the life and health of passengers and for their luggage;

- liability for preventing access to a means of transport, its cancellation, delay, loss of connection, including also the issue of due flat-rate compensation in such cases,

- the issue of carriage of disabled passengers or passengers with reduced mobility, including non-discrimination of such passengers when using transport services and as part of it: granting these passengers, as a rule, the right to transport, with exceptions dictated mainly by safety principles and taking into account technical possibilities of a given carrier, enabling these passengers to travel with assistance (sometimes they are transported gratuitously) or a certified guide dog, granting the right to gratuitous assistance of employees of the entity managing ports, airports, railway stations, terminal, etc., or assistance of the carrier's staff, providing gratuitous transport of a limited amount of equipment necessary for mobility and principles of carriers' liability for such equipment;

- obligation to provide necessary information to passengers;

- obligation for carriers to have third party insurance;

- obligation to establish in each Member State a body or bodies responsible for enforcing provisions of these regulations and granting passengers the right to file complaints to such bodies for violation of provisions of these regulations.

Taking into account the adopted method, i.e. EU regulations, the system looks uniform at first glance, but in reality it is still far from full unification.

Causes and effects of lack of full unification

There are at least a few reasons for the lack of full unification of the law of the carriage of passengers at the EU level.

The first of them results mainly from the scope of rules and exclusions adopted in individual regulations. Regulations do not apply to each carriage of persons performed in the territory of the European Union (or under domestic or international transport). It is an effect of numerous exclusions of application stipulated in regulations, i.a. due to the size of the means of transport or the number of crew (e.g. inland waterways regulation no. 1177/2010), irregularity of transport or route length (e.g. bus regulation no.181/2011) or no payment for transport (e.g. air regulation no. 261/2004). In such cases provisions of international carriage conventions will apply to international carriage, and domestic provisions of a given Member State to domestic carriage, or even to international carriage when a given problem cannot be solved on the basis of an international convention.

Secondly, some of the regulations grant European Union Member States the possibility to exclude application of certain provisions for a given period of time or stipulate the right to grant temporary exemptions from applying

them (rail regulation no. 1371/2007, and also bus regulation no. 181/2011). This period of time may be extended. It is primarily dictated by taking into account the difficulties that entrepreneurs dealing with transport, including also transport infrastructure, may encounter when applying all provisions of these regulations. This refers mainly to entrepreneurs from less well-off countries of the European Union.

The third reason for the absence of full unification is the lack of standardisation in the regulations - with the exception of carriage by rail and by sea - of the issue, highly important to passengers, of the statute of limitations for their claims. Limitation periods fall under procedural rules which rest with the Member States under the principle of procedural autonomy of these countries, understood as Member States' competence to regulate jurisdiction of courts and court procedures which serve to examine claims based on the Union law (see ECJ judgements of 16 December 1976 in C-33/76 *Rewe* and C-45/76 *Comet*; Resolution of the Polish Supreme Court of 17 March 2017, III CZP 111/16). However, a breach of this rule is being observed due to the need to comply with the principle of equivalence and the principle of efficiency (Wróbel, 2005, pp. 41-42; see ECJ judgement of 25 July 1991 in C-208/90 *Emmott*). According to the principle of equivalence, national procedural rules cannot be less favourable to claims based on the Union's law than similar claims based on a domestic law, while according to the principle of efficiency domestic procedural rules cannot make it impossible to exercise in practice rights based on the Union's law (Wróbel, 2005, p. 44).

The absence of the said regulation causes European Union Member States to apply different limitation periods in reference to the same claims resulting from EU carriage regulations, depending on whether a given claim has a basis both in the convention law and EU regulations (e.g. claim for compensation of the death of a passenger) or solely in the Union's regulations (e.g. claim for flat-rate compensation for flight cancellation or delay). In the first case, the absence of standardisation of the limitation period in the Regulation is an obstacle in the application of the limitation period resulting from an international carriage convention (CJEU in its judgement of 22 October 2009 in C-301/08 *Bogiatzi* against the air regulation no. 2027/97 (889/2002)). In the second case the limitation period resulting from the convention should not be applied and it is appropriate to apply the limitation period resulting from a domestic law (CJEU judgement of 22 November 2012 in C-139/11 *Moré* against air regulation no. 261/2004). Limitation periods resulting from a domestic law may be different, e.g. in the majority of European countries they are three years, but e.g. in Spain and Greece - five years. In Poland regulation of the limitation period of passenger claims is not uniform, but as a rule these period allow for one or two years. Earlier, for claims resulting from air carriage pursued on the basis of Regulation no. 261/2004, Polish courts applied a one-year, a two-year or even a ten-year limitation period, which did not foster certainty of law. The case was resolved by the Supreme Court in its judgement of 17 march 2017, III CZP 111/16 (more on this subject in Stec, 2017, pp. 591-598; Kasprzyk, Konert, 2017, pp. 55-72; Ambrożuk, Wesołowski, 2018, pp. 91-101). Currently this issue is already regulated in the Polish Aviation law (one-year limitation period).

As has been pointed out above, carriage by rail and by sea is an exception here. Rail regulation no. 1371/2007 and sea regulation no. 392/2009 do include limitation periods. This is because the EU legislator has appended extensive excerpts from international carriage conventions to them. The rail regulation was supplemented with an excerpt from the so-called CIV convention, that is Uniform Rules concerning the Contract for International Carriage of Passengers and Luggage by Rail, which is appendix A to the Convention concerning International Carriage by Rail (COTIF), done on 9 May 1980, amended by the Vilnius Protocol of 3 June 1999. The sea regulation was appended with an excerpt from the Athens Convention relating to the Carriage of Passengers and their Luggage by Sea, PAL 2002. Both of these conventions standardise limitation periods.

This is why, not going into legal complexities relating to appropriate application of provisions covered in appendices to the said regulations, it may be assumed that in the case of international carriage by rail performed in the territory of the European Union, claims of passengers resulting from rail regulation no. 1371/2007, where at the same time this carriage falls under application of the CIV Convention, are subject to a three-year, two-year or a one-year limitation period. It depends on what the claim concerns and on whether the carrier may be accused of actions or failure to act intended to cause damage, or if he acted or failed to act in a negligible way and was aware of the likelihood of damage. The same limitation periods are applied as a rule to passenger claims resulting from EU rail transport which is at the same time domestic transport, but only in reference to compensation claims for the death or injury of the passenger and compensation claims for damage to luggage, because the limitation period stipulated for in the appendix refers to such claims only. Other claims resulting from the above-mentioned regulation are subject to limitation periods stipulated in a domestic law (Ambrożuk, 2018a, pp. 41-48; see also Stec, 2017, pp. 600-602).

The question of establishing limitation periods seems slightly simpler in the case of the sea regulation no. 392/2009. It covers claims that are also subject to regulation in the Athens Convention PAL 2002, to which a two-year limitation period applies (Ambrożuk, 2018b, p. 136).

The above-mentioned solutions applied in the road regulation no. 1371/2007 points out that even where the limitation period has been regulated, not directly in the regulation but in its appendix, one cannot talk about a full unification of law in this scope in reference to rail carriage performed in the Union's territory.

The fourth reason for the absence of full unification involves giving Member States full discretion in terms of exercising obligations imposed by the regulations. An example here is the obligation, present in almost all regulations, for a Member State to appoint a body or bodies responsible for enforcing provisions of the regulations to which passengers may bring complaints for violations. The number of such bodies and conditions for filing complaints with them as well as the procedure of examining the complaints were left to the discretion of Member States, recommending only under European Commission's interpretative guidelines (see Interpretative Guidelines on Regulation (EC) No 261/2004 and on Regulation (EC) No 2027/97 (889/2002) and Interpretative Guidelines on Regulation (EC) No 1371/2007) that bringing in a claim to the said body should be preceded by filing the claim with the carrier itself. Hence the possible far-reaching discrepancies here in individual Member States.

The efficiency of such complaints may be different in individual Member States, too. E.g. in Poland until recently an administrative body appointed to enforce the provisions of the air regulation no. 261/2004 had not only exercised administrative supervision (as is the case now), but also adjudicated passengers' individual financial claims (flat-rate compensation), which caused severe problems in practice and judicial decisions (Ambrożuk, 2017, pp. 48–60). At the same time, in the Netherlands the complaints only had an effect in the sphere of administrative law and did not determine the passenger's individual claim, which the CJEU considered sufficient (see CJEU judgement of 17 March 2016 in joint cases C-145/15 *Ruijssenaars and Others* and C-146/15 *Dees-Erf*).

Moreover, difficulties in unification may result from a multiplicity of languages in which the regulations are issued or a diversity of legal cultures of individual Member States, thus from typical problems which emerge also on the ground of the convention law and other Union regulations. Differences in this regard may cause different interpretations of the same legal measures that are present in the regulations when the law is applied by entities coming from different Member States of the Union. The interpretative guidelines prepared by the European Commission and primarily by the CJEU case-law may prevent such different interpretations.

Summary

Regulations issued by authorised bodies of the European Union which govern the matters of carriage of passengers in individual branches of transport have contributed to far-reaching unification of the rules in place. Yet still, this does not mean full unification, which might never be achieved. Undoubtedly, full unification would benefit from systematization of limitation periods resulting from regulations for claims that passengers have the right to, by standardising them directly in the regulations. This would require breaking the procedural autonomy of Member States.

Resurrection of Securitisation – Has the EU Found the Right Solution?

Przemyslaw KATNER

University of Szczecin, Szczecin, Poland
ORCID 0000-0003-4059-5216

Abstract

Before the 2007 financial crisis, securitisation as an economic and legal construct had been developing dynamically in developed and developing countries, gaining significant impact on financial markets. The crisis, however, led to a breakdown in this sphere. Using data made available by the European Bank Authority and the Association for Financial Markets in Europe the scale of these measures was presented as well as the later image of securitisation in the USA and Europe. The paper then presents reasons which caused certain securitisation products irrespective of the pre-crisis rating level (even those rated 'AAA') to perform poorly during the crisis and reasons that hinder the development of securitisation in the post-crisis environment, especially in Europe, and which affected the relatively quick increase of US securitisation issuances and outstandings. This led to the need to look at attempts to revive securitisation in the European Union by relevant changes in the law, which would lead in particular to lowering the risk borne by investors and which would increase trust in securitisation, thus positively affecting its attractiveness. This is why the author analyses solutions adopted in Regulation 2017/24 (in force since January 1, 2019 and followed by other acts and documents related to securitisation) which introduces a general framework for securitisation and unified rules for simple, transparent and standardised (STS) securitisation as a high-quality securitisation, which is an opposite to complex, opaque and risky securitisation products available on the market. Particular attention is paid to due-diligence, risk-retention, transparency, simplicity and standardisation requirements that are imposed by the regulation.

Keywords: securitisation, securitization, Regulation 2017/2402, STS

Introduction

Securitisation is an economic and legal construct with a non-uniform character and often rather complicated structure. It is quite often assumed that it is a necessary element of properly functioning financial markets. Nevertheless, after the financial crisis which started in 2007, both securitisation issuances and outstandings in Europe have dropped drastically compared with the previous situation and remain quite low. What were (are) the reasons for it and has the European Union found a solution to this problem?

Securitisation is defined in various ways (e.g. Lipson 2012, p. 1233; Delivorias 2016, p. 1; in Polish literature e.g. Zombirt 2003, pp. 29–30; Baczyk 2015, pp. 748–749; Katner 2016, pp. 12-13). For example, Schwarcz (2012, p. 1298) defines it as "a financial transaction in which (1) a special purpose entity issues securities to investors and, directly or indirectly, uses the proceeds to purchase rights to, or expectations of, payment, and (2) collections on the rights or expectations so purchased constitute the primary source of repayment of those securities". Whereas Regulation 2017/2402 laying down a general framework for securitisation and creating a specific framework for simple, transparent and standardised securitisation (hereinafter Regulation 2017/2402) in recital 1 provides that "securitisation involves transactions that enable a lender or a creditor – typically a credit institution or a corporation – to refinance a set of loans, exposures or receivables, such as residential loans, auto loans or leases, consumer loans, credit cards or trade receivables, by transforming them into tradable securities. The lender pools and repackages a portfolio of its loans, and organises them into different risk categories for different investors, thus giving investors access to investments in loans and other exposures to which they normally would not have direct access. Returns to investors are generated from the cash flows of the underlying loans".

Development and downfall of securitisation

Securitisation is a relatively new economic and legal phenomenon. Its roots may be sought in the 18th century (Frehen, Goetzmann, Rouwenhorst, 2014, p. 287 *et seq.*), but usually it is assumed that modern securitisation was initiated in 1970 in the USA when the Government National Mortgage Association (GNMA, Ginnie Mae) began

publicly trading mortgage-backed securities (MBS), which gave investors the title to revenues obtained as a result of paying off these mortgages (in particular the principal and interest) (Deku, Kara 2017, p. 57 *et seq.*; Schwarcz, Markell, Broome 2004, pp. 1-3; Lipson 2012, p. 1247). In mid 1980s it appeared in Western Europe and then spread throughout almost the entire world (Salter, Utz 2001, p. 45; Mancuso 1997, pp. 59-60; Katner 2015, pp. 212-218; Lee 2002, p. 101 *et seq.*). The issued and transferred securities were gradually secured against assets other than mortgage receivables and which are a source of revenue, especially against receivables (also future receivables) resulting from e.g. consumer credit, credit card use, leasing agreements, contracts for the sale of goods, contracts for the provision of ICT services, medicine deliveries, etc. (Schwarcz, Markell, Broome 2004, p. 3; De Sear 2006, pp. 50-52). In the 1990s the so-called synthetic securitisation evolved, which is a securitisation model departing from the traditional one (Bell, Dawson 2002, p. 542 et *seq.*).

The securitisation market developed very dynamically (LoPucki 1996, p. 24). It is hard to give the exact numbers as there are varied sources and selection methodologies that are used to determine the securitisation issuance. However, the European Securitisation Forum (ESF) reported that in 1996 the European securitisation issuance amounted to less than EUR 40 billion in issues placed, in 1997 – almost EUR 50 billion, in 1999, after a drop in 1998, it was over EUR 70 billion (ESF Report 2001, p. 2). In 2002 the issuance in Europe rose to EUR 157.7 billion, in 2004 – EUR 243.5 billion and in 2006 – EUR 481 billion (ESF Report 2010, p. 3). In the USA, in 2000 the issuance was at the level of EUR 1,088 billion, it peaked in 2003 (EUR 2,914.5 billion) and in 2006 it was EUR 2,455.8 billion (ESF Report 2010, p. 3). If we take into account the outstanding balances, in 2004 securitisation was a USD 6 trillion industry (Schwarcz, Markell, Broome 2004, p. 1), and in 2007 – USD 8.9 trillion (Cheng, Dhaliwal, Neamtiu 2011, p. 541 *et seq.*).

Development of securitisation resulted from varied functions it performed. They include i.a. obtaining and diversifying sources of funding for the operation, diversification and transferring credit risk, freeing up regulatory capital and economic (internal) capital, improvement of return of assets and return on equity indexes and also increasing investment opportunities (Stopyra 2013, p. 310; EBA 2015, pp. 46-47).

Nevertheless, the financial crisis which started in 2007 has led to a regression in the development of securitisation. In 2007 the US securitisation issuance (taking into account asset-backed securities (ABS) and MBS, both public and private placements, excluding any retained volumes) amounted to EUR 1,164 billion and in Europe it was EUR 333.3 billion (ESF Report 2008, p. 20). In 2008 it was EUR 211.3 billion and EUR 45.8 billion, respectively, in 2009 - EUR 326.2 billion, EUR 18.5 billion and in 2010 – EUR 486.4 billion and EUR 72.5 billion (AFME/ESF 2009, p. 21 and AFME/ESF 2010, p. 21). Within the 'AAA'-rated securitisation products, rated by Standard & Poor's, Moody's Investor Services and Fitch Ratings, the US residential mortgage-backed security (RMBS) subprime products and US collateralised debt obligations (CDOs) default rates between 2007 and 2009 reached approximately 16% at the highest point. Within the 'BBB'- rated securitisation products the situation was much worse and the US RMBS subprime products default rates reached approximately 60% and 45% for non-subprime products while US commercial mortgage-backed securities (CMBS) and US CDO products had default rates of approximately 20% in 2007 and 2009 respectively (EBA 2015, pp. 11-12). Until 2006, virtually all primary issuance in Europe was placed with end-investors and other banks. However, in 2007 around one third of securitisation issuance and from 2008 until the first quarter of 2014 the vast majority of issued transactions were retained by issuers themselves. The amount outstanding peaked in Europe in years 2008-2009 at over EUR 2 trillion, to fall in 2013 to EUR 1.5 trillion (EBA 2015, pp. 10-11).

Situation after the crisis

There are opinions in the literature which claim that securitisation itself has contributed to the financial crisis, i.a. by leading to the sharp deterioration in lending standards (e.g. Engel, McCoy 2007, p. 2039 *et seq.*; Eggert 2009, p. 1259 *et seq.*; McCoy, Pavlov, Wachter 2009, p. 495 *et seq.*; Peterson 2007, p. 2186 *et seq.*). While investigating the situation it was found out that certain securitisation products, irrespective of their pre-crisis rating level, performed poorly during the crisis i.a. due to factors like (i) misalignment of interest between originators and investors that led to quite loose underwriting criteria of underlying loans in securitisation transactions; (ii) erroneous modelling assumptions from rating agencies and investors; (iii) the complexity of transactions; (iv) the lack of sufficient transparency towards investors and investor's due diligence. There was also a lack of sufficient state regulations. The specific elements in securitisation transactions that ran into difficulties during the crisis were "originate to distribute" securitisation model (where underlying assets were originated by financial institutions in order to distribute them to various third parties), excessive leverage and embedded maturity transformation (as securitisations relying on refinancing within a narrow window of time are vulnerable to market liquidity risks and present specific credit risks difficult to quantify) (EBA 2015, pp. 47-49, US Senate Hearing 2011).

It should be noted that most EU securitisation products before, during and after the crisis performed well with almost zero losses (EBA 2015, pp. 12-14, 47). In spite of that, after the crisis the balances outstanding in European securitisation were still relatively low - at the end of the first quarter of 2019 they were only EUR 990.9 billion (1,120.9 billion, if we include collateralised loan obligations (CLOs) and CDOs) (EBA 2020, p. 16) - and so was the case with the level of new securitisation transactions. Reasons for this were sought i.a. in the post-crisis stigma attached by investors to the whole securitisation market, in the macro-economic environment that unfolded since the financial crisis, in the tightening of the main credit rating agencies' rating methodologies and rating policies, affecting the securitisation asset class following the negative experience of securitisation ratings during the years of the crisis, in the change of investor base and the lack of secondary market liquidity, in a uniform approach of existing regulations to varied securitisations (regardless of how they are conducted, collateralised and of the degree of complexity) and in the potential regulatory uncertainty among issuers and investors as a result of the numerous regulatory initiatives (EBA 2015, pp. 7, 24, Delivorias 2016, p. 17; Katner 2018, p. 814).

Surprisingly, at the same time the US securitisation market was recovering much faster despite the fact that the US securitisation instruments during the crisis had reached much higher default rates than the ones originated in the EU. For instance, in the last quarter of 2016 US outstandings reached approximately EUR 8.8 trillion. And throughout 2016 the US issuance of securitisation products amounted to EUR 1,860.4 billion (AFME 2017, pp. 7, 11). However, securitisation markets in the USA have different characteristics to those in the EU and their recovery is at least in part due to the public sponsorship as vast majority of securitisation instruments in the US (in 2016 it was EUR 1,416 billion in agency MBS as to US issuance and EUR 6.2 trillion as to outstandings) benefit from public guarantees from the US Government Sponsored Enterprises (e.g. Fannie Mae). Banks investing in these products also benefit from lower capital charges under the US regulatory regime (AFME 2017, pp. 7, 11).

In order to change the situation and taking into account the importance of soundly structured securitisation for the market, the works of the Basel Committee on Banking Supervision (BCBS) and the International Organisation of Securities Commissions (IOSCO), the European Union initially implemented a legislative framework to address the risks inherent in securitisation (see e.g. EBA 2015, pp. 17-21 which shows a wide scope of regulatory reforms related to securitisation since 2009) and then it started works on rules adapted to better differentiate simple, transparent and standardised (STS) products from complex, opaque and risky ones. The works resulted in the aforementioned Regulation 2017/2402 that entered into force on January 18, 2018 and has been applied since January 1, 2019. Simultaneously, Regulation 2017/2401 on prudential requirements for credit institutions and investment firms was adopted and amended former provisions with respect to rules concerning securitisation. This type of a legislative act (regulation, not a directive) resulted from a pursuit to ensure uniform solutions on securitisation on the territory of the entire European Union. Next, the given legal acts were followed by other acts and documents relating to securitisation and STS securitisation (see e.g. a list of them in AFME 2020, pp. 5-8), the aim of which is to ensure uniform interpretation of the adopted provisions and manner of their application (e.g. Commission delegated regulation (EU) 2019/1851 of 28 May 2019 supplementing Regulation (EU) 2017/2402 of the European Parliament and of the Council with regard to regulatory technical standards on the homogeneity of the underlying exposures in securitisation).

Regulation 2017/2402

General framework for securitisation

As has been previously mentioned, Regulation 2017/2402 differentiates between STS securitisation and other types of securitisation. Article 2 includes definitions of all terms key to securitisation (and STS securitisation), like securitisation itself, standard and synthetic securitisation, resecuritisation, securitisation position, originator, original lender, securitisation special purpose entity (SSPE), sponsor, (institutional) investor, servicer, asset-backed commercial paper programme/transaction (ABCP programme/transaction), first loss tranche, etc.

With reference to all types of securitisation, Regulation 2017/2402 lays down a general framework within which it establishes due-diligence, risk-retention and transparency requirements for parties involved in securitisations, criteria for credit granting, requirements for selling securitisations to retail clients, a general ban on resecuritisation, requirements for SSPEs as well as conditions and procedures for securitisation repositories. It is worth pointing out in this respect that i.a. originators, sponsors and original lenders should - as a rule - apply to exposures to be securitised the same sound and well-defined criteria for credit-granting which they apply to non-securitised exposures. The due-diligence requirement is addressed to institutional investors who are obliged to verify varied information related to securitisation and take steps in order to ensure that they properly assess the risks arising from securitisation, to the benefit of end investors. In order to be able to do so, the originator, sponsor and SSPE should make at least certain information and documents available – as a rule by means of a securitisation repository – to potential investors as well as to holders of a securitisation position and to the competent authorities (transparency requirement). In Poland

such an authority is the Polish Financial Supervision Authority. The repositories are legal persons authorised and supervised by the European Supervisory Authority (European Securities and Markets Authority, ESMA) that centrally collect and maintain the records of securitisations and are supposed to provide the investors with a single and supervised source of the data necessary for performing their due diligence. Finally, the risk-retention requirement is intended to ensure that the interests of originators, sponsors, original lenders and investors are aligned. Regulation 2017/2402 tries to achieve it by imposing an obligation on the originator, sponsor or original lender to retain on an ongoing basis a material net economic interest (defined in Article 6(3) of the Regulation) in the securitisation of no less than 5% so that they retain a material net economic exposure to the underlying risks in question (with certain exceptions). The originators are also forbidden from selecting assets to be transferred to the SSPE with the aim of rendering losses on the assets transferred to the SSPE higher than the losses over the same period on comparable assets held on the balance sheet of the originator.

STS Securitisation

For STS securitisation - as one which is to ensure special protection to investors - apart from the indicated requirements resulting from general rules for securitisation, it is necessary to meet additional criteria. Most of all, the originator, sponsor and SSPE involved in a securitisation considered STS must be established in the European Union. Moreover, Regulation 2017/2402 provides criteria for a simple, transparent and standardised character of STS securitisation.

As to the simplicity requirement, i.a., the title to the underlying exposures must be acquired by the SSPE by means of a true sale or assignment or transfer with the same legal effect in a manner that is enforceable against the seller or any other third party. That excludes synthetic securitisation at the moment, but on July 24, 2020 the European Commission presented a proposal of a new regulation that would introduce STS balance-sheet synthetic securitisation (see also EBA, 2020). The transfer or assignment of the underlying exposures to the SSPE (and to the seller, if he is not the original lender) as a rule cannot be subject to clawback provisions in the event of the seller's insolvency. The underlying exposures must have specific features like e.g. meet predetermined, clear and documented eligibility criteria which do not allow for active portfolio management of those exposures on a discretionary basis, not include certain transferable securities and – without exceptions – any securitisation positions. Securitisation (ABCP transaction) should be backed by a pool of underlying exposures that are homogeneous in terms of asset type (e.g. pools of residential loans, auto loans or leases) which contain obligations that are contractually binding and enforceable. To prevent creation of 'originate to distribute' models the underlying exposures in particular should be originated in the ordinary course of the originator's or original lender's business pursuant to underwriting standards that are no less stringent than those that the originator or original lender applied at the time of origination to similar exposures that are not securitised and the originator or original lender should have expertise in originating exposures of a similar nature to those securitised.

STS securitisation also requires a wider scope of transparency than the one provided within the general framework for securitisation. And with respect to the standardisation requirement, STS securitisation assumes certain standardisation of practices and documentation. To this extent, among others, the interest-rate and currency risks arising from securitisation should be appropriately mitigated and any measures taken to that effect should be disclosed. As a rule, the SSPE should not enter into derivative contracts and should ensure that the pool of underlying exposures does not include derivatives.

The fulfilment of the above-mentioned requirements does not automatically make securitisation to be STS securitisation. To achieve this, it is necessary to notify ESMA of that fact and the securitisation must be included in the list of all notified STS securitisations maintained on ESMA official website.

Conclusion

At the moment it is difficult to tell clearly whether the route adopted by the EU to return securitisation's role in EU financial markets proves right. On the one hand this is caused by a relatively short period of applicability of new solutions, on the other by a current bad economic situation associated with the COVID-19 pandemic. One may only demonstrate that in 2019 the STS securitisation issuance reached EUR 67.6 billion (out of EUR 216.8 billion in total) and the cumulative number of STS notifications as of Q2 2020 was 330 (AFME 2020, p. 11, 14). An example of a successful STS securitisation on the Polish ground was securitisation carried out in 2019 by PKO Leasing S.A. – owned by PKO Bank Polski S.A., a major Polish bank – that involved the sale of a portfolio of high-quality leasing receivables with a total value of PLN 2.5 billion (approximately EUR 560 million).

Without a doubt, the adopted solutions lead to ordering the market and impose obligations on actors who take part in securitisation, which - if enforced - should ensure increased security of trading and thus encourage investment.

Uniform regulation of STS securitisation as high-quality securitisation seems to be especially important, and so does bringing about a certain correlation of interests of parties to securitisation in reference to the quality of securitised assets and the resecuritisation ban.

At the end, we should not directly compare the size of securitisation in the EU with US securitisation, where in 2019 outstandings reached EUR 9.8 trillion and placed issuance amounted to EUR 1,906 billion (AFME 2020, pp. 12, 16). Apart from the aforementioned role of agency MBS in these numbers, it must be noticed that in 2019 over 90% of outstandings in Europe were A- to AAA-rated (over 50% were AAA- rated) compared to only around 53% in the USA, while over 32% of US outstandings were CCC-rated or lower.

The Concept of Piercing the Corporate Veil in The Polish Capital Companies Law

Zbigniew KUNIEWICZ

University of Szczecin, Szczecin, Poland, zbigniew.kuniewicz@usz.edu.pl

Abstract

The issue in question which is the subject of the research analysis in this paper is not regulated in the Polish legal system. The consequence of the organizational structure adopted by the legislator involves a clear separation of the company from its shareholders. This separation is demonstrated in the personal, organizational and material sphere. From the point of view of the main theme of these reflections, the most important aspect of separate personhood of a capital company is to adopt the principle of non-liability of shareholders for the company's obligations. Company's debts are its own debts for which it is fully liable. For shareholders the company's debts are debts of a third party. Shareholders are obliged to make contributions to the company and only to this extend do they bear the economic risk of participation in the company which involves the likelihood of losing the contributed resources.

Even though the principle of shareholders' non-liability for the capital company's obligations results from the company's separate personhood, the legislator decided to express it directly in legal provisions. It is worth adding at that that shareholders' non-liability for the company's obligations is treated as a fundamental principle inscribed in the construction of capital companies. The above-mentioned comments trigger a question of whether the principle of shareholders' non-liability for obligations of a capital company is absolute or whether it may be lifted in certain circumstances. There are increasingly frequent opinions coming from legal scholars and the judicature, inspired mainly by the views of the Western legal commentary which questions the absolute nature of the discussed principle. It is therefore pointed out that in certain cases it is necessary to disregard the company's separate personhood and impose liability for its obligations on its shareholders. These situations are treated as exceptions and boil down to cases where the form of the company's legal personality was used to circumvent statutory bans or to achieve benefits contrary to principles of community life.

The method of interpretation of applicable laws in an apragmatic approach was employed in preparing this paper. Conclusions that derive from the analysis have the nature of postulates. They express a need for a normative regulation of the concept of the so-called piercing of the corporate veil in capital companies since the existing legal regulations provide a doubtful basis for applying this structure.

Keywords: capital companies, shareholders' liability for company's obligations.

Introduction

The aim of this paper is to present the concept for which trade law scholarship uses various terms, such as "piercing the corporate veil", "lifting the corporate veil" or disregarding separate legal personhood of a capital company (Sołtysiński 2013, p. 15). Therefore, the subject of the analysis will cover a limited liability company, a joint-stock company and also a simple joint-stock company which has already been regulated and will enter into force on March 1, 2021.

The concept of piercing the corporate veil presented in the title of the study refers to shareholders of a commercial company and its essence is that it is the shareholders, apart from the company itself, who would be liable for the company's obligations. The use of the conditional mood expressed by the term "would" is justified by the fact that the enumerated entities - as a rule - are excluded from liability for obligations of the company in which they are shareholders. The form of legal personality of a capital company provides a certain protective umbrella which in legal literature is called a corporate veil. The problem which is the platform for these reflections boils down to explaining whether the principle of shareholders' non-liability for a capital company's obligations can be lifted in the Polish companies law. Despite quite a significant degree of complexity of the research problem, these reflections will be conducted at such a level so as to be comprehensible also to those readers who do not have specialist legal or trade knowledge.

Company's separate legal personhood

When proceeding to substantive reflections, first one needs to remember a few basic principles on which the legal construction and functioning of capital companies are based. Most of all they are companies which require relevant capital to be established, which comes from contributions brought by shareholders. Upon entering the company in the entrepreneurs' register it acquires legal personality (Article 12 of the Polish Commercial Companies Code, hereinafter: CCC). The fact that the company has legal personality has certain legal consequences among which emphasis needs to be placed on the existence of the company's personal, organizational and material separateness from its shareholders.

The existence of personal separateness of capital companies means that these companies act as autonomous entities towards their shareholders. The consequence of being a shareholder involves a bonds between the enumerated entities and the company, which is called a corporate relationship. This relationship has a civil law nature, which means that it outlines relations between autonomous entitles guided by the principle of their equality (Opalski 2012, pp. 10-11). The content of a corporate relationship includes shareholders' obligations towards the company and company's obligations towards the shareholders resulting from legislation or articles of association or statutes. In particular, the company is entitled to a claim against the shareholders for full coverage of shares, whereas the shareholders may demand that the company pay the approved dividend.

The principle of debtor's liability for their debt

Civil law features a fundamental principle that governs financial liability, which stipulates that each debtor bears liability for their debt (Stelmachowski 1984, p. 309; Kubiak-Cyrul 2019, p. 94). Therefore, the existence of financial separation between the company and its shareholders means that each of the named entities is liable for their own obligations. It is unlimited liability because it covers the entire debt and its scope covers the debtor's entire property. As an example we can quote a situation where a capital company - as the buyer - executes a contract for the sale of real estate, and thus becomes liable for the performance of this contract, especially for paying the price. The expression of this obvious thesis is a consequence of applicability of the afore-mentioned principle of debtor's unlimited liability for his obligations. However, at this stage of reflections it is still an open question whether apart form the company (who is the debtor) there is another actor, shareholders in particular, who will be liable for the performance of the obligation arising from the contract executed by the company.

Provisions of the civil code, which is a basic legal act governing private law relationships, fail to stipulate for a legal norm which would directly state whether each debtor is liable for their behaviours. Legal literature treats applicability of this general rule as so obvious that it does not require specific normative reasoning (Radwański, Olejniczak 2010, p. 22). Nevertheless, the civil code has regulations that assign liability for debts of a specific debtor to other entities. Article 33^1 § 2 of the Polish Civil Code (hereinafter: CC) is an example of such a regulation. Pursuant to this provision, subsidiary liability for the obligations of an organizational unit which is not a legal person but has legal capacity is borne by its members. Subsidiary nature of this liability means that it arises when the given organizational unit becomes insolvent. The category of organizational units stipulated for in the said Article 33^1 § 2 CC includes partnerships, that is registered partnerships, professional partnerships, limited partnerships and joint-stock limited partnerships. Partners in these partnerships, apart from the shareholder in the joint-stock limited partnership, are liable for the companies' obligations.

Shareholders' non-liability for the company's obligations

Capital companies have a different legal status than partnerships. It is because they are organizational units equipped not only with legal capacity which is a determinant of them having rights and obligations, but they also have the attribute of legal personality. This property is afforded by statute in a sense that the legislator expressly confers legal personality upon companies, pointing to the moment a company obtains this personality (Article 12 CCC). The most significant consequence of legal personality of a capital company - at least from the point of view of the subject-matter of these reflections - is shareholders' non-liability for the company's obligations. Capital companies' having legal personality entails the principle of shareholders' non-liability for the company's obligations. Applicability of this principle may be derived from previous comments, emphasizing, on the one hand, the fact of a capital company having legal personality, and on the other by pointing out an absence of a legal norm which would burden shareholders with liability for the company's operation. However, in the case of capital companies, the legislator declared *expressis verbis* the principle of shareholders' non-liability for the company's obligations (Articles 151 § 4, 300^1 § 4, 301 § 5 CCC). Therefore, if we say that shareholders are liable in a limited way (up to the value of contributions made) for the obligations of the capital company, then such a statement is not true and is only a mental shortcut. In reality, it means that a company, as a legal person, is liable independently for its own debts, while shareholders are not liable for the company's obligations but only bear the economic risk of losing the contributions made to the company. This

risk surfaces when the company is dissolved and its assets prove insufficient to return the contributions to all shareholders (Kidyba 2015, p. 652; Szumański 2014, p. 636).

The form of legal personality that capital companies are equipped with is therefore a certain protective umbrella which shields shareholders against liability for the company's obligations towards its creditors. In certain, few, cases stipulated for in law, shareholders may be liable to the company. An example here is liability to the company for returning any undue performances received from the company, e.g. dividend (Article 198 and 350 CCC). However, it must be clearly stressed that shareholders are liable to the company, not to the creditors. Polish regulations of the commercial companies' law do not have a legal norm that would be a basis justifying the lifting of the principle of non-liability of shareholders for a capital company's obligations. Actions taken by bodies of a capital company are - pursuant to Article 38 CC - actions of the company itself for which it is fully liable. Legal scholarship emphasises that shareholders cannot be liable for the company's obligations since it is the basic principle of capital companies' law (Szumański 2012, p. 168; Kidyba 2017, pp. 358-359).

The principle of shareholders' non-liability for the company's obligations also refers to companies functioning as a holding company. It is characteristic to a holding company to comprise a parent company and a subsidiary or subsidiaries. Emergence of the parent-subsidiary relation between companies is a consequence of the parent company's holding an adequate stake in the subsidiary (Article 4 § 1(4) CCC). By having the status of a shareholder in a subsidiary, the parent company may influence the operation of this subsidiary. Possibilities of this influence depend on two factors. On the one hand, the number of shares held determine the "voting power" of the parent company at the general meeting or general assembly of the subsidiary. On the other hand, the discussed scope of influence of the parent company on the subsidiary is determined by the competences afforded to the general meeting and the general assembly of the subsidiary. Because the subsidiary is a separate entity from the parent company, a principle of capital companies law is applicable here, according to which the parent company is not liable for the subsidiary's obligations (Szumański 2012, p. 172).

The so-called corporate veil may only be pierced when a holding company agreement is made between the parent company and the subsidiary. Article 7 CCC expressly stipulates for admissibility of concluding such a contract. This provision lays down that an agreement for the management of the subsidiary or a transfer of profits by such company to the parent company may specify the scope of liability of the parent company for damage caused to the subsidiary and the scope of liability of the parent company for obligations of the subsidiary towards creditors. The analysis of Article 7 CCC shows clearly that provisions of the holding company agreement concerning liability of the parent company both towards the subsidiary and its creditors are not obligatory elements of the content of such an agreement. The holding company agreement may, therefore, not regulate the issue of liability of the parent company at all. Whereas the fact itself that such a provision may be placed in a holding company agreement is confirmation of the thesis consistently upheld here that on the ground of Polish companies law there is no regulation that would justify the so-called "piercing of the corporate veil".

Views of legal scholars and commentators and judicature

Polish legal scholars and commentators emphasize that normative regulations do not introduce instruments that would allow general relativisation of separate personhood of capital companies and thus assignment of liability for the company's obligations to shareholders. At the same time, they point out that a measure of "abusing the company's legal form" may at times be used by shareholders in order to circumvent statutory bans or to act in breach of principles of community life to the detriment of third parties. In the above circumstances, court intervention may be justified which would deprive shareholders of their privilege of non-liability for the company's obligations.

However, there is a theoretical and practical problem here involving indication of a legal basis that allows bypassing the company's separate personhood. Two regulations are considered in this regard, that is Article 5 CC and Article 58 § 1 CC. The former regulates abuses of an individual right by introducing a ban on using one's own right in a manner contradictory to its social and economic purpose or principles of community life. However, legal scholarship takes up significant reservations against application of Article 5 CC to achieve a result of circumventing separate personhood. They point out that the clause of abusing an individual right may be used as an instrument of protection of a defendant, not as a basis to bring in a claim (Sołtysiński 2013, p. 16). Article 58 § 1 CC in turn, declares invalid legal activities that are designed to circumvent the law. This provision also raises serious doubts as to whether the use of a legal from of a company may be deemed as circumvention of the law with effect of invalidity of the legal act of forming the company. It needs to be emphasized that Article 21 CCC, which is a special provision towards 58 § 1 CC, stipulates for a different effect than invalidity for defective performance of a legal act of forming a company. Pursuant to Article 21 CCC, the register court may adjudicate the dissolution of a commercial company registered in the register due to defects that have not been remedied within the time period defined by the registry court (Opalski 2012, pp. 14-15).

The presented doubts, associated with the application of the measure of circumventing the company's separate personhood are also present in Polish judicature. One needs to emphasize at that that the established line of judicial decisions of the Supreme Court assumes that the principle of separate personhood and of capital company's liability is an undisputed principle in the current legal status. Searching for justification for assigning shareholders with liability for the company's obligations, the Supreme Court cites examples of facts presented in the German literature as circumstances that allow the application of the concept of the so-called piercing of the corporate veil. It involves situations in which the property of various entities (e.g. shareholder and company) was mixed in such a way that a third party is not able to tell what is whose. Such a mixing may also have a personal scope and concern the activity of members of bodies of legal persons - in situations where these same natural persons serve in the bodies of different legal persons. Doubts may arise then as to on whose behalf they act. The Supreme Court is very cautious in reaching for the construct of law circumvention which is expressed in Article 58 § 1 CC (cf. judgement of the Polish Supreme Court of 2 November 2013, judgement of the Polish Supreme Court of 8 September 2014). At the same time the Supreme Court clearly emphasizes that invoking the concept of circumvention of the law in order to achieve an effect in which shareholders of a capital company are assigned with liability is exceptional in nature, limited to a specific example and justified by its circumstances.

The presented reflections have shown that sometimes there is a need to lift the principle of shareholders' non-liability for capital companies' obligations. However, existing regulations do not provide a clear legal basis that would allow for this objective to be implemented. Therefore, regulation of the premises and mode of application of the so-called piercing of the corporate veil in the Polish companies law is a justified *de lege ferenda* postulate.

Selected Issues of Incorporation and Implementation of Norms of Private International Law into National and EU Law (Based on Transport Agreement Regulations)

Krzysztof Wesolowski

University of Szczecin, Szczecin, Poland, krzysztof.wesolowski@usz.edu.pl

ORCID 0000-0002-4427-317X

Abstract

In some areas of private law a certain convergence of regulations applicable in different systems (bodies) of law can be observed. One of such domains is the transport law where, for many years now, a process of interpenetration of legal concepts and entire regulations has been noticed. It can take the form of, i.a., incorporation and implementation of regulations drawn from a different system of law. Each of these two methods has its strengths and weaknesses. The issue of incorporation and implementation of norms set out in international transport conventions into the EU law is particularly interesting. It is connected with regulations issued by the EU institutions with the aim to improve the legal status of passengers using various modes of transportation. The regulations were designed to supplement and modify the norms resulting from international conventions in order to enhance and protect passenger' rights. However, conventions are transposed into the EU law using different methods, different from the ones applied in national law. This gives rise to specific problems. The aim of the paper is to identify the problems and also the benefits and drawbacks of the solutions adopted. The research method used by the author include analysis of legal acts, case law and secondary literature.

Keywords: International Uniform Private Law, Incorporation, Implementation, Transport Law

Introduction

The existence of separate systems (bodies) of laws is an age-old phenomenon. In principle, these systems maintain their autonomy and integrity, specific axiology and rules of interpretation. A common problem arising from the coexistence in one domain of norms drawn from different systems of law is the issue of their hierarchy and, in consequence, precedence. The debate over that is endless. Essentially, the answers lie within the sphere of the constitutional law of individual states. This problem, however, does not exhaust the issue of coexistence and co-application of norms drawn from different systems of law.

In recent years, a new challenge has emerged in the form of multicentricity (polycentricity) of legal systems. It is a situation in which law applicable in a given state is laid down, applied and interpreted by many autonomous, though affecting one another, decision centers located within the state, and outside its structures (Łętowska, 2005, p. 5 et seq.). Such situation is contrasted with the traditional monocentric system rooted in legal positivism and normativism, in which law is understood as a hierarchical, autonomous and ordered system created by the state, with legal norms complying with a higher standard, thus acquiring a pyramidal shape, with the highest norm at its top (the famous Kelsen pyramid of standards with the so-called basic norm, *Grundnorm* at the top) (Kalisz, 2007, p. 35 et seq.). Multicentricity of a legal system can be observed mainly in the European Union member states. It is the result of obligatory co-application of national norms and the EU norms. Such situation leads to a number of problems which cannot be narrowed down to the issue of precedence only.

Multicentricity is reflected in the private law in the way norms drawn from one body of law penetrate to another body of law. The concept of multicentricity embraces the influence of norms of one legal system on the content of norms of another system, implementation of norms of one system into another system (mostly, from international or EU law to national law), and the incorporation of norms. The latter is particularly prominent in regulations regarding the transport agreement. This arises from the fact that this agreement – among very few – has been regulated at a supranational level and is governed by international conventions. In fact, in each branch of transportation there are several conventions that regulate transport agreements. These are as follows:

- the Convention for the unification of certain rules relating to international carriage by air signed in Warsaw on 12 October 1929, as amended by the protocol done at the Hague on 28 September 1955; the Convention, supplementary to the Warsaw Convention, for the unification of certain rules relating to international carriage by air performed by a person other than the contracting carrier, signed at Guadalajara on 18 September 1961,
- the Convention for unification of certain rules for international carriage by air signed at Montreal on 28 May 1999,
- the Convention on international carriage by rail (COTIF) signed at Berne on 9 May 1980, as amended by the Vilnius Protocol of 3 June 1999,
- the Athens Convention relating to the carriage of passengers and their luggage by sea, signed at Athens on 13 December 1974, amended by the Protocol of 19 November 1976 and Protocol of 2002 (PAL).

As country borders become more permeable, and thus – there is less justification for maintaining separate regulations for domestic and international transport – many countries decide to regulate the transport agreement in a given branch of transport by reference to relevant international convention (examples of such solutions in various systems of law are provided in the academic papers by Wesołowski and Dąbrowski (2017, pp. 542-544) and Ambrożuk, Dąbrowski and Wesołowski (2018, pp. 154-157). In result, convention norms are incorporated into national law.

The processes of implementation and incorporation of international convention norms, containing uniform private law norms and pertaining mostly to the problems of passenger transportation, can also be observed in the case of the EU law. However, these processes are different from transposition typical for normal national legislation, which leads to specific problems. The aim of this paper is to identify these problems, and also, the benefits and drawbacks of the solutions adopted.

Incorporation and implementation of an international convention as a measure of convergence of solutions adopted in different legal systems

For the purposes of this paper, the concept of incorporation of an international convention is understood as extension of its provisions onto situations which are not covered by its application of its own, inherent force (*ex prioprio vigore*). This extension occurs by reference included in the provisions of the legal system to convention norms. In result, the convention extends its scope of application, but still maintains distinctiveness from the incorporating law. It continues to be a specific micro-system, autonomous from other systems, including the incorporating system of law. Such incorporation has consequences pertaining to, i.a., the interpretation of convention regulations (cf. Gebauer, 2000, pp. 683–705; Czepelak, 2008, p. 395; Ambrożuk, Dąbrowski, Wesołowski, 2019, pp. 153–155) or gap filling (Dąbrowski, 2018, pp. 89–99).

Many different ways of reference to international conventions can be noted in internal law. One may come across references to a convention that governs a specific subject matter, however, references may be obscure and vague, disabling proper identification, with the reservation that it is a convention binding the state and by the law of the state, reference to such convention is made (e.g. art. 208 of the Polish act of 3 July 2002 – Aviation Law). The good point here is automatic incorporation of all amendments and supplements to the convention into internal law as applicable as on the date of entry into force of the referring provision. It also extends to a new international convention if the referring state becomes a party to the convention. The second option is reference to an international convention with an annotation that the reference also includes further amendments and supplements to the convention which entered into force after the referring provision entered into force, properly promulgated (e.g. art. 41 § 1, art. 97, art. 272, art. 279 of the Polish Maritime Code). Such incorporation method enables automatic incorporation into internal law of subsequent protocols and conventions amending or supplementary to the convention identified in the referring provision. However, in case of ratification of a new convention covering the same issues, to incorporate it, an amendment of the referring provision needs to be made. The third option is to refer to a given convention without referring to its subsequent amendments and supplements which may enter into force after the referring provision becomes effective (art. 181 § 1 Polish Maritime Code). This option necessitates amending of the referring provision whenever the convention is amended. Lack of such amendment may cause duality in the legal status – the convention as amended or supplemented will be applied in international relations subject to its scope, whereas internal relations will be governed by the convention in the unamended form, as indicated in the referring provision.

In turn, implementation of an international convention consists in enacting provisions in national law that fully adhere to and reflect regulations set out in the convention. The procedure may be forced or voluntary. Such provisions are related to the convention only in substance, i.e. it is only the content that is tied to the convention. Norms imposed by these regulations become an integral part of the domestic legal system in which they are issued, sharing its axiological system and rules of interpretation. If implementation is forced (which does not happen with

regard to transport relationships), interpretation of regulations implemented forcibly must take into account the key purpose, which is the unification of internal law at a supranational level.

Voluntary implementation may include convention regulations in their entirety or in part. In fact, such implementation resembles a situation common in private law when the legislator models the new regulations on solutions adopted in another legal system. However, implementation takes place only if the "transposition" of convention regulations into national legislation is not reduced to selected regulations, but at minimum, includes a significant part of convention regulations. Another important point is that the implemented provisions are not substantively changed. However, the question of distinguishing between the two legislative techniques during voluntary implementation has no major significance.

Norms arising from international transport conventions as a component of the EU law

The EU regulations on selected issues of passenger transport agreement in individual branches of transportation are applicable all across the European Union. At present, the EU system of passenger protection relies mostly on the following regulations (in order relevant to the branch of transportation):

1) Council Regulation (EC) No 2027/97 of 9 October 1997 on air carrier liability in the event of accidents, amended by Regulation (EC) No 889/2002 of the European Parliament and of the Council of 13 May 2002,
2) Regulation (EC) No 261/2004 of the European Parliament and of the Council of 11 February 2004 establishing common rules of compensation and assistance to passengers in the event of denied boarding and of cancellation or long delay of flights, and repealing Regulation (EEC) No 295/91,
3) Regulation (EC) No 1107/2006 of the European Parliament and of the Council of 5 July 2006 concerning the rights of disabled persons and persons with reduced mobility when traveling by air,
4) Regulation (EC) No 1371/2007 of the European Parliament and of the Council of 23 October 2007 on rail passengers' rights and obligations,
5) Regulation (EC) No 392/2009 of the European Parliament and of the Council of 23 April 2009 on the liability of carriers of passengers by sea in the event of accidents,
6) Regulation (EU) No 1177/2010 of the European Parliament and of the Council of 24 November 2010 concerning the rights of passengers when travelling by sea and inland waterway and amending Regulation (EC) No 2006/2004,
7) Regulation (EU) No 181/2011 of the European Parliament and of the Council of 16 February 2011 concerning the rights of passengers in bus and coach transport and amending Regulation (EC) No 20006/2004.

However, these regulations do not provide a full regulation of passenger transport agreement. They only amend and supplement regulations arising from international transport conventions. It was assumed that to viably improve the legal status of passengers, it is necessary to pass directly applicable regulations as the process of amending international law takes too much time. Thanks to that solution, an EU system of passenger protection came into being (Ambrożuk, 2014, p. 11 et seq.; Gospodarek, 2011, p. 56 et seq.; Stec, 2012, p. 433 et seq.; Stec, 2007, p. 247 et seq.; Stec, 2010b, p. 4 et seq.; Stec, 2010a, p. 969 et seq.; Koziński, 2010, p. 19 et seq.; Szymajda, Polkowska, 2002, p. 55 et seq.; Pavliha, 2013, p. 226 et seq.; Ambrozuk, Dąbrowski, Wesołowski, 2019, pp. 135–137).

The European Union joined the international transport conventions regarding passenger transport, in result of which they became part of the EU legal order. Pursuant to art. 216 (2) of the Treaty on the Functioning of the European Union, agreements concluded by the EU are binding for both the EU institutions and EU member states. This means that in the EU relationships, which also encompass domestic transport in the EU member states, both the convention regulations (regardless of whether the member state is a party to it) and other EU regulations that amend and supplement them, are applicable. However, the lack of accession of a member state to an international convention the EU is a party to, creates a complicated, dualistic legal situation in that state (cf. Koziński, 2010, p. 31 and Dragun-Gertner, Popławska-Dąbrowska, 2017, p. 92).

The EU legislator has thus treated the norms resulting from international transport conventions on passenger transports as a basis for the EU system of passenger protection. Nevertheless, relations between regulations arising from international conventions and EU regulations are not identical in all branches of transportation since different modes of reference to convention provisions were applied. However, the reasons for such a situation, including historical factors, have little significance for the subject matter of this paper.

As it comes to the EU Aviation Law, the EU legislator sort of incorporated conventions on aviation (first, the Warsaw Convention, then the Montreal Convention) by expressly referring to them in the content of the regulations. Yet, a typical referring provision is lacking. Therefore, the application of convention norms results rather from the

entirety of the regulation contained in individual regulations. Unquestionably, the fact of adopting the Montreal Convention by the EU is important.

In contrast, the situation is different in case of regulations applicable to sea and rail transport. However, the convention regulated these two branches of transportation in a different way. The Athens Convention concerning transport by sea was, in its original shape, criticized for favoring the interests of carriers. For years efforts were made on the international forum to change the convention. They resulted in the Protocol of 1 November 2002 (PAL 2002). The Protocol, despite the fact that it significantly improved the legal status of passengers, at first was not really applauded by states with a merchant fleet. It entered into force much later, i.e. on 23 June 2014, after it was ratified by 10 states (Belize, Bulgaria, Croatia, Denmark, Greece, Latvia, Malta, the Netherlands, Norway, Palau, Panama, Saint Kitts and Nevis, Serbia, Syria, Great Britain). The PAL 2002 ratification process would have been even slower had it not been for the stand taken by the European Union. On 23 April 2009 the EU adopted the Regulation No 392/2009 on the liability of carriers of passengers by sea in the event of accidents, which was a sort of transposition into the EU law of the Athens Convention, as amended by PAL 2002 pertaining to international and national carriers by category A and B ships. This happened through inclusion of Annex I, Provisions of the Athens Convention relating to the carriage of passengers and their luggage by sea of 1974, consolidated text, and the Protocol of 2002 to this Convention. The order and numeration of provisions was retained, and the provisions left out were highlighted. Moreover, in a similar way the International Maritime Organization reservation and guidelines, non-binding in their nature, for implementation of the Athens Convention, adopted by the IMO Legal Committee on 19 October 2006 (IMO guidelines), which constitute Annex II to the Regulation No 392/2009, were transposed to the EU law. Through this measure, they became binding. However, the Regulation itself contains a number of "supplementary" regulations which aim at enhancing the legal status of passengers in relation to the regulation of the Convention.

Such transposition into the EU law of the provisions of the Athens Convention seems, at first glance, no different from incorporation. The name of the convention, its structure and numeration of provisions were retained in the Annex. However, this method is closer to implementation than incorporation, since the Regulation contains in the Annex a text equivalent to the original Convention text (exempt some provisions). Nevertheless, it constitutes a distinct legal act governed by principles of the EU law. It was drawn up in all official EU languages (and not in English and French, the two texts of a single original of the Athens Convention being equally authentic). Thus, the Regulation is subject to the axiology and rules of interpretation of the EU law. The same holds true for gap filling.

Regardless of that, the European Union accessed the Athens Convention as amended by Protocol of 2002, based on two decisions of the Council of Europe of 12 December 2011.

Such situation, however, creates a problem of order of precedence that should be followed to govern the EU relationships – the Athens Convention or the Regulation (with Annexes). It constitutes not only a theoretical, but also practical conflict. Even if the differences between the content of the Convention and of Annex I to the Regulation are disregarded, the issues of interpretation and authenticity of languages on which interpretation is based, of gap filling and possible future amendments to the acts, remain unsolved. When transposing the provisions of the Athens Convention into the European Union law, the EU legislator did not determine the order of precedence of the regulations. The rule has it that international agreements concluded by the EU should take precedence over secondary legislation passed by the EU organs (cf. opinion of the Court of Justice of the European Union expressed in item 42. Judgment C-308/06 of June3, 2008, *Intertanko*). This would mean that in case of international transport carried out within the EU territory, precedence should be given to the Athens Convention. On the other hand, the logic dictates a reverse order of precedence of regulations, as pointed out in secondary literature (Koziński, 2010, p. 31). Yet, it does not solve doubts about the correctness of the solution adopted.

The situation is similar in case of rail transport. Provisions of the Appendix CIV to COTIF Convention were also transposed into the EU law (Regulation 1371/2007). It must be admitted, though, that the rail convention did not raise so many objections as the Athens Convention. The EU accessed COTIF, thus the CIV which relates to the transport of passengers as amended by the Vilnius Protocol of 3 June 1999. The changes introduced by this Protocol were, to a large degree, the effect of significant liberalization of the rail transport sector carried out by the European Union, in particular separation of infrastructure management and transport activity (cf. Freise, 2009, pp. 1237-1238). The Regulation tackled various aspects of rail passenger transport, and most importantly, strengthened passenger rights, and granted passengers the right to submit a complaint to any carrier's subcontractor or railway undertaking involved, based on joint and several liability of the carrier who entered into the transport agreement. Significant part of CIV was implemented by Regulation No 1371/2007, and specifically, by containing an excerpt from the Uniform Rules CIV in Annex No I. However, as it was the case with IMO, it was not transposed in its entirety. Some provisions, i.a. regarding jurisdiction, were left out in the belief that such issues fall under the exclusive competence of the EU.

Hence, also in this case, there is a legal act which is new – in relation to the convention – and governed by rules specific to the EU law. The mode of implementation is, in essence, the same as in the case of sea carriers. The Annex I is headed: Extract from Uniform Rules concerning the contract of international carriage of passengers by rail (CIV), Appendix A to the Convention concerning international carriage by rail (COTIF) of 9 May 1980, as modified by the Protocol for modification of the Convention concerning international carriage by rail of 3 June 1999. The structure (division into chapters and articles) and numeration have been retained in the same form as in CIV. Despite that, for reasons indicated above with regard to the Athens Convention, also this Regulation should be recognized as a new act of the EU law with all consequences thereof.

However, in the case of rail law, the issue of precedence between acts has been successfully regulated. As the implied by the provisions of the Agreement between the EU and the Intergovernmental Organization for International Carriage by Rail (OTIF) on the accession of the European Union to the Convention concerning International Carriage by Rail (COTIF) of 9 May 1980, as amended by the Vilnius Protocol of 3 June 1999, if international transport is carried out between the EU member states, Regulation 1371/2007 takes precedence over the CIV, and the uniform rules of CIV may be applied to it only subsidiarily (Freise, 2009, pp. 1237-1238). Art. 2 of this Agreement provides as follows: "Without prejudice to the object and the purpose of the Convention to promote, improve and facilitate international traffic by rail and without prejudice to its full application with respect to other Parties to the Convention, in their mutual relations, Parties to the Convention which are Member States of the Union shall apply Union rules and shall therefore not apply the rules arising from that Convention except in so far there is no Union rule governing the particular subject concerned." This rule also arises from recitals 7 and 8 of the preamble to the aforementioned Agreement ("Member States of the Union cannot invoke and apply the rights and obligations deriving from the Convention directly among themselves"; "the Convention applies fully between the Union and its Member States on the one hand, and the other Parties to the Convention, on the other hand"). However, if carriage is conducted between states being parties to the Uniform Rules CIV of which only one is an EU member state, then the legal relationship between the parties is primarily subject to the Uniform Rules CIV, and the Regulation shall be applied to it only as supplementary, based on the reference made in art. 8 § 2 COTIF, provided that the EU law is the governing law of the agreement, even if both parties come from the EU member state or member states. The important issue here is to identify the point of entry or point of destination in a state which is not a member of the European Union.

Strengths and weaknesses of the adopted method of regulation

The method of incorporation of international convention provisions has many benefits. It allows to directly apply the provisions with regard to relationships which fall outside the scope of *ex prioprio vigore* application of the provisions, with all the „weight" they gained being applied internationally (academic commentaries, reference literature, foreign case law) (Wesołowski, Dąbrowski, 2017, p. 547). Incorporation enables full compliance of internal legislation with international regulations and prevents misrepresentation of convention norms that may occur in translation of original, authentic convention texts into national languages (Młynarczyk, 2002, p. 29). When an international convention is incorporated into domestic law by a general reference to the convention, without being specific about it, adoption of a new convention or amending protocol will automatically trigger changes in the incorporating legal system. However, the downside is that incorporation may maintain some discrepancies in meaning that occur between equally authentic languages of a multilingual convention if no language is deemed prevailing.

However, essentially, the EU legislator did not apply the above method (only to some extent in the case of Aviation Law). The method of transposition of convention law to the EU law used in case of COTIF and Maritime Law raises some doubts. The creation of a new legal act, though its content may be largely consistent with the provisions of relevant international convention, does not allow for the use of the benefits of incorporation. In the case of the EU law which is by principle available in all official EU languages treated as equal and authentic, the problem of discrepancies between the language versions of regulations remains unsolved. This equal authenticity of the EU language versions gives rise to the issue of order of precedence of provisions, an issue that is not always solved *expressis verbis*. In the future, to avoid duality in legal status, it might be necessary to modify the regulations whenever any changes to the convention law are made. Another issue is the leaving out of some convention provisions from the annexes. Insofar as the non-inclusion of provisions concerning jurisdiction is understandable, the dropping of some other provisions is questionable. For example, provisions of Annex I to the Regulation 1371/2007 (rail), Title VI, contains provisions of art. 60 (1-3) CIF which define the prescription time-bar on claims. However, Annex I does not include provisions of art. 60 (4-5) CIF pertaining to suspension of time-bar periods with respect to claims filed with the carrier and provisions banning enforcement of time-barred claims. In this way a cohesive solution – ensuring that short time-bar periods on claims arising from rail transport agreements were counteracted by suspension of time-bar periods - became fragmented.

Abstract

In the manufacture of software, specifically in the activity of system analysis, the student of Systems Engineering and Informatics must know and systematically develop capacities for their performance in the treatment of system requirements, since the capacities executed in their mental space, are developed in their natural language at a common level without a guideline and theoretical basis of applied grammatical structure. Which leads to a subjective perception, identification and description of software requirements. Given these empirical facts, a guiding and guiding concept is proposed for the development of capacities that help the student in the sensitive identification, description, relationship and diagramming; based on the synergy between; a structure - intermediaries (based on the logic and logic of use cases) linked to language (semantic expression of meanings) to arrive at a conscious reason (thought) that helps and accompanies the modeling of software requirements. This research is of a quantitative approach, experimental type, explanatory level, pre-experimental design and deductive method, carried out to students of the Systems Engineering and Computer Science career of the university, to whom the Instrument "Components of the modeling of software requirements". In addition, a favorable student performance of 36% was obtained and the research hypothesis was corroborated. Ha = The logic-language synergy improves the modeling of software requirements in Peruvian students of Systems Engineering and Informatics.

Keywords: software requirements, logic-language, use case modeling.

Introduction

In software manufacture, throughout the software process (Pressman, 2010), specifically in the systems analysis activity, the systems and informatics engineer must have a sensory sensitivity to the context of the problem to identify, describe, organize, relate and synthesize the software requirements within their mental space in a complex and often deeply abstract way; managing to obtain, with strenuous efforts, software in terms of requirements, which are inputs for the next system design activity.

The capacities executed in the mental space are developed in their natural language at a level of colloquial and / or common use, without a theoretical base of applied sentence structure and with a confusing logic of the application of use cases (only to knowledge graphic icons and symbols); situation that leads to an analysis of software requirements

ALAYO, Alex PACHECO and Edwin ROQUE "Synergy, Logic-Language for The Modeling of Software Requirements in Students of Systems Engineering and Informatics" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

in a mental space of abstract empiricism with subjective features, causing enormous complications in the modeling of software requirements based on use cases.

For Aristotle, logic and language are closely related (Ruiz, 2015). If language is made up of signs with which we express (in a spoken or written way) our thinking, logic allows us to analyze certain uses of that language, specifically those related to the creation and transmission of knowledge. This problem, the aforementioned philosophical basis and the pertinent knowledge have made it possible to establish a synergistic relationship between the sentence structure of the Spanish language and the logic of use cases for the identification and description of software requirements as a pedagogical strategy to facilitate the management of the abstraction in requirements modeling through use cases

Materials and Methods

This research is of a quantitative approach, experimental type, explanatory level and pre-experimental design, carried out on a group of 28 students of the Systems Engineering and Informatics career, to whom the Document Measurement Instrument "Components of the modeling software requirements", which consists of 11 items, which systematically relate logic and language in the framework of modeling software requirements. Where the independent variable is studied: logical-language synergy of the ordinal polytomous type and the dependent variable, modeling of nominal dichotomous software requirements. The Document Measurement Instrument was applied in a pilot to 10 students of the Systems Engineering and Informatics career to later verify the reliability of the aforementioned with Cronbach's Alpha. Subsequently, it was submitted to the Judgment of three experts and the Kendall Coefficient was applied to measure the degree of agreement between several judges.

For the normality analysis, the Shapiro-Wilk Normality test was applied for the study variables, where P-value in each of the cases is $P > \alpha$ (0.05 - the null hypothesis is not rejected), so that observations are normally distributed. Regarding the general objective of the research, it was obtained as a result that the P-value in the ANOVA table is less than 0.05, so there is a statistically significant relationship between the modeling of software requirements (Proposed methodology) and the modeling of software requirements (previous methodology), with a confidence level of 95%. Likewise, when performing the homocedasticity test in the comparison of means, it was obtained that the calculated P-value is less than 0.05, therefore, the null hypothesis is rejected in favor of the alternative hypothesis, thereby corroborating the general hypothesis of the investigation. Ha = The logic-language synergy improves the modeling of software requirements in Peruvian students of Systems Engineering and Informatics. All these analyzes have been carried out with the support of the statistical software IBM SPSS statistics 25.

In addition, for the analysis of the research, the deductive method has been used whose research strategy was the synergistic review of the theoretical bases based on Aristotelian Thought, Chomsky's linguistic creativity and the Maturanian Language Theory.

Research Motivation

In software manufacture, throughout the Software Process (in our case Life Cycle), specifically in the System Analysis activity, the Systems Engineering and Informatics student must identify, describe, organize, relate and synthesize the system requirements within your mental space in a complex and often deeply abstract way; managing to obtain, with strenuous efforts, a software in terms of requirements, which are inputs for the next activity of System Design as another fundamental activity of the Software Process within the framework of Software Engineering.

The capacities executed in the mental space of the student, many times of deep abstraction, are developed in the Spanish language at a level of colloquial and / or common use without a guideline and theoretical basis of applied grammatical structure. Which leads to a subjective perception, identification and description of software requirements, causing enormous complications in the modeling of software requirements and future activities of the software process.

Synergy, logic-language for thought

For the analysis of the research, the deductive method has been used, whose research strategy was the synergistic review of the theoretical bases based on Aristotelian Thought, Chomsky's linguistic creativity and the Maturanian Language Theory.

In the first instance (Ruiz, 2015) states: there is the relationship between language, logic and thought, which is one of the great findings of Aristotle, the same one who maintains that from the senses that experience recovers, as a source of certain data, logic and language are going to be fundamental. Logic studies the form that a certain type of argument must have, those that try to prove or prove something; it shows what paths thought follows when it acts; Likewise, he observes that the basic element is language through words, with which we refer to realities through sentences to express or think combinations between these realities.

For his part, Chomsky points out that the fact that people are able to communicate means that there is something in our minds that allows us to do so. One way to define this position is to call it "rationalist", that is, to attribute a primary role to reason in our relations with experience. Giving primacy to reason over experience is like saying that experience and the world provide us with the data, but that we do not get to them without intermediaries, but rather through a structure that determines the way we perceive, or in which our mind processes that data; and it is this structure that we must verify and discover (Versace, 2016)

Likewise, the Maturanian Theory of Language establishes that acquiring awareness of something implies reflecting objective reality through generalized meanings that have been objectified in the word. The link between thought and language, therefore, is intimate and necessary, since the semantic expression of meanings of thought is given in language (Ortiz, 2016)

From these statements, a guiding concept is proposed, which is the basis for the approach, presentation and development of capacities that help the student in the sensitive identification, description, relationship and diagramming of components for the modeling of software requirements. The concept proposed in this research tells us: that the experiences of reality are perceived by the senses, through information, data and that in the synergistic link between; a structure - intermediaries (being the logic and logic of use cases, for example) and the language (semantic expression of meanings) a conscious reason (thought) is reached that contributes to the modeling of software requirements.

Abstraction methodology for modeling

For the generation of knowledge, based on the proposed guiding concept, and making it operational, 3 stages are proposed:

a. Initial moment. It is the writing of the business process, perceived by the senses and the knowledge generated in the mental space of the student, which must be processed in a logical way, with the conception of statements and written under the structure of the sentence. First, a framework description of the business process is made and then sentences are detailed as the subjects appear, in the environment of the main actions that they carry out called Thematic sentence (Tavera, 2016) and later the secondary or extension actions called Development sentences (Tavera, 2016), which are the details of the topic sentence, a description that is shown in Fig 1.

Fig. 1: Initial moment

b. Intermediate moment. Starting from the products of the initial moment, thematic sentences and development sentences and relying on the Matrix of thematic sentences and development sentences, the subjects, main actions and detailed actions are structured correspondingly, as shown in Table 1.

Table 1: Sentence matrix - moment in between

Tematic Sentence (TS)		Development Sentence (DS)
Student	Carry out previous registration actions	Consult Comprehensive Curriculum Record (RCI)
		Check license plate preview
		Make electronic payment
		Print license plate preview
Administrative secretary	Prepare and deliver payment receipt	
Student	Register no debit of goods	Start procedure
		Request format "No debit of goods"
		Complete the form of "No debit of goods"
Systems Engineering School	Formalize enrollment	Analyze student case
		Validate enrollment in Academic Management System (SGA)
		Print and endorse "Registration form"
		Register delivery of "Registration form"

c. Final moment. Using the results of the Matrix of topic sentences and development sentences and considering the following relationship between the elements of the sentence (language) and the symbols of the use case diagram of the UML modeling language, as shown in Table 2.

Table 2: Relationship between language and UML

Language	UML	Symbol
Subject	Actor	Tematic sentence	Case of use	Development sentence	Case of use - Extend		Case of use - Include	
We proceed to develop the diagram of use cases, resulting in the following diagram for the case of the Student actor, as can be seen in Fig. 2

Figure 2: Resulting use case diagram

This is the product that the student would obtain in the modeling of the software requirements.

Discussion of Results

(Vargas, 2015) proposes in his doctoral thesis "Model for the specification of initial software requirements from the syntactic and semantic relationship between objectives and problems", a model for the specification, formalization and relationship of organizational objectives, problems of the domain and objectives of the system in the phase of software requirements reduction, allowing to generate traceability and consistency. A set of syntactic and semantic rules is structured that facilitate an association relationship of common domain terms.

The proposal of this research proposes a guiding concept, which is the basis for the approach, presentation and development of capacities that help the student in the sensitive identification, description, relationship and diagram of components for the modeling of software requirements. The concept proposed in this research tells us. That the experiences of reality are perceived by the senses, through information, data and that in the synergistic link between; a structure - intermediaries (being logic and logic of use cases, for example) and language (semantic expression of meanings) a conscious reason (thought) is reached that contributes to the modeling of software requirements, by means of a value chain consisting of three moments.

a. Initial moment. It is the writing of the business process, perceived by the senses and the knowledge generated in the student's mental space, which must be processed in a logical way, with the conception of statements and written under the structure of the sentence.

b. Intermediate moment. Starting from the products of the initial moment, thematic sentences and development sentences and relying on the Matrix of thematic sentences and development sentences, the subjects, main actions and detailed actions are structured correspondingly.

c. Final moment. Based on the results of the Matrix of topic sentences and development sentences and considering the following relationship between the elements of the sentence (language) and the symbols of the use case diagram of the UML modeling language.

Regarding the general objective of the research, it was obtained as a result that the P-value in the ANOVA table is less than 0.05, so there is a statistically significant relationship between the modeling of software requirements (Proposed methodology) and the modeling of software requirements (previous methodology), with a confidence level of 95%. Likewise, when performing the homocedasticity test in the comparison of means, it was obtained that the calculated P-value is less than 0.05, therefore, the null hypothesis is rejected in favor of the alternative hypothesis, thereby corroborating the general hypothesis of the investigation. Ha = The logic-language synergy improves the modeling of software requirements in Peruvian students of Systems Engineering and Informatics

By applying the logic-language synergy, the modeling of software requirements improves in Peruvian students of Systems Engineering and Informatics, in the 2019-1 semester, where it can be seen that the average of the students' evaluations was 14.3214, improving Regarding the 2018-1 semester grades, since the average of the students' evaluations was 10.1622, where the logical-language synergy was not applied. These results can be seen in the Fig 3.

Fig. 3: Result of the improvement of the logic-language synergy

Horizontal Dimension of Subsidiarity In the Activity of Polish Local Government

Abstract

This paper addresses the idea and principle of subsidiarity, which undoubtedly may be called one of the modern foundations of European democracies. They have been and still are playing an important role in shaping the European social, political and legal thought. Currently, next to classical aspects of the principle of subsidiarity (making up the so-called vertical subsidiarity), another aspect, horizontal subsidiarity, is being observed. This horizontal dimension of subsidiarity, playing an increasingly important role in the functioning of contemporary democratic societies, is an implication of the principle of civil society in connection with the principle of public dialogue. This paper characterises how the principle of horizontal subsidiarity is understood now on the ground of Polish regulations and presents an example of implementation in the local government practice of a project corresponding to its characteristics.

Keywords: horizontal subsidiarity, territorial self-government, satisfaction of residents' needs, urban prototyping

Introduction

The idea of subsidiarity may undoubtedly be called one of the foundations of modern European democracies.

Shaped in the 1930s in opposition to socialism (in its two mainstreams - communism and social democracy) and liberalism, it was an attempt to revitalise the social order. It has been and still is playing an important role in shaping the social, political and legal thought bringing answers to fundamental questions such as: what is authority for? What objectives should it serve and what role should it play? (Millon-Delsol, 1995, pp. 6-7), and also what is the scope of independence and self-sufficiency of a citizen, social groups, smaller and larger communities in different spheres of the operation of the state? (Dolnicki, 2012, p. 23).

Currently, next to classical aspects of subsidiarity (making up the so-called vertical subsidiarity), another aspect, horizontal subsidiarity, may be observed. This, in turn, involves ensuring such a way of performing public tasks so that they are to the greatest possible extent implemented by civil society institutions.

The adopted research goal in this paper is to characterise how the principle of horizontal subsidiarity is understood on the ground of Polish regulations, and then, by means of a case study, how it applies to the activity of Polish territorial self-government. One of the projects carried out in Szczecin (one of Poland's largest cities) will serve as an illustration of the issue in question.

Sources of The Idea of Subsidiarity

The sources of the idea of subsidiarity - a philosophical thought and reflection which has shaped contemporary understanding of subsidiarity - may be sought in different stages of development of the European culture. It already appears in Aristotle's ancient philosophy as an important elaboration of his philosophy of politics, thus being an implication of criticism of Plato's' communism (Finnis, 2001, p. 177). It then emerges in medieval scholarship of St. Thomas Aquinas and in enlightened concepts of John Locke and Jean-Jacques Rousseau. However, an undoubted breakthrough in the shaping of the contemporary concept of subsidiarity occurred when its assumptions were expressed in the scholarship of the Catholic Church. It needs to be remembered that it was first expressed (though still not directly named) in the 1891 Encyclical Rerum novarum. It believed that the state's obligation to provide aid to a family that have found themselves in a difficult situation that they cannot overcome themselves constitutes valid

and substantiated care. Such state activity was not treated as taking away civil rights but as their appropriate protection (Wacinkiewicz, 2016, p. 289-290).

Subsidiarity rules were clearly named and formulated in the 1931 Encyclical Quadragesimo anno (Pius XI, 1946). Its essence is expressed fullest by the thought that what an individual can accomplish by their own initiative and industry cannot be taken from them for the benefit of the community. It is similar in the case of lesser organizations and small associations. Taking tasks from them which they are able to accomplish is treated on the ground of Quadragesimo anno as "injustice and a grave evil". Each intervention in public life due to its purpose and nature must have a subsidiary character - it is supposed to help social organizations, not absorb them (Pius XI, 1946, p. 58).

The question of proportionality of state action was also referred to by John Paul II in the Encyclical Letter Centesimus annus, published on the centenary of publication of Rerum novarum. Pointing out that expanding the range of state intervention (the concept of "welfare state", "social assistance state") which was bases on "respond(ing) better to many needs and demands", which results in remedying "poverty and deprivation unworthy of the human person", led to "excesses and abuses". "Malfunctions and defects in the Social Assistance State are the result of an inadequate understanding of the tasks proper to the State. Here again the principle of subsidiarity must be respected: a community of a higher order should not interfere in the internal life of a community of a lower order, depriving the latter of its functions, but rather should support it in case of need and help to coordinate its activity with the activities of the rest of society, always with a view to the common good". Consequences of erroneous understanding of the role (tasks) of the state are too obvious and negative at the same time. As concluded by John Paul II, "(b)y intervening directly and depriving society of its responsibility, the Social Assistance State leads to a loss of human energies and an inordinate increase of public agencies (...). In fact, it would appear that needs are best understood and satisfied by people who are closest to them and who act as neighbours to those in need. It should be added that certain kinds of demands often call for a response which is not simply material but which is capable of perceiving the deeper human need" (Jan Paweł II, 1996, p. 517-518).

The Essence of Contemporary Understanding of Subsidiarity

Inherent human dignity is central and key to the principle of subsidiarity stemming from the assumptions of the personalistic concept of man (Izdebski, 2015, p. 171). Irrespective of its sources, manifestations and nature, human dignity is an ethical and legal expression of the need for autonomy, respect, deference and self-actualisation, whereas a call for dignified treatment is one of the needs inherent in each individual (Wacinkiewicz, 2016, p. 494).

It is respect for human dignity, key to implementation of subsidiarity, that the following finding stems from: free persons responsible for their own actions are at the same time, and primarily, responsible themselves for meeting their own needs. They may use all of their rights, resources and capabilities for this purpose and what they choose to apply is the choice (free will) of the individual.

In turn, inability to meet one's necessary needs by their own resources opens an opportunity for supporting the person in need "from the outside", that is from the side of the community, associations and institutions of a civil society. The order of intervention is determined by a certain proximity of the supporting entity towards the person in need. Therefore, help first comes from the closest community, that is family. Then, taking into account the fact that we live in an organized society (which is made up of a number of levels of organization), room for interference from the institutions of civil society (in particular non-governmental organizations) opens

Only the inability to meet one's own needs associated with insurmountable difficulties, both as part of individual (independent) and collective (community) actions, provides a basis for public authority to act. This is when a public task occurs (Izdebski, 2011, p. 147). Its essence is to aid persons in need in overcoming life problems, insurmountable by means of one's own powers, resources and capabilities, and to remove reasons of such a state of affairs and to restore a person to normal social functioning. Thus, public tasks serve to enable life in conditions suitable to human dignity. Reasons for public authority intervention understood in this way still require one express supplementation: public authorities must act only for the purpose and within limits of necessary assistance. It is then that public authorities are obliged to bring help to persons in need. This does not entail at all freedom of the range of activities from the side of public authorities or, all the more so, consenting to an excessively broad range of intervention.

Subsidiarity in the Polish legal and administrative system

The principle of subsidiarity, along with values such as democracy, respect for the rights of the individual, cooperation of authorities and social dialogue, is also one of the foundations for the establishment, first, of the European Communities and then of the European Union. This, and the fact that it is reflected in normative acts adopted under

the auspices of organizations such as the Council of Europe (here in particular in the European Charter of Local Self-Government) and in constitutions of European countries (Constitution of the Italian Republic), and also at the same time the fact that it is not a widespread principle outside our continent caused it to be called "very European" (Izdebski, 2015, pp. 170-171) in the literature.

The principle of subsidiarity may also be called one of the prime principles of the political system of the Republic of Poland. It is all the more reasonable since the Polish Constitution sees the source of all rights and freedoms of an individual (citizen) in his inherent and unalienable dignity. It was expressed *explicite* in the preamble to the Constitution of the Republic of Poland in the following phrase: "the basic law for the State, based on (...) the principle of subsidiarity in the strengthening of the powers of citizens and their communities". All public authorities may be considered addressees of this regulation because it is their duty to strengthen (i.a. in their activity) the "powers of citizens and their communities".

Even though the content of the principle of subsidiarity was not elaborated in the provisions of the Polish Constitution, there is no doubt that it may be reconstructed also on the ground of its other provisions, in particular in those referring to territorial self-government. They demonstrate i.a that a local government participates in the exercise of public power and the substantial part of public duties which local government is empowered to discharge by statute is done in its own name and under its own responsibility (Article 16(2)). What is especially important, it is this local government that performs public tasks which were not reserved by the law (Constitution or statutes) to the organs of other public authorities (Article 163). Among these tasks the most important role is played by those which meet the needs of a self-governing community. The Constitution stipulates that they are performed by a local government unit as its own tasks (Article 166(1)). The Constitution also points out that the commune is the basic unit of local government (Article 164(1), which is especially important from the point of view of the principle of subsidiarity, and forms the first, "closest to the citizens", level of the self-government structure.

Let us look closer at this last issue. Now, in the Polish system of public administration the principle of subsidiarity outlines the need to implement public tasks at the lowest level of administrative structures. This specified, according to the said constitutional regulation, the basic role of territorial self-government, and within it - of the commune (as a basic local government unit) in the organization and operation of the public administration system.

The literature points in particular to two (essential from the political point of view) aspects where the principle of subsidiarity plays a crucial role. This involves first of all, specifying the essence of public tasks (solving individual and collective problems which are unresolvable under a civil society); second of all - dividing public tasks between different levels of public authorities (that is a vertical division of public tasks between individual authorities). Both aspects are traditionally classified into the category of the so-called vertical subsidiarity. Next to them, however, one can notice today another, third aspect of subsidiarity, that is horizontal subsidiarity. This, in turn, involves ensuring such a way of performing public tasks so that they are carried out to the greatest possible extent by civil society institutions. (Izdebski, 2015, pp. 172-173). This is how achieving the common good is to be done.

The literature defines horizontal subsidiarity "as a delegation of aspects of public policy making to non-state actors, such as business, NGO's and other interested participants of civil society" (Colombo, p. 39). It is also noticed that the horizontal dimension of subsidiarity enables perceiving society "as a conglomerate of different domains: the market, the state and civil society" along with its specific features and "unique coordination mechanisms" (van de Donk, 2019, p. 47). In such horizontal systems of coordination, there is more emphasis on the diverse nature of social arrangements explicitly avoiding any particular ranking that is a reflection of size, power or status (Mulé, Walzenbach, 2019, p. 141). The path leading to this emphasizes interactions of various stakeholders, while elements such as active participation, engagement or networking collaboration of actors from various fields (administration, business, civil society) are important themselves.
One may cautiously notice the complexity of the principle of subsidiarity in this horizontal angle, expressed both in a negative aspect (boiling down to public authority refraining from the performance of tasks which can be carried out by the individual, social groups, communities or civil society institutions), as well as in a positive aspect (entailing public authorities' duty to provide assistance to the named entities, which involves stimulating, inspiring, maintaining and supplementing the efforts of these entities) (Millon-Delsol, 1995, pp. 8-9).

Practical implementation of assumptions of horizontal subsidiarity - the example of the city of Szczecin

Szczecin is the third largest city in Poland in terms of the area and seventh in terms of population. It is the capital of the West Pomerania Province and at the same time the centre of the Szczecin metropolitan area. Its specific nature is manifested in a number of endemic features (including environmental ones - 60% of the area is covered by greenery

and waters). Szczecin is located right at the border with Germany (12 km) and is the only Polish metropolitan area with a cross-border nature. What is interesting, the capital of Poland, Warsaw, comes only fourth among European capitals in terms of its distance from Szczecin (550 km). Berlin, Copenhagen and Prague are all closer to Szczecin (125 km, 280 km and 505 km, respectively). The city of Szczecin, like many other European cities, faces quite characteristic developmental problems: suburbanization, demographical problems, or, from a more detailed perspective, too great a share of individual car transport in the city's transport structure.

An example of a project that is in line with the characteristics of the principles of horizontal subsidiarity is a model of urban changes for the old town implemented in the city - a project which combined potentials of activities of the administration, business and civil sector.

In 2019 an urban prototyping project was carried out in the city for one of the most significant public spaces of the old town. This complex participatory-research-design project was limited space-wise in its original assumptions to only one city square. Its aim was to develop a concept for transforming this area into a multifunctional living urban structure by working jointly, bottom-up and with various users of this space (Wacinkiewicz, 2020, pp. 10234-10240).

It needs to be stressed that from the start this project was conducted according to the assumptions of horizontal subsidiarity: municipal self-government authorities decided to refrain from deciding independently about the direction of transformations of this public space in favour of developing it in a joint effort of various stakeholders (users of this space). In this project task representatives of self-government authorities of the city along with non-governmental organizations, entrepreneurs, residents, students and also representatives of the academic circles, cultural institutions, artistic and general schools created solutions to improve the aesthetic and functional values of this place. At the same time, transport-related research commissioned by the city's authorities was carried out on the practice of use of the square's space by different users (i.a. its intensity, availability of transport, use of parking places, necessary changes in traffic organization).

As early as a few weeks into implementation, it became obvious to all those involved in the project (self-government authorities, social activists, residents) that activities that restore the space of the square to all its users and related problems that got revealed cannot be solved within the square itself. This is why residents, NGO representatives and entrepreneurs formulated a clear expectation not only towards creating a plan for the square alone, but also towards a comprehensive concept for the entire city. The city's authorities approved this proposal for extending the project, noticing in this socialized decision-making process a chance for creating a city centre area that is well-designed from the point of view of its users (residents, entrepreneurs, tourists, etc.) and that has a central role of the old town.

An expectation regarding a broad, holistic look at this fragment of the city's space resulted in the research, consultation and design process concerning the square being combined with arrangements made for the entire old town and its relation with the very centre of the city. Thus, not only did the spatial scope of the project expand, but primarily a need for a comprehensive analysis of many new elements in a much greater scale emerged.

The consultation-design process included issues such as protection of historical monuments and buildings in this area, guidelines on planned infrastructural investments in the area of the old town (rebuilding public squares, removing some parts of the road layout), shaping and protection of greenery or transport-related matters (introduction of hierarchy of roads, pedestrianizing some roads, or changes in a parking policy). These solutions were developed in cooperation with relevant public institutions and public authority bodies (e.g. historical monuments protection services, the Police, the fire brigade), entrepreneurs (who carry out economic activity in this and surrounding area), NGOs (those which operate in this area and those whose activity focuses on revitalisation, mobility, protection of historical monuments and buildings or social inclusion), residents, tourists and other users of this space (e.g. students of a nearby arts academy, students of a music secondary school and general schools in the area).

In effect, the concept of final changes was publically presented at the end of 2019. It was included in the framework of the most important planning documents (Study of conditions and directions of spatial planning) and strategic documents (Strategy for City's Development) and outlined an action plan for 2020-2026 which was approved for implementation by the city's self-government authorities (and which has been implemented since the spring of 2020). Its guidelines concern investment activities (including protection of historical monuments and buildings), principles for valorisation of green areas, transport changes associated with restricting traffic and many others - which were influenced in the most part by various stakeholders.

From the point of view of the principles of horizontal subsidiarity, the project resulted in effective networking of the collaboration of various actors and in making the decision-making process public. The drawing up of a comprehensive action plan enabled development of cooperation of various project's stakeholders and activation of non-governmental organizations. Measurable effects that should be observed already at an early stage of the project included i.a.

enhancing residents' involvement in the project expressed in high turnout and activity during consultation and design meetings; energising social activists and non-governmental organizations resulting in many initiatives (cultural, social, educational and environmental) implemented by means of i.a. participatory financial instruments (participatory budgeting); entrepreneurs' readiness (especially the catering industry) to coordinate their development plans with the drawn-up comprehensive action plan; reducing a social conflict associated with transport changes (a plan for construction of garage facilities in connection with current reduction of parking places and increased parking fees) and many others. Moreover, as early as one year into implementation of the comprehensive action plan it was established that its certain elements and tasks (performed previously by self-government authorities) will be performed by non-governmental organizations (subsequent stages of urban prototyping, public opinion surveys and social consultation, engagement-related activities). It also needs to be added that experience gained in this way proved invaluably useful in the face of the lockdown and restrictions triggered by the COVID-19 pandemic. A certain spin-off of the discussed project involved activities on the basis of which i.a. the city's authorities, in agreement with entrepreneurs and non-governmental organizations, agreed on temporary road closures or traffic restrictions in certain streets - in order to make it possible to carry out commercial and social projects there (e.g. catering services, artistic displays, environmental activities), while observing suitable social distance and safety rules.

Conclusion

Dignity of every person is a central value for the principle of subsidiarity stemming from the personalistic concept of the individual. It is observance of this principle that demonstrates that free people are responsible for meeting their own needs. Only inability to meet them on one's own and inability to meet them under a civil society makes public authorities authorised or even obliged to step in. From the perspective of the principle of subsidiarity understood in such a way, public authority does not exist to relieve (replace) individuals (communities) from the task of meeting their needs, but to support them and provide assistance where they are not capable of meeting their needs by means of their own capacities and resources.

Subsidiarity does not only mean that competences and tasks are passed the closest onto the smallest communities (including self-governing communities) but also that higher groups are obliged to aid lower groups when problems with correct implementation of tasks vested in them occur.

Currently, the horizontal dimension of subsidiarity has an increasing importance. It is an implication of the principle of civil society in connection to the principle of social dialogue and involves ensuring such implementation of public tasks so that they are performed to the greatest possible degree by civil society institutions.

The project and the comprehensive action plan created on its basis presented as an example of practical implementation of horizontal subsidiarity show the potential of projects designed with an overwhelming participation of civil society. The valuable experience and empirically verified models for action stemming from it are encouragement to develop projects that facilitate interactions and networking of collaboration of stakeholders from various fields (administration, business, civil society).

Abstract

The aim of this article was the issue of specific solutions for the evaluation of KWs and their remuneration was analyzed to make their job performance as maximized as possible. First of all, the analysis focused on one specific group of employees who are KWs. The empirical studies were conducted using questionnaires among employees of organizations operating in Poland – 185 employees took part in the research. Methods of statistical description and estimation were used, including Spearman correlation analysis and regression analysis with mediator. The presented results of empirical research allowed for the construction of a mediating model demonstrating the impact of the shape of solutions of HRM on motivation, engagement, and job performance of KWs. The presented results of research are therefore supported by the authors' initial research, which proved the positive impact of KWs absorption on the relationship between work motivation and job performance.

Keywords: Management, Knowledge Worker, Motivation, Engagement, Job Performance

Introduction

Knowledge workers (KWs) are specifically aware of how to allocate knowledge to use it effectively (Drucker, 1994). They are direct participants of the process of searching, creating, practical use and distribution of this strategic resource of the organization (Drucker, 2011; Jashapara, 2014; Klincewicz, 2012; Koźmiński, 2012; Oleksyn, 2014; Wellin, 2013). Their organizational commitment is based on needs and fulfilled personal goals through the organization (Meyer and Allen, 1997). KWs are characterized consequently by specific characteristics, i.e. autonomy, innovation, intellectualism, professionalism, reputation and cooperation (Bieńkowska and Ignacek-Kuźnicka, 2017). That characteristics imply the need to shape a unique combination of solutions in the area of human resources management conducting a positive impact on their attitudes and behaviors (Trzcieliński et al., 2013; Von Krogh et al., 2001). In this context it can be concluded that creating an atmosphere of motivation and engagement among KWs so that they can effectively perform their tasks and achieve the goals set for them is of fundamental meaning especially in knowledge-based organizations.

Nowadays, there is still a gap regarding the knowledge of the KWs' individual of the organization and the need to shape human resources management solutions dedicated to KWs in terms of their engagement, motivation, and job performance (Bieńkowska and Ignacek-Kuźnicka, 2017; Juchnowicz, 2012; Tabaszewska, 2011). The management scientists are confronted with a real problem, which can only intensify over the years. Manual skills are becoming increasingly insignificant, as more and more creativity, expertise, experience and skills are required from employees today (Jashapara, 2014; Davenport, 2007). Knowledge-based organizations are becoming dominant and are required to learn how to effectively manage KWs to stimulate their work engagement, work motivation and improve the employees' job performance. Many researchers confirm that, for example, adequate organization of training programs for KWs increases their involvement in work, which has also a positive impact on the results (Šikýř, 2013; Likert, 2016; Juhnovich, 2012). The literature findings concerning the close relationship between work motivation and work

Cite this Article as: Agnieszka BIENKOWSKA, Beata IGNACEK-KUZNICKA and Anna KOSZELA " The Influence of Chosen HRM Solutions for Knowledge Workers on Their Job Performance Through Work Motivation and Work Engagement – Result of Initial Empirical Research" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

engagement and also job performance, suggests that also the relevant shape of HRM solutions can positively stimulate work motivation (Salanova et al., 2015). It should not be omitted that an organization that focuses on a high level of work motivation, work engagement, which will result in high job performance, will ensure high performance of the whole organization (Bieńkowska and Tworek, 2019; Bieńkowska and Ignacek-Kuźnicka, 2019).

However, the trying to indicate appropriate and complex solutions raises problems that require scientific research. This explains the importance of making research to clarify the empirical correctness of the issue. Therefore, the main aim of this article will be to verify the influence of chosen solution of HRM on work motivation, work engagement and job performance of KWs.

Literature review and hypotheses development

Knowledge workers in an organization

Who are a knowledge workers? Before the "IT age", the answer was that it is a doctor, lawyer, teacher, preacher, or architect (Kowalski, 2011; Drucker, 2011; Wellin, 2013; Jashapara, 2014). What did these professions have in common? They were free professions, practiced by highly educated erudite professionals who, through their expert knowledge and high standards of behavior towards clients, created professional values (Murgia et al., 2016; Chong et al., 2017; Harlow, 2018). Drucker (2011) has significantly extended this traditional definition, mainly by creating the closed catalogue of professions, because he has managed to find KWs in public administration and business. According to him, they are excellent professionals with specialized knowledge, who operate and communicate routinely, beyond formal competence structures, using their autonomy in the decision-making process. Their natural environment is the culture of individuality (Jashapara, 2014), which allows for the self-fulfillment of individual interests in conditions of cooperation.

Armstrong and Taylor (2016) describe this culture as open because of the opportunity to share ideas and knowledge within a community of activities. Creating unique knowledge in an open culture is an attribute of power, one who possesses it is quintessential of the KWs (Armstrong and Taylor, 2016). Such an employee has a high value for the organization, at the stake of expected success (Griffin, 2017). For KWs, on the other hand, the value is the reputation and professional value that inspires him to continue to improve his expert skills (Griffin, 2017).

The theoretical considerations are complemented on the definition of the KWs by empirical research on some of its components:

- on innovative and self-fulfilment (Lewis and William, 2003; Fischer et al., 2019);
- the need for autonomy (Steinmann and Schreyogg, 2007; Fowler, 2014; Biesok and Wyród-Wróbel, 2018; Harlow, 2018; Pluta, 2018);
- over professional value (Evans, 2005; Hwang et al., 2015; Pluta, 2018);
- on professionalism (Evans, 2005; Fowler, 2014; Bieńkowska and Ignacek-Kuźnicka, 2017 and 2018);
- on intellectualism (Evans, 2005; Parmenter, 2015; Bieńkowska and Ignacek-Kuźnicka, 2017 and 2018;);
- on the creative process (Parmenter, 2015; Fischer et al., 2019);
- on cooperation and knowledge sharing (Parmenter, 2015);
- on passion (Evans, 2005; Fowler, 2014);
- on reputation and sense of responsibility (Maciariello, 2016; Biesok and Wyród-Wróbel, 2018).

The authors have explored and developed their own set of the characteristic of KWs, which determine it. The fundamental elements of this collection are autonomy, professional ethos, innovation, intellectualism, professionalism, reputation and cooperation (Bieńkowska and Ignacek-Kuźnicka, 2017). About the individual elements of this collection from the perspective of KWs' characteristics also wrote the other researchers: (Janz et al., 1997; Jungert et al., 2013) on freedom; (Evans, 2005; Steinmann and Schreyogg, 2007; Tidd and Bessant, 2013; Murgia et al., 2016; Chong et al., 2017; Griffin, 2017) on ethics related to professional ethos; (Tidd and Bessant, 2013; Fischer et al., 2019) discussed on innovation; (Hwang et al., 2015) described on the intellect; (Frick, 2010; Tidd and Bessant, 2013; Owen, 2013) on the role of the professionalism; (Frick, 2010; Hwang et al., 2015; Bhatnagar et al., 2017) about the reputation; (Davenport, 2007; Tidd and Bessant, 2013; Jashapara, 2014) about cooperation. The content of the concept includes significant object's characteristics, which use to create it. The above *differentia specifica* is the intention of the KWs concept (Grobler, 2006). The intention is a certain idealization, it is a sequence of conceptual states. In the set of characteristics describing a given concept, some characteristics are perceived as more typical, others as less typical. Such a lack of precision is caused by the difficulty in establishing a clear line, where it begins and where it ends, in our case - KWs.

Generally, the identification of an object using description is not the same as the ostensive indication of an object (Piłat, 2007). It is also the case with the KWs description. In this case, it is necessary to define the level of absorption of differentia specifica KWs as a continuum, in which particular places there is a certain intensity of the characteristics of the KWs.

This intensity is urgent in the context of HRM, especially in the development of solutions fitted to KWs (Teo and Noyes, 2008). In turn, the adopted shape of HRM solutions, e.g. in terms of evaluation of KWs or their remuneration, is critical in the context of KWs job performance (Raczek, 2016). Therefore, it is necessary to consider possible links between these contexts (Truss et al., 2013; Zelles, 2015). As a consequence, the empirical insight will be critical because sheds new light on this issue. To explain the relation, the empirical research will use the following intermediaries: KWs' work motivation and KWs' work engagement (Meyer and Allen, 1997; Truss et al., 2013; Armstrong and Taylor, 2016; Griffin, 2017).

Work motivation and work engagement of KWs and their job performance

In the literature, motivation is defined as the internal energy that makes people act (Griffin, 2017). Sources of motivation, types, and even more its level, according to research, have a significant impact on the organization (Steinman et al., 2001; Owen, 2003; Flower, 2015). The literature not only defines motivation but also work motivation, which Hackman and Oldham (1974, 1975) defined as the degree to which an employee is motivated to do his work effectively. Work motivation is shaped by three factors: work valuable, responsibility for the task, and feedback (Hackman and Oldham, 1975; Frick, 2010; Griffin, 2017; Jureczka, 2018; Sadeghi et al., 2019). It is considered that the nature of work is of great importance in terms of shaping certain employees' behaviors. Employees should respond positively to the four basic job characteristics: variety, task identity, autonomy, and feedback (Hackman and Oldham, 1976). These considerations of work motivation have resulted in the creation of the Job Characteristics Model, which states that internal motivation, which in the age of the knowledge-based economy, becomes more and more important, is determined by three psychological states that occur when a job has certain characteristics: diversity of the skills used to perform the task, the degree of ability to perform the task from start to finish, the autonomy of the job, the meaning and impact of the task on others, and the feedback about the task performed (Kovach, 1980; Steinmann and Schreyogg, 2001; Parmenter, 2015; Ding et al., 2019; Pak et al., 2019). This is based on the natural need for human development (Flower, 2015). There are some specific factors among KWs that determine their work motivation. Particularly important here is the high autonomy of work in performing tasks, the diversification of tasks, and the appropriate encouragement to further improve their skills (Janz et al., 1997; Saraswathi, 2011). Work autonomy is a source of strengthening work motivation and respect for independence is reflected in the sense of internal motivation (Steinmann and Schreyogg, 2001; Flower, 2015). The freedom to work and plan one's work, to adapt physical and cognitive elements within the limits of work according to Horwitz and colleagues (2003) is also important in shaping work motivation (Baron and Hanna, 2002; Thompson and Heron, 2002; Horwitz et al., 2003). Giving individuals and teams of the KWs, the autonomy to define their work, designing jobs, and providing appropriate support from senior management in knowledge management (McKenzie et al., 2001) is key to ensuring a high level of motivation among KWs.

This factor often proves to be critical because of their work characteristics, since KWs are creative workers who take responsibility for their work and are able to control themselves perfectly when performing tasks, which is why they are so motivated by their independence (Owen, 2003; Davenport, 2007; Frick, 2010; Tidd et al., 2013; Maciariello, 2016). The literature, therefore, confirms that the main driving force behind the work motivation of KWs is therefore autonomy, a sense of purpose of a higher level, aspiration for perfection (Flower, 2015; Bhatnagar et al., 2017). In contrast, internal motivation is largely supported by KWs' characteristics: creativity and innovation (Fischer et al., 2019). Moreover, the literature shows that the level of motivation is 48% higher among KWs' best employees than among the average (Hunter et al., 1990). Additionally, it was observed that properly designed working conditions for KWs, will provide an ideal background for additional actions known from HRM practices, such as adequate remuneration, recruitment, and selection based on P-O fit or employee development, which will then more effectively strengthen work motivation (Hackman and Oldham, 1980; Osterloh and Frey, 2000). Moreover, the research made by Bieńkowska and Ignacek-Kuźnicka (2019) confirmed that among KWs, work motivation is higher than among workers who do not have high KWs levels. Therefore, the results of these initial studies inspired the authors to continue searching for the characteristics and behaviors characteristic of KWs that determine employee's effectiveness in the organization (Bieńkowska and Ignacek-Kuźnicka, 2019). On this basis, it can be expected that it is natural that KWs have high work motivation.

As mentioned, due to the fact, as a natural consequence of the hypothesis that KWs have a higher level of work motivation, is the assumption that the work engagement of KWs will also be higher. Just as in the case of work motivation, there are many definitions in the literature for work engagement. Alarcon and Lyons (2011) described employees' work engagement as a multidimensional concept that is based on positive emotions related to the level of

engagement (Alarcon and Lyons, 2011). Other researchers understand work engagement by the employees' positive identification with the organization's mission, goals, and values (Simon, 2011). In general, work engagement is considered to be a mental state that corresponds to the positive affectivity of the employee (Bakker and Leiter, 2010). However, most often, the literature for measuring and defining work engagement adopts the Utrecht Work Engagement Scale (UWES), which presents engagement in three aspects: vigor, dedication, and absorption (Schaufeli et al., 2002). Thus, it is observed that employees engaged in work are characterized by such characteristics as perseverance and determination to dedicate their time and energy to work despite the existing conditions (vigor); a sense of motivation, and importance of the goal, which actively engages the employee in the work, even if it goes beyond the standards (sacrifice); and a deep concentration of employees on their tasks (absorption) (Schaufeli et al., 2002).

Similarly, the engagement of KWs is considered in three dimensions. Their relationship with the organization is considered in relation to how well employees understand their responsibilities, how much energy they bring to work, and how motivated they are to perform their tasks (Figurska, 2015). The care of work engagement among KWs is therefore important because one of the most important factors determining the contribution of KWs to the organization is their engagement. Employees who are engaged in work have high competencies, are more active, full of energy, are much more independent, and all this results in higher job satisfaction (Harter et al., 2002; Saks, 2006; Schaufeli et al., 2008; Bakker, 2009). Work engagement affects employees' job performance, improves their effectiveness, thus increasing the effectiveness of the organization and improving its results (Tidd and Bessant, 2013; Wellin, 2013). It is not without reason that employee work engagement may be a key factor of both business and organizational success (Albrecht, 2012; Tate, 2015; Tate et al., 2019). On the other hand, in the context of KWs, knowledge, and skills, as well as their attitudes and behaviors are becoming increasingly important in determining the success or failure of an organization (Figurska, 2015).

The proper management of KWs, due to its natural characteristics, i.e., the fact that it is located, acquired, developed, shared, used, and preserved by people, will contribute to raising the level of commitment to work (Morello and Caldwell, 2001; Staples et al., 2001; Morawski, 2003 and 2009; Davenport, 2007; Czubasiewicz, 2009; Figurska, 2010, 2012 and 2015). The literature is considered that work engagement is also directly related to internal employees' work motivation (Hallberg and Schaufeli, 2006; Schaufeli, 2013). This can be especially visible in the case of KWs, for whom the provision of certain specific characteristics of work results in increased motivation to work and, according to theory, will result in work engagement. Taking the above considerations into account, it seems natural to say that KWs also have high level of engagement to work.

The economic measure of effectiveness consists of the behavior presented as a result of mental and physical effort (input) and the effects of these behaviors (results) – together referred to as job performance (Brumbach, 1988; Griffin, 2017). Behaviors and actions determined by the organization's goals are, according to Campbell (1990), job performance. Motowidlo and colleagues (1997) studied the multidimensionality of this concept and stated that it is the total value of the behaviors required from employees. Borman and Motowidlo (1997) distinguished performance concerning a formal job description as something contextual, related to a task, as a voluntary contribution, apart from formal duties. Task-based performance indicators are according to Campbell (1990; 1997): leadership and administrative skills, ability to perform job-specific and non-specific tasks, and communication proficiency. According to Borman and Motowidlo (2008), there are 5 indicators of the assessment of contextual effectiveness: working for an organization apart from the formal duties of the job description, performing key tasks on time and with enthusiasm, being ready to support colleagues, being compliance with the rules in difficult circumstances, being compliant with the organization's policy to defend its goals (Szara et al., 2017).

Characteristics that identify KWs: intuitiveness and creativity are both important elements of individual behavior in the workplace and they directly or indirectly affect the efficiency of the organization. They belong to the whole set of productive behaviors that are expected from a member of the organization. According to Griffin (2017), dysfunctional behaviors are harmful to the organization's performance, and therefore KWs' characteristics contribute to performance. It was found that for these people the boundary between professional and personal life is blurred, they work more like volunteers than full-time employees (Evans, 2005). Welch (2005) claims that the attributes that an individual brings to the organization, the fact that he/she is passionate, is fundamental to measuring effectiveness (Parmenter, 2016). Attitude, individual abilities, and character traits are components that build the effects of work of KWs, but their efficiency determines the success of the organization (Davenport, 2007; Griffin, 2017; Pluta, 2018). The characteristics of KWs which affect the progression and decide about the results are the following: idealism, cooperativeness, innovativeness, autonomy, flexibility, high qualifications, interdisciplinarity, openness, illogical development paths, finding sense. These are examples of characteristics that lead to outstanding performance that exceeds standard expectations (Davenport, 2007; Tidd et al., 2013; Flower, 2015; Amstrong et al., 2016; Maciariello, 2016). It was established that autonomy and cooperation significantly and positively affect the effectiveness of KWs (Janz et al., 1997; Davenport, 2007; Jungert et al., 2013). Managers are aware that the natural environment for KWs

is to guarantee a high degree of work autonomy. This provides them with independence in decision-making (Jashapara, 2014), as well as the constant opportunity to improve their competence by performing various tasks, to which they are often mobilized by the opportunity to share their expert knowledge (Griffin, 2017). These common characteristics allow us to treat KWs as a cohesive group in the context of increasing job performance, because the factors determining the performance of KWs are identical, regardless of the profession (Davenport, 2007). KWs tends to identify more with their specialty, and they do it so much that they define performance in terms of representatives of their specialization (Griffin, 2017).

Therefore, achieving the best results at work requires a synthesis of three elements: knowledge, skills, and will – and this combination undoubtedly characterizes KWs (Evens, 2005). Organizations achieve better results by employing creative, cooperative employees with excellent skills who derive job satisfaction (Parmenter, 2016). It is therefore understandable that a higher level of contextual efficiency was found among KWs who identified themselves with the mission and long-term goals of the organization (Szara et al., 2017).

Moreover, numerous studies have proved the relationship between job performance and personal characteristics of KWs (Fitzpatrick et al., 1999, Buljac-Samardzic et al., 2010., Al-Makhaita et al., 2014; Bieńkowska and Ignacek-Kuźnicka, 2019) and it has also been proved that those workers who share their knowledge achieve better results than others (Cummings, 2004).

Therefore, based on the above considerations, as well as on the results of research already conducted by the authors (Bieńkowska and Ignacek-Kuźnicka, 2019), which proved the moderating effect of KWs absorption levels on the relationship between work motivation and job performance, extending the set of work-related characteristics by work engagement, the following hypothesis can be formulated:

H1: *The level of absorption of a KWs' characteristics positively affects the level of work motivation* (**H1a_1**)*, work engagement* (**H1a_2**) *and job performance* (**H1b**).

HRM solutions influence on KWs' job performance

Relation between HRM solutions and job performance of KWs

Over the years, many HRM strategies have developed which successfully can apply for different types of organizations (Becker and Huselid, 1999). However, it should not forget that HRM refers first of all to people - employees of the organization and because they are the key resource of the organization, the HRM strategy should select in such a way as to maximize the effectiveness of employees (Giauque et al., 2010). As mentioned above, KWs are a specific but increasingly fundamental group of employees whose maximization of results brings incredible benefits to the organization making it competitive in the global marketplace (Lee and Maurer, 1997; Horibe, 1999; Alvesson, 2000 and 2004; Amar, 2002; Benson and Brown, 2007). It is, therefore, necessary to focus on the choice of the shape of managing human resources in such a way that the employee of knowledge, feeling most comfortable in the organization, shows great effectiveness (Tabiu and Nura, 2013).

There is no doubt that many significant differences can be found between specific groups of employees (Pfeffer and Baron, 1988; Benson and Brown, 2007), as this causes different perceptions and responses to management strategies in the organization (Benson and Brown, 2007). Therefore, the verification of the HRM solutions' shape fit to the knowledge employees to increase their performance seems to be an essential aspect, given that some studies confirm the impact of HRM practices and processes on employees' behaviors and attitudes (Arthur 1994, Huselid, 1995; Giauque, 2010). The HRM strategy concentrated on employee engagement is bringing results in developing the productivity and efficiency of an organization. This strategy focuses primarily on evaluating employee development focused on the results that the employee achieves and on fair and competitive remuneration appropriate to the employees' results (Whitener, 2001). Such an approach seems to be critical in the context of managing KWs even for how KWs perceive of remuneration aspects. The structure and level of remuneration is the identification of KWs with their specific employee profile, i.e. a highly educated, knowledgeable, elite employee with strong added value for the organization (Thompson and Heron, 2005; Dickinson, 2006; Giauque et al., 2010).

Fulfilling the KWs' expectations about the specificity of remuneration - i.e. allocation of remuneration based on the difficulty of work performed - will result in a positive perception of the remuneration system, and thus HRM strategy as a whole, which will contribute to an increase in the employee's job performance (Thompson and Heron, 2005; Williams et al., 2007). Moreover, such an HRM strategy will allow for a sense of organizational support to root in the employee, which is greater the more the organization appreciates the employees for their contribution (Eisenberger et al., 1986; Giauque et al., 2010). This sense of organizational support increases the employee's sense of duty and willingness to fulfill his or her obligations to the employer (Eisenberger et al., 1990 and 2001; Shore and

Tetrick, 1991; Shore and Wayne, 1993; Hutchison, 1997). Based on those considerations, the following hypotheses can be formulated:

H2a. *For KWs there is a relation between the shape of HRM solution (employees assessment orientation on results of work rather than on actions and attitudes* (**H2a_1**)*, and remuneration of employees' orientation on difficulty of work rather than results of work* (**H2a_2**)*) and job performance.*

Relation between HRM solutions and work motivation, work engagement of KWs

As with the search for HRM solutions relevant to stimulate the job performance of KWs, the focus should also be on finding the right typologies of HRM solutions that will effectively strengthen their work engagement and work motivation. The research in this area (Hertzenberg et al., 2000; Horwitz et al., 2003) presents many factors as effectively shaping work motivation and the work engagement of KWs. Among them, special attention should focus on the assignment of challenging work, which brings better results and allows the employees to present their skills in difficult conditions (Hertzenberg et al., 2000).

Two of HRM's solutions, employee's assessment and employee's remuneration, are therefore especially highlighted (Keegan, 1998; Hansen et al., 1999; Swan et al., 1999; Robertson and Hammersley, 2000; Horwitz et al., 2003). In the context of employees' assessment, Drucker (1985) focuses on the need for managers to stay in regular contact with KWs to consult on the various options that will allow KWs to maximize its results (Drucker, 1985; Vora, 2004; Carleton, 2011). Therefore, KWs expect the work to be an intellectual challenge for them that will deliver the results the employer expects to add value to the organization (Jamrog, 2004; Carleton, 2011). It can therefore be concluded that the lifeblood behind KWs' motivation and engagement is its ability to achieve its goals and solve its problems - to face challenges and, moreover, this form of work provides KWs with great satisfaction (Sekaran, 1989; Mortimer and Lorence, 1989; Chen, 2008; Narang and Dwivedi, 2010; Bieńkowska et al., 2020).

That is why it is so important to shape the remuneration for KWs, as it turns out that the amount of remuneration itself is a secondary priority for KWs. It is much more significant that the employer should show KWs recognition for its contribution to the organization by praising its efforts (Pobst, 2014). If managers provide appropriate working conditions for KWs, they will ensure that they are highly motivated and committed to work that will result in high job performance in the long term (Drucker, 1985; Vora, 2004; Carleton, 2011).

H2b. *For KWs there is a relation between the shape of HRM solution (employees assessment orientation on results of work rather than on actions and attitudes and remuneration of employees orientation on difficulty of work rather than results of work) and work motivation* (**H2b_1_1, H2b_2_1**) *as well as (***H2b_1_2, H2b_2_2***) work engagement.*

Relation between work motivation, work engagement and job performance of KWs

Since a certain HRM solutions are effective in strengthening both work motivation, work engagement and job performance, it seems natural that in this relation it is job performance that will be the resultant variable. It seems natural, therefore, that the result variable will be even more effectively stimulated by work motivation and work engagement, which will be strengthened by appropriately selected solutions for KWs HRM.

Many literature references are confirming the positive relationship between work motivation and job performance (Bieńkowska and Tworek, 2019; Bieńkowska and Ignacek-Kuźnicka, 2019). The truthfulness of the relation results from the very perception and definition of work motivation. According to Bessell and colleagues (2002), it is the motivation that is one of the most important factors that make employees achieve effective and efficient job performance, i.e. make employees highly effective (Bessell et al., 2002; Azar and Shafighi, 2013).

In addition to work motivation, it is a work engagement that is often indicated as a positive influence on job performance. Employees with a high level of work engagement are also highly concentrated, energetic and enthusiastic about their tasks (May et al., 2004). Such feelings associated with the employees' working time translate into a higher level of job performance, which has confirmed in the literature (Salanova et al., 2005; Xanthopoulou et al., 2009; Bakker and Bal, 2010; Yongxing et al., 2019). Although there are not many studies that verify the relation between work motivation and job performance or work engagement and job performance among KWs, it seems logical to assume that for KWs, in particular, these relations will be strong. According to the concept of the Job Characteristics Model (Hackman and Oldham, 1976). Potential Employee Motivation is highest when the tasks performed are characterized by a high level of autonomy. It has been proven that both autonomy and cooperation are effective and, more importantly, positive for the job performance of KWs (Janz et al., 1997; Davenport, 2007; Jungert et al., 2013; Bieńkowska and Ignacek-Kuźnicka, 2019).

However, in the context of work engagement, there is evidence that direct work engagement of KWs affect the organization's performance (Davenport, 2007). Managers have particular difficulty in verifying the work engagement among KWs based only on observations because KWs' work tool is the mind and the processes taking place in the human mind are not visible. Therefore, to evaluate the level of work engagement, managers should observe the results of the work. It can conclude that the more so among KWs, researchers should investigate the relationship between work engagement and job performance (Figurska, 2015).

H2c. *For KWs there is a relation between work motivation* (**H2c_1**) *as well as work engagement* (**H2c_2**) *and job performance.*

In the context of the relations described above, it seems that there is a need to analyze for KWs the impact of the shape of HRM solutions (in the context of the employees' assessment system and remuneration) on job performance while analyzing the mediating role of work motivation and work engagement. It will allow us to verify and more comprehensively explain the mechanism of the shape of HRM solutions' influence on the job performance of KWs. Therefore, a hypothetical model of HRM solutions impact on KWs' job performance will be assumed, considering the mediating role of their work motivation and engagement, which is clearly connected to both of them. Therefore, in light of the above, the main hypothesis should be formulated:

H3: *For KWs the shape of HRM solutions (employees assessment orientation on results of work rather than on actions and attitudes and remuneration of employees orientation on difficulty of work rather than results of work) influence on their job performance (indirect effect) through the work motivation* (**H3_1_1, H3_2_1**) *and work engagement* (**H3_1_2, H3_2_2**) *(intermediary variable).*

The diagram illustrating all adopted research hypotheses is presented in Figure 1.

Figure 1: HRM solutions influence on KWs' job performance through work motivation and engagement
Source: own work

Research methodology and results

The research described in the article was conducted to verify the formulated hypotheses concerning the confirmation of the presented HRM solutions influence on KWs' job performance through work motivation and engagement.

The research was attended by 185 respondents, representatives of organizations operating in Poland, the members of the KWs group. The research only takes into account those observations for which the absorption of KWs' characteristics was equal to 3.0. It has been established that such a group of employees will be distinguished by an appropriate level of characteristics appropriate to KWs. The research was conducted using a questionnaire formulated specifically for the purpose of telephone surveys.

Variables Measurement

To examine the proposed hypotheses, key variables were defined: *work motivation*, *work engagement, job performance* and *absorption of KWs' characteristics,* and of course the shape of HRM solutions (*employees assessment orientation on results of work rather than on activities and behaviors and remuneration of employees*

orientation on the difficulty of work rather than results of work). Respondents evaluated all variables based on the list of factors and using a 7-point Likert scale (the scale from I strongly agree to I strongly disagree with a middle point: I do not have an opinion).

Work motivation was measured based on the concept of Hackman and Oldham (1974, 1975). The scale contains 1 item (based on a single question) referring directly to the previously presented definition of work motivation: "I am full of energy and enthusiasm to work in my work position, I am fully committed to the tasks entrusted to me by my organization."

Work engagement was measured according to the definition presented by Schaufeli and colleagues (2002). The scale was adapted from the Utrecht Work Engagement Scale (UWES) 9 scale and contains 9 items (Schaufeli et al., 2002):

- At my work, I feel bursting with energy.
- At my job, I feel strong and vigorous.
- I am enthusiastic about my job.
- My job inspires me.
- When I get up in the morning, I feel like going to work.
- I feel happy when I am working intensely.
- I am proud of the work that I do.
- I am immersed in my job.
- I get carried away when I am working.

Job performance was measured according to the definition presented by (Campbell, 1990; Motowidlo, Borman and Schmit, 1997; Szara et al., 2017). The measurement scale consists of 4 items relating to the quality of performed work, bringing satisfaction to the organization, timeliness of the tasks assigned to the employee, efficiency of the tasks performed understood in the context of the goals set by the organization and the effectiveness of the employee in the workplace.

Finally, the ***absorption of KW's characteristics*** is based on the concept developed by the authors: own study based on (Bieńkowska and Ignacek-Kuźnicka, 2017). The scale consists of 6 items:

- In my profession I use unique knowledge, which is why I am independent as an expert and at the same time I have great responsibility.
- I am open to interdisciplinary cooperation and sharing my specialist knowledge.
- I do my job in a flexible mode, without any strict supervision, and in the sphere of knowledge I have neither subordinates nor superiors, I have only partners.
- I am an intellectual and I constantly use my knowledge in my organization
- I create original solutions to the problems that I face,
and my original ideas are innovative.
- Because of my reputation, position, scope of competence and responsibility, I am an employee who influences the success of my organization.

Employees assessment orientation on results of work rather than on actions and attitudes was measured on a Likert scale. In order to focus on the differences between the examined phenomena (orientation of employee assessment on tasks vs. orientation on actions and attitudes), the variable was changed to a dichotomous one, but the observations for which the assessment was 3 were eliminated. Thus employee assessment orientation on results of work rather than on actions and attitudes was assessed: 1 - assessment oriented on results of work; 2 - assessment oriented on actions and attitudes.

Remuneration of employees' orientation on difficulty of work rather than results of work was measured on a Likert scale. In order to focus on the differences between the examined phenomena (difficulty of work vs. results of work orientation), the variable was changed to dichotomous to eliminate the observations for which the evaluation was 3. Thus, remuneration of employees' orientation on difficulty of work rather than results of work assessed: 1 - remuneration orientated on difficulty of work; 2 - remuneration orientated on results of work.

Descriptive statistics and reliability analysis of scales

As a first step in a research process, the reliability of scales of each variable was verified. The results of the analysis of the reliability of the measurement scales are presented in tab. 1. Cronbach's α indicates an internal reliability of the scales and measurements. In table 2. the frequencies for dichotomous variables are presented.

Table 1: Defined variables along with the descriptive statistics values and results of the reliability analysis of scales (N=186).

No.	Variable	No. of items	Cronbach's α	Factor analysis	Mean	Standard deviation
1	Work motivation	1	--	--	4,2270	0,7887
2	Work engagement	9	0,820	43,11%	3,8710	0,6309
3	Job performance	4	0,823	65,92%	4,3844	0,5435
4	Absorption of KW's characteristics	6	0,712	41,95%	4,2213	0,5154

Relations between work motivation and work engagement of KWs and their job performance – research results

In order to verify hypothesis H1 **(H1a_1, H1a_2, H1b),** the correlation between *the level of absorption of a KWs' characteristics and work motivation, work engagement and job performance of KWs* was calculated as the first part of the study. The correlation was analyzed with the use of Spearman correlation. The results are presented in table 3.

Table 3: Correlation analysis between the work motivation, work engagement, job performance and absorption of KWs' characteristics.

Correlation	**Work motivation**	**Work engagement**	**Job performance**
Absorption of KW's characteristics	rho(185)=0,423**, p<0.001	rho(186)=0,602**, p<0.001	rho(186)= 0,526**, p<0.001
	**. ** Significant correlation at 0.01 (two-sided)		

Source: own work

Based on the above research results, it can conclude that the absorption of KWs' characteristics is correlated with work motivation and job performance. More specifically, the level of correlation is statistically significant, so the research results are considered valid. Therefore, even though the correlation does not indicate a cause-and-effect relationship, it allows us to adopt **H1a_1, H1a_2, H1b** hypotheses. Logic suggests only one right direction of interaction, i.e., the influence of the level of knowledge absorption on work motivation and job performance, which is also illustrated by the literature. There is no possibility that the level of work motivation, engagement, or job performance will determine the level of knowledge absorption. As a result, it turns out that KWs have a higher level of work motivation, engagement, and job performance than employees who do not have this status.

Mediation Model – Research Results

Determining the correctness of the mediation model consists of three stages: checking the relations of independent variables to the mediator, checking the relations of dependent variables to the mediator, analysis of relations between independent and dependent variables. The first stage, i.e., verification of relations between independent variables and the mediator was performed using the Student's t-test for independent tests and verified the correctness of **H2b_1_1** and **H2b_2_1** and **H2b_1_2** and **H2b_2_2** hypotheses. A comparison was made:

- the average level of work motivation and engagement of the observed group of employees with results-oriented evaluation system with the average level of work motivation and engagement of the observations' group of employees with activities and attitudes-oriented evaluation system (**H2b_1_1** and **H2b_1_2**) (Table 4.);
- the average level of work motivation and engagement of the observations' group of employees with remuneration oriented on difficulties at work with the average level of work motivation and engagement of employees with remuneration oriented on work results (**H2b_2_1** and **H2b_2_2_2** (Table 5.)).

Table 4: Periodic evaluation orientation a work motivation and work engagement of employees.

	employee's assessment orientation	***N***	***M***	***SD***	***t***	***dt***	***p***
work motivation	on results of work	92	4,3187	0,69728	-2,109	116	0,035
	on activities and attitudes	27	3,9630	0,97985			
work engagement	on results of work	92	4,0159	0,61824	-4,104	117	<0,001
	on activities and attitudes	27	3,4280	0,76776			

Source: own work

Table 5: Remuneration orientation, a work motivation and work engagement of employees

	employee's remuneration orientation	***N***	***M***	***SD***	***t***	***dt***	***p***
work motivation	on difficulty of work	73	4,2877	0,77243	-0,982	124	0,328
	on results of work	53	4,1509	0,76952			
work engagement	on difficulty of work	74	3,9715	0,69937	-1,695	125	0,093
	on results of work	53	3,7652	0,64224			

Source: own work

The obtained results, which are presented in Table 4., show that there is a statistically significant difference between the average level of work motivation, work engagement related to the observations' group with a results-oriented employee evaluation system with the average level of work motivation and work engagement related to observation group with actions and attitudes-oriented employee evaluation system. It allows for the acceptance of hypotheses **H2b_1_1** and H**2b_1_2.**

At the same time obtained results, which are presented in Table 5, show that there is not a statistically significant difference between the average level of work motivation and work engagement referring to the observations' group with the difficulty of work with average work motivation and work engagement related to the observations' group with remuneration oriented on difficulties at work with the average level of work motivation and work engagement referring to observations with remuneration oriented on work results. Hypotheses **H2b_2_1** and **H2b_2_2** should be rejected.

In the second step, was to analyze the relationship of variables dependent on the mediator. To verify **H2c_1** and **H2c_2** hypotheses (Table 6, Table 7), r-Pearson correlation analysis was performed.

Table 6: Correlation analysis between analyzed variables for observations with dichotomous variable. Employees assessment orientation on results of work rather than on actions and attitudes.

		Work motivation	**Work engagement**
Job performance	r	0,418	0,401
	Sig.	<0,001	<0,001
	N	118	119

Source: own work

Table 7: Correlation analysis between analyzed variables for observations with dichotomous variable. Remuneration of employees' orientation on difficulty of work rather than results of work.

		Work motivation	Work engagement
Job performance	r	0,461	0,397
	Sig.	<0,001	<0,001
	N	126	127

Source: own work

The results presented in tables 6-7 clearly show that there is a statistically significant relations between work motivation, work engagement and job performance for both analyzed groups. Therefore, it allows to accept all verified analytical hypotheses in this part of research.

In the third step, the relationship between the independent variables and dependent variables should be analyzed. Thus, the analysis was performed with the Student's t-test for independent samples. The mean of job performance related to the observations' group with the orientation of employees' remuneration focus on the difficulty of work was compared with the mean of job performance related to the observations' group with the orientation of employees' remuneration focus on results of work **H2a_1** (Table 8), as well as the mean of job performance related to the observations' group with the orientation of employees' remuneration focus on the difficulty of work with the mean of job performance related to the observations' group with the orientation of employees' remuneration focus on results of work **H2a_2** (Table 9).

Tab.8. Periodic evaluation orientation and job performance of employees

	employee's assessment orientation	***N***	***M***	***SD***	***t***	***dt***	***p***
job performance	on results of work	92	4,4484	0,52615	-1,276	117	0,205
	on actions and attitudes	27	4,3056	0,45644			

Source: own work

Tab.9. Remuneration orientation and job performance of employees

	employee's remuneration orientation	***N***	***M***	***SD***	***t***	***dt***	***p***
job performance	on difficulty of work	74	4,4189	0,52360	-1,623	123	0,107
	on results of work	53	4,2689	0,49964			

Source: own work

Obtained results show that there is not a statistically significant difference between the average level of job performance related to both the different orientations of the periodic evaluation and the remuneration. Hypotheses **H2a_1** and **H2a_2** should be rejected.

In consideration of the above results, it should be stated that the mediation model can only be built for solutions in the context of employee periodic evaluations. It is not possible to build such a model for remuneration solutions, due to the lack of statistically significant relations between the orientation of these solutions and the level of work motivation and work engagement (rejection of H2b_2_1 and H2b_2_2_2 hypotheses). Therefore, it is not possible to adopt H3_2_1, H3_2_2_2 hypotheses.

Therefore, such a conclusion enables the next step and verify the mediating model of job performance. To do that, a mediation model was built for employees' assessment orientation on results of work rather than on actions and attitudes as an independent variable, and job performance as a dependent variable. The work motivation and work engagement will be tested as the mediators in the models (the following hypotheses H3_1_1 and H3_1_2). The obtained regression model should be statistically significant, and the total effect should be higher than the direct effect calculated for given variables (direct effect given the results described above is statistically not significant). The results of the analysis are included in Table 10 and Table 11.

Table 10: Work motivation as the mediator of the relation between employee's assessment orientation on results of work rather than on actions and *attitudes* and job performance.

Mediator	Direct effect value	Indirect effect value	Boot LLCI	Boot ULCI	R2
Work motivation	0,0116	0,0242	-0,0024	0,0524	0,1765

Source: own work

The obtained regression model with mediator is statistically significant (F (2,117) =12,5356 and corrected R2=0,1765). Moreover, work motivation is a statistically significant mediator of the model (p<0,001, coeff. = 0,2726, se = 0,0567). But the mediating effect is not statistically significant, as can be observed in table 5 (BootLLCI = -0,0024 and BootULCI = 0,0524). The obtained model shows that there is no reason to accept, that work motivation is a mediator of the relation between *employee's assessment orientation on results of work rather than on actions and attitudes* and job performance. Therefore, there is no reason to accept the hypothesis **H3_1_1.**

Table 11: Work engagement as the mediator of the relation between employee's assessment orientation on results of work rather than on actions and *attitudes* and job performance.

Mediator	Direct effect value	Indirect effect value	Boot LLCI	Boot ULCI	R2
Work engagement	-0,0088	0,0448	0,0188	0,0754	0,1614

Source: own work

The obtained regression model with mediator is statistically significant (F (2,118) =11,3585 and corrected R2=0,1614). Moreover, work engagement is a statistically significant mediator of the model (p<0,001, coeff. = 0,3048, se = 0,0668). The mediating effect is also statistically significant, as can be observed in table 5, based on which it can be concluded that indirect effect is higher than the direct one, and also significant (BootLLCI = 0,0188 and BootULCI = 0,0462 and they are both above the value of 0). The obtained model shows that work engagement is indeed a mediator of the relation between employees' assessment orientation on results of work rather than on actions and *attitudes* and job performance. Therefore, it allows for accepting hypothesis **H3_1_2**.
The obtained results are presented on in Figure 2.

Figure 2: HRM solutions influence on KWs' job performance through work motivation and engagement – verified.

Discussion

The article was aimed at verifying how to manage a specific group of employees, who are KWs. The first part of the research verified the influence of absorption of KWs on work engagement, work motivation and job performance. The examined group of KWs was characterized by the level of absorption of KWs above 3. Concentrating on the level of absorption of KWs' characteristics allowed to prove that if the realization of assigned tasks requires the use

of intuition and creativity (i.e. if the level of absorption of KWs is significant), the level of work engagement, work motivation and job performance will be higher than in the case of workers characterized by lack of KWs' absorption. The confirmation of this relationship allowed us to reach the main goal of the research, which is to verify the impact of HRM solutions on KWs' job performance, as well as the impact of work motivation and work engagement on this relation. The research focused on such shapes of HRM solutions as employees' assessment orientation to work results and employees' remuneration orientation to work difficulties.

The research did not confirm that the shape of HRM solutions: employee assessment and remuneration used in the research has an impact on KWs' job performance. It may result directly from the lack of consistency of the KWs, especially that although the direct relationship was not confirmed, indirect relationships can find. For one of the researched shapes of HRM solutions, a mediation model was built and verified, which shows that for KWs, the results-oriented employees' assessment influences the employee's engagement, and that engagement influences the job performance.

Such a finding, thus, provides organizations in which KWs are employed, a piece of partial information on how to manage human resources in the context of employees' assessment, to effectively strengthen their work engagement and thus provide the organization with high employees' job performance (Whitener, 2001, Bieńkowska et al., 2020). This is in line with the common opinions on employees' assessment system, which state that the main goal of employees' assessment is to provide information on the results and progress made by employees. Lack of such feedback contributes to the disruption of an employee's sense of self-fulfillment, and this contributes to the disruption of employees' work engagement (Amabile and Kramer, 2013). Moreover, it is observed that such a employees' assessment solution will also strengthen the work motivation. However, there are no reasons to accept that work motivation shaping by the employees' assessment orientation on the result will strengthen job performance. However, in the context of employees in an organization, it is important to take care of the level of their work motivation, because it brings many measurable benefits. Employees' assessment orientation on their results is an effective method to create a fair remuneration system for employees. It is recognized that among employees whose remuneration is fair, there is a significant increase in job satisfaction, which also significantly contributes to the job performance (Saks, 2006; Vosloo et al., 2014, Naji, 2014; Agustiningsih et al., 2016).

Unfortunately, the expectations of strengthening work engagement, work motivation and job performance through the employees' remuneration orientated on the difficulty of work, were not confirmed. Perhaps an adequate explanation for the results obtained from the conducted research is the fact that remuneration is not one of the most important motivating element of human resources management. In daily work, KWs experience complex problems and each of their tasks are unpredictable and unique (Jayasingam et al., 2016). To solve each task, they have to use their mental abilities and therefore, perhaps, more than on remuneration, they want to develop their skills and broaden their knowledge (Pobst, 2014; Bussin and Brigman, 2019). There is an opinion among researchers that the constant updating of salary structures and increasing salaries for KWs may not bring the result expected by the organization (Bryant and Allen, 2013). It can be expected that if the competitors offer richer opportunities for development, the KWs will decide to leave the job because they are more interested in development than the instability of work and job security (Pobst, 2014; Bussin and Brigman, 2019). Therefore, it is necessary to expand the research with further elements of HRM solutions to get a full picture of HRM strategies fitted to KWs' needs to positively strengthen work motivation and work engagement. Perhaps instead of focusing only on job performance, to verify also other components that may affect job performance and organization performance, such as employees' job satisfaction or organizational commitment. Although not all the intended results of the research have achieved, the presented results indicate that a certain shape of HRM solutions may have an impact on strengthening work motivation, work engagement and, consequently, KWs' job performance. It is important to recognize, from an organizational perspective, which HRM solutions will have a positive impact on KWs. Over the years, it is KWs that have become the dominant group in organizations, and this trend is continuing (Juhnovich, 2012; Šikýř, 2013; Liker, 2016). That is why it is the task of managers to stimulate KWs appropriately by shaping an effective style of human resources management (Salanova et al., 2015; Bieńkowska and Tworek, 2019; Bieńkowska, Tworek, Zabłocka-Kluczka; 2020).

Conclusions

The article raises upon a very important topic of appropriate shaping of HRM solutions to stimulate the job performance of KWs. The relationship between job performance and HRM solutions, which can be mediated by work engagement and work motivation among KWs, was partially explained by research. The results of the study confirmed that the level of absorption of KWs influences the level of work motivation and work engagement. However, most importantly, it was confirmed that there is a mediation model, which confirms the impact of results-oriented employees' evaluation on work engagement, which in consequence affects a higher level of job performance among KWs. Additionally, it was confirmed that this form of shaping the employees' evaluation also strengthens work motivation. From the organization's perspective, all the above conclusions are important because they provide

the organization with information on the appropriate way to shape the employees' evaluation to strengthen work motivation, work engagement and thus implicitly job performance among KWs. Therefore, it can be concluded that the identified research gap has been partly enriched by the research.

However, it is recommended to fill it with further empirical data. Unfortunately, the research done has some limitations. First of all, the constructs of work motivation were build using one item. Besides, a group of employees took part in the research, representatives of Polish companies only. The main limitation, however, was the fact that only a fragment of the phenomenon was examined. It should be remembered that the study included only two HRM solutions, i.e. employee evaluation and remuneration. The other HRM solutions, like HR planning, staff recruitment and selection, employees' development, etc., were not taken into account. Similarly, all constructions commonly perceived as strengthening job performance, e.g. job satisfaction, were not included in the study. It does, however, provide the opportunity to further explore the topic and conduct further research in this area. Therefore, the results only allow an initial verification of the topic, which also does not allow for any binding theories on the strengthening of job performance by HRM solutions among KWs.

Despite numerous research limitations, the indicated aim of the article was partially achieved by the authors. It has been confirmed that the specific shape of HRM solutions indirectly influences the job performance of KWs. Therefore, the topic seems to be very interesting for further investigation, especially as KWs are becoming an increasingly critical group of employees in organizations. Therefore, providing all the information on how to strengthen their engagement, motivation and, consequently, job performance, which will contribute to strengthening the position of an organization, will be extremely valuable for managers.

Abstract

This research project consists of the design of a robot model, equipped with artificial intelligence, with the ability to deliver drugs to patients with COVID-19 during their hospitalization; in this way, health personnel are not exposed to the risk of contagion of this disease. The humanoid-looking assistance robot is programmed in such a way that the assistance personnel indicate by means of the numerical keyboard to which bed to go, the robot moves and locates the number of the patient's bed through pattern recognition, facilitating the medication and conclude with care. The sensor system detects the objects around it, capturing this information to transmit it to the neural networks, which tells the robot which way to move. Neural networks and computer vision are recorded on an Arduino microcontroller. The mathematical models were processed in the Matlab software and the results obtained from the simulations showed the operation of the robot with the learning response time of the neural networks, for the displacement and recognition of the patient's bed number. All these systematized actions are developed with the concurrent design methodology that contains five stages, conceptual design, kinematic analysis, dynamic analysis, mechanical design and simulation. The assistance robot was designed, with neural networks and artificial vision, adding sensors, actuators and peripherals.

Keywords: Assistive robot, artificial neural networks, artificial vision.

Introduction

The World Health Organization (WHO) defines COVID-19 as: "the most recently discovered infectious disease caused by the coronavirus. Both the new virus and the disease were unknown before the outbreak broke out in Wuhan (China) in December 2019". It is a virus that causes respiratory diseases that is killing many people in the world (WHO, 2019). On the first front of the battle against COVID-19, are the doctors, nurses and technical personnel who risk being infected to save our lives. In the case of medical personnel, it is believed that the main reason for death is not age, but overexposure to the virus. (Villoria, 2020).

The specialty medical robot industry is booming, and researchers from one of China's leading universities have designed a specific one that they say could help save lives on the front lines of the battle against COVID-19 (Ranchal, 2020). For this research, the mobile robot was taken into account, which can recognize and identify objects, with a system based on Machine Learning methods, by means of a LIDAR sensor (Aponte and Llanos, 2018).
Currently most robots can acquire information about the environment, estimate the position and track the movement of the robot. Additionally, techniques or methodologies can be included for the positioning of the robot with odometry (Caldato, Achilles and Castanho, 2017) and (Cheng et al, 2017).

The use of neural networks is considered a technique of great contribution in the analysis of internal parameters of the motors (León, et al., 2020). Through the use of the Artificial Neural Networks platform of the Matlab software, different configurations were carried out to obtain a generalization of the network with a minimum error (Contreras, et al., 2019).

Cite this Article as: Jesús D. OCAÑA, Erick G. FLORES, Víctor A. ANCAJIMA and Alex PACHECO "Assistive Robot Model to Care for Patients with Covid-19" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

As a precedent, Baeza (2018) published his thesis entitled “Implementation of an artificial neural network in an 8-bit microcontroller for direction control of a mobile robot ', he concluded that the experimental results have shown that the Networks Artificial Neural B-Spline is able to achieve the direction control of the mobile robot. The neural network was implemented in an 8-bit microcontroller with which it was shown that recursive functions allow complex calculations to be carried out with the least processing power.

Valencia et al (2020) who carried out the research work called "Detection of infractions and license plates in motorcycles, by means of artificial vision, applied to Intelligent Transport Systems", reached the following conclusion, through the tests carried out, we confirmed the hypothesis Initial: using a mobile application, we were able to recognize motorcycle license plates, and using the Hough circular transform in Matlab, the limitations found in the developed prototype occur when there is excess sunlight, in which case the motorcycle license plates are overexposed in photos.

This project is justified because it is necessary that health personnel, who fight against COVID-19, do not expose themselves directly with patients, therefore, the protection of workers is key to guarantee the functioning of the health system and of society. The objective of this research work is to model an assistive robot to care for patients with covid-19. The robot's structure was designed with galvanized material, which is coated with a layer of zinc. It was simulated with ultrasonic sensors to detect obstacles, the number recognition operation was verified, because the hospital beds of each patient are numbered, and for the displacement control, the Arduino microcontroller was used. In conclusion, the proposed design and the viability of the simulations were achieved, verifying the response time of the entire system and subjected to failures for its verification, giving an expected functional result, for a future implementation.

Materials & Methods

The type of research is non-experimental with a descriptive purposeful level, since it is desired to inform, describe and design a medical assistance robot to care for patients with covid-19. The research design is of a transectional type, because the collection of data will be carried out in a single moment.

The methodology used is the concurrent design (Sabater and Verdú, 2012), which contains five stages:

Conceptual design, in this first stage the functional characteristics and technical specifications were developed, the requirements were identified, such as the structure and dimensions of the medical assistance robot, types of movement, trajectories, operating time, load capacity and precision.
Kinematic analysis, in this stage the analysis of the movement of the robot was carried out, for this the differential type robot was established and odometry was used to measure the position of the robot. The positions, velocity and acceleration of the robot in question were also calculated.
Dynamic analysis, in this stage the dynamic study was developed that allowed the selection of the motors, design of control strategies, implementation of ANN, artificial vision tests and simulation of the system.
Mechanical design, in this stage the kinematics and dynamics were integrated and the different stages that make up the methodology were listed, based on the creation of projects and elaboration of electronic circuits.
Simulation tests were developed with computer tools for verification and simulation of neural networks, the number recognition tests were used by the Matlab program and the part of electronic circuits, the Proteus 8.10 Professional program was used.

Proposed model and motivation

The following block diagram was proposed, which is shown in figure 1, it has a system of sensors to perceive the environment based on neural networks, determining the displacement and location of the robot, it also has a Camera to take images of the numbers of the hospital beds and process this data with pattern recognition. The listening block is for the robot to send audio signals, and a user interface to interact with healthcare employees.

Fig. 1: Block diagram of the assistance robot

Structure of the assistance robot.

The physical structure of the robot is made of materials whose characteristics respond to factors such as: resistance, compression, flexibility, impact, corrosion. The material to be used for the structure of the robot will be galvanized sheet, which is coated with a layer of zinc, which acts as an anti-corrosion agent, prolonging the useful life of the robot under wet or rainy conditions. The design of the physical structure of the robot is shown in figure 2, with a height of 1.6 m.

Fig. 2: Physical form of the assistance robot

Robot position

Figure 3 shows us the position of the robot, which is the general way to locate the robot, the equation of the robot in a linear combination of the X and Y axis. The total speed (VT) is the average of the tire speeds left (VL) and right tire speed (VR). To find the velocity in Vx and Vy, by Pythagoras we must know the angle φ, which is the angle that the robot moves. L comes to do the distance of the wheels.

Fig. 3: Robot position

Odontometric Equations

It is a system of equations that describe the velocity in x, the velocity in y, the angular velocity ω, with respect to the speeds of the robot's rim and the angle φ is the direction in which the robot is moving.

$$Vx = Vt\cos\varphi \tag{1}$$
$$Vy = Vt\sin\varphi \tag{2}$$
$$Vx = \left(\frac{VR+VL}{2}\right)cos\varphi \tag{3}$$
$$Vy = \left(\frac{VR+VL}{2}\right)sin\varphi \tag{4}$$
$$\omega = \frac{VR-VL}{L} \tag{5}$$

To find the robot's velocity at position (x, y), we relate the tires with respect to the robot's positions. The velocity Vx is what is called the first derivative of the position $\dot{x}$, the velocity Vy is the change in position at $\dot{y}$, the change in position $\dot{\varphi}$ is the velocity ω. These equations are called the state space system, it is a well-known system in control systems (Urquijo, et al., 2017).

$$\dot{x} = \left(\frac{VR+VL}{2}\right)cos\varphi \tag{6}$$
$$\dot{y} = \left(\frac{VR+VL}{2}\right)sin\varphi \tag{7}$$
$$\omega = \dot{\varphi} \tag{8}$$

Sampling Time

Using an encoder, the speed of the driving wheels is measured, thus determining the effective relationship between the speed indicated by the encoders and the actual speed at the wheels.

Fig. 4: Sampling time with the encoder

In this case, 2 encoders will be used, with a slot called Tick, this means that the entire turn of the encoder represents one turn of the motor. The times are sampled and since the speed is constant, we can determine how long the motor turns in one revolution? With this we can estimate the distance traveled at constant speed.

Delta = currentSampling - previousSampling

Distance

$$D = 2\pi R\frac{\Delta Tick}{N} \tag{9}$$

Where:
N is the number of encoder slots; in our case it will be 1.
R is the radius of the rim

Frequency

$$f = \frac{1}{Delta} \tag{10}$$

Angular Velocity

$$\omega = \frac{\frac{2\pi}{N}}{Delta} \tag{11}$$
$$\omega = f * \frac{2\pi}{N} \tag{12}$$

Linear velocity

$$V = \omega * R \tag{13}$$

Movement flow of the robot with Artificial Neural Network

A multilayer perceptron neural network was created, the input data of which are the ultrasonic sensors, the outputs of the neurons, are connected to the control Arduino for displacement.

The robot has 4 ultrasonic sensors installed, to detect the walls of the area and can recognize the entire environment, for this a multilayer perceptron was implemented, whose inputs are the sensors S1, S2, S3 and S4, and 2 output neurons O1 and O2, each output neuron has 2 states 1 or 0. This Neural Network was developed with the Matlab program and implemented in an Arduino microcontroller (Ocaña, et al., 2020).

Fig. 5: Multiplayer perceptron with 2 output neurons

Hospital bed number recognition process

PreProcessed

In this pre-processing stage of the image, the quality of the images was improved for their easy interpretation, for this the discrete Fourier transform (DFT) was applied, entered in the Matlab program (Krötzsch and Gómez, 2017).

$$X[k_1,k_2] = \sum_{m=0}^{N-1}\sum_{n=0}^{N-1} x[m,n]\, e^{-j\frac{2\pi}{N}(k_1 m + k_2 n)} \tag{14}$$

Inverse transform:

$$x[m,n] = \frac{1}{N^2}\sum_{k_1=0}^{N-1}\sum_{k_2=0}^{N-1} X[k_1,k_2] e^{-j\frac{2\pi}{N}(k_1 m + k_2 n)} \tag{15}$$

DFT was applied in image filtering, in the implementation of fast algorithms and in image analysis problems.
The Magnitude of the transform is given by:

$$X_M(k_1,k_2) = \sqrt{X_R(k_1,k_2)^2 + X_I(k_1,k_2)^2} \tag{16}$$

The phase of the transform is expressed as:

$$\emptyset(k_1,k_2) = \tan^{-1}\left(\frac{X_I(k_1,k_2)}{X_R(k_1,k_2)}\right) \tag{17}$$

In the DFT-2D applied to the image, represented as a matrix, the variable in the two axes is space. This implies that the frequency variable is associated with the spatial periodicities that appear in the image. The spatial frequency has units of (1/m)

Image reduction:
It is an operation that allows reducing the dimensions of the matrix (image), in order to reduce the number of iterations and to reduce the response time.

Grayscale
The representation of a grayscale image is the simplification of the image in a two-dimensional matrix that only contains relevant information on the luminance component of the YIQ color model, presenting intensity levels between 0-255, 0 being for the color black. and 255 for white.

Image complement:
The complement of the image is determined by subtracting from 255 the intensity value of each pixel belonging to the image

Control Circuit

In this stage 3 Arduinos are used, one controls all the ultrasonic sensors with neural networks, the other Arduino controls the motors for movement, the third Arduino is programmed through the keyboard to which bed it will attend, it also processes the image of the number hospital bed, it also detects people through body temperature and controls the motor to move the robot's head. The OV7670 camera is located on the robot head. The 4 ultrasonic sensors are located on the 4 sides of the robot, sensor 1 (S1) is connected to the front, left (S2), right (S3) and back (S4), these sensors are programmed to detect any obstacle at 50 cm. In figure 6 the total circuit of the robot is shown.

Fig. 6: Control circuit

Simulation Results

Robot simulation with neuronal networks

The Neural Network was simulated with the Matlab program, as shown in figure 7, the input corresponds to the 4 ultrasonic sensors, in the hidden layer there are 4 neurons with their respective weights (w) and polarization (b), in the output layer there are 2 neurons, with their respective weights (w) and polarization (b) and in the output we obtain 2 binary states.

Fig. 7: ANN Simulation in Matlab

In figure 8, the verifications carried out in Matlab are shown, each time a sensor detects an obstacle at 50 cm, it sends a pulse "1" and if there is no obstacle it sends "0" to the Neural Network. In the first upper left, the 4 sensors show 0, 1, 1, 0, which indicates that S1 is ahead there is no obstacle, in the left S2 and right S3, there is an obstacle, and behind S4 there is no obstacle, the exit it shows us 1 and 0, which means that the robot moves forward. In the second upper right, the 4 sensors show 1, 1, 0, 1, which indicates that S1 is ahead and S2 on the left is an obstacle, in the right S3, there is no obstacle, and behind S4 there is an obstacle, the output shows 0 and 0, which means the robot goes to the right. In the third lower left, the 4 sensors show 1, 0, 0, 1, which indicates that S1 is ahead there is an obstacle, S2 is left and S3 is right, there is no obstacle, and behind S4 there is an obstacle, the output shows us 1 and 1, which means that the robot goes to the left. In the lower right fourth, the 4 sensors show 1, 0, 0, 0, which indicates that S1 there is an obstacle, S2, S3 and S4 there is no obstacle, the output shows us 0 and 1, which means that the robot is going to back.

Fig. 8: ANN verification

Table 1 shows the result of the simulation tests of the Neural Networks, according to the data from the sensors, we will have a binary value in the output of the Artificial Neural Network. These values obtained from the neural network are sent to the control stage for its movement of the robot, when the four sensors detect 0 1 1 0, at the output of the neural network 1 and 0 are obtained, this data is sent to the control stage, ordering the robot to advance. In the second row we denote that the sensors detect 0 1 1 0, at the output of the neural network we obtain 0 and 0, this data is sent to the control stage ordering the robot to go to the right. In the third row we denote that the sensors detect 1 0 0 1, at the output of the neural network 1 and 1 are obtained, this data is sent to the control stage, ordering the robot to go to the left. In the fourth row we denote that the sensors detect 1 0 0 0, in the output of the neural network we obtain 0 and 1, this data is sent to the control stage ordering the robot to go back.

Table 1: Result of ANN simulation tests

Sensors	ANN Output	To move
0 1 1 0	1 0	Get moving
1 1 0 1	0 0	Right
1 0 0 1	1 1	Left
1 0 0 0	0 1	Back off
0 1 1 1	1 0	Get moving

Simulation of robot displacement with ANN

The simulation tests carried out on the control circuit showed the desired behavior, verifying the displacement in all directions. Figure 9 shows the simulation where the data from the Arduino with Neural Networks, due to the detection of the sensors, we can see that S1 and S4 are a long distance, S2 and S3 are obstacles, the output of the Arduino with Neural Networks is 1 and 0, sending this data to the second Arduino, to control the motors, according to this data received by this Arduino, the robot will advance, therefore motor 1 (M1) and motor 2 (M2) rotate clockwise , resulting in the robot moving forward and the robot movement can also be displayed on the LCD screen.

Fig. 9: Control circuit simulation

To evaluate the effective operation of the assistance robot, all movement tests were carried out, in addition the operation of the 2 encoders was simulated, resulting in efficient movement. To calculate the distance traveled by the robot, wheels whose diameter is 9 cm were used, as 1 turn of the encoder is equal to one turn of the wheel, therefore, one turn of the wheel equals 28.2 cm, when the wheel is turned 20 laps, the robot has traveled 5.6 meters. Head turning was also simulated to detect the hospital bed number.

Recognition Process

During the recognition process, there is a pattern of numbers for you to compare with the data captured by the camera. Each hospital bed has a number pasted on the wall at the top, these numbers are extracted and converted into black and white characters represented by binarization. To obtain more accurate binarization results, various local threshold values are used.

Although the values were taken properly, several points appear in the binarized image that produce a noisy image, Figure 10 (a). There are several methods that allow you to reduce this type of noise, such as Gaussian, low-pass and medium filters, etc. To maintain the shapes of the symbols by removing only noise, the labeling method is used. The elimination of noise resulting from the number taken, the labeling method shown in figure 10 (b) is used, where it is shown that the black points of the background and the white points within the characters have been eliminated

(a) (b)

Fig. 10: (a) Character plates after the binarization process (b) Character plates after the binarization and denoising processes.

After eliminating the noises, these characters are coded and entered into the recognition process, to carry out the identification of the hospital bed number.

Figure 11 shows the behavior of number recognition, each number has a representative graph, this graph is stored in the database as patterns, what is going to be compared are not numbers, but the graphs are compared. In figure 11 (a) it is observed that the number taken is 145, we can notice that this number has a characteristic graph that is stored as a pattern; the number of the hospital bed was taken by means of the camera as shown in figure 11 (b), and as a result of the recognition process it gives us a graph almost identical to the graph stored as a pattern, therefore, the result of this recognition process is number 145.

Fig. 11: (a) Representative graph of the number 145, (b) Image captured with its graph

Discusión

The results obtained in table 1 show that the ultrasonic sensors detect obstacles when the robot moves, these data taken from the sensors are collected and stored in the Neural Network. At the output of the neural network, the binary values are obtained that are sent to the control circuit for the movement of the assistance robot. These results are related to what Baeza (2018) maintains in the research called "Implementation of an artificial neural network in an 8-bit microcontroller for direction control of a mobile robot", who points out that the experimental results have shown that the Networks Artificial Neurals, is capable of achieving the direction control of the mobile robot, being implemented in a microcontroller, as in this investigation, the ANN training with ultrasonic sensors could be carried out on an Arduino NANO, and the robot's displacement could be verified with these networks. neuronal, resulting in efficient robot movement.

In the process of visual recognition, the numbers are extracted and converted into black and white characters represented by binarization, then the labeling method was used where the black points of the background and the white points within the characters have been eliminated, then this image is converted into a characteristic graph of this number taken. As a result of the recognition process, it gives us a graph almost similar to the representative graph stored as a pattern, thus detecting the number of the hospital bed. These results are corroborated with the study by Valencia et al (2020) who in their research entitled "Detection of infractions and license plates on motorcycles, using artificial vision, applied to Intelligent Transport Systems", reached the following conclusion, which was developed a platform in Matlab that can recognize the characters on the motorcycle plates regardless of the position in which it is in front of the camera, in some experiments there were problems in the character recognition stage, what happens is that on some occasions the matrix of some character has noise, giving better results the plates with a white background and black letters. Taking the results of the research by Valencia et al, it was possible to verify through the recognition of patterns the images must be converted to black and white represented by binarization and the plate must have a white background with black numbers, obtaining recognition efficient.

Conclusions

The model of an Assistive Robot was made to attend to patients with covid-19, a multilayer perceptron neural network was created, training with the Matlab program and recorded on the Arduino NANO board, where the sensors detect obstacles and the robot can move without any problem. The displacement operation was simulated and verified resulting in a functional assistance robot.

Visual recognition was checked, with the numbers extracted and converted into black and white characters represented by binarization, and this image was transformed into a characteristic graph of this taken number. As a result of the recognition process, it gives us a graph almost similar to the representative graph stored as a pattern, thus detecting the number of the hospital bed.

Recommendation Algorithm Based on Recommendation Sessions

Michał MALINOWSKI

Military University of Technology / Faculty of Cybernetics / Institute of Computer and Information Systems
Warsaw, Poland, michal.malinowski@wat.edu.pl

Abstract

The enormous development of the Internet, both in the geographical scale and in the area of using its possibilities in everyday life, determines the creation and collection of huge amounts of data. Due to the scale, it is not possible to analyse them using traditional methods, therefore it makes a necessary to use modern methods and techniques. Such methods are provided, among others, by the area of recommendations.

The aim of this study is to present a new algorithm in the area of recommendation systems, the algorithm based on data from various sets of information, both static (categories of objects, features of objects) and dynamic (user behaviour).

Keywords: Recommendation System and Algorithm, Graphs and Networks, E-Commerce.

Introduction

Recommendation Systems (RS) are currently ubiquitous in many areas of life. They become indispensable tools to help users to search for appropriate information in the huge amount of data that surrounds them. Such systems influence the decisions not only of decision-makers, but also of ordinary citizens in their daily lives. It is estimated that in 2020 the level of about 40 trillion gigabytes of data stored in social media databases, electronic mail systems (e-mails) and indexed websites will be reached.

Outline of algorithms of recommendation systems

The currently existing recommendation systems could be divided into three main techniques:

- **Content Based** (methods of filtering based on content) – such systems are constructed on the assumption that objects with similar features will receive similar ratings from the same user;
- **Collaborative Filtering - CF** (methods of filtering based on neighbourhood) - such systems are based on the idea, that if two users have made similar decisions in the past, their preferences will also converge in the future. This method can be divided into the following:
    - **Model Based;**
    - **Memory Based:**
        - **User Based;**
        - **Item Based.**
    - **Hybrid Collaborative Filtering.**
- **Hybrid Filtering** (hybrid algorithms) – systems using the rules of the two previous techniques.

Fig. 1: The idea of operation of the systems based on Content Based Filtering and Collaborative Filtering Methods.

Table 1. provides an overview, advantages and disadvantages of the algorithms used within the above mentioned types of methods [4].

Table 1: Comparison of recommendation techniques

Technique	Content Based	
Algorithms	Content Based algorithm using Hidden Markov Model	
Advantages		Disadvantages
No scarcity and cold start problem It ensures privacy		Requires rich description of items Requires organized user profile Content overspecialization is problem
Technique	Collaborative Filtering (Memory Based)	
Algorithms	User Based CF Item Based CF	
Advantages		Disadvantages
Easy to implement Data addition is simple Need not consider content Good scalability		Depends on explicit feedback Cold start problem Sparsity problem Limited scalability for large dataset
Technique	Collaborative Filtering (Model Based)	
Algorithms	Slope-one CF Matrix factorization	
Advantages		Disadvantages
Improving prediction performance Improving scalability and sparsity problem		Model is expensive Loss of information in matrix factorization
Technique	Hybrid Collaborative Filtering	
Algorithms	Combination Model Based and Memory Based	

Advantages	Disadvantages
Overcoming limitations of sparsity Improving prediction performance	Increased complexity Complicated for implementation
Technique	Hybrid Filtering
Algorithms	Combination Content Based and Collaborative Filtering
Advantages	Disadvantages
Collaborative and content based methods are complementary in their strengths and weaknesses Overcoming scarcity and cold start problem	Difficult for implementation

In algorithms of recommender techniques based on Content Based Filtering, user profiles include features and items chosen by the user in the past. Consequently, those algorithms have two main weaknesses: they only recommend items similar to those chosen in the past, and also, the system must extract meaningful and useful features from the description of items.

Collaborative Filtering's recommendation systems are based on the received information from users who shared similar interests and preferences in the past. In this method, algorithms use the feedbacks received from other similar users to give recommendations. The main advantage of this method over the previous one is that, in this technique, the community of users gives opinions about certain items, and also provide feedbacks and ratings. As a result, there is a chance for quite new items to be recommended to the user.

Considering the nature of this method, it provides the system will return weak and non-transparent predictions, when the number of users will be too low (Cold Start)

The algorithm described in the study can be classified as the hybrid algorithm type, because it can make recommendations based on both the similarity of objects' features (Content Based) and the similarity of users' behaviours (Collaborative Filtering - CF). Precise classification can be made only on the basis of the input data provided in the form of the graph **G,** which is described below.

The concept of a recommendation session may be reflected, for example, by the relationship between purchased orders and order items or between a product category and products. In the area of mathematical apparatus it is based on graph and network theory, and can be described on the basis of a bipartite directed graph **G** called the graph of the recommendation session such that:

$G =< N, E >$ (1)

where:

$N = J \cup O$ – the collection of nodes

$E \subset J \times O$ – the collection of edges (directed edges)

O – the collection of objects

The object ($o \in O$) may be:

- products in an Internet shop;
- a video in a video-on-demand service;
- an employee in an employment-related service;
- press article in the news service;
- a person on a social network application.

J – collection of kernels

The kernel ($j \in J$) may be:

- a products' category – one of the sub-collections of products having common features;
- the purchase order – the result of the customer's actions in the shop, which is finalised with the purchase;
- a wish list – a sub-collection of the shop's products related to the customer, which such sub-collection results from the customer's future shopping preferences;
- an expert – a sub-collection of products indicated by the discipline specialist;
- a website visit ID – a unique key assigned to a user's visits to the website. A visit consists of a sequence of viewed/visited pages of an online store;

- a person – IT structure identifying and describing the user in the IT system.

Due to the adopted and further discussed interpretation of the model and its components, the following limitations are assumed to be met:

$J \cap O = \emptyset$ – no kernel shall be a facility and no facility shall be a kernel

$(\forall j \in J)(\exists e \in E)(e = (j, o))$ – each kernel must be associated with at least one object

$(\forall o \in O)(\exists e \in E)(e = (j, o))$ – each object must be associated with at least one kernel.

Fig. 2. The recommendation session's graph

A single session **S** can be presented as a sub-graph of the graph **G** such that:

$S =< N', E' >$ (2)

where:

$N' = j \cup O'$ – a collection of session's nodes

$E' \subset E$ – collection of session edges

$O' \subset O$ – a collection of session's objects (related to a kernel)

$j \in J$ – a session's kernel

$(\forall o \in O')(\exists e \in E)(e = (j, o))$ – each object of a session is associated with a kernel

$(\nexists o \in O \backslash O')(\exists e \in E)(e = (j, o))$ – there is no kernel-related object that is not a part of the session.

Fig. 3. Single recommendation session model

The session is made up of one kernel only and of all edges and objects related to the kernel.

The sessions (*S*) may be:

- the products' category and the products themselves;
- the purchase order and the order's items;
- the customer's wish list with the elements;
- an expert with his/her assessments;
- an identifier (ID) of the website visited, along with the pages visited;
- a person with his/her colleagues.

In addition, due to its physical properties and similarities, the session's kernels can be grouped into classes **K.** The kernels of the same type are grouped into the classes, e.g.: products' categories, purchase orders, etc.

Where:

$K \subset J$- the class is the sub-collection of the kernels' collection

The class ($K \subset J$) of the session's kernels may be:

- the categories of the products;
- the purchase orders;

- the customers' wish lists;
- experts;
- identifiers (IDs) of the website visits;
- persons.

In addition:

$(\forall i \neq j)(K_i \cap K_j = \emptyset)$ – no kernel is present in two or more classes

$\bigcup_{i=1}^{|K|} K_i = J$ – each kernel belongs to a class

Fig. 4. The classes of the kernels

Algorithm of the Recommendation Session

Let $\boldsymbol{C}$ be a collection of users using the recommendation system and $\boldsymbol{O}$ a collection of all possible objects that can be recommended.

In addition, let $\boldsymbol{u}$ be a utility function measuring the utility of object $\boldsymbol{o} \in \boldsymbol{O}$ for user $\boldsymbol{c} \in \boldsymbol{C}$. This is $\boldsymbol{u}: \boldsymbol{CxO} \rightarrow \boldsymbol{W}$, where $\boldsymbol{W}$ is an ordered collection (e.g. non-negative integers)

Then, for each user $\boldsymbol{c}$ belonging to $\boldsymbol{C}$, a sub-collection $\boldsymbol{R_c}$ belonging to $\boldsymbol{O}$ is selected, which maximises the usability for the user. This means that for the arranged $\boldsymbol{c} \in \boldsymbol{C}$ we determine the collection of the recommended objects as follows:

$$R_c = \{r \in O: u(c,r) = \max_{o \in O} u(c,o)\} \qquad (3)$$

In a general case, the task of the recommendation algorithms is to find a sub-collection $\boldsymbol{R_c}$ called the collection of recommended objects for user **c**.

In a specific case, a recommendation is made to the selected object $\boldsymbol{m}$ without directly considering the user $\boldsymbol{c}$, for whom the recommendation is made. Therefore, condition (3), taking into account a change in the function of the recommendation such that $\boldsymbol{u}: \boldsymbol{OxO} \rightarrow \boldsymbol{W}$, can be presented as follows:

– firstly, the collection of recommendations for user $\boldsymbol{R_c}$ is replaced by $\boldsymbol{R_m}$, i.e. the collection of recommendations for the object;

– secondly, for the arranged $\boldsymbol{m} \in \boldsymbol{O}$, we determine the collection of recommended objects as follows:

$$R_m = \{r \in O: u(m,r) = \max_{o \in O} u(m,o)\} \qquad (4)$$

Considering user $\boldsymbol{c}$ consists in the fact that it is him who, consciously directing his behaviour, selects an object $\boldsymbol{m}$ from the $\boldsymbol{O}$ collection, against which recommendation $\boldsymbol{R_m}$ shall be built up.

ARS (Algorithm of the Recommendation Sessions) based on this particular case.

Fig. 5: Architecture of the Algorithm of the Recommendations Session (ARS)

<u>Input data:</u>

G – the session graph

m – object (graph node) to which the recommendations are to be linked

Output data:

R_m – vector of recommendation for the object **m** (the lower the position in the vector, the better the recommendation for the object **m**)

Steps:

K01: Presentation of input data

Example:

G $=< N, E >$

m = o_3

where:

$N = J \cup O$

$O = \{o_n : n = \overline{1,9}\}$

$J = \{j_n : n = \overline{1,6}\}$

$E = \{< j_1, o_1 >, < j_1, o_2 >, < j_1, o_5 >, < j_2, o_2 >, < j_2, o_3 >, < j_2, o_4 >, \dots, < j_6, o_1 >, < j_6, o_6 >\}$

Fig. 6: The graph of the input session G with the input object (node) marked m

K02: The design of the sub-graph **G'$_m$** of the graph **G** consisting of node **m** and nodes adjacent to the node **m** and edges between them and node **m.**

Example:

G'$_m$ $=< N', E' >$

m = o_3

where:

$N' = O' \cup J'$

$O' = \{o_3\}$

$J' = \{j_2, j_4, j_5\}$

$E' = \{< j_2, o_1 >, < j_4, o_1 >, < j_5, o_1 >\}$

Fig. 7: The designed sub-graph G'$_m$ of the graph G

K03: The construction of the sub-graph **G''$_m$** of the graph **G** composed of the graph **G'$_m$** and the nodes adjacent to the nodes of the graph **G'$_m$** and edges between them and the nodes of the graph **G'$_m$**

Example:

G''$_m$ $=< N'', E'' >$

m $= o_3$

where:

$N'' = O'' \cup J''$

$O'' = \{o_3, o_2, o_4, o_5, o_6, o_7, o_8, o_9\}$

$J'' = \{j_2, j_4, j_5\}$

$E'' = \{< j_2, o_1 >, < j_4, o_1 >, < j_5, o_1 >, < j_2, o_4 >, < j_2, o_5 >, < j_2, o_9 >, < j_4, o_2 >, < j_4, o_6 >, < j_4, o_7 >, < j_5, o_2 >, < j_5, o_8 >\}$

Fig. 8: The constructed sub-graph G''$_m$ of the graph G with estimated incoming steps of the nodes

K04: Estimation of the incoming steps for each node that is the object of sub-graph **G''$_m$**

Example:

$deg_{in}(o_3) = 3$

$deg_{in}(o_2) = 3$

$deg_{in}(o_4) = 2$

$deg_{in}(o_5) = 2$

$deg_{in}(o_6) = 1$
$deg_{in}(o_7) = 1$
$deg_{in}(o_8) = 2$
$deg_{in}(o_9) = 1$

Fig. 9: Sorted objects (nodes) with the removed object m

Application of the algorithm

The algorithm, as the part of the scientific research, was used to build recommendations for a real existing e-commerce solution based on real data. The precise data were downloaded from the relational database (MySQL) of the online store's IT system AM76 (https://am76.pl) for the time period from the 15th to the 20th of December 2019.

Fig. 10: Data structure in the form of an ERD diagram of the database of the IT system AM76.pl

The data used to build graph G was information such as:

O – a collection of objects being products with unique identifiers: idproduct (*produkt.id*)

$J = K_1 \cup K_2$ – collection of kernels made up of two classes:

K_1 - visiting a shop with unique identifiers: phpsesid (view_source.phpsesid)

K_2 - the purchase orders with unique identifiers: purchaseorderid (*purchaseorder.id*)

$E = E_1 \cup E_2$ – a collection of edges composed of:

E_1 - visiting the products: phpsesid –> idprodukt

E_2 - the items of the purchase orders: purchaseorderid –> productid

Fig. 11: Examples of data for individual elements of the graph G

The data described above have been exported to the graphs' database Neo4j. This database allowed to present the data contained in the MySQL relational database in the form of the Graph **G**.

OpenSource software called Cytoscape was used for the research. Cytoscape is a software environment for integrated models of biomolecular interaction networks. The basic version of the above mentioned software has been enriched with a plugin called CypherQueries, which allows for direct connection to the Neo4j database. Neo4j is a native graph database, built from the ground up to leverage not only data but also data relationships.

Within the research, individual steps (K01–K06) of the "ARS" algorithm were executed.

K01

The incoming graph **G** containing:

- 1733 nodes (red) in the collection O;
- 2056 nodes (blue) in the collection K_1;
- 314 nodes (green) in the collection K_2;
- 7459 edges in the collection E_1;
- 964 edges in the collection E_2.

Moreover, the object **m** was an object (node) with the identifier (idproduct) 4537 having the name "Teotihuacan: City of the Gods".

K02

The sub-graph **G'm** of the graph **G** has been constructed. The sub-graph consisted of the node **m** and nodes adjacent to it and edges linking them. The adjacent nodes were the kernels of the sessions, in which the node **m** occurred.

Fig. 12: The constructed sub-graph G'$_m$ of the graph G

K03

The sub-graph **G''m** of the graph **G** was built. Nodes that are objects related to the kernels of the sessions being in the graph have been added to the subgraph **G'm**.

Fig. 13: The constructed sub-graph G''m of the graph G

K04 and K05

Using the Cytoscape software's analytical module, the incoming steps for each node of the sub-graph **G'm** were estimated, and then the steps were sorted in descending order.

Fig. 14: The result of sorting the incoming steps of the graph G''$_m$

K06

Eventually, the result of the sorting was saved in the CSV file, omitting the m node with the identifier (idproduct) 4537. This file was a physical representation of the resultant vector $\mathbf{R_m}$.

Evaluation of the algorithm

In order to assess the effectiveness of the algorithm against other recommendation algorithms it is proposed to:

- implement the tested n-algorithms in a real e-commerce system;
- present the results of recommendations to clients based on a random algorithm with a 1/n probability (where n is the number of tested algorithms);
- register the actions taken by users as a collection $D = \{d_1, d_2, d_3, d_4, d_5, d_6, \dots\}$ in which the action in the n-th step would be represented by the vector
  $d_n =< d_n(1), d_n(2), d_n(3), d_n(4) >$
  where the vector positions mean:
  $d_n(1)$ – the recommendation algorithm used
  $d_n(2)$ – the object, for which the recommendation was made
  $d_n(3)$ – the resulting vector of the recommended objects;
  $d_n(4)$ – the object selected by the client

On the basis of the collected results, a measure of effectiveness for the tested algorithms should be calculated in the form of

$$\boldsymbol{E(a')} = \frac{\sum_{n=1}^{|D|}[d_n(1)=a' \; AND \; (4)\in d_n(3)]}{\sum_{n=1}^{|D|}[d_n(1)=a']} \qquad (5)$$

where:

a' – algorithm for which efficiency is calculated;

$[i]$ – Inverson's operator.

$$[i] = \begin{cases} 1 & gdy\ i\ jest\ prawdziwe \\ 0 & gdy\ i\ jest\ fałszywe \end{cases}$$

$d_n(i)$ – returns the value of vector d_n at the position $n = 1{\cdot}4$

Modifications and development

The base form of the Recommendations Session Algorithm can be developed in various directions, among other such as:

Adding a third layer of session nodes

It consists in adding consecutive layer of nodes (kernels and objects), creating the sub-graph $\mathbf{G''_m}$, adjacent to the nodes of the sub-graph $\mathbf{G''_m}$.

In addition, further algorithm steps such as:

- calculating the outgoing steps of all nodes;
- deletion of the step 1 nodes (sessions with one object);
- calculating the incoming steps of nodes;

In this way, the resulting vector of recommendation $\mathbf{R_m}$, for object **m,** shall have higher values of parameters indicating the position of the recommendation, i.e. the incoming steps, without the need to expand graph **G**.

The additional cost that will then be incurred will be linked to additional calculations.

Adding weights to edges

At the stage of preparation of the graph **G**, the weights' values should be related to the individual classes of the session's kernels. Then assign these weights to the edges coming out of them. As a result, the incoming steps of objects shall be the sum of the weights of the incoming edges.

Thanks to this procedure the property shall be given that some session classes, such as expert recommendations, are more valuable than random visits by an anonymous user.

Pathway of a user

In order to eliminate the algorithm's historic agnosticism, an auxiliary variable should be implemented in the form of the vector **M**, in which information about "viewed" objects shall be stored. The first element of this table would be the node **m**, which after a change would be called $\mathbf{m_1}$. For the subsequent elements of the table **M**, indexes would be the number of steps in which the user would "visit" subsequent nodes. The steps of the algorithm would then depend not on a single node **m**, but on the vector of nodes **M**.

Pathway of recommendation

As an impulse for the development of the next path of the algorithm, one may consider the willingness to receive as a result not only a proposal for the next step (recommendation vector $\mathbf{R_m}$), but the whole path of recommended products ending with a satisfactory state, for example, a purchase. For this purpose, the theory related to the Semi-markowski processes of the CD class (continuous over time, discrete in their states) can be used. In this case, the modifications would be much larger and, above all, would involve different conversion of the source data and construction of the Graph **G**.

Conclusions

The presented algorithm that is the member of the group of recommendation algorithms is relatively simple. The biggest difficulty is to prepare the input data for this algorithm in the form of Graph **G**. This difficulty is especially visible in the aspect of extraction and export of real data from functioning systems (mostly relational databases) to the graph-network structure (Graph **G**).

The algorithm, in its basic form, is historically agnostic in relation to users' actions. For the algorithm, the current history of user actions is irrelevant.

Furthermore, the characteristics of the users of the algorithm are irrelevant for the algorithm. This may be both a disadvantage (lack of personalization) and an advantage (meeting the GDPR requirements). The algorithm gives the same results in each call for various users. The only variables affecting the algorithm are the selected object for which a recommendation is made and the Graph **G**.

The practical usefulness of the results of the algorithm may give rise to discussions due to the very similar values of the parameter indicating the position of the recommendation, i.e. the incoming steps. However, this feature is very much dependent on the size of the Graph **G**, and precisely on the number of edges in the graph. The bigger is the number of the edges, the higher the degree of nodes in the graph.

Abstract

IT strategic alignment is a subject that is constantly surfacing these last years. To keep up with a market in rapid evolution, companies must keep there IS (Information System) in perfect alignment with their strategic objectives. In this context, several frameworks have been developed to propose scientific approaches for IT strategic alignment and IS governance and management. Indeed, large renown companies all over the world based their IS management and governance processes on reputed frameworks in this domain such as COBIT5, ITIL, TOGAF, ZACKMAN.. Unfortunately, these frameworks are not adapted to SME (Small and Medium Enterprises) mainly in developing countries.
The main aim of this paper is to propose a novel approach that can be used by Moroccan SMEs to engage their IS strategic alignment. This approach is based on COBIT5 and relies on two phases distinguishing between external stakeholders' needs and internal ones. Our approach has been tested in a Moroccan SME and leaded to tangible results presented in this paper.

Keywords: IT Strategic alignment, COBIT 5, IS governance framework, Moroccan SMEs

Introduction : General Review

Seeking for digital solutions is becoming a major reality for companies nowadays; it enables to identify the efficiency of an operation via customer feedback and statistical data. Efficiency of processes is more and more depending on its digitalization level. Actually, information is considered as the most important asset of the company. This fact makes companies stakeholders aware of the importance of the quality and security of their information system. Thus, IS strategic alignment is becoming a hot topic in governance and management high standards.

Information system strategic alignment is a managerial practice that aims to better understand, create, and reinforce the IT convergence and synchronization with the purposes, trajectories, and rhythms of the enterprise.

In this context, two approaches are used. Downstream, a strategic alignment approach can start from the business strategy and deduce the involved processes and the corresponding IS which leads to an IS projects portfolio elaboration. Upstream, the alignment of the information system strategy with the business lines and the support functions can benefit from IT innovations impact on companies' strategies and governance approaches. Thus, the steering elements are determined by a combination of the strategy, governance, alignment and urbanization of the information system and IT innovations. (Lufman, 2000)

Strategic alignment relies heavily on the shared will and commitment of the stakeholders. The information system department (ISD) must be able to promote and implement the strategic alignment of the information system and

seek for the support and the commitment of all the stakeholders. CIO (Chief IS Officer) can be helped by different frameworks developed as best practices for IS strategic alignment and IS governance and management. The question is: **Are these frameworks adapted to SME in developing countries?**
In this paper, we will present a review of few main IT management and governance frameworks. In a second part, we will present the problematic and related work of these frameworks for SMEs in developing countries. Finally, we will present our proposed approach and its application in a Moroccan SME case.

IS Strategic Alignment Frameworks

Several reasons justify the importance of IT Strategic Alignment, foremost the information system creates value and is a source of competitive advantage. It is also possible to demonstrate links between the information system uses and the company's performance.

The most profitable and important investment is to model the information system and justify its adequacy with the strategy development. The major challenge of strategic alignment thereby is to make the information system an asset at the service of the enterprise's strategy (Henderson, 1999).

Strategic alignment should be seen as an iterative process. It can occur at all levels and it should ideally be an approach affecting the entire enterprise and its information.

Several frameworks have treated this subject notably Zackman, TOGAF, Henderson and Venkatram Model, ITIL and more recently COBIT5. In the literature review, we will briefly present and discuss the effectiveness of these frameworks.

Strategic alignment implies a partnership approach. It must be a profitable relationship and cannot be carried out without the commitment of all the stakeholders. (Arthur A. Thompson, 2001) It requires an effort, to explain and use common tools. To communicate and work together, the various stakeholders must use methods and tools that are understandable by everyone but even thought, the strategic alignment is not synonymous of uniformity. (Morton, 2007)

Venkatraman and Henderson Model

Aligning the information system with the main enterprise goals and strategy is the major business challenge today. (Venktraman and Henderson, 1999)

IT Strategic alignment is the main pillar among five pillars of information systems governance which comprise: Value creation, resource management, risk management and performance measurement.
Venkatraman and Henderson (1999) define four interaction perspectives between IT and Business activities at the strategic level.

Henderson and Venkatraman present four forms of the IT Strategic Alignment:

a) Operational execution of the strategy

In this first type, the general management and the business departments are at the origin of the strategy.
In this case, the ISD adapts to the existing processes and its task comes down to trying to satisfy, in particular, the need for availability, speed, costs and deadlines.

b) Information System as a vector of technological transformation

The general management defines a new strategy that will trigger a redefinition of the ISD strategy. Information System Direction is called upon to implement an innovation expressed by the top management. Once the ISD strategy is redefined, it is necessary to think about the infrastructures and the technological processes necessary for its implementation. The ISD is evaluated in this case by its ability to provide a technological innovation adapted to enterprise needs and delivery deadlines.

c) Information System Direction as the origin of the strategy and source of competitive advantage

This type of IT strategic alignment is a mode that prevails in sectors dominated by technology such as the telecommunications sector and the automotive industry.
The strategy of the Information System Direction in this case defines the overall strategy of the firm. ISD is adopting major technological innovations to provide the enterprise with a competitive advantage. ISD is then required to translate new technology trends into products and services based on the business's strategy.

d) Information System as an Operational Service Provider

In this type, the focus is on the relationship between ISD and the business management. The IT service is developing infrastructure and processes to provide an excellent level of service. The enterprise's processes are then called to optimize performance (Service quality, user satisfaction…). The same enterprise may have to follow different modes of alignment depending on the activity and the desired positioning. (Morton S. a., 2008)
The most widespread situation for industrial SMEs is the first form 'operational execution of the strategy' because usually the strategy stems from top management but, regardless of its role, every IT activity, project, or service must play a part in creating business value.

Generally, we conduct a strategic alignment assessment, to identify improvement tracks by linking them to the business strategy, and define where the enterprise can benefit from IT to achieve its strategic objectives.

Several governance frameworks have dealt with this area, notably ITIL, and COBIT5. It is therefore essential to compare these frameworks in order to choose the framework that can be adapted to Moroccan SMEs.

Both ITIL and COBIT5 have value to offer to the firms. Picking the right controls in each of these frameworks or standards may help SMEs to increase their productivity and efficiency.

The Open Group Architecture framework (TOGAF)

Developed in the mid-1990s, TOGAF is one of the pioneers in this domain; it is today recognized as an industry standard. The framework seeks to develop cartography of the company's organization, so that the technical and business teams can share different views of a single element according to their skills and roles in the project. TOGAF recommends a joint work between IT and business from the organization analysis, to the information system architecture urbanization. It seeks to maintain the project alignment with the business objectives. (CIGREF, 2007) The collaboration between the technical and business teams allows an acceleration of new processes deployment. TOGAF brings together a set of best practices for businesses of all sizes, but does not allow the development of the implementation process. (TOGAF , 2013)

ITIL (Information Technology Infrastructure Library)

Developed from best practices related to IT management in organizations, ITIL aims to help organizations better understand the processes directly related to information system management.

ITIL takes a Lifecycle approach to provide best practice guidance for IT Service Management. There are five stages in the ITIL Service Lifecycle: Strategy, Design, Transition, Operation, and Continual Service Improvement. (ITIL V3, 2014)

ITIL approach is based on the process notion and is divided into six basic modules focused on IT management; User support; internal cost management and ISD service levels; software asset management; management of technological infrastructures; management of the development cycle of application software solutions; and security management. Yet ITIL is more focused on IT management and does separate clearly governance and management.

COBIT5 (Control Objectives for Information and Technology)

The framework was developed by the ISACA (Information System Audit and Control Association) in order to control and prevent IT risks that could harm the company financially.

Its four main IT domains are: IT planning and organization, acquisition and implementation, delivery and support, surveillance. COBIT provides an implementable set of controls over information technology and organizes them around a logical IT framework.

COBIT5 tried to integrate a single framework that deals with the alignment and the implementation phases simultaneously while separating management and governance.
The framework targets the top-level needs of an enterprise as depicted in the **Figure 1**, the framework seeks to improve overall business orientation via IT controls starting by stakeholders needs and business strategy definition.

Figure 1 : Bottom-up requirements depiction COBIT5 (ISACA, 2012)

COBIT5 represents a process-oriented approach that encompasses 5 domains (planning, construction, execution and metrology) and 37 distinct processes that comprise 210 activities. It can be adapted to all business types, industry, technological environment, geographic location and entrepreneurial culture.

After our benchmark in this field, we can deduce that TOGAF and Venkatraman & Henderson models are classic frameworks that focus primarily on the enterprise architecture and do not consider the implementation process in a detailed way.

Concerning ITIL, the framework enables IT services to be managed across their lifecycle, whereas COBIT aids enterprise IT Governance to generate the maximum added value via IT investments.

COBIT5 provides a theoretical framework to define goals and objectives but also to measure the company's adaptation and alignment degree. The framework covers the business end to end, which is beneficial for Moroccan SMEs. Thus, in the second part, we will focus on COBIT5 as a global framework for IT strategic alignment. But is COBIT 5 as a global framework adapted for SMEs IS strategic alignment?

COBIT-was developed in 1994 (and published in 1996) by the Information Systems Audit and Control Association (ISACA). ISACA was created in 1967 and has been represented in France since 1982 by AFAI (French Association of Computer Audit and Consulting). It is a control framework that aims to help the management of risks (security, reliability, compliance) and investments. Cobit5 is a toolbox that achieves objectives by implementing effective governance and IT management. (Fabrice Garnier de Labareyre, Dominique Moisand, 2011).The fifth version Of COBIT focuses on the value that the governance of IT can bring to the Business particularly.

Understanding and managing the risks associated with ICT is an integral part of the COBIT5 theoretical framework. It seeks to mitigate risk in order to meet ICT governance needs and ensure the integration of communication and information systems.

COBIT5's principles and processes

COBIT5 framework is based on five principles of corporate governance and IT administration.

a) Meeting stakeholders needs

COBIT5 provides all the processes required to support the creation of added value through the use of ICT. This principle is related to the concept of strategic alignment. However, a constant challenge for each enterprise is how they will succeed in implementing their strategic alignment. COBIT5 offers organizations, the opportunity to begin by analyzing their business and IT strategic alignment by defining the main strategies. (ISACA, IS Audit and Assurance Guideline Assertions and best practices, 2012)

b) Covering the enterprise End-to-End

COBIT5 is able to perform all the functions and processes within a company. The framework does not focus only on the function of ICT but also considers information and technology as assets that should be treated like all other assets. A focus on covering the enterprise end-to-end requires a crucial shift in the minds of business and IT management; it implies a move from managing IT as a cost, to managing IT as an asset.

c) Applying a single integrated framework

Compared to previous versions, COBIT 5 includes a greater and more comprehensive definition of business management related to governance and ICT management

d) Enabling a holistic approach

The implementation of effective GEIT (Getting Started with Governance of Enterprise IT) requires a holistic approach that will take into account the interaction between processes and various structures notably: organizational structures, processes, culture and behavior, information, infrastructures, and people skills.

e) Separating governance and management

COBIT makes an important distinction between governance and management. This separation remains essential for the responsibilities breakdown in SMEs. COBIT5 makes a difference between ICT governance and ICT process management, as they both include different types of activities.

Governance ensures that the needs, conditions and options of interested parties are assessed to determine objectives that can be achieved by the business; to set an orientation in the context of the priorities and decisions; and to control performance and compliance. (COBIT5, 2012)

It ensures that stakeholders needs, conditions and options are ***evaluated*** to determine balanced, agreed-on enterprise objectives to be achieved, setting ***direction*** through prioritization and decision making, and ***monitoring*** performance and compliance against agreed-on direction and objectives. (EDM) (ISACA, 2012)

Management covers the planning, design, production and management activities in line with the management set up by the governance team in order to achieve the company's objectives.

Although COBIT5 is a global framework that guides the deployment process, the question that really arises is: can this framework be applied to Moroccan SMEs?

To meet this question, we will start by defining the Moroccan SME, and try to decipher the possibility of conducting a strategic alignment based on COBIT5.

COBIT5 Framework for Moroccan SMEs

Moroccan SMEs (Small and medium sized enterprises) play an essential economic and social role. Before 2005, most of the organization based the definition of SMEs on the number of employees. Actually, the workforce is considered as the closest variable to assess the contribution of the SMEs to GDP of the country. Nevertheless, this criterion does not determine an official definition of SME. For this reason, a second quantitative criterion is retained in Morocco which is the turnover. (OECD, 2005) In what follows we will state the limits and problems of Moroccan SMEs, as well as the related works in the case of COBIT5 application within SMEs in wider sense, since its application remains very minimal in Moroccan SMEs.

SME cases: organization and management specificities

Although COBIT5 is a general framework and includes all the necessary aspects to conduct strategic alignment, the framework still remains very large for Moroccan SMEs, because corporate governance (CG) may sound worrying to some small and medium sized enterprises (SMEs), where the owner generally assumes the role of manager as well.

In SMEs, there is often an absence or a lack of formal strategy documents. Another problem that usually comes up in SMEs is the absence of middle management with the ambition to step forward and assume responsibility for communication with employees. In a small and medium-sized enterprise, there is generally financial and human resources lacking which drive the owner to play the role of manager and to be directly connected to the executors, and it usually creates communication problems within the company. And last but certainly not least the paradox, 'if it works, we do not seek to improve or modify the existing' and if it does not work, investments are stopped and SMEs fear to face financial issues due to changes.

The question then is: How can we adapt an existing framework to increase its adequacy for SMEs in developing countries?

Related work: CoBit5 for SME

Erik Guldentops 2012 addressed the case of IT governance in SMEs based on COBIT5 framework in a wide sense. (Guldentops, 2012) His main contributions remain very theoretical, the IS researcher argues that COBIT5 offers an overview of the overall IS function, by linking it to audit and governance. Thereby, there are some drawbacks when focusing on SMEs.

When SMEs adopt IT, they will be confronted to the same challenges as IT alignment, IT failures, IT business orientation, and basing on COBIT5 to IT Governance.

As an IT practitioner E.Guldentops relies on the fact that SMEs have limited resources and cannot be compared to large organizations. Within SMEs, the CEO often assumes the role of owner and manager. But even with all these weak points, the author still believes that there is no framework that encompasses IT, information, and their functions in organizations, better than COBIT, even for SMEs.

If we analyze (Guldentops, 2012) the author's hypothesis, the fifth principle of COBIT5 and which in our opinion remains the most important in driving an IT strategic alignment 'Separating governance from management' is not often applied in SMEs where usually the CEO is the owner. Thus, although COBIT5 is an performing framework in terms of strategic alignment assessment, and it manages alignment and implementation phases while covering the end-to-end enterprise based on a single framework. COBIT5 remains very large for an SME, and difficult to adapt to an environment where the resources are very resistant to change and in a country where the application of COBIT is not widespread yet.

COBIT5 relies in particular, on a very functional approach to the organization. In this framework, the Information System operates in parallel with the actual organization - and in some way disconnected from it - because it is based on the nominal arrangement of functions.

In this context, the alignment of the information system consists on reconciling, often on an ad hoc basis, the reality of operations with an idealized vision of the organization (ISACA, 2012)

IS strategic alignment for Moroccan SME conceptual framework (ISSA- Moroccan SME): Towards a new approach based on Cobit5

Moroccan SMEs are characterized by some unique specificities as defined in the previous chapter which make COBIT5 difficult to apply. To meet SMEs limits and weak points, we suggest a new approach based on COBIT5 as an IT governance framework.

Figure 2 : General overview of ISSA-SMEs framework

ISSA Framework can be described in two phases as depicted in **Figure 2**: the first one represents a prototype driven by the external stakeholders needs. The positive results of the first phase notably employees awareness and motivation lead to the second phase, which consists of using the basic framework which is COBIT5 by considering the internal and external stakeholders needs and business strategies as drivers. The second phase depends largely on the first phase success within Moroccan SMEs.

Stating the IS projects portfolio based on Cobit5 focusing on financial risks

Table 1: Stakeholders needs priorities assessment according to Moroccan SMEs Leaders

	Stakeholders needs	
Perception of the priority degree of stakeholders needs by Moroccan SMEs leaders :	External stakeholders:	Internal stakeholders:
	HIGH	MEDIUM
Trigging event:	Customers, communities, suppliers requirements (Audit, fiscal control...) Government laws and policies	Business and support functions needs Business strategy and objectives

In Moroccan SMEs, generally the strategy is not predefined. The company is often obliged to respond to its external environment requirements firstly: fiscal audit or simple audits imposed by its external stakeholders (Customers, parent company, banks…)

The deployment of ISSA-Moroccan SME framework can be depicted as follows:

Figure 3 : ISSA-Moroccan SME framework

To better understand ISSA-Moroccan SME framework, we will detail each predefined phase in the subsequent.

Overview of ISSA framework deployment

II.2.1. *The first phase of ISSA-Moroccan SME framework*

Figure 4 : First phase of ISSA-Moroccan SME framework

The driver of strategic alignment is no longer the business strategy but the external stakeholders' requirements in the first phase of ISSA-Moroccan SME Framework as depicted in **Figure 4**.

Even in SMEs, IT function must always be in perfect alignment with the needs of the company which in ISSA framework are the external stakeholders' needs. To meet external environment requirements implicitly implies a change in the strategies and objectives of the business and IT function; usually these changes affect the business actual procedures and processes. The transition to the ISSA-Moroccan SME second phase depends on the first phase success. This will make SME leaders react and be conscious of strategies formality importance and will drive them to consider both internal and external stakeholders needs, as well as the separation between governance and management.

II.2.2. The second phase of ISSA-Moroccan SME framework

Figure 5 : Second phase of ISSA-Moroccan SME framework

Once the first phase is well successful; Moroccan SMEs leaders will see results that highlight the importance of strategic alignment within their organization, they will be more conscious of the business strategies definition importance and will thereby consider internal and external stakeholders needs for optimal processes that generate concrete results.
Thus, in this second phase, we will use the basic framework which is COBIT5 by relying on its first principle 'Meeting stakeholders needs' in wider sense as depicted in **Figure 5**.

ISSA-SME Application

II.3. Context

To better understand IT strategic alignment process; we decided to deal with the case of a Moroccan industrial SME based on ISSA framework by introducing the human factor and thereby change management in this process.
Information system strategic alignment involves two conditions, firstly understanding the company's strategy by the ISD. And secondly taking into consideration IT constraints and opportunities.
As advanced, generally in Moroccan SMEs, there is no formal strategy. So instead of starting by the business strategy identification, we will start by determining the external stakeholders requirements. The implementation of ISSA-Moroccan SME framework will be done in two phases.

II.4. ISSA-Moroccan SME Framework application

The second COBIT5 principle 'Covering the enterprise End-to-End' allows us to focus on all the areas affected by the business external environment which represents the driver of ISSA-SMEs framework**.**

The first phase of ISSA-Moroccan SME Framework

The first phase of ISSA-Moroccan SME framework aims to firstly consider external stakeholders requirements. In this context, asset preservation is the main objective of the company. It was a recommendation among others reported by an auditors group and a part of the strategy to improve Moroccan units to be in perfect alignment with the parent company.

Preserve the real estate of the company	- Preserve the know-how - Preserve the brand identity - Preserve the company's goodwill	- Manage security and continuity - Manage confidentiality / Right of access - Manage risks	Aligned
	- Preserve the company's assets	-	Not aligned

Figure 6 : First phase of ISSA-Moroccan SME implementation

For assets preservation, our project consisted mainly on two axes. Firstly: an asset management procedures manual implementation, and secondly: setting up asset management software. A project that remains crucial for an industrial company which holds several assets and seeks to expand its portfolio.

The main outputs of this phase are stakeholders' awareness of the strategic alignment importance, as well the experience and motivation generated by the positive results. All these factors led the company to define its strategic objectives and have a clear vision of its future projects. Downstream, a strategic alignment approach can start from the business strategy and deduce the involved processes and the corresponding IS which leads to build an IS projects portfolio.

The second phase of ISSA-Moroccan SME framework

Once the project has been implemented, SME leaders have noticed positive results that have improved the business profitability by reducing the assets costs. And thereby leaders and employees have recognized the importance of an IS strategic alignment. This led them to formalize their strategies and implement the remaining portfolio projects.

The industrial Moroccan SME has been able to change its basic structure, its functioning and employees habits in order to be in strategic alignment with its strategy which henceforth consider both internal and external stakeholders needs which is the first basic driver in COBIT5 framework. Our change management plan was well successful, as the first phase made employees more conscious of change management and continuous improvement importance. This awareness guides them today to be in strategic alignment internally and with their external environment constantly.

Firms should align their IS with their business strategy and their external environment requirements. In our case, before embarking in the strategic alignment analysis, we were able to identify some improvements tracks without

relying on a specific IT Strategic alignment framework. But with a well-founded alignment analysis we were able to make a project portfolio for the enterprise and above all a prioritization assessment for our potential projects. The Bottom-up approach while using ISSA-SMEs framework allowed us to cover the whole company but also to be more than just opportunistic, and try to bring the most concrete added value to our perimeter by focusing on the highest priority projects.

Conclusion

In Morocco, leaders start to realize the importance of strategic alignment. Whatever the enterprise's size or turnover, it must set goals in alignment with its strategy to ensure its market positioning. Good practices, like those presented in COBIT 5, must be understood and applied properly. Whether it is applied for a small or large company, we can always adjust COBIT 5 to the company's external drivers and needs for better IT governance and management.

Before starting any process, it is crucial to use an approach. In our case, despite the existence of several frameworks dealing with our subject, Moroccan SMEs specificities have meant that only COBIT5 can be applied, under the condition of going through a pre-phase that consists on focusing firstly on the external stakeholders needs. This first phase will generate the interest of giving more importance to a strategic alignment with the internal company needs. Moroccan SMEs would need a flexible organization with stronger cooperation from employees, which cannot be done in an environment of insecurity. Change management is a major challenge for Moroccan SMEs; but this field of information systems is probably no more exceptional or problematic than any other perimeter. Aligning IT is no longer a choice but an obligation for all the SMEs that want to keep their positioning in a highly competitive market and avoid unnecessary expenses.

Acknowledgments

This paper and the research behind it would not have been possible without the support of Pr N.Belkhayat. His enthusiasm, knowledge and encouragement have been an inspiration and kept our analysis on track. We are also grateful for our families support, and for the insightful comments offered by the anonymous peer reviewers. The generosity and expertise of one and all have improved this study in innumerable ways.

Abstract

There are various factors behind the success of global brands. These factors may include brand strength, competitive advantage, customer loyalty or the proper application of your marketing strategy. In many cases, it must respect the development of current trends. Today's world is characterized by speed, which is largely reflected in the marketing field. People are increasingly demanding on the products and services offered. Their demands on the quality of transport, simplicity, but also on the perception of price differentiation are increasing. The aim of the article is to find out the principles of success of the strategy applied in the company on the basis of relevant information from the given issue. In this article, we focus on the successful use of the marketing strategy of the UBER brand, which was able to change the quality of low-cost travel through a mobile application. We divided the article into three basic parts. In the first part, we analyze the description of the situation that led to the emergence of the service, communication and customer strategy of the brand. We use analysis and synthesis in which we identify different views of authors from various studies focused on the success of marketing strategy. Based on the obtained data, we describe the differentiation strategy and its successful use.

Keywords: UBER, Marketing Strategy, Diferentiation Strategy, Marketing Communication

Introduction

The marketing strategy is defined by a number of authors as a whole, which is focused on different areas. El-Ansary (2006, pp. 266-293) argues that in its formulation it is necessary to understand customer behavior, analyze the market in detail, segment it, focus on those segments that have the potential for high and regular demand, then transform their requirements for technical specification of the product and differentiate it so that the market is covered as much as possible. The above definition implies a comprehensive view of the author on marketing strategy. Another view of the perception of marketing strategy is provided by Krizanova et. al. The authors claim that the CRM area (2018, pp. 2567) is a key area in shaping a company's marketing strategy. According to the authors, it contains key activities aimed at acquiring and maintaining the value of products and services provided to customers. In this context, the authors Poliak et al. Stated that the distribution policy should be an essential part of the applied marketing strategy. According to the authors, a suitably chosen form of distribution route can contribute to the overall satisfaction of the customer with the product or service (2014, pp. 153 - 161). The authors' views on the perception of marketing strategy are different. None of the authors emphasize marketing communication. The importance of marketing communication in marketing strategy is emphasized by Navas and Lu. The authors argue that the right marketing strategy should also take into account the marketing communication of the product or service (2020, pp. 839 - 851). Based on the above, it is possible to express that when creating a marketing strategy of a company, it is necessary to focus on various forms of marketing communication and thus get the customer's awareness. Zauskova and Reznickova argue that with a properly applied and enforceable marketing strategy, a brand can create strong competitive stability in a global market environment. (2019, pp. 133-150) By creating a stable competitive advantage, the company can ensure higher customer loyalty and thus maximize profits.

There are already several models in place to create and properly apply a marketing strategy. One of them is Porter's Generic Strategies model, which compares the benefits provided to customers and the size of the analyzed market. When creating this model, it is necessary to focus on managing customer segmentation. According to Gajanova et al. it is necessary to take into account the psychographic factors that determine the correct definition of the customer segment. (2019, pp. 65-84). Krylov (2019, pp. 12-25) also agrees with this opinion. After the correct definition of the customer, it is possible to identify individual strategies in the models, which companies can use in order to strengthen

market presence. In the second part of the article, we also describe the selected strategy that is currently used by the UBER brand.

Our research is focused on the analysis of the current situation of the UBER brand in the market environment. Using Porter's generic model, we identify those areas that will identify the current UBER brand interface in relation to updating and creating a new marketing strategy.

The initial situation of UBER brand

In development, the process of providing a service in the classic taxi service was lengthy and less comfortable. To call a taxi, it was necessary to go to the street and wave at it, or call the dispatching center and order it. The disadvantage was the long wait, the impossibility of tracking his current location, tracking whether the taxi will arrive on time or not. The disadvantage was also the price, which was unknown in advance and its amount depended on various factors (eg the amount of fuel consuption, the length of the route, etc.). We are currently seeing a trend of evolving technologies that many brands must respect. One of them is UBER. The brand was established in 2009 in San Francisco in the form of a startup with the priority goal of differentiating itself from the classic taxi service. At the time of the brand's creation, there was no direct competition on the market with the possibility of ordering a taxi via the online application. At the beginning of the brand, the main activity was to provide luxury car transport.

The current position of the UBER brand is strong worldwide and its services cover more than 120 countries around the world.1 From the above, it can be argued that it is a stable brand with a global presence. At present, the company's activity is to provide customers with a simple and transparent form of transport from point A to point B. The added value is the use of an online platform, on which the marketing concept is based. The condition for using the application is registration. Communication with the customer is also built on the online platform. This takes place through a mobile application available for all existing platforms. The user has an online overview of where the car ordered by him is located and at what time and from where it will pick it up. If the customer cannot determine his exact, just use the GPS integrated in the mobile and the Uber service responds to the customer's location via the application by sending a driver to the GPS location.2

Difference from the classic taxi service

The difference compared to the classic taxi service is in all elements of the application. The basic difference is the price differentiation and methods of payment, it is also the method of communication between the carrier and the customer. In addition to the above, the differentiation lies in the safety and quality of the service provided and also in its variability.

Also agrees with the opinion at Hollowell. (2019, p. 13-18)

Uber offers several service options according to the type of car, number of seats, luxury and affordability to cover the requirements and preferences of the customer segment as much as possible. These are Uber X, TAXI, BLACK, SUV and LUX. Uber X and Uber TAXI is designed for people who are looking for a cost-effective solution, Uber BLACK is designed for those who like to travel in a black car (sedan) and want to have their personal driver, Uber SUV for people who need more space and Uber LUX for those who need luxury during the move from point A to point B. The variability of the services provided brings customers significant added value in the form of a travel experience. For customer segments, we have defined that the priority of UBERU is to provide value. This can be seen in the variability of services. However, the disadvantage of variability is its geographical availability because the variability of the service depends on registered drivers.3

Using the service from the UBER brand is significantly more affordable than when using the services of the classic taxi service. Setting the price below the price level of the taxi service is caused by the service settings. In contrast, Uber does not have costs associated with the classic taxi service (own taxis, their depreciation, costs for the purchase and installation of taximeters, etc.), so it can afford to set a lower tariff for transportation. This tariff is specific to each region. Customers also have the opportunity to calculate the price of the route they have chosen in the application environment. In the case of several passengers who have the same direction, these passengers do not have to deal with the issue of the distribution of fares or owe each other. All they have to do is choose the fare splitting option in the Uber application and the same amount will be automatically withdrawn from each passenger's account

[3] Difference between an UberX, Uber Black and Uber Taxi: https://www.quora.com/What-is-the-difference-between-an-UberX-Uber-Black-and-Uber-Taxi

Another difference compared to the classic taxi service is the integration of regular drivers. Uber drivers differ significantly from the competition in their specific specifications. This means that they are ordinary drivers on the road who are unemployed or interested in earning a living in addition to their work. In order for drivers to be able to carry out this activity, they need to register with the company via the website, download the application and can start providing their services for which they are paid (80% of the transport price, 20% profit for Uber). The basic conditions that drivers must meet include a minimum age of 21 years, a driver's license valid in the country or verified in a foreign country in which he wants to provide the service, integrity, active driving for at least 3 years. Compared to a taxi service, they do not have to have a license for taxi drivers if they provide the service only occasionally.

Uber cares about the safety of its customers and employees, so it builds the Global Safety & Security Team, a team that helps drivers integrated into the service and customers move safely around the city. The team includes, for example, former Boston Police Commissioner and former vice president of trust and security on eBay.[4]

Only drivers who prove their integrity on the basis of an extract from the criminal record, as well as an extract from the driver's registration card and information on the technical condition of the vehicle may register for the Uber service. The vehicle must not be older than 10 years and must pass a technical and emission inspection. Uber also relies on feedback from the driver as well as the passenger, thus trying to ensure the quality of service. Rides are also monitored and stored in the system, so in the event of customer or driver dissatisfaction, Uber can respond quickly to the problem.

Customer Segmentation

In the previous chapter, we described the deifferentiation of the brand from the classic taxi service. In the individual difference points, we were able to identify value for the customer. Therefore, value creation through service is an important part of UBERU's strategy. The customer does not have to wait and be unsure which car and which driver will arrive when his pick-up is at the given address, the customer will receive a text message that the pick-up is in place. Value is also provided for each customer individually. In connection with the expansion of the company, the customer segment of the brand was gradually formed. At the beginning of the brand's development, a typical customer was a rich young man who needed to get from point A to point B in a luxury car and are willing to pay extra for transportation. Currently, the target segment of the brand is a person who does not have their own car. A typical customer also has his own behavioral characteristics. These characteristics can be, for example: he likes to travel in style, he requires VIP style, I want to be more socialized, I want a luxurious but cost-effective and safe ride and so on. In many cities, the brand (UberX) offers its customers 30% better price rates than the classic taxi service. The key factor in customer satisfaction is value. This is provided in the form of a holistic approach by providing an alternative transaction flow. The basic model applied by the brand to customers consists of the following steps: search (exclusive ride - VIP, which is cost-effective), book (availability on request from customers), payment (applied non-cash transaction - card, internet banking, mobile phone or watch), control (feedback and satisfaction with the driver and traffic). [5]

Based on the key steps, it can be argued that the current value that the brand provides to all customer segments is reliability. Another key factor proving the success of the brand is to meet the customer's request within 10 minutes of placing the order. In this context, it is also possible to talk about an effectively applied logistics strategy of the brand. The authors' statements at the beginning of the article declared the distribution policy as an integral part of the marketing strategy. Based on the analysis of the UBER brand, it can be argued that, in addition to distribution, the brand's logistics operations related to the service provided are also important.

Competitive position and marketing communication of the brand

In addition to the customer segment, it is important to perceive the competitive position of the brand. At the beginning of the chapter, we claimed that in the beginning, the brand had no competition. It can be argued that it had a monopoly global position. However, the brand currently has a number of global competitors. There are various services on the market that offer the main product of passenger transport as well as Uber. The difference in competition can be perceived in who performs this service. BlaBlaCar, for example, can be seen as competition. Like UBER, BlaBlaCar is built on an online platform, but the difference can be seen in the connection of ordinary drivers with free space in the car. Other competitors include brands such as Easy Taxi, Gett, Flywheel, Software, Hailo, LeCab, whose primary

[5] Uber Business Model Canvas: Know what led to Uber's success: https://jungleworks.com/uber-business-model-canvas-what-led-to-uber-success/

goal is to simplify the process of calling, tracking and paying for a taxi, limousine or licensed driver. Other online platforms differ in their geographical location or the possibilities they offer to their customers (for example, Ola, Taxi Mobility, Lyft, Haxi, Taxicode, Sidecar, Bolt and others). Another competitor is ZoomCar, which differs from Uber in that the customer can rent the entire car for a certain period of time. The same principle is to work on an online platform. The basic difference between the UBER brand and competing brands is the price for transport and their geographical effect. When defining the resulting strategy, it is necessary to take into account all these findings, as the resulting strategy is also based on price differentiation.

When formulating the brand's marketing strategy, it is necessary to take into account the use of marketing communication. The UBER brand chooses an unconventional way of communication, which tries to attract customers. One of the non-traditional marketing events was "#OMGUBERICECREAM", the aim of which was to include "request ice cream delivery here" options in the online application and subsequent ordering of ice cream. Customers could thus order ice cream online, where they could set the place where the ice cream car should be displayed and then select the option of ice cream delivery right here. In a similar way, customers could order Christmas trees or roses for Valentine's Day from the comfort of home. The campaign was designed for the US market. A similar marketing event was the "#UberKITTENS" event, in which customers could adopt a kitten brought to them by the driver.[6] In addition to non-traditional events and promotions, the brand also cooperates with well-known organizations. One of them is Red, who has been helping to fight AIDS for a long time. In this marketing event, UBER provided customers with the opportunity to support the organization just after the end of the ride in the amount of $ 5. A marketing campaign to support homeless war veterans took place in a similar way. The brand does not use traditional forms of marketing communication. Instead of mass communication in the form of billboards or the use of advertising space on television or in the print media, it uses another non-traditional form. The brand strives to combine the value provided to customers in the form of its service with a marketing communication tool. When entering a new market, it offers customers the opportunity to try the online service for free. Here, the effect is combined for free with the communication tool word of mouth. In this way, the brand will save money on mass communication and, in the form of an effect, will allow customers to use the services for free. Tanwar claims that, according to the brand's experience, it is an average cost advantage of 48%. (2013, pp. 11-17) The mentioned event is limited by the number of days and rides when customers can use the service free of charge. The traditional and cost-effective tool is the use of communication with customers in the form of social networks. Numbers are also a success of this form of communication. The brand has 22 million fans on the social network Facebook, it has 1 million fans on the social network Twitter and 1.4 million fans on Instagram.

Strategic Brand Management

At the beginning of the chapter, we provided a theoretical view of the perception of marketing strategy by various authors. The authors identified in several factors that need to be followed in formulating and implementing the strategy. We described these in the first chapter of the article. Based on the theoretical evaluation and the initial situation of the UBER brand, we came to the conclusion that the principle of operation of the company is based on the strategy of differentiation. According to the author Tanwar, the differentiation strategy is focused on the uniqueness of a product or service that offers exceptional features for customers. (2013, pp. 11-17) With the opinion of the author, it is possible to identify the UBER brand, whose main idea is based on the assumption of a unique service for the general public.

The long-term goal that UBER wants to achieve is to create value-added potential for the customer and provide him with such benefits that they do not need to own a car. The aim is to achieve cost-effectiveness, practicality in using the service and better comfort than when using your own car. In this context, it is possible to take into account the environmental aspect, which can lead to an overall reduction in emissions, but also the total number of cars on the streets. The company strives to achieve these goals through various activities in areas that point to the main differences from the classic taxi service. Focusing on these areas ensures and strengthens the brand's competitive advantage.

In the following subchapters, we identify individual areas that are a key factor in formulating the resulting brand strategy.

Factors proving success

In the first chapter, we identified areas through which the brand provides added value to the customer, we identified areas of variability compared to the classic taxi service and we defined the competitive position. In order to strengthen

[6] Marketing campaigns of UBER: http://newsroom.uber.com/2012/07/omgubericecream/

the importance of our chosen strategy for the UBER brand, it is necessary to identify the facts proving the success of this brand.

As already mentioned in the introduction to the article, UBER in 2015 developed into the position of the most valuable "startup" in the world. This year, the company's value reached approximately $ 51 billion. In 2018, the company became one of the second most popular companies in the world.

Proof of success is the ever-growing trend of UBERU users. In Year 207 there were about 3 million of them, in 2018 this number rose to 5.21 million, in 2019 it rose to 6.90 million. Compared to 2017 - 2019, in the first quarter the number of users recorded 5% more than 1 Q from previous years. Similar to the number of users, the number of market shares is evolving in 2018, reaching a market share of 71%, in 2019 it was 70%. The highest market share was achieved in the month of January in 2016, when the brand's market share reached 87%. Despite various factors (increased competition, new customer requirements), the brand's market share is still high at present.

The company's success is also due to annual revenues, which reached USD 19 billion in 2016 and have been growing steadily since that year. In 2017, businesses had revenue of $ 34 billion, in 2018 it was $ 50 billion, and in 2019, revenue was $ 65 billion. Similar to the exponential growth of annual revenues, it is also possible to record a quarterly increase in brand revenues. The company's net income of $ 0.4 billion since 2014 was $ 14.1 billion in 2019, an increase of approximately 3,525%.

Proof of success is also the confidence of investors willing to invest considerable funds in Uber. Uber uses the raised capital to expand into new cities and improve its services. Investors include, for example, the Chinese company Baidu, which invested $ 600 million in Uber in December 2014, and Google Ventures, which invested approximately $ 258 million. Investments continue today and are also showing a growing trend.

The success of Uber is also evidenced by the number of new companies that are trying to apply its successful strategy to their industries and thus achieve similar business success. Examples include applications such as Swifto (Uber for dog walking), HomeHero (Uber for nursing seniors), Saucey (Uber for alcohol) or Eaze (Uber for medical marijuana).

These numbers and facts prove the success of the company and on this basis it is possible to confirm the identified differentiation strategy. Despite the diversity of services offered to the general public, the brand is globally stable, competitive with a high market share.

Discusion

In the second chapter, we identified the currently used UBER brand strategy. We argued that UBER uses a differentiation strategy, where it tries to adapt individual services to the requirements and needs of the general public. We are currently witnessing the use of the same strategy in several cases. An interesting example is Apple, which has changed the world of computing. It managed to differentiate itself from the competition through design-different products, which also contained high added value for the customer. The company has created a certain type of culture that provides them with loyal customers and constantly returning customers with strong competitive stability in a global market environment. At present, the company's products also represent a certain social-status symbol, which is why there is such great interest in them. The importance of the status symbol is also emphasized by Nadanyiova, who argues that in order to be competitive, it is necessary to differentiate the product. However, it is important to then analyze the process of perception by the customer. (2017, pp. 90-94) Another example for comparison can be the Booking service, where the customer can book accommodation from more than 800,000 hotels worldwide via the website. The service allows customers to search for hotels in one place, compare them, find out their occupancy or prices, thus making their work easier and saving time. Again, we can say that it is a matter of creating a certain customer culture that uses this platform.

We are of the opinion that the differentiation strategy will be applied more and more often in various areas, depending on the development of current trends. At a time when the customer can choose from a large number of products with similar properties, the task, respectively. the goal for each company is to bring a specific product that is partially different from the competition. According to Hollowell et al. such an approach can lead to building customer loyalty and loyalty to the brand (2019, pp. 13-18). The company can thus bring a product with added value for the customer (eg vegan products) or a product with a different use. However, the use of this form will become more and more demanding because the strategy of differentiation is not only about an innovative product, but also about the high loyalty of customers, who will become more and more demanding. Gajanova et al. (2020, pp. 1 - 18). With increasing customer loyalty, we can also see the growing strength of the brand. The connection is expressed by Chankoson and Thabhiranrak, who argue that the stability and strengthening of the brand is related to meeting customer requirements, which may ultimately reflect their level of loyalty (2019, pp. 129-138). Nadanyiova et. Also agrees with this opinion. al, which also considers the satisfaction of customer requirements to be an important factor. (2020, pp. 90 - 108) In view of these facts, its use in some already oversaturated market segments will be questionable. We see great potential in the use of a differentiation strategy in services, where individual providers can take advantage of the expansion of

information technology or cashless payments. It can also lead to the transfer of a certain part of the business to entities that are dedicated to the area and can do it more efficiently.

As the differentiation strategy is that the product differs from other competing products and is perceived as exceptional, there is a risk that the product will not be captured in the target market. Gregova et al. (2020, pp. 150-160). The risk may arise due to the excessive conservatism of the target market, which does not need a product that is different. To be successful in the market, a company must adapt its products to evolving market conditions. Insufficient innovation policies can result in the loss of customers to the detriment of competitors. Tuffnell et al. Also report on this factor, who consider it to be significant (2019, pp. 58-63). On the other hand, exaggerated innovation will disrupt the core of the product, leading to an outflow of customers.

In connection with the identification of the strategy, there are also threats that may adversely affect the company in the future. One of them is the pressure from investors. The company obtains funds for its growth from its investors. This form of financing allows start-ups to significantly accelerate their growth rate. Investors expect the invested funds to be valued as soon as possible and can therefore intervene intensively in the management of the company. They may also exert undue pressure on business management. However, the pressure to maximize profits can also have the opposite effect and put a start-up in trouble.

Conclusion

In the article, we analyzed the initial situation of a successful and stable UBER brand. Based on the analysis, we identified the main elements of the strategy, which are based on the differentiation from the classic taxi service and provided to the general public. These elements included price differentiation and method of payment, the method of providing the service and communication, services, the integration of ordinary drivers into the service and the safety and quality of the service provided. Elements focused on differentiation from the competition are characteristic of the differentiation strategy, which we theoretically discussed in the introductory part of the article. The contribution of our article was to find out what is the basis of the company's success with the use of the current marketing strategy. We found that the brand is based on the originality of a startup applied to the market at the right time, in the right place and offered to the right customers. Uber correctly identified market requirements, thus ensuring customer satisfaction by transforming their requirements into service specifications in the form of added value. The company offers a variable, affordable, secure and quality service that it can sell with the right choice and appropriately applicable marketing communication.

Abstract

The article deals with the problem of innovative development of the regional system with an emphasis on the study of the innovative potential of economic entities, assessment of their innovative component and further management using the optimal strategy of innovative development. Using the method of assessing the innovative potential based on the process approach, representatives of various industries and economic entities were interviewed on the example of the Voronezh Region, which is part of the Central Federal District. The resulting assessment made it possible to identify the innovative potential of each economic entity using the matrix of opportunities and track its dynamics over three years. Practical conclusions of the research of innovative potential allowed to identify its key components in the regional system of assessment of innovative potential, allowed to determine the criteria of innovative susceptibility of economic entities, and management perspectives allowed to algorithmize the process of developing an innovative development strategy. The proposed methodology for assessing the innovative potential of economic entities evaluates it from the position of two components: the index of economic and technological development and the index of ability to innovate, which allows a comprehensive approach to the study of activities and the optimal development of innovative development strategies. A comprehensive assessment of the innovation potential, which forms the right management impact, leads to an increase in innovation activity and an increase in the innovation potential of economic entities of the regional system.

Keywords: Innovative Potential, Regional System, Innovative Activity, Assessment Of Innovative Potential, Strategy Of Innovative Development.

Introduction

The modern world does not stand still, it is constantly evolving. Today, it is difficult for humanity to imagine its life without a telephone, computer, car, household appliances, namely, without innovations that have become familiar to us. Innovation is the main driving force behind economic and social development today. Innovative activity has led the world community to a new, higher stage of development. Innovation processes originate in individual branches of science, and end in the field of production, causing progressive changes in it. In our time, innovation is not a whim,

Cite this Article as: Yu.N. STEPANOVA, S.S. MORKOVINA , D.S. PETROV , A.V. IVANOVA and S.A. KUZNETSOV" The Innovative Potential of The Regional System: Research, Evaluation And Management" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

but a necessity for survival, competitiveness and continued prosperity. The need for innovative development of society is a new era of the new century, predetermining the modern development of the economy, which shifts the priorities of values from material goods to ideas. Implementation of innovative development is possible only if business entities have a new resource for growth - innovation potential.

In order to correctly assess the degree of influence of the innovative potential on the development of an economic entity in a regional cut, it must be studied, firstly, from the concept of essence (as a measure of the form of movement), and secondly, from the concept of composition (as a measure of the transition of matter from one form to another). Since 1980, the process of researching innovative potential was launched into scientific circulation by Christopher Freeman. From this point on, there are endless discussions about the components and approaches to the formation of innovative potential.

Freeman (1980), Zhits (1999), Chukhrai (2002), Ankh-Erdene (2014), investigated the innovative potential only from the standpoint of the resource approach, which allows assessing only the current situation of the development of the innovation process.This approach is not complete, since under different conditions resources can be used in different ways, and ultimately they do not serve as a guarantee of the same economic results, and therefore do not serve as a comparable characteristic of innovative development.

Porshnev (2009), Barancheev (2015) clarified the resource approach by proving that it is the presence of open and hidden resource opportunities that leads to the achievement of the ultimate goals of an economic entity. However, the authors named their approach to researching innovative potential as targeted. Here, the innovative potential is revealed through the analysis of the "output" of innovation and is a reflection of the final result of the implementation of existing opportunities (in the form of a new product obtained during the implementation of the innovation process). At the same time, this approach does not take into account the presence and balance (complexity) of the structure of the components of innovative potential and the sufficiency of the level of development of potential for the formation of innovative activity of an economic entity.

Drucker (1985), Lisin (2002), Titova (2010) attempted to comprehensively combine the totality of resources and the results of their practical use in order to implement innovative activities by an economic entity in the regional context. Thus, a resource-targeted approach has been formed, which makes it possible to assess not only the current state of the available resources, but also the effectiveness of their use.

The application of the above approaches led to the fact that in the classical literature two concepts of innovation potential were formed in the "narrow" and "wide" sense. Innovation potential in the "narrow sense" is a set of innovations, innovations confirmed by patents, licenses and other documents confirming the intellectual property right to innovations. In the “broad sense”, innovation potential is an organized set of interrelated conditions and resources (material, financial, personnel, information, intellectual and others) that ensure the production and reproduction of scientific, technical and technological innovations and the possibility of innovation.

In the context of the "broad sense" it is interesting to study the resource component of the innovative potential of economic entities of the regional system.

In order to clearly understand how to manage innovation potential, it is necessary to know how resources - a source of potential to be translated into the form of a result, what action needs to be taken, how to generate energy in order to launch a systemic innovation process. For these purposes, you need to use all the functionality of the resources: capabilities, abilities and readiness. Opportunity, as a function of resources, will reflect their stage of movement when they exist only in the form of prerequisites or trends, but act as the forthcoming. Ability, as a function of resources, will show the conditions for their successful application in innovation. Readiness, as a function of resources, will determine their state when everything has already been done in order to begin the process of creating innovations.

Accordingly, this article is aimed primarily at identifying the relationship of innovation potential with the stages of the life cycle of economic entities of the regional system. Firstly, to determine the strength characteristics of the innovative nursery, capable of creating new opportunities at the stage of the life cycle. Secondly, to assess the innovative potential of economic entities in order to identify their innovative susceptibility. Thirdly, we need to develop a strategy for the balanced and dynamic development of economic entities of the regional system in an innovative economy.

The rest of the article is organized as follows: Section 2 briefly discusses the determinants of growth that underlie innovation potential and analyzes the relevant literature, Section 3 presents a methodology for assessing innovation

potential, Section 4 analyzes our assessment results by methodology and their impact on the regional cut. Section 5 describes the results of our research. Finally, the last section provides concluding conclusions and further research proposals.

Theoretical, Informational, Empirical, and Methodological Grounds of the Research

It is well known that a fairly wide circle of scientists has studied the resource component of the innovation potential, which is the basis for its formation. Thus, using various theoretical and methodological approaches, these studies focused on a different set of factors for the growth of innovative potential, but did not trace the connection with the life cycle of an economic entity. In this paper, exploring the innovative potential, we consider growth factors, complementing their vector with a factor, and also highlight the connection with the life cycle of an economic entity of the regional system in order to form management impact in the form of an innovative development strategy. Kokurin (2001) characterizes material resources most fully, defining them as the material basis of innovation potential, containing a technical and technological base, which will subsequently influence the scale and pace of innovation activities of an economic entity of the regional system. The importance of material resources is that they are formed in industries that manufacture means of production, which, through the use of new technologies, lay in them potential opportunities that are realized or unrealized later. With the development of society and the intensification of the use of knowledge, the influence of the information resource on the innovation potential does not decrease, but, on the contrary, increases. Kalitich (2002) in his studies proved that this resource is not independent and in itself has only potential value, only by combining with other resources - experience, labor, qualifications, technology, technology, energy, raw materials; it appears in "kinetics" as the driving force of innovation potential. Nevertheless, an information resource (such its active forms as knowledge bases, models, algorithms, programs, projects, etc.), like an enzyme, transfer material factors from a latent state to an active one. This type of resources, unlike others, is practically inexhaustible. Financial resources are part of the innovative potential as an organic unity of available resources and unused opportunities for their alternative investment. Thus, they are characterized by a set of sources and reserves of financial capabilities that are available and can be used to achieve specific goals and objectives. The amount of financial resources reflects the financial strength, the ability of the system to participate in the creation of wealth and the provision of services. Dobrov (1999) argues that in addition to the providing function, financial resources also perform an insurance function, directly duplicating, and also measuring in monetary units material, information, intellectual resources that are part of the innovative potential. The importance of an intellectual resource in the formation of innovative potential can be reflected from three positions: economic, managerial and social. The economic aspect was considered by Smith (2007) in the doctrine of human capital. Mill (1980) wrote about the quantity and quality of human ability to work. Nelson and Winter (2002), argued that the evolutionary theory of economic growth is impossible without man. Schumpeter (1982) concluded that innovation processes are a factor in economic growth. Social aspects explored in their theories by Hayek (1965), Habermas (2002) and proved that the basis of the generator of the intellectual resource of people lies in the social interaction between them. Management aspects were reviewed by Mintzberg (2000), Prahalad and Hamel (2002) laying the foundations of the theory of strategic management. Thus, undoubtedly, the quality of intellectual resources and the degree of their involvement in social production directly affect the rate of economic growth. The dominant role of intellectual resources makes a person the main producer and consumer of innovations, that is, the process of developing new ideas is launched in conditions of a clear presentation of one's capabilities and desires, thus adaptation to new economic realities takes place. Intellect enables a person to generate new ideas from the moment they start and, with the help of new technologies, bring them to a finished product. Thus, the intellectual resource is, as it were, a vector resource for the remaining components of the innovative potential, allowing to reveal their additional capabilities and increase the effectiveness of their contribution at all stages. innovation production process. Proceeding from the fact that each phase of the life cycle of an economic entity has its own temporal characteristic, it is important to determine and assess the innovative potential at each stage using precise quantitative and qualitative criteria. Afonichkin and Ignatiev (2012) identified the relationship of potential with the life cycle through various growth trends and identified the following areas: development, uniform development, outstripping growth, stagnation and decline. Simonova (2013), considering this area, formed a mechanism to prevent the influence of negative factors on the development of crisis phenomena that lead to a loss of competitiveness of an economic entity. This made it possible to destroy ineffective and ineffective links within the economic entity, respectively, the innovative potential, passing through the crisis stages, contributes to the formation of new - effective links and in large quantities. Based on the foregoing, we note that an economic entity, being at the stage of formation, forming its goals and looking for like-minded people, already has a synergistic effect from the resource component of the innovative potential and here it is important to correctly assess the susceptibility of the components of the potential to further growth and development. At the stage of growth or development, the potential in the form of a force vector accumulates all available resources, including their hidden capabilities to achieve the set goals. The stage of maturity or growth stabilization is associated with the implementation of the existing potential, which is sufficient to maintain the present effective state of management. As a result, the period of slowdown in growth leads them to the stage of decline, as a contradiction between the initially available potential and the environment. There is a gap in the mechanism of formation of potential resources.

This particular section is devoted to answering the following question: "What is the trend in the development of innovative potential in Russia?" The answer to this question can be given by comparing the statistics. Analysis of reporting of international statistics developed by the International Business School INSEAD and the World Intellectual Property Organization (WIPO) expressed in the form The Global Innovation Index (GII), reflects the most complete set of indicators of innovative development in different countries of the world and indicates the following. In general, for the period 2013–2019. Russia has significantly increased its innovative potential against the background of the world level, improving its position in GII from 62nd to 46th place (+16 points in 7 years). Data presented for 129 countries and ranking by the level of innovative development/ The picture that we get in Figure 1 characterizes the GII index, which in its structure includes two sub-indices: the first is the resources of innovation, the second is the results of scientific, technical and innovative activities. According to the results of the report presented at the final conference in New Delhi in 2019, there was a steady improvement in the situation in the first sub-index, it gives an improvement (+11 points), but a worsening of the situation in terms of the impact of the second sub-index on the economy and society (-10). Among European countries, Russia ranks 31st out of 39 possible. According to the index of GDP per capita, 6th place.

Fig. 1: Global innovation index of Russia and its elemental components

It is clear that three positions stand out as Russia's GII advantages: human capital and science, the position is characterized by indicators of the scale of higher education and the presence of graduates of scientific and engineering specialties; the level of business development, the position is characterized by the indicators of workers employed in the field of knowledge-intensive services; the development of technologies and the knowledge economy, the position is characterized by indicators of the results of innovative activity: the number of patent applications for inventions and utility models, the quality of scientific publications.

Two positions are noted as a negative impact on the overall efficiency of innovation activity in Russia: legislative and legal, affecting the loan portfolio of microfinance institutions and transactions using venture capital, as well as infrastructure.

The following figure 2 shows the dynamics of Russia by Development Indices: GII, HDI, KEI, GCI, IQ in the period from 2012 to 2019.

Fig. 2: Russia's position on development indices: GII, HDI, KEI, GCI, IQ

The Human Development Index (HDI) is a combined indicator calculated annually by experts from the United Nations Development Program together with a group of independent international experts. In 2019, the index shows an increase of 6 points. In particular, there is an improvement in its structural components of indicators of the duration of education, life expectancy of the population and indicators of gross national income (GDP) per capita.

The Knowledge Economy Index (KEI), characterizes the level of innovative development, calculated according to the method of the World Bank. The index is an indicator of science and measures the achievements of a country in terms of the achieved level of education of its population in two main indicators: the adult literacy index (2/3 weight) and the index of the cumulative share of students receiving primary, secondary and higher education (1/3 weight) ... It is generally accepted that in developed countries the minimum indicator of the index should correspond to 0.8, with the level of education being the determining factor. The value of this index for Russia is 0.832, an increase of 22 points.

The Global Competitiveness Index (GCI) is calculated according to the World Economic Forum methodology, based on a combination of publicly available statistics. It characterizes the overall competitiveness of the country and the competitiveness of business (Business Competitiveness Index, BCI). At the end of 2019, Russia's position corresponds to 43rd place, an increase in the index compared to 2013 (+24 points).

At the end of 2019, Russia ranks 33rd in the (IQ) rating of countries and loses 5 points compared to 2012. The (IQ) index characterizes three indicators: the average IQ of the population, school performance and the number of Nobel laureates. Russia entered the top 25 countries by only one indicator - the presence of Nobel laureates.

It is obvious that Russia is moving in the right direction and only innovation, research and development can lead the country to potentially new economic realities. Yes, of course, today it is inferior to the leading countries, but it already has a certain experience of innovative development and potential in the form of human resources and science development, which is proved by international indices. Thus, the given vector of innovative development of the economy becomes predetermined for economic entities of the regional system, whose innovative potential should be developed, analyzed and evaluated, turning it into a systematic innovation activity.

All existing methodological and conceptual directions of researchers in assessing the innovative potential can be combined into three approaches: resource, resource-market, and cost.

The resource-based approach inherently reflects the assessment of the impact of production, technical, human, financial, resources on the innovative potential. Here, the assessment of the innovative potential consists in the sequential calculation of particular indicators and the general total indicator for each type of resource (Sidorova, 2018). Also, based on the express method, an assessment is carried out by resource groups: end-to-end and specific, the second is considered dominant (Belousov, 2017). The assessment of innovative potential using the index of only financial and economic indicators (Somenkova, 2017), or the effectiveness of the results of individual activity (RIA) (Kalachikhin, 2013) is one-sided as it covers only one area of activity. The complexity of the assessment is important here. If an economic entity has high innovative capabilities, but cannot disclose and apply them, the combined nature of the assessment (Terebova, 2017) makes it possible to identify reserves for increasing the efficiency of using

potential. But an assessment based on the calculation of a single integral indicator, including resource, performance and management components, cannot be adequately accurate, since a large number of criteria are concentrated in one indicator and weight is lost from significance.

The resource-market approach evaluates the resource impact of the innovative potential on the functioning of an economic entity in a market environment. Here, the assessment of innovative potential forms the basis for the mechanisms of strategic and innovative management (Kulabukhov, 2006). A comprehensive assessment methodology is based on calculating an integral indicator in two directions (Derevyankin, 2013) of the potential and efficiency of innovation activities. Assessment (Kagan, 2012), the readiness of an economic entity and its ability to innovate, is expressed in the form of successful commercialization, which leads to increasing competitiveness and increasing business value. The value approach assesses the innovation potential based on the economic value added of an economic entity, taking into account the factors that affect the determination of value growth (Yakovleva, 2018). This approach to assessing the innovative potential has not found mass application in practice. The methodology is based on the assumption that the innovative potential should reflect the capabilities of an economic entity in terms of resource provision and strengthening of competitive positions and ensure economic growth and development, reflecting the ability to obtain maximum results with minimal costs, that is, create additional value. The estimation algorithm consists in calculating a complex indicator using the distance method to compare the calculated indicators with the standard.

We believe that it is impossible to carry out a comprehensive assessment of the innovative potential in terms of achieving the goals of innovative development using the above proposed approaches. All these approaches do not consider the innovative potential, with a process component, since the estimates obtained are abstracted from the goals of innovative development and the indicators used are focused only on the resource approach. Our special direction of research is to consider the innovative potential, on the one hand, as a product, and on the other hand, as a component of the result of an activity, that is, as a process.

The methodology for assessing innovative potential is based on two subjective and objective approaches. An objective approach is associated with the perception of innovation as a result (product), where innovation is measured directly, it is the unit of analysis. The subjective approach of assessment characterizes innovation as an activity (process), and the unit of analysis here is innovation. We argue that the assessment should be based on resources. -product approach and rating method. The methodology of innovative potential should be based on an assessment of the degree of readiness of an economic entity of the regional system to introduce innovations. Our methodology will be expanded by calculating a complex indicator consisting of 2 partial assessments: characterizing economic and technological activity (Iet) and innovation susceptibility (Iir). The main tools of the assessment methodology are indices, criteria, indicators and the square matrix of innovation potential presented in Figure 3. The red "low" zone contains indices of innovation potential from 0 to 4 points. Yellow "middle" zone - from 5 to 7 points. Green "high" zone - from 8 to 10 points.

Fig. 3: Innovation potential matrix

Each index is decomposed into ten (10) criteria reflecting personnel, scientific and technical, production and technological and organizational and managerial potential, ability and willingness to innovate. The evaluation of the criteria in the composition of the indices is based on the determination of growth rates by comparing the corresponding value for the reporting year and the value for the year preceding the reporting year. Positive dynamics of the criterion is estimated at 1 point, negative or zero dynamics are estimated at 0 points. Thus, summing up the total number of points, the value of the indices (Iet) and (Iir) is determined. As an information base for analyzing the innovative potential of an economic entity, the data contained in the reporting under IFRS (Balance Sheet; Statement of Financial Results) and Rosstat data - "Information on the organization's innovative activities" are used. The positioning of the innovative potential of an economic entity according to the assessment results is presented in Table 1. Based on the assessment results, we understand the state of economic and technological activity and innovation susceptibility

Table 1: Positioning innovation potential based on evaluation indices

The value of the indices (Iet) / (Iir) in points	Identifier of innovative potential for innovation potential matrix
8-10 / 8-10	IP_1 - The absolute leader in innovation
8-10 / 5-7	IP_2 - Successful Traditionalist - Moderate Innovator
8-10 / 0-4	IP_3 - Successful Traditionalist - Modest Innovator
5-7 / 8-10	IP_4 - Moderate Traditionalist - Leader of Innovation
5-7 / 5-7	IP_5 - Moderate traditionalist - Moderate innovator
5-7 / 0-4	IP_6 - Moderate Traditionalist - Modest Innovator
0-4 / 8-10	IP_7 - The humble traditionalist is the innovation leader
0-4 / 5-7	IP_8 - Modest Traditionalist - Moderate Innovator
0-4 / 0-4	IP_9 - The humble traditionalist innovator

Results

Figure 4 summarizes the results of assessing the innovative potential of ten innovatively active economic entities of the regional system of the Voronezh region, which is part of the Central Federal District (CFD) of the Russian Federation. The research period was divided into three phases, lasting one year (2015/2016; 2016/2017; 2017/2018). It has been established that the innovation leader is FPC Cosmos-Oil-Gas LLC. The high level of development of innovation activity is evidenced by the line of movement of its innovative potential from the square "Moderate traditionalist - Moderate innovator (IP_5 - 5) (2015/2016) to the square "The absolute leader in innovation" (IP_1 -1) (2018/2019). The benchmark for the development of innovative activities - the green zone belongs to JSC NVP "Protek", whose innovative potential is identified as "Moderate traditionalist - Leader of innovations". In the group with an average level of resource endowment and susceptibility to innovation are LLC "BH" and LLC "BMK" - (IP_6 -6) (2018/2019), while in the red zone with a low level of resource endowment with unstable susceptibility the remaining six subjects are in innovation.

More than half of the subjects during the analyzed period increased their innovative potential, which corresponds to the positive dynamics of movement in the matrix. At the same time, 40% lost their innovative potential over the analyzed period. The results obtained are quite satisfactory and allow us to draw a number of conclusions.

Figure 5 shows the dynamics of the number of economic entities with a positive value of the criteria that form (Iet) and (Iir) and their changes. The growth of innovative potential is largely due to growth (Iet), primarily the growth of capital productivity and the turnover of current assets. Thus, 40% of the index criteria (Iet) have a positive trend in 60% of subjects.

Fig. 4: Development of the innovative potential of economic entities of the Voronezh region according to the matrix of opportunities

The contribution (Iir) to the formation and development of innovative potential is not high. Let's note the criteria: the level of specialized higher education of workers (Iir 3) - positive dynamics in terms of growth rate in 7 subjects; the share of personnel training costs in the total costs of technological innovation (Iir) 4 and the share of R&D costs performed in-house in the total costs (Iir) of 5-6 entities. A detailed analysis of the criteria for assessing innovative potential made it possible to establish that the most problematic area is the commercialization of innovations, characterized by such criteria as the share of costs for the production and sale of innovative products (goods, works, services) in the structure of total costs for the production and sale of products (goods, works, services) and the share of innovative products (goods, works, services) in the total volume of manufactured products (goods, works, services). A decrease in these criteria in dynamics predetermines a slowdown in the growth rate of innovative potential, to a greater extent than the rest of the analyzed criteria. The results obtained for 10 leading economic entities determined the cause-and-effect relationship between the state of their innovation potential and the level of innovation activity of the regional system. In confirmation of the data of our study, the Russian Regional Innovation Index (RIII) of the Voronezh Region at the end of 2019 is 0.409 and +3 points compared to 2018. Figure 6 shows the distribution of the five sub-indices of the forming RII. The subindex of socio-economic conditions for innovative activity (SEA) contains three groups of indicators: basic macroeconomic indicators; educational potential of the population; digitalization potential -13th place in the rating of 85 regions of the Russian Federation.

Fig 5. Criteria for the development of innovative potential in the composition of indices (Iet) and (Iir)

Fig 6. RRII subindices of the Voronezh region for 2019

Scientific and technical potential (STP) consists of indicators of funding for research and development; the provision of scientific personnel and the effectiveness of scientific research and development - 27th place. The lack of financial support for research and development at the level of large and medium-sized enterprises of the regional system is a factor limiting its scientific and technical potential. Evaluation of innovative activity (ID) is formed according to indicators of the volume of production of innovative products and its profitability - 18th place. Assessment of the quality of innovation policy (CIP) - 14th place.

Conclusions and Recommendations

As a result of the study, the innovation potential was considered as a set of private potentials, their interconnection and active influence on each other were proved. The technical and economic conditions and conditions for innovative susceptibility were determined, capable of bringing the innovative potential of an economic entity into action. In the course of the study, a universal methodology for assessing the innovative potential of economic entities of the regional system engaged in any type of activity, without industry reference, was presented. Thus, our results of assessing the innovative potential of economic entities of the regional system made it possible to identify indicators on the basis of which proposals for the development of innovative activities are formed, which are of a strategic nature. In general, our results have proved the importance of innovation potential as a resource component of the regional system. It is he who should determine the strategic vector of the formation and development of the mechanism for managing the regional system. As a recommendation, we note that the management impact should be formed in two directions. First, it is a process one, since this component of the innovation potential presupposes its constant maintenance at a competitive level, renewal and growth. The second, product (productive), as the component assesses the effectiveness and efficiency of its use by the subjects of innovation in the region.

As part of the strategy for managing innovative potential, it is necessary to develop a system of differentiated organizational and economic measures for the development of innovative activities of an economic entity in accordance with the status of its innovative potential, calculated using the matrix of opportunities, which will generally increase the strategic competitiveness of the regional system.

Abstract

Global contradictions and world economic crises heighten social inequality and population's distrust towards the existing authorities. Fascist ideology and technologies are used as means and tools for overcoming crisis situations. The purpose of the research is to study and analyse the factors and conditions for the rise of fascism in modern society. The authors have found that fascism has numerous country variations. Fascist trends are extremely active not only across the world, but also within individual civilizations. At the same time, the ideological connection between fascism and liberalism was detected. The new anti-fascist movement must not only combat fascism itself but also end the conditions that lead to the rise of fascism.

Keywords: Liberalism, Fascism, Modern Social Relations, Global Contradictions, Anti-Fascist Movement.

Introduction

Global contradictions and world economic crises heighten social inequality and population's distrust towards the existing authorities. The expansion of migration processes leads to an increase in national tension. Economic crises have changed for the worse the situation of the global middle class population. Global and internal problems, overlapping each other, significantly affect the consciousness of citizens, cause increased anxiety and economic insecurity, provoke massive aggressive sentiments, a negative attitude towards the ruling political elite and political institutions, sometimes taking radical forms. Fascist ideology and technologies are used as means and tools for overcoming crisis situations.

The economic and social spaces of European countries are fertile ground for fascist sentiments to grow. Historical and political analysis shows that the fascist ideology is in demand in societies affected by the ideological crisis, where population professes political nihilism.

Fascism is not a challenge, a splash in a particular era or culture. The challenges of fascism are fundamental and immanent in human history. After the collapse of the Soviet Union, the trends of fascism became more and more evident. In 1974, the world homicide rate was 2.85 per 100,000 people. At the same time, the trend was downward. The trend has changed upward since the early 1980s. By 1993, the homicide rate had risen to 3.85. In 2011, 6.9 homicides were recorded per 100,000 people (Bagdasaryan and Sulakshin, 2017).

RASPOPIN "Fascization Trends in Modern Society as A Response to Global Contradictions" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

Research Material and Methods

The study is based on the theoretical works on fascist ideology and practice of Russian and foreign scholars: A. Bauerkemper (2006), B.N. Bessonov (1995), S.G. Kara-Murza (2008), A. Fenner A. and E.D. Weitz (2004), St. Breuer (2005), A.J. Gregor (2006), etc.

The purpose of the research is to study and analyze the factors and conditions for the rise of fascism in modern society.

During the research process, there were used general scientific research methods: analysis, synthesis, comparison, analogy.

Research Results

History knows the names of great conquerors who dreamed of world domination: Alexander the Great, Genghis Khan, Tamerlane, etc. The desire for glory received various ideological justifications. In the ancient world, the ideas about the superiority of free men over slaves prevailed. In the Middle Ages, the concept of 'the chosen' was widespread. The development of capitalist relations has led to understand chosen people as the most successful in the competitive struggle. The existence of mankind began to be interpreted as a field of global competition. The one who managed to win rivals was considered successful. The fascist experience of the 20th century became a new form of the ideology of anthropological superiority.

In 1945, fascism was stopped. The existence of the USSR and a Soviet alternative based on the ideology of human equality made it possible. The idea of human equality pushed out the idea of superiority. Seven decades have passed. The USSR, bearer of an alternative ideology had collapsed, and fascism started to rise again.

Fascism is an ideology of organization of a state and social relations based on the right of superiority (Bagdasaryan and Sulakshin, 2017) and the right of violence (Bauerkemper. 2006) over other people (Bagdasaryan and Sulakshin, 2017).

A fundamental mistake is to identify the phenomenon of fascism with communism. Today this point of view is becoming dominant in the world political science discourse (Luks, 2008) (Hayek, 2005). As a result, the accusations against fascism are transferred to communism (Laqueur, 1991).

However, analysis shows that communism and fascism are at opposite poles of the ideological classification. Communism – fundamental equality, liberalism – equal rights, fascism – anthropological inequality. Communism – a man as a social being, liberalism – a man as an individual, fascism – a man as a 'wolf', a superman. Communism – solidarity, liberalism – competition, fascism – war. Communism – collective property, liberalism – private property, fascism – corporate property. Communism – internationalism, liberalism – bourgeois nationalism, fascism – racism. Communism – labor income, liberalism – surplus product (profit), fascism – direct exploitation. Communism – freedom from exploitation, liberalism – freedom from social burdens, fascism – freedom as a supremacy the free over the unfree. Communism – world brotherhood, liberalism – world market, fascism – world domination. Communism – integrity, liberalism – morality, fascism – morality of power. Communism – responsibility for the weak, liberalism – the strong overcomes the weak, fascism –repression of the weak.

Thus, liberalism is obviously closer to fascism than communism, while there is no ideological connection between communism and fascism. In other words, the USSR is quite confidently the opposite of Nazi Germany. It is no coincidence that with the collapse of the USSR, fascism began to come back again.

In 1929, the world was hit by an unprecedented economic crisis. The status of majority population has deteriorated. The situation in Europe was exacerbated by an influx of immigrants and refugees. The migration flows were caused by the collapse of the former traditional empires: the Russian Empire, the Ottoman Empire and the Austro-Hungarian Empire. There were many Jews among the refugees and migrants. In the wake of the economic and social downturn, the Europeans' hatred of strangers was rising. Of all xenophobic movements, anti-Semitism came to the fore, and fascist and Nazi parties swept to power.

Today the scenario has been repeated. The financial and economic crisis has an extremely negative impact on the majority European population. The aftermath of revolutions across the Middle East is a massive resettlement of migrants and refugees to Europe. A series of terrorist attacks perpetrated by migrants from the Middle East is generating xenophobia. Anti-Semitism of the 1930s is replaced by Islamophobia. The popularity of far-right parties has been rising. They push out the parties of the political center incapable to respond to new challenges.

As fascism of the 1920s-1940s, there is a huge amount of research. Fascism existed not only in Germany and Italy, as is traditionally believed. Many countries turned out to be fascist to one degree or another. Here are just some examples.

Austria. Engelbert Dollfuss, chancellor of Austria, built a model of the state based on Mussolini's fascist Italy. The monopoly political position in the country belonged to the fascist party 'The Fatherland Front' (Pauley, 1981).

Albania. The fascist regime in Albania was established after occupation in 1939 by Italy and led to wide-spread fascism in society. The fascist state in Albania was attached to Fascist Italy. The Albanian Fascist Party held power in the state.

The United Kingdom. Fascism in the mid-1930s had a prospect of success in Britain. The British Union of Fascists was founded in 1932 by the English aristocrat Oswald Mosley. Two years later, the organization was renamed the British Union of Fascists and National Socialists, reflecting the intention to unite the ideas of Mussolini and Hitler. Dozens of branches of the British Union of Fascists were opened throughout the country. With the outbreak of war in 1940 the British Union of Fascists was banned by Winston Churchill (Benewick, 1972) (Cross, 1961).

Fascist parties existed in Greece, Denmark, Ireland, Spain, the Netherlands, Latvia, Lithuania, Poland, Norway, Romania, etc.

Currently, three forms of fascism can be distinguished.

Postmodern Fascism. Neoliberalism today has a strong fascist nature. It affirms the hard power of a minority. For the sake of the power of a minority, a majority must be suppressed at national and global levels. Legalizing same-sex marriage in the US became a fundamental milestone in the fascism of neoliberalism.

Clerical Fascism. Today clerical fascism mostly has an Islamic face.

Classical Fascism. The Islamisation of Europe and terrorist attacks have become a catalyst for Neo-Nazism. This form of fascism is based on the growing migrant phobia of the European population.

The modern world is a system with a center and a periphery. The disparity between living standards in the center and the periphery is constantly growing. The center systematically conducts military operations in peripheral countries, and as the experience of recent years shows, the quality of life in the periphery is falling. It proves that violence-based traditional for fascism policy still exists.

One of the conditions for fascism is a rise of xenophobia. At the same time, the mass media act as a tool for managing xenophobia. Nowadays, the management capabilities of the media mass have grown up to the global level.

However, the largest media companies are mainly located in developed Western European countries and the US. It means the actual dominance of certain states in selecting and interpreting information.

The word-frequency analysis data show that the terms 'Muslims', 'Islam', 'migrants', 'migration' and 'the Russians' have become the words of high-frequency (Bagdasaryan and Sulakshin, 2017).

Thus, The New York Times used the word 'the Russians' 199 times in 2004, 212 times in 2008, and 472 times in 2014. As for the terms 'Muslims' and 'Islam', these terms were used 150 times in 2008, 184 times in 2010, 245 times in 2012, and 318 times in 2014. The words 'migrants' and 'migration' were used in the texts 35 times in 2008, 43 times in 2010, 55 times in 2012, and 84 times in 2014.

It demonstrates that the images of internal enemy (Muslim immigrants) and external enemy (the Russians) are the part of today's propaganda. The informational promotion of the topic of xenophobia is taking place again. Xenophobia has become a popular media topic again.

The rise of xenophobia inevitably leads to pogroms, war, and military escalation. Since the Western media actively point out 'a half-ring of hostile encirclement' for Europe ('hostile Muslims' are in the south and southeast, and 'hostile Russians are in the east), the United States appears to be the only partner for Europe in this situation.

Artificially created hostility determines two fundamental consequences for Europe: the expansion of the American military presence and Europe's economic dependence on the US economy (Minakova, 2018).

Nationalist ideology is on the rise in modern Ukraine. To spread nationalism there, the following tasks were solved:

1) destruct the previous civilizational identity; 2) compose the historical justification of a new nation; 3) cultivate the image of the enemy. Naturally, Russia was declared this enemy.

After the 2014 Coup in Ukraine, in which nationalist militants (Right Sector, football ultras) played one of the decisive roles, Nazification took on particularly radical manifestations.

The nationalist militants of The Right Sector movement and football ultras played one of the decisive roles in the 2014 Coup in Ukraine, after this the process of Nazification of public life became more radical.

In 2008, Stepan Bandera and Roman Shukhevych were listed among the 12 greatest Ukrainians. During the Great Patriotic War 1941-1945, the followers of Bandera brutally tortured more than 5 million civilians of the Western Ukraine, and more than 5 million Ukrainians were sent to Nazi Germany for forced labor, half of them did not return to Ukraine.

In 1943-1944, detachments of the Ukrainian Insurgent Army of Shukhevych exterminated over 100,000 Poles. And it is far from making the full list of their crimes committed during the Great Patriotic War.

Monuments to these Nazi criminals have been erected in modern Ukraine. At the same time, the memorials to Anti-Fascists have been demolished and desecrated. The West chooses not to pay any attention to modern Ukrainian nationalists; the obvious parallels with 1941 are ignored by Europe.

The main factor opposing the fascist scenario is the Russian idea. It is not an exaggeration to assert that the Russia civilization has anti-fascism nature (Berdyaev, 1946).

We dwell on the differences between fascism and the Russian idea.

Firstly, the difference in social equality, i.e. the issue of equality and human dignity. Fascism asserts the fundamental nature of human inequality. According to fascist ideology, inequality is not only social, but also anthropological phenomenon. The Russian idea, on the contrary, is based on the dream of the fundamental equality of mankind.

Secondly, the differences in the proposed models of inter-ethnic relations. Fascism is based on the idea of national superiority and the destruction of other nations. The Russian model, on the contrary, supports the protection of ethnic groups. It was developed a unique system of ethnic coexistence within the framework of the Russian model. The Russian history knows ethnic conflicts, but they are isolated incident.

Thirdly, the difference in understanding the interpersonal relations. For fascism, struggle is the basis of this relationship: in the 'struggle for existence' the strong survive, and the weak die out. Instead of struggle the Russian Idea proposes following the path of altruism and solidarity.

Fourthly, the difference in understanding the ultimate goals and the historical mission. The goal of fascism is world domination. The master-slave relationship is a key system for fascism. The Russian idea presupposes the salvation of the world from those who sought to dominate over it.

Finally, the difference in understanding the human nature. In fascism, a superman is an ideal person. For the Russian idea, a social individual (a brother) is a human being.

Thus, the fascist model is absolutely different from the Russian model, these two models are hostile.

Conclusion

As a part of the study, it was revealed the ideological connection between fascism and liberalism. The liberal principle of competition, and as a result dividing people into successful and unsuccessful was legitimized institutionally and ideologically by fascism.

Fascism has numerous country variations. Fascist trends are very active not only in the world, but also within individual civilizations. As in the era of Hitler and Mussolini, the development of a world anti-fascist movement is an urgent step for the global community. Currently, despite the widespread use of anti-fascist idea, there is no

genuine large-scale anti-fascist movement. To build it, it is necessary to focus on the positive and negative experience of anti-fascism in the 1930-1940s.

Despite the visible success of the anti-fascist policy in the post-war years, after a certain period of time, the fascist movements again attract supporters. The victory over fascism in 1945 delegitimized it, but did not eradicate the reasons that gave rise to their historical reproduction. Thus, the new anti-fascist movement must not only combat fascism itself, and also end the conditions that lead to the success of fascist ideology.

Abstract

The exponential growth of Artificial Intelligence applications in the last decade, led to a debate in the science, business, political and activist communities about the ethical implications such systems. The dispute about ethics in AI is not new, already 60 years ago in the birth hour of Artificial Intelligence, the discussion on unwanted moral and technical consequences of automation has begun (Samuel, 1960). In the last decade, research on ethical aspects of Artificial Intelligence has increased tremendously. With ethics as a vast domain on one side and Artificial Intelligence with its broad and growing complexity on the other, the factorization of these areas cannot be approached in the entire spectrum. In this article we would like to introduce a conceptual model of ethics assessment for Artificial Intelligence systems based on tabular data.

At first, we present and reevaluate a model of ethical dimensions after which we will analyze contextual differences and risk levels of Artificial Intelligence systems. Based on the context and the risk level we derive an ethical assessment to be applied at every stage of the development lifecycle of an Artificial Intelligent system based on tabular data.

Keywords: Ethical Artificial Intelligence, Development Lifecycle Artificial Intelligence, Ethical Assessment, Ethical Dimensions.

Introduction

More and more modern applications and software components make use of some form of Artificial Intelligence (AI), such as: Supervised Learning, Unsupervised Learning or Reinforcement Learning. Thus, we call such applications Artificial Intelligence systems. The most used technology to implement AI is some form of Machine Learning (ML), by implementing one of the various types of models, e.g., regression analysis, decision trees, support vector machines, deep neuronal networks, etc. The model used is highly dependent of the problem to be tackled. In Artificial Intelligence systems based on tabular data, where typically supervised or unsupervised learning is applied, problems are defined to belong to one of the four clusters depicted below, depending on the nature of the data, if discrete or continuous.

Independent of data and the model used, the machine learning algorithms employed in an Artificial Intelligence system all operate with a probabilistic outcome. The models used are often called *black-box systems*, due to the lack of transparency on how the outcomes are *produced*, based on a specific input.

While the design and production of AI based software is mostly dominated by data scientist, engineers, developers; the operation and the interaction with such systems is widely spread in the society, not seldom in high stake environments (e.g., health, financial, traffic, general business). Thus, the development of such systems is in need of ethical consideration when society and humans rely upon them to make decisions.

Fig. 1: AI problem areas depending on data type

In the recent years, many political and scientific bodies have published guidelines *for ethical Artificial Intelligence*. The European Commission published last year the *Ethics Guidelines for Trustworthy AI* (European Commisision, 2018) next to many other regulatory aspects as summarized by (Ion and Carutasu, 2020). In the United Kingdom, the government in partnership with the Alan Turing institute has produced "a guide for the responsible design and implementation of AI systems in the public sector" (Leslie, 2019). The United States of America government has published an *Artificial Intelligence Ethics Framework* (United States Intelligence Community, 2020) in June 2020, which has been already adopted by many US agencies. Also, many agencies, communities and non-government organization have published their own guidance. Just to name a few: the highly regarded Future of Life organization has published the so-called 23 Asilomar AI Principles (signed by 1677 AI/Robotics researchers and 3662 others, 2017), that are endorsed by hundreds of researchers in the field of AI and robotics. The OECD also adopted in May 2019 the recommendation of the council on Artificial Intelligence (Yeung, 2020).

Compiling an exhaustive list of all publications, legal materials and other mentions, would be beyond the scope of this paper, however a good overview on the global Artificial Intelligence ethics guidelines is given by Jobin et. al (Jobin, Ienca and Vayena, 2019). The authors claim after analyzing 84 documents that *"… further thematic analysis reveals significant semantic and conceptual divergences in both how the elven ethical principles are interpreted, and the specific recommendations or areas of concern derived from each …"*. Therefore, we claim the need for a conceptual model of ethical assessment that can be understood applied by engineers, data scientists, developers, program and product managers, testers, etc. that are directly involved in the planning, creation, development, deployment, and monitoring of Artificial Intelligence systems based on tabular data.

Guiding Ethical Principles

In prior work (Stefan and Carutasu, 2020), we have defined a framework for ethical dimensions in intelligent decision support systems based on Artificial Intelligence with an approach for ethical issue mitigation. The resulting six ethical dimensions are *(order is random)*:

Fairness,

Reliability & Safety,

Privacy & Security,

Inclusiveness,

Transparency,

Accountability.

In this paper we would like at first to analyze the ethical dimensions and extend and adjust the framework (if needed) based on the work done by Jobin et. al. (Jobin, Ienca and Vayena, 2019), considering this a more complete analysis of the recent published AI ethical guidelines. The ethical dimensions from Jobin are ordered based on the frequency of appearance in the number of documents analyzed, we keep this order in the comparison table below:

Table 1: Comparison of ethical dimension models

Ethical Dimensions based on	
Article from Jobin (Jobin, Ienca and Vayena, 2019)	**Initial model** (Stefan and Carutasu, 2020)
1. Transparency	1. Transparency
2. Justice and Fairness	2. Fairness
3. Non-Maleficence	3. Reliability and Safety
4. Responsibility	4. Accountability
5. Privacy	5. Privacy and Security
6. Beneficence	6. Inclusiveness
7. Freedom and autonomy	
8. Trust	
9. Sustainability	
10. Dignity	
11. Solidarity	

The comparison above confirms, that our initial model already captured the most relevant (by frequency of appearance in literature) six ethical dimension. Thus, we analyze the dimensions 7. – 11. from the table above in more details, considering the extension of our initial model.

Discussion on addition ethical dimensions

Freedom and autonomy refer on one hand to positive (granting) freedom, such as empowerment or freedom to withdraw consent, on the other hand the term refers to negative (inhibit) freedom, such as manipulation or surveillance. We believe that aspects of freedom, in the sense mentioned above, positive as well as negative, are covered especially throughout the dimensions of transparency, privacy and security, as well as others.

Trust we believe, is not necessarily an ethical dimension. Trust or Trustworthy we regard as a natural consequence of the ethical dimension model, where all six dimensions contribute, but most significantly the dimension of transparency. Having transparent systems, leads to understanding the system and only things understood humans can and will trust.

Sustainability, Dignity and Solidarity are rather values of humanity that shall be strongly considered in scenarios aiming towards Artificial General Intelligence (AGI), defined as the Artificial Intelligence on par with Human Intelligence. AGI is beyond the scope of this paper.

In conclusion, the initial six ethical dimensions are appropriate for an ethical assessment of an Artificial Intelligence System.

Applied ethics to AI

Applying an ethical framework to any *Artificial Intelligence* systems has many facets. In an attempt to prove towards stakeholders, authorities, auditors, users and beneficiaries of the system that an ethical framework was build-in and operates as desired, it is mandatory to aim towards explicability of the system, that in turn generates the necessary trust for acceptance. Also, we claim that ethical values should be always applied and build in with a contextual awareness.

Context Aware Ethical Framework

The importance of the ethical principles mentioned above is dependent on several factors as well as on the context in which the application shall be later used. An Artificial Intelligence based system used in the medical sector to diagnose human diseases is far more sensitive to ethics compared to a recommender system, used by an online shop to suggest additional products for purchase. An often-discussed bias of Artificial Intelligence systems is the so-

called gender bias. The gender bias can result from an inadequate but rationally correct data set. A typical and recent example was the Amazon AI recruiting tool that showed biased against womeni. The bias arose as the model was trained observing patterns on applicants over a period of 10 years back. Most came from men, a reflection of male dominance across the tech industry. While this example highlights best the gender bias and many have appealed for gender neutral Artificial Intelligence, we need to be aware and treat that matter context dependent. A counter example would be the system, mentioned above, used to diagnose human diseases. In such a context the gender property is a crucial factor, at least for some human diseases, that have a diverse incidence rate or may have different symptoms for female compared to male.

In conclusion, any ethical assessment needs to be applied within the constraints given by the context in which the Artificial Intelligence system will be used. In the following chapters we will discuss how to assess the context as a level of risk and the recommended ethical dimensions to be considered at every level.

Explainability of Artificial Intelligence Systems

The other influential factor to ethics in Artificial Intelligence systems is contained it the explainability of the system, the way it operates and how it produces the outcome. As mentioned in the introduction, many Artificial Intelligence systems nowadays are regarded as a “black-box”, which contributes negatively to the usage and trust of AI systems in the wide society.

Explaining and understanding how an Artificial Intelligent System operates, depends on the level of expertise available with the receiver. For example, a data scientist may understand the system in terms of which machine learning model was chosen for the system and how the data has been prepared and used for training. While on the other hand, an applicant for a loan at the bank would like to understand the particular outcome of his scoring, after this was processed by an Artificial Intelligence System.

A more complete research on explainability of interpretability of machine learning systems, where most Artificial Intelligence Systems are based on machine learning, is given by (Doshi-Velez and Kim, 2018). The authors claim that the below list is non-exhaustive, however it should suffice to highlight the various factors that contribute towards explainability of an Artificial Intelligence system:

Global vs. Local Interpretability – Global Interpretability implies understanding the system as whole, the data, the design and training of the model, etc. Typically, it requires a certain level of expertise in the field of machine learning. The local interpretability implies solely the reasoning for a particular outcome, which should not require any expertise.

Area, Severity of Incompleteness – Especial in very complex domains interpretability becomes a challenge. For example, looking at self-driving cars as the system of Artificial Intelligence, there is a large spectrum of interpretability

Time Constraints – It should not be neglected that any user can afford a limited time to understand the explanation. The time available varies depending on the context.

Nature of User Expertise – The level of expertise of the user affects all the other three factors mentioned above. It also affects the level of sophistication that can be part of the explanation.

Conceptual model of ethics assessment for Artificial Intelligence Systems

Assessment of context

The ethical assessment needs to start early in the planning phase of any Artificial Intelligence System. At first during the goal definition stage, the product owner needs to define the impact of the system to be build. According to Bostrom et. al. (Bostrom and Yudkowsky, 2014) it is widely agreed that current Artificial Intelligence Systems have no moral status. However, the Artificial Intelligence Systems must be designed considering the human moral status, which is roughly defined by two criteria:

Sentience: the capacity for phenomenal experience or qualia, such as the capacity to feel pain and suffer

Sapience: a set of capacities associated with higher intelligence, such as self- awareness and being a reason-responsive agent

Thus, at first the Artificial Intelligence System to be designed, needs to assess for the above. As an example, in the medical field an Artificial Intelligence System that helps diagnosing humans and implicitly recommends medical treatment, can cause extreme pain, suffer or even premature death if not operating correctly. In contrast, another Artificial Intelligence System optimizing advertisements to be placed on a specific website is highly unlikely to cause pain or suffer, neither physical nor morally to any human.

In a recent published withe paper on Artificial Intelligence (Commission, 2020) the European Union, suggest a binary distinction for a risk-based approach in AI applications. Among all Artificial Intelligence Systems, some should be considered high-risk AI application when two cumulative criteria are met:

- First the Artificial Intelligence system is employed in a specific sector, considered sensitive, such as: healthcare, transport, energy, and parts of public sector
- Second, the Artificial Intelligence system is used in such a manner that significant risks are likely to arise. The assessment of the level of risk of a given use could be based on the impact on the affected parties, where significant effects are produced.

While definitions of context in which an Artificial Intelligence System can be more or less risky, are still vaguely formulated in both, legislation and scientific literature, we recommend classification of context at four levels: high-risk, medium-risk, low-risk, no-risk.

Matching the level of risks ethical dimensions result in the following matrix representing mandatory and recommended dimensions to be considered:

Table 2 : Comparison of ethical dimension models

Level of risk: *Example:*	No risk *Ads optimizer*	Low risk *Product recommendations*	Medium risk *Loan application*	High risk *Human medical diagnosis*
Ethical dimensions:				
Transparency				
Fairness				
Reliability and Safety				
Accountability				
Privacy and Security				
Inclusiveness				

We expect in near future, a legislative format, that would classify Artificial Intelligence Systems more accurately in risk categories. Therefore, we recommend considering all ethical dimensions in every AI System. Beyond the legislation, a well implemented ethical assessment, increases the quality and the adoption of every Artificial Intelligence System, as it becomes more trustworthy.

Applied Ethics at every stage of the development lifecycle

While many, intentionally or not, associate the development of Artificial Intelligent systems based on tabular data, with traditional software development, in reality the development stages are significantly different. The abstract SDLC model can be applied to both, traditional software development and Artificial Intelligence systems, however the phases differ substantially. Most Artificial Intelligence implementations rely upon Machine Learning techniques, thus the specific term found in the literature is *Machine Learning Lifecycle (MDLC)* or *MLOps*. In his paper (Qian *et al.*, 2020) the author exemplifies five phases of ML lifecycle:

1. Specification
2. Design
3. Development
4. Deployment
5. Audit

Fig 2: Development stages defined by (Qian *et al.*, 2020)

Another way to look at modern, cloud-based Machine Learning lifecycle is described by (Hummer *et al.*, 2019). The author also compares the classical application lifecycle to AI Application lifecycle and highlights key differences in the table below.

Table 3: Comparison of Application Lifecycle Classical vs AI by (Hummer *et al.*, 2019)

Classical Application Lifecycle	AI Application Lifecycle
Requires dev / ops skills	Involves more diverse skill sets
Relatively short running	Long-running, resource intensive
Human speed (low change frequency)	Continuous (re-)training
Few versions of software artifacts	Huge number of models
Linear evolution of artifacts	Specialized models coexist
Configurations applied at runtime	Parameters tuned at training time
Codebase changes trigger new builds	Data/code changes trigger new builds (re-training)
Deterministic testing	Statistical/probabilistic testing
Monitoring of application performance and KPIs	Monitoring of model accuracy, drift, and KPIs

There are many other suggested frameworks in the literature. Also, the international enterprises, such as Microsoft, Google, IBM, etc. that do have solutions around machine learning and necessary tools, define their own frameworks, typically limited on the solution portfolio they offer.

Therefore, we would like to define a more generic framework for Artificial Intelligence systems, based on tabular data. The framework consists of four distinct stages:

1. Planning,
2. Data,
3. Model,
4. Deployment

Each stage is separated in several phases:

Table 4: Generic Development Lifecycle of an Artificial Intelligence System

Planning	Data	Model	Deployment
• Ideation • Scope • Requirements • Ownership	• Framing the problem • Data exploration • Data collection • Data preparation	• Choosing the model • Training the model • Testing the model • Optimizing the model	Deploy Application Monitor Performance Continuous Testing User Adoption

The ethical assessment needs to span all stages of development, and every role that participates in the creation and usage of the Artificial Intelligence System, needs to be aware of its own contribution towards the ethical framework and the assessment.

In *Table 5 : Ethical Dimension at every stage of the development* lifecycle we have grouped the ethical assessment for every stage of the development lifecycle of an Artificial intelligence system. Further we would like to detail the ethical dimensions at every stage of the development lifecycle. In doing so, we assume that the Planning stage is governed by the product owner, as well as sponsors and executives. The product owner is expected to oversee the whole lifecycle including the adoption of the Artificial Intelligence System by the users. In the *Data and Model stages* mostly Data Scientists and Data Engineers (sometimes also called Machine Learning engineers) are the roles

to work extensively on the system. Lastly, in the *Deployment stage*, data and infrastructure engineers make the system available to the end-users. In addition, application testers and user adoption experts should be involved at this stage.

Table 5 : Ethical Dimension at every stage of the development lifecycle

Ethical dimension vs Development lifecycle	Plan	Data	Model	Deploy
Transparency	Who are the users and the stakeholders of the Artificial Intelligences System and who needs to audit / understand the system? Plan for explainability towards any interested stakeholder, agency, operator, user or other third party	Data collection, preparation, mining, and other data operations, need to be documented and exposed to anybody (as defined in the planning phase)	Model selection should consider the transparency dimension, in a way that results can be interpreted by anybody (as defined in the planning phase). Implement global explainability wherever possible	Whenever possible add local explainability to every particular outcome. Available Frameworks: • LIME • SHAP
Fairness	Assess in the context of the AI System, the individuals and particular groups that may treated unequally (advantaged or disadvantaged)	Assess the data as well as how the model produces results based on: • Race • Sex • Gender identity • Ability status • Socio-economic status • Education level • Religion • Country of origin		Use available toolkits to assess fairness, such as: AIF360 (IBM) Microsoft
Reliability and Safety	Enforce documentation of sources of errors along the whole lifecycle. Ensure traceability and auditability of decisions performed by the system.	Dataset is representative and sufficient to produce predictable results.	Confusion Matrix (Precision and Recall) of the model should match the risk context highlighted in the section above	Third-party auditors and other agencies maybe interested in global explanations of the model, that can be achieved with tool like: GLMR or BRCG
Accountability	Who is responsible for the output of the system? How is the responsible party liable?	Who has authority over the data used? For personal data, is consent available?	Accountable entity needs to understand the performance of the model	Users of the system are informed about the accountability and responsibility of the system
Privacy and Security	Ensure data sources are protected. Ensure model cannot be attacked	Data sources must be protected at any time: at rest and during data manipulation. Consider also who has access to sensitive		Data sources and model should not be exposed.
Inclusiveness	Enable anyone use / interact with the system (people with disabilities, different cultures / languages, etc.) Ensure the system is well intended towards humans and societies	Is the data inclusive of minorities, other cultures, etc.?	Is the model trained for minorities, different cultures, etc.?	The system interface should be inclusive of everyone who is supposed to use the system.

Ethical Assessment by dimension at every development stage

In the planning stage all ethical dimensions need to be covered in depth. Some of the dimensions need contextual estimations while other should offer guidelines for stages to follow. Last but not least, the product owner, or an ethical expert if existent, needs to keep an overarching overview on the ethical considerations during all stages of development.

Transparency. This ethical dimension is one of the most relevant to generate trust and finally adoption for the users of the system. Transparency could be possibly also important for auditors or regulatory bodies, especially if the Artificial Intelligence System is classified as a high-risk application.

At the planning stage, in order to achieve transparency, the requirements need to include a degree of explainability or interpretability of the outcome produced by the system. This can be achievement with several toolkits, depending on the method targeted.

The data scientist, in the data stage of the development need to assess what data features will contribute significantly to the outcome and make all the knowledge available at the model stage.

When developing the model for an Artificial Intelligence system, one of the most important decision is the accuracy versus the interpretability of the model.

Fig. 3: Interpretability vs. Accuracy of Machine Learning Models[ii]

Last but not least, at the deployment stage explanations (typically local interpretability) need to be made available in relevant form for end-users of the Artificial Intelligence system.

Fairness. In recent years, the fairness and with that the elimination of bias has become a crucial element for any Artificial Intelligence System, especially those dealing with personal data and the classification of humans in categories, being it for loan application, CV pre-selection or medical diagnosis. Every Artificial Intelligence System needs a method of treating individuals and groups equally. Most biases that lead to unfairness, origin in the available data set (e.g. underrepresentation of a particular race or gender), or in biases after data manipulation. Another source of unfairness is the model itself, that might user correlation features that do not represent a causality. Ensuring fairness is probably a challenging task, however the following attributes should be avoided to the extend possible: *Race, Sex, Gender identity, Ability status, Socio-economic status, Education level, Religion,*

Country of origin.

At planning phase, depending on the context (e.g. medical diagnosis requires gender and probably also sometimes race for a correct diagnosis) the restriction on these features need to be part of the requirement for the developing team.

For the fairness ethical dimension, the data and model stages need to work hand in hand based on the requirements from planning and the context of the Artificial Intelligence system. All sensitive attributes mentioned above, should not be used as long as those are not mandatory due to the context. For this particular case, an explanation should be provided via the transparency dimensions.

At the deployment stage the fairness of the Artificial Intelligence system can be tested using several toolkits available. Those have risen in the last couple of years, becoming more complex, more specific and more powerful. Some of them are:

AI Fairness 360 - https://aif360.mybluemix.net/

Fairlearn - https://fairlearn.github.io/

Reliability and Safety. This ethical dimension requires a great performance in accuracy of the model. It also connects back to the explainablity of the model, the so-called global explanation, which is explaining results on the model implementation, in contrast to local explanation that would provide reason for a specific outcome. The degree of explainability for a particular model is highly dependent on the model selection. Typically, the more performant a model, the less explainable how it delivers results.

At the planning stage the product owner, together with other stakeholders or even with an ethical committee if available, should not leave this task solely to the data scientist as it needs to be considered already in the planning phase.

At the data stage, the data scientists need to make sure that the dataset is representative and sufficient to produce predictable results.

For the model, it is of crucial importance that the model does not produce erroneous results, thus a special attention should be given to the confusion matrix, including the precision and recall. Naturally, all that in the context of the Artificial Intelligence system.

At the deploy stage, attention should be paid not only to end-users but also to third-party auditors that might need to assess the system for reliability and safety. Thus we suggest to use models for globlal explainability such as:

Skater - https://github.com/oracle/Skater, or

ELI5 - https://github.com/TeamHG-Memex/eli5

Accountability. Probably the single ethical dimension that does not necessarily require a technical implementation. Nevertheless, it requires the product owner to define accountability of the Artificial Intelligence system. In common business scenarios, the accountability towards third-parties is with the company developing the system. In some scenarios, where multiple parties contribute towards a single system, accountability can become challenging and needs to be agreed (possibly contractually) early on. For example, an AI company may develop an Artificial Intelligence system (the model), based on a dataset (data) provided by a supplier, after which the system gets licensed to the final beneficiary company (deploy) that uses it with its end-customer. When an end-customer files a complain that he/she was treated unfairly by the system, who takes responsibility. The unfair treatment can happen because of the original data, the model or the deployment. Who is accountable? This example should highlight how important this aspect is, however, in most cases it can be treated similar to traditional software development.

At plan stage, the product owner together with all other stakeholders, need to ensure which entity is responsible for the output of the Artificial Intelligence System and implicitly how is the responsible party liable.

At data stage, scientists should also be aware about the dataset used. It should be also documented who was authority over the data, and especially when personal data is used, consent for the usage of data need to be available.

For the model stage, it is relevant to provide information towards the stakeholders on how the model will operate, in such a manner that responsibility and liability can be adjusted.

At the deploy stage, end-users of the system need to be made aware about who has accountability and how is this party liable.

Privacy and Security. This particular ethical dimension is to be treated similarly to privacy and security in traditional software, especially when privacy is concerned with having the user consent to use data or protection of data towards externals. However, there is a major difference in Artificial Intelligence Systems, as the data scientist and engineers need to have full access to data during the data and model stage. Access to data sources at rest and during manipulation of data needs to be strictly regulated and governed.

During the plan stage, product owners need to ensure that data sources are protected and that the models are not only protected but also robust to manipulation. For data privacy and security, existent models, such as privacy-by-design (Cavoukian, 2009) can be used. Model robustness in Artificial Intelligence systems based on tabular data does not require the complexity of such used in image classification.

At data and model stage, data scientist and data engineers are required to protect the datasets at rest and during manipulation. An important consideration is also who has access to sensitive data, such as medical records.

Inclusiveness. Everyone using the system should be able to interact with it and draw the same level of benefits from it. The system should be designed in a way that it is beneficent to any human, despite culture, race, disabilities, etc. Often the inclusiveness is misunderstood as limited to the interface. For example, early facial recognition systems

had difficulties to be used by other races than Caucasians. Therefore, inclusiveness needs to be addressed at every stage of development.

At plan stage, the product owner should assess inclusiveness based on the people who are planned to interact with the system. Especially those Artificial Intelligence systems that are meant for the wide society (consumer) this dimension need to cover, all races, all cultures, people with disabilities, etc.

For and inclusive system, the dataset needs to be inclusive and representative of all features that the Artificial Intelligence system needs to cover later.

Also, the model, needs to be trained on all the features that include minorities, different cultures and other relevant features.

For the deployment, a special attention should be given to the user interface, which needs to made available to everyone who is supposed to use the system, including minorities, people with disabilities, different cultures and languages.

Conclusion

In this paper we have presented a complete ethical assessment for Artificial Intelligence systems based on tabular data. Initially we have analyzed a minimum set of ethical dimensions that need to be considered, comparing our initial research work with other models published. We have argued why the six dimensions of the ethical model suffice to ethically assess an Artificial Intelligence system.

We claim that any ethical assessment needs to be performed in a contextual aware framework, that allows for risk level assessment first. Once the risk level is defined within the context ethical dimensions can be evaluated and applied at every stage of the development lifecycle.

In building Ethical Artificial Intelligence systems, all six ethical dimensions must be applied for every of the four stages at the development lifecycle. This method creates a robust assessment that is presented in this paper as a conceptual model, that needs further refinement and detailing in respect to the context in which the system will be used. However, the above ethical assessment and recommendations build a solid ground to design, develop and deploy Artificial Intelligence systems that fulfil the ethical standards based on current guidelines published and research literature available.

Ethics of Artificial Intelligence systems is currently in rapid and continuous development, that brings the ethics more and more into the field of engineering. This overarching discipline area is expected to grow towards an interdisciplinary field of research, to adapt ethics for the distinct types of Artificial Intelligence implementations across many application domains.

If you can't explain it simply, you don't understand it well enough. — Albert Einstein

Abstract

The article reveals topical issues of improving the taxation of e-commerce entities in the global economic crisis caused by the spread of corona virus infection COVID-19. The purpose of the article is to study the current state of e-commerce in Ukraine and identify possible ways of improving taxation of activity subjects in the situation of deepening corona crisis. The article is based on general scientific methods of cognition: abstract-logical, dialectical and system analysis, induction and deduction, analogy and extrapolation, as well as logical generalization. E-commerce is a promising activity that has been showing steady growth for many years. The ability to do business online allows many businesses to adapt to new business conditions, including quarantine restrictions imposed by the spread of corona virus COVID-19. E-commerce is one of the types of economic activity, which is developing and at the same time it is also a reliable source of budget, despite the crisis. However, the economic crisis has faced with businesses in this area, so these ones need state support. The potential of e-commerce is significant. It allows its subjects to reorient its activity depending on the needs of the business environment. We should take into account this feature when we develop measures to support this area and provide conditions for its sustainable growth. The proposed measures will increase the number of online stores, turnover from operations in this area and sales of goods via the Internet, the number of taxpayers and tax revenues to the state budget, as well as reduce the amount of concealment of income from transactions.

Keywords: E-Commerce, COVID-19, Corona Crisis, Business Entities, Taxation.

Introduction

Considering extraterritorial nature of e-commerce operations, as well as the global scale of corona crisis, many business participants have been negatively affected by pandemics and quarantines. In most cases, the risks are associated with the lack of payments under the agreements, the refusal of customers to purchase planned goods (works, services), the difficulty of establishing the supply of physical goods.

According to the Global Innovation Index 2019, in recent years Ukraine is on the list of countries with per capita income below the average and in 2019 it had second place among the 26 countries included in the sample by this criterion (out of 130 countries covered research) [3]). After all, according to experts of the International Monetary Fund, countries with low per capita incomes and developing countries will be with the highest risk zone during the current crisis [6].

During recent years, there has been seen a steady growth of the e-commerce market in Ukraine and in the world. However, the outbreak of the COVID-19 corona virus pandemic has caused a global economic crisis. And it has also affected e-commerce activities.

For most countries of the world, the problem of choosing the mechanism of e-commerce taxation to ensure the filling of the state budget is relevant. Taking into attention fact that each country has different tax regimes, respectively, and tax rates, entrepreneurs have the opportunity to produce, exchange and place their goods and services based on their value in different parts of the world (usually in more attractive tax jurisdictions) [11]. Sometimes this is contrary to the interests of the state where the entrepreneur is registered as a taxpayer and, as a result, that causes tax competition.

Therefore, in the current situation, support for e-commerce at the state level is crucial. In the absence of effective measures, supporting the domestic segment of e-commerce and the IT industry may cause increasing of shadowing of this area and outflow of highly qualified professionals abroad. This will negatively affect the filling of the state budget.

In our work, we will focus on highlighting the current state of e-commerce in Ukraine and identifying possible ways of improving taxation of the subjects of this activity in the situation of corona crisis deepening.

The Main Part

Today, e-commerce taxation issues are being discussed and tried to be properly addressed by statesmen, politicians and scientists, as the World Wide Web is perceived as a kind of interstate and international information environment. Thanking this network, completely new markets have been formed and are dynamically developing, forming an independent segment of the world economy [16]. The latest includes e-commerce, so the authors believe that improving the mechanism of tax regulation of e-commerce with maximum consideration of its specific features is an important scientific task.

The formation of the idea of e-commerce, its subjects, ways and methods of its implementation was influenced by the works of such famous scientists as A. Summer, D. Strauss, W. Tanzi, E. Winston, W. Dick, G. Duncan, W. Zwass, I. Evod, R. Kalakota, D. Kozie. Problems of e-commerce pay attention in their scientific publications A. Koren [7; 8], A. Nellen [10], M. Papis-Almansa [11], E. Redih [13], L. Tymchenko, P. Melnyk, L. Tarangul [14], G. Yurchuk [16] and others. However, the issue of improving the taxation of e-commerce and supporting its subjects in the context of the corona crisis requires additional study. This is due to the fact that doing business on the Internet and excessive tax burden in most countries, including Ukraine, encourages its subjects to apply schemes to minimize tax liabilities, as well as to transfer economic activity to countries with a favorable tax climate.

At the beginning of 2020, before the outbreak of the pandemic, e-commerce in Ukraine accounted about 4% of the total retail market. According to the results of 2019 in Ukraine, the volume of the e-commerce market amounted more than 97 billion UAH, among them physical goods and services were sold worth more than 76 billion UAH, which is 17% more than in 2018. According to experts, in 2020 it is expected to increase volumes of purchasing and selling goods on the Internet up to over 87 billion UAH (or 15%). It is worth noting that globally, e-commerce market in 2019 amounted more than 3.3 trillion US dollars, which is 531 billion US dollars more than in 2018. According to market analysts, in 2020 sales are expected to exceed to 3.8 trillion USA dollars [12].

Of all the e-commerce sectors in Ukraine, the most common type is B2C – Business-to-Consumer, which is represented mainly by online stores and marketplaces, where goods are sold to the final consumer. The level of trust in making purchases on the Internet has strengthened and every third Internet user buys goods online [6]. With the

outbreak of the pandemic and the introduction of quarantine measures, a significant number of consumers switched to buying goods (works, services) online. Therefore, e-commerce, unlike other areas of economic activity, was able to balance and survive in a crisis, but with some losses.

The government has taken a number of urgent measures to support domestic businesses, including a partial easing of fiscal pressures (through the introduction of tax breaks and tax exemptions for supply of goods where it is necessary to implement pandemic measures, a moratorium on tax audits). etc. [2]. However, taking into account that it is difficult to estimate the magnitude of businesses and state losses due to the corona crisis, experts emphasize the need for government support for business at least for the coming years.

According to the analysis of the works of L. Tymchenko, P. Melnyk, L. Taranguland others (2008), the introduction of new taxes as an additional source of filling the budget, in particular taxes in the field of e-commerce, is quite justified.

However, this can lead to the manifestation of not only stimulating but also disincentive function of taxes [8]. An effective push for the development of e-commerce at the initial stage may be the introduction of a moratorium on the introduction of new taxes for several years (following the example of the United States), as well as non-interference of the state in the face of relevant regulatory authorities. However, it does not preclude the introduction of special tax regimes or tax benefits for businesses in the field of commerce to stimulate activity and increase tax revenues to the state budget.

The most acceptable direction for the implementation of transformations in the field of e-commerce taxation may be making some amendments to the legislation of Ukraine, taking into account foreign experience and recommendations of international organizations. This conclusion coincides with the position of the Organization for Economic Co-operation and Development, which in its document "E-Commerce: Framework for Taxation" (OECD, 1998) determines that the basic principles of taxation applied to traditional trade should be guided by e-commerce taxation. Of course, we should take into account these principles when the improvement of its taxation is carried out. However, e-commerce is a specific activity, so it requires the development of special measures with maximum consideration of its features.

Research Methodology

In the process of the research it was established that the modern system of taxation of e-commerce entities in Ukraine is based on the application to them of generally established norms and rules of taxation (Fig. 1).

However, the mechanism of taxation of e-commerce entities does not take into account a number of specific features of this type of activity, which encourages businesses to hide a significant amount of financial resources and reduce the tax base. In modern tax legislation, there are not enough effective methods of tax control, which allow to identify e-commerce entities that underestimate the amount of actual income [2]. M. Papis-Almansa (2019) notes that in practice it is difficult to ensure effective control of e-commerce, because most transactions of purchase (sale) are carried out on the Internet, and each batch of goods is almost impossible to verify [11].

In order to alleviate the negative impact of the pandemic crisis, as well as to find ways to expand the tax base and de-shadow business in the field of e-commerce, it is advisable to consider tax breaks (cancellation or deferral of VAT payments until the end of 2020), preferential lending and state support for the financing of the IT industry (in particular, through government procurement for the development and provision of digital services). An effective means of support may be the introduction of tax holidays for newly created e-commerce entities (for 2 years), which will stimulate new work place creation and , will help reduce the number of unemployed in the country. As a result, in the future it will have a positive impact on filling the state budget.

It will be essential to consider measures to intensify activities in the field of e-commerce and its taxation more carefully.

A reduction of VAT rate on certain activities in the field of IT technologies, which are currently the most popular (for example, the development of software for online services (online education, on-line medicine, on-line employment, etc.)) may be a significant reduction in the impact of the crisis on e-commerce entities. State support may be an increasing (up to 50%) share of advance payments for e-commerce entities involved in ensuring the supply of goods (works, services) for state needs for the period of overcoming consequences of a pandemic.

Fig. 1: The main elements of taxation the system of e-commerce entities

The development and implementation of an online system of early bankruptcy prevention (such system is successfully used in the European Union) can be a resisting way of the shadowing of e-commerce and other areas of activity.

In the future, the best option for e-commerce taxation in Ukraine could be using of alternative tax systems. The essence of this approach is to form a methodology for calculating tax base, namely the introduction of fixed indicators that will allow tax authorities to control e-commerce entities, tax revenues, and which activities will lead to filling the state budget [8].

Alternative taxes in the world are applied to those activities where there is a significant turnover of funds that are difficult to control and tax. In particular, in such countries as Turkey, Tunisia, Morocco, they are used instead of VAT on small businesses, and in Pakistan they are used instead of excise tax [1]. The application of alternative taxes prevents the relocation of significant turnovers to the shadow segment of the economy. Taking into account the specific features of e-commerce and the tendency of its subjects to conceal or underestimate the tax base, and other violations of tax legislation, this experience can be really relevant for Ukraine.

One of the alternative forms is the income tax. This tax is applied to the taxation not of the actually received income, but of the estimated (conditional) one. That means, when using this approach, the average possible (or

projected) income is taxed. Using of such tax provides assignment of each payer to a particular type of activity for whom the average rate of return is set separately. Considering Ukrainian realities, such approach is promising.

The creation of a special regime may lead to the fact that the provided tax benefits will be used as a mechanism of minimizing tax liabilities. However, the Internet itself is a driving force for the economies in many countries; therefore, the provision of such benefits can be seen as a preference from the state for rapidly developing e-commerce.

On the other hand, the introduction of new taxes for the taxation of e-commerce entities will be irrational and burdensome, as reforming the current tax system in Ukraine is aimed at reducing the number of taxes and fees. However, domestic tax legislation contains the concept of a single tax, which allows not essential changes and additions to the Tax Code of Ukraine. This will take into account the specific features of the research area, namely the development of indicators of basic profitability and fixed physical indicators of its entities. Considering the virtual nature of e-commerce, the application of this approach will verify the correctness of the calculation of the tax base of business entities; minimize their opportunities in terms of understatement of the tax base. As a result this will attract more participants having been taxed.

In addition, it will contribute to: 1) expanding the tax base, in particular, by reducing tax evasion in this area; 2) reduction of administrative costs in the implementation of control and verification measures; 3) taxation fairness. After all, such approach does not create incentives for understatement of income by economic entities but promotes taxation of income, which in other conditions may be escaped from taxation [2].

State tax policy and practical aspects of e-commerce taxation should exist as symbiotic areas and should be considered analogically. After all, improving the mechanism of e-commerce taxation is impossible without a proper understanding of the necessary methodological framework, and the last one may lead to the impossibility of implementing innovations in practice.

Results of the Research

Nowadays the Tax Code of Ukraine does not define the physical fixed indicators of business entities in the field of e-commerce and the amount of basic income that they have. But the peculiarities of the domestic tax system will allow creating an effective tool for modern taxation of such entities on the basis of the above mentioned approach. This approach has two important advantages: 1) minimal costs of tax control; 2) the impossibility of distorting the tax base by the taxpayer.

It is useful to adapt the studied approach to Ukrainian realities by introducing a special tax regime for e-commerce entities on the basis of a simplified taxation system, namely, assigning these entities to a separate (additional) group of single taxpayers with annual income with transition period: 2021 - 10 million UAH; 2022 – 15 million UAH; 2023 – UAH 20 million UAH. On the one hand, the introduction of an additional group of taxpayers in the Tax Code of Ukraine will ensure the legalization and reduction of the shadow segment of e-commerce, and, on the other hand, it will not require significant financial costs to improve taxation.

According to the proposed approach, the subject of taxation is a business entity that receives income from business activities on the Internet. Respectively, the object of taxation is the established income received by a legal entity or individual from the sale of goods (works, services) through using of information and communication systems. And at the same time, the tax base is the amount of the established income.

Therefore, it is proposed to apply a special tax regime with the following variables for payers of the additional group of the single tax, in particular, business entities in the field of e-commerce. The single tax base (TB) is proposed to be calculated as the difference between the amount of basic income, expenses and social tax benefit by the formula (1):

$$TB = I_B - Ex - B_{soc}\ , \qquad (1)$$

I_B – basic income adjusted for inflation per taxable entity; Ex – expenses; B_{soc} – social tax benefit.

I_B can be calculated by the following formula (2):

$$I_B = \frac{I}{1 + I_{Ac} - I_B}\ , \qquad (2)$$

where I is estimated fixed income, that is an income in value terms per one taxable entity; I_{Ac} is the actual inflation index; I_B is an index of inflation laid down in the budget.

Reducing basic income, in the case when actual inflation exceeds budget forecast, will allow the entrepreneur to compensate for the losses from this by reducing tax base. That is, using of formula (2) is aimed at supporting the entrepreneur, not the budget, but, paradoxically, in the future it will strengthen the country's economy.

Expenses (Ex) are calculated by applying two coefficients K_I and $K_{e\text{-}com}$ to the amount of received basic income I_B by the formula (3):

$$Ex = I_B \times K_I \times K_{e\text{-}com}, \quad (3)$$

K_I is reducing the basic income ratio ($K_I = 0{,}8$);
$K_{e\text{-}com}$ is corrective preferential coefficient of basic income of e-commerce, which is determined by the peculiarities of economic activity of e-commerce product groups and takes into account traditional goods trade (works, services) (remote trade) and digital goods trade (works, services).

The social tax benefit (STB) is calculated as following: the monthly social tax benefit is 100% of the minimum salary on January 1st of the reporting period (on January 1st, 2020 it was 4,723 UAH). If the minimum wage does not change during the year, the STB = 4 723 × 12 UAH, and if it changes, the social tax benefit will be calculated by the formula (4):

$$B_{soc} = \sum_{th}^{n} S_{th} \times n_{th}, \quad (4)$$

S_{th} is the minimum salary for n_{th} months.

It is proposed to apply a transition period for the single tax rates for a separate group of taxpayers, in particular, business entities in the field of e-commerce: 2021 - 20%; 2022 - 18%; 2023 - 15%. On the one hand, the proposed reduction of the single tax rate to 15% of the potential income of e-commerce entities will reduce the level of tax evasion and reduce the shadow segment of the economy; on the other hand, it will ensure the economic efficiency of this tax. After all, excessive tax pressure encourages businesses to look for gaps in tax legislation and use various schemes of tax evasion, reduce or stop business activity [2].

The single social contribution is calculated on the same tax base as the single tax for single tax rates for a separate group of taxpayers.

Basing on research by Russian scientists L. Frolova (2009) and A. Koren (2007; 2011), it can be argued that the analysis of e-commerce indicators is quite difficult because there are problems with collecting data on the enterprises' activities, their income, quantity and type of products etc. This is often due to the fact that e-commerce is a relatively new activity and is used by most companies as an additional way to market or promote products. The latest ones do not carry out separate accounting of transactions occurring on the Internet, which makes it difficult to obtain reliable data.

In general, the application of the proposed measures to support e-commerce in the context of the economic crisis will contribute to the further development of this area, increase the number of online stores in Ukraine, turnover from operations in this area and sales of goods via the Internet, increase the number of taxpayers and tax revenues to the state budget, as well as reduce the amount of concealment of transactions' income.

Conclusion

During recent years there can be seen a steady growth of the e-commerce market in Ukraine and in the world. However, the outbreak of the COVID-19 corona virus pandemic has caused a global economic crisis. And it has also affected e-commerce businesses.

In the context of the above mentioned the formation of an effective system of e-commerce taxation, which would take into account the specific features of economic activity on the Internet, is one of the urgent issues closely related to increasing revenues to the state budget and Ukrainian development. The developed measures should be aimed at filling the state budget, because the socio-economic situation of the country's citizens depends on the timely tax payments. Introduction of tax holidays, preferential crediting of the industry, increasing (up to 50%) share of advance payments for e-commerce entities involved in the supply of goods (works, services) for the state,

government orders for the supply of goods (works, services) by entities e-commerce, in particular the IT industry for the period of overcoming the effects of the pandemic, will be a stimulus for work place creation, and thus contribute to reducing the number of unemployed in Ukraine, which in turn will have a positive impact on filling the state budget.

In the case of stabilization of the crisis related to the COVID-19 pandemic, it is worth considering the possibility of introducing an alternative tax system for e-commerce entities, which, according to the analysis of the scientific literature, are successfully applied to those activities where there are significant turnover difficult to control and tax.

Abstract

Current trends in regional analyzes require highly demanding mathematical and statistical calculations. This fact is due to significant amount of data and classification of economic systems as „soft systems“. Due to the fact that in these systems there are a number of factors, the structure of which is not precisely defined, the data are vague and incomplete, it is necessary to look for more effective analytical tools. At present, the characteristic feature of regional analyzes is the prediction of sustainability (sustainable region, sustainable processes). One of the dominant sectors influencing sustainability is tourism, which significantly affects the values of economic, social or environmental factors. These effects are due to increased movements of subjects in space and the subsequent action of subjects in preferred destinations. Transfers to these destinations are conditioned by the values of the significance criteria, autonomous entities choose the destination according to preferences, i.e. the entities try to maximize the values of their preferences, especially the quality of life. (Xu, et al., 2020; McGrath, 2020). Grouping of subjects in destinations leads to a change of environment. Changes in the values of preference factors may occur. Autonomous entities will define new criteria for maximizing the values of their preferences, therefore it can be assumed that there will be a change in the significance of destinations and the transfer of entities to other destinations. As a progressive tool for mapping infrastructure and finding local extremes, which quantify the requirements of entities and serve to identify the movement of autonomous entities, at present, characterized by a high degree of use of ICT (Industry 4), artificial intelligence and autonomous systems based on a multiagent environment appear. According to (Reis, 2020), artificial intelligence (AI) is at the heart of academic and public debate and an important progressive tool. The authors conducted an extensive literature search and examined the impact of AI on European Union (EU) policy. Multiagent approaches to the analysis of sustainable development are presented, for example, by studies (Pons-Pons, et al., 2012), the authors present a georeferenced agent-based model.

Keywords: Tourism, Artificial intelligence, Multiagent systems

Introduction

Within socio-economic structures, the individual is confronted with a set of factors on the basis of which he decides in his behavior. The goal of an individual's behavior is usually to change his location with respect to the values of preferred socio-economic variables, such as job availability, safety, air quality etc. On the contrary, the individual's position in the environment will affect the values of socio-economic variables. The change of location is performed by the individual by changing the position along the selected trajectory, while from the point of view of the time horizon between the change of location it is possible to choose trajectory along physical infrastructure (roads, regional borders etc.) or virtual infrastructure (minimum distances, region significance, etc.). In the case of virtual infrastructure, different criteria are placed on the availability of trajectory points than in the case of physical infrastructure. Virtual infrastructure expresses connections between elements of infrastructure independent of the physical interconnection of elements, such as the inclination of municipalities to the superior state unit (for example using the European classification NUTS or LAU nomenclature), change of position is related to a longer time horizon.

The behavior of individuals in this environment is the behavior of autonomous systems that make decisions based on the environment in which they are (state of the environment), relationships with the environment and environmental parameters (state of the environment) depending on the states in which autonomous individuals are located (state of autonomous system). The state of the environment and the state of the environment can be affected

by the state of other autonomous elements. As part of meeting the needs of entities, there is a regrouping of entities in elements using different infrastructures, which again changes the values of socio-economic factors. These findings are confirmed in almost 10 years of research (Aksay et al., 2020ú where bird flows are investigated using AI based on spatial distribution and environmental needs. From the above, it is possible to specify the basic requirements for creating a model for monitoring and predicting the behavior of autonomous systems on a selected infrastructure.

For example, a study (Olsavszky, et al., 2020) states that standard time series analyzes cannot be performed for analyzes at NUTS2 level due to the complexity of basic techniques and is a machine learning method for these complex data regional analyzes. It is obvious that it is necessary to define the infrastructure as an independent environment that uses selected factors to modify its structure and parameters, used by autonomous systems. This can be achieved by defining infrastructure elements, without defining links. Links in the environment are variables that are defined as a pair of neighboring nodes based on belonging to a selected factor, in other words a combination of factors, respectively. In this case, autonomous systems can be implemented using multi-agent systems, where the set of agent states, the set of available stimuli, the set of available actions that the agent can perform, but also the set of system states and the system environment are decisive for the agent's behavior.

The use of significant regional information better reveals an identifiable area of the image and contributes to the recognition of human behavior (Tan, 2020). The priority action of an agent is to move around the selected infrastructure in the direction of a positive change in the value of a certain factor in order to maximize profits depending on the competition of other agents and the current state of the system. Maximization of the profit from the selected factor is indicated by the trajectory to the local or global extreme of the quantity. This section should follow keywords. This section should provide background of the study and highlight research motivation.

Methodology

For processing a similar type of task, it can be further assumed that there is a large set of subjects who have target behavior dependent on states, environment and stimuli, and there is an environment of these subjects in which they are embedded and which also change their state. For this type simulations can be used. Simulation is used in cases where accurate mathematical quantification of reality is very difficult, or is almost impossible or even excluded. Creating models and simulating the operation of modeled systems are a basic approach to the analysis of multiagent systems. The monitored system is examined by means of a model, its reactions to input stimuli are determined and an analysis of its behavior is performed. The simulation is used as a tool in regional analyzes of sustainable environment by a large number of authors, for example, the study (Jia, et al., 2018) uses simulation for analyzes of spatial and temporal changes in land use based on conventional natural and socio-economic indicators.

The combination of simulation, modeling and multi-agent approach can effectively predict flows, which is confirmed by a study (Han, Huang, 2020), in which the authors literally state that existing methods of predicting traffic flows cannot fully reflect the real-time situation, therefore in this study based on in-depth learning. A simulation is an imitation of an objective reality, state, or process. Simulation generally means displaying selected key features or monitoring the behavior of selected systems, in order to analyze knowledge about their operation, in other words to optimize performance or maximize profits. In a given objective reality, only a certain part of the reality formed by a bounded system (infrastructure of the state, region, etc.) is essential, which will enable the defined system to be simplified and appropriately represented.

The model, which is an abstraction of the system or reality, can then be described using available, distinguishable elements and connections, or elements and states. In the analytical phase, a discrete system is assumed, the number of autonomous objects is integer, also the values of attributes of infrastructure elements change stepwise (if they are described by a continuous function, the values on the time discrete axis are identified). In the case of the movement of autonomous systems on the selected infrastructure, the defined problem is the identification and reachability of the extreme in the infrastructure by the autonomous individual (optimization of the profit from the selected quantity for the subject).

The problem is defined as finding a path on a selected infrastructure with a non-decreasing value of the selected attribute on the next infrastructure node. The simulation model must include infrastructure generation and quantification using data series, determination of logic for the behavior of the subject when passing through the infrastructure and in competition with other entities. Back-validation of the simulation can be performed on historical macroeconomic data. Changes in the simulated system can be expressed by a change in the state of the autonomous entity (including a change in position), a change in infrastructure parameters (a change in an attribute or an attribute value) in a time series. Timed passes are performed sequentially, yet multiple events and agents can

be identified at the same time. However, there is a problem of synchronization and ensuring the correct sequence of events.

Due to the complexity of macroeconomic simulations, samples of available objective realities (scenarios) are generated for the model, it is not possible to enumerate all possible states. If a model is to be created and to simulate system based on agents, especially a multiagent system, it is necessary to use the agent as an element of the modeled system. However, this may conflict with the definition of the environment as a system in which autonomous elements move independently. Therefore, it is appropriate to distinguish between the subsystem of autonomously moving entities, that is, elements that change their internal state and performing actions according to their own decisions, aimed at meeting one of the objectives and the environment subsystem, as data carriers for autonomous elements.

Agent theory

A an agent can be defined as an entity designed to continuously and autonomously fulfill goals in an environment that affects the conditions leading to the fulfillment of goals and causing the agent to change from the current to the target state. Thus, the agent is determined by the environment in which he operates, as well as by the mission and the resulting target behavior, to meet the goals he can have a certain amount of intelligence that is used to solve problems. Multiagent systems (MAS) are those systems where more than one agent moves in the environment, they can be described as a group of discrete, loosely interconnected autonomous systems (agents) that cooperate or compete to achieve a common goal. Multiagent issues are related to social behavior, such as the ability to form groups based on common interests. The MAS is therefore characterized by the cooperation of agents, conditioned by mutual interactivity, based on mutual communication. It is necessary to define and create means for this communication. The agent can be more generally understood as a hardware or software system that is autonomous, social, reactive, proactive, while autonomy we understand the ability of the agent to work without human intervention, the ability to control his reactions and communication and modify the internal state on this principle. Social adaptability is the ability of an agent to interact with other agents using a language designed to communicate with agents. The ability of social behavior is given by the ability of agents to form social bonds in order to achieve common goals, to maintain information about other agents and to form judgments about them, to form coalitions and teams from which they expect mutual benefit. A necessary condition is the ability to adjust the view of the surrounding world in the model, based on changing interrelationships. The agent also behaves rationally, which is action aimed at achieving his goals, not to disappoint. An agent works in a certain environment, an environment we call everything that an agent comes into contact with, including other agents.

A standard system approach applies to the definition and identification of an environment, so the environment can be fully or partially observable, depending on whether the agent can monitor and recognize its complete state. Furthermore, the environment can be static or dynamic, with the static environment changing only through the actions of the agent. A static environment can be understood as an environment with a fixed structure, even if the attributes of the elements of the structure change in the environment. The environment can be further understood from the point of view of states and actions, we distinguish between deterministic environments, resp. nondeterministic, while in a deterministic environment the state is given only by the previous state and the action performed. The environment in which the agent operates is given by the Agent system. The result of the agent's activity is the change of the agent system from the current to the target state, caused mainly by examining the system, searching for internal laws, gaining new knowledge and subsequent gradual transformation to the desired state.

An environment in which several agents operate is called a Multiagent system, it can be described as a group of loosely interconnected autonomous systems (agents) cooperating in order to achieve a common goal. The communicating agent can use strategies in the system that select actions from the action database and determine which action will be performed in response to the current state of the environment. It is obvious that the strategic approach is an extension of parallel processes with the possibility of choosing the dominant strategy, ie the strategy that is best for the agent, independently of the chosen strategies of other agents. In most cases, agents make decisions based on their knowledge. Then we talk about the so-called rational agent. A rational agent always chooses a dominant strategy. Thus, agents can influence each other's behavior within strategies, perform their actions in harmony with others, act against others, or be neutral and not interfere with the activities of others.

Tools for working with infrastructure

In the first phase, it is always necessary to determine the environment for the functioning and interaction of subjects. If a fixed infrastructure is defined in the system (eg roads in the road network, etc.), these "corridors" can be used for the movement of the subject. Depending on the level of differentiation, movement within the corridor

can also be understood as movement in the sub-infrastructure. To minimize the effects of system composition and decomposition, or changes in the resolution level of the system, it can be generalized that the infrastructure indicates the existence of a link of the appropriate type between two nodes, allowing movement between system elements. Binary incidence and relational matrices can be successfully used as a tool for indicating links in the system.

This shifts the recording of the environment system to two levels. In the first level, the selection of available elements of the environment is made, which will form the infrastructure nodes and which will set the basic resolution level. Nodes are recorded in a relational node-node matrix. The environment is further characterized by a set of factors belonging to individual nodes. The factor values are assigned to each node as a set of vectors. Based on the selected relevant factor, the relevant physical or virtual infrastructure is generated in the second level, due to the possible scope of the system, the infrastructure is unrated and can be recorded by a binary matrix. If the links between nodes are known at the level of individual factors, the relevant type of infrastructure is determined (existence of a road, existence of a railway, geographical proximity of municipalities, affiliation to a superior node or geographical location using GPS). The set of generated bonds is then stored in layers in incidence and relational matrices or by weight combinations for combinations of factors. Simple agents can be used to generate the infrastructure, with the logic {"does the current node have bindings?", "Does the number of bindings correspond to the required structure density", "is another node available?", "Does the new edge match the conditions", "was the edge already registered", "Edge enable", "edge rejection", "edge shift"}.

If the infrastructure created exists, a precedent-setting phase will occur. Precedence's are recorded in a binary precedence matrix and record the increase or decrease in the value of the relevant factor (or a combination of the values of several factors) in places with existing infrastructure of the relevant type. The values are compared in the immediately adjacent nodes (with the first precedent). The independence of the environment and agents makes it possible to calculate multiple precedence's based on the identified first precedents, enabling agents to "see around the corner", i.e. to identify the direction of increase of the value of the relevant factor between more distant nodes. There are agents in the environment who select the available infrastructure based on their priorities. The goal of the behavior is to move to a node with a higher value in the desired factor or combination of factors. These nodes can be local extremes, and agents begin to cluster in these extremes.

Based on clustering in nodes, it can happen that the agent is rejected by the node and moved to another node than the defined local extreme. In this way, the agents find and occupy even more distant extremes. At certain time intervals or at the initiative of the node (for example, after a certain number of rejected agents, etc.), new values of factors in the nodes are calculated, based on the demand of the agents and their interest in the node. Subsequently, based on the new values of factors, new precedents and regrouping of extremes will be calculated, which leads to a new movement of agents. Recalculations in nodes take place on the basis of the lucrativeness of socio-economic parameters, for example, with a high number of agents, the value of "safety" factors decreases or the value of the "labor availability" parameter increases, etc.

Theoretical design of agents' work

The standard search algorithms are designed to explore search spaces systematically. This systematicity is achieved by keeping one or more paths in memory and by recording which alternatives have been explored at each point along the path. When a goal is found, the path to that goal also constitutes a solution to the problem. In many problems, however, the path to the goal is irrelevant. When identifying critical points, the path to the destination does not matter, another class of algorithms can be considered that do not care about the paths at all.

Local search algorithms operate using a single current node (rather than multiple paths) and generally move only to neighbors of that node. Typically, the paths followed by the search are not retained. These local search algorithms are not systematic, however, are less demanding processing and usually identify acceptable solutions in large or infinite (continuous) state spaces, characteristic of the infrastructure. Local search algorithms explore analyzed landscape. A complete local search algorithm always finds a goal if one exists; an optimal algorithm always finds a global minimum/maximum.

The modified "hill-climbing" search algorithm (direction-ascent version) was used for search. It is a loop that continually moves in the direction of increasing value. It terminates when it reaches a "peak" where no neighbor has a higher value. The algorithm does not maintain a search tree, so the data structure for the current node need only record the state and the value of the objective function. Hill climbing does not look ahead beyond the immediate neighbors of the current state.
The modification of the algorithm is as follows. If there are multiple paths from a node, the path to the node that has precedence in the higher power matrix is selected. If there is a match for multiple nodes, the path leading from the

selected node to the node with the highest multiple precedence is selected. In case of a match, the selection is random.

Figure 1 shows the analyzed theoretical regional infrastructure. Graph nodes are regional entities that are characterized by the values of the factors on the basis of which agents increase their benefit (they maximize the benefit by searching for the entity with the highest value of the factor that is of interest to the agent). In the figure, the maximization factor values for nodes 2 and 5 are 100 and 120. It is clear that the benefit maximizing agent will try to reach node 5. To simplify the analysis, agents do not use absolute values when making decisions, but use ratio assessment (binary logic), where the agent proceeds through the individual nodes in the direction of increasing the value of the maximization factor. The increments are stored in a precedent matrix, where for a given row element the value "1" is stored in the column if the row element (node) has a lower value of the maximization factor than the column element. In Figure 1, the growth directions are indicated by the oriented edge.

Fig 1. Regional infrastructure as a network graph

The example shows that the agent is unable to recognize the global maximum and identifies local maxima as pseudoglobal maxima. In Figure 1, the agent would not distinguish the significance of nodes 2 and 5 and would not identify the exchange of maxima when swapping factor values (100 <-> 120). For better agent orientation, multiple precedents are calculated, (powers of the precedence matrix) identifying paths equal to the power of the respective precedence matrix. These matrices (Figure 2), when inserted into the agent's memory, allow the identification of reaching the global (or one of the pseudoglobal maxima) if it reaches any local maximum (the agent compares the path length to the reached local maximum and the pseudoglobal maximum).

The example shows the passage of an agent coming from node 15. In the case of a simulation, the autonomous agent will pass through the nodes in the order: node 15, node 14, node 11, node 5. Through this pass, the agent reaches the local maximum. The logic of the passes is shown in Figures 2 and 3. In the first step, the agent decides between the path to node 13 and 14. (Figure 2, single (first) precedence's matrix). In the first logic, the agent looks for a node to which there is a longer (arbitrary) path. There is a path of length "1" from node 15 (red bounded line) to both nodes, there is no longer path (dashed areas in all matrices do not contain the value "1"). Because the first logic did not determine the direction of motion, the agent follows the second logic. The agent searches for the longest path from nodes 13 and 14 (green bounded line). The higher value is in line 14, where there is precedence in the quadruple precedence's matrix. The agent therefore chooses a path to node 14. From node 14, the only path leads to node 11, the agent does not use logic.

Fig 2. The first logic of an agent in precedent matrices

At node 11, the agent decides between the path to node 5 and node 8 (Figure 3). The agent indicates that the longest path of length 3 (triple precedence matrix, figure 3) leads to node 5. A path of length 3 also leads to node 8, but is part of the path on which the agent is located. The agent chooses the path to node 5. There is no path from the node, the agent found a local maximum, if we take into account the reachability of local extremes, then he found a pseudo-global maximum.

Fig 3. The second logic of the agent in precedent matrices

Conclusion

The paper outlined the principles of possible creation of a multi-agent system, which would serve to simulate the behavior of the human population in real space with a variable infrastructure that provides various links in the system. From the point of view of system creation, it is a set of structures recorded using a universal tool, incidence and relational matrices. For the movement of agents across the infrastructure, the links between nodes are

transferred to sessions, the direction of growth of the analyzed variables in the system is determined based on the availability in the generated infrastructure. For work with an oriented system, a matrix apparatus is again used, incidence and relational matrices of precedence are used, so-called precedent matrices. A group of agents whose goal is to maximize profit based on a selected factor, resp. groups of factors. Agents that map (create) infrastructure can also be involved in the system to prefer areas of greater importance. The system is in the stage of theoretical design, in no case is it a final design and it cannot be ruled out that some of the mentioned procedures and proposals will not be feasible or are a "blind way".

Some authors (Malik, et al. 2020) see multiagent systems and artificial intelligence as powerful tools, which, however, need to be supplemented by other tools in the future, for example through Fuzzy logic. Despite the fact that environmental factors are important factors influencing the competitiveness of a destination and are positively linked to the economic performance of developed destinations, the link between environmental competitiveness and tourism growth in less developed destinations appears weak and insignificant adaptations (Zhu, et al. 2020). It is therefore necessary to prioritize the identification of essential infrastructure as an important parameter of the intensification of structural regional analyzes. Despite these facts, analyzes of sustainable tourism must also be based on scattered multilevel interactions and feedbacks, leading to organizational processes that improve the identity of entities, regions and competitiveness, in particular through effective multilevel coevolutionary adaptations (Zhu, et al. 2020) based primarily on determinants. intentions, experience, systemic approach and social responsibility.

The presented methods of identification of local extremes were used in the project as a starting point for identifying the creation of critically exposed places that may negatively affect the sustainability of the region and the sustainability of tourism. At present, it is a concept that significantly intensifies research procedures and which can be used to identify and simulate the negative and positive effects of entities involved in tourism in the region.

The multiagent approach based on binary precedent identification currently shows weaknesses, when in some cases it cannot identify real global extremes, it identifies pseudoglobal extremes based on global identification with respect to the environment. Previous studies have also shown that multiple precedents need to be interpreted in relation to local minima and to determine the longest paths to local maxima for these minima (length of the path already traversed). When identifying multiple precedents related to local maxima (length of the longest, still existing path from a selected location to available local maxima), it can lead to misinterpretation of autonomous movement conditions because it replaces the maximum benefit criterion for the criterion of the frequency of occurrence of the maximum benefit value.

Abstract

The article is a study of social potential in the context of digitalization of the economy and society and a consideration of its opportunities for development. The study establish that the economy digitalization is one of the most widely discussed aspects of the global socio-economic process, which has numerous, multifaceted and diverse manifestations. The fact, that the growth of digital technologies entails an exponential increase of quantitative and qualitative integration changes in the society communication system is noted. It is stated that American scientist N.

Negroponte proposed the term “digital economy” in 1995. The article clarifies that researchers identify five areas of digital technologies impact on economic activity and indicate their areas of implementation: the Internet of Things, Big Data, innovative 3D printers, the economy of sharing. It is stressed that the global trends of digitalization of national economic systems are the development of technologies for microelectromechanical systems (MEMS), cognitive robotics, computer-aided design (CAD), mechatronics, high-precision instruments, supersensitive sensors, signal preprocessing, cloud data, Internet. The article considers that the areas of digitalization of the economy impact on social potential are as follows: the labor market, online educational services, cybercrime and business. Digital technologies and products currently considered innovative trends in the modern socio-economic environment as the most promising for the development of social society potential are presented. The process of digitalization of goods and services production has not only technological advantages, such as a new industrialization on a digital basis, increasing the competitiveness of economic entities, etc. Despite the importance of digitalization of the national economy, public authorities should not forget that the main vector of its development is the socialization of the economy, its fulfillment, first, the social functions to ensure the welfare of households and the whole society through effective use of digital information technologies. That is why the development of various legal acts, that will implement digital technologies in public life and at the same time protect the rights of citizens, deserves special attention.

Keywords: Digitalization, Digital Economy, Society, Social Potential.

The topicality of the research problem

Currently, the digitalization of the economy is one of the most widely discussed aspects of the global socio-economic process, which has numerous, multifaceted and diverse manifestations. The base of it is the deep penetration of digital technologies, i.e. the use of hardware and software for the collection, processing and transmission of digital information in all areas of economic activity and social relations [8, p. 951]. Estimates of the economy digitalization phenomenon are ambiguous, but researchers agree that its study is essential and only scientific understanding can achieve a harmonious combination of technical and technological progress and socio-economic life. That is why the study of social potential of the economy and society digitalization is extremely relevant.

Analysis of recent studies and publications

The digital economy as a new socio-economic system based on a new technological opportunities is the subject of many works of futurists and philosophers. A significant number of works ensuing the specific goal to reveal the causes and repeat the success of companies that use new business models are devoted to this problem. Among the foreign authors dealing these problems are H. R. Varian (1992), T. Pearson (1994), A. Goldfarb (2013), S. M. Greenstein (2013), C. E. Tucker (1998), K. Schwab (2017) and others. A large amount of research is conducted under the auspices of international organizations (e.g., OECD), national research institutions of different countries and initiative groups (e.g., MIT Initiative on the Digital Economy, IDE). Ukrainian economists are also actively involved in creating the conceptual apparatus of the institutional palette of systems research in the digital economy. Among them are V. Groysman, V. Heitz, N. Heorhiadi, A. Hrytsenko, Y. Zaitseva, S. Kniaz, S. Kubiv, O. Moskalenko, R. Skrynkovskyy, T. Yefimenko, V. Yuzevych and others [1–28]. However, at the same time, a significant number of problems regarding the vision of the digital development of the economy and society concept remain insufficiently solved.

The aim of the study is to analyze the social potential in the context of digitalization of the economy and society and to identify opportunities for its development.

The object of the research is the social potential in the conditions of economy and society digitalization.

The subject of the research is the digitalization of the economy and society.

The principal material statement

Digitalization is, first, a procedural phenomenon. Today, the exponential growth of digital technologies entails an exponential growth in the quantity and quality of integration changes in the society communication system. The emergence of technical means such as the Internet and mobile devices allowed members of society to be in constant communication with each other is the first step in digitalization as well as a harbinger of global modifications of social institutions and the total vector of society development [16, p. 37].

The term “digital economy” was proposed in 1995 by American scientist N. Negroponte (1995) [17, p. 44], but, despite more than two decades of its widest popularity, the meaning of the concept remains indefinite.

The digital economy, also known as the Internet economy, the new economy, or the web economy, refers to the one that is mainly based on digital technologies include digital communications networks, computers, software, and other related information technologies. In other words, the term “digital economy” refers to the convergence of computing and communication technologies over the Internet and, therefore, to the flow of information and technologies that stimulate e-commerce and huge organizational changes [15, p. 138].

There are two approaches to the concept of “digital economy”. The first one interprets it as a set of industries focused on the production of electronic goods and services based on digital technologies. Examples are distance learning, creation and implementation of media content, etc. This approach considers, in fact, a new group of products produced based on a certain technology and designed to meet both existing and new needs, formed in a noteworthy as the realization of the opportunities provided by technology. The second approach considers the digital economy as a new format of the economic environment formed under the influence of scientific and technological progress in the field of digital technologies and realizes the opportunities provided by them in all areas of socio-economic activity [20].

The development of the digital economy in the broadest sense of the word extends to the following main areas:

- financial, where digital technologies cover a fairly high share of all financial services;
- production, where its main share falls on the high-tech sector;
- trade, where Internet commerce is currently not so common;
- social, for example, health care, education, provision of other social services [12, p. 9].

The global trends of digitalization of national economic systems are, first, the development of technologies for microelectromechanical systems (MEMS), cognitive robotics, computer-aided design (CAD), mechatronics, high-precision instruments, supersensitive sensors, pre-processing of signals, Internet and cloud data, etc. These technologies provide the digitalization embodiment of production processes [10, p. 68].

Researchers identify five areas of digital technologies impact on economic activity: 1) data collection and analysis; 2) personalization and setup; 3) experiments and continuous development; 4) innovation in contracts; 5) communications and communication tools.

Implementation realms of the above areas are:

1. Internet of Things. This concept of a physical objects computer network equipped with embedded technologies allow them to interact with each other and/or with the external environment, implies that the organization of such networks can restructure economic and social processes, eliminating the need for human participation in actions and operations, more advanced concept of the Internet of Everything. Internet of Everything is the integration of people, processes, data, and things into a network leads to the development of procedures to process the vast amounts of data generated by connected objects. The basis of the Comprehensive Internet is things, data, people, and processes.
2. Big Data. This is a socio-economic phenomenon associated with the emergence of technological capabilities for the analysis of huge data sets and the transformational consequences that follow from this. The defining characteristics of "big data" are represented by the 3 V formula; the components the formula are physical volume, velocity of growth and processing, and variety of structured and semi-structured data types.
3. Innovative 3D printers. These are devices for layer-by-layer creation of physical objects based on digital three-dimensional models, which use reduces the time and effort of creating and replicating many objects, but requires a wide range of new materials.
4. Sharing economy, where people and companies organize business through digital platforms [1, p. 91].

Under the influence of digital technologies, management mechanisms and market business models are changing, value-added models are being transformed, the importance of intermediary activity in the economy is decreasing, and the possibilities of an individual approach to the creation of goods and services are increasing. The transition to the intensive use of digital technologies can have far-reaching political implications for macroeconomics.

In developed and a number of developing countries, with a rapidly growing economy, the so-called “knowledge economy” is being formed as a new economic system, as well as a new market structure, in particular, the labor market.

The knowledge economy is characterized by the following features: accelerating the aging trend of highly educated population with a median age of forty-five years, tertiary education (share – 60%), the highest integrated indicator – the human development index, average GDP per capita – 52 thousand dollars, developed digital economy, almost full coverage of the Internet – 85% of the population [3, p. 1973].

According to the framework proposed by J. Rasmussen, there are three categories of people employed in the economy: "Skill", "Rule" and "Knowledge". The classification of these categories is based on the length of the training period required to perform the relevant tasks, as well as the nature and degree of autonomy of work. Examples of occupations that fall into the category of "Skills" are operators, salespeople, drivers, security guards, support workers. To perform the labor functions of the category "Rule" requires specialized, applied training, which is typical for locksmiths, accountants, nurses, office administrators. The category "Knowledge" includes such professions as: teachers, doctors, physicists, chemists, engineers, managers, scientists [6, p. 663].

In this regard, it is important to stimulate the emergence of new segments of the economy and the development of high-tech jobs, already created in our country (only 17% of jobs belonging to the category of "Knowledge"); they would focus on knowledge, which, in turn, will stimulate the demand for professionals who meet the latest requirements of digitalization:

- possession of cognitive skills (excellent memorization of information, good skills to find, process, and transform information, the ability to draw conclusions, model and build hypotheses, apply the knowledge in practice);
- possession of social and behavioral skills (ability to interact in a team on the base of positive communication, adequately respond to stressful situations managing the emotions and emotional state, to conduct adequate self-assessment and evaluation of others, the ability to solve problems);
- possession of digital skills, i.e. the development and application of digital intelligence based on digital citizenship, in particular, for the future development of digital entrepreneurship).

Despite many discussions both on foreign and domestic scientific and technological platforms, there is no commonly accepted vision of the labor market future. There is also no consensus on the key factors that will affect future jobs and wages. Currently, most scientists emphasize that the labor market is under the impact of the Fourth Industrial Revolution focus on technological developments in robotics, neuromorphic engineering, and the creation of artificial intelligence. Some experts view the future of materialized labor in five dimensions: the future of jobs; quality of jobs; increasing inequality in wages and incomes; formation of a "new" social protection system (for example, developed countries are already conducting experiments on the "introduction" into practice so-called "unconditional income"); conducting social dialogue in a system prone to the transformation of industrial relations [14].

The development of the digital economy has a great impact on the labor market: the structure of employment is changing, there are new requirements for professional competencies, and the demand for ICT professionals is growing. Citizens employed in almost all sectors of the economy must master digital skills in work with information using modern means of telecommunications and software [4, p. 52].

With the digitalization of economic relations, new specialties and professions are emerging. There is a rethinking of the very concept of "high qualification", as the criteria for skilled work in the traditional definition is the presence of higher or specialized education and the manifestation of professional experience, skills and abilities. Nevertheless, in a digital economy, the ability to permanent adaptation to acquire new knowledge, skills and abilities is of particular importance. At first glance, these trends do not carry any negative burden, if you ignore the specific feature of the fourth industrial revolution in the labor sphere. Its essence is that it does not create many jobs in new industries. For example, in the United States, only 0.5% of employees are busy in new industries that did not exist in the twentieth century. Moreover, about 47% of jobs in the United States may become automated in the next two decades, and as a result, the relevant professions will disappear [2, p. 10]. The labor market will have a tendency to increase polarization, the essence of which is that the intensification of employment will be inherent to highly profitable cognitive and creative professions, as well as low-income manual labor and its weakening for medium-income standard professions.

According to research The Future of Jobs, published by the World Economic Forum, by 2020 the world labor market will add 2 million jobs, but 7.1 million will disappear. Jobs will appear in the intellectual and high-tech spheres, and will reduced in the real sector of the economy and administrative work [19].

In addition, an "economy on demand" model of doing business will seriously affect the labor market; this model assumes that at any time anywhere in the world the consumer can get what he wants. This model is projected on the

labor sphere. As a result, there may be a proliferation of unregulated virtual labor, and the class of workers who earn from order to order and disenfranchised will increase.

Such changes in the labor market are at odds with the existing human resources and education system and raise questions: what to do with people who have not found a place in the digital economy, as they do not have creative potential, special social and communication skills, and cannot work in conditions of uncertainty and rapid change? At the same time, in some industries the situation is changing slowly (higher education, mining and processing industry, construction); others are faster (health, transport, consumer goods, public sector, engineering, energy), but some are very fast (banking, insurance, high technology, telecommunications, media, retail, sports and entertainment). Thus, there is a kind of "digital labor trap", which will result in the emergence of so-called "digital marginals" (the people who are unable for a number of reasons to adapt to digital social and working conditions) [13, p. 16].

New jobs are being created at least in the field of IT and robot maintenance. Their number is less than the number of potentially lost jobs due to the introduction of robots in all industries. However, today there are new areas of economic activity related to digital technology and mass dissemination of information. For example, photo and video blogging, which, in fact, is not direct, but the sale of individuality, the sale of information, which, according to Pierre Levi, is synonymous with "knowledge". Moreover, ubiquitous automation, increasing productivity, leads to cheaper goods. At the same time, the purchasing power of people who lost their jobs due to the introduction of robots and failed to retrain into IT specialist or video blogger will tend to zero. This means that the goods will simply remain unpurchased and the manufacturer will suffer losses. The consequences of this economic paradox can be observed today; in developed countries, the question of the providing and receiving unconditional basic income for some members of society arise more and more often.

Another important area of digital economy development, which covers a huge number of people, is widespread free online courses. However, for a long time, distance education was only a supplement to traditional university education. The organization of online training first helps those who received education without leaving work. Modern online courses have a number of fundamental differences. The main one is that online educational platforms are focused on students. Anyone who has access to the Internet can attend such courses. The second difference is that such an educational product is not limited by the services of university courses. The main idea of such projects is that anyone can learn any necessary skill [5, p. 76].

In the context of digitalization, cybercrime is actively developing, and it poses the most serious danger to the financial sector, as mobile devices and financial mobile applications have already become part of the remote banking infrastructure. The threat is posed by smart contracts in organizations and companies that do not interact directly with money (like banks), but are close by and through them large amounts can be accessed. Thus, despite all the advantages of digital technology in the financial sphere, the threats are quite high. For fraudulent purposes, a digital resource of cryptocurrency is used; it has the properties of transactions anonymity, uncontrollability of any regulators, the lack of any collateral, and the impossibility of canceling the transaction. With the help of cryptocurrency, usually, bitcoins, conduct illegal transactions, evade taxes, and launder money obtained by criminal means. Cryptocurrency can also be used to finance international terrorism [11].

The digital age is changing the approach to making business, as well as the requirements for information technology used: 1) marketing management systems, sales and service; 2) telephony and messengers; 3) document management and personnel management systems; 4) accounting systems and many other enterprise applications. Thus, digitalization closely penetrates into most spheres of public life. Digital technologies and products that are currently considered innovative trends in the modern socio-economic environment and are the most promising for the development of social potential of society are presented in Table 1.

Table 1: The most promising for the development of society social potential digital technologies and products

Digital Technology Type	Overview of Digital Technology
BioTech	The consumption of living organisms and biological processes in production, agriculture and medicine with the use of high technologies
RetailTech	Technologies developed by startup for use in trade. These technologies include: 3D body scanning, consumer tracking by AI-enabled assistants to help retailers and consumers
LegalTech	Digital technologies in the legal field of business, specializing in information technology services for professional legal activities, and since the late 2000s also in the provision of legal services to consumers using information technology

InsurTech	The field of the latest insurance technologies to give existing insurance products a digital form, as well as to change radically the product or the process of concluding a contract for its provision in order to improve the quality of customer service
GovTech	All IT products, solutions, developments, services that help to solve public sector problems
Digital marketing	Internet marketing has evolved into digital marketing with use of comprehensive methods of on-line strategy, website development and mobile applications, creative and copywriting, contextual advertising and SMM, as well as other interactive products. The most popular forms of digital channels are search promotion; contextual and teaser advertising; media and banner advertising; promotion on social media and blogs; creation of mobile applications for smartphones, tablets and other media; viral advertising
CRM&BPM	CRM is a sales system, ready-made processes for managing all types of transactions. Bpm'online CRM combines the capabilities of a customer relationship management (CRM) system and a business process management system (BPM).
Digital insurance	Digital insurance allows insurance companies to reduce costs, increase customer service speed, provide standardization and improve the responses and services quality, establish a close relationship between the insurance company and the customer. The use of cloud platforms reduces the likelihood of errors, and the process itself becomes open and allows you to track the status of claims settlement.
ePrescription	ePrescription (electronic prescription) is carried out on the basis of 3 procedures: eCapture provides formation of an electronic prescription by a doctor of a medical institution; eTransfer is a confidential transfer of an electronic prescription to a pharmacy; eDispensation means data transfer from the pharmacy back to the medical institution, confirmation.
TeleHealth	"Digital" technologies to provide remote medical services and support the work of doctors

Source: [7] improved by the authors based on [21–29]

Thus, we can identify the basic characteristics of the digital phase of society:

- a strong trend of steady and unhindered development of technologies and expansion of the constantly updated technological innovations. Moreover, the growth of computing capacity significantly exceeds the cognitive abilities of person;
- absence of geographically determined barriers to the dissemination of digital technologies and knowledge, increasing availability of information for all members of society;
- the tendency to "mobilize" and individualize the input and output devices of information transmission, which, in turn, leads to the blurring of boundaries between the biological nature of man and artificial technological products;
- the presumed unlimited amount of information transmitted through communication channels, which are constantly expanding;
- growing demand for subjectivity and constant reorganization of skills that are dominant in the economic relations of a digitalized society;
- evolution of social institutions and historically formed communication systems under the condition the corresponding institutional and technological base;
- the set of functional possibilities of human labor replacement by automated work that extensively replaces physical work of people with work of robots expands [9, p. 224]. Moreover, the first three industrial revolutions mechanized human labor, that is, facilitated human labor, but person still remained involved in the process of material production, the fourth industrial revolution displaces person from the realm of physical labor and fully automates it. Such automation in the end no longer facilitates human labor, but directly replaces human labor and may lead to negative socio-economic consequences in the future [18, p. 49].

Conclusions

The study [1–29] found that the digitalization of the economy is one of the most widely discussed aspects of the global socio-economic process, which has numerous, multifaceted and diverse manifestations. The growth of digital technologies entails an exponential increase in the number and quality of integration changes in the communication system in society. Researchers identify five areas of impact of digital technologies on economic activity and indicate their areas of implementation. The main directions of the economy digitalization impact on the social potential are the labor market, online educational services, cybercrime and business. Digital technologies and products are presented that are currently considered innovative trends in the modern socio-economic environment and are the most promising for the development of society social potential. The process of digitalization of goods and services production has not only technological advantages, such as a new industrialization on a digital basis, increasing the competitiveness of economic entities, etc. According to the author's opinion, despite the importance of digitalization of the national economy, public authorities should not forget that the main vector of its development is the socialization of the economy, its fulfillment, first, the social functions to ensure the welfare of households and the whole society through effective use of digital information technologies. That is why the development of various legal acts, that will implement digital technologies in public life and at the same time protect the rights of citizens, deserves special attention. Further research, in our opinion, should be aimed at studying the world experience of digitalization of socially significant spheres and the implementation of the best ideas in our country.

Abstract

The article presents the methodology of proceeding while designing a manipulator with 6 degrees of freedom. The main goal of the project was to produce as many elements as possible using a 3D printer and to ensure maximum load capacity of 0.5 kg in the position of the greatest tilt of its arms. In the project described above, a manipulator was made in which nearly 90% of the elements were obtained in 3D printing technology. A smartphone with dedicated software written in C ++ was used to provide communication of the robot with the user. The STM32 microcontroller was used as a source of communication and computational element in the robot. The designed manipulator is modelled on Autodesk Inventor 3D graphics software. The culmination of the work was the preparation of a physical model and verification of its correct functioning.

Keywords: Robot, Manipulator, 3D Printing, Mechanical Engineer.

Introduction

In order to illustrate the intensive development of robotization in the world (Dekle R., 2000) the data on the increase in the number of robots used in the industry on the Japanese market are presented and the economic effects of this development are presented.

There are more and more manipulators and robots in the world around us that are designed to make our lives easier by helping us with various tedious and dangerous physical and mental work. It has been noticed that the continuous development of this technology allows for new possibilities of using them in everyday life. Autonomous mobile robots (Karunarathne D.Morales Y.Kanda T. and Ishiguro H., 2017), (Morales Y. Kanda T. and Hagita N., 2014), (Ferrer G. Zulueta A.G. Cotarelo F.H. and Sanfeliu A., 2017), (Truong X.T. and Ngo T.D., 2017) are often used for this purpose, which allow, for example, to move luggage, guard buildings or give instructions. The item (Sekiguchi S. Yorozu A. Kuno K. Okada M. Watanabe Y. and Takahashi M., 2020) describes an innovative way of controlling such a robot, which follows a human without knowing their direction. Another group are humanoid robots created by inspiration from human abilities or appearance. A comprehensive literature review of these robots and the latest technological achievements are presented in (Kahraman C. Deveci M. Boltürk E. and Türk S., 2020). The item (Alontseva D.L. Ghassemieh E. Krasavin A.L. and Kadyroldina A.T., brak daty) describes an intelligent robot used in the implant treatment process. In this process, in addition to a number of important parameters, the most important are the distance of the plasma spray and the speed of the plasma stream. It would be impossible for humans to directly provide these parameters.

A wide range of robots are those which help to recover from various accidents by assisting in rehabilitation - the so-called rehabilitation manipulators (Chu C.Y. and Patterson R.M., 2018). The item (Wang D. Wang Y. Zi B. Cao Z. and Ding H., 2020) presents the development of a robot for rehabilitation of fingers using active and passive training. In (Hussain I. Salvietti G. Spagnoletti G. Malvezzi M. Cioncoloni D. Rossi S. nad Prattichizzo D., 2017), (Zhang L. Li J. Cui Y. Dong M. Fang B. and Zhang P., 2020), (Akdoğan E. Aktana M.E. Korua A.T. Arslana M.S. Atlıhana M. and Kuranb B., 2018), robots used for rehabilitation of upper limbs were described. In turn, items (Lewis C.L. and Ferris D.P., 2011), (Shi D. Zhang W. Zhang W. and Ding X., 2020), (Weiqun W. Zeng-Guang H.

Lina T. Feng Z. Yixiong Ch. and Min T., 2014), (Guzmána C.H. Blanco A. Brizuelac J.A. and Gómez F.A., brak daty) show examples of robots and ways of controlling them used for rehabilitation of lower limbs.

Thanks to the use of manipulators and robots, it is possible to perform activities in places that are difficult to access, dangerous or unfriendly to humans, e.g. exploration of oceans (Kadiyam J. nad Mohan S., 2019), (Vigneshwaran S. and Yuvaraj K., 2020) or space (Wanga X. Shib L. and Katupitiyaa J., 2020), (Jackson L. Saaj Ch.M. Seddaoui A. Whiting C. Eckersley S. and Hadfield S., 2020), (Xu R. Luo J. nad Wang M., 2020), (Wu Y. He M. Yu Z. Hua B. and Chen Z., 2020). The article (Zereika E. Bibuli M. Miškovic N. Ridaoc P. and Pascoal A., 2018) broadly presents the directions of development of marine robotics.

It should be noted that the interest in robots is greater than in manipulators, but the manipulator is to a certain extent the basis of the robot and therefore the focus has been placed on it in this work.

It has been decided to design and manufacture a manipulator with as many components as possible using 3D printing technology (Zeng L. Li P. Yao Y. Niu B. Niu S. and Xu B., 2020), (Balogun H.A. Sulaiman R. Marzouk S.S. Giwa A. and Hasan S.W., 2019).

3D printing is an additional method of producing elements, which is increasingly popular in the world around us. It owes its popularity mainly to the affordable price of printers, simplicity of use and the ability to produce complex shapes. Treating the same shapes with traditional methods would be very expensive and sometimes even impossible. Based on forecasts (Piątek Z., 2019) the use of additive technology in each field will approximately double, and Asia is considered to be the region with the fastest development of this technology.

The next assumption in the described project was to obtain appropriate torques in the kinematic nodes, allowing for proper operation of the manipulator with a maximum load capacity of 0.5 kg. In addition, communication between the manipulator and the user should be carried out using a smartphone.

The use of the manipulator control by means of a telephone (Jiang Ch. Fahad M. Guo Y. and Chen Y., 2018), (Grazioli C. Faura G. Dossi N. Toniolo R. Abate M. Terzi F. and Bontempelli G., 2020) enables accessibility for the general public, and not only for one employee at the workstation by means of a programming device (teaching panel) or a PC. Nowadays, the telephone is increasingly used to control various devices (Grazioli C. Faura G. Dossi N. Toniolo R. Abate M. Terzi F. and Bontempelli G., 2020). E.g. modern intelligent home systems (Lin Y. Wang S. Yang Ch. Shen V.R.L. Juang T.T. and Hung W., 2020), (Phangberthaa L.N. Fitria A. Purnamasaria I. and Muliono Y., 2019) allow you to control various devices to save energy and increase comfort. The way of controlling the keypad by means of a telephone (Azeta J. Bolu C.A. Hinvi D. Abioye A.A. Boyo H. Anakhu P. and Onwordi P., 2019), (Gunawan A.S. Hartanto B. Mili A. Budiharto W. Salman A.G. and Chandra N., 2017) also allows for controlling its operation away from the workstation. The main operating systems for mobile devices are: Android, iOS from Apple, Windows Phone and BlackBerry. 81.5% of the smartphone software market belongs to Android, 14.8% works with Apple's iOS software, 3.3% - Windows Phone and 0.4% belongs to BlackBerry OS in the book by (Płonkowski M., 2018).

Selection of the kinematic structure

The first stage in designing the manipulator was the selection of its cinematic structure. It is usually determined by the intended use of the machine to carry out the previously assumed activities (tasks). A stationary serial kinematic structure (with an open kinematic chain) was selected to perform the functions assumed in the project described above. This structure allows the manipulator to operate freely in any direction and its application can be varied. In addition, the serial structure takes up less space than the parallel structure, which is significant for using the manipulator in a small area.

In order to obtain 6 degrees of freedom in relation to the base, 6 independent rotary actuators were used and their arrangement is shown in Fig. 1.

Fig. 1: Kinematic diagram of the manipulator, A-F - manipulator drives, 1-3 parts of the manipulator.

The described spatially arranged rotary pairs are class V. On this basis, the number of degrees of freedom is checked below using formula (1).

$$w = 6 \times n - \sum_{i=1}^{n} i \times p_i \tag{1}$$

Calculations according to the above algorithm confirmed the selected number of 6 degrees of freedom in relation to the ground using 6 drives.

Assuming a working space of 500 x 900mm, it is assumed that the parts marked in Fig. 1 with numbers 1, 2 and 3 are respectively: 200, 150 and 90mm (counting from the manipulator flange. The sum of the lengths of these three significant parts is 440mm, which is almost half of the longest side of the table, i.e. assuming that the manipulator is located in the middle of the assumed work area, its workspace occupies almost the entire area. For this reason, the above assumption has been met. At this stage of design, the acceleration of the drives equal to 1 m/s^2 was assumed.

Selection of Manipulator Drives

The design assumes a load capacity of 0.5 kg at full reach of the manipulator, which affects the required drive system. It has been assumed that the drives used will be electric motors due to their compact design and the lack of the need for additional medium such as liquid or compressed air. The dimensions of the manipulator and the planned lifting capacity support the use of stepper motors or micro-servomotors.

Knowing the dimensions of the key parts and the maximum load capacity, the necessary torque has been calculated, which must be reached by the drives when moving with an acceleration of 1 m/s^2.

The torque calculations were made for the most difficult position, which is for the straightened arm in the horizontal direction. In this position, the maximum load of 0.5 kg, the mass of the parts, the mass of the drive units, including their centres of gravity, is taken into account. Taking into account all these parameters, the motors were selected starting from the manipulator gripper (assuming that the centre of gravity of the lifting capacity is located in the axis of the manipulator's parts) to its turntable. The diagram used for the calculation is shown in Figure 3.

Fig. 2: Diagram of the manipulator system at the maximum horizontal tilt A - F - manipulator drives, m1 - m3 - equivalent masses of the robot elements, meC , meD , meE - masses of individual drives, m - mass 0.5 kg

The drive torques have been calculated for the worst case, when the manipulator is affected by the greatest torques (the system shown in Fig. 2). Suggesting the obtained high torque (holding) and the possibility of step control, a stepper motor with a gear was used. The exception is the "F" motor, where a servo is used due to the low torque. More important parameters of the selected drives are presented in Tab. 1.

Table 1: parameters of the selected drives

Motor	Model	Current [A]	Voltage [V]	Torque [Nm]	Gear ratio	Weight [kg]
A	JK42HS34-0404	0.4	12	0.25	2	0.22
B	JK42HS40-0504	0.5	12	0.43	10	0.28
C	JK42HS40-0504	0.5	12	0.43	4.4	0.28
D	JK42HW34-0334	0.33	12	0.22	2.6	0.2
E	JK35HY26-0284	0.6	7.4	0.064	None	0.13
F	Redox S90–micro	0.5	4.8 - 6.0	0.21	None	0.009

Motors with the same voltage (12V) were selected. Unfortunately, due to the reduction of weight, one of the motors had lower voltage (7.4V), which resulted in the possibility of higher temperature of this motor during power supply than the others.

Planetary gears with helical teeth were used to execute the ratio aimed at increasing the torque. It was selected because of the possibility of obtaining large gear ratios with small dimensions and the possibility of distributing the pressure over a larger number of teeth (orbitals). On the other hand, the use of helical teeth was dictated by the increase in the number of buttresses, i.e. the distribution of pressure over several pairs of interlocking teeth and the reduction of vibrations and noise. Additionally, using 3D printing technology, any gear can be made, eliminating the need to purchase a planetary gear. It can be designed according to its structural requirements (size, shape, gearing).

It was decided that a planetary gear with a fixed rim will be used, and the outer gear (sun) will be placed on the motor shaft.

The gear ratio $i_A = 2$ is impossible to be achieved with planetary gears and a classic external gear unit is used. Drive "A" is the drive of the manipulator's turntable located at its base. For this reason, efforts have been made to select the right size of gears to ensure adequate rigidity at the base and a secure bearing to prevent the gear wheel from changing its position other than in its own axis. The larger pitch circle diameter was adopted: 85mm, while the smaller one of 42.5mm and the module 2.0.

The gear ratio $i_B = 10$ realized by a single-stage planetary gear would require large dimensions of this gear, so it was decided that a two-stage planetary gear will be designed.

Due to the design of the gears using the 3D printing method and their strength, the smallest number of $z_1 = 20$ teeth was assumed. The number of rim teeth (z_3) should not be less than 80. In addition, this number depends on the size of the orbitals between the sun and the rim because their number of teeth cannot be too small either. The number of teeth of orbital gears has been calculated from the correlation of the sum of pitch diameters.

$$d_{pBrim} = d_{pBsun} + 2 \times d_{pBorbitals} \tag{2}$$

$$z_2 = \frac{z_3 - z_1}{2} \tag{3}$$

It was noted that for the minimum number of $z_3 = 80$ teeth, number of $z_2 = 30$ teeth is sufficient. In order to protect against unforeseen loads on the manipulator parts, it was decided to use the number of $z_3 = 88$ teeth on the rim, the number of orbitals teeth being $z_2 = 34$.

Knowing the final number of gear teeth, the gear ratio was calculated and compared with the assumed ratio when selecting the drive.

$$i_B = 2 \times \frac{z_1 + z_3}{z_1} \tag{4}$$

The calculated ratio $i_B = 10.8$ is greater than the assumed ratio of 10. According to the calculations, it was assumed that the calculated gear ratio meets the assumed requirements of the selected drive.

Another important parameter influencing the strength and correctness of teeth made with the 3D printing method is the height of the tooth h, which should not be less than 2mm.

The height of the tooth is:

$$h \leq 2 \times y \times m_B + c \tag{5}$$

where: y- tooth height factor ($y = 1$); m - tooth module; c - tip clearance ($c = 0.1 \times m$).

$$m_B \geq 0.95 \tag{6}$$

On the basis of the calculated value (11) the tooth module $\mathrm{m_B} = 1.125$ was adopted.

The number of teeth for other gears in other planetary gears was calculated analogously and the results are presented in Tab. 2.

Table 2: planetary gear data

Gear	z_1	z_2	z_3	Assumed ratio	Calculated ratio	Module
B	20	34	88	10	10.8	1.125
C	12	15	42	4.4	4.5	
D	24	9	42	2.6	2.75	

Control System

When designing the manipulator control system, the choice of Arduino microcontroller and STM was considered. After analyzing the specific AVR and STM controllers, it was found that the STM is a better microcontroller and has a lot of inputs/outputs, which is important when designing a system to control six drives. STM32L152 - energy-saving model, with Cortex-M3 core on Nucleo base board - L152RE was chosen.

It was decided that the communication between the microcontroller will take place via a Bluetooth connection using the Bluetooth HC-05 module.

The project involves the use of drives in the form of 5 stepper motors and one servo. The control of the servo is realized by connecting it directly to the STM controller. On the other hand, the control of stepper motors is more complicated because you need a suitable controller that is connected between the microcontroller and the stepper motor. The two most important parameters during the selection of the controller are the current supplying the motor and the way of controlling the motor, i.e. the appropriate resolution of the controller depending on the number of steps per motor rotation. On this basis, the A4988 driver used for small stepper motors in prototype projects was selected.

The stepper motor controller allows to power the drives with 8 - 35V. The adopted motors need a 12V power supply, but to minimize the risk of "lost steps" a higher voltage of 24V is used. For this reason, a suitable power supply LRS-150-24 was selected, which is a modular pulse type power supply with an output voltage of 24V DC and 6.5A. It provided an effective power supply for all manipulator motors.

3D Manipulator Model

The future of 3D printing is industry 4.0 and bioprinting (Maoa et al (2019); Stanco et al (2020); Farhat et al (2021)). In industry 4.0 can have a significant impact on short run and 'on demand' production. This will reduce the costs of transport and storage of the product (Wang et al (2014)).

In order to visualize and later print out the manipulator components on a 3D printer, a 3D model of the manipulator was made. Autodesk Inventor software was used.

The first step was to model the selected motors, and then adjust the appropriate mounting of planetary gears to them.

Each planetary gear has been designed to be as compact as possible, with the assumed durability during operation. The gear yoke is mounted in the gear cover with a lightweight HK 1612 needle bearing (dimensions: 16x22x12mm). The connection of the rim to the stepper motor is made by screwing it to the threaded holes in the motor. The connection of the central gear with the outer gear (sun) was realized by a positive connection.

When designing all connections, the possibility of easy and quick assembly and disassembly had to be taken into account. Another priority was to use as few parts as possible to assemble the entire manipulator.

The mechanism of rotation along the vertical axis in relation to the base is commonly called a turntable. A 1:2 ratio of the rotary drive gear is assumed. As this is an element at the base, attempts have been made to increase its dimensions in order to move the centre of gravity closer to the base. The turntable element with a gear wheel, bearing element and motor mounting with planetary gear is made of one element using 3D printing technology (Fig. 3).

Fig 3. a) View of the two-stage planetary gear, b) assembly of the manipulator's turntable together with the motor and planetary gear

The entire manipulator is fixed with seven M4 screws to a plate which serves as a base for the entire structure. It also serves as a stabilizer and can be loaded with additional weight to protect the entire manipulator against loss of stability. Visualizations of the work of the modelled manipulator with six degrees of freedom are shown in Fig. 4.

Fig 4. Visualization of the manipulator's work

Manipulator control

The communication between the smartphone and the microcontroller is realized by means of Bluetooth wireless communication.

The manipulator is controlled by means of a smartphone through the RoboticArm application having twelve buttons responsible for the movement of each of the motors in a given direction. The application was used when testing the operation of the algorithm implemented on the microcontroller and confirmed that the electronic circuit is correctly connected. A more advanced program was needed to conduct experimental studies based on the repeatability of movements. It was compiled on a PC. It allows you to control the motors in the same way as in a smartphone application, and has an additional function to create a list with the order of rotation of specific components by a given angle. The view of the proprietary application interface is shown in Fig. 5. The program was written in C++ language using QT Creator environment.

Fig 5. Application user interface for communication with the manipulator

Physical model of the manipulator

3D prints are made with Fused Deposition Modeling technology from a group of thermoplastics, because it is a commonly used method for prototype elements, and access to such a printer is the most common. The printer uses a dedicated program that generates the code with the filament path. The filament is applied from bottom to top - layer by layer.

The print parameters for ABS are set as follows:

- extruder temperature: 275°C,
- table temperature: 80°C,
- layer thickness: 0.14 – 0.19mm,
- degree of filling: 50 – 90%,
- fill type: default (cross).

Planetary gears were the priority element of the printout. It has been noted that the components produced after assembling do not have the necessary tooth play for the correct operation of the gear. It was decided to reduce the number of teeth in orbitals by one. In this way, sufficient play and correct operation of the gear is achieved. In addition, according to the formulas for the planetary gear ratio with the rim fixed, the number of orbital teeth does not affect the gear ratio change. Important parameters are the number of sun and rim teeth, which do not change.

The next design stage was to prepare the A4988 drivers to work with selected stepper motors. Each drive has a different upper limit of current flow through the coils. Exceeding the permitted electrical current may damage the motor. Setting the appropriate current on the controller is carried out on a potentiometer located on the controller board. The voltage to be set between the potentiometer and ground was calculated. The results of the calculations are presented in Tab. 3.

Table 1: setting of potentiometers in controllers of appropriate stepper motors

Motor	Maximum current [A]	Resistor [Ω]	Reference voltage [V]
JK42HS40-0504	0.5	0.1	0.36
JK42HS34-0404	0.4	0.068	0.19
JK35HY26-0284	0.6	0.068	0.30
JK42HW34-0334	0.33	0.068	0.15

The physical model of the manipulator described is shown in Fig. 6.

Fig. 6: A physical model of the designed manipulator

Tests and experimental studies

It was decided to test the designed and built control system and manipulator for its correct operation. In the first place, a division of the experimental research carried out was made. They list the following steps:

- checking the proper functioning of the motor control system outside the manipulator using a smartphone;
- testing the operation of motor-driven and telephone-controlled gears;
- testing the operation of planetary gears;
- mounting the drives on the manipulator and testing the strength of the structure;
- checking the correct operation of the assembled manipulator.

The first experimental study, according to the created list, was to check the correctness of cooperation of the control system with the engines themselves, using a smartphone with the installed control application as a control panel.

The application controls checked the operation of all motors, in each side and in different order of their start. Observing the set engine operation, it was found that the engines work correctly. On this basis, the correct functioning of the communication system was confirmed.

The next experimental study was to check the operation of the gears used in each gear. The first step was to check the correct gearing of the gear at the motor A (turntable), two-stage transmission B and transmissions C and D. Gear B is a two-stage gear so it was decided to test the first stage separately and the two stages simultaneously.

Based on this test, all gears were found to be working properly. In the case of a two-stage gear, it has been noted that the orbitals are subject to gentle vibrations and generate noise. Helical teeth were used mainly for this reason in order to reduce vibrations and the associated noise. When pressing down the orbitals, the vibrations disappear and the transmission becomes quiet. It was found that after putting the yoke and cover on, the gears are pressed down, which prevents the occurrence of vibration and noise.

Testing the operation of planetary gears involves putting a yoke on the gear orbital. Two different yokes were used in the project. The first one, with full orbital mount (around the entire circumference) and the second one with incomplete mount. It was observed that in the first case the orbitals rotate around their own axis while in the second case the orbitals do not always rotate in the axis of attachment. The reason for this is the presence of a force that causes the gears to slide out of the incomplete component along the circumference of the attachment. It was found

that the occurring phenomenon will be compensated for by the cover housing and will not adversely affect the operation of gears C and D, in which this type of yoke was used.

After analyzing the gear behavior, a cover was attached and screwed to the gear rim, restarting the motor with the completely assembled gear.

It was confirmed that the installation of the yoke and the cover pressed down the orbitals in the two-stage B gear eliminating the previously generated vibrations and noise. All gears run smoothly.

The most important experiment was to check that the manipulator will not damage during simple movements without load. Successful passing of this test allowed to conduct another one, under the load.

In the experiment, the system the system was connected to the power supply and the operation of the drives was checked, starting from the turntable and then from the drives located at the very end of the kinematic chain, i.e. drive F, E, D, C and drive B.

On the basis of the performed tests, correct operation of A, C and D gears and E and F drives was found.

The other parts of the manipulator are also robust enough not to be damaged during machine movements.

Due to the unforeseen increase in the weight of individual parts in relation to the assumed values, the testing of the maximum load capacity of the manipulator was abandoned. It was decided to weigh and verify the constructed parts and gears in order to determine the permissible lifting capacity of the manipulator. The masses of individual elements together with those assumed in the original assumptions are presented in Tab. 4.

Table 1: Comparison of individual elements of the manipulator in terms of actual and assumed mass

Component:	Assumed weight [kg]	Actual weight [kg]
Component 1	0.1460	0.229
Component 2	0.0795	0.185
Component 3	0.0360	0.080
Drive C	0.2800	0.364
Drive D	0.2000	0.288
Drive E	0.1300	0.130
Drive F	0.0090	0.009

Based on the masses obtained in Tab. 4, the possible lifting capacity "x" for each drive has been calculated. According to the calculations, it should be expected that a built manipulator can carry an object with the lowest calculated weight, i.e. not more than 0.3 kg.

The manipulators (robots) are required to repeat their movements. It has been noticed that the device has play in the fastening of yokes to the components. This allows the components to move inertly to a certain extent. This is due to the inaccuracy of the 3D printouts. In order to eliminate the existing play it would be necessary to make more precise prints of the gear elements on a 3D printer together with a high-quality filament.

Summary and conclusions

Nearly 90% of the manipulator's elements were made by additive 3D printing using the FDM method. The design has shown that printed parts are not always as parts modeled in the computer program.

Planetary gears are the key elements of additive technology. Their correct operation was demonstrated and two types of yokes were presented - with closed and open mounting. It was found that a better combination of orbitals is a yoke with a closed mount, because when the mount is open, the orbitals try to change their own axis of rotation in relation to the mount as a result of meshing force.The two-stage gear, despite previous concerns about its proper operation, behaves correctly and maintains the assumed torque.

The analysis of the work carried out shows that it has been possible to create a 6-degree manipulator control system controlled by means of a smartphone. The application for the phone and the program for the microcontroller were used. According to the conducted experimental research, the correct operation of the programs has been proved and the possibility of controlling the manipulator drives with a smartphone.

The manufactured manipulator in a static position poses no risk of damage to its components - the structure is durable. It is worth noting that the components were made with 80% filling and the gears with 50% filling. For this reason, the components turned out to be heavier than expected.

It was decided to calculate the maximum load capacity analytically as it was noted that it may differ from that assumed one due to the increased weight of the components. The analysis showed that the designed manipulator with the elements made with the additive technology with filling, presented in this paper, should lift an element of weight not exceeding 0.3 kg. The originally assumed value was 0.5 kg. Due to the use of improper material filling, it was not possible to achieve the assumed capacity.

Abstract

The article describes the construction and principle of operation of the MTS 320, second in Europe Road Simulator used for durability studies. The first stage of the methodology of conducting sustainability studies on the Road Simulator is to collect reference data. For this purpose, 32 measuring sensors are placed on a large-size semi-trailer vehicle. Acceleration, displacement and stress were measured at selected points of the trailer frame and its support frame. The data were collected in configurations for a loaded and unladen semi-trailer moving on roads classified as motorways, national and local roads in central Poland. Statistical analysis of the obtained results was performed. Additionally, spectral analysis (ASD) was performed. The result of the conducted analyses was to determine the usefulness of the collected reference data in terms of their application for durability tests of large-size vehicles.

Keywords: MTS road simulator, sensor, reference data, durability tests, mechanical engineering.

Introduction

At present, many manufacturers of commercial vehicles (Spickenreuther M. Bersiner F. and Fricke E., 2012) carry out durability tests of their products. Dynamic testing plays an important role in the development of road vehicles. The main advantages of this type of tests are to check individual components of the vehicle as well as the overall assessment of the produced cars. In (Doddsa C.J. nad Plummer A.R., 2001), (Raath A.D. and Van Waveren C.C., 1998), (Azrulhisham E. Asri Y.M. Dzuraidah A.W. Nik Abdullah N.M. Che Hassan C.H. and Shahrom A., 2011), examples of stations with four forcing actuators, used for durability tests of vehicles, are reviewed. In turn, the ref. (Lyashenko M.V. Klementiev E.V. and Sokolov-Dobrev N.S., 2016) shows a station for complex tests of one vehicle axle. Another example of a dynamic test station with four actuators is described in (Morato M.M. Nguyen M.Q. Sename O. and Dugard L., 2019). In this solution, a vehicle structure with semi-active suspension system is tested. The analytical model of a four-actuator station is described in (Hassen D.B. Miladi M. Abbes M.S. Baslamisli S.C. Chaari F. and Haddar M., 2019). Thanks to such tests, already at the design stage, of prototype solutions, we can correlate the produced prototype with numerical simulations (Shafiullah A.K.M. and Wu C.Q., 2013), (Coutinho I.A. and Jr J.R., 2020), (Farrahi G.H. Ahmadi A. and Reza Kasyzadeh K., 2020). The purpose of durability analyses is to reduce the time and costs of product development, prevent breakdowns and optimise the vehicle structure (Bai-yan H. Shu-xin W. and Feng G., 2010), (Hay N.C. and Roberts D.E., 2006), (Liu W. Wang R. Ding R. Meng X and Yang L., 2020), (Petersen J.D., 1986). This way of proceeding very often helps to avoid numerous complaints about the product or its individual components. There are many examples of durability tests of components manufactured in commercial vehicles in the literature. Authors of work (Chin C.H. Abdullah S. Singh S.S.K. Ariffin A.K. and Schramm D., 2020) describe factors, including the quality of road surface, which affect the durability of the suspension damper. In turn, the ref. (Kong Y.S. Abdullah S. Schramm D. Omar M.Z. Haris S.M. and Bruckmann T., 2019) indicates that rural and off-road roads contribute the most to shortening the lives of the tested shock absorbers. In ref. (Coutinho I.A. and Jr J.R., 2020) is describes the methodology of endurance testing of brake chamber type components. Work (Hou Y. Zhou W. and Shen C., 2011) describes an experimental test of fuel and exhaust system tightness during durability tests in a passenger car.

Passenger cars are not the only group of commercial vehicles that undergo durability tests. Single track vehicles are also of wide interest. Many literature reports (Chindamo D. Gadola M. Armellin D and Marchesin F., 2017), (Nehaoua L. Hima S. Arioui H. Seguy N. and Espié S., 2007), (Cossalter V. Lot R. Maso M. Massaro M. and Sartori R., 2008), (Petrone N. and Meneghetti G., 2019) describe how to test whole motorcycles as well as selected components, e.g. frames.

The authors of the article decided to carry out durability tests of a large-size semi-trailer type vehicle. The first stage of these studies is to collect reference data from actual runs on roads of different quality. During the trips, data will be collected to estimate the duration of durability tests. Also on their basis, the elapsed time will be determined, which will be mapped on the station during the planned durability tests.

MTS Road Simulator

The road simulator described in the article is the second one in Europe used for durability tests of large-size vehicles. The general view of the Road Simulator is shown in Fig 1. The largest element of the station is the seismic mass (1) of about 600 tons, placed on the foundation (7). Its task is to suppress the vibrations that occur during the work of the described station. The seismic mass can move from 0 to 50 mm above the foundation. During the operation of the Road Simulator, the seismic mass maintains a preset level above the foundation, while at the same time ensuring vibration insulation of the entire station. Its movement is ensured by 26 pneumatic shock absorbers (2). There are axle hydraulic actuators (3) on the seismic mass. These actuators can only operate in the vertical axis. For this reason it is not possible to simulate manoeuvres such as acceleration or deceleration. Each actuator is responsible for the operation of one wheel of the tested vehicle. The Road simulator software allows you to run any number of actuators in a given test. This allows 1, 2, and 3 axle vehicles to be tested. In addition, there is a coupling device (8) on the station. Its work is ensured by two actuators responsible for the operation of the kingpin. The main actuator (4), which introduces the forces in the vertical axis, and the side tilt actuator (5), by means of which the movements of the fifth wheel coupling will be simulated, similar to those occurring under real conditions in tractors. During the simulation, the station controls the angle between the main actuator and the side tilt actuator. If the angle of inclination is greater than 2°, the simulation is automatically interrupted and the station is switched off. This procedure protects against excessive lateral tilting of the tested product, which in extreme cases could lead to serious twisting of the frame and its irreparable damage.

The coupling device allows the installation of a semi-trailer coupling instead of a fifth wheel so that various types of agricultural products of the trailer type can be tested. In addition, in the case of vehicles with their own power unit, e.g. buses and trucks, it is possible to lower the coupling device below the top plate (6) and force the axles only.

Fig 1. 1) seismic mass, 2) pneumatic accumulators, 3) axle hydraulic actuators, 4) main kingpin actuator, 5) kingpin side tilt actuator, 6) top plate, 7) foundation, 8) coupling device.

Arrangement of measuring sensors on the trailer

In order to collect the data which inform about the trailer's behaviour on the road, 32 measuring sensors were used. They were located in different parts of the vehicle. The displacement sensors and part of the accelerometers are positioned to measure the movement of the vehicle and its suspension relative to the road. The strain sensors were located at different points of the trailer's frame. Their location was dictated by numerical simulation results. In these locations during numerical analysis an increased stress value was observed. The following measuring sensors were located on the semi-trailer:

- 2 accelerometers (±300 m/s^2) measuring in three axes (6 measuring channels): placed in the central part of the front wall and the central part of the sidewall (Table 3);
- 6 accelerometers (±300 m/s^2) with measurement in one axis close to the wheels;
- 2 accelerometers (±300 m/s^2) with measurement in one axis at the front of the frame;
- 2 accelerometers (±300 m/s^2) with measurement in one axis close to the kingpin on the saddle;
- 6 displacement sensors (±0.32 m) located at each wheel, measuring the distance between axles and frame;
- 10 half-bridge strain gauge sensors located at critical points in the trailer's frame.

The HBM measuring system was used to record measurement data. The measurement path consisted of, apart from the sensors mentioned above, the following amplifiers: MX1601 (16 channels) for accelerometers, universal amplifier MX840 (8 channel) used for displacement sensors and amplifier for strain gauge sensors MX1615 (16 channels). All these amplifiers were connected to the CX22 data logger. The measurement data was recorded using Catman DAQ software at 300 Hz. No filters were used during the measurement. Due to the fact that the hydraulic actuators of the axles on the MTS 320 road simulator, which are responsible for their excitation, are only able to move in a vertical direction, it was decided that the cable displacement sensors and accelerometers would be placed on the axles near the wheel hub. This location of the sensors will allow for a more accurate measurement of the values that will be reproduced during the simulation on the station. The cable sensor was attached to the lower flange of the main beam. Fig 2 and 3 show how the sensors are mounted near the trailer's axles.

Fig. 2: The method of attaching cable sensors to the trailer axles.

Fig. 3: The way the accelerometers are mounted on the trailer axles.

Additional single-axle accelerometers were installed in the front part of the semi-trailer near the kingpin (Fig 4) and near the front stakes on the rim (Fig 5). They were used to obtain information on the accelerations occurring in the front of the trailer. Moreover, in the middle of the front wall of the semi-trailer and on the frame of the side wall, 3-axis accelerometers were installed. These sensors recorded accelerations in the upper part of the semi-trailer body. Fig 6. Show overall distribution of the sensors as accelerometers and displacement located on the trailer.

Fig. 4: The way the accelerometers are mounted in the vicinity of the trailer's kingpin.

Fig. 5: The way the accelerometers are mounted near the front stakes.

Fig. 6: Overall view of distribution of the accelerometers and distance sensors on the trailer.

Apart from displacement sensors and accelerometers, strain gauges were installed on the trailer at selected points. The locations of the strain gauges were selected based on previous simulations of numerical calculations. The locations of the strain gauges are shown on the Fig 7.

Fig. 7: Distribution of the strain gauges sensors on the trailer.

Acquisition of the Reference Data

After the measurement installation was completed, the signals were recorded during reference runs. These runs were made on previously selected road sections in Poland.

The physical values were measured by sensors for an unladen semi-trailer (unladen combination - semi-trailer + truck) and for a loaded semi-trailer. The load consisted of 26 concrete blocks, each weighing 1 tonne. The unladen set covered the distance of about 350 km. This route consisted of: 60 km of express roads which can be classified as very good quality roads, 180 km of national roads (of medium quality) and 110 km of local roads (of the worst quality). The 26T loaded set, on the other hand, covered 490km of which 180km were motorways and expressways, 200km national roads and 110km local roads. In total, statistical reference data were collected over a distance of about 850 km.

The route of the described set was chosen to collect measurement data for different types of roads. Having statistical data from several very large transport companies, whose number of vehicles ranges from 100 to 200 sets, it has been determined that during the operation of large-size vehicles of the semi-trailer type 90% of the routes are driven with semi-trailers loaded, while 10% of the semi-trailer routes - unladen. Moreover, it was found that most of the trailers drive on motorways (80% of routes). Statistically, local and national roads account for 10% each. In

addition, the statistics show that, on average, a semi-trailer travels from 90,000 km to 120,000 km per year. The statistics are different for smaller carriers (less than 100 transport units). In their case, during their operation, 50% of the trailers drive on motorways, 30% on national roads and 20% on local roads. In addition, the loaded sets account for 70% of all runs.

Due to the average number of kilometres driven, it was assumed that 500,000 km would be simulated on the road simulator, which is equal to a period of about 5 years of trailer operation.

Due to the fact that in the Polish market, a larger percentage of trailer users are small and medium-sized transport companies (Gmyz L., 2015), it has been assumed that 500,000 km with a load (which accounts for 80% of the simulated kilometres) and 100,000 km without a load (20% of the simulation duration) will be simulated. Additionally, it was assumed that 50% of the total number of simulated kilometres will be express roads, 30% will be simulated national roads and 20% local roads. Table 1 shows the statistical average annual vehicle mileage. On the other hand, table 2 compares the type of roads with the number of kilometres driven during the reference data collection.

Table 1: Statistical average vehicle mileage during the year

Reference data				
	Vehicle loaded (26 tonnes)		**Vehicle not loaded**	
	[km]	**[%]**	**[km]**	**[%]**
Annual mileage	**90,000**	**90 %**	**10,000**	**10 %**
Types of roads				
Highways	45,000	50 %	5000	50 %
National roads	27,000	30 %	3000	30 %
Local roads	18,000	20 %	2000	20 %

Table 2: Breakdown of road types with the number of kilometres travelled during reference data collection

Reference data		
Types of roads	**Vehicle loaded (26 tonnes)**	**Vehicle not loaded**
Highways	180	60
National roads	200	180
Local roads	110	110
Total	490	350

Analysis of Measurement Results

This chapter presents the results of measurements recorded by the sensors while driving an unloaded and loaded set (26 tons). Figures 8, 9 compare the results of the acceleration measurements on the axles, the frame and the front of the frame. Fig 10 shows the results of the stress measurement. In Fig 11 the results of relative displacement between the lower flange and the axle are collected depending on the road type. The following results apply to unloaded semi-trailer runs.

Fig 8. The acceleration value measured on the axles depending on the road type for an unloaded semi-trailer.

Fig 9. The acceleration value measured on the frame and on the fifth wheel and front of the frame depending on the road type for an unloaded semi-trailer.

Fig 10. The value of the measured stress at selected points of the frame of an unloaded semi-trailer when travelling on different types of roads.

Fig 11. Measurement of the relative displacement between the axle and the lower flange measured when the semi-trailer is unloaded.

When analysing the results of the maximum amplitude values (for an unladen semi-trailer) of acceleration and stress, it should be noted that for both physical quantities the smallest amplitudes were recorded for roads with the best road surface type. No significant differences were observed between national and local roads. Taking into account the results of measuring the relative displacement between the axles and the lower flange of the semi-trailer, it was observed that the average amplitude value measured on the local road is 60% higher than on the motorway and 16% higher than on the national road. When analysing the stress indications measured with strain gauges, no significant differences resulting from the type of roads on which the test vehicle was running were noticed. The greatest stress was observed in the front part of the trailer frame and in the solebar lower flange. The measured stress values did not exceed 200MPa. The stress measured at other selected points of the frame did not exceed 50MPa.

Figures 12, 13 compare the results of the acceleration measurements on the axles, the frame and the front of the frame. Fig 14 shows the results of the stress measurement. In Fig 15 the results of relative displacement between the lower flange and the axle are collected depending on the road type. The following results apply to unloaded semi-trailer runs.

Fig 12. The acceleration value measured on the axles depending on the road type for a loaded semi-trailer.

Fig 13. The acceleration value measured on the frame and on the fifth wheel and front of the frame depending on the road type for a loaded semi-trailer.

Fig 14. Measurement of the relative displacement between the axle and the lower flange measured during the run of the loaded trailer.

Fig 15. Measurement of the relative displacement between the axle and the lower flange measured during the run of the loaded trailer.

When analysing the results of the measured maximum values (for a loaded semi-trailer) of acceleration and stress, it should be noted that for both physical quantities the smallest amplitudes were recorded, as for the unladen semi-trailer, for roads with the best road surface type. Taking into account the results of measuring the relative displacement between the axles and the lower flange of the semi-trailer, it was observed that the average amplitude value measured on the local road is 66% higher than on the motorway and 38% higher than on the national road. In addition, it was noted that when driving on local roads, the sensors on the right side of the semi-trailer indicated on average 30% higher values than the corresponding sensors on the left side of the trailer. This trend can be explained by the fact that, when driving on local roads, the semi-trailer was going downhill, which had potholes in the asphalt surface. Right-hand traffic is in force in Poland.

By analysing the stress indications measured with strain gauges, the influence of the type of road on which the tested vehicle was running was observed. The greatest stress was observed in the front part of the trailer frame and in the solebar lower flange. The measured stress values did not exceed 250MPa. The stress measured at other selected points of the frame did not exceed 120MPa. For example, when analysing the stress measured on the lower flange of a loaded trailer, it was observed that the amplitude value measured on the local road is 61% higher than on the motorway and 46% higher than on the national road.

In addition to statistical analysis, a spectral analysis (ASD) of selected signals was performed. Fig 16. shows a comparison of the spectrum of signals measured by the accelerometer on the RH wheel of the third axle for runs with a loaded and unladen trailer on different types of roads.

*

Fig 16. ASD spectrum for the accelerometer on the 3rd RH wheel.

Analysing the signal spectrum for the accelerometer it was noticed that for local and national roads there are two dominant frequencies. A basic frequency (2Hz) and another one of 12Hz. Several dominant frequencies were recorded for expressways (7,14,21,28,35Hz).

Fig 17. shows a comparison of the signal spectrum measured with a draw-wire displacement sensor on the RH wheel of the third axle for runs with a loaded and unladen semi-trailer on different types of roads.

Fig. 17: ASD spectrum for the displacement sensor on the 3rd RH wheel.

Analysing signals from the displacement sensor, a similar character of the amplitude-frequency spectrum to that of the accelerometer was observed. There are several dominant frequencies on expressways regardless of the trailer load. As regards national and local roads, the basic frequency was 1.2 Hz. The amplitude level is the highest for local roads, as confirmed by previous statistical analyses. As in the case of statistical analyses, the highest amplitudes of the measured displacement were observed in the spectrum determined from the runs on local roads with a loaded set.

Fig 18 shows a comparison of the signal spectrum of the measured stress at a selected point on the structure (strain gauge placed on the saddle plate) for runs with a loaded and unladen semi-trailer on different types of roads.

Fig 18: ASD spectrum for a strain gauge placed on the saddle plate.

Also in the signal coming from the strain gauge sensor, a repeating dominant frequency for expressways can be observed. Also the highest amplitudes were obtained for local roads with a loaded vehicle. The basic frequency for national and local roads was 1.2 Hz and coincided with the frequency obtained from displacement sensors. The data collected from various roads for a loaded and unladen semi-trailer showed that local roads had the highest amplitudes. Therefore, it can be assumed that it is the local roads that will make the greatest contribution to the strain on the structure of the semi-trailer during its lifetime. Conclusions from the conducted analyses are consistent with the results described in the literature [18].

Conclusion

The way of collecting statistical data on reference runs on roads of different quality described in the article is the first stage in the course of the proceedings during the durability tests of large-size vehicles. The collected data will be used to simulate durability on the test station of the MTS 320 simulator. The analysis of statistical data shows that the highest values measured with displacement, acceleration and strain gauges were recorded for local roads. Data from these routes should first of all be taken into account when developing the type of excitations for endurance testing. The method of data collection described in the article, using different sensors, will allow for mapping in a wider range of frequencies of signals occurring during endurance testing. This will be ensured by the use of cable displacement sensors and strain gauges. In spectral analysis, the dominant frequency measured using them was lower than that obtained for accelerometers.

The durability tests of a large-size vehicle, which include, among others, the implementation of a measuring system, collection of reference data, development of a road profile and durability tests on a dedicated stand, last about 6-8 weeks (simulation of 500,000 km). In fact, vehicles of this class they cover the distance of 500,000 km in about 4-5 years. The cost of this type of endurance test is approximately € 80,000. The main argument for the legitimacy of carrying out durability tests of large-size vehicles are the savings resulting from possible costs related to the repair of product defects that may occur during the operation of the vehicle. The level of savings resulting from identifying possible product defects already at the durability testing stage depends on the production volume. With unit production, savings will amount to hundreds of thousands of €. However, in the case of mass production, the savings scale can reach millions of euros. Testing on the bench allows for faster implementation of the product without hidden defects for series sale, which makes the company more competitive on the market, profiting from vehicles previously launched for sale.

Abstract

Purpose: This study examined anti-corruption reporting practices across companies listed on the Warsaw Stock Exchange, by looking at both the extent of anti-corruption disclosure and the coercive determinants of that extent, in particular the potential pressure from the regulator that requires mandatory anti-corruption disclosure under the Directive 2014/95/EU (Directive). **Design/methodology/approach**: The sample comprised 71 selected listed companies over 6 years. Content analysis was used to measure the extent of anti-corruption disclosure. The econometric model was estimated using panel fixed effects. **Findings:** The Directive enforcement increased significantly the extent of anti-corruption disclosure Surprisingly inclusion in the Respect Index, government ownership and foreign ownership are not significant determinants of anti-corruption reporting. **Originality**: Our study contributes to the understanding of the impact of Directive and other coercive variables on anti-corruption disclosure, a specific subset of sustainability reporting. In particular, it presents the contribution of accounting to the struggle against corruption.

Keywords: anti-corruption disclosure; CSR disclosure; ESG disclosure; sustainability disclosure; non-financial disclosure; Directive 2014/95/EU

Introduction

There is a growing global demand for better disclosures provided by listed companies as stakeholders nowadays expect not only the financial performance of listed companies, but also their performance in corporate social responsibility (CSR) aspects, including anti-corruption.

Corruption may be defined as "the abuse of entrusted power for private gain" (Transparency International, n.d.). Corruption has negative consequences to society and hazardous impacts on companies (Barkemeyer *et al.*, 2015). Corruption matters for business because it hampers growth, escalates costs and poses serious legal and reputational risks (UN Global Compact, n.d.). Hence the transparency of corporate reporting may have an important role to play in constraining corruption.

Although corruption issues have become a standard element of mainstream reporting guidelines, such as those by GRI, research shows that, overall, anti-corruption disclosure practices around the world are still underdeveloped (Sari *et al.*, 2020; Issa and Alleyne, 2018; Islam *et al.*, 2017; Branco and Matos, 2016), especially when compared with other CSR aspect disclosure practices (Matuszak and Różańska, 2017). Reporting on corruption by many companies has often been superficial and incomplete because this issue is complex and highly sensitive and public disclosures of such topic can lead to misguided perceptions (ACCA, 2008).

In recent years, the European Union (EU) reached an important milestone in the enhancement of the transparency of listed companies' CSR aspects when EU issued its Directive 2014/95/EU (European Union, 2014) to require large companies with an average of 500 or more employees to disclose non-financial information. Large listed companies need to disclose, among others, information on their anti-corruption and bribery matter. More specific, for this matter, companies must disclose a description of their policy including the due diligence processes implemented, the outcomes of this policy, principle risks, and their management on a "comply or explain" basis, with considered reasons for non-disclosure. Companies were expected to comply with the new disclosure requirements of the locally transposed laws by 2018.

Our study responds to a call in the literature to investigate pressure from regulators on companies to disclose anti-corruption actions (D'onza *et al.*, 2017). Such an examination can be made within the framework of the coercive isomorphism, a particular subset of institutional theory (Sari *et al.*, 2020). The rationale is that this specific principle reflects pressures from powerful stakeholder groups, including regulators (DiMaggio and Powell, 1983). Previous studies have tested the pressure from different coercive sources (Barkemeyer *et al.*, 2015; Sari *et al.*, 2020), but so far have not taken into account the pressure from mandatory accounting regulations.

Therefore, in this study, we referred to coercive isomorphism and we ask how Directive 2014/95/EU (Directive) pressure has shaped anti-corruption disclosure provided by listed companies in Poland, one of most corrupt country in the EU on Transparency International's report (Transparency International, 2019). Poland has become one of the then 28 EU countries that have transposed the Directive into their national legislation. Since then, anti-corruption disclosures are required among certain Polish enterprises by the Polish Accounting Act (PAA).

To fill the existing literature gap, this paper examines anti-corruption reporting practices of Polish listed companies, by looking at both the extent and the coercive determinants of that extent, in particular the potential pressure from the regulator that requires mandatory anti-corruption disclosure under the Directive.

In order to explore the research question, we analyzed the anti-corruption disclosure using a content analysis for a sample of 71 companies listed on the Warsaw Stock Exchange (WSE). Our analysis shows that the extent of the anti-corruption disclosure across all content items increased significantly after Directive implementation period compared to the period before implementation. The findings reveal that the Directive enforcement is associated with the extent of anti-corruption disclosure. Surprisingly, other coercive variables, namely inclusion in the Respect Index, government ownership and foreign ownership are not significant determinants of anti-corruption reporting.

Thus, the current paper makes a number of contributions to the rare literature on anti-corruption disclosure, a specific subset of CSR reporting. In particular, we assume that our study contributes to the understanding of the impact of Directive on anti-corruption disclosure that reflects the role of accounting in combating corruption.

We begin with literature review, theoretical background and hypothesis development, followed by the methods, results, and conclusion.

Literature review and hypothesis development

Literature review

Corruption is an important topic for accounting researchers, among others. As the purpose of accounting is to provide information on the financial performance and, increasingly, the CSR performance of a company, its role also includes providing the data necessary to control and prevent corruption activities (Barkemeyer *et al.*, 2015). Increased transparency in corporate reporting therefore leads to a greater likelihood of detection of corrupt acts, which reduces information asymmetry between principals and agents and enables shareholders and other stakeholders to make more informed decisions (Wu, 2005). Hence the anti-corruption disclosure are closely related to the role of accounting in the struggle against corruption. To date, there is little but growing literature on anti-corruption disclosure practices as an integral part of CSR reporting.

First, there are descriptive studies which generally show low disclosure levels (Matuszak and Różańska, 2017; Issa and Alleyne, 2018). For example, Issa and Alleyne (2018) documented a state of limited maturity regarding the disclosure of anti-corruption procedures in the sustainability reports of 66 Gulf Cooperation Council companies in Saudi Arabia, Oman, Kuwait, Bahrain, UAE, and Qatar. In Polish setting, Matuszak and Różańska (2017) stated that among others CSR matters, anti-corruption deserves careful attention, as it is not disclosed by most companies listed on WSE.

Second, there are examinations of factors explaining the variability of disclosures. Previous studies proved among others that the pressure from different coercive sources has positive impact on the level of anti-corruption reporting. In particular, participation in corruption-related initiatives was found to be positively related to corruption-related reporting (Barkemeyer *et al.*, 2015; Branco and Matos, 2016). Moreover, variables related to the ownership structure, such as state or foreign ownership was found to have influence on anti-corruption disclosure. For example, Sari *et al.* (2020) showed that the dependence on government tenders and foreign ownership are associated with the level of disclosure. While, Branco and Matos (2016) documented that government-owned companies seem to exhibit greater concern to improve the corporate image through disclosure.

In fact, the literature also recommends examining pressure from regulators on companies to disclose anti-corruption efforts (D'onza *et al.*, 2017). Such an examination can be made within the framework of the coercive isomorphism, a particular subset of institutional theory (Sari *et al.*, 2020). The rationale is that this specific principle reflects pressures from powerful stakeholder groups, including regulators (DiMaggio and Powell, 1983). Previous studies so far have not taken into account the pressure from mandatory accounting regulations.

To fill the existing literature gap, this paper examines anti-corruption reporting practices of Polish listed companies, by looking at both the extent of anti-corruption disclosure and the determinants of that extent, in particular the potential pressure from the regulator that requires mandatory anti-corruption disclosure under the Directive.

Theoretical framework

The question of how anti-corruption disclosure provided by companies are shaped can be addressed through institutional theory that has been cited many times in the accounting literature (Barkemeyer *et al.*, 2015; Issa and Alleyne, 2018; Sari *et al.*, 2020). The theory is considered appropriate for this question as it provides a theoretical explanation of how firms respond to non-market pressures to undertake particular activities (DiMaggio and Powell, 1983; Issa and Alleyne, 2018), including anti-corruption disclosure practices. Within the framework of coercive isomorphism, a particular subset of institutional theory, an organization provides disclosure as a response to pressures from influential stakeholders (Deegan, 2014). Powerful institutions that can pressure an organization to adopt specific disclosure practices include governments, certification body, and politically powerful stakeholders among others (Deegan and Unerman, 2011). When pressures from these stakeholder groups arise, an organization needs to respond to obtain legitimacy (DiMaggio and Powell, 1983). However, organizations may have varying degrees of freedom to take strategic responses to institutional pressures (Barkemeyer *et al.*, 2015).

In response to previous recommendations from literature to investigate regulators' pressure on companies to report their anti-corruption efforts (D'onza *et al.*, 2017), this study adopted coercive isomorphism. This is because regulators reflect pressure through, for example law enforcement (DiMaggio and Powell, 1983), as in the case of transposing the Directive into the national legislation of EU member states. To strengthen contributions to the existing literature, this study explores not only pressure from regulators but also pressures from other possible coercive sources.

Hypotheses development

This paper investigates four key coercive variables potentially influencing the extent of anti-corruption disclosure in Poland. These variables are Directive enforcement, inclusion in the Respect Index, government ownership and foreign ownership.

Directive 2014/95/EU enforcement

The rationale for expecting Directive to significantly affect anti-corruption disclosure is that companies would be keen to follow new "norms" that are imposed upon them (Deegan, 2002). According to institutional theory, companies may strive to increase the insufficient and non-compliant level of anti-corruption disclosures to reduce regulatory pressure.

Assessments of the state of the art of non-financial reporting, before the implementation of the Directive, by Matuszak and Różańska (2017), showed that there was an information gap regarding some of the aspects required by the Directive. As noted by Matuszak and Różańska (2017) tested companies placed little emphasis especially on reporting about anti-corruption. After the implementation of the Directive, research conducted by Skoczylas-Tworek (2020) documented that companies still show considerable restraint in disclosing anti-corruption information. Unfortunately, no research confirms the potential impact of the Directive on the extent of anti-corruption disclosures.

In the previous literature, it was clearly stated that overall reporting quantity increased subsequent to a on-financial mandate (Damak-Ayadi, 2011; Kerret *et al.*, 2010). Considering that we expect that the extent of non-financial disclosers will increase even in such a sensitive area as the fight against corruption. Considering the theoretical and empirical evidence, we hypothesize:

> ***H1:*** **There is a positive relationship between the Directive 2014/95/EU enforcement and the extent of anti-corruption disclosure.**

Inclusion in the Respect Index

Participation in a particular CSR initiative, association or coalition can potentially result in coercive pressure being put on the company to undertake certain practices (Barkemeyer *et al.*, 2015; Sari *et al.*, 2020). This mainly includes international initiatives, like UN Global Compact which promote corporate engagement with corruption as part of a wider array of CSR aspects. But this could potentially also apply to local and regional initiatives that may exert a positive influence on corruption-related reporting. A key example here is the RESPECT Index which is the first index of companies respecting the CSR rules in the Central and Eastern Europe's region.

The RESPECT Index portfolio covers Polish companies listed on the WSE Main Market which operate in accordance with the highest standards of management with regard to corporate governance, reporting and investor relations standards, and which also include environmental, social and governance factors (Macuda *et al.*, 2015). The participating companies are screened by WSE and the Association of Listed Companies. If the company does not respond to coercive pressures from the project makers, the membership will be terminated. As transparency, accountability as well as communication with stakeholders are at the core of this project, we would expect that corporate inclusion in the RESPECT Index has a positive impact on anti-corruption disclosure. Past study document the statistically significant positive impact of inclusion in the RESPECT Index on non-financial disclosure practices, excluding ethical matters before Directive implementation (Dumitru *et al.*, 2017). Hence, we hypothesize:

H2: **There is a positive relationship between inclusion in the Respect Index portfolio and the extent of anti-corruption disclosure.**

State ownership

It is assumed that state ownership has a positive impact on CSR disclosures. Governments of most post-communist EU member states are struggling to address corruption effectively in their countries' regulations. In this regulated environment, governments have the potential to force companies to comply with anti-corruption laws and disclose their anti-corruption efforts. This coercive pressure is especially effective for companies whose capital structures are dominated by government shares. State owned enterprise themselves are usually politically sensitive as their activities are more visible to the public and there is a greater expectation that such firms will be aware of their public obligations (Muttakin and Subramaniam, 2015), in line with the coercive isomorphism tenet.

Previous studies showed inconsistent findings for this variable. A positively significant association between state ownership and the extent of CSR-related disclosures is quite well documented in the literature (Muttakin and Subramaniam, 2015; Branco and Matos, 2016). However, there are recent studies that show that the state ownership is not a significant predictor of CSR disclosure (Matuszak *et al.*, 2019), including anti-corruption disclosures (Sari *et al.*, 2020). Bearing the above in mind, the following hypothesis has been developed:

H3: **There is a positive relationship between state ownership and the extent of anti-corruption disclosure.**

Foreign ownership

It is assumed that foreign ownership can influence on CSR disclosure. According to Haniffa and Cooke (2005) foreign shareholders typically demand high-level corporate disclosure due to geographic separation. Moreover, a foreign shareholder is likely to be more interested in the company's global accountability, in particular how the company is trying to meet the global community's expectations in relation to sustainable business practices, including anti-corruption practices and reporting (Sari *et al.*, 2020). This is where coercive pressure from foreign shareholders can come into play. Foreign investors can push companies to report on anti-corruption activities and, by responding to this pressure, the companies may get continuous supports and legitimacy from this stakeholder group in the form of capital inflows (DiMaggio and Powell, 1983; Deegan and Unerman, 2011).

Studies investigating the effects of foreign ownership on CSR disclosures in an emerging economy context are scant and provide unclear results. A positive association between foreign ownership and CSR disclosure practices is documented in some prior studies (Khan *et al.*, 2013; Muttakin and Subramaniam, 2015; Sari *et al.*, 2020). However, there are studies that found the foreign ownership to have no statistically significant influence on CSR disclosure (Matuszak *et al.*, 2019). Thus, the following hypothesis has been developed:

***H4*: There is a positive relationship between foreign ownership and the extent of anti-corruption disclosure.**

Research Methodology

Research sample and data collection

Our initial sample comprises of all firms listed on WSE. To be included in our sample, companies have to meet the following criteria:

(1) They must be Polish companies (ISIN – PL)
(2) They must have been experienced in non-financial reporting at least in 2014.
(3) They have to fulfil criteria imposed by transposed Directive concerning employment, assets, and income for the period 2017-2019.
(4) They had to have required data for 2014-2019.

The final study sample was composed of 71 Polish companies (426 company-year observations).

The data concerning employment, assets, and income were obtained from the Notoria Service Database. The data concerning non-financial anti-corruption data were hand-collected from non-financial statements being a separate section of management commentary (not stand-alone) or being a separate stand-alone report. In order to verify developed hypotheses our time scope is 2014-2019 and it covers the period before (2014-2016) and after (2017-2019) implementation of the Directive.

Variables

To quantify the disclosure on anti-corruption practices (dependent variable), a content analysis method was utilized. In order to measure the level of anti-corruption disclosures, based on the Directive's requirements, the existence of non-financial content items was examined, namely:

1. A description of the policies pursued by the undertaking in relation to anti-corruption
2. A description of the outcome of anti-corruption policies
3. A description of the principal risks related to the anti-corruption
4. A description of how the undertaking manages those risks related to the anti-corruption.

If the content item was present in the management commentary or standalone CSR report, it scored 1, and 0 otherwise.

As PAA as well as Directive do not favor any content item over another, we treat each item as equally important, and we used the same binary scoring for each item. This approach allowed us to evaluate the extent of anti-corruption disclosure made by companies. Further anti-corruption disclosure index (AC) was computed according to the following formula:

$$\text{AC disclosure index} = \frac{\text{Sum of scores obtained by company}}{\text{4 (total number of content items)}}$$

Independent and control variables together with their measurement approach are presented in table 1.

Table 1: Description of the independent and control variables

Variables	Description/measurement approach
Independent variables	
Directive 2014/95/EU (DIRECTIVE)	Dummy = 1 for 2017-2019, or 0 for 2014-2016.
Respect index (RESPECT)	Dummy = 1, if company is listed in Respect index, 0 otherwise
State owned enterprise (SOE)	Dummy = 1, if State is a shareholder of the company and 0 otherwise

Variables	Description/measurement approach
Foreign investor (FOREIGN)	Dummy = 1, if company has at least one foreign shareholder having more than 5% of shares and 0 otherwise
Control variables	
Risky industry (RISKY_IND)	Dummy = 1, if company is a member of a risky industry, according to TI's Bribe Payers Index (Transparency International, 2019), namely: oil and gas, basic materials (including forestry and mining), defense, capital goods, construction, telecommunications, and utilities sectors; 0 otherwise.
Company size (SIZE)	Value of assets in mln PLN

Source: own elaboration.

In terms of control variables, in line with previous studies (Blanc *et al.*, 2017; Sari *et al.*, 2020), this research employs company size and industry type as control variables as these variables may influence anti-corruption disclosure practices.

Method of analysis

Three basic types of models, pooled models (OLS), fixed-effects models (FE) and random-effects models (RE), were used to model panel data in the study. All models were estimated with robust (HAC) standard errors. The proposed model is given as:

$$AC_{it} = ß_0 + ß_{1,it}DIRECTIVE + ß_{2,it}RESPECT + ß_{3,it}SOE + ß_{4,it}FOREIGN + ß_{5,it}RISKY_IND + ß_{6,it}SIZE + \varepsilon_{it}$$

In this research, the significance of the differences between groups (clustered years) was tested using the Wilcoxon signed-rank test. According to Field (2018), the Wilcoxon signed-rank test is a nonparametric test that can be used in situations in which there are two sets of scores to compare, but these scores come from the same participants.

Results and discussion

Descriptive statistics are presented in Table 2. Among Polish listed companies, the level of anti-corruption disclosures varies from the minimum level of 0 to the maximum level of 1. The average AC is 0.52 indicating that there is a room for improvements in terms of disclosure extent. Standard deviation of AC is 0.43 suggesting that there is a high variability among Polish companies in terms of anti-corruption disclosure.

Tabela 2: Descriptive statistics

Variable	n	Minimum	Maximum	Mean	Median	Std. Deviation
AC	426	0.00	1.00	0.52	0.50	0.43
AC1	426	0.00	1.00	0.64	1.00	0.48
AC2	426	0.00	1.00	0.60	1.00	0.49
AC4	426	0.00	1.00	0.44	0.00	0.50
AC5	426	0.00	1.00	0.39	0.00	0.49
RESPECT	426	0.00	1.00	0.33	0.00	0.47
SOE	426	0.00	1.00	0.20	0.00	0.40
FOREIGN	426	0.00	1.00	0.47	0.00	0.50
RISKY_IND	426	0.00	1.00	0.45	0.00	0.50
SIZE (mln)	426	97.08	348044.00	26289.55	2154.09	56276.81

Source: own elaboration.

In table 3 we compare the mean AC index and its components before and after implementation of the Directive. The results indicate that in each case the change between clustered years are statistically significant (p-value<0.001). After implementation of the directive, the AC index, and all components increased significantly (mean increase: 203%, 196%, 218%, 208% and 190% respectively), however the variability among sample companies decreased but only in relation to AC index, AC1 and AC2 components which is reflected in decreasing SD (31%, 58% and 36% respectively). In terms of AC3 and AC4 the variability increased (SD increased 22% and 31% respectively) which is unexpected result. This result can be explained indicating that before Directive implementation companies do not disclose much about anti-corruption issues in general. After implementation of the Directive, in majority cases companies started reporting about anti-corruption policies and their outcomes (AC1 and AC2), but some of them do not treat their activity as corruption exposed and thus do not identify AC risks and how they mitigate those risks (AC3 and AC4).

Table 3: Comparison of the mean AC index and its components before and after implementation of the Directive (2014-2016 versus 2017-2019)

		AC		AC1		AC2		AC3		AC4	
Period	n	Mean	SD	Mean	SD	Mean	SD	Mean	SD	Mean	SD
Before implementation (2014-2016)	71	0.26	0.38	0.32	0.45	0.29	0.42	0.22	0.37	0.20	0,36
After implementation (2017-2019)	71	0.78	0.26	0.96	0.19	0.91	0.27	0.67	0.45	0.59	0,47
Change		203%	-31%	196%	-58%	218%	-36%	208%	22%	190%	31%

In order to verify developed hypotheses, the panel data analysis was utilized. Subsequent to running the necessary tests (F-test, Breush-Pagan test, Wald test, Hausman's test) for choosing the right model, the fixed-effect model with time fixed effect (FE model 2) was the most appropriate model for this research. Therefore, the results of the fixed-effect model 2 were considered for further discussion about the implications of the study (Table 4).

Table 4: Estimated coefficients from the panel data analysis covering years 2014 - 2019

** p<0.10. ** p<0.05. *** p<0.01. Source: own elaboration.*

According to the results, independent variables explained almost 60% of the variation in the dependent variable. Directive (DIRECTIVE) was found to have a positive significant effect on AC (b1 = 0.64; p-value<0.01), thus the first hypothesis (H1) is accepted.

The other independent variables namely RESPECT, SOE, FOREIGN have no statistically significant effect on AC, thus the H2, H3 and H4 cannot be accepted.

In terms of control variables, the current results show that size of the company (SIZE) and being a member of risky industry (RISKY_IND) have a statistically significant and negative impact on AC (b6 = -0.001; p-value<0,01; b5 = -0,18; p-value<0.01, respectively).

Conclusions, limitations, and future research agenda

This paper investigated anti-corruption reporting practices, by looking at both the extent of anti-corruption disclosure and the coercive determinants of that extent, in particular the potential pressure from the regulator that requires mandatory anti-corruption disclosure under the Directive. An examination indeed showed that the Directive enforcement is associated with the extent of anti-corruption disclosure. This extent increased significantly across all content items, namely anti-corruption policy, the outcome of this policy, the associated risks and their management after Directive implementation period. Hence, this finding supports the institutional theory, by providing empirical evidence of how firms responded to regulatory pressure to provide anti-corruption disclosure. Unexpectedly, other coercive variables namely inclusion in the Respect Index, government ownership and foreign ownership are not significant determinants of anti-corruption reporting. Thus, anti-corruption reporting practices in Polish setting are therefore partially explained by coercive isomorphism.

This study makes at least two major contributions to the literature. Firstly, this study examines the extent of anti-corruption reporting, a specific subset of CSR disclosure which is rarely mentioned in the social accounting literature, although anti-corruption disclosure is very important as it reflects the role of accounting in the fight against corruption. Secondly, it provides a deeper understanding of the manifestation of coercive pressures related to anti-corruption reporting. In particular, our study contributes to the understanding of the impact of Directive on anti-corruption disclosure practices by EU companies. In other words, it presents the contribution of accounting to the struggle against corruption.

Our research has important implications for governments because it revealed that companies responded positively to the regulator's pressure by increasing anti-corruption disclosure. Our research suggests that as a result of Directive, stakeholders should be provided with more complex information about company anti-corruption activities.

As with all research, there are limitations related to our study. Firstly, while the assumptions of the analysis made it possible to examine the extent to which companies report their anti-corruption commitment, it did not allow us to shed light on their actual commitment to anti-corruption efforts. Secondly, our study focuses on disclosure practices in one EU country and it gives no insight into how companies from different EU countries would respond to the pressure of mandatory regulation in the area of anti-corruption.

These limitations open up some possibilities for future research. Firstly, the future research could examine the link between the extent of anti-corruption disclosure and the actual level of corporate involvement in anti-corruption activities. Furthermore, the pressure from enforced Directive 2014/95/EU could be investigated across multiple UE countries.

Abstract

Purpose: This study aims to investigate whether making non-financial disclosures (NFD) obligatory affect their materiality by focusing on the differences in the materiality of NFD across companies listed on the Warsaw Stock Exchange over the period surrounding the implementation of the Directive 2014/95/EU (hereafter the Directive). **Design/methodology/approach:** To this purpose, we constructed a novel, hand-collected materiality index of NFD in line with the reporting requirements introduced by Directive. The sample comprised 71 selected listed companies over 6 years. **Findings**: The materiality of NFD have increased over the years of analysis. The implementation of the Directive positively influenced the materiality of non-financial information. **Originality**: Our study contributes to the understanding of the impact of Directive on the materiality of NFD. It has important implications for policy makers because it revealed that mandatory regulations form a crucial instrument in improving the materiality of NFD. Our research suggests that, due to Directive, stakeholders should be provided with more material non-financial information.

Keywords: materiality principle, relevance, quality of non-financial disclosure; non-financial reporting; Directive 2014/95/EU; ESG disclosure, sustainability disclosure

Introduction

Over past decade companies have faced increased institutional pressure to report more about their environmental and social impacts. In this context, multidimensionality of non-financial reporting is associated with greenwashing (Marquis *et al.*, 2016), information overload (Wu and Pupovac, 2019) and decreased decision usefulness to stakeholders (Slack and Tsalavoutas, 2018). These issues mainly relate to voluntary non-financial reports, which have been criticized for the lack of material information in them, for selective content and for highlighting the positive aspects of corporate performance (Wensen *et al.*, 2011). The call for a greater focus on materiality in this context is therefore considered an important and possibly the most effective remedy against these issues (Eccles and Krzus, 2015).

Among many key principles of non-financial reporting, materiality is the most significant and complex. This principle represents the driver through which companies can identify and select issues that are essential to be included in non-financial reports, thus favoring the expectations and needs of all stakeholders (Global Sustainability Standards Board, 2018). The concept of materiality, in fact, acts as a filter to the voluminous data while satisfying key stakeholders and provides a balance on „selective reporting" and „mechanized reporting" (Zhou, 2011). In this way, materiality principle may play an important role in non-financial reporting.

Materiality of disclosure is one of the fundamental principles of the non-financial reporting regime introduced by the Directive 2014/95/EU (Directive). As Baumüller and Schaffhauser-Linzatti (2018) highlight, in designing the Directive, the EU commission acknowledged the importance of the materiality of disclosure to avoid information overload stakeholders. However, in the context of these new reporting requirements, the concept of materiality is different from existing definitions in the field of similar reporting practices. Moreover, the presented concept is difficult to interpret due to the fact that there are different kinds of "materialities" to be found within the Directive itself.

According to the Directive, large companies (exceeding 500 employees) having headquarters in Member States are required to provide so-called "nonfinancial statement". Companies were expected to comply with the new disclosure requirements of the locally transposed laws by 2018.

In this study, we referred to mandatory reporting and we ask how Directive has impacted the materiality of non-financial reports provided by Polish listed companies? We focus on Poland as it has become one of the then 28 European Union (EU) countries that have transposed the Directive into their national legislation. Since then, non-financial statements are required among certain Polish enterprises by the Polish Accounting Act (PAA).

Empirical studies on the materiality of reports in the context of reporting obligations are rare in the literature to date. Several studies found an increase in overall non-financial reporting quality (Haji, 2013; Fatima *et al.*, 2015; Hąbek and Wolniak, 2016) including only one study (Hąbek and Wolniak, 2016) that used also relevance to proxy for reporting quality and documented that the legal obligation of non-financial disclosure (NFD) has a positive effect on the relevance of reports. However, this study compared voluntary reports with mandatory reports prepared in selected EU countries based on various national regulations in the field of non-financial reporting prior to introduction of the Directive. Thus, it did not examine the effectiveness of the new regulations in relation to materiality of NFD. Other studies found that a non-financial reporting mandate is associated with a decrease in quality (Pedersen *et al.*, 2013) and some studies did not draw a conclusion in either direction (Dumitru *et al.*, 2017).

These findings can be linked to institutional theory (DiMaggio and Powell, 1983), that provides ambiguous predictions concerning potential consequences of mandatory non-financial reporting on materiality as well as overall disclosure quality. According to this theory, companies' behavior is shaped by institutional forces which homogenize companies' practices (DiMaggio and Powell, 1983) including, but not limited to, NFD. This process called isomorphism is determined by coercive, mimetic and normative pressures. Due to the existence of various types of institutional isomorphism there is uncertainty about how companies will behave after the introduction of new mandatory regulations.

On the one hand, legislative pressure (coercive isomorphism) causes companies to adapt to new standards, to gain social legitimacy thus to provide high-quality information. However, companies are not passive players against these forces, and institutional theorists acknowledge that there is resistance to institutional demands and companies can even reject institutional expectations (Oliver, 1991). For example, due to regulations some companies may lose the opportunities to distinguish itself on the market and thus reduce the quality of the reports. Moreover, in some cases companies with passive sustainability strategies may tend to meet the minimum requirements of the regulation (compliance). In this way, companies can try to reduce reporting costs by "ticking the box" instead of reporting the most important issues and thus not focusing on quality. This is why coercive pressure can be a double-edged sword.

On the other hand, mimetic isomorphism suggests that the new mandatory regulations expose some companies to uncertainty about how to report under the new guidelines, causing these companies to imitate the reporting behavior of their peers' (e.g. more experienced in NFD) rather than disclosing information that is material to their stakeholders.

According to Gulenko (2018) some studies suggested such forces, however more research is needed to understand the forces behind companies' non-financial reporting behavior in response to new regulation. This call for new research is especially timely with regard to the materiality of the reports because there is almost no research in this area.

To bridge the gap in knowledge on the effect of mandate on materiality of non-financial reports, the purpose of the paper is to examine the effect of Directive implementation on materiality of NFD in Poland, the country that have introduced mandatory regulation on NFD for the first time.

To this purpose, it was useful to analyze NFD before and after the new legislation entered into force. To examine NFD, we used content analysis and developed a self-constructed materiality index applying the non-financial reporting regime introduced by the Directive.

The following three research questions are answered:

RQ1. To what extent are non-financial reports material?

RQ2. Whether there is a higher materiality of NFD because of Directive implementation?

RQ3. What are the specific materiality differences between reporting in the pre-implementation period and reporting in the post-implementation period?

The results indicate that there is statistically significant change in the materiality of NFD between the period before and after implementation of the Directive among Polish listed companies. Generally, implementation of the Directive has increased the level of materiality of NFD, but there is still room for significant improvements in particular in terms of providing materiality analysis, disclosing strategic approach to material non-financial issues in business model and including non-financial key performance indicators relevant to the particular business.

Our study contributes to the literature by developing a unique measurement tool namely a self-constructed materiality index applying the non-financial reporting regime introduced by the Directive. It also contributes to the understanding of the impact of Directive on materiality of NFD practices by EU companies. This research has also practical implications for policy makers, companies and its stakeholders.

The reminder of the paper is as follows: In Section 2, we analyze the concept of materiality according to the Directive requirements; Section 3 presents sample selection and methodology; Section 4 refers to the empirical findings and discussion while Section 5 presents concluding remarks.

Materiality based on the nonfinancial reporting requirements of the Directive 2014/95/EU

Overview

Despite the importance of materiality principle in both accounting in general and non-financial reporting, the Directive fails to define, and even mention, the concept of materiality (La Torre *et al.*, 2020). This is also clearly visible in the EU Guidelines 2017/C215/01 on non-financial reporting issued in 2017 (European Commission, 2017). The intent of these Guidelines "is to provide balanced and flexible guidance on reporting non-financial information in a way that helps companies to disclose material information consistently and coherently". Despite the unclear legal status of these Guidelines and its non-binding nature, they add clarity to the reporting requirements of the Directive and use a different, in some cases clearer, wording which directly relates to the term "materiality". However, these Guidelines also illustrate that the concept of materiality is not consistently applied to all requirements of the Directive and that several "types" of materiality are used, although closely related to each other (Baumüller and Schaffhauser-Linzatti, 2018).

Materiality in the context of the general provision for non-financial reporting (the minimum content and materiality matrix)

Art. 19a (1) of the Directive states: "Large undertakings […] shall include in the management report a non-financial statement containing information to the extent necessary for an understanding of the undertaking's development, performance, position and impact of its activity, relating to, as a minimum, environmental, social and employee matters, respect for human rights, anti-corruption and bribery matters […]".

It can be seen that there is the expression "information [...] necessary for understanding [...]" and not "material for". However, regarding this regulation, the EU Guidelines formulate a key non-financial reporting principle called "disclose material information". To clarify this principle, Guidelines refer to Art. 2 (16) of Directive 2013/34/EU, thus linking the materiality to the relevance of the information for users in making decisions.

Taking the above into account, quoted regulation in Art. 19a (1) of the Directive addresses three components of information which could possibly qualify for being material:

1. Information necessary for an understanding of the company's development, performance and position.
2. Information necessary for an understanding of the company's impact of its activity.
3. Information relating in each case to certain matters specified in the Directive.

Point 3 refers to material information on certain categories of issues that are clearly reflected in the Directive and should be disclosed as a minimum. These include: environmental, social and employee matters; respect of human rights; anti-corruption and bribery matters. The EU Guidelines explain that these set of issues refer to the breadth of information disclosed. However, the depth of information reported on a particular issue depends on its materiality. This means that the materiality of the information set is determined by points 1 and 2.

Point 1 relates directly to the general provision for the management report and links the reporting requirements of Art. 19a (1) to a strong financial perspective. Companies are required to report information that is relevant to their assets, liabilities, financial position and profit or loss. Thus, in this case, the materiality analysis is based on an outside-

in approach. It reflect how certain issues effect the company and issues are material depending on their ability to make such effects (Baumüller and Schaffhauser-Linzatti, 2018).

Point 2 introduces the new element to be taken into account when assessing the materiality of non-financial information namely impact of (the company's) activity. This element is specific to the sustainability reporting according to GRI standards, referring to the perspective of the company's stakeholders. In this context, GRI 101: Foundation 2016 (Clause 1.3) addresses to the following understanding of materiality: "Relevant topics, which potentially merit inclusion in the report, are those that can reasonably be considered important for reflecting the organization's economic, environmental, and social impacts, or influencing the decisions of stakeholders." Thus, two dimensions are distinguished, both of which can induce materiality independently: "influence" and "stakeholders". The combination of these two dimensions results in the so-called materiality matrix. This is the outcome of the materiality analysis, the process by which a company determines and prioritizes its relevant aspects and topics that need to be included in sustainability report (Bellantuono *et al.*, 2016). It is based on a list of topics that are potentially relevant, identified e.g. using interviews or checklist approaches. Thus, in this case, the materiality analysis is characterized by an inside-out approach. Topics are material if they reflect impact of the reporting organization on its stakeholders and the concept of sustainability as a whole (Baumüller and Schaffhauser-Linzatti, 2018).

Materiality in the context of nonfinancial KPIs

Art. 19a (1) (e) of the Directive requires the presentation of "non-financial key performance indicators relevant to the particular business" in the non-financial report. The EU Guidelines explain that the non-financial statement should contain material narratives and disclosures based on metrics commonly known as key performance indicators (KPIs). Further, the EU Guidelines encourage companies to disclose material KPIs, both general and sectoral (European Commission, 2017).

The requirement to present material KPIs relates to the matters included in the minimum content (in section 2.2). Moreover, as the EU Guidelines add, a company needs to disclose KPIs that are necessary to understand its development, performance, position and impact of its activity.

To meet this reporting requirement, first, a company needs to identify the material matters. Second, a company needs to identify possible non-financial KPIs for each of these matters, usually using a checklist approach. For each matter, the relevance of KPIs may differ. Thus, third, a company subsequently needs to judge the materiality of these possible KPIs in financial and stakeholder perspectives.

The materiality principle is expected to limit the number of KPIs to a reasonable amount. However, the wording of Art. 19a (1) (e) also suggests that each matter is to be supported by at least one KPI.

The role of stakeholder identification in the materiality analysis

The EU Guidelines outline the crucial role of stakeholder identification in the application of the materiality principle in non-financial reporting. They highlight that companies are expected to consider, as can be guessed, in the materiality process, the information needs of all relevant stakeholders. Companies should focus on the information needs of the stakeholders as a collective group and not on the needs or preferences of individual or atypical stakeholders or those with unjustified information demands. Where relevant, this may include, but is not limited to: investors, employees, consumers, suppliers, customers, local communities, public authorities, vulnerable groups, social partners and civil society (European Commission, 2017).

The materiality analysis is designed to meet the information needs of the company and its stakeholders, and in this respect is more effective if it can understand and capture the needs of the company's stakeholders. A proper understanding of these needs is essential to the effectiveness of non-financial reporting. This can explain the importance of the stakeholder identification process in the shift towards more material non-financial disclosure. Previous quantitative analysis conducted by Torelli *et al.* (2020) has shown that stakeholder engagement plays a fundamental role in the report production process, particularly in the materiality analysis itself.

It is not surprising then that the EU Guidelines recommend companies to provide material information on their engagement with relevant stakeholders, and how their information needs are taken into account.

Materiality and business model (strategy and objectives)

Art. 19a (1) (a) of the Directive requires the presentation of "a brief description of the undertaking's business model" in the nonfinancial report. The EU Guidelines add that this includes company's strategy and objectives. Disclosures

should provide insight into the strategic approach to relevant non-financial matters and explain the short, medium and long-term consequences of the information reported. Targets and benchmarks can be presented qualitatively or quantitatively. Where appropriate, companies may disclose material information based on scientific scenarios (European Commission, 2017). The new approach to materiality must focus on what is important to the business. But it needs to do so with a broader perspective to capture a long-term view of the problems that could affect the success of its strategy.

Materiality and consistency with other elements of the management reports

The materiality concept is expected to make the non-financial statement consistent with other elements of the management report. According to EU Guidelines the clear link between the information provided in the non-financial report and the other information disclosed in the management report makes the information more useful, relevant and cohesive (European Commission, 2017).

Research Methodology

Research sample and data collection

Our initial sample comprises of all firms listed on the WSE. To be included in our sample, companies have to meet the following criteria:

(1) They must be Polish companies (ISIN – PL)
(2) They must have been experienced in non-financial reporting at least in 2014.
(3) They have to fulfil criteria imposed by transposed Directive concerning employment, assets, and income for the period 2017-2019.
(4) They had to have required data for 2014-2019.

The final study sample was composed of 71 Polish companies (426 company-year observations).

The data concerning employment, assets, and income were obtained from the Notoria Service Database. The data concerning non-financial materiality data were hand-collected from non-financial statements being a separate section of management commentary (not stand-alone) or being a separate stand-alone report. In order to verify developed hypotheses our time scope is 2014-2019 and it covers the period before (2014-2016) and after (2017-2019) implementation of the Directive.

Non-financial materiality index

To quantify the materiality of NFD, a content analysis method was utilized. Following the Directive and its Guidelines (European Commission, 2017) analyzed in Section 2, we examined the existence of selected materiality items presented in Table 1.

Table 1: NFD materiality index and its components

Materiality items:			Measurement approach
MI1	**Materiality matrix**		1 = inclusion of materiality analysis with materiality matrix as part of the non-financial report; 0 = otherwise
MI2	**Non-financial KPIs**		1 = inclusion of non-financial KPIs relevant to the particular business; 0 = otherwise
MI3	NFD material matters sub-index (MMI)	Description of **environmental matters**	1 = existence of chapter or point about environmental matters; 0 = otherwise
MI4		Description of **employee matters**	1 = existence of chapter or point about employee matters; 0 = otherwise
MI5		Description of **human rights matters**	1 = existence of chapter or point about human rights matters; 0 = otherwise
MI6		Description of **social matters**	1 = existence of chapter or point about social matters; 0 = otherwise
MI7		Description of **anti-corruption and bribery matters**	1 = existence of chapter or point about anti-corruption and bribery matters; 0 = otherwise
MI8	**Sustainability strategy**		1 = inclusion of the strategic approach to relevant non-financial matters in business model; 0 = otherwise

Materiality items:		Measurement approach
MI9	**Targets for future**	1 = inclusion of targets for future with an explanation of the short-term, medium-term and long-term implications of NFD; 0 = otherwise
MI10	**Stakeholder's identification**	1 = existence of stakeholder's identification; 0 = otherwise
MI11	**Consistency with other elements of the management reports**	1 = clear links between the information presented in the non-financial statement and other information disclosed in the management report; 0 = otherwise

Source: own elaboration.

Each materiality item, in each company was scored separately. If the materiality item was present in the management commentary or standalone CSR report, it scored 1, and 0 otherwise. This approach allowed us to evaluate the selected materiality items for each company. As MI3-MI7 reflects the minimum content of material matters required by the Directive, we clustered them and computed the NFD material matters sub-index according to the following formula:

$$\text{NFD material matters sub-index (MMI)} = \frac{MI3 + MI4 + MI5 + MI6 + MI7}{5 \text{ (total number of materiality items MI3-MI7)}}$$

Further NFD materiality index (MI) was computed according to the following formula:

$$\text{NFD materiality index} = \frac{MI1 + MI2 + MI3 + MI4 + MI5 + MI6 + MI7 + MI8 + MI9 + MI10 + MI11}{11 \text{ (total number of materiality items)}}$$

Method of analysis

In this research, the significance of the differences between clustered years were tested using the Wilcoxon signed-rank test which is a nonparametric test that can be used in situations in which there are two sets of scores to compare, but these scores come from the same participants.

Results and Discussion

Descriptive statistics are presented in Table 2. Among sample companies the level of MI varies from the minimum level of 0.09 to the maximum level of 1. The average MI is 0.58 indicating that there is a room for improvements in terms of disclosure of material non-financial information. Standard deviation of MI is 0.31 suggesting that there is a high variability among Polish companies in terms of disclosure of material non-financial information. The highest mean values are for MI3-MI7 (0.92, 0.81, 0.69, 0.83, 0.65, respectively) indicating that the level of material content matters in sample companies is relatively high.

Table 2: Descriptive statistics

Materiality items	n	Minimum	Maximum	Mean	Median	Std. deviation
MI	426	0.09	1.00	0.58	0.64	0.31
MI1	426	0.00	1.00	0.27	0.00	0.44
MI2	426	0.00	1.00	0.39	0.00	0.49
MI3	426	0.00	1.00	0.92	1.00	0.27
MI4	426	0.00	1.00	0.81	1.00	0.39
MI5	426	0.00	1.00	0.69	1.00	0.46
MI6	426	0.00	1.00	0.83	1.00	0.37
MI7	426	0.00	1.00	0.65	1.00	0.48
MI8	426	0.00	1.00	0.21	0.00	0.41
MI9	426	0.00	1.00	0.54	1.00	0.50
MI10	426	0.00	1.00	0.50	1.00	0.50

Materiality items	n	Minimum	Maximum	Mean	Median	Std. deviation
MI11	426	0.00	1.00	0.52	1.00	0.50

Source: own elaboration.

According to Figure 1, all materiality items have increased over the years of analysis, which is a positive trend. Moreover, the increase within period before implementation of the Directive is visibly lower comparing with the increase after implementation. This suggests that implementation of the Directive could have a positive impact on materiality of non-financial information. This initial conclusion is confirmed taking into consideration the results of further analysis presented in Figure 2. The results indicate, that there is significant difference between the mean MI before and after implementation of the Directive. In order to assess the statistical significance of the changes between the clustered years before and after implementation of the Directive for MI and all materiality items Wilcoxon signed-rank test was utilized. As presented in Table 3, the Wilcoxon test showed statistically significant differences between the MI before and after implementation of the Directive (Z=6.89, p-value<0.001). Moreover, the variability of disclosure of material non-financial information decreased which is a positive trend (MI standard deviation decreased -31%). In terms of the materiality items, the Wilcoxon signed-rank test confirmed the statistical significance of the differences between the clustered years for all MI components. The highest increase is observed around MI8 (219%) and the lowest round MMI (76%). Therefore, it can be noted that the implementation of the Directive positively influenced the materiality of non-financial reports.

Conclusions, limitations, and Future Research Agenda

The principle of materiality can play an important role in non-financial reporting by countering information overload and greenwashing.

In this paper, focusing on the evaluation of the materiality of NFD in Poland over the period surrounding the implementation of the Directive, we investigated whether making non-financial disclosures obligatory affect their materiality.

We found that the NFD of Polish WSE companies are increasingly material and that the Directive has significantly increased its materiality. However, there is still space for improvements in particular in terms of providing materiality analysis, disclosing strategic approach to material non-financial issues in business model and including non-financial key performance indicators relevant to the particular business. Hence, this study supports the institutional theory, especially coercive isomorphism in the form of regulatory pressure. However, this pressure is not very strong because companies are still resisting it.

Our study has important theoretical and practical implications. It contributes to the non-financial disclosure literature. First, we developed a self-constructed materiality index applying the non-financial reporting regime introduced by the Directive. Our framework conceives materiality as a multidimensional construct, constituted of the various types of materiality resulting from the analysis, contextualization and interpretation of the relevant sections of Directive and EU Guidelines. Second, our study contributes to the understanding of the potential impact of Directive on materiality of NFD practices by EU companies. Third, it adds to widen the empirical researches addressed to investigate the materiality of NFD in mandatory context.

This research has also implications for policy makers, companies and its stakeholders. First, it revealed that mandatory regulations are a crucial instrument for policy makers in improving the materiality of NFD. It also showed that there is a scope for the national government to introduce further guidance for companies to ensure higher materiality of NFD leading to higher quality of disclosures. Second, our assessment tool created for measuring the materiality of non-financial reports can also help those companies that are willing to self-assess their non-financial reports and/or improve their reporting process. Third, our research suggests that as a result of Directive, stakeholders should be provided with more material information.

Our research has several limitations that should be noted. The Directive is not the only one factor affecting the materiality of NFD. There may be other institutional forces impacting the materiality of NFD, especially mimetic isomorphism. Moreover, the impact of the Directive on the non-financial reporting of companies from other EU countries may be potentially different. Future research should consider extend our research along each of above-mentioned limitations.

Abstract

Purpose: This study investigated the differences in the reliability of non-financial disclosure (NFD) across companies listed on the Warsaw Stock Exchange over the period surrounding the implementation of the Directive 2014/95/EU (Directive). **Design/methodology/approach**: To this purpose, we constructed a novel, hand-collected NFD reliability index in line with the reporting requirements introduced by Directive. The sample comprised 71 selected listed companies over 6 years. **Findings**: The reliability of NFD have significantly increased over the years of analysis. The implementation of the Directive positively influenced the reliability of non-financial information. **Originality**: Our study contributes to the understanding of the impact of Directive on the NFD practices by European Union companies. Our research has important implications for policy makers because it revealed that mandatory regulations form a crucial instrument in improving the reliability of NFD. Our research suggests that, due to Directive, stakeholders should be provided with more reliable non-financial information.

Keywords: reliability principle; credibility, CSR disclosure; Directive 2014/95/EU; non-financial disclosure; ESG disclosure; sustainability disclosure

Introduction

There is a growing global stakeholder pressure for reliable non-financial disclosures (NFD) provided by companies. Nowadays, we can observe that the number of non-financial reports or CSR reports increase, however, their quality in particular reliability, is different. These reports do not always provide stakeholders with expected information which in turn rises reliability problems such as lack of comparability of information or difficulties in evaluation of NFD. These problems are getting worse as there is still no single, commonly accepted standard according to which NFD should be developed (Hąbek, 2013).

The above-mentioned NFD quality problems motivated European Union (EU) to issue Directive 2014/95/EU (Directive), which has been transposed into law for all EU Member States, with the objective to "increase investors and consumers trust" (European Union, 2014). According to the Directive large public interest entities and groups should issue a non-financial statement, disclosing to their stakeholders the main corporate non-financial information, i.e. "information to the extent necessary for an understanding of the undertaking's development, performance, position and impact of its activity, relating to, as a minimum, environmental, social and employee matters, respect for human rights, anti-corruption and bribery matters, including: (a) a brief description of the undertaking business model; (b) a description of the policies pursued by the undertaking in relation to those matters; (c) the outcome of these policies; (d) the principal risks related to these matters including how the undertaking manage those risks; (e) relevant non-financial key performance indicators" (Matuszak and Różańska, 2017).

In this study, we referred to mandatory reporting and we ask how Directive has impacted the reliability of non-financial reports provided by Warsaw Stock Exchange (WSE) companies?

Research on the reliability of reports in the context of reporting obligations is at a nascent stage in the literature. Several studies found an increase in overall non-financial reporting quality (Frost, 2007; Damak-Ayadi, 2011; Haji, 2013; Fatima *et al.*, 2015; Hąbek and Wolniak, 2016; Mion and Loza Adaui, 2019; Mazzotta *et al.*, 2020). However,

Cite this Article as: Łukasz MATUSZAK and Ewa RÓŻAŃSKA " The Impact of Directive 2014/95/EU Implementation on Reliability of Non-Financial Information – Empirical Evidence from CEE Country" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

only three of them (Hąbek and Wolniak, 2016; Mion and Loza Adaui, 2019; Mazzotta *et al.*, 2020) used credibility to proxy for reporting quality. Hąbek and Wolniak (2016) documented that the legal obligation of NFD has a positive effect on the credibility of reports in selected EU countries prior to introduction of the Directive. Similarly, Mion and Loza Adaui (2019) showed statistically significant differences for the dimension of credibility of reports in Italian and German companies after the implementation of the Directive. Other studies found that a non-financial reporting mandate is associated with a decrease in quality (Pedersen *et al.*, 2013; Vormedal and Ruud, 2009) and some studies showed inconclusive results (Dumitru *et al.*, 2017; Lock and Seele, 2016), including only one study that was focused entirely on credibility (Lock and Seele, 2016). Lock and Seele (2016) operationalized the credibility of reports through the four aspects truth, sincerity, appropriateness and understandability. They fund that the regulatory context did not impact reporting credibility of European companies. Mandatory reporting of CSR in France and Spain did not consistently benefit reporting credibility.

These findings can be linked to institutional theory (DiMaggio and Powell, 1983), that provides ambiguous predictions concerning potential consequences of mandatory non-financial reporting on reliability as well as overall disclosure quality. According to this theory, companies' behavior is shaped by institutional forces which homogenize companies' practices (DiMaggio and Powell, 1983) including, but not limited to, NFD. This process called isomorphism is determined by coercive, mimetic and normative pressures. Due to the existence of various types of institutional isomorphism there is uncertainty about how companies will behave after the introduction of new mandatory regulations.

On the one hand, legislative pressure (coercive isomorphism) causes companies to adapt to new standards, to gain social legitimacy thus to provide high-quality information. However, companies are not passive players against these forces, and institutional theorists acknowledge that there is resistance to institutional demands and companies can even reject institutional expectations (Oliver, 1991). For example, due to regulations some companies may lose the opportunities to distinguish itself on the market and thus reduce the quality of the reports. Moreover, in some cases companies with passive sustainability strategies may tend to meet the minimum requirements of the regulation (compliance). In this way, companies can try to reduce reporting costs by "ticking the box" instead of providing reliable reports and thus not focusing on quality. This is why coercive pressure can be a double-edged sword.

On the other hand, mimetic isomorphism suggests that the new mandatory regulations expose some companies to uncertainty about how to report under the new guidelines, causing these companies to imitate the reporting behavior of their peers' (e.g. more experienced in non-financial reporting) rather than disclosing information that can build trust among their stakeholders.

According to Gulenko (2018) some studies suggested such forces, however more research is needed to understand the forces behind companies' non-financial reporting behavior in response to new regulation. This call for new research is especially timely with regard to the reliability of the reports because there is little research in this area.

To bridge the gap in knowledge on the effect of mandate on reliability of non-financial reports, the purpose of the paper is to examine the effect of Directive implementation on reliability of NFD in Poland, the country that have introduced mandatory regulation on NFD for the first time. To address this purpose, we used content analysis method and examined NFD of 71 Polish companies listed on WSE, for the years 2014-2019, to construct NFD reliability index. The results indicate that there is statistically significant change of the reliability of NFD between the period before and after implementation of the Directive among Polish listed companies. Generally, implementation of the Directive has increased the level of reliability of NFD but there is still room for significant improvements in particular in terms of comparisons in time and between entities as well as external assurance of NFD. To the best of our knowledge this study is the first investigating the impact of mandatory regulation on reliability of NFD in Poland.

We assumed that our study contributes to the understanding of the potential impact of Directive on reliability of NFD practices by EU companies. This research has important implications for policy makers since it revealed that mandatory regulations are a crucial instrument in improving the reliability of NFD. Our research suggests that in order to improve reliability of NFD, regulations should go further and expect at least, that NFD to be externally assured. Stakeholders that will be provided with more reliable NFD could be encouraged to use it in their decision-making processes to a greater extent.

The reminder of the paper is as follows: In Section 2, we analyze the concept of reliability according to the Directive and EU Guidelines; Section 3 presents sample selection and methodology. Section 4 refers to the empirical findings and discussion while Section 5 presents concluding remarks.

Reliability of the non-financial information required by the Directive 2014/95/EU and EU Guidelines

Overview

As it is mentioned above the main objective of the Directive is to "increase investors and consumers trust". According to Cambridge Dictionary (Cambridge Dictionary, 2020), trust is "to believe that someone is good and honest and will not harm you, or that something is safe and reliable" This definition indicates specific features of trust which are being safe and reliable. Relating this feature to information we could say that if the non-financial information is aimed at rebuilding investors and consumers trust it should be safe and reliable. In this sense reliability of non-financial information is a central point of the Directive and in the same time its final goal. Despite the importance of reliability feature for, both accounting in general and non-financial reporting, the Directive fails to define, and even mention, the feature of reliability.

Following Article 2 of the Directive, the European Commission prepared non-binding guidelines on methodology for reporting non-financial information, including non-financial KPIs, general and sectoral, with a view to facilitating relevant, useful and comparable disclosure of non-financial information by undertakings. The Guidelines refer to the expected quality of NFD indicating principles/dimensions that should be followed in order to build reliable non-financial information. The EU Guidelines 2017/C215/01 on non-financial reporting were issued in 2017 (European Commission, 2017). Despite the unclear legal status of these Guidelines and its non-binding nature, they add clarity to the reporting requirements of the Directive and use a different, in some cases clearer, wording which directly and indirectly relates to the term reliability feature. In this research we used content analysis and developed a self-constructed NFD reliability index applying the non-financial reporting regime introduced by the Directive and based on EU Guidelines.

In order to develop NFD reliability index we have analyzed the guidelines and checked where the regulator refers to reliability issue. Based on the analysis we selected reliability items which were included to our NFD reliability index.

Previous literature employed various methods to assess the reliability of non-financial reports. For example Lock and Seele (2016) as well as Mazzotta *et al.* (2020) operationalized credibility based on Habermas communication theory, by four constructs, namely understandability, being a precondition of credibility, truth, sincerity, appropriateness. Mion and Loza Adaui (2019) measured credibility index based on seven components: adoption of sustainability reporting guidelines, evidence of independent verification or assurance; evidence of stakeholder engagement, description of instruments used for stakeholder engagement in sustainability reporting process, availability of quantitative data about sustainability expenditures and performance and inclusion of a materiality analysis as part of the sustainability report. While Hąbek and Wolniak (2016) measured credibility index based on six categories namely: readability, basic reporting principles, quality of data, stakeholder dialogue outcomes, feedback, independent verification. None of above-mentioned research used Directive requirements to proxy for the reliability.

Reliability and understandability

Point 3.2 relates to "Fair, balanced and understandable" principle which is mostly linked with reliability issue. First it should be stressed that Guidelines place understandability together with fairness. This logic is fully supported by the communication theory where understandability has a special place in the credibility concept: It is a necessary precondition to enter discussions on credibility (Lock and Seele, 2016). In this context we can state, that to be reliable, non-financial information shall be understandable first. The Guidelines indicate the ways how to enhance understandability of non-financial information. The suggested activities are as follows:

- using plain language and consistent terminology, avoiding boilerplate, and, where necessary, providing definitions for technical terms,
- explaining key internals of the information disclosed, such as measurement methods, underlying assumptions and sources,
- disclosing both qualitative and quantitative information. While quantitative information may be effective in reporting some non-financial issues (KPIs, targets, etc.), qualitative information provides context and makes the non-financial statement more useful and easier to understand. A combination of narrative reporting, quantitative information and visual presentation supports (graphs, diagrams, charts, etc.) effective and transparent. According to study by Helfaya et al. (2019) the preparers and users of a company's environmental report perceived the use of visual tools a one of the most significant dimensions/features of reporting quality.

In this research according to the Guidelines understandability is proxied by three variables namely: (1) availability of visual presentations about NFD (visual tools), (2) evidence that information uses plain language and consistent terminology, avoiding boilerplate, and, where necessary, providing definitions for technical terms (readability), (3) availability of a description of measurement methods, underlying assumptions and sources (quality of data).

Reliability and being fair

Point 3.2 of EU Guidelines indicate, that non-financial information can be made fairer and more accurate through, for example:

- appropriate corporate governance arrangements (for instance, certain independent board members or a board committee entrusted with responsibility over sustainability and/or transparency matters),
- robust and reliable evidence, internal control and reporting systems;
- effective stakeholder engagement; and
- independent external assurance.

According to report of Irwin and McGill (2018) users of non-financial information (in particular investors) want to have a confidence in its reliability. The key element that contribute to their confidence, among the others, is external assurance. When the information is assured by an independent third party, users can have more confidence in the information, although it may not necessarily change how they use it. Moreover, the third party's expert view can influence the perception of management and the board in terms of their attitude and approach to controls, risk management and governance.

In this research according to the Guidelines being fair is proxied by the evidence that non-financial information is externally assured.

Reliability and comparability

Point 3.6 of EU Guidelines indicates that the content of the non-financial report should be consistent over time. This enables users of information to understand and compare past and present changes in a company's development, position, performance and impact, and relate reliably to forward-looking information (European Commission, 2017). Further, EU Guidelines highlight, that consistency in the choice and methodology of KPIs is important to ensure that the non-financial statement is understandable and reliable. KPIs should be used consistently from one reporting period to the next in order to provide reliable information on progress and trends. In this context existence of in-time comparisons should enhance reliability of non-information since it increases users understanding of the given phenomena and supports them in drawing better conclusions.

In this research comparability is proxied by availability of comparisons in time in NFD (consistent over time).

Research Methodology

Research sample and data collection

Our initial sample comprises of all firms listed on the WSE. To be included in our sample, companies have to meet the following criteria:

(1) They must be Polish companies (ISIN – PL)
(2) They must have been experienced in non-financial reporting at least in 2014.
(3) They have to fulfil criteria imposed by transposed Directive concerning employment, assets, and income for the period 2017-2019.
(4) They had to have required data for 2014-2019.

The final study sample was composed of 71 Polish companies (426 company-year observations).

The collected data are grouped in two categories: (1) data concerning employment, assets, and income comprised of the absolute values; and (2) non-financial reliability data used to calculate the statistics. The data from the first group were obtained from the Notoria Service Database. The data from the second group were hand-collected from non-financial statements being a separate section of management commentary (not stand-alone) or being a separate stand-alone report. In order to verify developed hypotheses our time scope is 2014-2019 and it covers the period before (2014-2016) and after (2017-2019) implementation of the Directive.

Non-financial reliability index

To quantify the reliability of NFD, a content analysis method was utilized. Following the Directive's guidelines (European Commission, 2017), we examined the existence of selected reliability items presented in Table 1.

Each reliability item, in each company was scored separately. If the reliability item was present in the management commentary or standalone CSR report, it scored 1, and 0 otherwise. In order to decrease the subjectivity of this evaluation, we employed cross-check analysis (scores given by one author were checked independently by the second author and conversely). Discrepancies across members of the research team were discussed and reconciled. This approach allowed us to evaluate the selected quality principles for each company. NFD reliability index (RI) was computed according to the following formula:

$$\text{NFD reliability index} = \frac{RI1 + RI2 + RI3 + RI4 + RI5}{5 \text{ (total number of reliability items)}}$$

Table 1: NFD reliability index and its components

Reliability items:		Measurement approach
RI1	**Visual tools**	1 = use of visual presentation in NFD, e.g. graphs, diagrams, charts, etc. ; 0 = otherwise
RI2	**Readability**	1 = evidence that information uses plain language and consistent terminology, avoiding boilerplate, and, where necessary, providing definitions for technical terms of definitions of technical terms; 0 = otherwise
RI3	**Quality of data**	1 = existence of at least one item: a description of measurement methods or underlying assumptions or sources; 0 = otherwise
RI4	**Consistent over time**	1 = existence of comparable non-financial information; 0 = otherwise
RI5	**Assurance**	1 = evidence that non-financial information is externally assured; 0 = otherwise

Source: own elaboration.

Method of analysis

In this research, the significance of the differences between years and/or groups was tested using the Wilcoxon signed-rank test which is a nonparametric test that can be used in situations in which there are two sets of scores to compare, but these scores come from the same participants.

Results and Discussion

Descriptive statistics are presented in Table 2. Among Polish sample companies the level of RI varies from the minimum level of 0 to the maximum level of 1. The average RI is 0.32 indicating low level of reliability of non-financial information. This suggest that there is a still room for improvements in terms of reliability of non-financial information. Standard deviation of RI is 0.30 suggesting that there is a high variability among Polish companies in terms of reliability of NFD. In terms of reliability items, the highest mean RI4 (mean=0,52) which indicate that on average 52% of companies disclose comparable information in their non-financial statements.

Table 2: Descriptive statistics

Variable	n	Minimum	Maximum	Mean	Median	Std. deviation
RI	426	0.00	1.00	0.32	0.20	0.30
RI1	426	0.00	1.00	0.48	0.00	0.50
RI2	426	0.00	1.00	0.36	0.00	0.48
RI3	426	0.00	1.00	0.15	0.00	0.36
RI4	426	0.00	1.00	0.52	1.00	0.50
RI5	426	0.00	1.00	0.11	0.00	0.31

Source: own elaboration.

According to Figure 1, the mean RI level as well as almost all its components (except RI5) have increased over the years of analysis, which is a positive trend. Moreover, the increase within period before implementation of the Directive is visibly lower comparing with the increase after implementation. This suggests that implementation of the Directive could have a positive impact on reliability of NFD. Surprisingly, RI5 level decreased over the years of analysis. In 2014 approximately 20% of sample companies verified their non-financial statement by external auditor. In the period 2015-2017 the share of such companies decreased to around 10%, and in 2019 non-financial statements were not assured. This indicate that after Directive implementation sample companies refrain from verifying NFD by external auditor.

Figure 1: Development of the mean RI and its components

Source: own elaboration

Figure 2 and Table 3 presents a comparison of the mean RI across the years of analysis. The results on the graph indicate that there is significant difference between the mean RI in years before and years after implementation of the Directive (Figure 2). Moreover, in order to assess the changes between the years, Wilcoxon singed-rank test was utilized. The test confirms that mean RI between the years before and after implementation of the Directive differs significantly (p-value<0.001) (Table 3 – three stars). This difference cannot be observed within the years before and after implementation of the Directive.

Table 3: Comparison of the mean RI across the years of analysis

Years	RI_2014		RI_2015		RI_2016		RI_2017		RI_2018	
	Z	Sig.	Z	Sig.	Z	Sig.	Z	Sig.	Z	Sig.
RI_2015	0.2									
RI_2016	0.4		0.3							
RI_2017	4.8	***	5.1	***	5.1	***				
RI_2018	5.8	***	5.8	***	5.9	***	2.6	**		
RI_2019	5.7	***	5.7	***	5.9	***	2.2	**	1.2	

*** p<0.05, *** p<0.001. Source: own elaboration.*

Figure 2: Comparison of the mean RI across the years of analysis

Source: own elaboration.

In order to assess the statistical significance of the changes between the clustered years before and after implementation of the Directive for RI and all reliability items Wilcoxon signed-rank test was utilized. As presented in Table 4, statistically significant differences can be observed between the RI before and after implementation of the Directive ($Z = 6.30$, p-value<0.001). The RI increased by 147% between clustered years having standard deviation on almost the same level. This indicate that relative variability decreased which is a positive trend. In terms of reliability items, the Wilcoxon signed-rank test confirmed the statistical significance of the differences between clustered years for each RI component. The highest increase is observed around RI2 (208%) and the lowest round RI4 (176%). In general, it can be noted that the implementation of the Directive positively influenced the reliability of non-financial information. The improvement in the reliability of non-financial reporting is in line with Hąbek and Wolniak (2016) and Mion and Loza Adaui (2019) findings.

Table 4: Comparison of the mean RI and its components before and after implementation of the Directive (2014-2016 versus 2017-2019)

		RI		RI1		RI2		RI3		RI4		RI5	
Period	**n**	**Mean**	**Std. dev.**	**Mean**	**Std. dev.**	**Mean**	**Std. dev.**	**Mean**	**Std. dev.**	**Mean**	**Std. dev.**	**Mean**	**Std. dev.**
Before implementation (2014-2016)	71	0.19	0.25	0.25	0.41	0.18	0.36	0.08	0.26	0.28	0.41	0.15	0.22

Conclusions

In this analysis, we examined whether the reliability of NFD provided by Polish listed companies has changed over the period surrounding the implementation of Directive. The undertaken analysis allowed us to confirm the statistically significant change of reliability of NFD between the analyzed periods. Generally, implementation of the Directive has increased the level of reliability of NFD but there is still room for significant improvements in particular in terms of comparisons in time and between entities as well as external assurance of NFD.

We assumed that our study contributes to the understanding of the potential impact of Directive on reliability of NFD practices by EU companies. This research has important implications for policy makers since it revealed that mandatory regulations are a crucial instrument in improving the harmonization of legislation of NFD. Our research suggests that as a result of Directive, stakeholders should be provided with more comparable and externally assured information. This could encourage them to use NFD in their decision-making processes to a greater extent.

Our research has several limitations that should be noted. In terms of measurement instrument developed for this study, we used binary codding scheme instead of rating scale. We focused only on the Polish setting. The impact of the Directive on the non-financial reporting of companies from other EU countries may be potentially different. Future research should consider extend our research along each of above-mentioned limitations.

Abstract

Purpose: This study examined human rights reporting practices across companies listed on the Warsaw Stock Exchange, by looking at both the extent of human rights disclosure and the coercive determinants of that extent, in particular the potential pressure from the regulator that requires mandatory human rights disclosure under the Directive 2014/95/EU (Directive). **Design/methodology/approach**: The sample comprised 71 selected listed companies over 6 years Content analysis was used to measure the extent of human rights disclosure. Panel data analysis was undertaken and the econometric random effect model was estimated. **Findings:** The Directive enforcement is associated with the extent of human rights disclosure. Also, inclusion in the Respect Index is positively related to human rights reporting, while UN Global Compact participation did not turn out to influence human rights reporting. **Originality**: Our study contributes to the understanding of the impact of Directive and other coercive variables on human rights disclosure, a specific subset of CSR reporting. In particular, it presents the contribution of accounting in promoting human rights and effective enforcement of corporate responsibility for respecting human rights.

Keywords: Human Rights Disclosure; CSR Disclosure; Non-Financial Disclosure; ESG Disclosure; Sustainability Disclosure; Directive 2014/95/EU

Introduction

The United Nation (UN) vision of the role of enterprises in human rights was realized by introducing the Guiding Principles of Business and Human Rights in 2011. Reaffirming the role of the state as a defender of human rights, it also defines the role of enterprises as those that should respect human rights, regardless of state obligations (McPhail and Ferguson, 2016). Despite the better recognition of human rights as a business issue in corporate reporting in recent years, especially in Western European, companies most reports remain silent about human rights policies or their performance (KPMG, 2017). There is also the gap between reporting on identified human rights risks and disclosure on what companies do about such risks (Frank Bolt, 2019).

Accounting literature generally show that, overall, human rights disclosure practices around the world are still underdeveloped (Christ et al. 2019; Cubilla-Montilla et al. 2019), especially when compared with other CSR aspect disclosure practices (Matuszak and Różańska, 2017). Previous studies also shows that companies failed to adhere to GRI's 'labour' and 'human rights' reporting guidelines (Parsa *et al.*, 2018). This may be explained by the fact that soft disclosure regulations give these companies grounds to avoid improvements in their human rights reporting (Islam and Jain, 2013) and that human rights obligations should be made mandatory rather than considered as a duty of care (Lauwo and Otusanya, 2014).

The rationale behind hard regulation is that disclosure can play a significant role in promoting human rights and fulfilling corporate responsibility to employees and the workforce in companies' value chains (Gallhofer *et al.*, 2011). Similarly, Gallhofer *et al.* (2011) stress the importance of governance in promoting and protecting human rights and emphasize that accounting through disclosure can play a significant role in this process.

Cite this Article as: Łukasz MATUSZAK and Ewa RÓŻAŃSKA " Human Rights Disclosure under Increasing Coercive Pressure: An Examination of the role of Directive 2014/95/EU" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

In recent years, the European Union (EU) reached an important milestone in the enhancement of the transparency of listed companies' CSR aspects when EU issued its Directive 2014/95/EU (European Union, 2014) to require large companies with an average of 500 or more employees to disclose non-financial information.

Large listed companies need to disclose, among others, information on human rights matter. More specific, for this matter, companies must disclose a description of their human rights policy including the due diligence processes implemented, the outcomes of this policy, principle human rights risks, and their management on a "comply or explain" basis, with considered reasons for non-disclosure. The Directive 2014/95/EU (Directive) is the first reporting regulation to explicitly mention human rights. Companies were expected to comply with the new disclosure requirements of the locally transposed laws by 2018.

Mandatory reporting on human rights can successfully provide the necessary impetus for the effective enforcement of corporate responsibility for respecting human rights. The question of whether the Directive fully succeeds in fulfilling this role, however, cannot be answered in an unqualified affirmative way (de Roo, 2015) and without empirical evidence.

Our quantitative study is motivated by this still unanswered question and provide an evidence on the role of Directive in human rights reporting.

An examination of pressure from regulators on companies to disclose human rights issues can be made within the framework of the coercive isomorphism, a particular subset of institutional theory. The rationale is that this specific principle reflects pressures from powerful stakeholder groups, including regulators (DiMaggio and Powell, 1983). Previous studies on human rights have tested the pressure from different institutional sources (Flynn and Walker, 2020; Cubilla-Montilla *et al.*, 2019), but so far have failed to take into account the pressure from mandatory accounting rules (Hubers and Thijssens, 2020).

Therefore, in this study, we referred to coercive isomorphism and we ask how Directive pressure has shaped human rights disclosure provided by listed companies in Poland. Poland has become one of the then 28 EU countries that have transposed the Directive into their national legislation. Since then, human rights disclosures are required among certain Polish enterprises by the Polish Accounting Act (PAA). In addition, there was no prior reporting legislation on human rights in Poland. We focused on the country of Eastern Europe as companies from this region, are much less likely to acknowledge human rights as a business issue than companies in Western Europe (KPMG, 2017).

To fill the existing literature gap, this paper examines human rights reporting practices of Polish listed companies, by looking at both the extent and the coercive determinants of that extent, in particular the potential pressure from the regulator that requires mandatory human rights disclosure under the Directive.

In order to explore the research question, we analyzed the human rights using a content analysis and binary disclosure index in both management reports and, where issued, stand-alone reports for a sample of 71 companies listed on the Warsaw Stock Exchange (WSE). Our analysis shows that the extent of the human rights disclosure across all content items increased significantly after Directive implementation period compared to the period before implementation. The findings reveal that the Directive enforcement is associated with the extent of human rights disclosure. Also, inclusion in the Respect Index is positively related to human rights reporting, while UN Global Compact participation did not turn out to influence human rights reporting.

Thus, the current paper makes several important contributions to the scant literature on human rights responsibilities, a specific subset of CSR reporting. In particular, we assume that our study contributes to the understanding of the impact of Directive on human rights disclosure that reflects the role of accounting in promoting human rights and in meeting corporate responsibility to employees and workforce in corporate value chains.

We begin with literature review, theoretical background and hypothesis development, followed by the methods, results, and conclusion.

Literature Review and Hypothesis Development

Literature Review

The accounting through disclosure can play a significant role in promoting and protecting human rights (Gallhofer *et al.*, 2011). However, this specific issue of CSR reporting has not yet become a focus area for social and environmental accounting researchers. To date, there is little but growing research on human rights disclosure an integral part of CSR reporting.

First, there are scant empirical studies which generally show low level of human rights disclosure (Islam and Jain 2013; Matuszak and Różańska 2017; Cubilla-Montilla et al. 2019; Christ et al. 2019). For example, Islam and Jain (2013) focus on major Australian garment and retail companies and found a low level of human rights disclosures. Christ *et al.* (2019) gathered evidence about modern slavery disclosure by the top 100 Australian listed companies and documented that the volume and quality of disclosures are low. In Polish setting, Matuszak and Różańska (2017) stated that among others CSR matters, human rights deserve careful attention, as it is not disclosed by most companies listed on WSE and a large number of companies still have a considerable amount of work to do in order to improve the level of reporting in the area of human rights.

Second, interestingly, most of previous studies examine pressure from different institutional sources on companies to disclose human rights issues. In particular, Cubilla-Montilla et al. (2019) stated that society's cultural values as a normative institutional pressure are currently insufficient to increase information on the practices that companies undertake in relation to commitments to human and labour rights. A study by Christ *et al.* (2019) helps to understand the institutional pressures that currently drive the behavior of companies in relation to modern slavery issues. In more detail, the response of the sampled Australian companies to increasing pressure to report on their efforts to combat modern slavery practices remains very marginally in line with the concepts of mimetic and normative institutional pressures. This support the idea that legislation is needed to encourage further engagement. In line with coercive institutional pressure Islam and McPhail (2011) explored the role that International Governmental Organizations such as the ILO may have played in human rights disclosures. While, Parsa *et al.* (2018) examines how successful the GRI has been in enhancing comparability and transparency of 'labour' and 'human rights' reporting.

In fact, previous literature failed to take into account the pressure from mandatory accounting rules that are considered one of coercive institutional factors. Hubers and Thijssens (2020) made an attempt to assess the potential impact of the EU non-financial reporting regulation on human rights disclosures among Dutch financial services listed companies. However, the results of regression analyses, in which they control for time trends, show that in fact, there is no such effect. The lack of statistically significant results may be due to numerous limitations of the study, including a small research sample.

To fill the existing literature gap, this paper examines human rights reporting practices of Polish listed companies, by looking at both the extent of human rights disclosure and the determinants of that extent, in particular the potential pressure from the regulator that requires mandatory human rights disclosure under the Directive.

Theoretical Framework

The question of how human rights disclosure provided by companies are shaped can be addressed through institutional theory that has been cited many times in the accounting literature (Islam and McPhail, 2011; Christ *et al.*, 2019). The theory is considered appropriate for this question as it provides a theoretical explanation of how firms respond to institutional forces to undertake particular activities (DiMaggio and Powell, 1983; Flynn and Walker, 2020), including human rights disclosure practices. For example, regulators and civil society groups can coerce companies to act in certain ways, professional organizations exert a normative influence over companies, and interactions with peers lead companies to imitate each other (DiMaggio and Powell, 1983). Within the framework of coercive isomorphism, a particular subset of institutional theory, an organization provides disclosure as a response to pressures from influential stakeholders (Deegan, 2014). Powerful institutions that can pressure an organization to adopt specific disclosure practices include governments, certification body, and politically powerful stakeholders among others (Deegan and Unerman 2011). When pressures from these stakeholder groups arise, an organization needs to respond to obtain legitimacy (DiMaggio and Powell, 1983). However, companies are not passive players in this process, and institutional theorists acknowledge that there is resistance to institutional demands and companies can even reject institutional expectations (Oliver, 1991).

In this study we use institutional theory and its predictions about the effects of coercive institutional pressures on firms. This is because regulators reflect pressure through, for example law enforcement (DiMaggio and Powell, 1983), as in the case of transposing the Directive into the national legislation of EU member states. To strengthen contributions to the existing literature, this study explores not only pressure from regulators but also pressures from other possible coercive sources.

Hypotheses Development

This paper investigates three key coercive variables potentially influencing the extent of human rights disclosure in Poland. These variables are Directive enforcement, UN Global Compact membership and inclusion in the Respect Index.

Directive 2014/95/EU enforcement

The rationale for expecting Directive to significantly affect human rights disclosure is that companies would be keen to follow new "norms" that are imposed upon them (Deegan, 2002). According to institutional theory, companies may strive to increase the insufficient and non-compliant level of human rights disclosures to reduce regulatory pressure.

Assessments of the state of the art of non-financial reporting, before the implementation of the Directive, by Matuszak and Różańska (2017), showed that there was an information gap regarding some of the aspects required by the Directive. As noted by Matuszak and Różańska (2017) tested companies placed little emphasis especially on reporting about human rights. After the implementation of the Directive, companies still show low levels of disclosure in disclosing human rights policies, outcomes and risk management, according to the Alliance for Corporate Transparency Research database. Unfortunately, no research confirms the potential impact of the Directive on the extent of human rights disclosures.

In the previous literature, it was clearly stated that overall reporting quantity increased subsequent to a non-financial mandate (Damak-Ayadi, 2011; Kerret *et al.*, 2010). Considering that we expect that the extent of non-financial disclosers will increase even in such a specific area as human rights. Considering the theoretical and empirical evidence, we hypothesize:

***H1*: There is a positive relationship between the Directive 2014/95/EU enforcement and the extent of human rights disclosure.**

Participation in UN Global Compact

Another source of institutional pressure can be international human rights accords. These include International Labour Organisation and UN Global Compact among others. Although adherence to these accords is voluntary, companies experience coercion from the originators of these accords and from NGOs to commit to them (Flynn and Walker, 2020).

Previous studies showed that the ILO plays an important role in the emerging disclosure of corporate accountability for workplace rights. Since the ILO' standards were endorsed and accepted by the global community, the number of companies disclosing on workplace human rights has increased significantly (Islam and McPhail, 2011). With regard to UN Global Compact, it was found that this initiative has a positive impact on the comprehensiveness of CSR reporting (Fortanier *et al.*, 2011). Hence, we hypothesize:

***H2:* There is a positive relationship between participation in UN Global Compact and the extent of human rights disclosure.**

Inclusion in the Respect Index

Institutional pressures could potentially also apply to local and regional initiatives that may exert a positive influence on human rights reporting. A key example here is the RESPECT Index which is the first index of companies respecting the CSR rules in the Central and Eastern Europe's region.

The RESPECT Index portfolio covers Polish companies listed on the WSE Main Market which operate in accordance with the highest standards of management with regard to corporate governance, reporting and investor relations standards, and which also include environmental, social and governance factors (Macuda *et al.*, 2015). The participating companies are screened by WSE and the Association of Listed Companies. If the company does not respond to coercive pressures from the project makers, the membership will be terminated. As transparency, accountability as well as communication with stakeholders are at the core of this project, we would expect that corporate inclusion in the RESPECT Index has a positive impact on human rights disclosure. Past study document the statistically significant positive impact of inclusion in the RESPECT Index on non-financial disclosure practices, excluding ethical matters before Directive implementation (Dumitru *et al.*, 2017). Taking into account the above considerations, we hypothesize:

***H3:* There is a positive relationship between inclusion in the Respect Index portfolio and the extent of human rights disclosure.**

Research Methodology

Research sample and data collection

Our initial sample comprises of all firms listed on the WSE. To be included in our sample, companies have to meet the following criteria:

(1) They must be Polish companies (ISIN – PL)
(2) They must have been experienced in non-financial reporting at least in 2014.
(3) They have to fulfil criteria imposed by transposed Directive concerning employment, assets, and income for the period 2017-2019.
(4) They had to have required data for 2014-2019.

The final study sample was composed of 71 Polish companies (426 company-year observations).

The data concerning employment, assets, and income were obtained from the Notoria Service Database. The data concerning non-financial human rights data were hand-collected from non-financial statements being a separate section of management commentary (not stand-alone) or being a separate stand-alone report. In order to verify developed hypotheses our time scope is 2014-2019 and it covers the period before (2014-2016) and after (2017-2019) implementation of the Directive.

Variables

To quantify the disclosure on human rights practices (dependent variable), a content analysis method was utilized. In order to measure the level of human rights disclosures, based on the Directive's requirements, the existence of non-financial content items was examined, namely:

1. A description of the policies pursued by the undertaking in relation to human rights
2. A description of the outcome of human rights policies
3. A description of the principal risks related to the human rights
4. A description of how the undertaking manages those risks related to the human rights.

If the content item was present in the management commentary or standalone CSR report, it scored 1, and 0 otherwise.

As PAA as well as Directive do not favor any content item over another, we treat each item as equally important, and we used the same binary scoring for each item. This approach allowed us to evaluate the extent of human rights disclosure made by companies. Further human rights disclosure index (HR) was computed according to the following formula:

$$\text{HR disclosure index} = \frac{\text{Sum of scores obtained by company}}{\text{4 (total number of content items)}}$$

Independent and control variables together with their measurement approach are presented in table 1.

Table 1: Description of the independent and control variables

Variables	Description/measurement approach
Independent variables	
Directive 2014/95/EU (DIRECTIVE)	Dummy = 1 for 2017-2019, or 0 for 2014-2016.
Respect index (RESPECT)	Dummy = 1, if company is listed in Respect index, 0 otherwise
UN Global Compact (UNGC)	Dummy = 1, if company is a member in UN Global Compact, 0 otherwise
Control variables	
Risky industry (RISKY_IND)	Dummy = 1, if company is a member of a high-risks industry (Frank Bolt, 2019) namely: apparel, textiles, food, beverages sectors; 0 otherwise.
Company size (SIZE)	The value of assets in mln PLN

Source: own elaboration.

In terms of control variables, in line with previous studies (Dumitru *et al.*, 2017; Brammer and Pavelin, 2006) this research employs company size and industry type as control variables as these variables may influence human rights disclosure practices.

Method of analysis

Three basic types of models, pooled models (OLS), fixed-effects models (FE) and random-effects models (RE), were used to model panel data in the study. This procedure allowed us to choose appropriate model for further analysis. The proposed model is given as:

$$HR_{it} = ß_0 + ß_{1,it}DIRECTIVE + ß_{2,it}RESPECT + ß_{3,it}UNGC + ß_{4,it}RISKY_IND + ß_{5,it}SIZE + \varepsilon_{it}$$

In this research, the significance of the differences between groups (clustered years) was tested using the Wilcoxon signed-rank test. According to Field (2018), the Wilcoxon signed-rank test is a nonparametric test that can be used in situations in which there are two sets of scores to compare, but these scores come from the same participants.

Results and Discussion

Descriptive statistics are presented in Table 2. Among Polish listed companies, the level of human rights disclosures varies from the minimum level of 0 to the maximum level of 1. The average HR is 0.52 indicating that there is a room for improvements in terms of disclosure extent. Standard deviation of HR is 0.42 suggesting that there is a high variability among Polish companies in terms of human rights disclosure.

In table 3 we compare the mean HR index and its components before and after implementation of the Directive. The results indicate that in each case the change between clustered years are statistically significant (p-value<0.001). After implementation of the directive, the HR index, and all components increased significantly (mean increase 157%, 121%, 144%, 210% and 202% respectively), however the variability among sample companies decreased but only in relation to HR index as well as HR1 and HR2 components which is reflected in decreasing SD (-20%, -44% and -22% respectively). In terms of HR3 and HR4 the variability increased (SD increased 22% and 37% respectively). This last result can be explained indicating that before Directive implementation companies do not disclose much about human rights issues in general. After implementation of the Directive, in majority cases companies started reporting about human rights policies and their outcomes (HR1 and HR2), but some of them do not treat their activity as violating human rights and thus do not identify HR risks and how they mitigate those risks (HR3 and HR4).

Table 2: Descriptive statistics

Variable	n	Minimum	Maximum	Mean	Median	Std. Deviation
HR	426	0.00	1.00	0.52	0.50	0.42
HR1	426	0.00	1.00	0.67	1.00	0.47

Z		6.43		5.69		5.58		5.19		4.86	
p		<0.001		<0.001		<0.001		<0.001		<0.001	

SD – standard deviation. Source: own elaboration.

In order to verify developed hypotheses, the panel data analysis was utilized. Subsequent to running the necessary tests ((F-test, Breush-Pagan test, Hausman's test) for choosing the right model, the fixed effect model was indicated. However, this model cannot be estimated due to collinearity issue among two variables UNGC and RISKY_IND. Therefore, following the Breush-Pagan test the results of random effect model was considered for further discussion about the implications of the study (table 4).

According to the results, Directive (DIRECTIVE) was found to have a positive significant effect on HR (b1 = 0.26; p-value<0.01), thus the first hypothesis (H1) is accepted.

Being listed on Respect index is positively and statistically significantly related with HR (b2 = 0.45, p-value<0,05), thus the H2 can be accepted. This cannot be said about being a member of UNGC, which have no statistically significant effect on HR, thus the H3 cannot be accepted.

In terms of control variables, only being a member of risky industry (RISKY_IND) have statistically significant and positive impact on HR (b4 = 0.03; p-value<0,05).

Conclusions, limitations, and future research agenda

This paper investigated human rights reporting practices, by looking at both the extent of human rights disclosure and the coercive determinants of that extent, in particular the potential pressure from the regulator that requires mandatory human rights disclosure under the Directive. An examination indeed showed that the Directive enforcement is associated with the extent of human rights disclosure. This extent increased significantly across all content items, namely human rights policy, the outcome of this policy, the associated risks and their management after Directive implementation period. Hence, this finding supports the institutional theory, by providing empirical evidence of how firms responded to regulatory pressure to provide human rights disclosure. Also, inclusion in the Respect Index is positively related to human rights reporting, while UN Global Compact participation did not turn out to influence human rights reporting. Thus, with regard to UN Global Compact institutional pressure have not produced the intended results.

The current paper makes two important contributions to the literature. Firstly, it provides an insight into corporate disclosure on human rights responsibilities, a specific subset of CSR reporting where there is almost no academic literature at present. Secondly, it contributes towards a better understanding of the possible coercive pressures on human rights reporting. In particular, we assume that our study contributes to the understanding of the impact of Directive on human rights disclosure that reflects the role of accounting in promoting human rights and in meeting corporate responsibility to employees and workforce in corporate value chains.

Our research has also important implications for governments because it revealed that companies responded positively to the regulator's pressure by increasing human rights disclosure.

As with any empirical study, this study has its limitations. Firstly, the research focuses on coercive factors and does not consider other institutional factors that pressure firms in normative and mimetic ways. Secondly, our study focusses on disclosure practices in one EU country and it gives no insight into how companies from different EU countries would respond to the pressure of mandatory regulation in the area of human rights. Future research should consider extend our research along each of above-mentioned limitations.

Abstract

Following the adoption of Directive (EU) 2019/1158 of the European Parliament and of the Council on the work-life balance of parents and carers, EU countries have begun to reform parental leave. This directive is based on the Swedish model, which should provide mothers and fathers with more equal division of parental leave to care for the child and at the same time give them an equal footing in the upbringing of the child. The authors analyze the Swedish model of parental leave, as well as the impact of the newly adopted directive on the legal systems of the Kingdom of Sweden, the Kingdom of Denmark, and the Slovak Republic. They question whether the Slovak Republic, as a former country of the Eastern bloc, is approaching Western models by the measures adopted, or on the contrary, the measures adopted do not meet the needs of practice or European standards.

Key words: Maternity Leave, Parental Leave, Work-Life Balance, Employee, Employer, Equality

Introduction

Discussions and efforts to reform parental leave have been going on in the European Union for years. For a long time, the legal regulations did not correspond to the real needs of parents and carers, it regulated only the basic requirements and it was scattered in several directives. As early as 2017, a proposal for a new directive was presented to ensure that the principle of equality between men and women is applied with regard to equal opportunities in the labor market and equal treatment at work. However, the Directive (EU) 2019/1158 of the European Parliament and of the Council on the work-life balance of parents and carers (also known as the Work-Life Balance Directive) was adopted in December 2019, with the Member States being required to transpose it by 02nd of August 2022. The model that inspired creation of this new directive was Swedish law, which is considered by professionals to be flexible and equal in the approach to childcare of both parents. However, till this day, not all countries provide parents with the same flexible childcare options as the Kingdom of Sweden. We consider the topic to be highly important, as only thanks to well-set childcare options can both parents adapt in the labor market in the same way. As Treľová states (2019)“ It is necessary to perceive the family as a whole, to look at the woman and the man as equal partners, who strengthen their family together, take care of their children and the household together, participate in the financial security of the whole family.” We therefore decided to compare the legal status of parental leave following the adoption of the directive on work-life balance in the Slovak Republic, as a country of the former Eastern bloc, the model Kingdom of Sweden and also Denmark, which is described as a country with an ideal work-life balance. The result of the comparative analysis are de lege ferenda proposals for better regulation as well as enhancement of the position of parents caring for a child.

The New Directive and Legal Regulation in the Slovak republic

The adoption of the work-life balance directive brings many changes that Member States will have to transpose into their national legal systems (Barancová, 2003). For the purposes of the legal analysis of this article, we will focus on those changes that concern parents, not caregivers. Among the most significant changes brought about by the directive on work-life balance can be the introduction of paternity leave or leave of the other partner in the care of a child who is not the child's mother. According to the new regulation, the father of a child should be entitled to at least 10 days of leave in the period immediately after the birth of the child, which would be paid at least at the level of social benefit during temporary incapacity for work in the given state. Paternity leave cannot be linked to years worked or the length of employment with the employer (Hamuľák, Nevická, 2018).

Another significant change is the introduction of compensation for at least 4 months of parental leave and at least at the level of social benefits during temporary incapacity for work in the country. Certain part of parental leave to be reserved for each parent on a non-transferable basis and can be taken in installments up to 8 years of child's age. The employee must determine the length of the parental leave, which he or she wants to draw. Unlike paternity leave, it is possible to link parental leave to years worked, in particular with regard to the compensation provided.

The most resonant novelty is the introduction of greater flexibility in working hours. Parents caring for a child under the age of 8 should be entitled to shorter working hours, flexible working arrangement and flexibility in the place of work. The employer is obliged to respond to the request for flexible work organization and, in the event of a negative answer, to state the reasons why he did not comply with the employee. At the end of the need to apply flexible work organization, the employee is entitled to return to the original or equivalent job. At the same time, force majeure leave is introduced due to urgent family reasons, when the presence of an employee is required. The extent of such leave may be left to the discretion of the Member States (Hamuľák, Nevická, 2018).

The Ministry of Labor, Social Affairs and Family of the Slovak Republic has set the importance of transposing the new directive on work-life balance as of medium importance. We do not agree with this and we are convinced that the adoption of changes to the Slovak legal order should have the highest priority.

In the Slovak Republic, a distinction is made between the terms maternity leave and parental leave, while maternity leave can be taken exclusively by a woman and parental leave by both a man and a woman. As the concept of maternity is directly linked to a woman, the Slovak legislation does not recognize the concept of maternity leave for a man. In connection with the care of a newborn child, a man is also entitled to parental leave in the sense of a woman's maternity leave, i.e. a man's parental leave if the man is taking care of the newborn child. As Treľová mentioned (2016), in this context, the term parental leave for a man is synonymous with maternity leave for a woman. The term second parent is not introduced in the Slovak legal system and therefore we use the terms father of the child and mother of the child. Act no. 311/2001 Coll. the Labor Code (hereinafter also referred to as the "Labor Code") grants women the right to maternity leave and parental leave and men the right to parental leave. Pursuant to the Article 166 of the Labor Code, a woman is entitled to maternity leave in connection with childbirth to the extent of 34 weeks. A man is entitled to leave to the same extent as a woman, only if he is caring for a newborn child, i. e. for a basic period of 28 weeks. Maternity leave in connection with childbirth may not be shorter than 14 weeks and may not end or be interrupted before the expiry of 6 weeks from the date of childbirth. Both women and men are entitled to a maternity social benefit if they have been insured for at least 270 days before childbirth. However, they only receive maternity benefit for one child at the time. The amount of maternity benefit is individual for each mother and father, but not more than 75% of the gross wage assessment base. In order for the child's father to be entitled to maternity benefit, the child's father must take the child into care from the mother on the basis of a written agreement. Entitlement to maternity benefits arises for the father at the earliest from the sixth week after birth, but no later than until the child is 3 years old.

To deepen childcare, both mother and father can request parental leave. The employer is obliged to comply with such a request. Parental leave is provided to the extent requested by the parent, but not longer than 3 years of child's age. During parental leave, the parent is entitled to parental allowance under specified conditions, which in 2020 is € 270 per month if the parent has not met conditions for maternity benefit and € 370 per month if maternity benefit has been paid. Apart from parental leave and maternity leave, neither the father nor the mother of the child have other entitlements to special forms of leave (Krippel, 2019). A pregnant woman is only entitled to justified obstacles at work during examinations at the doctor's and the father can transport the mother of the child from and to the hospital during childbirth. The child's parents are not entitled to the flexibility of the place of work or the guaranteed place of the child in kindergarten. They may request appropriate working time arrangements if they are caring for the child on a permanent basis, but this may be refused by the employer if serious operational reasons prevent him from doing so. These operational reasons are not legally defined, hence abusable. Fulfillment of this

obligation is therefore enforceable only through the courts, which means that work time flexibility is hardly used in practice (Poruban, 2019). As part of the regulation of working hours, the category of women and men permanently caring for a child under three years of age (lonely women or lonely men permanently caring for a child under 15 years of age) is protected during overtime and on-call time, which they can perform only with their consent (Treľová, Matlák, 2018).

As follows, in the Slovak Republic it is still assumed that the primary breadwinner of the family will be the father of the child and the mother will take care of the child and the running of the household (Burda, Capíková, Nováková, 2018). Treľová also states that, although parental responsibilities also arise for the father in connection with the care of the child, he most often continues to work, leaves care to the child's mother and thus not exercising the right to take parental leave. Equality in childcare and the fulfillment of professional objectives within the meaning of the work-life balance directive are not transposed into the Labor Code at all, which is also reflected in the statistical survey of the European Institute for Gender Equality (Mesarčík, 2019). The results considers point 72.0 to be the European average of gender equality in the workplace. The Slovak republic achieved a result of 66.5 points, while up to 80% of domestic work is provided by women.

Parental Leave in the Kingdom of Sweden and the Kingdom of Denmark

As the authors have already stated, the new directive is largely inspired by the legislation of the Kingdom of Sweden (hereinafter "Sweden") and is based on the equal status of men and women in the upbringing of a child as well as the economic security of the household. The phrase parental leave is often used by the authors because it was Sweden, that first introduced paid parental leave for fathers in 1974. It is necessary to emphasize that the term maternity leave and paternity leave was replaced by the single term parental leave, so that the legislation itself avoided differentiation in giving parents time to care for the child. Sweden has become a model for new legislation on parental leave for liberality and progression in childcare.

Parental leave in Sweden provides parents with a total of 480 days of parental leave, of which at least 90 days belong to the mother and 90 days to the father. During the first 390 days, the child's parents are entitled to almost 80% of their average daily wage, but a maximum of € 92 per day, which is approximately € 2,576 per month. The remaining 90 days are paid in a lump sum. The condition for obtaining the right to paid parental leave is the duration of the employment relationship and the payment of contributions at least 240 days before the birth of the child. Those who do not meet this condition are entitled to social benefits, as the Swedish Institute for future studies states. Parents have the right to take up leave until the child is 8 years old, and at the same time until they have the right to ask the employer to reduce the working hours by up to 25%. The employer is obliged to comply with such a request.

Another benefit that the Swedish system provides to parents is 10 days of paid paternity leave after the birth of a child. Like the parental allowance, the payment of the paternity leave comes from the parental insurance, which must be paid by each employee and contributed to by the employer. It was the size and method of granting paternity leave in Sweden that also inspired the European Union to create a directive on work-life balance. In addition to the above, the state also contributes to the parents a child benefit up to the age of 16, in parallel with the receipt of parental allowance, in the amount of 115 € per month, as the Swedish national social institute states.

In addition, all children with Swedish citizenship are guaranteed a place in a free kindergarten and primary school, which provide them with free lunches. Healthcare is free for children and young people up to the age of 20, including dental care. The even distribution of parental leave was also reflected in the actual use of parents. An analysis by the Swedish National Social Insurance Agency from 2018 showed that up to 27% of the total cost of parental allowances was paid to the child's father, which is by 6.9% more than in 2012, as shown by the Swedish national social institute. Based on the above, it can be stated that the Swedish model in practice brought greater involvement of the father in the care of the child, enabled more women to return to work and thus brought a greater degree of equality in caring for the family between a man and a woman (Hamuľák, Nevická, 2018).

The legislation on maternity and parental leave in the Kingdom of Denmark (hereinafter also referred to as "Denmark") is similar to Sweden. The mother of the child is entitled to maternity leave in duration of 4 weeks before the planned birth and 14 weeks after the birth. This right is not transferable and belongs exclusively to the mother of the child. During maternity leave, the mother is entitled to maternity benefit if she was employed before giving birth and worked at least 40 hours a month for 3 months prior to giving birth. The father of the child is entitled to 2 weeks of paternity leave, which he must take during the 14 weeks after the birth of the child. Subsequently, both parents are entitled to 32 weeks of parental leave. Each parent has a non-transferable right to 32 weeks, which must be exhausted by the child’s age of 9, i. e. a total of 64 weeks. However, the child's parents are entitled to financial compensation for only 32 weeks. Statistics of the European Commission show, that the amount

of maternity and parental benefit depends on the parent's income, but it is up to a maximum of approximately € 590 per week. The condition for entitlement to maternity benefit is the fulfillment of all-day personal care for the child. Studies show that the child's fathers take primarily 2 weeks of paternity leave and only a minimum of parental leave, while mothers of children tend to take the full entitlement to both maternity and parental leave.

The working week in Denmark normally lasts from Monday to Friday and the established weekly working time is 37 hours. Overtime is possible but not recommended. Parents have a legal right to use state kindergartens and crèches from the child's age of 6 months. At the same time, when caring for a child, it is possible to request flexible working time arrangements as well as to work from home or another suitable place for 1-2 days during the week. This contributes significantly to the fact that up to 79% of Danish women are employed and up to 66% of their daytime they can engage in activities other than work, as shown by Denmark's government statistics.

The Comparative Analysis and *de lege ferenda* Proposals

The conclusions of the analysis of the position of parents in employment relations in the Slovak Republic show that they are far from close to the standards introduced in the European Union by the directive on work-life balance, as O. Hamuľák mentioned (2018). Fathers of children are not entitled to special paternity leave; they can only take the mother of the child from and to the hospital at birth. Although parental leave is provided relatively generously, in the range of almost 3 years, the amount of parental allowance does not even cover the basic needs of parents and their child (Ladiverová, 2018). In addition, the right to parental leave belongs to both parents and there is no specially reserved part that is non-transferable. We consider it appropriate to introduce a certain non-transferable period, which could only be used by the father or by the mother of the child in addition to maternity leave. Extending the non-transferable period would contribute to greater use of parental leave by fathers as well, as if they did not use up the time, they would lose their allowance in the same way as parental allowance.

Compared to Sweden or Denmark, we are of the opinion that the parental leave in the Slovak Republic is outdated and does not meet the needs of the labor market or modern parents. Parental leave is granted in both Sweden and Denmark for approximately the same range of 1 to 1.5 years. While taking parental leave, the parent receives a parental allowance that is approximately at the level of his or her previous salary. The child's parent can thus make full use of parental leave to take care of the child, without having to consider the impact of the time spent on the family budget. While in Denmark it is forbidden to work while receiving parental allowance, in the Slovak Republic the child's parent can work while receiving parental allowance if he or she has secured childcare. The authors are of the opinion that providing parents with parental allowance for almost 3 years, but in a lower amount, is ineffective, as most parents in Slovakia still work in addition to receiving parental allowance. Following the example of Sweden or Denmark, we propose to shorten the period of parental leave, respectively, leave it up to the parents to determine for how long they want to take parental leave so that they can aliquot increase their parental allowance.

The lack of paternity leave regulation and obstacles at work for force majeure family reasons in Slovakia is also inadequate (Freel, Kováčiková, 2013). The introduction of the institutes in question is not only about helping the mother, but also about equality in the care of the child within the meaning of the directive on work-life balance and Article 6 of the Labor Code. The legal regulation of an obstacle to work for force majeure reasons could be in the form of a justified obstacle to work without compensation of wages or with compensation of wages, with the employee working out the time later. It is a matter of enabling the combination of parental and caring responsibilities without a disproportionate burden on the employer in the form of wage compensation.

In line with the adopted work-life balance directive, it would be appropriate to introduce flexibility in the place of work for persons who are permanently caring for a child under the age of 8, given the employer's operating conditions allow it. As the practice in Denmark has shown, the reduction in working hours and the possibility to work from home or another suitable place makes a significant contribution to women's participation in the labor market, as they can combine family and work responsibilities.

We believe that the institutes introduced by the work-life balance directive are beneficial and positive for the labor market in the European Union. For Slovak labor relations, they will mean a step forward, provided that they are transposed quickly and correctly. For Western countries such as Sweden and Denmark, the new directive does not introduce substantial changes in principle, as they already provide more generous legislation for working parents.

Conclusion

Based on all the above facts and statistical information, the authors believe that the Swedish or Danish model has shown in practice that if the conditions for children 's fathers are favorable, they are also more interested in staying on paternity or parental leave. This contributes to greater equality and equivalence in the upbringing of a child. The legal regulations of the Slovak Republic provide parents with the possibility of caring for a child in an above-standard time range, but for compensation that does not correspond to the level of their salary evaluation. The drawing of parental leave up to 3 years of age of the child is insufficiently financially secured, which causes the participation of parents in the labor market during the receipt of parental allowance. The purpose of parental allowance or parental leave is therefore far from being fulfilled. Bureaucracy, ineffective settings, low contribution, and failure to take into account the needs of working parents thus certainly do not bring Slovakia closer to Western standards. According to the authors, the introduction of a 10-day leave for fathers immediately after childbirth could help not only the mother and the child, but also to increase the number of fathers who will later stay at home with the child and request parental leave. Statistics have clearly shown that there is interest among fathers, it is only necessary to create the right conditions for them. We also consider it necessary to adopt a more flexible form of parental leave as soon as possible so that parents can actually use it to care for their child.

Abstract

This paper presents a novel Infrastructure 2 Pedestrian approach to increase human life and health safety. After introducing the reader to the subject of the issue, the authors motivate their research area to improve pedestrian safety on the roads. In addition to purely human arguments, the economic factors supporting the need to develop this type of solution are also presented. Then, the concept of the proposed method and selected use cases with the possibility of applying the solution are introduced. The authors also estimate the potential profits from the implementation of the proposed concept. The article summarizes brief conclusions.

Keywords: pedestrian safety, infrastructure to pedestrian (I2P), accidents, human life.

Introduction

Human life and health are priceless. Every day, road users are killed or injured on the roads of the whole world. The victims include not only people involved in car accidents but also vehicle run-offs. The scale of this problem is enormous. More than 1/5 of people who die on roads do not use a car, motorcycle, or bicycle - they are pedestrians. Following the definition from World Health Organization (WHO, 2013): "a pedestrian is any person who is traveling by walking for at least part of his or her journey. In addition to the ordinary form of walking, a pedestrian may be using various modifications and aids to walking such as wheelchairs, motorized scooters, walkers, canes, skateboards, and rollerblades. The person may carry items of varying quantities, held in hands, strapped on the back, placed on the head, balanced on shoulders, or pushed/pulled along. A person is also considered a pedestrian when running, jogging, hiking, or when sitting or lying down in the roadway".

Pedestrians are most at risk of death or serious injury in a road accident. The death of pedestrians or their serious injury can often be avoided. It is obvious that to increase pedestrian safety on the roads, appropriate road investments are necessary. Proposals and recommendations for road safety systems should be consulted and presented to governing bodies and political leaders to implement systemic solutions. WHO (2013) published recommendations for implementing methods to improve pedestrians' safety on roads. In addition to tips on how to increase the awareness of road users, it also contains a description, still valid in 2020, how to prepare the road infrastructure and improve vehicle design for pedestrian protection (Euro NCAP, 2020).

The current technical and technological possibilities related to the automotive industry and wireless communication systems create an opportunity to use them to increase pedestrians' safety as road users. The most popular ones are those responsible for communication between the vehicle and pedestrian (Vehicle to Pedestrian - V2P), vehicles and infrastructure (Infrastructure 2 Vehicle), the pedestrian and the vehicle (Pedestrian to Vehicle - P2V). Details on the functioning are not the subject of this study, and information about them can be found in many publications, including (Gerónimo et al., 2010; Chen et al., 2017; Seo et al., 2017; Tahmasbi-Sarvestani et al., 2017; Vourgidis et al., 2020). The authors would like to present a new approach to increasing pedestrian safety on the roads. The original proposal concerns a novel Infrastructure 2 Pedestrian (I2P) approach to increase human life and health safety. The proposed solution may be an element of system implementations to increase pedestrian safety and allow for significant profits to secure human health and life and the consequences resulting from their loss.

Motivation to research

Every year, as mentioned in the introduction, people die on roads worldwide - over 270,000 are pedestrians, which accounts for over 20% of all road fatalities. The accidents happen unexpectedly - during a walk, on the way to school, to shopping or a public transport stop. Apart from deaths, over a million pedestrians are injured each year due to accidents - some of the wounded require very long rehabilitation, and some of them, unfortunately, never recover (become permanently disabled). Considering physical health, it is also necessary to pay attention to the deterioration of the mental state and trauma after the accident, not only of the victims but also family to the accident victims. Many of these tragedies could have been avoided.

Human life and health cannot be converted into money. It cannot be valued. However, the costs associated with accidents involving pedestrians can be estimated. In the case of hitting pedestrians by vehicles, emergency services are necessary in almost 100% of cases. Additionally, the police are called to the scene to find the perpetrator of the accident. Each of these activities generates costs. The victim of an accident with more severe injuries is hospitalized. The length of stay in the hospital varies depending on the injury. After leaving the hospital, the victim of an accident often requires costly rehabilitation (sometimes short and sometimes requiring many years) to regain full fitness. In many cases, trauma after an accident also requires psychological support for both the accident victims and their relatives - additional costs. The economic impact of pedestrian road traffic hasn't been quantified. Still, following with the (WHO, 2010) report, road traffic crashes, in general, are estimated to cost between 1 and 2% of the gross national product.

Based on many studies, it is possible to indicate the causes of accidents and the methods of preventing them or minimizing the probability of their occurrence (WHO, 2013; Zegeer and Bushell, 2010; Job, 2012; Peden et al., 2004; Stigson et al., 2008; Mooren et al., 2011). The most critical factors influencing pedestrians' safety are vehicles' speed, alcohol consumed by drivers and pedestrians, deficiencies in infrastructure solutions, and inadequate, insufficient visibility of pedestrians on the road. While in the case of excessive speed and alcohol consumption, social campaigns and promoting road safety can make a difference, good pedestrian visibility, and supplementing the infrastructure with appropriate solutions will certainly improve pedestrians' safety on the road.

WHO presents the system safety approach ensuring pedestrian safety (WHO, 2013). It recommends solutions focusing on the construction of appropriate road infrastructure to minimize pedestrians' risk of accidents. A wide range of land-use planning and road design strategies to improve pedestrian safety have been developed and implemented in different countries (Sleet et a., 2011; Tiwari, 2011; Ewing and Dumbaugh, 2009).

The use of smartphones and other wearable things is growing exponentially worldwide. O'Dea (2020) estimated that in 2020 61% of the world's population owns a mobile phone, of which 73% are smartphones. By 2024 (O'Dea, 2020) mobile device users will increase over to 92% of the world's population. While the risk of talking and texting while driving a vehicle is now well documented (WHO, 2011), much less is known about walking and mobile devices distraction. Since 2005, several studies have been published that suggest pedestrians who are distracted by phone conversations, or other activities such as listening to music or texting, take more significant risks when crossing roads (Schwebel et al., 2012; WHO, 2011; Lacy et al., 2004; Stavrinos et al., 2011; Nasar et al., 2008).

"Many pedestrian safety problems cannot be solved simply by addressing one of the 'three Es' (engineering, education, enforcement) in isolation. Engineers, law enforcement, designers, planners, educators, and citizens should all play a role in identifying and implementing effective countermeasures for improving pedestrian safety" (Lacy et al., 2004). Specific interventions and focal measures for increasing pedestrian safety are listed in (WHO, 2013). The author's novel approach should be added to the list of perspective and promising solutions.

The situation in Poland in recent years is presented in this part of the article. According to the data included in (Jaździk-Osmólska and Korneć 2019)**Error! Reference source not found.**, the annual social costs of road accidents and collisions in Poland in 2018 were estimated at 56.6 billion PLN, i.e., over 12.5 billion EUR. Considering that more than 20% of road accidents and collisions involve pedestrians, it can be assumed that the cost of taking into account only victims of pedestrian accidents is EUR 2.5 billion. The largest share of the cost categories of road accidents and collisions in Poland in 2018 are:

– production losses by way of death or incapacity of the employee at work (58%),
– share of losses of material (21%),
– administrative cost and operational (17%),
– non-material losses and medical expenses (4%).

Unit costs of road accidents and collisions in 2018 were as follows:

– the unit cost fatality - 0.531 million EUR,
– the unit cost of the victim's hard morning - 0.73 million EUR,
– the unit cost slightly injured victims - 0.01 million EUR,
– the unit cost of road accidents - 0.31 million EUR,
– the unit cost of a road accident - 0.0059 million EUR.

The cost estimate unit consists of a valuation of the following categories of costs generated by the elementary traffic incidents:

– costs of police and rescue,
– costs and funeral services,
– costs of hospitalization,
– costs of criminal proceedings,
– costs of compensation and redress,
– material losses,
– economic losses of the country.

Based on reports of road accidents in Poland in 2018 (Symon, 2019) and 2019 (Symon, 2020), Table 1 represents quantitative data with the number of accidents. Authors selected three causes of accidents involving pedestrians:

– careless entrance to the road in front of a moving vehicle,
– crossing the road in an unauthorized location,
– entering the road at the red light.

Table 1: Number of accidents with pedestrians in Poland in the years 2018 and 2019

	The year 2018			**The year 2019**		
	Accident total	**Death**	**Injured**	**Accident total**	**Death**	**Injured**
Careless entering the road in front of a moving vehicle	1031	148	906	941	156	806
Crossing the road in an illegal place	262	53	212	218	54	166
Entering the road at the red light	202	18	195	155	14	145

For the data presented above, it is possible to estimate the costs related to these events. Due to the limitation of the volume of the article, the calculation was made for 2018. The adopted measures assumed 50% of serious and lightly injured cases of all injured victims.

Table 2: The cost of accidents with pedestrians in Poland in the year 2018

Costs in EUR [MILLION]	**Death**	**Seriously injured**	**Injured**	**Total**
Careless entering the road in front of a moving vehicle	78.58	330.73	4.83	414.14
Crossing the road in an illegal place	28.14	77.39	1.13	106.66
Entering the road at the red light	9.56	71.18	1.04	81.78
Total	116.28	479.30	7.00	602.59

As shown in Table 2, based on (Jaździk-Osmólska and Korneć, 2019), Poland's total social cost for these three causes of pedestrian accidents alone in 2018 is valued at over 600 million EUR. This amount shows how it is crucial to improve pedestrian safety on roads from an economic perspective. Considering the authors' solution, investments made in the appropriate road infrastructure can allow for huge savings. The funds obtained using this can be designated for other purposes of the economy. Jaździk-Osmólska and Korneć (2019) also forecast the costs of road accidents until 2023. The value of the estimated amounts is at the level of 12.5 billion EUR year on year. Therefore,

it can be assumed that the above calculation of road incidents involving pedestrians will also be valid in 3 years, and the period from 2021 to 2023 will amount to a total of 10 billion EUR.

Infrastructure 2 Pedestrian approach

Considering the arguments presented in the previous section, the authors propose a novel Infrastructure 2 Pedestrian (I2P) approach for increasing human life and health safety. The concept and idea of the proposed solution are presented in the figure below.

Fig. 1: Proposed a novel Infrastructure 2 Pedestrian (I2P) approach for increasing human's life and health safety

The proposed solution's basic assumption is to equip the existing or newly emerging road infrastructure with devices enabling communication between pedestrians and infrastructure elements. Bearing in mind that almost 80% of the world's society has smartphones, it can be assumed that pedestrians already have the appropriate equipment in the form of a mobile device for communication with external elements. Mobile devices equipped with appropriate wireless technologies, such as Wi-Fi, Bluetooth, 5G, or technologies developed in the future (Skokowski et al., 2017; Malon et al., 2017; Malon et al., 2018), can communicate with the infrastructure. Maślanka and Skokowski (2020) presents a possible technological solution for the proposed I2P method, considering the currently available technologies and newly emerging wireless systems, particularly 5G technology. In this study, the authors want to present a novel I2P approach to increase human life and health safety and estimate its implementation's expected profits.

The proposed approach is based on the communication of road infrastructure elements with pedestrian mobile devices to prevent dangerous road incidents involving them. The proposed Infrastructure 2 Pedestrian approach has an immense application potential and can directly contribute to increasing pedestrian safety and significant social benefits. Simultaneously, it should not generate enormous investment costs and, more importantly, not for the end-users of this system - pedestrians.

Use cases for the prosed I2P approach

In this part, example use cases will be presented. They do not cover all possible scenarios for which the proposed solution could be applied.

Preventing the causes of accidents involving pedestrians

The proposed solution can significantly improve safety and reduce the number of accidents involving pedestrians for the three causes of accidents mentioned above, i.e., careless entering the road in front of a moving vehicle, crossing the road in a prohibited place, and entering the road at a red light.

Fig. 2: Using the proposed I2P approach for preventing the causes of accidents

In applying the proposed I2P solution, the pedestrian could be notified, warned, or alerted by sending an appropriate message by the infrastructure to his mobile device (smartphone). Upon receiving such an alert, pedestrians would have a better chance of avoiding an accident.

Localization of dangerous places

Another case of using the proposed I2P solution may be the location of particularly dangerous places, i.e., places where accidents occur most frequently. Most pedestrian collisions happen when pedestrians are crossing the road (Crandall et al., 2002). The question is: where and how to collect data about sensitive places? Data on pedestrian facilities and road infrastructure may come from different sources (Zegeer et al., 2008; Litman et al., 2009) like road infrastructure and road safety audits, and police reports on road accident locations. The process of identifying particularly dangerous places due to the necessity to correlate data from many sources may take a very long time (data exchange between different institutions).

Suppose the infrastructure is equipped with the proposed solution in the event of an accident involving pedestrians. In that case, information may be immediately transferred to the central unit, where information about the place, time, and causes of the accident would be collected. In such a situation, there would be no need to correlate data from many sources, and the safety of the place where a significant number of accidents took place could be increased in a much shorter time. Such information directly reaches institutions planning roads or responsible for road safety.

Increasing visibility of pedestrians

One of the causes of accidents involving pedestrians is insufficient visibility. In (Maślanka and Skokowski, 2020), it was indicated that the reasons for this include:

– inadequate, or lack of, roadway lighting,
– bicycles and vehicles not equipped with lights,
– pedestrians not wearing reflective accessories important bridge at night,
– pedestrians are sharing road space with fast-moving cars.

Fig. 3. Using the proposed I2P approach to increase pedestrians (for example, at night)

The use of the proposed I2P solution could indicate pedestrians' presence on the road through communication between their devices and the road infrastructure (displaying the so-called radio beacon (Maślanka and Skokowski, 2020)). The infrastructure could then use I2V technology to transmit information to connected cars approaching pedestrians. The vehicle driver would be notified with an appropriate message about a pedestrian's presence on the road despite the lack of visibility. In this case, a solution can also be indicated that the infrastructure will inform a pedestrian about the situation based on information about an approaching vehicle. The pedestrian then has a chance to react appropriately before the vehicle arrives.

Others

Basic use cases were presented before. If the proposed system is implemented, there would probably be many other I2P applications that can increase pedestrian safety and all road users' safety in general.

Profits from the application of the proposed I2P solution

Preventing even one fatal accident would already be a sufficient profit from the application of the I2P system. Human life is priceless, and it is impossible to define what the costs of implementing such a solution should be. As in point 2.1, the specific social costs related to pedestrians' participation in road accidents and collisions for Poland are presented. The potential public profits (savings) using the proposed I2P solution 'in a million EUR for different values of its' effectiveness are shown in table 3.

It can be noticed that even for very low efficiency, the profits achieved can be huge, and the saved resources can be used for other purposes. The authors believe that the costs of creating an I2P solution would concern only one of the parties, i.e., road infrastructure - pedestrians already have devices in the form of their smartphones, smartwatches, or other devices that can work with the infrastructure. Nothing excludes the possibility of creating dedicated devices, e.g., for the elderly or children who cannot operate modern devices. The concept of a technological solution for the proposed solution has been presented in the authors' study (Maślanka and Skokowski, 2020).

Table 3: Potential profits in Poland using the I2P solution

PROFITS in million EUR / efficiency of the solution	**100%**	**90%**	**80%**	**70%**	**60%**	**50%**	**40%**	**30%**	**20%**	**10%**
Careless entering the road in front of a moving vehicle	414.1	372.7	331.3	289.9	248.5	207.07	165.7	124.2	82.8	41.4
Crossing the road in an illegal place	106.7	96.0	85.3	74.67	64.0	53.3	42.67	32.0	21.3	10.7
Entering the road at the red light	81.8	73.6	65.4	57.2	49.1	40.9	32.7	24.5	16.7	8.2
Total	602.6	542.3	482.1	421.8	361.5	301.3	241.0	180.8	120.5	60.3

It should also be considered the penalties that await both drivers and pedestrians if they do not comply with the roads' rules. Of course, they depend on the country, but they are within the fine's upper limits, especially for drivers who do not give way to the pedestrian crossing in designated places. They increase significantly in cases of hitting pedestrians. In extreme situations related to severe damage to health or death resulting from hitting a pedestrian by the driver's fault, they end up with many years of imprisonment, which also generates high costs for the state budget (Ontario Ministry of Transportation, 2020; **Error! Reference source not found.**Poland In, 2019). The presented system would also make it possible to reduce the number of such offenses, which would encourage road users to use the elements of the I2P system.

Conclusions

Nowadays, there is a need to build road infrastructure that would increase pedestrian safety. The year-to-year social costs of each country related to the loss of life or damage to pedestrians' health connected with road accidents are enormous. Improvements should be sought that will allow us to achieve the goal - reduce the number of pedestrian casualties. Many solutions concern constructing safer crossings for pedestrians, right road marking, and separate lanes. The authors' infrastructure expansion approach shows the possibility of looking at the problem from an entirely new perspective.

The I2P concept can prevent road accidents involving pedestrians by equipping the infrastructure with appropriate technology. The presented estimation of potential savings, determined for one country (Poland), shows the global scale of profit by implementing the proposed solution. The novel using mobile device communication to an infrastructure approach to increase human life and health safety should be considered by relevant state authorities and institutions when developing solutions to improve pedestrian safety. With the synergy of the proposed I2P system with other factors taken into account in planning the road improvements, increasing road safety will increase the chances of achieving the final goal of zero injuries among pedestrians.

Abstract

The article analyzes the features of the commodity and geographical structure of Russia's non-commodity non-energy exports to the countries of North Africa. As a result of the analysis of the geographical structure of such exports, the main importer of such goods from Russia, which is Egypt, has been established.

The commodity structure of non-commodity non-energy exports to North Africa has been analyzed. There is a tendency of dominance of lower-processing goods when exporting to Egypt, Libya, Morocco, Sudan, Tunisia. In the structure of exports to Algeria the higher-processing goods dominate. The main goods related to non-commodity non-energy exports exported to North Africa have been identified. The main exported lower-processing goods for all countries are fertilizers, grain, semi-finished unalloyed steel products, ammonia. However, analyzing the export of non-commodity non-energy goods from Russia on the whole, as well as the share of Russia's exports to each North African country, it was concluded that the volumes of such exports from Russia are insignificant.

The article analyzes the features of the commodity and geographical structure of Russia's non-commodity non-energy exports to the countries of North Africa. As a result of the analysis of the geographical structure of such exports, the main importer of such goods from Russia, which is Egypt, has been established.

The commodity structure of non-commodity non-energy exports to North Africa has been analyzed. There is a tendency of dominance of lower-processing goods when exporting to Egypt, Libya, Morocco, Sudan, Tunisia. In the structure of exports to Algeria the higher-processing goods dominate.The main goods related to non-commodity non-energy exports exported to North Africa have been identified. The main exported lower-processing goods for all countries are fertilizers, grain, semi-finished unalloyed steel products , ammonia. However, analyzing the export of non-commodity non-energy goods from Russia on the whole, as well as the share of Russia's exports to each North African country, it was concluded that the volumes of such exports from Russia are insignificant.

For research purposes, it is necessary to determine the concept of commodity, non-commodity energy, non-commodity non-energy exports. The work uses the classification of the Russian Export Center (further - REC), according to which non-commodity non-energy products are divided into 3 groups by the degree of processing

Based on the data of foreign trade statistics, it can be concluded that the total volume of non-commodity non-energy exports (further - NNE) of Russia reached 155.1 billion U.S. dollars by the end of 2019. This is 0.5% more than in 2018.

Further analysis of such exports to North Africa (Algeria, Egypt, Libya, Morocco, Sudan, Tunisia) was carried out.

The study used data from the official statistics of the FCS of Russia, the data of the REC Sampling was carried out in accordance with the codes of UCN FEA EAEU.

The dynamics of non-commodity non-energy exports from Russia to Algeria is represented in Table 1. As can be seen from the table data, the largest volume of non-commodity non-energy exports was in 2017 (4.52 billion U.S. dollars). The share of NNE in Algeria in total Russian exports increased from 2013 to 2016, then decreased.

At the same time, in the structure of the Russian NNE from Russia to Algeria for the period from 2013 to 2019, a greater share is occupied by the top processingof such exports. Analyzing the structure of the products of the top processing, we can draw the following conclusions. In the first place from year to year there are always unclassified goods, except for 2014. Such products include, among other things, intelligent innovative products, IT products.

There was a significant increase (by 271.16%) of goods of group 8526 (radar equipment) in 2019 compared to 2018.

In 2018, goods of the group 8705 - special vehicles (0.18 billion U.S. dollars), groups 84 - mechanical equipment and equipment, computers (0.20 billion U.S. dollars) are allocated from the goods of the top redistribution in terms of export volumes.

However, in total Russian exports of NNE to Algeria took a small share: 0.09-1.34%. At the same time, since 2016, there has been a downward trend in the share of NNE in Russia's total exports to Algeria.

The volume of Russia's NNE to Egypt increased until 2018, and in 2019 there was a decrease in such volumes.

Analyzing the structure of NNE goods to Egypt, the following is established. Until 2019, the NNE was dominated by the lower processed goods (in the first place the goods of the group 10 - grain, 7207 - semi-finished unalloyed steel), in 2019 - the top redistribution of the NNE (according to the REC - unclassified goods).

In general, Russia's total exports saw an increase from 2013 to 2017, and from 2018 - a decrease in the share of exports from Russia to Egypt of NNE goods. However, Egypt is the leader of all North African countries in terms of the volume imported NNE goods from Russia .

Analyzing the volume and share of NNE to Libya in the total exports of Russia,it was found that NNE goods took a share of 0.03-0.05% in exports from Russia.

By analysing the structure of NNE products, the following conclusions can be drawn. Between 2013 and 2019, in the structure of the NNE to Libya lower-processed goodsdominate . According to the REC data, the largest share of such goods is occupied by the goods of the UCN FEA EAEU 10 group - grain, 7207 - semi-finished products of unalloyed steel

Analyzing the export of non-commodity non-energy products of Russia to Morocco,it was found that the share of GNE goods in Morocco increased from 2013 to 2019, from 0.02% to 0.11%. At the same time, the total volume of exports of such goods is also unstable, from 0.09 in 2013 to 0.33 billion dollars U.S. in 2019. However, the export of NNE goods to Morocco takes a small share of Russia's total exports.

Analyzing the structure of NNE goods in Morocco, it was found that between 2013- 2019, the structure of NNE goods in Morocco is dominated by lower-processedgoods, from 59.5 per cent in 2017 to 90.8 per cent in 2015. The largest share in such exports is occupied by the goods of the EAEU 31-fertilizer , 10 - grain, 7207 - semi-finished unalloyed steel products (from 2013 to 2017), 2814-ammonia (from 2018).

Analyzing the export of non-commodity non-energy goods of Russia to Sudan,it is established that the share of NNE goods in total exports of Russia is 0.02-0.12%. At the same time, the largest volumes of exports were in 2018 (0.5 billion U.S. dollars)

Analyzing the structure of NNE goods in Sudan,it was found that during 2013-2019, the export structure of non-commodity non-energy products is dominated by lower-processed goods (UCN FEA EAEU 10 - grain, in 2019 - group 1512 - sunflower oil).

However, despite the predominance of lower-processedgoods, in 2018 there is a significantshare of the higher-processedgoods: group 30 - pharmaceutical products (0.01 billion dollars). At the same time, the above lower-processed goodsremained on the first place.

The share of NNE goods in Russia's total exports to Tunisia is 0.02%-0.07%. Analyzing the export dynamics,it was established that the largest increase in exports of NNE goods was observed in 2014 (amounted to 156.12%).

The structure of NNE goods maintains a general trend for all North African countries - the predominance of lower-processedgoods (goods of the UCN FEA EAEU 7207 - semi-finishedunalloyed steel products, 10 - grain, 2814-ammonia, 1507 - soybean oil).

Thus, after analyzing the geographical structure of NNE exports of goods to North Africa, it was found that Russia exports the largest volumes of such goods to Egypt, the second largest import of such goods - Algeria. Since 2016, the smallest exports of such goods have come to Libya.Non-commodity non-energy exports to North Africa account for a small share (from 0.74% in 2013 to 3.13% in 2017). Exports of NNE goods to North Africa grew from 2013 to 2017, and from 2018 such volumes decrease.

Fig. 1: Share of non-commodity non-energy exports to North African countries in total Russian exports , %

The NNE structure in North African countries tends to predominate lower-processed goods for all countries except Algeria, where NNE higher-processed goods (unclassified goods) is predominant.

At the same time, the main exported lower-processed goods for all countries are the following: goods of the group of goods on UCN FEA EAEU 31-fertilizers, 10 - grain, 7207 - semi-finished unalloyed steel products, 2814-ammonia 10 - grain.

The leader in importing NNE goods from Russia is Egypt. Thus, in 2019, the export of NNE to Egypt ranked 18th in the total volume of NNE goods from Russia, in Algeria-29, Morocco - 61, Tunisia - 69, Sudan - 80, Libya - 92

Abstract

The article analyzes the existing institutional framework for cooperation between the Russian Federation and North African countries such as Sudan, Egypt, Morocco, Algeria, Tunisia and Libya. Trade interaction with these countries has both common positive and negative aspects, as well as qualitative differences, based on different levels of socio-economic development, political situation, level of development of trade and economic cooperation with the Russian Federation. The study attempts to consider promising areas of foreign trade cooperation and to propose an institutional basis for its implementation.

Africa is seen as one of the most promising areas of cooperation by the International Economic Community. The Russian Federation has long-term foreign economic relations with almost all countries of this region, but recently there has been a need to rethink the institutional framework of these links in order to intensify cooperation. This is largely due to the fact that Russia's increasing competition in this region is made up by Chinese entrepreneurs, establishing effective cooperation in various sectors of the economy of African countries. The aim of the study is to assess the established institutional framework of Russia's cooperation with African countries, determine the expediency of its use and develop recommendations for its improvement in accordance with current economic challenges and realities.

Cite this Article as: TKACHENKO M.F.,, SHAFIEV P.M., BUDARINA N.A., TATAYEVA I.Y.,and BLUDOVA S.N.“ Assessment of The Institutional Framework of Russia's Cooperation with North African Countries” Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

Many studies have been devoted to studying the problems and prospects of Russia's foreign trade cooperation with African countries (Sozontov Yu, Sidorova G.M., Dzubkov I., etc.), but the institutional framework of foreign trade cooperation has not been sufficiently studied.

Considering the overall institutional framework of Russia's cooperation with African countries, it is worth noting that it is represented by the following institutions. On the part of the Russian Federation, cooperation with African countries is carried out by: embassies, Eximbank, the Russian Export Center, the Chamber of Commerce and Industry, the Roscongress Foundation, the Association for Economic Cooperation with African Countries (AECAC), the Russian-Egyptian Business Council, all sorts of commissions and forums working on the basis of bilateral agreements. In particular, the functioning of the Russia-Africa economic forum on the platforms of which a new dialogue mechanism- the Russia-Africa Partnership Forum was created- is promising.
On the part of African countries, the main institutions promoting foreign trade cooperation with Russia are:African Development Bank, African Export-Import Bank, Russian-Arab Business Council, various commissions and forums (e.g. forum of Russian-Arab cooperation) working on the basis of bilateral agreements.

Cooperation with African countries is implemented within the framework of signed agreements on bilateral cooperation. These agreements were often signed in the mid-20th century and now active work is carried out to renew them. The main platform at which cooperation is supposed to be implemented is the Russia-Africa Forum, where the goals and objectives of cooperation are formed every three years, as well as an action plan for three years.

At the present stage, strategic areas of foreign trade cooperation are the export to African countries of military-industrial complex goods, agricultural products, etc. Algorithm of work with African countries is often based on the performance of the won tenders of international organizations for the supply of food or other goods or on the implementation of treaties concluded at forums, exhibitions, fairs.

The countries under analysis have different levels of institutional and socio-economic development and therefore have different needs to form an institutional framework for foreign trade cooperation.

At the same time, the existing commodity structure of exports from Russia to Africa can potentially become a factor in stimulating the development of goods with a high share of added value.

Table 1 presents the data of the rating calculated by the Russian Export Center on the prospects of countries for non-commodity exports from Russia for 2018.

Table 1 : Rating of the prospects of countries for non-commodity exports from Russia for 2018.

Country	Rating REC (2018)	Import of RF	Trade complementarity	Import growth rate	Import simplicity	Transport availability
Sudan	98 (-8)	65	25	113	119	56
Tunisia	82 (+12)	72	31	119	53	84
Libya	68 (-7)	86	41	130	10	96
Algeria	62 (+3)	15	2	61	116	23
Morocco	28 (+4)	51	64	31	6	23
Egypt	14 (+10)	10	1	40	70	125

Source:https://www.exportcenter.ru/services/analitika-i-issledovaniya/interaktivnye-analiticheskie-rodukty/renking_perspektivnosti_stran/

According to the rating, the higher the indicators, the more expedient is to cooperate with the country. As can be seen from the table, the least interesting from the point of view of non-commodity exports is the development of foreign trade relations with Egypt, and the most promising are the foreign trade relations with Sudan. Thus, when it comes to the prospect of further development of foreign trade cooperation, especially in the non-commodity sector, it is in these countries that the institutions promoting foreign trade should be given the most attention. At the same time, as can be seen, the prospect of foreign trade cooperation on the most profitable goods for Russia does not correlate with the level of development of existing trade relations. Thus, the closest foreign trade cooperation is carried out with Egypt, but, based on the rating, cooperation with this country, from the point of the view of non-commodity exports, is not promising.

The next point for consideration is the existing key institutions of cooperation with the Sudan and their shortcomings. There are diplomatic relations between the two countries, several cooperation treaties in various fields. Russia has

been cooperating with Sudan in various investment, economic and educational projects. The Russian-Sudan Intergovernmental Commission on Trade and Economic Cooperation is a key escort mechanism. At the same time, the country does not have a foreign ministry of the Russian Foreign Ministry. The nearest diplomatic mission of the Russian Federation is in the Republic of Uganda. The REC has an expert on the country. There is also no Russian trade mission in the country. There are virtually no foreign trade cooperation organizations with Russia in the Sudan, and there is no representation of the African Export-Import Bank or other major African banks that promote foreign trade. At the same time, Sudan is one of the seven countries that make the largest purchases of goods from Russia.

In our opinion, a number of measures need to be taken to revive foreign trade relations:

1. To renegotiate the bilateral treaty on foreign trade cooperation in accordance with modern realities.
2. To consider the creation of an industrial zone or free economic zone in Sudan, for organizing Russian production facilities in the country with the possibility of further export of manufactured products to other countries
3. To consider the creation of supply chains and cooperatives in the production and sale of Russian companies' products in Sudan and surrounding markets
4. To establish a marketing agency in Sudan, which will study Sudan's needs for goods produced in the Russian Federation, to study the national characteristics of demand for goods, to conduct measures to generate demand for Russian products for those groups of goods that have not been exported to Sudan through international marketing tools.

It would be useful to consider intensifying cooperation, given that the country may, in the long-term, after the political problems have been resolved, improve both its economic situation and the volume of imports.

In general, the risks and barriers to foreign trade are identical for all African countries, with the exception of a few countries with good development, such as Algeria, Morocco, Tunisia and Egypt. Let's consider some parameters of formalization of foreign trade transactions based on the rating Doingbusiness (table 2,3 and 4)

Table 2: Data of rating Doingbusiness 2020 ranking by indicator "International Trade"

Country	General rating	Rating by indicator «International trade»
Morocco	53	58
Tunisia	78	90
Egypt	114	171
Algeria	157	172
Sudan	171	185
Libya	186	129

Source: https://russian.doingbusiness.org/ru/data/exploreeconomies

Sudan and Libya have the lowest ratings (table.2). It is in these countries, under certain conditions, that there is the potential to increase foreign trade with Russia. Of course, there are big political problems in these countries, but it is necessary to start building the foundation of fruitful foreign trade cooperation by forming an institutional structure now. For example, taking into account the data from tables 3 and 4, it is possible to begin to build a modern system of institutions to promote foreign trade with these countries, which is oriented to the characteristics of those countries.

Table 3 : Parameters of registration of export operations based on the Doingbusiness Rating by indicator "International Trade"

Country	Export clearance time: Border and Customs control(in hours)	Export clearance value: Border and Customs control (US $)	Export clearance time: paperwork (hours)
Morocco	6	156	26
Tunisia	12	375	3
Egypt	48	228	88
Libya	72	575	72

Algeria	80	593	149
Sudan	180	967	190

The assessment of the parameters of registration of import operations, based on table 4 data, shows that the greatest difficulties of registration of imports are in Sudan, while in Libya, import clearance is carried out with less complexity than in other countries.

Table 4: Parameters of the registration of import operations based on the Doingbusiness rating on the indicator "International Trade"

Country	Cost of import clearance: paperwork (US $)	Import clearance time: Border and customs control (in hours)	Import clearance cost: Border and Customs control (US $)	Import clearance time: paperwork (hours)	Cost of import clearance: paperwork (US $)
Libya	50	79	637	96	60
Morocco	67	57	228	26	116
Egypt	100	240	554	265	1000
Tunisia	200	80	596	27	144
Algeria	374	210	409	96	400
Sudan	428	144	1093	132	420

Source: https://russian.doingbusiness.org/ru/data/exploreeconomies

You can see that the best conditions in the field of cargo clearance are in Morocco and Tunisia. Sudan and Libya have the greater difficulties, primarily due to the unstable political situation.

Let`s consider the country risks that are present in foreign trade transactions with the countries being analyzed.

Cooperation with Sudan and Libya as with the most promising countries carries the following risks:

Political: political instability, threat of renewed military conflict (South Sudan)

Economic: low level of economic development and, as a result, low purchasing power of the population, high corruption component in decision-making, lack of foreign trade strategy, possible confrontation with Chinese companies.

Global: global crisis, pandemic, difficulties in moving goods due to border closures.

Barriers: the difficulty of entering the domestic market due to informal demands from officials, the difficulty of overcoming customs formalities on exports and imports, the absence of an organization that protects the economic interests of Russian FEA participants

Success factors: relatively well-established foreign trade links, high export capacity for high value-added goods, a large number of specialists in various fields educated in the Russian Federation, which can contribute to the establishment of foreign trade relations. In the future, the growth of labor resources and consumer demand. The presence of infrastructure projects or plans for their development (allow to increase the export of materials from the Russian Federation for their implementation).

Algeria, Egypt, Tunisia and Morocco generally share the same risks of foreign trade and barriers to entry into domestic markets. The risks of cooperation with these African countries are as follows:

Political : possible pressure from EU countries in case of sanctions against the Russian Federation and demand to reduce foreign trade cooperation

Economic: low purchasing power of the population, lack of foreign trade strategy of cooperation, possible confrontation with Chinese and European companies.

Global: global crisis, pandemic, difficulties in moving goods due to border closures

Barriers: historical economic ties with the EU that may hinder the development of cooperation with Russia, the absence of an organization that protects the economic interests of Russian FEA participants in Algeria and Morocco and Tunisia.

Success factors: established foreign trade ties, high export potential for high value-added goods, the current structure of foreign trade with Russia with accurately viewed new directions, a large number of specialists in various fields educated in the Russian Federation, which can contribute to the establishment of foreign trade ties, participation in the creation of a national industrial base and, accordingly, widely used Russian technologies and manufacturing processes. The presence of infrastructure projects or plans for their development (allow to increase the export of materials from the Russian Federation for their implementation). The ability to integrate into the world's production chains with a high share of added value and, in the long term, the possibility of export of higher-processed products to other countries . There is the possibility of direct exports from the southern regions of Russia and the creation of the necessary infrastructure there to expand export-import operations. In the future, the growth of labor and consumer demand is expected.

Thus, the analysis showed that unlike China, the Russian Federation operates on a promising African market without a certain strategy and not on a permanent basis. Despite the marked intensification of partnership, often specific activities are not present. The advantage of the Russian Federation can be the creation of a mechanism of mutually beneficial cooperation in the foreign trade sphere. China has an aggressive foreign trade position in the African market, related to the export of resources (primary sector products) and the export of its own goods to African countries (ready goods of the highly differentiated spectrum). China's reluctance to embed African countries in high-tech chains also gives Russia an advantage in using this factor. A possible alternative to such an aggressive strategy could be a strategy of mutually beneficial cooperation. In order to strengthen trade and economic cooperation, it is right to form a marketing agency (trade office) in each country, whose tasks will include studying the domestic market of each individual African country and searching directly on its territory for new niches for export-import operations. The main task of the agency should also be to promote selected goods to the market of each country.

Of course, the African market has common features, and yet cooperation with each country must be based on individual basis, taking into account its internal characteristics. The second area of work of such an agency should be the coordination of foreign trade cooperation with nearby countries. Within the framework of REC and country marketing agencies or trade missions it is advisable to analyze the needs of African countries in goods, independently look for suppliers of such products in Russia and help them to establish trade relations with African partners.

Given the complexity of doing business, it is possible to create technological maps and algorithms for passing customs formalities, obtaining trademarks and forming a catalog of reliable counterparties, with quarterly updates.

Channels of Research Dissemination to Reach End-User Targets

Maria EGGINK
University of Mpumalanga, Nelspruit, South Africa
maria.eggink@ump.ac.za

Abstract

Dissemination of research is important in order to justify the research expenses and to reach the intended goals of the research. Unfortunately the findings of research do not always reach the intended end-user and the expenses are often fruitless. The aim of the research is to determine how the research findings of university researchers can reach the end user in order to ensure a return on investment, monetary or otherwise. Secondary data was used and a literature study was conducted to determine the current dissemination practices. Research repositories were reviewed as a proposed channel for research dissemination that is more accessible to end-users. It was found that the more popular dissemination channels were not necessarily the best channels that to reach the intended target. It is proposed that universities consider the establishment or improvement of institutional repositories in order for research findings to reach wider communities and end-users.

Keywords: Research Dissemination, Institutional Research Repositories

Introduction

The high cost spent on research is one of the reasons why it is important to ensure that dissemination of research findings takes place effectively (Neta *et al*., 2015:49; Wilson, Petticrew, Calnan and Nazareth, 2010:1; Holmes and Savgård, 2008:8; Bero *et al*., 1998:465). Lavis, Lomas, Hamid and Sewankambo (2006:621) mention the importance of linking discovery with application in order to ensure the benefits of the investment. According to Bero *et al*. (1998:465), not much attention is paid by researchers to disseminate their findings, despite the high cost of the research.

Derman and Jaeger (2018:121) regard dissemination of research results as ethical conduct of research and they stated that if research dissemination does not take place, it is regarded as a waste of resources and they further indicate that results should not be withheld, even if the results are negative. According to Uzwyshyn (2016: 19), publicly funded research, using taxpayers' money, should be publicly accessible through the publication of an article and by making original data available. Uzwyshyn opines that this will lead to healthier competition, commercialisation and have a positive effect on the economy.

Four associations, including the Association of American Universities, the Association of Research Libraries, the Coalition for Networked Information, and the National Association of State Universities and Land-Grant Colleges, working with research universities in the US, convened in 2008 to discuss possible ways to enhance research dissemination. These associations developed the following vision statement for the university's role in dissemination:

> "The creation of new knowledge lies at the heart of the research university and results from tremendous investments of resources by universities, federal and state governments, industry, foundations, and others. The products of that enterprise are created to benefit society. In the process, those products also advance further research and scholarship, along with the teaching and service missions of the university. Reflecting its investments, the academy has a responsibility to ensure the broadest possible access to the fruits of its work both in the short and long term by publics both local and global.

> Faculty research and scholarship represent invaluable intellectual capital, but the value of that capital lies in its effective dissemination to present and future audiences. Dissemination strategies that restrict access are fundamentally at odds with the dissemination imperative inherent in the university mission" (Association of American Universities, Association of Research Libraries, Coalition for Networked Information, and National Association of State Universities and Land-Grant Colleges, 2009:1).

The roles of universities have changed from that of teaching to include knowledge creation and knowledge transfer. Eggink (2017), in a study on the changing role of universities, indicated universities' role in national innovation systems and how the universities' role, as actors in innovation systems, coincides with the change in views in economic theory from neo-classical theories to evolutionary neo-Schumpeterian economics. Eggink (2017) emphasised the important contribution of universities to the performance of innovation systems and eventually economic growth and development. Without dissemination of research findings, knowledge transfer is not taking place to the extent that it can make a difference in the performance of innovation systems and ultimately, the economy.

Dissemination of research results are treated as more important in certain fields of study than in others. In the medical field, for example, the research findings often have a direct practical application and therefore the impact is often measured. In the social sciences that is not always the case. Research results are often published without any follow up on the implication or use of this information by the intended end-user.

The research question is: how do university researchers disseminate their research findings and how can we ensure that the research findings reach the intended end-user? The aim of the research is to determine how the research findings of university researchers can reach the end user in order to ensure a return on investment, monetary or otherwise. These returns are not necessarily in monetary form. It may also be in the form of an improvement of living standards or any other outcome that was originally intended by the research.

For the study secondary data and a literature study was used to determine and debate the dissemination practices of university researchers. First, the different concepts are defined. Second, the importance of research dissemination is discussed. Thereafter the current dissemination practices are critically reviewed and reported on. Research repositories are reviewed as a proposed channel for research dissemination that is more accessible to end-users.

Concepts

Different terminology is used to describe how research findings are spread and made known to users of these findings or new knowledge. Dissemination of research is the term that will be used in this study and is defined as the transfer, imparting, distribution or communication of research findings or knowledge from producers to potential users. This definition is derived from components of different definitions of dissemination, knowledge transfer and knowledge translation. Louis and Jones (2001:8) define dissemination as consisting of "purposive, goal-oriented communication of information or knowledge that is specific and potentially useable" and emphasise that the intent of dissemination is not only to disperse information, but to do it in a way that will promote the use of the information.

Schillinger (2010:1) distinguish between the terminology that is used by the Centers for Disease Control and National Institutes of Health (in the US) and the Canadian Institutes of Health Research. The definitions of these terms used by Schillinger (2010:1), are specifically aimed at the health profession and research, but has elements that can be applied to a wider field, including social sciences research. The definition of dissemination that is used by these institutions, is as follow: "the targeted distribution of information and intervention materials to a specific public health or clinical practice audience". In order to have a more generic definition, dissemination is not necessarily aimed at a specific identifiable target group. Where some research is aimed, for example, at policy making in a specific government department or solving a problem in a specific community, other research may be aimed more generally at the broader public. Another term used in this context is the diffusion of knowledge. Diffusion includes, according to the terms defined in Schillinger (2010:1), successful adoption of the interventions.

Dissemination of research findings or knowledge does not necessarily include implementation or integration of research. The implementation and integration are in some cases the aim and function of the researcher, but in other cases these functions lie with the users of the knowledge themselves. Some applied research, action research, and contract research may, for example, include the implementation of the research knowledge by the researcher. On the other hand, in cases where the target or end user is more generally defined, the researcher does not have control over the implementation of the research findings or knowledge.

The definition of knowledge transfer that is used by the Canadian Institute of Health Research (Schillinger, 2010:1) states that knowledge transfer is "the imparting of research knowledge from producers to potential users". Fry *et al*. (2009:4) has a similar definition of dissemination by stating it as "…to pass on their [researchers] findings to those

who may be interested in them". These definitions do not limit the users to a specific target group, nor do they imply implementation or integration of the research knowledge. These definitions, however, imply the intent to reach the end user and form therefore part of the broader definition of dissemination that will be used in this paper.

Importance of dissemination of research findings

The amounts that are spent on research and development (R&D) varies per country, as indicated in Table1 for a few selected countries. The table indicates the data extracted from OECD.Stats and are given for 2016, as later figures are not available for all countries. The R&D spending are in some countries higher than three per cent of the Gross Domestic Product (GDP) and amounts for example in the USA to US$17 000 894,8 million (2010 dollars, constant prices, purchasing power parity). These amounts are often very high and should therefore ensure a sound return on investment. Even in countries where the R&D spending per GDP does not compare well with the rest of the world, these amounts are still high and cannot result to be fruitless expenditure. Businesses, aiming at making maximum profit, will most probably not tolerate R&D expenditure that does not have the potential to be profitable. The question is whether these decisions are also being taken seriously when it comes to public R&D expenditure.

Table 1: Gross domestic expenditure on R&D by sector of performance and field of R&D

Table compiled from data extracted from OECD.Stat

The importance of research dissemination is further emphasised by the reasons why researchers disseminate their findings. In a study by Wilson *et al*. (2010), based on a questionnaire sent to a sample of 232 UK-based principal investigators of publicly funded applied and public health research, the following reasons for disseminating research findings were indicated by the respondents, revealing also the percentages of responses: raise awareness of findings (93%); influence policy (85%); influence practice (84%); stimulate discussion/debate (75%); transfer research to practice (75%); raise the organisational profile (65%); attract future funding (62%); research assessment exercise (53%); justify public funding (48%); promote public understanding of research (40%); satisfy contractual requirements (37%); improve your own communication (24%); other (11%). The fact that this study focussed on research in the medical field may have an effect of the findings due to this kind of research that is aimed at a specific target group, such as government for policymaking. The direct outcome of the research is perhaps not aimed at the general public due to the technical nature and application possibilities thereof. Yet, the results of this study give an indication of the important reasons for dissemination. The percentages in brackets is how many researchers indicated the reason and it is not necessarily an indication of the importance of that reason. Yet, it is alarming that only 40% of the researchers indicate that their dissemination is aimed at promoting public understanding of research. It may be that only 40% of research has the public as end-users, but we should question whether researchers are reaching the end-user or not?

Further advantages of disseminating research data and/or findings, includes: collaboration on research projects, even internationally; reduced costs of data collection; and access to data allows diversity in research, resulting in a more holistic approach to solving problems (Shahi *et al*., 2014:244-246).

Dissemination Channels

In order to improve the effectiveness of dissemination, an active plan of dissemination should already be included in the planning process of the research. Holmes and Savgård (2008:6) emphasised the importance of including dissemination planning in the planning stage of the research, including the time and budget needed for the dissemination of the research.

In some cases it is recommended that the end-users be involved from the planning phase in order to make sure that dissemination takes place (Derman and Jaeger, 2018:121; Holmes and Savgård, 2008:10). For research that is commissioned and the end-user is the party who requested the research, it is almost given that the end-users be involved from the planning phase. Yet, it is not always possible to involve end-users. The funders or requesters are not necessarily the end-users. It is also possible that the end-users are the general public and not an identifiable specific target group.

The choice of dissemination channel is imminent for reaching the intended end-user target. The different channels of dissemination are summarised and the advantages and disadvantages of these channels, as identified by literature, is included in Table 2.

Table 2: Dissemination channels

Dissemination channel	Advantages	Disadvantages	Reference
Technical report	Effective method of factual information	Resource intensive; Limited audience; Retrieving of report later may be difficult	Holmes and Savgård (2008:15-18)
Non-technical summaries	Often available on the Web; Summaries of different qualities and styles can be generated		Holmes and Savgård (2008:15-18)

Peer reviewed publications	Appropriate channel for science community; Quality assurance and confidence in results; Indicators of quality and impact	Long timescales of peer review processes; Results in small changes in practice; Generally ineffective	Holmes and Savgård (2008:15-18) Fry *et al.*(2009:4) Bero *et al.* (1998:467)
Professional journals	Effective channel of communication with practitioners	Not always accepted for impact factor and citations among academic researchers	Holmes and Savgård , 2008:15-18;
Internet	Easy access of reports	Quality of websites are not assured;	Holmes and Savgård, 2008:15-18
	Cross-referencing possible; Audio and visual materials can be attached or linked; fast and flexible dissemination is possible; ability to publish a vast number of research; addresses the rights of the consumers to have access to research information	Intellectual property right protection challenges; Academic accreditation and peer review challenges	Duffy, 2000:350
Social media	Useful to develop and sustain networks and collaborations	Does not always allow two-way communication; networks are small and not widespread	Cooper, 2014:2;8;
Newsletters	Often used to keep extended users informed of developments	Difficult to get articles from researchers to publish	Holmes and Savgård (2008:15-18)
Face-to-face	Proper understanding can be enhanced through questions and explanations		Holmes and Savgård (2008:15-18)
Workshops and seminars	Suitable for targeted audience; Dialogue is possible; Enhance “buy-in”; Contacts and relationships are built	Limited number of end-users; Difficult to get end-users to attend	Holmes and Savgård, 2008:15-18

Conferences	Fast dissemination of changing fields, such as computer science	Generally ineffective	Fry *et al.* (2009:5) Bero et al. (1998:467)
Media reports	Reaching broader public	Misreporting	Wilson *et al*., 2010:7

Source: Own compilation

A large component of measuring universities' quality is based on their research outputs. Lecturers' performance and promotion at universities are in many cases also measured by evidence of their research outputs. The problem lies in how the research outputs are measured. Often research outputs are measured by the number of articles published in high-status or historically accepted journals and monographs or by the number of citations or h-index. The concerns are: do the research findings reach its target market? Do the findings reach the end-user? Do the number of citations imply that the end-user or target market is reached or do they publish only to be cited by other researchers and then still do not reach the target market? The study by Wilson *et al*. (2010), based on principal investigators of publicly funded applied and public health research (as was previously mentioned), indicated the communication channels used by them for dissemination. Academic journals were indicated by 98% of the respondents as a means of communication used, 96% indicated conference presentations, 91% that they report to funders, 62% use seminars, 57% workshops, 54% Web access to full report, 50% Web access to summary report and less than 50% indicated that they make use of other channels such as press releases, networking, face-to-face, newsletters, media interviews, etc.

Fry *et al.* (2009:5) opine that publications that are better-suited for the dissemination of applied or practice-based research and are aimed at non-academic target groups, is often viewed as low status and prestige among researchers. Researchers therefore often do not reach their target group through the channel of dissemination used. According to Fry *et al*. (2009:4), researchers have to make a choice between fast publication reaching the target audience, and slower dissemination or publication in a "high-status" journal. Fry *et al*. further indicate that publication is not only a means of communication, but also a means of measuring quality. Yet, Fry *et al*. (2009:7) reason that there is a risk that journal articles become dominant due to its popularity to be used as performance measurement. According to Holmes and Savgård (2008:15-18), the manner in which the research results should be disseminated will differ, depending on the needs and circumstances of the end-user. Bero *et al*. (1998:467) concluded in their study of systematic reviews, that passive dissemination "is generally ineffective, and at best, results only in small changes in practice". The passive dissemination that they refer to includes publication in conference proceedings or journals or mailing of educational materials.

Early dissemination of research findings is important. Balas and Boren (2000:60) found that it takes on average 17 years for research findings after dissemination to be implemented in practice. Their study was based on the medical field and done in 2000, but it does give an indication of the lag of implementation of research findings. Even if this process speeded up due to access to internet and the improvements in communication, there is still a lag from reaching research findings until it is disseminated and then implemented. The slow peer review process of many publications is an example.

Consideration should therefore be given to criteria such as academic quality, speed of dissemination, reaching non-academic targets, and the wider socio-economic impact (Fry *et al*., 2009:7).

Research repositories and open access publication

Research repositories is a means of overcoming some of the challenges of disseminating research findings to end-users. Lynch (2003:2) defines research repositories as follows: "a university-based institutional repository is a set of services that a university offers to the members of its community for the management and dissemination of digital material created by the institution and its community members". Students and researchers have access to libraries and online journal databases while registered or working at universities, but once they leave the university, their possibilities to access research information is reduced (Borah and Aguiniga, 2013:506). The broader public, who are often the intended end-users of research findings, do not have easy access to these resources either. According to Van Wyk and Du Toit (2016:108), only 5% of the global institutional repositories are in Africa and they state that "Lack of access to information and technology has a profound negative effect on the African digital scholarship". Many of the publications can only be accessed at a high cost. An institutional repository may enhance access for researchers and the broader public to research findings.

The advantages of a research repository include, inter alia: the provision of a reference database; to share research publications more easily; to improve visibility of research findings to the outside world; to reach more people outside their fields; to enable researchers to manage their own publications online; and to provide a flexible database (Hazzard and Towery, 2017:3-4; Robinson, 2009:134). According to Van Wyk and Du Toit (2016:107), it is important to manage the digital scholarship such as dissertations, theses, proceedings and publications, because it forms part of knowledge capital and should be seen as assets of the institution. By managing digital scholarship through a research repository, improves visibility and accessibility of research findings. Shahi *et al*. (2014:244) add advantages of data sharing such as collaboration on research projects, diversity in research leading to a more holistic approach, validation of each other's work, increased transparency, increased quality, and the reduction of costs.

The establishment of research repositories is not without challenges. The main challenges that are reported include, inter alia, the availability of funds, time and personnel, digitising, formatting, organising, maintaining, documenting, protecting and providing access to data, competition among researchers, and recognition of researchers (Hazzard and Towery, 2017:5; Shahi *et al*., 2014:245).

Conclusion

With the changing roles of universities from knowledge generation to knowledge transfer, it became important for university researchers to disseminate their research data and or findings in such a way that it reaches the intended target markets. The high costs of research, whether funded privately or publicly, as well as the importance of research findings for socio-economic changes, necessitates the avoidance of fruitless expenditure. There is an ethical responsibility by researchers to ensure the highest return on investment, measured in financial terms as well as social terms.

Literature revealed the importance of dissemination plans by researchers already in the planning phase – a practice that is not necessarily used by all researchers. In this paper the advantages and disadvantages of different channels of dissemination were analysed. It was found that certain channels, such as publication in high-status journals are of the more popular channels. The reasons identified for the popularity of these channels include the channel's ability to measure quality as well as performance through the numbers of publications and citations. It raises questions on the ability of these channels to reach the intended target. It is proposed that universities seriously consider the establishment or improvement of institutional repositories in order for research findings to reach wider communities and end-users. Institutional repositories are not without challenges, especially with respect to intellectual property protection, plagiarism, and ensuring of quality. Universities should therefore revise their policies and management of research dissemination, property protection and plagiarism to address these challenges. Universities should further revise policies on measurement of research outputs and performance in order to accommodate the different ways of research dissemination and not to limit it to publication through certain channels that restricts the end-users of research findings from accessing this information.

Abstract

The paper analyzes the relationships between smartphone performances as to various technical features and scores obtained in user reviews for Samsung, Apple, Huawei and Xiaomi. Results show that usability is the feature that mostly influence the value for customers; significant value is also attributed to screen, dimension and manufacturing quality.

Keywords: user review, smartphone, Apple, Huawei, Samsung, Xiaomi.

Introduction

The role of user reviews in assessing the customer satisfaction and, therefore, the commercial success of products is more and more relevant. In particular, within the smartphone industry, customer satisfaction can drive the strategic decisions as to the development of specific technologies (Shin, 2015) since different design features can differently affect satisfaction of smartphone users (Liu and Yu, 2017). Customer satisfaction can turn into customer loyalty and therefore guarantee stronger competitive position (Bayraktar et al., 2012; Kim et al., 2016). For this reason, it seems critical to define how performances of smartphones as to different technical features can turn into an overall positive or negative opinion of the device.

This work is a first attempt of analyzing the relationships between technical performances and scores obtained in user reviews of smartphones from the four market leaders: Samsung, Apple, Huawei and Xiaomi. Indeed, such relationships define the technical features that most influence the value that customers attribute to the product and can guide strategic decisions of companies regarding the technologies on which invest more.

In what follows, after the literature review on the dynamics of the smartphone market and the use od bid data analysis, the methodology is presented and primary results are shown and discussed. Conclusions close the work.

Literature Review

The dynamics of the Smartphone Market

From 2007 until today the smartphone market has grown enormously thanks to the developments of new operating systems and innovative applications. Although such growth, the main smartphone Original Equipment Manufacturers (OEMs) have changed over time. In fact, brands like Nokia and Blackberry - which dominated the global sales smartphone market in the early years - were overtaken by Apple and Samsung in 2011. In recent years, manufacturers such as Huawei, Xiaomi and Vivo have been increasing their sales and market shares. Indeed, such companies adopted very different types of strategies to reach high market shares. One of the ways to gain competitive advantage in hi-tech companies is to constantly innovate (Michelino et al, 2015; Lamberti et al., 2017; Cammarano et al., 2019; Zhang et al., 2020) and competitive strategies in the smartphone world have changed over the years.

In the early years of cell phone production, the strategy used was cost-leadership (Lin and Wang, 2008). This allowed to optimize costs and processes and have large profit margins. In this way, OEMs moved their component production to developing regions such as South Korea and Taiwan. However, this strategy has been replaced by differentiation (Bayraktar et al., 2017): leading companies such as Apple, Samsung and Huawei decided to constantly innovate in the implementation of technology and design for phones. However, innovation comes also from component suppliers, in particular from semiconductor manufacturers such as Qualcomm, Broadcom, Intel, Nvidia, Sony and many others (Shin et al., 2017). In fact, the hi-tech market segment is characterized by intense competition, therefore it is necessary for each player in the supply chain to provide value added. Moreover, the Shanzhai case in China has attracted a lot of interest as Chinese smartphones have gained high market shares (Jin-Li et al., 2011). Shanzhai is a cluster of unbranded companies specializing in several activities. Each of them has specialized knowledge on a single

component that can facilitate and improve the performance of an OEM. Each company focuses on a single product which can be a processor, a display, DRAM memory or on the single process which can be the design of integrated circuits or the final assembly (Liu et al. 2015).

Finally, one of the key roles in the hi-tech sector is marketing management. Therefore, marketers have begun to recognize the importance of adapting their market to the tastes, preferences and desires of consumers (Zhou et al., 2009). Marketing managers have identified quality as a key concept for customer satisfaction. The quality of products and services is an important tool for companies to create greater value for the customer and to achieve high corporate profitability (Porter, 1980). From the consumer point of view, perceived quality is his/her perception of the overall quality of a product in relation to its final purpose, compared to other alternatives (Aaker, 1991). Certainly the quality perceived by the customer depends on many factors such as: reliability (Talke et al., 2009), design (Xue, 2019), price (Völckner and Hofmann, 2007), brand (Bauer et al., 2007), reputation (Cretu and Brodie, 2007) and many others. However, in high-tech markets, consumers perceive the quality of a product also in its relationship with innovation (Michelino et al, 2014; Cammarano et al., 2017). Indeed, consumers consider the company research and development efforts and innovative capacity as a positive proxy for products. For this reason, consumers usually buy a new product when the previous one was not satisfactory or if the new product offers greater value than the last version (Calantone et al., 2006).

Big Data Analysis

Since the 1990s, marketers have tried to predict new products or business ideas by capturing customer information such as demographics, complaints, and requirements using market-oriented planning to formulate new product development. Therefore, many studies have identified the usefulness of user information to improve the manufacturing process of a new product (Von Hippel et al., 2012). Traditional data collection methods involved surveys, questionnaires, personal or telephone interviews. The main advantages of these methodologies concerned the accuracy of the data by defining the analysis sample, the clarity of the qualitative data, e.g. personal satisfaction of the purchase (Yang et al., 2006). Of course, these methods are tedious and time consuming. The main disadvantages of these methods relate to sample size and response rates. In general, a large sample can improve the accuracy of the estimate and the generalizability of the results (Day et al., 1994). Non-response errors modify the information of the selected sample (Assael and Keon, 1982), thus decreasing the reliability and validity of a study and making it difficult to generalize. Therefore, to overcome these problems, scholars are pushing towards the adoption of the Internet and online content analysis (Yang et al., 2003), to take advantage of fast response times and access anywhere (Sackmary, 1998). Therefore, an innovative methodology in the statistics area is the use of big data analysis (BDA). BDA is linked to the explosion of information on the web with unstructured and heterogeneous variables that are produced in continuous time. In fact, it has become very convenient to store this information on the internet and use it over time. In this case the problem of observations is overcome, and the accuracy would be high if the information were independent and homogeneous. Big data are a collection of documents, video images, network data that should not be valued as a database, but as a source of discovery and knowledge (NRC, 2013). This growing demand for data across all levels of society has made data a valuable commodity. Indeed, many scholars used web information to uncover hidden patterns, unknown correlations, and market trends that could help companies to make more accurate and appropriate business decisions. For example, Vidal et al., used 69,961 tweets to investigate consumer behavior in relation to food. Zhou et al. (2015) conducted a sentiment analysis on online product reviews to identify customer needs. Therefore, it is important that companies know their customers' opinions on their products to increase sales (Atzmueller, 2012). User experiences have played a key role in identifying features that need to be improved in upcoming smartphone releases. In this way, the smartphone industry has grown over time and has brought new product and service innovations (Suh et al., 2017). However, information about user experiences posted in web communities is described in a non-systematic way for product improvement. For this reason, it is necessary to carry out some precautions during the evaluation and choice of the activities to improve. Therefore, big data must be collected cleanly to achieve research purpose, as this data are different from primary data created specifically by researchers to answer specific research questions (Walsham, 1995). In recent years, the literature is pushing more and more to exploit the availability of big data to carry out new research and theories (Johnson et al., 2019).

Methodology

The data source for the work is alaTest, a web service developed by International Consumer Services which aggregates thousands of user reviews and combines them into a single quality rating, named alaScore. The algorithm used for aggregating such reviews takes into account both experts and users reviews and provides a score ranging from 0 to 100. Moreover, ratings on a five stars scale are provided and positive and negative reviews are provided for different technical features: battery life, camera, design, dimension, manufacturing quality, performance, portability, price, reliability, screen, sound quality and usability.

We collected data regarding 257 smartphones launched from 2007 to 2020, for a total number of 496,381 reviews: for the purpose of this study, we focused on the reviews of the devices launched from the four current market leaders: Samsung, Apple, Huawei and Xiaomi and provided some descriptives, comparing the results of the four companies among them and with the average results of the sector.

Results

In Table 1 the sample is described as to number of smartphones and relative reviews analyzed.

Table 1: sample description

Brand	***# Smartphones***	***# Reviews***
Apple	21	224,309
Huawei	16	5,714
Samsung	39	162,303
Xiaomi	13	446
Other brands	168	103,609
Total sector	**257**	**496,381**

Figure 1 shows the market share of the four companies as of October 2019 - October 2020 (data source: gs.statcounter.com) and the average values of the alaScore.

Among the four companies only Huawei has an average alaScore value lower than the overall sector, thus confirming a general positive rating for the devices of market leaders. Yet, the highest value of alaScore is obtained for the company, among the four, which worst performs on the market. For this reason, a deepening of the analysis is performed, by breaking down the alaScore in its components.

Figure 1: market share and average alaScore ratings

In Figure 2 average experts and users scores are reported together with the percentage of five and four stars ratings attained. It emerges that for all the brands the scores provided by users are higher than those coming from experts and such gap is particularly high for the two worst market performers (Huawei and Xiaomi). In a similar way, these two companies have a significant number of "good" (four stars) ratings, whereas Samsung and Apple have higher numbers as to "excellent" (five stars) ratings. Therefore, it seems that the commercial success is more related to expert reviews than to user ones and that only devices gaining a five stars rating are effectively capable of turning such rating into higher market share. Obviously, the result can also be associated to the higher prices of Samsung and Apple smartphones if compared to those of Huawei and Xiaomi: indeed, higher prices turn into higher revenues (and therefore higher market share) even when selling volumes are lower.

Figure 2: experts vs. users scores and five and four stars ratings

Figure 3 shows the average positioning of the four brands as to the technical features reported by alaTest: the percentage of positive feedbacks is reported, also comparing them with the average assessment of the sector (black dot). The percentages are calculated on the total number of reviews received, including not only positive and negative ratings, but also neutral ones.

Samsung is the best performer as to screen and portability if compared to both the other three companies and the sector as a whole; high values are also obtained for usability, manufacturing quality and dimension. Apple is the best performer as to usability and a good rating is also achieved for the dimension of the devices, whereas for all the other features quite poor rating are achieved. Huawei is the best performer as to dimensions and a good judgement is obtained also for battery life. Finally, Xiaomi gets the highest ratings as to performance, screen, price, battery life, manufacturing quality and reliability.

Results seem quite controversial: indeed, while Samsung and Xiaomi have a significant number of attributes for which positive ratings are obtained, Apple and Huawei are almost always under the sector average. This begs a question about the effectiveness in assessing the customer value of a smartphone through its technical features.

Figure 3: positioning maps as to the different technical features

Nevertheless, some conclusions can be drawn when analyzing the four companies together.
A synthesis of the results is provided in Table 2 where a plus is reported when the company performs better than the average values of the sector, a minus otherwise. In the upper rows of the table, where the overall scores are reported, the four companies seem to perform better than the other firms in the sector, consistently with their market supremacy: both experts and users scores are higher and at least one between five and four stars ratings is awarded. Yet, when we come to the technical features, surprisingly a general lower performance is recorded for the four leaders if compared to the sector average with the only exception of Xiaomi and, to some extent, of Samsung. For example, usability is the only feature for which both Samsung and Apple (overall more than 50% of the market share) perform better than the other companies in the sector: therefore, this can be considered as one of the most valued attributes when acquiring a new device. Other important features are the dimension - for which both Samsung and Huawei have higher values than the sector average - the screen and the manufacturing quality, with high scores for Samsung and Xiaomi, and the battery life, for which high ratings are obtained by Huawei and Xiaomi. Such results set the possible priorities on which companies should invest to strengthen their market position.

Table 2: sample description

		Samsung	***Apple***	***Huawei***	***Xiaomi***
scores	alaScore	+	+	-	+
	Experts score	+	+	+	+
	Users score	+	+	+	+
	5 stars rating	+	+	+	-
	4 stars rating	-	-	+	+
technical features	Performance	-	-	-	+
	Usability	+	+	-	-
	Screen	+	-	-	+
	Design	-	-	-	+
	Camera	-	-	-	+
	Price	-	-	-	+

	Battery life	-	-	+	+
	Portability	+	-	-	-
	Dimension	+	-	+	-
	Manufacturing quality	+	-	-	+
	Reliability	-	-	-	+
	Sound quality	-	-	-	-

Conclusions

This research is at a very early stage of development and this work is only a first attempt to define relationships between market performances, user reviews and technical features. Much effort should be done in at least four directions.

First, perhaps the time horizon (from 2007 to 2020) is too wide, and the analysis should be confined to shorter time periods by comparing scores and reviews of different periods with the market performances of the same period. Even if the alaScore is quite a stable indicator, which takes into account the *âge des tests*, a more confined analysis could provide better indications. Moreover, in doing so, a longitudinal analysis could be performed, pointing out how the relationships between technical features and market performances have changed over time.

Second, the market share as a measure of market success can be flanked by other indicators, such as the sales volume, which are not affected by price. Indeed, the use of market share overestimates the success of expensive devices and underestimates results of cheap ones. If it is true that a high price is justified when high value is attributed to the product, using sales volumes can provide new insights as to the features which are highly valued by a mass market.
Third, by considering the percentage values of positive reviews on the total number of reviews, including the neutral ones, the technical assessment may be underestimated: therefore, the authors are considering the exclusion of neutral reviews.

Lastly, the analysis should be widened to other players in the industry, as to compare results obtained by best and worst market performers and more robust statistical analyses should be performed to obtain more generalizable results.

All these directions will guide our future research.

Abstract

The study has concluded the importance of complex tools to ensure a management control process at enterprises with state participation. The tools have been divided into two groups, basic tools and operational tools. In particular, the basic tools create the necessary management, financial and legal basis for enterprise's activities. The operational tools provide effective implementation of the goals and objectives designated by the management at the division level, as well as during direct business operations. As a result, it was created a multi-level system of the main tools for organizational support of management control at enterprises with state participation. The system allows getting a comprehensive idea of the functional purpose of various tools, adjusting the organizational processes. It also increases the responsibility of the executive management for the development and effective implementation of advanced management control system.

Keywords: Management Control, Basic Tools of Management Control, Operational Tools of Management Control, Enterprises with State Participation.

Introduction

Today, there is a rise of uncertainty and dynamism of the external environment, confusion of economic ties and mechanisms, and increase in competition for resources at all levels of management. These circumstances determine the relevance of the development and widespread implementation of successful management models.

Obviously, control in its various forms plays an important role in all links and management processes. A control function coordinates the work of individual subsystems of the control system, and identifies the reserves of the most rational use of resources.

Specific academic research interest is a problem of management control improvement in large companies with a high level of division of labor and management processes. Coordination and ensuring effective work of specialized elements within management structure in a large enterprise requires increase in control and changes in approaches to its organization. The described processes are typical for modern enterprises with state participation.

KUZMICHEVA "Organizational Support of the Management Control Process in Enterprises with State Participation" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

The development and implementation of the effective control system in enterprises with state participation is an imperative requirement to ensure the adoption of managerial decisions on realizing their internal potential and creating a development strategy. It requires such enterprises to use an advanced (from the perspective of modern economic conditions) system of appropriate approaches, tools, techniques and various models.

Research material and methods

The study is based on the theoretical works on management control of the following foreign scholars: R.N. Anthony (1993, 1998), L.H. Gulick and L.F. Urwick (1937), J.D. Mooney (1931), U. Schäffer (2013).

The purpose of the research is to develop the organizational and methodological basics of management control system in enterprises with state participation, taking into account their special aspects.

The research results were obtained using general scientific and special methods: analysis, synthesis, induction and deduction, modeling, logical, complex and systemic approaches to the assessment of economic phenomena and processes.

Research Results

Management control system in enterprise can be characterized as a communication network of management accounting. Herewith, subjects of the system are vested with certain powers, or these subjects are responsible for monitoring the state of controlled object. In particular, the actual data are compared with the required figures; the deviations and the degree of their possible influence on the results of achieving the goals of organization development are assessed. Since control is needed at all levels of organization management, it ensures the effectiveness of management process at all stages (Bogataya, 2005), (Garrison, Noreen and Brewer, 2018).

It is a system that consists of input, output and a set of interrelated elements. The input is information support of control. The output is information about the object of management, obtained as a result of control procedures. The interrelated elements include technology, procedures, regulations, control environment, accounting system, and key areas of responsibility.

The characteristics of human resources, regulations, procedures, and corporate culture influence the effectiveness of management control (Minakova and Nosachevsky, 2019).

The costs of creating and ensuring the smooth functioning of management control system, together with the opportunity costs from an economic point of view, should not exceed the expected losses from the absence of such a system.

Among the main objectives of a management control system are resource conservation and resource efficiency, use of organizational potential of an enterprise, well-timed adaptation of an enterprise to changes in the internal and external environment, as well as ensuring the effective functioning of an enterprise in general (Bovykin, 2008).

The introduction of an effective management control system requires a solution of certain tasks. These tasks are related to observance of the following core principles: an enterprise's orientation to accomplish a strategic plan; ensuring the safety, effective use of resources and potential of an enterprise; ensuring the financial and economic stability of an enterprise in the face of constant changes of the internal and external environment; maintaining a relatively high quality of primary information for decision-making; compliance with organizational rules procedures, and legal requirements.

Enterprises with state participation have a particular economic importance; play a strategic role in certain industries and services. Thus, according to the Federal Antimonopoly Service (2018), the contribution of state and state-owned companies to Russia's gross domestic product in recent years has been about 70%. Enterprises with state participation have become a subject of this study. A significant part of the empirical research was carried out on the materials of the Russian Post JSC.

In Russia, the Russian Post is a natural monopoly in the public postal service industry, which includes 90 branches and separate subdivisions. The company employs over 20 thousand people. The study found that the management

control system of Russian Post enterprise is multi-level and involves a continuous exchange of information between the levels of enterprise management.

The procedure for interaction between structural units is enshrined in the regulations of the enterprise, including provisions on structural units and job descriptions of employees.

The insufficient amount of financial resources allocated for the development of the technical base, human resources, and integrated logistics infrastructure of Russian Post has led to the use of an ineffective technological mechanism for the functioning of the postal services system. The authors have found that the efficiency of Russian Post is lower than that of many commercial enterprises of public postal communications, transportation, and courier delivery services (Table 1).

Table 1: Analysis of the effectiveness of Russian Post and other relatively large companies operating in public postal services in 2018

Indicator	**Russian Post**	Other public postal services (307 companies)	DHL International	Pony Express	SPSR Express
1. Financial stability					
1.1. Autonomy ratio (financial independence), the share of the organization's assets, provided with its own funds	**0,08**	0,3	0,4	0,1	0,7
1.2. Investment coverage ratio, the ratio of equity and long-term liabilities to the total amount of capital	**0,2**	0,3	0,4	0,7	0,7
2. Financial responsibility					
2.1. Current liquidity ratio, the ratio of current assets to current liabilities of the debtor	**1,0**	1,3	1,1	1,4	2,7
2.2. Quick liquidity ratio, the ratio of liquid current assets to the debtor's current liabilities	**0,9**	1,2	1,0	1,1	2,6
3. Performance efficiency					
3.1. Sales profitability, the ratio of sales profit to revenue, %	**3,6**	5,2	17,1	3,5	5,4
3.2. Return on assets, ratio of net profit (loss) to the total assets of organization, %	**0,9**	5,2	77,6	2,0	5,2

In connection with the relatively low efficiency of the use of budgetary funds, there is an objective need to improve the efficiency of enterprises with state participation. Thus, we find it relevant to increase the profitability of an

organization with state participation. The success of solving this problem depends on management control system, including ensuring the effective use of budgetary and extra-budgetary funds.

A management control system in enterprises with state participation is a set of interrelated divisions and procedures for internal monitoring, processing and analysis of operating results, assessing and avoiding possible risks. These activities and measures intend to ensure the implementation of state policy in business, safety and efficiency of economic activities, reliability and verifiability of accounting records, compliance with legal requirements and regulations.

From an organizational perspective, the management control process in enterprises with state participation requires an integrated approach based on a reasonable combination of various tools.

Structurally, according to functionality, the tools for organizational support of the management control process in enterprises with state participation can be divided into basic tools and operational tools (Fig. 1).

Basic tools include managerial, financial, and judicial components. Operational tools include personnel, technological and informational components.

Management control is a key tool that allows tracking enterprise progress and reasons for deviations from established plans and strategies, promoting the differentiation of duties and responsibilities between organizational units for certain decisions, and finally it allows assessing and managing risks, leveling their consequences.

At the same time, the ability to avoid unwanted deviations protects enterprise from the adverse consequences caused by any activities.

Fig. 1: A multi-level system of the main tools for organizational support of the management control in enterprises with state participation

To create an effective management control system, it is necessary to achieve controllability of each division of enterprise. It is important that the information obtained from a manager of certain level is submitted for a review to a manager of higher level.

The employee incentive system must stimulate employees to avoid negative deviations from the plans and regulate negative factors, appeared during the work of the department.

In addition to the fact that primary control should not be concentrated in the hands of one manager, it is necessary to assign each control function to a specific center of responsibility.

The absence, for various reasons, of a managerial control body should not affect the process of implementing control measures.

In this case, financial tools are characterized by the development of a set of internal accounting and reporting that meets the enterprise specificity and reflects the indicators that are most in demand for budget planning and substantiation of management decisions.

It is advisable to decentralize these indicators depending on the level of responsibility of a particular unit. This will ensure transparency and increase the reliability of management reporting, and reduce the time required to prepare reports for senior management.

It is also important to analyze competitors' reports, for example, to check open access documents. It will improve the quality of organization development plan, including financial planning.

In regards to judicial tools, it is important to note that the organizational structure provides legal expertise for the implementation of the current legislation, by-laws, and regulations of an enterprise. The organizational structure should effectively interact with all divisions of an enterprise.

This approach will guarantee to make legislatively grounded advanced management decisions aimed at sustainable development of an enterprise, to protect the company's property, including intellectual and business reputation.

Feasibility study of a project at the inception and planning phase can prevent contradictions in terms of the regulatory framework and company objectives.

In general, the basic tools for organizational support of the management control process in enterprises with state participation create the necessary management, financial and legal basis for activities, including:

- company strategy development and tactics (mission, goals, objectives, perspectives for development, and reasonable justification);
- creating new business lines by taking into account the profit maximization or obtaining social, environmental, and other non-commercial effect;
- optimal allocation of available resources, including financial;
- monitoring the resource efficiency;
- following the current legislation and proposing local rules for company development, etc.

To ensure management control, the personnel component, including the personnel resource of an enterprise, the qualifications of employees, their ability to work effectively in the current enterprise management system, increasing labor productivity has a significant importance.

In this regard, key employees responsible for management control processes and involved in a decision-making on the issue of improvement of a management control system should participate in staff retraining and professional development programs.

The technological basis of management control is a set of measures aimed at increasing the competitiveness of an enterprise using management technologies, information processing methods, introduction of advanced models for the implementation of control measures, taking into account industry aspects.

These tools allow quickly and effectively coordinate business processes in organization and its divisions, to aggregate and analyze accounting, management, operational and financial reporting with data, indicators and dynamics information, to form reasonable plans for the development of divisions and the organization as a whole.

In addition, another important aspect is to ensure information security and effective enterprise data transfer between employees (including transition to electronic document management system, restricting employee access to software in order to minimize cyber security risks), as well as between an enterprise and external environment.

Thus, the operational tools for a management control process in enterprises with state participation provide effective implementation of the goals and objectives designated by the management at the division level, as well as during direct business operations.

Of course, the executive management of an enterprise is subordinate to the board of directors and shareholders. The executive staff possesses the listed basic and operational tools and has the ability to adjust the functioning of organizational processes and, as a result, bears a significant share of responsibility for the development and implementation of the effective management control system in an enterprise.

Executive performance is evaluated by the superior body, focusing on internal data reporting and external data sources, at the same time paying attention to the quality of enterprise planning of business activities based on the results of financial, management, accounting reporting, avoiding failure, conflict situations, abuse of authority, as well as concentrating on achieving goals for a specific period of time.

Taking into account the complex structure of enterprises with state participation, certain divisions and services within an enterprise or interconnected vertically and horizontally integrated units are used as organizational forms of the management control system. There is also a mixed organizational form: every division appoints an employee responsible for collecting and providing relevant information.

Introduction of certain organizational form of management control system depends on the characteristics of organizational structure of an enterprise, focusing on the comparison of its advantages and disadvantages.

It is advisable to engage external specialists to perform audit procedures. They evaluate the efficiency of a management control system, as well as to substantiate recommendations for improving this system, taking into account resource constraints and the economic feasibility of the costs required.

The external auditors' attention should be focused on priority topics and in-depth analyses of issues, a list of divisions and levels of departments subject to control.

Conclusion

The study pays attention to the importance of a reasonable combination of various tools to ensure the process of management control in enterprises with state participation. Based on functional purposes, we have divided these tools into two groups (basic tools and operational tools), and specified their characteristics. In particular, the basic tools create the necessary management, financial and legal basis for enterprise's activities. The operational tools provide effective implementation of the goals and objectives designated by the management at the division level, as well as during direct business operations.

As a result, it was created a multi-level system of the main tools for organizational support of management control in enterprises with state participation. The system allows getting a comprehensive idea of the functional purpose of various tools, adjusting the organizational processes. It also increases the responsibility of the executive management for the development and effective implementation of advanced management control system.

Abstract

The COVID-19 pandemic has posed uncertain challenges for the hospitality sphere and academia, the recognition and solution of which will build a new model for the development of the hospitality industry. The purpose of the article is to substantiate the parameters for assessing the economic attractiveness of tourism and the hospitality sector in crisis conditions (in the context of the COVID-19 pandemic). The research methodology is formed on the basis of system analysis, synthesis and generalization of scientific literature. The theoretical basis of the study was the latest articles and publications of scientists who studied the problem of the development of the hospitality sector in a crisis environment (in the context of the COVID-19 pandemic). It has been determined in the article that the sphere of hospitality encompasses a set of services related to accommodation, meals, transportation, organization of leisure for consumers of services, aimed at meeting their needs as much as possible. It has been substantiated that the economic attractiveness of the hospitality sector is the ability of entrepreneurial structures whose activities are aimed at meeting the demand of customers – consumers of hotel, tourist, excursion, restaurant and other forms and types of business, to ensure a high level of performance and efficiency. It has been concluded that in the context of worsening epidemic situation and rise in COVID-19 cases, tourism and hospitality enterprises should significantly revise the existing policy of economic attractiveness and change approaches to organizing work with consumers of

JEL Classification. Z32.

Introduction

In recent years, more and more scholars are inclined to believe that important vector for improving the state of the European and world economy is the development of tourism and hospitality sphere. This component is especially relevant for regions with insufficient level of the production sector development, but with significant natural resource and historical potential.

Hospitality sphere is one of the key areas of the European economy development both in terms of employment and direct contribution to the economy (about 5% of GDP). Between 2013 and 2016, 1.6 million new jobs were created in the hospitality sector, increasing the number of employees from 10.3 million to 11.9 million, while the number of enterprises increased from 1.82 to almost 2. millions. Along with tourism, the hospitality sector is the third largest area of social and economic activity in the EU (White Paper for Hospitality in Europe, 2019). About 95% of the accommodation and catering sector in the European Union is classified as a small business with up to nine employees. Only 17% of employees work in large companies identified as having more than 250 employees (Mike Peters & Joerg Frehse, 2005).

The period 2019-2020 became extremely difficult for the development of the hospitality sphere. The problem of COVID-19, travel restrictions and the low level of consumer confidence in hospitality have a negative impact not only on the development of the industry itself, but also on the development of the European economy as a whole.

The COVID-19 pandemic has forced scientists to question the effectiveness of the Western economic model of hypercompetition and steady growth. The pandemic is an ideal period for the transition from Western economy to a convergence economy that focuses on the ability of enterprises to survive, adapt, evolve, and grow in the face of rapid change (Mike Peters & Joerg Frehse, 2005; Ambika Gandhi & Laurette Dubé, 2020).

COVID-19 continues to be reported around the world. In addition, many countries have reintroduced travel restrictions following the resumption of COVID-19 outbreaks, especially in Europe. Some countries have returned to partial restrictions and curfews, and in many countries borders remain closed. As a result, the number of consumers of hospitality services decreased by 700 million people in January-August 2020 compared to the same period in 2019, resulting in a loss of $ 730 billion for businesses, which is 8 times more than in 2009, during the global economic crisis (UNWTO, 2020).

The COVID-19 pandemic posed uncertain challenges to the hospitality industry and academia, the awareness and solution of which will allow building a new model for the development of the hospitality industry. One of the important areas of research should be to determine the parameters of economic attractiveness of enterprises in the hospitality industry in the crisis and the development of guidelines for its evaluation.

Literature Review

A significant amount of foreign research on the development of the hospitality industry in 2019-2020 proves that the COVID-19 crisis continues to have a negative impact on the activities of hospitality enterprises (Gössling, S., Scott, D., & Hall, CM, 2020; Dogan Gursoy & Christina G. Chi, 2020; Vik Krishnan, Ryan Mann, Nathan Seitzman & Nina Wittkamp, 2020). The spread of the pandemic poses a significant threat to the hospitality sector (Yang et al., 2020), given its dependence on human mobility (Domínguez-Mujica et al., 2011; Lamsfus et al., 2015).

Aims

The purpose of the article is to substantiate the directions of improving the economic attractiveness of tourism and hospitality in crisis conditions (in the context of the COVID-19 pandemic).

Methods

The research methodology is formed on the basis of systematic analysis, synthesis and generalization of scientific literature. The study analyzes the development of tourism and hospitality as important components of the national economy. The theoretical basis of the study were the latest articles and publications of scientists who have studied the development of hospitality in a crisis (in the pandemic COVID-19).

Results

Semantics of the concepts «hospitality sphere» and «economic attractiveness of hospitality sphere»

The concept of "hospitality sphere" has not so long been used in scientific and practical activities; until recently, the concept of "hospitality industry" was more common. In a broad sense, the content of the concept of "hospitality sphere" is associated with hotel activities, as well as with the manifestation of professional and personal attention to consumers of this service. Therefore, often, the characteristics of the concept are based on the level of customer service in terms of providing them with hotel, restaurant and additional services. It is the presence of the last component (additional services) that complicates the process of determining the content of this concept, since it covers a large number of components aimed at maximum satisfaction of the needs of tourists.

The multi-vector nature and lack of established approaches to the content of the concept of «hospitality sphere» complicates the research process at the theoretical level, as well as makes it impossible to form a system of applied measures. The issue of a clear scientific substantiation of the essence of this economic concept and the development of recommendations for the introduction of quantitative and qualitative parameters for assessing its economic attractiveness is becoming increasingly important.

The existence of the problem is evidenced by the diversity of approaches of scientists to the interpretation of the concept of «hospitality sphere». The vast majority of them, among the set of additional services allocates catering, accommodation, transportation, recreation (Skobkin, SS, 2000). Some provide services for cognitive, entertainment, business, health and sports purposes (Baranova, A. Yu., 2009).

The sphere of hospitality covers a large number of components aimed at maximum satisfaction of consumer needs:

- accommodation establishments (hotels, motels, campsites, botels, tourist bases, boarding houses, rotels, flotels, bungalows and others);
- commercial tourist enterprises (tour operators, travel agencies, tourist bureaus, excursion bureaus, other enterprises in the sphere of tourism);
- specialized transport companies;
- catering establishments (restaurants, cafes, bars, canteens, snack bars);
- institutions of culture and art;
- enterprises whose activities are aimed at providing individual and mass entertainment services;
- other enterprises whose activities are aimed at meeting the needs of service consumers.

Thus, the scope of the concept «hospitality sphere» covers *a set of services related to accommodation, food, transportation, organization of leisure for consumers of services, aimed at maximum satisfaction of their needs.*

The meaning of the concept "hospitality sphere" is a set of features combined in this concept, which allows determining how a particular object (phenomenon) differs from other objects (phenomena). The meaning of the concept «hospitality sphere» is formed as a combination of "sphere" (sphere, limits of something) and «hospitality» – the art of receiving customers – consumers of hotel, tourism, sightseeing, restaurant and other forms and types of business.

Characteristics of the «art of receiving customers» are proposed in the definition of «hospitality» given in the explanatory dictionary of N. Webster: «Hospitality is service based on the principles of hospitality, characterized by generosity and friendliness towards guests» (Webster, M., 2012) . From the point of view of the sphere of hospitality, the author proposed the following definition: «… sphere of entrepreneurship, consisting of such services that are based on the principles of hospitality and are characterized by generosity and friendliness towards guests» (Webster, M., 2012).

Similar to the previous one is the vision of Robert Brymer, who notes that hospitality is the secret of any caring

service. The care shown to the guest, the ability to feel the needs of the client is elusive, but such obvious features in the behavior of the employee. Hospitality is friendliness in receiving and entertaining guests, free reception and treats for travelers (Brymer, Robert A., 1995). According to the author, the sphere of hospitality «…is a collective concept for many and diverse forms of entrepreneurship that specialize in the market of services related to the reception and service of guests» (Brymer, Robert A., 1995).

Thus, the vast majority of scholars are inclined to believe that the main one of the most important aspects of the definition of «hospitality» is customer satisfaction and it needs to be constantly improved and enhanced.

According to J. Walker, the hospitality industry combines tourism, hotel and restaurant business, catering, recreation and entertainment, conferences and meetings (Walker, John R., Walker, Josielyn T., 2013).

The economic attractiveness of the hospitality industry is the ability of business structures whose activities are aimed at meeting the demand of customers - consumers of hotel, tourism, sightseeing, restaurant and other forms and types of business to ensure a high level of performance and efficiency.

It is possible to identify two main groups of factors that affect the economic attractiveness of the hospitality industry. The first group allows to determine the quantitative characteristics of the development of business structures. The second group contains qualitative characteristics that are quite difficult to define and evaluate, but their impact is a very important aspect of determining attractiveness as an economic characteristic.

Indicative list of these groups of factors is proposed in Table 1. It is variable, depending on the approaches used to assess economic attractiveness.

Table 1: Factors influencing the economic attractiveness of the hospitality industry

Quantitative factors	Qualitative factors
Number of hospitality enterprises and dynamics of their growth (decline)	The reaction of service consumers to the economic processes taking place
The magnitude of demand for services of business structures in the hospitality industry	Organizational-economic, technical-economic, social-economic and innovation-investment processes (their vector) in business structures of the hospitality sphere
Cost of services	The state of the competitive environment
The ratio of the cost of services and the average salary	Business environment
The average salary of a hospitality worker	Feedback from consumers and competitors
Sales of services	Ethics of corporate governance
Profitability of activity	Influence on the development of related industries or individual territories

Economic attractiveness of tourism and hospitality sphere in the context of the COVID-19 pandemic

In the face of the deteriorating epidemic situation and increase in the incidence of COVID-19, tourism and hospitality enterprises need to significantly revise their existing policies of economic attractiveness and change their approaches to organizing work with consumers of services.

The vast majority of experts and advisory organizations such as McKinsey and Company (Gössling, S., Scott, D., & Hall, CM, 2020) emphasize that it is the hospitality sector that is at maximum risk and the consequences of anti-epidemic measures for industries will be extremely difficult. It is in the hospitality sector that the maximum decrease in the number of jobs is predicted (20% of all vulnerable positions). In the restaurant industry, McKinsey and Company predicts a 13.4 million job loss, while food preparation and serving (including fast food) can affect 3.6 million workers.

Considering the projected options for the development of national economies in a pandemic, McKinsey and Company proposed nine potential scenarios based on the extent to which the spread of the pandemic is controlled and the effectiveness of economic policies to counter the effects of quarantine (Figure 1). A survey conducted by the company in the summer of 2020 among 2,000 global business leaders showed that scenarios A_3 (19% of respondents) and A_1 (33% of respondents) are considered the most likely.

Fig. 1: Scenarios for the development of the national economy in the pandemic COVID-19 (McKinsey and Company, 2020)

Each scenario has different implications for the country's economy. Scenario A_3 predicts GDP recovery as early as 2021. A more conservative scenario – A_1 – predicts a delay in GDP recovery until 2023.

Regarding tourism and hospitality, scientists (Vik Krishnan, Ryan Mann, Nathan Seitzman & Nina Wittkamp 2020), based on the analysis of the relationship between the economic development of the national economy and the performance of enterprises in the industry, determined that under the A_3 scenario, the economy is recovering slowly, revenue for the available hotel room is falling by 53 percent in 2020 and returns to pre-crisis levels in 2022. Under scenario A_3, it will be six months after the restrictions are lifted before the behavior of service consumers begins to be based on traditional, economic factors.

The consequences of the development of the national economy under the A_1 scenario are more complex and negative for the hospitality sector: recovery to the level of 2019 occurs only after 2023.

It should also be noted that a significant proportion of restaurant customers (64.71%) and the majority of hotel customers (70.42%) believe that the use of different technologies to provide services will be necessary in the COVID-19 environment to minimize contact of a human with human (examples: work; contactless payments such as Apply Pay or contactless bank cards; digital menus that can be viewed on personal mobile devices using QR codes; contactless digital payments; keyless entry; contactless elevators, etc.) (Dogan Gursoy & Christina G. Chi, 2020).

Conclusions

To improve the economic attractiveness of hospitality activities in the context of the COVID-19 pandemic, it is necessary to adhere to the following directions:

1. Ensuring a balance of costs and revenues: business structures involved in the hospitality industry have a significant number of fixed costs (salaries, current accounts, investment activities, etc.). An indisputable advantage of these structures is the search for adequate ways to increase revenue by reducing costs, but against the background of not reducing the quality of services provided.
2. Ensuring income growth while maintaining a positive response from consumers. Typically, owners increase the cost of services, do not satisfy customers and create an imbalance between the offer of the business owner and the demand of the client.
3. Application of modern technologies. In recent decades, the means and capabilities of the global electronic Internet have played a significant role in the development of hospitality. The results of the survey showed that if customers are satisfied with the service, they tend to come back and spend more, while dissatisfied customers will go and never return because of just one negative experience in the hotel.
4. The close connection between the development of hospitality and the development of the economy and social sphere. The development of the hospitality industry is ensured by economic, social, industrial development and technological forces.

Abstract

The purpose of the research is to reveal the economic essence of reshoring, and analyse the impact of reshoring on the effectiveness of economic systems in the world. Methods of economic analysis were used to study the influence of reshoring on the effectiveness of economic systems. The analysis and subsequent cross-country comparison were carried out in two periods: 1999-2007 and 2010-2018. The following indicators were used in the analysis: GDP growth; the share of industry in the GDP structure; the share of services in the GDP structure; the current account balance. It is revealed that currently reshoring is not an effective tool for overcoming turbulence in the world economy. The analysis of reshoring policy showed that: 1) its local performance in terms of increasing the share of manufacturing in GDP; 2) the process of restoring does not change the growth trend of "service economy" in most countries; 3) the weakness of the current reshoring to improve the balance of payments. It is justified that an increase in the flexibility of the reshoring policy in terms of taxes, regulations, effective personnel policy, and tariff reduction will help diffuse the weaknesses of reshoring and attract direct foreign investment, as well as create conditions for making the most of reshoring in developing sound competition and countering global crises.

Keywords: Reshoring, Offshoring, Industrialisation, Deindustrialisation, Sustainability, Economic Security.

Introduction

The current realities of the economic space are such that fierce competition is being waged not only at the corporate level, but also at the state level. At the same time, governments use the entire arsenal of tools, including trade wars, sanctions, embargoes, and new programmes to encourage the return of industries to their home countries, the so-called reshoring.

KARPUNINA "Reshoring as a Modern Trend in the Development of the Global Economic System" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

Reshoring as a new trend in the development of the world economy appeared at the end of the first decade of the 20th century in the US economy and was aimed at strengthening the industrial basis of the state. According to official data, in response to the 2008 crisis, at the very beginning of the reshoring process, the American economy gained 1.86 trillion dollars in value added from the manufacturing industry and net-creation of 25 thousand new jobs in 2016 (instead of net-loss of about 220 thousand jobs in the industry on average a year in the early 2000s) (Holden, 2012).

Later, many developed countries also joined in the process of industrial reindustrialisation, thus starting the redistribution of production forces on the scale of the global economic system.

However, increasingly, experts say that in fact, the improvement in the employment in the US economy occurred due to a rapid increase in imports of non-oil goods and the attractiveness of the US economy for imports from developing markets due to the higher cost of goods than in developing markets, and the response of companies to the upcoming increase in import tariffs for Chinese goods during the US trade war with China, rather than the effectiveness of the reshoring policy.

What is the actual economic efficiency of reshoring? Can reshoring act as an effective anti-crisis tool to increase the stability of the world's economies? What is its impact on the economic security of modern states? The answers to these questions represent the purpose of our research and require detailed.

The first part of the article includes a literature review and hypothesis development. Methods of economic analysis were used to determine the effectiveness of reshoring and its impact on the development of world economies. Methods of comparison, historical and logical method, deduction and induction, and system method were used to justify the advantages and disadvantages of reshoring as an anti-crisis tool for improving the stability of the world's economies, as well as to establish its impact on the economic security of modern states and digitalisation processes.

Literature Review and Theory Development

This research is based on the study of the specifics of offshoring as an important economic and social phenomenon that determined the transnational movement or dispersal of activities that were previously carried out in the home country (Doh et al., 2009; Kenney et al., 2009; Manning et al., 2008).

In the works of scholars offshoring is as a clear trend towards deindustrialisation of developed countries, manifested in the long-term and consistent decrease in the production of industrial goods or in employment in the manufacturing sector; the substitution of industrial production for a massive sphere of services in the GDP or employment; the excess of imports of goods and services over exports and maintaining deficit in foreign balance.

If offshore solutions are considered as a way to accelerate the innovation process and a faster and more cost-effective introducing products into the market (Lewin et al., 2009; Di Gregorio et al., 2009; Dossani and Kenney, 2007; Kedia and Mukherjee, 2009; Roza et al., 2011) then the reshoring policy of US and other developed countries should have the opposite consequences.

However, research from a later period (Ellram et al., 2013; Fratocchi et al., 2014; Tate, 2014; Holden, 2012; Stevens, 2016) explains why once profitable offshore deindustralisation tools actually reduced domestic industrial production and led to a serious weakening of the technological level of development of specific industries.

Sukharev (2013) is sure that the reasons for the general economic decline, the decrease in the technological efficiency of many industries due to the lagging implementation of automation lie in deindustrialsation. Deindustrialisation, associated with the development of international outsourcing of production through the actual withdrawal of production from countries, led to the transnationalisation of corporations in order to minimise the costs of companies, as well as localisation of "serial" production in new economies unlimited cheap labour resources, especially in the Asian region. Other effects of deindustrialization were reduction in the number of well-qualified industrial personnel in the economies of developed countries, as well as copying basic technologies in the outsourcing countries and increasing competition. The result is a shift in the trade balance of developed countries towards increasing imports, an increase in the budget deficit, as well as a stronger dependence of the economies of developed countries on the situation in world markets and the economic and political stability in developing markets.

Many researchers note that offshoring of industrial production from the US economy (which began in the mid-1960s and continued until the economic crisis of 2008) resulted in a strong weakening of many industries in the US economy and the replacement of their products by cheap imports.

So, if in 1980 the share of American industry accounted for about 20% of the country's GDP, in 2010 this figure was already 12%. This is a very low value compared to other countries which are rivals of the United States (South Korea, China, Germany). The practice of offshoring also weakened the industry of developed countries by bringing industrial

products from developing countries to their market in the 1990s and 2000s. This attack of cheap imports was better tolerated by the economies of Germany and Japan due to a more successful restructuring of their industries, including the flow of technologies and resources from low-tech industries to medium-and high-tech ones, which allowed them to constrain the influx of cheap imports unlike the US economy, which failed to carry out a protective restructuring of its industry (Van den Bossche et al., 2014).

As a result, the American industry employs 12 million people, which accounts for a mere 8.4% of total employment, whereas employment in the healthcare sector is 11.2%, and the one in the public sector is 15.4%. In addition, the policy of deindustrialisation has led to another acute problem of economic security, namely a significant stratification of American society. According to official statistics, the ratio of incomes of 10% of the wealthiest and poorest citizens in the United States has increased up to 16 times, while the Northern European countries which did not allow a sharp deindustrialization the increased fivefold (Blyahman, 2013).

Thus, the study of reshoring processes is now becoming increasingly relevant due to the need to unlock its potential in order to use it for ensuring a balanced development of the world economy.

Material and Methods

The scientific hypothesis of the research is the assumption that reshoring is not only a modern trend in the development of the global economic system, but also an effective tool for increasing the stability of the world's economies during turbulence, as well as for ensuring their economic security, and a motivating mechanism for moving to a new digital stage of development.

To justify the proposed hypothesis, the following goals were set:

- to identify objective prerequisites for the emergence of reshoring in the modern global economic system;

- to reveal the economic essence of the process of reshoring;

- to evaluate the economic result of the reshoring process through its impact on the economy of individual countries and the world economy as a whole;

- to determine the effect of reshoring manifestations in terms of economic security.

The following methods were used in the research: economic analysis, comparison, historical and logical method, deduction and induction, and system analysis.

The method of economic analysis was used to analyse the dynamics of growth of production jobs and the number of companies transferred to the United States from offshore countries in the process of reshoring. To prove the effectiveness of reshoring as the main industrial trend in developed countries, we analysed its impact on the negative consequences of long-term deindustrialisation in the United States using the method of economic analysis and comparison. The method of economic analysis was also used to assess the growth dynamics of the "service economy" and improve the balance of payments as a result of the implementation of the reshoring policy in various countries.

The historical and logical method enabled us to identify the historical prerequisites for the emergence of reshoring in the economies of developed countries as a stage of overcoming the negative consequences of deindustrialisation. The methods of deduction and induction as well as the system method were used to justify the conclusions drawn from the data analysis, as well as to prepare guidance for the development of reshoring policy.

The information base of the research involves materials and analytical data of World Economic Forum, Euler Hermes Economic Research Department, Reshoring Initiative, Bureau of Economic Analysis, World Bank, OECD.

Results and Discussion

I. The phenomenon of reshoring in its modern sense emerged in 2010 first in the United States, and then in several European countries, and consisted in the rejection of previously popular policy of transfer of production to areas of cheap labour and the concentration of important high-tech industries inside developed economies with the aim of fighting for economic and industrial sovereignty (Competitiveness Policy Council, 1992). According to economists, the reshoring programme in developed countries is a political and economic response to the crisis of 2008-2009 (Van den Bosscheet al., 2014). Analysts estimate the effectiveness of the new US industrial policy in the form of multi-factor industrial growth, which stimulates employment growth in related sectors of the American economy, reduces the dependence of developed countries on imports and solves the problem of foreign trade deficits. In the term of economic security, they see the main reason for the success of reshoring in the presence of skilled workers in the

economies of developed countries and a strict state policy to stimulate growth in their economies (Tate, 2014). For example, in the main offshore industrial zone of the world, China, in 2004, the average salary of a worker at a factory was 58 cents per hour, and in 2014, a Chinese worker received $ 3. At the same time, the decline in the US industry, which was caused by the policy of deindustrialisation, led to a decrease in the cost of working hours in the US industry by 12% from 1995 to 2014 (Euler Hermes Economic Research, 2014). In addition, the leadership of the US economy in the new industrialisation is based on the idea that the US is a global center of financial capital and a global hub of human capital (Yudina, 2015).

According to experts of the research department of Euler Hermes Economic Research, the introduction of reshoring is not only an economic trend, but also a political vector of the struggle for votes (Euler Hermes Economic Research, 2014). Thus, the reshoring programme has become fundamental for US President Donald Trump, who made the protection and competitiveness of the American economy "Make America great again" the basis of his policy and proposed the transfer of the production of American giants Apple, Caterpillar, General Electric, Ford and others to their homeland.

Competition laws and robotisation push the EU countries to actively stimulate reshoring processes as well. For example, in Germany, the "National industrial strategy-2030" was adopted, according to which the process of reshoring is implemented by returning production facilities based on their mass robotisation (the "Industry 4.0" model) and is a step to a new stage of digital development. According to the World Economic Forum, robots accounted for about 29% of all working hours in 2018, and this share will have reached 50% by 2025. Robots already perform 47% of all tasks related to information processing, and 31% of work related to physical labour. The rate of robotisation of production over the past five years (2014-2018) is an average of 20% per year in the world (International Federation of Robotics, 2019; Molchan et al., 2019; Karpunina et al., 2019; Karpunina et al., 2020).

In 2018, there were 422,000 more robots in the world three-quarters of all equipment is concentrated in five countries-China, Japan, South Korea, the United States and Germany. Robots perform tasks faster than humans and reduce labour costs, so the cost of one working hour of human work in the German automotive industry is 40 euros, in China it is about 10 euros, and the cost of a robot's working hour varies from 5 to 8 euros. At the same time, the average cost of the most industrial robot for five years to 2017 decreased by 17% (from 53 thousand dollars to 44 thousand dollars) (International Federation of Robotics, 2019).

To assess the real impact of reshoring on the economy, it is necessary to analyse its volume and the volume of attracted direct foreign investment in the US economy. Thus, the American public business organisation "Reshoring Initiative" draws the following conclusions about reshoring operations in 2010-2018: the total number of production jobs transferred to the United States from offshore countries amounted to about 757 thousand, if we count from the point of minimum employment in the manufacturing industry in 2010, and the number of companies that conduct new re-profiling and receive direct foreign investment increased by 38% compared to 2017; the largest volume of reshoring (72%) in the US economy came from Asia and it created 77,967 jobs by 856 companies.

At the same time, the main volume of reshoring and direct foreign investment came to the United States in 2010-2018 from China (28%), which created 144,299 new jobs by 1,042 companies, from Germany (15%, 76,578 jobs, 323 companies), from Japan (14%, 70,964 jobs, 317 companies), from Mexico (7%, 35,851 jobs, 135 companies) and from Korea (5%, 22,301 jobs, 82 companies) (Reshoring Initiative, 2018).

II. To prove the effectiveness of reshoring as the main industrial trend in developed countries, we will conduct a real assessment of its impact on the negative consequences of long-term deindustrialisation in the United States.

For the assessment, we will focus on two periods: the "deindustrial" period (1999-2007) and the "industrial" (reshoring) period (2010-2018). From the economic analysis of the impact of reshoring on global economic trends, we essentially exclude the period of the global crisis of 2008-2009 to get a more realistic picture and diffuse out the impact of the crisis on the world economy (Figure 1).

Fig. 1: Comparison of the US economy's GDP growth during the deindustrial period (1999-2007) and during the reshoring period (2010-2018), in %

(Source: own elaboration based on Bureau of Economic Analysis, 2019).

This data enable us to conclude that the negative trend of deindustrialisation to reduce the share of production in the structure of American GDP has not yet been overcome, but at the same time, the growth of GDP in industry in the period under consideration is 29%, which is higher than the growth of GDP in production in the deindustrial period (24%). At the same time, the share of production in the GDP structure continues to decline and was 18% at the end of 2018 (compared to 21.5% the share of industry in 2007). It should be noted that the reshoring period of 2010-2018 was also characterised by a decrease in the dynamics of GDP growth. Thus, the total GDP grew by 50% in 1999-2007, and by only 37% in the period from 2010 to 2018. Moreover, this comparable decline over the period from 2010 to 2018 occurred in all the basic sectors of the American economy, while growth was provided only in the manufacturing and transport sectors of the American economy. We can also note the stabilisation in the American mining industry, where aggressive growth in the period from 1999 to 2007 by 2.7 times was replaced by a mere 13% growth in GDP from 2010 to 2018. The negative trend of GDP growth in the US agricultural sector in the deindustrial period (56%) to 14% in the rating period, as well as in construction - from 71% to 60% in 2018, is also alarming. But we can note a positive trend of growth in the US transport industry from 43% to 52% of the total growth for the period from 2010 to 2018.

Since the majority of countries, both developed and developing, are involved in the American industry reshoring processes, let's consider at what happens to the change in the share of industry in the GDP structure of most countries (Figure2).

Fig. 2: The share of industry in the GDP structure in 2010 and 2018, %
(Source: own elaboration based on World Bank and OECD, 2019)

During the 2010-2018 reshoring period, the share of industry in global GDP decreased from 27% to 26%, and this pattern is observed in all regions. In Europe and Central Asia, the share of industry declined from 24% to 23%, in Latin America from 29% to 24%, in South Asia from 29% to 26%, and in the Middle East and North Africa from 46% to 39%.

At the country level, Thailand, China, and Brazil had the largest declines of 5%, and India had the largest declines of 4%. Industries in Sweden, Singapore, and the Philippines each lost 2% of their GDP. Mexico reduced the industry by 1%, a similar decline in the US industry. Despite the fact that Japan and Korea are the leaders in the number of firms transferred to the US, their industry grew as a share of GDP by 1% in the case of Japan, and Korea managed to keep its share despite the reshoring, as did Italy, Hong Kong and the UK. The share of industry in Vietnam and Russia has increased. Reindustrialisation programme, despite significant direct foreign investment and reshoring in the US economy, has enable German industry to increase its share in the GDP structure. The flow of most Western European industries to the United States also allows the German economy to actually absorb the EU economy (Figure 3).

Fig. 3: Change in the share of industry in the GDP structure in 2018 to 2010, % (Source: own elaboration based on World Bank and OECD, 2019)

The same picture is shown by the following graph of changes in the share of production in the GDP structure during the reshoring and deindustrial periods, since the average global share of production has not changed (Figure 4).

Fig. 4: The share of manufacturing in the GDP structure in 2010 and 2018, %
(Source: own elaboration based on World Bank and OECD, 2019).

Despite the development of reshoring and the growth of direct investment, the share of production in the United States fell to 11%. A decrease in production in Thailand (minus 4%), Brazil and China (3% each), India, the Philippines and tech-rich Sweden (minus 2%), as well as a 1% decrease in Hong Kong, Korea, and Russia. France, Great Britain, Japan and Singapore retained their share of production. The reindustrialisation programme allowed to increase the share of production in the structure of German GDP by 1%, and also, despite reshoring, to increase the share of production by 1% in Italy, Mexico and the Netherlands, while the largest increase in production was achieved in the economy of Vietnam.

A successful industrial reshoring programme should be based not only on the process of transferring industry from various countries to developed ones, but also on the transfer and re-profiling of the "service" part of the world economy to the industrial one.

Our analysis below allows us to conclude that the process of reshoring and the growth of direct foreign investment not only can not change the negative decline in the share of industry and production in the GDP structure, but also does not change the growth trend of the "service economy" of most countries. This conclusion can be made based on the data in the Table 1, which shows the growth of the "service" part of global GDP in China, Thailand, India, the Philippines, Hong Kong, Korea, Brazil, and the United States.

Table 1: Change in the share of services in the GDP structure in 2018 to 2010, %

Country	Services, value added (% of GDP) % of GDP		Change in the share of services in the GDP structure in 2018 to 2010, %
	2010	2018	2018/2010,%

Sub-Saharan Africa	50,7	52,4	3,4

Source: own elaboration based on World Bank, 2019.

It is likely that this growth in "service" GDP also reduces the share of industry in countries such as the United States, China, the Philippines, Thailand, India, and Brazil. A decrease in the "service" part of GDP in a number of countries, such as Hong Kong, Germany, Italy, Japan, Korea, and the United Kingdom allowed not only to resist the American reshoring, but also to increase the share of industry in the GDP structure or leave it at the level of 2010. This allows us to draw a conclusion about the current weakness of the American reshoring programme.

At the end of assessing the impact of reshoring on the economic systems of various countries, we suggest reading the following analysis of its impact on the foreign trade balance of payments (Table 2).

Table 2: Change in the current balance of payments, 2018 to 2010, millions of US $

Country	Current account balance, millions of US $		Change in the current balance of payments, 2018 to 2010, millions of US $

Source:own elaboration based on World Bank, 2019.

This analysis enables us to draw a conclusion about the weakness of the current reshoring to improve the balance of payments. Thus, the US economy, despite the optimistic assurances of politicians, continues to worsen its payment discipline. The deficit current balance of payments has grown to490 billion US $. At the same time, Vietnam, Korea and Germany are increasing their balance of payments surpluses, which allows them to effectively counter negative trends in reshoring and capital outflows. Our analysis confirms the problem of China's actual loss of its own market due to increased competition with major global market players. This problem is not only in reshoring, but also in the growing costs of companies that operate in the Chinese market, the insufficient rate of robotisation of the Chinese economy, as well as a tough trade war with the main US economy.

Conclusions

Our analysis has shown that reshoring can be an effective means of improving the situation in the economy of most countries during crises, increasing their economic security by optimising the employment situation, stimulating further robotics and automation, as well as a measure of stimulation in the transition to a new stage of digital development of the industry.

However, based on the results of the analysis, it can be concluded that reshoring has not yet become the main trend of the world economy, and often serves as a political element to relieve tension in a number of countries and sectors of the economy. The current weakness of reshoring as a tool for changing the "service" structure of the world economy's GDP, the predominance of information technology operations in the structure of world exports and imports, and overcoming the deficit balance of payments can be explained by its locality and fragmentation in ensuring political and economic stability during turbulence, especially during emerging sanctions and trade wars.

At the same time, the process of reshoring is very positive despite globalisation of economic processes, it stimulates the world economy to compete with new technologies and processes, allows local resistance to global crises, and also creates prerequisites for intensive digital development.

It is necessary to ensure stability and flexibility in the implementation of a reshoring policy for the further success of the return of production in the United States and other countries and for the future growth of direct foreign investment.

This is possible by improving the tax policy, implementing flexible regulations, effective personnel policy for training qualified labour, reducing tariffs and other barriers. It is necessary to maximise the positive forces of reshoring through further automation, the development of the Internet of things, the promotion of the "Industry 4.0" concept, and the implementation of the policy of forming environmental awareness. The flexibility of the new policy will help to diffuse the negative aspects in the process of reshoring as well as to attract direct foreign investment.

Atypical Forms of Employment in the Slovak Republic

Silvia TRELOVA
Faculty of Management Comenius University in Bratislava, Bratislava, Slovak Republic,
e-mail: silvia.trelova@fm.uniba.sk

Abstract

The issue of flexibility in employment relations means an agreement between the employer and the employee, and this is beneficial for both of these subjects of employment relations. One of the manifestations of the effect of flexibility in labour law is the possibility to perform work through flexible employment relations, also referred to as atypical employment relationships. Atypical forms of employment include all forms of employment that are not the employment relationship for a determined weekly working time (full-time) and for an indefinite period. This article analyzes individual atypical forms of work, which are enshrined in the legislation of the Slovak Republic and clarifies the application of the relevant provisions in practice.

Keywords: atypical forms of employment, fixed-term employment relationship, part-time employment, job sharing, homework, telework.

Introduction

In the past, employers mostly used the typical (standard) form of employment to perform work. These classic employment relationships are characterized by daily eight-hour working hours, work evenly spread over five days a week and work performance agreed for an indefinite period. The typical form of work is currently in the background and the so-called flexible forms of employment are coming to the fore. In an ever-changing business environment, only flexible organizations „are able to adapt to current requirements, modify organizational structure, create flexible workplaces, flexible work regimes, and implement distance work. Such an approach places great demands on the introduction of innovations, on their acceptance and on changing attitudes to work. However, without such changes, today the organization would jeopardize its own existence in the market in which it operates." (Wojčák, 2013)

Flexible forms of work performance are considered to be beneficial for both employees and employers. The extent to which this is true depends on the type of flexible working arrangements. (Bajzíková, Šajgalíková, Wojčák and Poláková, 2013) As flexible work performance has not only positive features (e.g. individual work plan, the possibility of reconciling work and family), but also negative (e.g. employee isolation, health and safety problems and employee protection) and requires legislative changes, the issue of work flexibility is current and often discussed topic.

Fixed term employment relationship

Slovak labour law in accordance with the basic labour law regulation (the sources of labour law see Hamuľák, 2019a) - Act no. 311/2001 Coll. The Labour Code, as amended (hereinafter referred to as the "Labour Code") clearly prefers the conclusion of employment contracts for an indefinite period, in some cases their conclusion for a fixed period (for a predetermined time) is allowed. Compared to an employment contract for an indefinite period, a fixed-term employment contract is an atypical form of employment contract. Within the framework of employment relations, this type of employment contract should not prevail. Indicators of the development of the main forms of employment indicate a tendency for labour market flexibility, but the Slovak Republic still belongs to the countries with a monopoly position of employment based on employment contracts for an indefinite period.

In the field of EU law, the legal regulation of fixed-term employment is enshrined in Council Directive 1999/70/EC of 28 June 1999 concerning the framework agreement on fixed-term work concluded by ETUC, UNICE and CEEP (Directive 1999/70) and characterizes a fixed-term employment relationship as an employment relationship which expires on "objective conditions such as reaching a specific date, completing a specific task, or the occurrence of a

specific event". This directive lays down general principles for fixed-term work, the prohibition of discrimination against fixed-term workers and the conditions under which fixed-term employment relationship may be concluded in such a way as to avoid abuse of the chain of fixed-term employment contracts and relationships - successive fixed-term employment contracts. or relationships (for more details see also Freel and Nováková, 2016).

A fixed-term employment relationship must meet all the legal characteristics of the employment relationship, and this also applies to the employment contract that establishes it. In terms of content, an employment contract establishing a fixed-term employment relationship contains a determination of the duration of the employment relationship, as this employment relationship is specific in that the duration of the employment relationship is defined in advance in the employment contract. Fixed-term employment ends with a legal event, in particular at the end of the agreed period. The duration of the employment relationship can be defined either by direct time information (e.g. a specific date of termination of employment) or in another way that does not raise doubts as to when the employment relationship should end. With a time limit in a form other than a specific date of termination of employment, a situation may arise that if such an event did not occur before the expiration of the maximum specified for the employment for a certain period of time (before the expiry of two years), a fixed-term employment relationship changes to an indefinite employment relationship. Such a change also occurs in the absence of a written form of employment contract, as an employment contract for a certain period must also be in writing. The lack of this requirement does not result in the invalid establishment of an employment relationship, but this employment relationship is considered by law to be an employment relationship for an indefinite period.

In connection with the duration of the employment relationship, the Labour Code establishes an irrebuttable legal presumption that if the employee continues to perform work with the employer's knowledge after the agreed period, this employment relationship will change to an employment relationship for an indefinite period, unless the employee and employer agree otherwise. It follows from the above that the reclassification of a fixed-term employment relationship to an indefinite employment relationship will take place only with the consent of the employer.

In order to prevent abuse of the chain of fixed-term employment contracts, Directive 1999/70 requires the Member States, after consultation with social partners in accordance with national law, collective agreements or practice, to adopt one or more of the following measures:

- set out the objective reasons for renewal of employment contracts for a fixed period,
- determine the maximum total duration of successive fixed-term employment contracts
- determine the number of renewals of such employment contracts.

It should be noted that these are not cumulative requirements of the directive, but they can be understood as alternatives.

In accordance with this directive, the Slovak Labour Code regulates the legal conditions for concluding a fixed-term employment relationship. Act no. 257/2011 Coll., which amends the Labour Code, as amended, and which amends some laws, extended the period of fixed-term employment to three years and increased the number of repetitions to three years as part of increasing the flexibility of fixed-term employment. (Freel, 2012) At present, the maximum permissible duration of a fixed-term employment relationship without any substantive reason is two years, while a fixed-term employment relationship may be extended or renewed at most twice within a two year period without the employer having a material reason to do so. A further extension or renewal of a fixed-term employment relationship to two years or over two years is possible only on the basis of substantive reasons, at least one of which must be stated in the employment contract. According to § 48 par. 4 further extension or renewal of a fixed-term employment relationship "can be agreed only in the following reasons:

a) substitution of an employee during maternity leave, parental leave, leave immediately linked to maternity leave or parental leave, temporary incapacity for work or an employee who has been given long term leave to perform a public function or trade union function,
b) the performance of work in which it is necessary to increase employee numbers significantly for a temporary period not exceeding eight months of the calendar year,
c) the performance of work that is linked to the seasonal cycle, which repeats every year and does not exceed eight months in the calendar year (seasonal work),
d) the performance of work agreed in a collective agreement."

If the agreement of a fixed-term employment relationship, its extension, re-agreement is in conflict with the law, this part of the employment contract on the duration of the employment relationship is invalid and this employment relationship is considered an employment relationship for an indefinite period.

A fixed-term employment relationship ends at the end of the agreed period without the employer or employee having to express an intention to terminate the employment relationship. This employment will end at the end of the agreed period, even in social situations such as temporary incapacity for work, pregnancy, maternity leave, parental leave. If there is an interest in terminating the employment relationship earlier, the fixed-term employment relationship may be terminated before the expiry of the agreed period in all ways provided for in the Labour Code.

The nature of the fixed-term employment relationship implies the fact that in the event of termination of employment, there is no need to discuss with employees' representatives, the employer is not obliged to offer the employee other suitable work before termination and the employee is not entitled to severance allowance. This does not apply if the employment is terminated before the end of the agreed period and the employee meets the conditions for entitlement to severance pay. Upon fulfillment of the conditions stipulated by law for the creation of the right to discharge benefit, the employee is entitled to this monetary benefit.

The labour legislation of the Slovak Republic responded to the changes caused by the COVID-19 disease. As a result of the state of emergency declared in connection with the COVID-19 disease, there was a legislative adjustment of the fixed-term employment relationship. If a fixed-term employment relationship is to end or has ended during this state of emergency or within two months after its dismissal, and if the material conditions for its extension are not met, this employment relationship may be extended once and for a maximum of one year. The employer is obliged to discuss such an extension of the fixed-term employment relationship with the employees' representatives. In the absence of negotiation, an fixed-term employment relationship is considered to be an employment relationship concluded for an indefinite period of time. We emphasize that this legislative change is of a temporary nature. As Hamuľák (2012) states, these measures can be included among the so-called employment protection legislation, the purpose of which is to introduce tools to ensure the protection of existing employment relationships in order to eliminate the increase in unemployment.

Employment relationship with reduced working time (part-time employment)

Part-time employment is a significant type of atypical employment and has a constantly growing tendency. A part-time employment contract is an employment contract establishing an employment relationship within which the extent of the employee's working hours does not reach the limit set for the established weekly working time for a particular employer. According to the Labour Code, an employee's working time is considered to be the period of time in which the employee is available to the employer, performs work and fulfills obligations in accordance with the employment contract. This definition of working time is in in accordance with Directive 2003/88/EC of the European Parliament and of the Council of 4 November 2003 concerning certain aspects of the organisation of working time, according to which “working time means any period during which the worker is working, at the employer's disposal and carrying out his activity or duties in accordance with national laws and/or practice”.

The length of the established working time is determined by the employer, which may not exceed the length of the statutory maximum weekly working time - 40 hours a week. According to § 49 par. 1 of the Labour Code “an employer may agree with an employee in the employment contract, a reduced weekly working time than determined weekly working time”. Reduced working time, which need not be distributed over all working days, may be agreed between the employer and the employee when concluding the employment contract or at any time during the employment relationship. Reduced working time may be agreed for both employment relationship for an indefinite period and fixed-term employment relationship. The employer may agree with the employee on the change of the established weekly working time to a reduced working time and the change of the reduced working time to the established weekly working time. Overtime work may not be ordered on an employee performing a part-time employment, but such an employee may consent to such performance (for more details see Hamuľák, 2019b).

The Labour Code does not define the concept of part-time employment. Who is considered a part-time employee is defined by Council Directive 97/81/EC of 15 December 1997 concerning the Framework Agreement on part-time work concluded by UNICE, CEEP and the ETUC (Directive 97/81/EC). According to this directive, it is “an employee whose normal hours of work, calculated on a weekly basis or on average over a period of employment of up to one year, are less than the normal hours of work of a comparable full-time worker.” The definition of a comparable employee is already defined by the Labour Code (§ 40 par. 9) as “an employee, who has agreed an employment relationship for an indefinite period and a determined weekly working time of the same employer or an employer according to § 58, who carries out or would carry out the same type of work or a similar type of work taking into consideration qualifications and experience in a relevant field”. Such an part-time employee shall be entitled to wages corresponding to the agreed reduced working time. The Labour Code prohibits discrimination

against employees working on the basis of a part-time employment relationship. Some rights are granted to such employees on a pro rata temporis basis, e.g. as regards holiday entitlement, minimum wage entitlements (for more details see Hamuľák, 2016).

We can state that the Slovak legal regulation of part-time employment is compatible with the Directive 97/81/EC and that an employee who performs part-time work is covered by all rights and obligations arising from the employment relationship. In Slovakia, in 2019, part-time work accounted for 8% of total employment (Eurostat, 2020a).

Job sharing

In order to increase the flexibility of employment relations, the Labour Code introduced a relatively new legal institute within the framework of an part-time employment established by an employment contract, namely a job sharing. At this institute, the employees organize (distribute) their own working time and job description appertaining to the job. In addition to the employment contract, an agreement on the assignment of an employee to a job sharing will be concluded between the employer and the employee. In accordance with the Slovak Labour Code, this agreement must be concluded in writing, otherwise it is invalid.

Before concluding an agreement on the assignment of an employee in a part-time employment to a job sharing, the employer shall notify the employee in writing of the working conditions applicable to the job sharing. The number of employees within a job sharing is not limited by law. The time interval that individual employees spend at work is not predetermined and is the sole responsibility of the employees themselves. In the event of an obstacle to work on the part of the employee in a divided job, the employees who share the job with him are obliged to represent him. "The obligation of the employee to represent one another in a job sharing is imposed by the Labour Code as a conditional legal obligation, unless the employee is prevented from doing so by serious reasons." (Barancová et al., 2019)

The agreement on the assignment of an employee to a job sharing may terminate in the form of notice in writing, both by the employer and the employee. The agreement expires one month from the date of notification of termination, unless the employer agrees otherwise with the employee.

Home work and telework

In addition to the atypical forms of work performance, another form of employment with elements of flexibility is regulated. If the nature of the work allows it, the employer can agree with the employee on the so-called home work or telework, according to the conditions agreed in the employment contract, either at home or at another agreed place. This form of employment is specific to the place, as well as the form of work performance.

As part of home work and telework, the employee does not have to be physically present at the employer's workplace and can perform his work agreed under the employment contract from the comfort of his home or at another agreed place. The place of work of the employee must be agreed in the employment contract as its essential requirement. On the basis of contractual freedom, the participants in this legal relationship may agree that the performance of this activity will be carried out either within an employment relationship for an indefinite period or a fixed term employment.

The Labour Code defines home work as the employment of an employee who performs work for the employer during working hours, which he schedules himself and this employment is governed by the Labour Code with exhaustively listed deviations. In addition to the provisions on the organization of the determined weekly working time, also the provisions on continuous daily rest, continuous weekly rest shall not apply to such an employee. Unless otherwise agreed between the employer and the employee, the employee is not entitled to wages for overtime work, wage benefits for work on holidays, wage benefits for night work and wage compensation for difficult work performance. Similarly, the provisions on downtime do not apply to this employee. A specific feature is also the important personal barriers to work on the part of the employee, for which he is not entitled to compensation of wages from the employer, with the exception of one obstacle, namely the death of a family member.

The above also applies to telework, which means the modernization of work organization and the possibility of reconciling the work and social life of the employee and, in particular, allows autonomy in the performance of the employee's duties. Telework is considered to be work of an employee performed in an employment relationship, which he performs for the employer according to the conditions agreed in the employment contract at home or at

another agreed place using information technology during working hours, which he schedules himself. Similar to home work this employment relationship is governed by the Labour Code with exhaustively listed deviations.

Although home work and telework have a lot in common, telework is characterized by a specific feature, namely the use of information technology. Due to this fact, the employer is obliged to provide, install and perform regular maintenance of hardware and software necessary for the performance of such a form of work. However, the employee can also use his own hardware and software equipment for telework. The employer is responsible for ensuring, especially with regard to software, protection for data processed and used in telework. At the same time, the employer is obliged to inform the employee about all restrictions on the use of hardware and software and also of the penalties for any breach of these restrictions.

Apart from certain exhaustively listed deviations, there is a tendency to place an employee who performs home work or telework on an equal footing with other employees. For this purpose, the employer is obliged to adopt measures to prevent employees performing home work or telework from becoming isolated from other employees and give them an opportunity to meet with other employees. The Labour Code places special emphasis on the creation of conditions on the part of the employer enabling such employees to meet other employees. Other measures precluding employee isolation are not specified by the Labour Code. In order to fulfill these measures, the employer should invite employees performing home work or telework to cultural and sporting events organized by the employer, provide them with meals in their own catering facility, if possible, and not forget to deepen their qualifications.

One of the important duties of the employer is the obligation to prevent the employee from being disadvantaged at home work and telework with a comparable employee at the employer's workplace. For this purpose, such an employee must also have comparable working conditions. As we stated in the section - Part-time employment, a comparable employee is defined by the Labour Code.

It should be noted that in the conditions of the Slovak Republic, the performance of activities in the form of home work and telework is beginning to be applied to a greater extent. Although Slovakia is one of the countries with a lower rate of teleworkers, the number of teleworkers is increasing every year. While in 2016 3.2% of the total number of employees worked from home, in 2019 it was already 3.7% of employed persons working from home. In 2019, 3.5% of men and 4% of women worked from home (Eurostat, 2020b). Although the benefits of home work and telework are more often emphasized, the pitfalls associated with telework cannot be underestimated. Dolobáč (2018) speaks of "the pitfalls associated with the fact that this employee must be de facto available at any time in certain circumstances", which can lead to “telechicane”.

It should be noted that in the conditions of the Slovak Republic, the performance of activities in the form of home work and telework is beginning to be applied to a greater extent. And currently in connection with the spread of coronavirus COVID 19, work from home is used both as a protective measure but also as a corporate benefit. In connection with the measures taken during the pandemic, in the performance of work, the so-called "Home-office" applies. However, the Labour Code does not define the term home office as such. According to the valid legal regulation, during this period the employer is entitled to order the performance of work from the employee's household, if the agreed type of work allows it and the employee has the right to perform work from his household, if the agreed type of work allows it and there are no serious operational reasons on the part of the employer. which do not allow the performance of household work.

There is a difference between housework and home office. Unlike home work, which is defined by the Labour Code, the concept of home office is not enshrined in legislation. Home work is performed from the employee's own household on a regular basis, it is of a permanent nature, the home office is used as a benefit that the employer offers to its employees. The work performed by an employee as a home office is of an occasional nature. This work is performed with consent, or in agreement with the employer.

Casual work

Another atypical form of employment is the performance of casual work, which could also be performed in an employment relationship with a non-standard determination of the extent of the employee's employment. Under this form of employment, the employer would not be obliged to allocate work on a regular basis, but would be bound only to the allocation of work in situations where the work agreed in the employment contract occurs and the employee is currently available to the employer. An employment relationship and an employment contract in relation to the performance of casual work would require a definition of the term "casual work" in the Labour Code. This form of employment could be enshrined not only in a fixed-term employment relationship but also in an indefinite employment relationship.

As the performance of casual work was not excluded from its material scope by the Labour Code, following Directive 1997/81 EC on the framework agreement on part-time work, the performance of casual work must be carried out on a part-time basis according to the applicable legal status.

The use of casual work could be relevant not only in times of economic crisis but also in other crisis situations that the employer will find in the future. At the same time, it is a very good alternative to unemployment, because even in such a legal form, the employee can maintain work habits and skills, which he often loses during unemployment.

Irregular assistance

As is clear from the concept of 'irregular assistance', these are legal situations where it is not possible to determine the extent of working time in advance for a longer period, because such work is governed by the employer's capabilities and, on the other hand, by the employee's capabilities. Within this job, the employee performs work only occasionally in accordance with the needs of the employer.

Temporary assignment of an employee

"Temporary assignment may refer to a complex of legal relationships between an employee, an employer and a third party." (Barancová et al., 2019) The Labour Code allows for two types of assignment of an employee to another employer, i.e. to the user employer. The first possibility is that the employee is temporarily assigned by his employer, for whom objective operational reasons are given for this procedure. The assignment is made on the basis of a temporary assignment agreement with the user employer. In this case, the employment relationship between the employer and the employee continues.

The second temporary assignment option is implemented through agency work through temporary employment agencies. It is typical that the agency employs a natural person on the basis of an employment contract in order to assign him to a user employer for a limited period of time. Agency employment, in addition „to being a flexible way of employment, enables the acquisition of work, work habits by those categories of employees who find it more difficult to find job." (Olšovská, 2014)

The temporary assignment may be agreed for a maximum of 24 months and may be extended or renegotiated to the same user employer up to four times within 24 months. If, in accordance with this, the employee is not temporarily assigned, the employment relationship between the employee and the employer or the temporary employment agency terminates and an employment relationship is established for an indefinite period between the employee and the user employer.

Agreements on work performed outside employment relationship

In addition to the employment relationship established by the employment contract, a employment relations may also arise on the basis of agreements on work performed outside employment relationship. These agreements represent an additional form of employee participation in the performance of work (work performance agreement, agreement on work activity, Agreement on temporary job of students). These are agreements that have a special position in the Slovak contractual system. According to the statistical data of the Social Insurance Agency, 411,028 citizens of the Slovak Republic worked on the agreement on work performed outside employment relationship at the end of 2019 (Social insurance Agency, 2020).

The purpose of the legal regulation of agreements on work performed outside employment relationship is to provide both subjects of the basic employment relation with certain advantages resulting from the specificity of the work.

Agreements on work performed outside employment relationship should be concluded only for small-scale tasks, respectively in the case of the needs of the employer, which are usually of a short-term nature or it is necessary to perform work tasks of a unique nature. The employment relation established by the agreement is significantly freer than the employment relationship and creates a relatively wide scope for the exercise of the contractual freedom of the participants. On the other hand, the agreement, unlike the employment relationship, does not establish several legal claims, in particular as regards entitlement to holiday, entitlement to compensation in the event of obstacles at work, remuneration for overtime work, provision of catering. However, these claims may be enshrined directly by the parties in agreements on work performed outside employment relationship.

Conclusion

In conclusion, we would emphasize that flexible forms of employment are one of the most typical manifestations of flexibility in labour law. Their aim is to contribute to the flexibility of the labour market, to increase employment. On the other hand, these forms of employment should only be an ancillary role in cases where it is not possible or expedient to work full-time for an indefinite period. In addition to specific selected types of flexible employment - fixed-term employment, part-time employment, home work or telework, agency work, agreements on work performed outside employment relationship, there are also other forms of employment containing elements of flexibility that could be in the near future to become a part of the Slovak legal order.

As the use of flexible forms of employment has a growing tendency, it is necessary to pay increased attention to them and there is a need for their sufficient legal regulation also with regard to the necessary protection of employees.

Accelerating Progress Model (AP Model) in the SDGs Implementation – a Chance to Achieve 2030 Agenda Goals Under COVID-19 Conditions

Katarzyna CHŁAPEK,
Cracow University of Economics, Cracow, Poland, chlapekk@uek.krakow.pl

Sylwia KRAJEWSKA
Cracow University of Economics, Cracow, Poland, krajewss@uek.krakow.pl

Abstract

The implementation of 2030 Agenda with respect to social, environmental and economic issues is of key significance for the future of our planet and requires the current engagement of all the inhabitants of the Earth. All these aspects play a special role in the context of the COVID-19 pandemic, hence the need for assessing the SDGs progress with a view to adapting activities in this area to the present circumstances. The analysis presented in the paper points to an insufficient level of communicating SDG-related actions, particularly at the stage of sharing and disclosing good practices. Another issue is the lack of adequate and user-friendly measuring tools, facilitating the determination of the progress in the SDGs implementation by various stakeholders. The paper aims to present a model for accelerating the SDGs implementation (AP model), based on the verification of good practices related to the goals as well as an analysis of COVID-19 implications. The major advantage of the AP model is its simplicity as a measuring tool, which serves to strengthen an entity's sense of contribution to the achievement of 2030 Agenda. The paper stresses the necessity of undertaking further research on the possibility of measuring an individual company's impact on achieving Agenda goals. The awareness and knowledge of the impact of specific actions on the quality of life of future generations can accelerate the SDGs implementation. The conclusions presented in the paper may be put into practice by various groups of 2030 Agenda stakeholders, as well as stimulate further research at an academic level.

Keywords: MDGs, SDGs, COVID, good practices

Introduction

The issue of sustainable development has been discussed in the international arena for a number of years. In 1984, Douglas argued in his work on the "Meanings of the Sustainability" that it should be borne in mind that this term indicates "food self-sufficiency" (an economic perspective), "stewardship" (an ecological perspective), and "community" (a sociological perspective) (Barker *et al.,* 1988 p. 2). Considering the key significance to the well-being of the whole world, the issue of and attempts to take adequate action towards sustainable development are undertaken by international organizations including the United Nations (UN). The achievement of sustainability, aimed to ensure the security of present and future generations, can only be possible through international cooperation and mobilization of global resources.

The authors believe that the achievement of the Sustainable Development Goals (SDGs), as set forth by the 2030 Agenda (UN, Agenda 2030), can only be possible through SDG acceleration through, among others, applying relevant good practices. On a number of occasions, making contact with various groups of the potential stakeholders of the 2030 Agenda, we have observed cases of SDG-related ineffective communication, particularly with regard to the lack of necessary measurement tools.

In light of the above, the conducted study aims to identify the current progress in the SDGs implementation through verification of relevant good practices, and to analyse the consequences of the COVID-19 pandemic, which constitute the basis of the proposed model of the SDGs acceleration (AP model). The created model can serve as a tool for communication among all the entities engaged in the SDGs implementation and it can also be a basis for creating rankings of actions affecting the 2030 Agenda acceleration. The AP model is an uncomplicated measurement tool, mainly aimed to create a positive sense of contribution to the implementation of a global project – the 2030 Agenda.

Cite this Article as: Katarzyna CHŁAPEK and Sylwia KRAJEWSKA "Accelerating Progress Model (AP Model) in the SDGs Implementation – a Chance to Achieve 2030 Agenda Goals Under COVID-19 Conditions" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

The model proposed in this work and the conducted analysis can be treated as guidelines for a number of entities which take up the challenge of implementing SDG initiatives, as well as an inspiration for further research on support tools aimed to accelerate achieving 2030 Agenda goals.

The main thesis of the paper is the statement that sustainable development goals (SDGs) under the conditions of COVID-19 can only be achieved through 2030 Agenda acceleration actions based on relevant good practices – hence the research goal is focused on an analysis of good practices and COVID-19 implications with a view to building a model for accelerating the SDGs implementation (AP model).

The basic research method is based on long-standing and in-depth observations on the SDGs implementation process, the employed good practices and proposed measurement tools related to achieving 2030 Agenda goals. The research study comprises a review of world literatures in the area of development gaps, the SDGs and the current conditions related to the COVID-19 pandemic. It also refers to earlier studies on the ways of communicating achievements in this area, presented in annual reports, and the possibilities of influencing SDGs progress by various entities, presented under a grant entitled "Non-Financial Reporting in the Perspective of Sustainable Development – a programme for adult education trainers" as part of "social innovation incubators in the field of adult continuing education", co-financed by the European Social Fund. The employed methods also include the observations and assessments of current world trends.

The work assumes that it will stimulate interest in strengthening the SDGs implementation, especially under COVID-19 conditions, through good practices as a source of inspiration for taking action, coupled with the measurement of individual contribution to the SDGs acceleration using the proposed model.

Sustainable development goals

The globalization of economic life offers a number of opportunities, but it also poses serious threats in various areas with respect to economic, social and environmental issues. For a number of years, the problems of the contemporary world have been the subject of interest of international organizations including the United Nations (UN). This organization undertakes actions aimed to counteract existing threats and seeks to achieve global goals – an initiative launched through identifying so called Millennium Development Goals in 2000 (MDGs) (UN, 2000), which give attention both to positive and negative effects of globalization. Undertaking actions aimed to bring benefits for all inhabitants of the Earth, the Organization identified the following fundamental values of international relations:

1. Freedom
2. Equality
3. Solidarity
4. Tolerance
5. Respect for nature
6. Shared responsibility.

Also, the key goals were set which translate the fundamental values to specific actions. As a result, eight MDGs were formulated:

1. Eradicate extreme poverty and hunger
2. Achieve universal primary education
3. Promote gender equality and empower women
4. Reduce child mortality
5. Improve maternal health
6. Combat HIV/AIDS, malaria and other diseases
7. Ensure environmental sustainability
8. Global partnership for development.

All member states declared their will to meet the goals by 2015 (Sachs, 2012).

The Resolution adopted by the General Assembly on 25 September 2015 (UN, Agenda 2030), referred to in this work as the 2030 Agenda, draws on the goals set in 2000, extending the list of goals from 8 to 17 (Griggs *et al.*, 2013). Table 1 presents the description of Sustainable Development Goals in accordance with the 2030 Agenda, and a comparison with 2000 goals.

Table 1: Millennium Development Goals and Sustainable Development Goals

Millennium Development Goals (MDGs)		Sustainable Development Goals (SDGs)	
1	Eradicate extreme poverty and hunger	1	End poverty in all its forms everywhere
2	Achieve universal primary education	2	End hunger, achieve food security and improved nutrition and promote sustainable agriculture
3	Promote gender equality and empower women	3	Ensure healthy lives and promote well-being for all at all ages
4	Reduce child mortality	4	Ensure inclusive and equitable quality education and promote lifelong learning opportunities for all
5	Improve maternal health	5	Achieve gender equality and empower all women and girls
6	Combat HIV/AIDS, malaria and other diseases	6	Ensure availability and sustainable management of water and sanitation for all
7	Ensure environmental sustainability	7	Ensure access to affordable, reliable, sustainable and modern energy for all
8	Global partnership for development	8	Promote sustained, inclusive and sustainable economic growth, full and productive employment and decent work for all
		9	Build resilient infrastructure, promote inclusive and sustainable industrialization and foster innovation
		10	Reduce inequality within and among countries
		11	Make cities and human settlements inclusive, safe, resilient and sustainable
		12	Ensure sustainable consumption and production patterns
		13	Take urgent action to combat climate change and its impacts
		14	Conserve and sustainably use the oceans, seas and marine resources for sustainable development
		15	Protect, restore and promote sustainable use of terrestrial ecosystems, sustainably manage forests, combat desertification, and halt and reverse land degradation and halt biodiversity loss
		16	Promote peaceful and inclusive societies for sustainable development, provide access to justice for all and build effective, accountable and inclusive institutions at all levels
		17	Strengthen the means of implementation and revitalize the Global Partnership for Sustainable Development

Source: authors' research based on (UN, 2000) and (UN, Agenda 2030).

The analysis of goals presented in Table 1 indicates that the MDGS are continued, but some specific global problems are also identified, the resolution of which are related to the SGDs.

The 2030 Agenda, apart from goals, contains 169 related targets (Biermann *et al.,* 2017, Schroeder *et al.,* 2018). The goals and respective targets are interdependent and indivisible (Blanc, 2015), ensuring balance between three aspects of sustainable development: economic, social and environmental (Fig. 1).

Fig. 1: Three aspects of sustainable development under the 2030 Agenda
Source: authors' research based on (UN, 2030 Agenda)

Efforts aimed to achieve development in all three dimensions should be integrated and balanced. Sustainable development in three dimensions (economic, social and environmental) is a key characteristic which enables various entities to adopt the SDGs (SDGF, 2016). It also enables them to understand that sustainable development is key to long-term successful and prosperous activities in contemporary markets.

A special role of good practices in the SDGs implementation

Actions aimed to meet sustainable development goals require participation of a broad range of actors. It is commonly stressed that humanity's actual progress towards sustainable development is very slow (Baumgartner R.J., 2011). To meet the current challenges, the Division for Sustainable Development Goals (DSDG) in the United Nations Department of Economic and Social Affairs (UNDESA) acts as the Secretariat for the SDGs, providing substantive support and capacity-building for the goals and their related thematic issues. DSDG plays a key role on advocacy and outreach activities relating to the SDGs and serves Member States, Major Groups and other stakeholders, as well as the general public, by providing wide access to information and knowledge for sustainable development, through its online Sustainable Development Knowledge Platform and social media outlets. The Division also supports, facilitates and monitors multi-stakeholder partnerships and voluntary commitments announced at its Partnerships for SDGs online platform (Partnerships for SDGs). DSDG's website provides information about the particular SDGs including events, publications and partnerships. Currently, 960 events, 1205 publications and 5132 partnerships are identified. Specific figures related to the particular SDGs with regard to partnerships are presented in Table 2.

Table 2: Partnerships by the SDGs

goal	1	2	3	4	5	6	7	8	9
partnerships	739	689	619	1081	833	598	642	1140	474
goal	10	11	12	13	14	15	16	17	
partnerships	433	622	807	981	1948	621	558	1152	

Source: authors' research based on (SDGS)

Many undertaken partnerships relate to several or sometimes all SDGs, hence the sum of all partnerships in all SDGs is not equal to all good practices, i.e. 5132.

The visualization of the number of partnerships related to the specific SDGs (See: Fig. 2) points to large discrepancies in the number of registered partnerships, depending on the goal.

Fig. 2: Undertaken partnerships by SDGs

Source: authors' research based on (SDGS)

A detailed analysis leads to the conclusion that the number of initiatives undertaken under Goal 14 differs considerably from the remaining goals, comprising as many as 1948 registered initiatives. For goals 17, 8 and 4 the number of registered initiatives exceeds 1000, and for goal 13 it is close to 1000 (981 initiatives). Goals 10 and 9 rank lowest in terms of registered initiatives (below 500), and 16 and 6, for which the number of registered initiatives does not exceed 600 (displayed on an online platform).

The Partnerships for SDGs online platform is a global registry of voluntary commitments and multi-stakeholder partnerships made in support of sustainable development and the 17 SGDs. It also facilitates the sharing of knowledge and expertise among multi-stakeholder SDG-related partnerships and voluntary commitments, and for providing periodic updates on their progress. The Partnership for SDGs platform is open to all (Perez-Batres *et al.*, 2011). Everyone can register a voluntary commitment or multi-stakeholder partnership which aims to drive the implementation of the 2030 Agenda and the 17 SDGs and to provide periodic updates on progress. So, stakeholders, including Member States, civil society, local authorities, private sector, scientific and technological community, academia, and others, can register own good practice there.

The methodology of criteria of registration is based on a popular idea called SMART deliverables - Specific, Measurable, Achievable, Resource-based, and Time-bound. Registered initiatives should be:

- Specific: initiatives should aim for concrete deliverables, contributing to specific goals and targets under the 2030 Agenda.
- Measurable: initiatives should set measurable progress indicators, to facilitate review of progress.
- Achievable: initiatives should set attainable goals and strive to deliver results.
- Resource-based: registered initiatives should have a secured resource base, rather than merely project proposals,
- Time-bound: initiatives should be time-specific.

Only those initiatives which meet the above criteria, following a positive verification by the UN Secretariat, can be published on the online platform. Initiatives are encouraged to maintain up-to-date information and periodically self-report progress once a year through the online platform, focusing on how the initiative has contributed to the achievement of specific goals and targets in the 2030 Agenda.

Good practices can be adopted and registered on the platform by a wide range of stakeholders (Hajer *et al.,* 2015; Killian *et al.,* 2019). The division of good practices by sector is presented in Fig. 3.

Fig. 3: SDGs good practices by sector

Source: authors' research based on (DSDG, 2020)

A sectoral analysis of initiatives indicates that government initiatives represent the largest group, followed by initiatives undertaken by civil society organizations. The entities least engaged in undertaking and registering good practices include intergovernmental organizations; also, the group of philanthropic organizations has a very low position in this ranking.

The data presented by the UN can be a basis for analysing initiatives by region (Fig. 4).

Fig. 4: Good practices in SDGs by region

Source: authors' research based on (SDG Good Practices, Success Stories and Lessons Learned in SDG, 2020).

The largest number of initiatives are undertaken by Latin America countries (32% of all initiatives), followed by Asia and the Pacific (28%), and Europe (24%). The smallest number of SGD initiatives are undertaken in West Asia and North America (merely 2%, respectively).

Before the pandemic, progress in achieving all the 17 SDGs was uneven, posing a challenge for organizations, governments, entrepreneurs and citizens. The current analyses suggest that the process of achieving sustainable development goals is likely to be delayed (Leal Filho *et al.,* 2020). Social and economic pressures and resulting failures lower the priority ranking of sustainable development goals. Moreover, the potential and possibilities created by sustainable development goals, e.g. eradicating extreme poverty and hunger, can be weakened by COVID-19.

Therefore, in order not to squander past achievements, it is necessary to take necessary action, at an academic and practical level, towards the SDGs implementation, giving attention to local and global threats resulting from the failure to do so.

The SDGs implementation and COVID-19 implications

In March 2020, overnight, we practically woke up in a completely different world. The COVID-19 pandemic poses a serious threat to the normal life and welfare of billions of people worldwide. From this perspective and in the context of an uncertain future, we should reflect on lessons drawn from this situation. Despite considerable damage done to people, their sources of income and the economy, COVID-19 can turn out to be an unexpected opportunity for building mankind's solidarity and transforming the crisis into a platform for the SDGs implementation.

"Stopping" the world is an opportunity to go back to the fundamental principles and build a sustainable world. However, to make it happen it is necessary to take relevant, holistic and prompt action, giving special attention to the implications of COVID 19. Table 3 presents facts referred to in the UN report (Report, 2020).

Table 3: Implementation of sustainable development goals before the COVID–19 pandemic and its implications

Goal	Before COVID - 19	COVID-19 implications
1	The world will not be able to eradicate poverty by 2030 [2010 – 15.7%, plan for 2030 – 6%].	COVID-19 causes the first increase in global poverty in several decades. In 2020, more than 71 million people plunged into extreme poverty.
2	The lack of food security was already on the rise. Depending on a region, inhabitants are affected by a moderate or serious lack of food security [2014 – 22.4%, 2019 – 25.9%]. The stopping of growth and devastation of children are likely to become more severe.	The pandemic (apart from climate change, military conflicts and locust) is another threat to food systems. The crisis hit small food manufacturers (they account for 40%–85% of all food manufacturers in developing regions).
3	Progress in many health-related areas continued, but it is necessary to accelerate it in the area of tuberculosis, HIV, child and mother health, and vaccines.	Healthcare disruptions may jeopardise several decades of improvements. In 2020, an increase by hundreds of thousands in deaths below the age of 5 is expected.
4	Progress towards inclusive education and fair quality was too slow. In 2030, more than 200 million children will not go to school.	Education gaps are widened by COVID-19. The effect of the closure of schools - 90% of children did not continue education. Distance learning is not available for at least 500 million children. Only 65% of elementary schools have basic hand washing facilities, which are key to combating COVID-19.
5	Despite some progress, full gender equality was not achieved. Fewer girls are forced to marry; more women perform leader functions.	Lockdowns increase the risk of violence against women and girls (physical, sexual and psychic). In some countries, the number of home violence cases increased by 30%. Women are at the forefront in the fight against the coronavirus. Women account for 70% of health care services staff and social workers.
6	Apart from progress made, billions of people have no access to water and sanitation services.	3 billion people worldwide do not have basic hand washing facilities in their homes (the most effective way of preventing COVID-19).

7	Scaling up is required in the field of sustainable energy. 789 million people are deprived of electricity (2018).	Inexpensive and reliable energy is key to the work of health care centres.
8	Global economic growth slowed down.	The world is facing the most serious economic recession since the Great Depression. During the pandemic, 1.6 billion workers of the informal economy face the threat of losing their income. Tourism is facing unprecedented challenges.
9	Growth in production output decreased due to customs duties and tensions in trade relations. R&D outlays increase, but they should be accelerated.	The air transport has gone through the most serious crisis in its history. The number of air passengers decreased by 51% from January to May 2020 (as compared with the respective period of 2019).
10	In some countries, income inequalities decreased. GINI index decreased in 38 out of 84 countries (2010–2017).	The most vulnerable groups are hit hardest by the pandemic (older generations, persons with disabilities, children, immigrants and refugees).
11	The percentage of urban population living in slums decreased to 24% in 2018.	More than 90% of the cases of COVID-19 are recorded in urban areas.
12	The world is still using its resources in an unsustainable way.	The pandemic is an opportunity for developing improvement plans for a more sustainable future.
13	The global community evades its obligations related to climate change, which results in catastrophic fires, hurricanes, droughts and floods	COVID-19 may lead to a 6% decrease in greenhouse gas emissions in 2020. There is still a lack of 7.6% of annual reduction aimed to reduce global warming by 1.5°C.
14	Ocean acidification is still a threat to the maritime environment and ecosystems. Ocean acidification is predicted to increase by 100-150% by 2100, affecting half of all sea organisms.	A drastic decrease in human activity caused by COVID-19 can be a chance for ocean regeneration.
15	The world does not achieve goals by 2020 in the area of the loss of biodiversity. More than 31 000 species are threatened by extinction. Two billion hectares of land were degraded, affecting approx. 3.2 billion people and resulting in the extinction of species and increased climate change.	Trade in wild animals destroys ecosystems and results in the spread of contagious diseases. Pangolins are likely to transmit the coronavirus.
16	Every day 100 civilians are killed in military conflicts despite the protection of international law.	COVID-19 implications constitute a threat to world peace and security. As early as in 2019, the number of people running away from war, persecution and conflicts exceeded 79.5 million – the highest level in history. In 60% of countries prisons are overcrowded, which leads to the spread of COVID-19.
17	No data available	

Source: authors' research based on (Report, 2020)

The 2020 Report on sustainable development goals presents up-to-date information which indicates that before the COVID-19 pandemic progress was uneven and we were not on the right track to achieve the goals by 2030. However, some positive trends were recorded: improved access to education and drinking water; a decrease in the occurrence of many contagious diseases; and an increase in the number of women in managerial positions. Simultaneously, the number of people suffering from hunger increased, the state of the environment deteriorated drastically, and dramatic inequalities persisted in all regions. The changes were insufficient in terms of their pace and range. The COVID-19 has made the achievement of the goals even more difficult. Johns Hopkins University in Baltimore conducts pandemic statistics based on data provided by international organizations, central and local governments and its own research. The report published in October 2020 indicates that the number of infections worldwide since the pandemic outbreak amounts to 38 006 121, the number of deaths - 1 083 875, and the number of recoveries - 26 354 211 (https://www.hopkinsmedicine.org/coronavirus/index.html).

Health care systems in many countries are on the verge of collapse. The lives of half of the world's work force have been hit hard by the pandemic. More than 1.6 billion pupils do not go to school, and dozens of millions of people are again affected by extreme poverty and hunger, which destroys the modest progress made in recent years. Limited access to food resources, education, work and medical services provides fertile ground for conflicts and social unrest, as well as an increasing interest in dangerous nationalistic slogans (Barbier *et al.,* 2020).

In this context, it is worthwhile to cite António Guterres, Secretary-General of the United Nations: (…) *At the start of this Decade of Action to deliver the SDGs, I call for renewed ambition, mobilization, leadership and collective action, not just to beat COVID-19 but to recover better, together – winning the race against climate change, decisively tackling poverty and inequality, truly empowering all women and girls and creating more inclusive and equitable societies everywhere*" (Report, 2020). The presented challenges and the need for global mobilization to achieve the SDGs provide incentives for academics to actively engage in research aimed to develop tools for large groups of stakeholders, which could also act as motivating factors. Therefore, special attention should be given to developing models based on good practices with a view to accelerating the SDGs implementation under new and difficult conditions, preventing the destruction of the hitherto progress [Leal Filho *et al.,* 2020).

In the context of the above challenges, an attempt has been made to build a model for accelerating SDG actions.

A model for accelerating initiatives in the SDGs implementation

On the basis of a literature review and UN reports on SDG implementation and challenges, undertaken and registered on the UN good practices platform, and considering the implications of the COVID-19 pandemic, an attempt has been made to build a model for accelerating the achievement of sustainable development goals (AP model). For this purpose, the following assumptions have been made:

1. As a point of reference, the number of good practices registered to this day is 5132, considering time limitations (after 5 out of 15 years for implementing the Agenda 2030), and also considering current threats and risks posed by COVID-19, and assuming that initiatives undertaken for each goal should reach the level of current good practices in the amount of 5132.
2. The percentage share is determined for the number of registered good practices for a given SDG in the total number of good practices, which is treated as the level of performance (%) of the target level of good practices set forth under point 1.
3. According to the provisions set forth under points 1 and 2, we calculate the percentage of good practices to be undertaken (performed). The achievement of these levels will facilitate acceleration actions in achieving specific SDGs. .
4. Considering the values presented under point 3, target levels for each goal are presented in the form of a coefficient.

The above procedure for building the model is a basis for necessary calculations – the sources of data for the AP model (see: Table 4).

Table 4: Calculations for the AP model

Goal (G)	1	2	3	4	5	6	7	8	9
Partnerships	739	689	619	1081	833	598	642	1140	474
% of performance	14	13	12	21	16	12	13	22	9
% to be performed	86	87	88	79	84	88	87	78	91
Model coefficient	0.86	0.87	0.88	0.79	0.84	0.88	0.87	0.78	0.91
Goal (G)	10	11	12	13	14	15	16	17	
partnerships	433	622	807	981	1948	621	558	1152	
% of performance	8	12	16	19	38	12	11	22	
% to be performed	92	88	84	81	62	88	89	78	
Mode coefficient	0.92	0.88	0.84	0.81	0.62	0.88	0.89	0.78	

Source: authors' research

Calculations based on the presented assumptions allow for building a model which indicates the share of specific good practices in accelerating the SDGs implementation (accelerating progress model (AP model) in achieving the SDGs) in the form presented below:

AP model =

0,86G1+0,87G2+0,88G3+0,79G4+0,84G5+0,88G6+0,87G7+0,78G8+0,91G9+0,92G10+0,88G11+0,84G12+0,81G13+0,62G14+0,88G15+0,89G16+0,78G17

AP model	=	0,86G1+0,87G2+0,88G3+0,79G4+0,84G5+0,88G6+0,87G7+0,78G8+0,91G9 +0,92G10+0,88G11+0,84G12+0,81G13+0,62G14+0,88G15+0,89G16+0,78G17

The interpretation of the AP model is as follows: if one initiative was undertaken affecting all the SDGs, the value in the model of accelerating the SDGs implementation would reach the value of 14.3.

The authors are aware of the imperfections of the proposed model. However, it is an innovative measurement tool which allows for determining the contribution of particular good practices in accelerating the SDGs implementation. The proposed model enables all entities which undertake initiatives towards the SDGs implementation, regardless of their size, form of ownership, legal and organizational structure or the goal of activity, to determine their individual contributions to the SDGs implementation. At this stage of the process, it is not possible to propose the desirable size of the AP model, but the authors intend to carry out further research in this area.

The global crisis caused by COVID-19 indicates that efforts aimed to achieve sustainable development goals and implement related initiatives are much more significant now than before the pandemic outbreak. The current global crisis is showing us the interdependence of our economic, social and natural spheres, which need to be approached in a holistic manner (Sustainable development in the European Union, 2020). The SDGs implementation can become an important element of policies aimed to improve the quality of life and to resolve the problems of the lack of water and food, and universal access to health care services.

Conclusions

Before the pandemic, progress in achieving all the 17 sustainable development goals was uneven (Barbier *et al.,* 2020). Although extreme poverty and infant and mother mortality rates have decreased since 2000, and low income countries have reduced their poverty rates, progress in these areas has been made to the detriment of other important goals, particularly environmental sustainable development goals 11–15 (Barbier *et al.,* 2020). It points to imbalances between the three aspects of sustainable development: economic, social and environmental, which prevents Agenda 2030 implementation. This adverse trend was strengthened by COVID-19, which had the most serious impact on developing countries. The pandemic is likely to have a negative impact on 12 out of 17 goals [1-8; 11, 13, 16, 17] (Barbier *et al.*, 2020), in which the implementation of good practices was insufficient.

The fight against COVID-19, similarly to the SDGs implementation, requires exchange of information on good practices among all the actors engaged in social, economic and environmental activities. Shaping individual attitudes should be initiated at the lowest educational levels with a view to developing the right attitudes and forms of behaviour in the future. The sum of individual actions can determine the success of the SDGs implementation. A key role is played by the communication of information on the progress in sustainable corporate development. The communication itself of information on initiatives and actions is a tool for disseminating sustainable practices. It has been observed that companies and various institutions should learn how to effectively tell their "stories" about sustainable development and its goals.

In this context, the following areas can be the subject of general interest:

- increasing the possibility of registering good practices on the Partnerships platform,
- strengthening a sense of individual contribution to the SDGs implementation, based on the use of the proposed model,
- strengthening a sense of global and overall responsibility through intensifying the exchange of information about the 2030 Agenda,
- the use of actions proposed in the 2030 Agenda in the fight against the COVID-19 pandemic.

The authors, being aware of the imperfections of the proposed solutions, have a justified conviction that achieving 2030 Agenda goals can be accelerated through influencing an entity's awareness of the possible impact on the 2030 Agenda acceleration.

Abstract

Effective and informed business models are a challenge especially in terms of their impact on competitiveness of units. In the reality of the COVID-19 pandemic, intellectual capital has a special place in a business model. The aim of this article is to draw attention to the impact of intellectual capital, revealed in a business model, on the competitiveness of a unit and its particular importance in the current conditions of economic life. The article uses official financial and non-financial data of KGHM and results of the most popular business rankings. The research shows that there is a link between competitiveness of a unit and its intellectual capital activities in the business model. In the context of the threat to continuation of activities of many units, the article reveals the need for further research in the area of adjusting the business model to specific operating conditions, taking into account the role of intellectual capital. Only a re-examination and a substantial modification of the business model, based on intellectual capital, may enable survival in a crisis situation. Research of the study and formulated conclusions can be useful to both scientists and practitioners interested in opportunities to support units in tackling the challenges posed by COVID-19.

Keywords: Intellectual Capital, Business Model, COVID-19, Non-Financial Data.

Introduction

Functioning of enterprises in a global economy emphasises the importance of taking holistic actions and effective decisions affecting individual competitiveness. Analysing the content of currently published financial and non-financial reports of business entities, it can be seen that, apart from classic information function, they are also tools for influencing image formation and perception by a wide range of stakeholders, i.e. they become a kind of marketing tool.

Among many issues included in these reports, units present their business models, which, in accordance with the guidelines of the International Integrated Reporting Council, can be presented by indicating resources in the form of six capitals, which consist of: financial, manufacturing, human, natural, intellectual, as well as social and relational capital. The authors' interest was aroused by intellectual capital, which is presented in different ways in terms of content, visual and terminology in reporting units. A very important issue is also the place of this capital in the unit's business model in terms of building a competitive advantage.

In view of the above, the aim of the study is to identify the place of intellectual capital in the business model of the selected capital group and to attempt to determine the impact of that model on its market position.

The main thesis of the study is that the value-chain based business model of a unit affects its level of competitiveness in a dynamic and unstable market, and that properly defined and managed intellectual capital strengthens this position.

The basic research method is a thorough analysis of the relationship between intellectual capital in the business model and the possibility of achieving a competitive advantage, and verification of observed trends in the economic practice of units. The research reviewed domestic and foreign literature on intellectual capital and business model and verified four national rankings. Then an empirical analysis was made on the example of the KGHM Group.

The assumption of the study is to arouse interest and discussion on the role and place of intellectual capital in the entity's business model, in view of the challenges posed by the reality caused by the COVID-19 pandemic.

The role of a business model in building a competitive advantage

Many Polish economic units have been subject to the obligation to describe their business model, which is related to the amendment of the Accounting Act (Act, 1994, Article 49b(2)), resulting from the implementation of provisions of Directive 2014/95/EU on the disclosure of non-financial information and information on diversity by certain large units and groups (Directive 2014/95/EU). Unfortunately, disclosures by units about the business model (also referred to as the business model), despite their experience in this area, are still a challenge in reporting process. Beginning with the issue of location in the statement (financial or non-financial, separate or integrated, complying with the relevant standard or according to their own standard), entities raise many dilemmas in the area of presentation of this issue.

There are many definitions of a business model in the literature, which additionally makes interpretation difficult. The analysis of the literature on the subject enables stating that there is no single, commonly accepted definition of a business model (Krasodomska, 2014, p. 108). For example, according to the International Integrated Reporting Council (IIRC), a business model is "a system of resources, activities, results and effects adopted by an organisation that aims to create value". (IIRC, 2013, p. 6). Components of a business model include (Bek-Gaik, 2015, p. 484):

- presentation of the entity, in particular information on its activity, area of activity and structure,
- the business strategy chosen,
- value chain - position of the entity and links to key inputs and output assets,
- financial results - a way to control profitability or generate revenue through a business model,
- creation of value - a way leading to value and desired effects through the entity's inputs and assets, as well as actions and relationships taken.

By presenting non-financial information, including the business model, economic units point to many benefits, which are also emphasised by the international organisation Global Reporting Initiative (GRI), indicating the five main ones (Anam, 2017, p. 2):

1) confidence-building, where particular attention should be paid to transparency on non-financial performance in order to contribute to reducing reputation risks and developing dialogue with stakeholders;
2) improving processes and systems, by diagnosing and improving internal management and decision-making processes;
3) progress in implementation of vision and strategy, through a comprehensive analysis of strengths and weaknesses and involvement of stakeholders, as necessary in sustainability reporting processes, leading to the development of vision and strategy and ensuring integration of sustainable development into business strategy;
4) reducing compliance costs by measuring sustainability performance;
5) competitive advantage, as companies seen as leaders and innovators are able to influence their position in terms of attracting investment, initiating new activities, entering new markets and negotiating contracts.

By pointing out the advantages of reporting non-financial data itself, resulting from scientific research, we can often encounter conclusions which show the link between their presentation and competitive position. It is possible to mention, among others, the basic benefits of non-financial reporting mentioned by M. Anioł: strengthening of the competitive position, more effective management of financial and non-financial risks, improvement of corporate governance and the management system, which facilitates internal processes and improves work efficiency. The author also mentions the advantages in the area of marketing issues, which include: creating a positive image as an employer, leading to an increase in the chances of retaining current and acquiring new, highly qualified employees, shaping a positive opinion on published financial data and building good relations with authorities, officials and public institutions (Sobczak, 2014).

From this perspective, we find a link with aspects of marketing in a new perspective, where it is postulated to build an honest and ethically operating organisation that offers values and benefits in the form of so-called ethical added value (Graczyk, 2008, p. 107). It is believed that the use of socially engaged marketing tools may contribute to (Krajewska-Nieckarz, Łuczak, 2013, p. 58):

1) building positive attitudes of external stakeholders (clients, local government, investors, contractors) towards the company;
2) increase in motivation and commitment of employees;
3) increase in purchases of products from a socially engaged company;

4) strengthening and making the company's mission credible, by including social and ethical elements;
5) improving internal and external image of the company;
6) increase in the value of the company and acquiring new investors, for whom social value is as important as financial value;
7) reducing consumer sensitivity to product prices;
8) increase in the efficiency of business operations;
9) increase in the company's innovativeness.

With regard to the issue of building competitive advantage, the business model and resources, as well as the relationships that are used and shaped by the unit, are of particular importance. In view of this aspect, it is worth recalling the scheme proposed by the IIRC for the value creation process, presented in Figure 1.

Fig. 1: Value creation process according to IIRC

Source: (Krasodomska, 2015, p. 80)

In accordance with the figure presented, it is proposed to units to present their business model by identifying resources in the form of six capitals: financial, productive, human, natural, intellectual, as well as social and relational. Thanks to the actions taken in the unit and relations in the area of the indicated resources, the unit can present the achieved results in an identical layout. So presented layout of the business model presentation clearly shows the process of value creation in the unit.

Intellectual capital - specificity and place in the business model

Intangible resources constitute an integral part of conducting business activity. Nowadays, a change in the importance of material factors in terms of creating company value is becoming noticeable. On the other hand, the role of the ability to adequately use "hidden" resources, which is undoubtedly intellectual capital, is growing (Grudzewski, Hejduk, 2004, p. 40).

The term *intellectual capital* appeared in 1969 and was used by J.K. Galbraith in a letter to Polish scientist, M. Kalecki (Śledzik, 2011, p. 57). In 1975, *"The Intellectual Capital of Michal Kalecki: A Study in Economic Theory and Policy"* was published. It was the first official publication on intellectual capital (Strojny, 2006, p. 65). Despite the passage of time, to this day it has not been possible to develop a single, universally accepted definition of intellectual capital or intangible assets in literature. It can be seen that, depending on the adopted perspective or research goal, the authors of the definitions emphasise the features, components or economic benefits resulting from the use of this very capital (Bombiak, 2016, p. 109). Difficulties related to creation of a uniform definition of intellectual capital have contributed to numerous explanations, among which the most commonly recognised and indicating the relationship with creation of an unit's value and the impact on its competitive advantage are contained in Table 1.

Table 1: Selected definitions of intellectual capital

Author	Definition
L. Edvinsson, MS Malone	Intellectual capital is a hidden asset, reflecting the gap between the market value and the book value of the company
D. Dobija	Intellectual capital is a source of financing of the company's intangible resources contributing to the generation of future benefits, and thus significantly influencing the process of creating goodwill
J. Fitz-Enz	Intellectual capital is the intellectual property of a company and a complex interweaving of processes and culture connected with a network of various types of relations and human capital.

Source: Own elaboration based on Edvinsson et al., 2001, p. 39; Fitz-Enz, 2001, p. 23-24; Bombiak, 2016, p. 110.

Among the presented definitions, the wording proposed by L. Edvinsson and M.S. Malone, who, defining intellectual capital as "the gap between the market value and the book value of the company", points to the particular importance of this resource in the entity from the perspective of value creation and, at the same time, competitive advantage, deserves special attention. Similarly, M. Dobija draws attention to the process of creating company value by intellectual capital, pointing out the significance of this resource in the process of creating company value.

Intellectual capital consists of many knowledge-based components that shape the market value of a company. As in the case of the definition of intellectual capital, as in the case of its components, we encounter various positions, as shown in Table 2.

Table 2: Components of intellectual capital by different authors

Author	The concept of intellectual capital	Components
Konrad's Group (Sveiby and company)	Konrad Report	- intellectual capital attributed to the unit (individual capital) - intellectual capital attributed to the organisation (structural capital)
Sveiby	Intangible Asset Monitor	-internal structure -external structure -individual competence
L. Edvinsson, (Company "Skandia")	"Skandia's" value scheme	-human capital -structural capital
Petrash, Edvinsson, Onge, Armstrong	Value platform	-human capital -client capital (relations) -organisational capital (structural)
Stewart	Identification of intellectual capital components	-human capital -structural capital -client-related capital

Source: Own elaboration on the basis of the study: Adamska, 2015, p. 18; Bontis et al., 2000; Stewart, 1991; Sullivan, 2000; Sveiby, 2001.

When analysing the components of intellectual capital, one can notice its reference to the individual competences of specific persons (Konrad Report and the Non-Material Assets Monitor).

Intellectual capital is certainly a complex category, created on the basis of the most valuable resource of contemporary organisations, namely knowledge (both the hidden one, gathered in the minds of employees, and the one codified in company documents). This knowledge is the basis for the creation of intangible assets in the unit. The difficulty in developing a uniform definition and approach to intellectual capital is mainly due to the fact that this resource is complex and unique. This uniqueness is a significant asset of the capital in question, as it enables the creation of a lasting competitive advantage for a given unit. On the other hand, it causes numerous problems in determining its value reliably.

From a financial accounting perspective, intellectual assets are not treated as a separate resource, but are included in goodwill. It is important to note that the goodwill of modern economic units many times exceeds the value of material assets at their disposal. It is also worth pointing out that only part of the intellectual capital is subject to typical legal regulations. We are talking about so-called intellectual property, including property rights to trademarks, utility and

industrial designs, patents and copyrights. It is these elements that are subject to valuation, planning and management. They have exceptional potential for creating company value.

There are numerous proposals for valuation of intellectual capital in the literature. Work in the area of recognition and measurement of intangible assets was initiated thanks to the difference between the market value of the company and the net book value of its assets (Paliszkiewicz, 2009, p. 119). Despite L. Edvinsson's statement, "it is better to measure roughly what matters than to measure exactly what is meaningless" (Stańczyk, Kryński, 2007, p. 251), and due to the complexity of the issue, no uniform methodology for measuring intellectual capital has been developed yet.

Both business practice and research are aimed at trying to construct new business models that are adapted to the current reality. Similar needs are reported in the area of intellectual capital management, which is one of the resources in the business model. Many business units make advanced attempts at intellectual capital management (Pobrotyn, 2012, p. 121). Their modern organisational models are characterised by the dominant role of human and intangible resources. It is a kind of 'escape' towards softer management elements. Contemporary companies, aware of the importance of employees for their effective operation, invest in intellectual capital, which allows to improve the technical and organisational efficiency of work systems, improves the quality of life at work, and the motivation of employees becomes stronger (Sokołowska, 2005, p. 17).

Focusing on intellectual capital is, above all, the result of its great importance in terms of building a company's competitive advantage. The proper combination and management of the components of intellectual capital contributes to its effective creation and expansion.

Optimal management of intellectual capital is intended to lead to a strong market position for the company. The appropriate shaping of the components of this capital should become necessary in the pursuit of development and effective competition (Beyer, 2012, p. 252). The effects in terms of competitive advantage generated by intellectual capital are presented in Figure 2.

Fig. 2: Selected fields of competitive advantages generated by intellectual capital
Source: (Szara, Pierścieniak, 2007, p. 255)

The intellectual capital held is conducive to the creation of new products and brands and to building the company's reputation. Moreover, it is an opportunity to make effective use of the resources held by the unit and to make use of the strength of the company and the opportunities created by its environment. It initiates the construction of internal and external relations, as well as its own development and a very important opportunity to carry out research and development (R&D).

Today, the management of intellectual capital is regarded as one of the basic tools for managing the future. It is an opportunity to radically reorient the way all entities think and act. It brings units measurable effects in the form of: an increase in the value of intellectual capital, an increase in creativity, competitiveness, development of intellectual resources and promotion and management of knowledge. It is this knowledge, which allows to gain an advantage over other entities, that influences the final result, i.e. the value of the entity. Creating it, based on intellectual capital, gives the company a chance to gain and maintain efficiency at a high level in the long term (Pobrotyn, 2012, p. 132). In view of such perceived role of intellectual capital, we notice its particular importance in the process of value creation, described in the business model.

Presentation of intellectual capital in reporting of the KGHM Group in 2016-2018 and the impact of the business model on its competitiveness

The KGHM Group was chosen as a practical example to present the issues of intellectual capital in terms of business model and competitiveness. In the KGHM report we can read that "KGHM Polska Miedź S.A. Capital Group is a global, innovative organisation which conducts technologically advanced exploration, extraction and smelting activities. The KGHM Group is one of the world's leading producers of silver and copper. It also produces gold, nickel, rhenium, lead and platinum. For several decades, it has been extracting and processing polymetallic ores, mainly copper and silver - initially based on one of the largest deposits in the world located in south-western Poland, and currently operating on four continents - in Europe, South America, North America and Asia. KGHM Polska Miedź S.A. Capital Group consists of KGHM Polska Miedź S.A. as the parent company and several dozen subsidiaries - 75 entities in total, employing over 34 thousand people" (Sustainable Report of KGHM Polska Miedź S.A. for 2018). In addition, KGHM is extremely active in the fight against the COVID-19 pandemic through its activities for Polish hospitals and institutions. The initiatives taken for their own employees and their families deserve particular emphasis (https://kghm.com/pl/koronawirus). Taking into account the pandemic situation, KGHM identifies risks related to the significant importance of the Chinese economy for copper consumption.

The entity builds its competitive advantages in five areas: financial stability, innovation, integrated from exploitation to sale, global reach of operations, and, important from the point of view of intellectual capital, unique competences and skills.

The description of the unique competencies and skills shows that "during its over 60-year history, KGHM Polska Miedź S.A. has gained experience, knowledge and skills which have allowed it to transform itself from a local mining company into an international Group, playing a significant role on the global non-ferrous metals market. The skills of the employees are and will be used in the future as one of the basic elements of building a competitive advantage in the industry and in building a strong position of Poland as an industrial centre" (Sustainable Report of KGHM Polska Miedź S.A. for 2018). It would not have been possible to implement measures to increase competitive advantage if it had not been for cooperation with the Stakeholders, among them: employees, including trade union members, suppliers, customers, industry organisations, competitors and research and scientific institutions, as well as universities.

On the KGHM website it is possible to find electronic versions of integrated reports since 2005. After analysing the content of the individual years, it can be concluded that in the years 2005-2012, the entity prepared an "annual report", and issues related to the broadly understood intellectual capital were defined as: people and the environment, social responsibility, people with the greatest company capital, corporate social responsibility and employment. In the subsequent years 2013-2017, the report was described as an integrated report, and the term human and intellectual capital was used to present the issues discussed. For 2018, KGHM has prepared a sustainable report in which the human capital category appears. In the report for the following year, the term "Integrated Report" was reinstated, but no intellectual capital category was introduced (Integrated Report of KGHM Polska Miedź for 2019).

The information contained in the Integrated Reports of the KGHM Group for 2016 and 2017 shows that, similarly to the previously analysed reports, it was prepared in accordance with the guidelines of the Global Reporting Initiative (GRI), in version GRI G4 (KGHM Polska Miedź S.A. Integrated Report for 2016 and 2017).

The key financial and non-financial data ***statement***, presenting separately the significant values of KGHM Polska Miedź S.A., the KGHM Group and KGHM INTERNATIONAL LTD. and Sierra Gorda S.C.M., the data are divided by capital. Only in the case of KGHM Polska Miedź S.A., human and intellectual capital, treated together, was included among the listed capitals, i.e. production, natural and social capital.

Table 3: Human and intellectual capital of KGHM Polska Miedź S.A.

HUMAN AND INTELLECTUAL CAPITAL

	2016	2017
Total number of employees	18 266 people	18 198 People
Number of employees taking part in a single training event	31 133 people	28 387 People
Number of accidents	370	300
Fatal	13	2
Severe	2	4
LTIFR rate (Lost Time Injury Frequency Rates, total number of accidents / total number of hours worked x 1 million)	12.7	10.4

Source: Own elaboration on the basis of the study: KGHM Polska Miedź Integrated Report for 2017

In the reports presented, human and intellectual capital is presented literally, i.e. in conversion to employees. The total number of workers employed is given and classified according to the number of those involved in the training, and the number of accidents, including severe and fatal ones, is disclosed. In the years under consideration, the number of workers and accidents decreased slightly. In addition, there is the LTIFR rate, which indicates the ratio of the total number of accidents to the total number of hours worked. This rate has decreased in relation to the previous year.

The report also indicates that one of the priority elements of management is innovative activity aimed at raising productivity by increasing the role of intellectual capital and strengthening the protection of intellectual property. The most important activities undertaken in 2016 were also presented, including work on contractual clauses securing intellectual property rights in the case of contracts for research and development. In 2016, 12 R&D projects were continued with key industry partners as well as scientific institutions.

The Integrated Report of KGHM Group treats intellectual capital very generally. What is more, it was presented together with human capital. It can be concluded that this capital is embodied by the number of employees. The fact has been highlighted that management seeks to increase the role of intellectual capital. The presented R&D activities have been shown through the prism of innovative activity, which was particularly emphasised in 2016.

The report for 2017 states that "the most valuable capital of KGHM Group are its employees. The experience and commitment of our staff is the key to the development of all areas of our business model - it builds the global importance of the company and makes us an integrated, future-oriented organisation". KGHM intends to maintain and improve human capital and the related intellectual capital.

The report states that: "safety, cooperation, result orientation, responsibility and courage of employees translate into the results and position of the entire Group. The best experts and specialists are recruited and the knowledge and competences of experienced employees are used. KGHM shares its knowledge and ingenuity, and places great emphasis on commitment and honesty in its daily work. The consequence of such an approach is efficiency, the company's achievements and market position" (Sustainable Report of KGHM Polska Miedź S.A. for 2018).

In the case of the report for 2018, KGHM changed its name from "Integrated Report" to " Sustainable Report". It also does not use the term intellectual capital, but human capital, which is the most important and crucial in the continuous improvement of processes; equally important in the development is innovation and the involvement of employees.

Intellectual capital, alongside financial, productive, natural, social and relational and human capital, is a fundamental element of the business model. KGHM's business model is divided into seven areas through which the Group provides a full value creation chain - from exploration to the sale of finished products. On the basis of Figure 3, it can be concluded that the presentation of the business model in the KGHM Sustainable Report is very general and only visually and terminologically presents the process from the search for resources to their sale. This may be due to the reluctance of enterprises to disclose details of their business model as a key element in building competitive advantage in the global economy.

Fig. 3: Business model

Source: Own elaboration on the basis of the study: Sustainable Report of KGHM Polska Miedź S.A. for 2018

In the context of the impact of the business model on KGHM's competitiveness, four national rankings have been verified, which include:

1) R1/2000 companies - ranking of the Rzeczpospolita daily "List 2000", which presents the largest companies in Poland in terms of generated revenues (List 2000)
2) R2/200 companies - Wprost Ranking of "200 Largest Polish Companies", which presents the largest Polish companies in terms of generated sales revenues (200 Largest Polish Companies)
3) R3/100 companies - Ranking Wprost "Polish Ambassadors" (Polish Ambassadors)
4) R4/800 companies - Ranking of "800 largest industrial companies in Poland".

The statement includes sales value, net profit, assets, equity - all these parameters on an annual basis (2017 and 2018). The sale in 2018 serves as a criterion for sorting out the base of companies, which best illustrates the scale of their operations. The list includes companies directly involved in the production and extraction of raw materials and those providing services to industry (800 largest industrial companies in Poland).

KGHM's places in the individual rankings are presented in Table 4.

Table 4: Position of KGHM in the selected rankings

Ranking	2016	2017	2018	2019
R1/2000 companies	**7**	**7**	**7**	**no data**
R2/200 companies	**5**	**6**	**6**	**6**
R3/100 companies	**no data**	**1**	**no data**	**10**
R4/800 companies	**no data**	**6**		**no data**

Source: own elaboration

On the basis of the presented rankings for the years 2016-2019, it can be concluded that the entity occupies a high and stable place, which proves its high competitiveness and effectiveness of its value chain-based business model.

Despite the fact that in the knowledge era, intellectual capital is one of the most important elements creating the value of a company, there is still no commonly accepted way of disclosing information about it. Integrated reporting may provide a solution to this problem, provided that the IIRC guidelines are improved in the future.

Conclusions

When determining the components of intellectual capital, the studied entity is relatively compatible, i.e. it lists mainly experienced team, knowledge and innovation, strategies and integrated management. In terms of figures, repeated information is the number of workers employed and data on training and accidents at work. None of the reports analysed included an evaluation of intellectual capital. This may indicate that we are dealing with a relatively young phenomenon, but at the same time difficult to evaluate and interpret. The lack of top-down valuation rules means that the report providers simply stop at disclosing their resources. Each report contains information on the research and development activities carried out. Awareness of the huge role played by workers is also highlighted. In the case of the Integrated Report of KGHM Group, information on intellectual capital is marginal.

In view of the above, it is justified to develop a single, universally accepted definition of intellectual capital and to categorise its components. The need is also identified to develop commonly used methods of valuation of intellectual capital, which has a relevant importance in terms of building a competitive advantage of an enterprise.

At a time of unprecedented crisis related to the COVID 19 pandemic, there is a need to re-examine the business model and pay particular attention to human resources as a fundamental component of intellectual capital. Employees are the unit's most important stakeholders and play a crucial role in maintaining business continuity in difficult times. Business continuity planning and management covers infrastructure, cyber, employee, business, operational and communication risks, and aims to manage an organisation that faces new challenges and risks and ensure continuity of operations and production (PwC, 2020).

There is a need to re-examine the business model. Completing the missing elements in the risk management and business continuity strategy, adopting the changes associated with the digital transition and modelling scenarios such as 'what if ' may not be sufficient in the current crisis situation. It is becoming necessary to return to the fundamental foundations of the business model, which may be to investigate sources of revenue and identify all risks that disrupt the process of providing products and services to customers. It is crucial to have widely diversified and balanced distribution channels for products and services, in particular virtual functions using web, mobile and social platforms (Wagner, 2020).

Taking into account the above considerations and the exemplary presentation of the issues presented in KGHM, it is particularly important to pay attention to the place of intellectual capital in an unit's business model. This capital can be a key link in the process of creating value over time in view of the reality caused by the COVID-19 pandemic. Actions in this area, by building a competitive advantage, will make it easier to continue to operate in the face of the current challenges.

Application of The Model of Risk Classes (MRC MODEL) In Covid Time

Katarzyna CHŁAPEK

chlapekk@uek.krakow.pl
Cracow University of Economics, Cracow, Poland

Abstract

The phenomenon of economic risk is the subject of many scientific considerations, and measuring it has been identified as a challenge. In addition, the current situation of the COVID-19 pandemic has a significant impact on business security around the world. The aim of the article is to draw attention to the possibility of measuring economic risk using discriminatory analysis tools, in the form of a model of risk classes. The advantage of the model is the availability of data from a financial statement. The study used official financial data of companies listed on the Warsaw Stock Exchange (WSE) and information collected from the websites of the entities subject to the study. The study shows that it is possible to use the proposed model in the economic risk analysis of units. This article recognises the need for future studies on how to adapt the model to current conditions, especially in the areas of non-financial data, in order to include them in the model of risk classes. The results of the study can be useful to both scientists and practitioners interested in economic risk assessment in economic entities.

Keywords: measurement of the risk, model of classes of the risk, discriminatory analysis, COVID

Introduction

The widespread topic of risk indicates an increase in interest in the world literature, but it does not bring a model approach to measuring economic risk, which could be implemented in the Polish reality. The opportunities created by the market are at the same time threats which very often hinder the survival of individual units and may create a real threat to their survival in a broad global market (Brunnermeier *et al.,* 2019). The fact that the risks arising from the globalisation process itself is repeatedly highlighted, which is linked to the need for economic units to constantly adapt to the broadly defined changes taking place in the economy (Liu, 2012, p. 287).

The issue of risk and its quantification on the basis of data from financial statements is a challenge to accounting as a system. Already R.C. Merton (winner of *the Bank of Sweden Prize in Economic Sciences in Memory of Alfred Nobel i*n 1997) emphasised the possibilities of creating goodwill through better use of risk management in the entity, which can definitely lead to an increased competitive position (Girotra, Netessine, 2011, p. 104). The dynamic development and changes in the economic reality make the measurement of phenomena more and more complicated (Walińska, 2014, p. 509), hence the methods of its implementation should be constantly verified and adjusted, both to the requirements and conditions of the market and to the possibilities offered by modern computing techniques. It is believed that a great role in the sphere of measuring such a complex phenomenon as economic risk is played by modern measurement methods, together with their technical support in the form of IT systems, using exploratory techniques that make it possible to carry out extremely complex calculations in the field of advanced mathematics, statistics and econometrics, which are a tool of extraordinary information capacity and rapid impact on the perception of scientific cognition of the phenomena studied, and which also increase the cognitive and representative value of the issues studied.

Confirmation of the need to create current models related to the subject of risk measurement is confirmed by the constant struggle on the theoretical ground in this subject, discussed among others in the Harvard Business Review (Merton, 2013, p. 51). The current situation of the COVID-19 pandemic poses another challenge and reveals the need for an in-depth analysis of the economic risk phenomenon (Noy *et al.,* 2020, p. 413).

Cite this Article as: Katarzyna CHŁAPEK "Application of The Model of Risk Classes (MRC MODEL) In Covid Time" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

The main aim of the article is to present the concept of measuring economic risk, based on data contained in financial statements in the form of a model of risk classes, as a tool to support the analysis of this phenomenon in the COVID-19 pandemic. According to the author, the model, which is based on data from the period after the recent crisis, that is to say, after 2008, can be a tool to support economic risk assessment in economic entities, especially in the current conditions. The concept of economic risk in the article is limited to risks related to the activities of business entities.

Through the use of the research method, which is a controlled experiment, it was possible to create a model verified by the tools of discriminatory analysis, which means criticising the resulting knowledge in order to determine its application in practice, which was the main assumption of the author, since the developed model is to have the properties of implementation in the measurement of risk, with the simultaneous indication of the development possibilities of economic theories, both in terms of measurement methods and in terms of research conclusions. The classification into a specific risk class derived therefrom, which is the measure of risk, determines the average, rather than the strict and accurate relationship between the phenomena being studied, given the uncertainty of economic life.

Economic risk as a threat to individual safety at the time of COVID-19

The concept of risk is associated with every area of social life, by putting all events dependent on active human activity at risk. The origin of the word risk has not yet been unequivocally explained, as its etymology dates back to ancient times, but nevertheless, in all expressions, risk has two different but closely related meanings:

- a risks caused by human activity, as processes taking place within the human environment, but outside of the human activity,
- a risk that is a dangerous undertaking, taken by a man characterised by courage (Kaczmarek, 2010, p. 64).

Particularly noteworthy is the system proposed by F. H. Knight to distinguish between risk and uncertainty, which is based on the division into measurable and non-measurable uncertainty (Karmańska, 2008, p. 29-30). Based on these assumptions, uncertainty is defined as a state of immeasurable uncertainty, and risk is a quantifiable form of uncertainty. Another example of interpretation, proposed by Mr Bromiley, K. D. Miller and D. Rau (Bromiley *et al.,* 2001; Urbanowska-Sojkin, 2013, p. 19) refers directly, in the definition of uncertainty and risk, to a business entity, defining uncertainty as the unpredictability of the situation both within the entity and in its environment, and risk in the context of strategic management as the unpredictability of the variability of results of undertakings related to revenues, costs, profits and market shares.

Given the omnipresence of risk in business activities and the dynamic emergence of new risk areas, it becomes necessary to seek to assess existing and future threats (Lai *et al.,* 2009, p. 44). The prerequisites for sound risk assessments are tests to identify risks in the light of current market conditions, measurement using appropriate methods and techniques and on the basis of reliable and credible information, and proper interpretation of the results obtained.

The role of accounting in this matter is not insignificant because of its informative function, based on fulfilling both the requirement of reliability and the reliability of the information, aimed at the particular importance of the qualitative characteristics of economic information according to quality theory (Micherda, Szulc, 2013, p. 43). In the context of economic rationality and current trends to which both accounting and management are trying to conform, any sign of risk that represents both an opportunity and a threat is relevant and therefore perceived according to a neutral concept of risk (Jajuga, 2008, p. 13). With regard to management, the role of the threats associated with risk is emphasised, and preference is given to seeking to exploit them in order to achieve benefits, both in the development and day-to-day operation of the entity (Merchant, 2012, p. 32). In view of the definition of risk, which includes in its scope the results achieved as a result of operations (Nowak, 2013, p. 497) in the accounting conclusions, each result (understood as net financial result) is of significant importance, with particular attention paid to the negative result (net loss), resulting in a decrease in the value of the capital and, consequently, a decrease in the value of the unit, which is also connected with a negative impact on its development capabilities (Micherda, 2005, p. 199). Measurement of risk is particularly important for business security because "the risk is to involve all kinds of resources into activity: physical, financial and human. It also concerns the results that are achieved as a result of the activities conducted" (Nowak, 2013, p. 497)

The situation of the COVID-19 pandemic, which is a global phenomenon, undoubtedly represents an extremely important risk, which can be identified in the process of identifying the risks of business units. The so far unknown consequences of the various activities of market participants will be reflected in the financial results of all entities,

hence the particular need to examine the situation of entities on the basis of available data in the form of financial data generated by the accounting system.

Assumptions and classification capabilities of the model risk classes

The measurement of economic risk, based on the financial statements, is an attempt to assess the likelihood of a specific risk being realised and to evaluate the possible economic impact related to the realisation of the identified risk. In this respect, it means to determine first of all the impact of a specific risk factor on the financial situation of an enterprise (Walczak, 2008, p. 305). The market conditions of recent years have led to the concentration of the main objective of doing business not only on the increase in the value of the owners' assets (Skoczylas, 2009, p. 75), which responded to the postulated idea that "the main financial principle of a business enterprise is to maximise the owners' wealth" (Myddelton, 1996, p. 17), but also on the impact on social development and responsibility towards environmental problems.

The literature of the subject distinguishes a number of methods for a specific quantification of risk. The basic division, implemented from the analysis of the unit's activity, allows for separation of:

1. *the qualitative analysis methods* including:
- analysis of the structure of financial statements,
- analysis of the dynamics of the different values of financial statements (Skoczylas, 2009, 143).

2. *the quantitative analysis methods*, including methods of descriptive statistics: arithmetic mean, median, standard deviation. By classifying the methods of quantitative analysis it is possible to distinguish:
- comparison methods, also called deviation methods,
- deterministic methods,
- stochastic methods, including:
  - econometric methods of causal analysis,
  - discriminatory methods (e.g. *Altman's Z-score model (*Altman, 1968, p. 589-609)).

Professor Edward I. Altman (Professor at *the Stern School of Business at New York University)* developed *the Altman model, the Z-score indicator,* which combines traditional indicator analysis with multidimensional discriminatory analysis to enable the best possible differentiation of units at risk of bankruptcy. At a conference in New York, *Asset and Risk Allocation,* held in April 2013, he identified areas of major risk (Altman, 2013). During the *Credit Risk Seminar* at the Cracow University of Economics in March 2019, Professor E. Altman presented in a speech entitled *Credit Cycle Outlook and the Altman Z-Score Models After 50 Years* the possibility of using this model in assessing the condition of individuals and their risk of bankruptcy.

The methods used to analyse an unit's activities on the basis of financial statements, using a discriminatory analysis, may at the same time, on the basis of their cognitive value, constitute basic methods for quantifying risk. Their interpretative support may be provided by the construction of diagrams defining the uncertainty levels of an entity's situation, *grouped into specific classes* (Monkiewicz *et al.,* 2010, p. 24). The concept of risk measurement using risk classes is commonly used in the insurance and banking industry, as well as in all types of ratings (Korol, 2010, p. 77-78).

Drawing on the experience in this area (Sierpińska, Wędzki, 2010, p. 154), under the conducted research, it was decided to measure the risk using this methodology, specifying in detail the conditions of belonging to a specific risk class, including indications of the use of discriminatory analysis in the classification of objects into classes (Hand, 1994). On the basis of the review of the scientific acquis, the legislation and recommendations laid down in national and international regulations, the market analyses carried out and the systematic observation of units operating in a market environment on a multi-annual basis, the items likely to have a significant effect on an undertaking's financial position have been identified. The current trend towards the multiplication of owners' capital has also been confirmed, according to which a particular area of interest should be beneficial financial results, unambiguous with:

- making profits,
- maintaining financial liquidity,
- maximising the market value of the unit (Micherda, 2005, p. 12).

The research carried out has made it possible to specify the following attributes, which may be of significant importance in the context of the theoretical issues referred to above and the provisions of ISA 570 (ISA 570), including:

1. *a decrease in the balance sheet total*, where the basis for assessment is the *Balance sheet*,
2. *a negative net cash flow*, where the basis for assessment *is the Cash Flow Statement,*
3. *no dividend payment*, where the assessment is based on data from the *Cash Flow Statement,*
4. *a negative net financial result stream*, the assessment of which is based on the data contained in the *profit and loss account*.

Due to the assumptions of the method of discriminatory analysis, determining its application to the division of comparable objects into groups of objects as similar as possible, due to the properties describing them, it was decided to use linear discriminatory analysis (Panek, 2009, p. 278). This choice is also supported by the fact that, in the light of the latest research on the effectiveness of the analysed methods, discriminatory analysis took second place, behind the classification tree method (Dębkowska, 2012, p. 182).

The determined scale of the economic risk classes allows for its measurement in five steps, from the lowest risk, marked R0, to the highest risk, marked R4. In addition, each risk class from R0 to R4 has been assigned a corresponding numerical identifier from 0 to 4, characterising each risk class. The classification assumed an increasing trend, according to the assumed designations, from level 0, which is characteristic of an unit with a low level of risk, to level 4, which is characteristic of an unit with the highest level of risk in the assumed scale.

On the basis of these assumptions, the units were analysed in terms of the four characteristics listed and classified, specifying detailed conditions in the following ranges:

1. trend of the balance sheet total - in the case of a decrease in the balance sheet total, the unit is defined as meeting the condition of an unfavourable situation (the condition is met),
2. net cash flow - in a negative net cash flow situation, an unit is determined as meeting the condition of an unfavourable situation (the condition is met),
3. dividend - in the absence of dividend payment, an entity is defined as meeting an unfavourable situation condition (the condition is met),
4. net financial result - in a situation of negative financial result, i.e. net loss, an unit is defined as fulfilling the condition of an unfavourable situation(the condition is met).

Detailed classification assumptions for determining the appropriate risk class are set out in Table 1.

Table 1: Principles for classifying units into risk classes

Risk class symbol	Numeric symbol of risk class	Determination of risk class	Qualification conditions
R0	0	Risk at level 0	Does not meet any condition of an unfavourable situation
R1	1	Risk at level 1	Meets 1 condition of an unfavourable situation
R2	2	Risk at level 2	Meets 2 conditions of an unfavourable situation
R3	3	Risk at level 3	Meets 3 conditions of an unfavourable situation
R4	4	Risk at level 4	Meets 4 conditions of an unfavourable situation

Source: own elaboration

The model uses a classification using the Mahalanobis distance concept and uses a *posteriori probability,* i.e. probability based on knowledge of the values of other variables that a given case belongs to a specific class (Kaczmarek, Czajka, Adamska, 2008). In the study, the highest classification capacity was obtained on the basis of data from 2009, where data analysis was used for all variables and for variables selected by using ANOVA, Levene and Brown Forsythe tests.

The result of the conducted research process is a model of risk classes, on the basis of which it is possible to classify the selected unit to the appropriate risk class. The shape of the classification functions is presented in Table 2.

Table 2: The shape of classification functions for individual risk classes

Indicator abbreviation/risk class	R0	R1	R2	R3	R4
Constant	-94.3895	-82.0821	-78.2784	-60.4243	-226.480
W2	-13.4492	-12.8185	-14.0382	-13.1956	-32.604
W4	0.7200	0.6575	0.7482	0.7074	1.620
W7	-32.4344	-34.1088	-28.0344	-24.4290	-46.021
W8	416.5322	394.7925	378.2531	338.3605	636.514
W12	-1.0660	-1.0503	-0.9966	-0.9659	-2.238
W16	287.9066	239.9838	320.8627	296.6303	649.887
W17	-12.9711	-11.6148	-13.7309	-11.9249	-28.694
W18	4.8679	4.5385	5.3328	4.3248	11.742
W21	-0.2616	-0.0186	-0.7448	-0.8879	-1.864
W24	41.6464	37.6495	43.4848	35.7551	81.443
W25	7.1539	4.6743	6.6784	6.8128	11.681

Source: own elaboration

Each risk class is assigned a function defined by parameters. The determination of qualification to particular risk classes is based on 11 financial indicators selected for the model, presented in accordance with the Bronisław Micherda concept, described in Table 3.

Table 3: List of indicators selected for the model

Indicator abbreviation	Indicator name
W2	Payables turnover ratio
W4	Productivity rate
W7	Debt to equity ratio (financing structures)
W8	Debt ratio
W12	Leverage ratio
W16	Ratio of coverage of borrowed funds by financial surplus
W17	Return of sales (ROS I)
W18	Return of sales (ROS II)
W21	Return on equity (ROE)
W24	Financial liquidity index II
W25	Ratio of monetary self-sufficiency of financial activities

Source: own elaboration

The indicators selected as variables of the classification function characterise all the areas under analysis, in accordance with the adopted concept of indicator analysis, namely:

- W2, W4, W7, W8, W12, W16 enable an assessment of the asset and capital situation of the entity,
- W17, W18, W21 may be used to assess the profitability of an entity,
- W24 i W25 are among the indicators characterising the entity's financial liquidity.

When concluding on the shape of the classification functions, it should be noted that all the areas mentioned in the assessment of an entity's performance are important in measuring its risk.

The results of the conducted discriminatory analysis, indicating the classification and forecasting capabilities of the model created, are presented in Table 4.

Table 4: Classification and forecasting capacities in annual analysis based on 2009 data, after elimination of extreme and outlier cases

	correctness for the teaching sample (u)	correctness for the test sample (t)
for all variables	87.50%	35.71%
for variables selected according to ANOVA test	70.83%	42.86%
for variables selected according to Levene test	83.33%	50.00
for variables selected according to Brown-Forsythe test	41.67%	42.86%

Source: own elaboration

On the basis of the results presented in Table 4, it can be concluded that:

- high diagnostic power in the teaching sample (u) was obtained both in the situation of the analysis carried out for all variables and the analysis carried out on the variables selected according to the Levene test, the lowest in the analysis on the variables selected according to the Brown-Forsythe test;
- the highest diagnostic power in the testing sample (t) was obtained when carrying out the analysis on variables selected by the Levene test, and the lowest when carrying out this analysis on all variables,
- diagnostic power for variables selected according to ANOVA test showed average diagnostic power, both in the teaching (u) and testing (t) sample.

In the light of the information presented, a detailed analysis of the obtained results of the partial classification was performed in two studies: for all variables and in the analysis on variables selected by the Levene test (Table 5). The detailed analysis also included an analysis of the wrong choices, which strengthened the researcher's conviction of the reliability of the proposed model, due to the classification discrepancies, which fall within the vast majority within one class.

Table 5: List of the highest classification ability (2009) in the teaching (u) and testing (t) sample

List of the highest classification ability in the teaching (u) and testing (t) sample						
	for the whole sample	**R0**	**R1**	**R2**	**R3**	**R4**
after elimination of extreme cases and outliers for all independent variables in the **teaching sample (u)**	87.50	80.00	80.00	85.71	100.00	100.00
after elimination of extreme cases and outliers for all independent variables in the **testing sample (t)**	35.71	0.00	33.33	50.00	0.00	100.00
after elimination of extreme cases and outliers for independent variables selected according to the Levene test in the **teaching sample (u)**	83.33	80.00	100.00	71.43	100.00	66.67
after elimination of extreme cases and outliers for independent variables selected according to the Levene test in the **testing sample (t)**	50.00	33.33	66.67	50.00	0.00	100.00

Source: own elaboration

When analysing the results presented in Table 5, it can be concluded that the highest classification power in the group of units classified in class R4 has a discriminatory analysis performed on all independent variables (100% in the teaching sample (u) and 100% in the testing sample (t)). Among units classified in class R3 in both cases, the analysis showed the same results - 100% in the teaching sample (u) and -

0% in the testing sample (t). As regards the classification into the group of units in the risk class R2, significantly better results were obtained on the basis of the analysis carried out for all independent variables (85.71% in the teaching sample (u) and 50.00% in the testing sample (t)). In risk class R1, more favourable results were obtained on the basis of analysis conducted among units selected according to the Levene test - 100.00% in the teaching sample (u) and 66.67% in the testing sample (t). As far as the classification of units to the R0 risk group is concerned, in the teaching sample (u) the same results were obtained in both cases - 80.00%, while in the testing sample (t) better classification results were obtained by conducting the analysis on variables selected according to the Levene test.

Although the classification indicates some discrepancies, the proposed model of risk classes is a solution which supports the process of quantifying economic risk in units. Further research is needed to increase the credibility of the model and to adjust its parameters to the current market conditions, but it should be noted that the repeated attempts to build bankruptcy warning models have been characterised by a much lower level of effectiveness, which was even 50.6%(Sen *et al.,* 2004, p. 219-223). Despite the low credibility of the first models, they have become an inspiration for further attempts at scientific research. Currently, the bankruptcy warning models of E. Altman (Altman, 1968, 589-609) and A. Hołda (Hołda *et al.,* 2004, p. 169) are the models commonly used by auditors.

Model of risk classes (MRC model), as a tool to measure economic risk in COVID time conditions

The model of risk classes was developed on the basis of a survey which covered 54 entities (companies listed on the Warsaw Stock Exchange). The subject of the study were the financial statements together with the annexes for the years 2009-2012. This is a period in which economic entities have been confronted with the effects of the crisis which began in 2008. The verification of the model of risk classes was carried out on a sample of the same units from another period where the study included financial statements together with the annexes for 2013-2014. The scope of the study covered only financial information.

Taking into account the established research assumptions, the units surveyed were classified according to four specific attributes. The systematics carried out on the basis of the assumptions made allowed to group the units covered by the study into 5 risk classes, from R0 to R4. The units were then classified using the model of risk classes. The measurement results are presented in Table 6.

Table 6: Results of risk class classification for 2013 and 2014

Item	UNIT NAME	2013		2014	
		risk class by 4 attributes	risk class by the model of risk classes	risk class by 4 attributes	risk class by the model of risk classes
1	AWBUD	3	3	3	3
2	BUDIMEX	0	0	0	0
3	DECORA	2	2	2	2
4	ELEKTROTIM	0	0	0	0
5	NOWAGALA	3	3	1	2
6	RESBUD	2	2	1	4
7	ROVESE	4	4	4	4
8	TRAKCJA	2	2	2	2
9	UNIBEP	1	1	0	0
10	YAWAL	4	4	1	1

Source: own elaboration

Analysing the classifications received, it can be concluded that the model of risk classes achieved 100% effectiveness in 2013, but in 2014 there were differences in classification. The classification differences concern two units (Nowa Gala, Resbud), where the classification using the model of risk classes included the established companies in the group with a higher risk level. In the case of Nowa Gala, the classification discrepancies relate to a difference within a single risk class, while the Resbud classification indicates a divergent designation of a risk class as follows: according to four predefined attributes, the unit was classified as having a risk level 1, while the measurement of risk using the model of risk classes allowed the unit to be classified as having a risk level 4, which is a group of units with a significantly higher risk level. The reasons for this discrepancy are seen in the decline in the level of key indicators, the share of which in the classification function is high. Despite the discrepancies identified, there is a high level of credibility of the model of risk classes. The diagnostic capabilities of the model are confirmed by the observations made in subsequent years among the entities covered by the survey:

1. AWBUD - suspension of trading in shares on the WSE on 02.05.2019, then return to the WSE, but currently operates as PARTNERBUD S.A. in bankruptcy;
2. NOWAGALA - a decision is to be taken in November 2020 on the withdrawal of shares from the WSE;
3. RESBUD - suspension of trading in shares and return to the WSE in 2019;
4. ROVESE – deleted from trading on the WSE on 30.08.2016;
5. YAWAL – exclusion from the WSE on 27.10.2015.

All companies listed above have been classified according to the model of risk classes as entities with high risk (class 3 or 4).

Given the potential for misinterpretation using the model approach to measuring economic risk, it is planned to continue research on the tool developed. However, its high classification capacity is noted, which allows it to claim the possibility of using in COVID-19 time.

Conclusion and indication of future research

Remembering the words of Professor Elżbieta Burzym, quoted after E. Walińska (Burzym, 2008, p. 34; Walińska, 2014, p. 511), stating that:"(...) accounting is used to measure (or more broadly - to identify, measure, analyse and communicate), and this measurement concerns, based on prices, the value of economic states and processes and the results of these processes", one should aim at indicating methods supporting the appropriate quantification of economic life.

The proposed model of risk classes may make it possible to measure a very complex phenomenon, which is economic risk. It is a tool addressed both to the persons managing units, analysing financial statements, and to auditors, making it possible to assess the unit whose report is subject to the audit process. This is particularly important in the context of the threats faced by units, especially in view of the COVID-19 pandemic, which also implies the need for a thorough analysis of the situation of the units.

At the same time, the study also poses a challenge to continue research in the area of risk measurement in order to adapt the proposed model of risk classes to current market conditions, taking into account data from non-financial reports, including social and environmental issues.

Resumen

Este estudio presenta los múltiples factores a considerar para establecer los principios, objetivos y estrategias que influyen en la cultura organizacional en materia de gestión de la innovación con énfasis en la I4.0., donde se identifican 99 factores en base a revisión de literatura. Este estudio es significativo al presentar la determinación de un número reducido de factores, seleccionando los más significativos, mediante los métodos CODAS (Combinative Distance Assessment) y Organización de Clasificación de Preferencias para el Enriquecimiento de las Evaluaciones (PROMETHEE II) de manera comparativa. El análisis incluye adicionalmente métodos de ponderación de reducción de la ambigüedad, que considera la ponderación basada en los conocimientos adquiridos por los investigadores en la cultura organizacional de innovación y el juicio de expertos bajo la escala Saaty. El análisis comparativo determinó que las alternativas propuestas por el análisis CODAS modificado y PROMETHEE II, tienen un factor de coincidencia 43% entre los principales 30 factores seleccionados de 99, de las alternativas iniciales disponibles, proporcionando mayor confianza en la selección de factores en gestión de la innovación, así como la toma de decisiones en la asignación de recursos disponibles en las organizaciones para estos fines.

Abstract

This study presents the multiple factors to be considered to establish the principles, objectives and strategies that influence the organizational culture in terms of innovation management with emphasis on I4.0. This study is significant because it presents the determination reduced of the number of factors, where 99 factors are identified based on the literature review, selecting the most significant ones, by means of the methods CODAS (Combinative Distance Assessment) methods and Preference Classification Organization for the Enrichment of Evaluations (PROMETHEE II) in a comparative way. The analysis also includes weighting methods for the reduction of ambiguity, which considers the weighting based on the knowledge acquired by the researchers in the organizational culture of innovation, and the judgment of experts under the Saaty scale. The comparative analysis determined that the alternatives proposed by the modified CODAS analysis and PROMETHEE II have a factor agreement of 43% of the main 30 factors selected from 99, of the initial available alternatives, providing greater confidence in the selection of factors in innovation management, as well as the decision making in the allocation of available resources e in the organizations for these purposes

Keywords: Innovation, Organizational culture, CODAS, PROMETHEE II, MCMD, I4.0

Cite this Article as: Verónica SANSABAS-VILLALPANDO, Iván Juan Carlos PÉREZ-OLGUÍN, Luis PÉREZ-DOMÍNGUEZ and Arturo WOOCAY "Innovation Cultural Management Under I4.0 Environment A PROMETHEE II and CODAS Analysis" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

Introduction

The study presents in a comparative way the multi-criteria decision making analysis tools CODAS methods and PROMETHEE II for innovation management with emphasis on the I4.0; the analysis additionally includes ambiguity reduction weighting methods, which considers the weights based on knowledge acquired by researchers in the innovation organizational culture, and the judgment of experts under the Saaty scale. The alternatives presented in the modified CODAS and PROMETHEE II comparative analysis have a factor agreement of 43% from the top 30, selected from 99 available initial alternatives, providing greater confidence in the selection of factors in innovation management, as well as decision making in the allocation of available resources in organizations for these purposes.

Theorectical And Conceptual Framework

The organizational culture is fundamental for innovation (Naranjo-Valencia & Calderón-Hernández, 2015; Hoogan & Cote, 2014; Krásnicka, Głód, Wronka, 2018), for increasing the companies competitiveness (Piccarozzi, Aquilani, & Gatti, 2018), for this reason, and considering the six dimensions established by the OECD (2015): (i.e. research and development, product, commercialization, quality and finances as the main ones),; 99 alterntives are identified in literature review and categorized in technology, finances, process, knowledge, organization and management of intellectual property (Sansabas-Villalpando, Pérez-Olguín, Pérez-Domínguez, Rodríguez-Picón & Méndez-González, 2019), considering Industry 4. 0 (Zhong, Xu, Klotz, & Newman, 2017; Adamik & Nowicki, 2019; Müller, 2019; Birkel, Veile, Müller, Hartmann & Voigt 2019; Braccini & Margherita, 2019), the use of new technological tools derived from artificial intelligence, the Internet of things, large data, automation, robotization, digitalization, etc., as relevant information for comparative analysis

Multi-criteria decision analysis methods (MCDA) have been successfully applied in different fields and disciplines (Roodposhti, Rahimi, & Beglou,2014; Sałabun, Wątróbski, & Shekhovtsov, 2020; Dachowski, & Gałek, 2020. The PROMETHEE II method (Preference Ranking Organization Method for enrichment evaluation), based on the preference function that can be effectively used on finite set of classification and selection alternatives based on some mutually independent and contradictory criteria, using pairwise comparison of alternatives where deviations shown by the alternatives according to each criterion are considered (Brans, & Mareschal, 2005).

The steps used in the development of the PROMETHEE II method.

Step 1. Standardize the initial decision matrix

For benefit criterial:

$$R_{ij} = \frac{[x_{ij} - Min(x_{ij})]}{[Max(x_{ij}) - Min(x_{ij})]} \tag{1}$$

- For non benefit criterial:

$$R_{ij} = \frac{[Max(x_{ij}) - x_{ij}]}{[Max(x_{ij}) - Min(x_{ij})]} \tag{2}$$

Step 2. Calculate the evaluative differences of the alternative *ith* alternative with respect to other alternatives.

Step 3. Calcule the values of the preference function:

$$P_j(a,b) = \begin{cases} 0 & si\ R_{aj} \leq R_{bj} \\ (R_{aj} - R_{bj}) & si R_{aj} > R_{bj} \end{cases} \tag{3}$$

Step 4. Calculate the added preference function:

$$\pi(a,b) = \left[\sum_{j=1}^{n} w_j P_j(a,b)\right] / \sum_{j=1}^{n} w_j \quad (4)$$

Step 5. Determine the input and output flow of the hierarchies:

Input flow:

$$\varphi^{+} = \frac{1}{m-1} \sum_{b=1}^{m} \pi(a,b) \quad (\mathrm{a} \neq b) \quad (5)$$

Output flow:

$$\varphi^{-} = \frac{1}{m-1} \sum_{b=1}^{m} \pi(b,a) \ (\mathrm{a} \neq b) \quad (6)$$

Step 6. Calculate the net outranking for each alternative:

$$\varphi(a) = \varphi^{+}(\mathrm{a}) - \varphi^{-}(\mathrm{b}) \quad (7)$$

Step 7. With the obtained values of $\varphi(a)$ the alternatives are hierarchized.

Methodology

This study is based on the multi-criteria analysis of the 99 factors that influence the promotion of an organizational culture towards innovation with emphasis on Industry 4.0, the CODAS methodology is applied, see the process in Figure 1. Subsequently, the initial CODAS analysis was evaluated, selecting the factors and considering the highest value, that differs from the initial analysis, which was consider the lowest value for classification purposes, thus defining the modified CODAS; continuing with PROMETHEE II, in both methods include the assignment of linguistic terms (HFLTS), are included for the assignment of values within a qualitative context, (Rodriguez, 2012). The weighting used is obtained by AHP (Wind & Saaty, 1980), the knowledge acquired and the reduction of ambiguity. Cronbach's alpha analysis is carried out to determine the consistency of the values included. A modified comparison of CODES and FTOPSIS is performed to determine the level of agreement in the higher-ranking factors.

Fig. 1: CODAS methodology (Sansabas-Villalpando, Pérez-Olguín, Pérez-Domínguez, Rodríguez-Picón & Méndez-González, 2019).

Results

In the comparative analysis as a tool for decision making with the multicriteria methods of CODAS modified and PROMETHEE II, an agreement is found, in the selection of the factors of 43%, providing a reinforcement in the selection of organizational culture factors of innovation management, this applied allows to assignment of resources focus on relevant management. Table 1 presents the results obtained from the modified CODAS and Table 2 the results obtained from PROMETHEE II.

Conclusions

In the analysis carried out of the modified CODAS methodology and PROMETHEE II we found a 43% coincidence in the selection of the most significant factors; this allows us to conclude that the tool for decision making of factors the innovation in Industry 4.0 environment can be determined under any of the two methods as a tool that complements the selection of the allocation of resources by the decision-makers.

Abstract

Labor migration is the main type of world migration in the XXI century. The paper summarizes the key routes through which internal and international migration impact rural development and some of the evidence pertaining to these effects in low-income countries. It concludes that, although the study of migration impacts on rural economies has come a long way from the early dual theories of development, some of the potentially more important aspects remain to be investigated systematically. International labor migration is a complex and ambiguous phenomenon and is a process of territorial interstate movement. Labor migration is a common feature of economic development. The main causes of labor migration in the world are analyzed and Ukraine is singled out. The mobility of people for temporary or permanent employment is a common characteristic of agricultural activity. In some regions, especially in rural areas, there are incredibly significant migration flows, which have a significant impact on people, households, and regions of origin. Despite the growing debate about the motivations and consequences of recent migration flows, the costs and benefits of this global phenomenon remain unclear and remain far beyond public policy. The purpose of this paper is to review key issues related to labor migration in rural areas; analysis of the impact of migration processes on economic development; identification of the main directions of migration management for improvement in interconnection of state governance and business representatives.

Keywords: migration, international labour migration, labour market, rural development, business, sustainable development

Introduction

International labor migration is a complex and ambiguous phenomenon and is a process of territorial interstate movement. Ukraine is now among the top ten donor countries for international migrants in the world. Labor migration is a common feature of economic development. The main causes of labor migration in the world are analyzed and Ukraine is singled out. Mobility of people for temporary or permanent employment is a common part of agricultural activity. In some regions, especially in rural areas, there are incredibly significant migration flows, which have a significant impact on people, households and regions of origin. Labor migration plays a key role in the redistribution of labor between countries, regions, and continents, thus changing the situation in the global, regional and national labor markets.

The reasons for labor migration are often attributed to the problems of Ukrainians. According to a survey which was held by the sociological group "Rating" commissioned by the Center for Analysis and Sociological Research MRI from 30 to 31 July 2020, unemployment is one of the most important problems for Ukrainians (31% of respondents). The list also includes such problems as low production (19%) and delayed wages (5%).

Formulation of the goals of the article

Despite the growing debate about the motivations and consequences of recent migration flows, the costs and benefits of this global phenomenon remain unclear and remain far beyond public policy.

The purpose of this article is to review key issues related to labor migration in rural areas; analysis of the impact of migration processes on economic development; identification of the main directions of migration management for improvement.

Results of the research

Labor migration from Ukraine is growing every year. According to various estimates, 1-5 million Ukrainians are working in other countries. The Ministry of Social Policy of Ukraine notes that the current number of permanent labor migrants from Ukraine is 3.2 million, but due to the seasonal nature of this phenomenon, 5-7 million people are involved in the process.

Fig. 1, 2. Main countries of residence of Ukrainian labour migrants in 2019, %

According to the State Statistics Service [7], the total migration movement of the population in Ukraine in 2019 in rural areas amounted to 166 thousand people. For analysis of this situation was calculated ratio the amount of people employed in agriculture and the amount of people employed in rural areas. Thus, according to the State Statistics Committee in 2019, 3010.4 thousand people worked in agriculture. This number has increased compared to 2018 (2937.6 thousand people), but remains lower than in 2012 (3308, 5 thousand people). According to the results of the labor force survey, 5,205.7 thousand people are employed in rural areas out of a total of 16,668 thousand people.

Analyzing case of Ukraine, labor migration can be of two types: internal and external. The issue of international migration of the population of Ukraine, as well as internal, becomes especially relevant due to modern socio-economic threats. Internal migration, i.e. movement within the borders of individual states, is no less important for economic and social development than interstate. It does not affect the number and composition of the population, but causes changes in its location, gender and age structure of the inhabitants of individual regions, is a consequence and an important factor of regional differences, directly related to industrialization and urbanization, rural depopulation.

The reasons for the international labor migration of Ukrainians include military conflict, political instability, and unemployment. Also, the introduction of a visa-free regime with the European Union exacerbates the situation. There is the tendency of young people to study in European countries, which then remains to work in the EU after training. So, it has significantly affected the outflow of Ukrainians abroad. The reasons for migration can be completely different, but there are 2 common factors: the first is high wages, and the second is security.

Fig.5: Classification of the main reasons of labour migration

Source: developed by authors

Political reasons for migration are political instability in the country, corruption in public bodies, military action in Donbass, etc. It is noted that according to the State Statistics Service, with the beginning of the war in the East in 2014, about 1.3 million Ukrainians migrated to other countries. As a result, there has been a significant problem of labor migration for the country as a whole and a shortage of professionals in the corporate and industrial sectors, which is acutely felt by business.

An unexpected reason for labor migration in 2020 was the situation with the coronavirus. According to the National Bank of Ukraine (NBU), 10% of labor migrants returned to Ukraine and another 10% of seasonal migrant workers stayed at home without being able to leave due to restrictions on movement. Also, the Polish Association of Employers of the Construction Industry reported that at the end of March 2020, 20% of Ukrainians workers involved in construction, left Poland because of quarantine regime.
The social reasons are the health care and education system, social life and leisure. It is noted that in 2019 the integrated Barometer was 2.61 points out of 5 possible on the Likert scale. Thus, the assessments of the health care system are divided: 58% of respondents are dissatisfied with the state of the system, while 42% assess domestic medicine satisfactorily or positively. Almost 52% were satisfied with the education system, with 48% saying that they were completely or partially dissatisfied with it.

Also, 72% of respondents are dissatisfied with the security situation in the country and feel insecure about their own future, 62% have a negative assessment of the legal framework and regulation in the country, in particular the lack of discrimination and the level of democratic freedoms.

The main economic reason of labor migration is unemployment. According to an analytical note on the situation on the labor market from the State Employment Service, the number of unemployed (according to ILO methodologies) in 2019 decreased by 91 thousand people compared to 2018. Thus, in 2019, the total unemployed population in Ukraine was 1.5 million people. Analysts of the State Employment Service note that in 2019 there was a reduction in unemployment in both urban and rural settlements. The unemployment rate in rural areas decreased by 23 thousand people (to 493 thousand people), in percentage terms - from 9.2% to 8.7% of the labor force.

The State Employment Service also notes that the unemployment rate in Ukraine is the highest among European countries. Thus, in the EU this figure decreased from 7.3% to 6.7%, and among young people (under 25) - 15.2% to 14.4%.

Fig. 6: Unemployment rate in 2017-2019 years

Source: developed by authors with using www.stat.gov.ua

Another important demotivator for Ukrainians is the average salary. In December 2019, it was 12.3 thousand UAH (366.3€). At the same time, the lowest salaries are received by workers in the field of agriculture, forestry and fisheries - only 7-9 thousand UAH (208€-268€). This fact is also quite significant, given that it is among the inhabitants of rural areas is popular work in agriculture.

The Ukrainian young specialist is primarily interested in a job with a high and stable income, which unfortunately cannot be guaranteed in rural areas. In addition to the lack of full-fledged infrastructure in the villages (lack of logistics, transport, internet, etc.), young people are frightened by the lack of prospects and lack of benefits to stay. Therefore, quite often young people go to a place where life is not complicated by inconveniences. According to the State Employment Service, 337.4 thousand young people received the status of unemployed in 2019. This is almost a third of the total number of unemployed.

Also, younger and rural people predominate among migrant workers: 41% of migrant workers are under the age of 35, compared with 34% of the total population. This is even more pronounced in Poland, where 47% of Ukrainian migrant workers are under 35 years of age. In addition, Ukrainian migrants are almost equally from urban and rural areas. As less than a third of Ukrainians live in rural areas, migration is twice as common there as in urban areas.

Fig. 7: Tools for labor migration management

Source: developed by authors

Among the measures that the state can take are:

- ✓ increase the size of the minimum wage,
- ✓ untie the amount of salary from all deductions,
- ✓ increase security (effective police and army),
- ✓ improve the legal environment and justice in Ukraine,
- ✓ continue health care reform,
- ✓ improve the environmental situation in the country,
- ✓ focusing on local communities – creating and supporting community-driven programs,
- ✓ attracting yang people for entrepreneur activity – supporting start-up programs.

There are many examples of state support decisions in management of migration processes. Start-up programs often require little more than a convincing idea and no income or record of accomplishment to allow individuals to work in the country. Their founders would usually not qualify for an employment-based visa. About half of OECD countries have introduced visas for start-up founders in the last years. In Australia and Canada, start-up entrepreneurs with innovative ideas who secured funding qualify for permanent residency immediately – irrespective of what happens to their company. Poland started offering in 2018 a “Poland Prize” pilot to attract foreign start-up and innovative firms. France now vies to offer the most attractive package with a lump sum for selected nominees and facilitations for family members and staff. These ideas could be used for stimulating citizens stay in the native country involving in own business and creating of the national GDP.

Additional source of influence for decreasing of labour migration is business. Business can also influence the interest of citizens to stay in Ukraine. First of all, through creation of job places. Also, agricultural holdings have such a lever as a salary. Raising wages and only a "white" salary will encourage people to work in Ukrainian companies. In addition, agricultural companies must ensure safe working conditions and promote the professional development and training of employees. The social contribution of companies in the regions of their activity is particularly important. Oleg Bakhmatyuk, CEO of Agroholding Ukrlandfarming, notes that the consequences of the growing scale of labor migration are particularly noticeable in the agricultural sector. There is tangible shortage of representatives of technical professions in Agribusiness such as drivers, combine harvesters, machine operators, agronomists - who have some specialized education and easily adapt to the environment of neighboring countries, such as Poland.

Agricultural companies are trying to solve the problems of social infrastructure development and others that motivate Ukrainians not to leave their native villages. Their facilities are mostly located in rural areas and they are actively involved for the process of creating jobs for residents. One such example is the annual competition from the Agro-industrial Holding MHP "Village. Steps to Development". The main goal of such and similar competitions from agricultural companies is the development of entrepreneurship in villages and united territorial communities (UTC), support of socio-economic, cultural and tourist potential of rural areas. Competition "Village. Steps to Development" started in 2016 when was implemented in 3 districts of Cherkasy region. In 2019 it was also implemented in 8 regions of Ukraine.

Other agricultural holdings also engaged in social responsibility activities and programs. It should be noted that the general infrastructure in rural areas often does not meet modern standards, to which young professionals are particularly attracted. Therefore, the agrarian company joins in creating a new, more attractive "face" of the villages. Agricultural companies help communities to develop social infrastructure: schools, kindergartens, recreation areas, sports grounds, parks etc. Also, they participate in such large-scale projects as road repairs, gasification, or construction of water mains.
Also, agricultural holdings themselves can create a demand for Ukrainians. So, for example, according to the sites for finding job positions, such as Work.ua, Robota.ua and AgroRobota.com.ua, every month there is opening about 700-800 vacancies in the field of agriculture. The average number of vacancies per month in agriculture on search sites is presented on the figure 8.

Fig. 8: The average number of vacancies per month in agriculture on search sites in Ukraine
Source: developed by authors

Most often offer agricultural work in the areas of sales (plant protection means, seeds, fertilizers) - about 200 vacancies, i.e. 4 part of all vacancies that are presented each month in the agricultural sector (as of 2020). Twice less, but also popular positions in the field of crop production: work for agronomists, assistants and chief agronomists, consultants and technologists, etc. - about 100 vacancies are presented (or it is 8th part of all offers).

Also, popular areas for work in agriculture are animal husbandry (vacancies for veterinarians, experts, livestock breeders), agricultural machinery (tractor drivers, engineers, managers) and trading (work for foreign trade and procurement managers).

In addition to the large number of vacancies in agriculture, the popularity of work in agriculture determines by the amount of the potential salary.

Table 1: Salary in agricultural sector in Ukraine as of July 2020

Profession	Salary as of July 2020, UAH (€)*
Stockbreeder	11 133 (332 €)
Tractor driver	13 200 (393 €)
Trader	15 840 (472 €)
Mechanical engineer	18 800 (560 €)
Agronomist	23 220 (691 €)

**) – currency exchange rate – 33.58 UAH/ 1 €*
Source: compiled by authors with using www.agrorobota.com.ua

Despite the fact, that the problem of labor migration in Ukraine is obvious, in agricultural companies the problem of outflow of personnel from enterprises in the regions is not called acute. For example, at MHP Agroholding's enterprises in Vinnytsia region, where about 10,000 employees work, the staff turnover at the end of 2019 was about 40%. Most of those fired are employees of production units. About 15% of those fired go for temporary and seasonal work in Poland, the Czech Republic, Germany, Denmark and other countries. The peak outflow abroad is the period April-June. Most often, after working abroad for 3 months, people return home and to the company.

Should be also noted that companies themselves do not refuse to re-hire migrants. Obviously, capacity of the labor market in the regions is not so great that companies can afford not to hire highly qualified workers. Most often they are electricians, mechanics, electric gas welders, engineers.

Fig. 8: Number of international migrants and refugees in Ukraine, 1990-2019

Source: UN DESA (2019a), UNHCR (2018) and UNWRA (2019)

Instead of the situation with migration, companies try to solve such problems in advance. The main method of solving problems in enterprises is increasing the material motivation of employees. Companies annually adjust the level of salaries in accordance with the labor market based on research that has shown in the Table 2.

Table 2: Salary in the biggest Ukrainian agricultural companies, 2019 year

#	TOP 20 agricultural holdings by land bank	Average wage in company, UAH (€)
1	Kernel	13 625 (410 €)

The study of the main causes of labor migration allowed us to outline the directions of their solution or elimination (Fig.9).

Fig. 9: Management of labour migration for sustainable development of rural areas

Source: developed by authors

Conclusions

The effects of migration in Ukraine have so far been positive, but if the significant net outflow of migrants is maintained, Ukraine will eventually suffer losses. Ukraine needs to develop an effective migration policy to be able to make the consequences more manageable. In a situation of shrinking labor and real wage growth faster than productivity, rising labor costs and labor shortages will eventually be a deterrent to investment. In addition, it will become difficult to finance national expenditures, such as pensions and infrastructure support, if more Ukrainians work and pay taxes abroad rather than at home. For a country with an aging population (increase in middle age due to increased life expectancy and low birth rate), prolonged net emigration of people of working age will create problems in the long run. To make conclusion there are three direction of migration management: economic, social and environmental. Synergy of measures of all direction will influence to the sustainable development of rural areas. Agricultural companies carry out a set of activities to motivate employees. But some of them does not take a wait and see attitude and is constantly working to improve the personnel motivation system. The company also brings the level of wages in line with the labor market based on annual research.

In addition to salaries, employees of the company have a lot of opportunities for additional earnings, a system of material and non-material incentives is working there are programs according to which employees who are recognized as the best at the end of the half-year receive a 20% bonus to wages during the next half of the year. There is a payment for seniority, vouchers are provided to the sanatorium.

Abstract

The paper is devoted to discussing stylized approaches to tax incentives through the research of investment behavior in Russian regions. A review of research on the investment determinants made it possible to divide the influence on the investment process of companies, financial market and state policy. The empirical research was based on the socio-economic characteristics of Russia in the regional context. Based on the analysis of investment activity in the Northern regions of Russia, it was proved that companies operating in these regions especially need constant and timely updating of equipment as well as the volume of investment is insufficient and the lack of proper attention to this issue leads to the sharp deterioration of heavy working conditions in the region. It was substantiated that national specific of economy and investment behavior in Russia result in the need for a differentiated approach to investment tax incentives. The study was carried out with the financial support of the Russian Foundation for Basic Research within the framework of scientific project No. 19-010-00198.

Keywords: investments, investment activity, investment activity of Russian enterprises, tax incentives of investment activity, financial system.

Introduction

Investment processes are stagnating in Russia. The average investment rate in the country is stable at about 20%, with an average saving rate of 28% (Lvova and Semenovich, 2019). In 2015-2016 there was a decrease in capital expenditures, in 2017-2018 there was a sluggish growth, which stopped in 2019. In the third quarter of 2019, it was only 0.8% (Rosstat, 2019, p. 11; Central Bank of Russia, 2019). In 2020, the situation has worsened critically: it is predicted that the physical volume of investments will decrease by 7.4% (Institute for Economic Forecasting, 2020, p. 9) by the end of the year. Moreover, the degree of depreciation of fixed assets in recent years is approaching 50% with a renewal rate of 4% (Rosstat, 2019, p. 11; alternative (more pessimistic) assessments are presented in: Fomin and Khanin, 2017), which makes the problem of the investment recession critical for the Russian economy.

Against the background of the increasing role of the state (the state share in Russian banking assets increased in 2019 to 73%: Afanasyev and Shash, 2020, p. 115) in distribution processes, the tax incentives for investment discussion attracts a natural interest in this context. The instruments used in this area are obviously ineffective or insufficiently effective since they are the result of stylized approaches to the justification of tax policy, which are

Cite this Article as: Viktor V. IVANOV, Neli R. ABRAMISHVILI, Nadezhda A. LVOVA, Natalia V. POKROVSKAIA and Alexander Yu. ANDRIANOV " Regional Determinant in Critics of Stylized Approaches to Tax Incentives of Investment Activity in Russia" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

focused on a rather abstract investor. As a result, a significant part of investment tax incentives does not contribute to business development, but current consumption (Ivanov, 2019). The importance of tax regulation of economic processes arises against the background of the need to mitigate the consequences of the coronavirus crisis (Pogorletskiy and Sollner, 2020).

In contrast to stylized approaches, the specificity of the author's position lies in the fact that we do not seek to find a universal solution to the problem, believing that tax incentives for investment activity in Russian business require differentiated instruments. Continuing a series of studies on this issue (Ivanov et al., 2019b; Ivanov et al., 2020; Ivanov et al.,2021), we propose to approach its solution not only from empirical but also fundamental positions, analyzing the theoretical and practical prerequisites for an effective solution. As for the empirical support, at this stage of the study, we will focus on the regional features of the investment activity of Russian business, which will be revealed using the example of the regions of the North.

The purpose of the study is to substantiate the importance of a differentiated approach to tax incentives for investment activities with an emphasis on the regional aspect. The first part of the article will reveal the theoretical background of the introduction of this approach. The second part will focus on the typical limitations of empirical research in this area, which is based on a stylized approach, appealing to the conditional investor. In the third part, we will focus on methodology importance justification of researching investment activity in the northern regions of the Russian Federation. In the fourth part, we present the results of the study.

Theoretical prerequisite for a differentiated approach to tax incentives for investment

All leading scientific schools in economics have contributed to the development of ideas about the drivers of business investment activity. In the neoclassical theory, a decrease in the interest rate, an increase in productivity, and an expansion in demand were analyzed as the main drivers of business investment activity. According to the institutional approach, investment activity is a consequence of the formation and development of economic institutions. Keynes attributed the "marginal efficiency of capital" and "rate of interest" to the determinants of business investment activity, linking them with the expectations and preference for liquidity on the part of investors under conditions of uncertainty. In the studies of H. Minsky (post-Keynes direction), these drivers were investigated in more depth with an emphasis on the terms of investment financing, which highlighting the decisive role of relations between "lenders" and "borrowers" (companies in the financial and non-financial sectors, respectively).

Which theory does best reflect domestic practice? How does it lead us to the conclusion about the importance of a differentiated approach to tax incentives for investment?

On the first question, we share the position of I.V. Rozmainsky (2006), believing that the reasons for the stagnation of investment activity in Russian business are most clearly traced in the context of the post-Keynesian interpretation. First, it is essential to consider the interaction of the real and financial sectors of the economy, examining the problems of transforming savings into investments (the problem of a low propensity to invest with a relatively high propensity to save in the context of the specifics of investment processes in Russia has been repeatedly addressed by A.S. Bulatov (2017)). Secondly, it is no less important to take into account the importance of uncertainty in the perception of participants in the investment process, which makes the problem of "investment myopia" of Russian business (Rozmainsky, 2006) more urgent, in conjunction with limited financial availability.

According to entrepreneurs, investments are constrained by increased uncertainty, the required profitability does not compensate investment risks, and there is not enough money to implement projects. This position is reflected in the regular surveys of the Russian Statistic Service (Rosstat). According to its results, the majority of respondents consider "the uncertainty of the economic situation in the country" among the essential restrictions on investment activities (based on the results of recent years, these are, first of all, a high inflation rate, lack of own financial resources, investment risks, high percentage of commercial loans) (Rosstat, 2019, p. 106).

According to the National Research University Higher School of Economics, investments, as a rule, are made by Russian organizations forcibly due to the physical deterioration of fixed assets, and not to improve efficiency and expand the business (HSE, 2018, p. 6-9; HSE, 2019, p. 5-8). In these conditions, overcoming the stagnation of investment processes should objectively contribute to the development of channels for transforming savings into investments, subjectively - an increase in entrepreneurial confidence (Lvova and Semenovich, 2019, p. 30), which is linked with the revision of the national model of economic behaviour (Mirkin, 2019). Both tasks are incredibly complicated by the unfavourable external environment associated with international sanctions against Russia (Fedorova et al., 2016), which actualize the search for internal reserves of investment growth. This problem is actively discussed in the literature, including in the context of alternative trajectories for the national financial

system development (Mirkin, 2018) considering financial paradoxes (Lvova et al., 2016b) in emerging markets (Lvova et al., 2018).

International trends in tax incentives for companies' investment activity

The key areas of business investment activity stimulation through corporate taxation are direct tax incentives for investments in fixed assets (mainly by depreciation policy) or reducing the overall tax burden to keep free cash at the disposal of the business, used at the discretion of companies, including for investment.

In the second half of the twentieth century in developed countries there were a decrease in corporate profit tax rates and a decrease in the importance of corporate taxes in total tax revenues. At the same time, according to a study by M. Devereaux, R. Griffith and A. Klemm (2002), conducted in 16 developed countries from 1982 to 2002, the value of tax revenues as a percentage of GDP did not change significantly, which is explained by the expansion of the tax base, including reduction of investment tax deductions. In ten countries — the United Kingdom, Ireland, Australia, Canada, Finland, France, Germany, Italy, Spain and the United States — direct tax incentives to stimulate investment declined.

Detailed assessment of corporate taxation in 1983-2001 for the same 16 countries showed that a reduction in the corporate tax rate by 5 percentage points led to relatively higher capital expenditures, compared with tax deductions equivalent to an increase by 5 percentage point of investment present value. At the same time, an opportunity to increase the write-off rate had more significant results in countries with a higher corporate tax rate (Vartia, 2008).

A decrease in corporate tax rates and an expansion of the base of these taxes due to a lower present value of capital investments is noted for twenty-six OECD countries from 1982 to 2007 (Loretz, 2008). Characteristics of approaches to corporate taxation in 142 countries from 1996 to 2016 by E. Steinmuller et al. (2019) confirmed the widespread trend towards lower corporate tax rates. However, since 2003, the authors have not observed a clear tendency to expand the tax base. During this period, the present value of future profit tax reductions on investment expenditures fell in 70 countries, remained unchanged in 31 countries, and increased in 41 countries.

The positive effect of accelerated depreciation on capital expenditures was shown in a sample of various state corporate tax regimes in the United States in 2000-2010 (Ohrn, 2019) and as a result of enabling an accelerated write-off in the first year of use since 2007 in the UK (Maffini et al., 2019).

The model of taxation for Estonian businesses is of particular interest: since 2000, only withdrawn profits have been taxed in the country. At the same time, the object of property taxes in Estonia is land, not fixed assets. The exemption from taxation of non-withdrawable profits creates essential prerequisites for investing in further business development and makes the Estonian tax system the most attractive among the OECD countries (Lundeen and Pomerleau, 2004). However, the implications for European business are ambiguous (see, for example, the analysis of the background and implications of the mergers and acquisitions in Europe (Saksonova and Kantane, 2016)). At the end of the twentieth century, the demand for non-standard tax policy measures increased (see Lvova et al., 2016a), with the Baltic countries becoming laboratories for successful testing many such measures.

As a result of the tax reform, from 2000 to 2003, capital investments of Estonian companies increased by 17% (with the largest increase in investments typical for small companies). At the same time, over the same period, liquid assets increased by 12%, and retained earnings and reserves by 8% (Masso et al., 2013). A. Hazak (2009) also points out the potential inefficiency of asset allocation as a result of Estonian taxation, noting, based on the results of a study of the financial statements of Estonian companies from 1996 to 2004, a more significant increase in cash compared to long-term investments. Since 2017, taxation of withdrawn profits has also been implemented in Georgia, since 2018 - in Latvia (first impact of tax and monetary policy on economic growth in the country is considered in (Saksonova and Koleda, 2018)).

The ambiguous consequences of national business taxation regimes, among other things, can be explained by the peculiarities of measuring the relationship between tax incentives and business investment activity according to empirical data. The factors that determine the complexity of such a measurement are: the importance of correctly determining the analyzed period, taking into account the variability of tax policy; the difficulty of identifying the role of tax incentives in comparison with other factors, including macroeconomic ones; informational limitations of the financial statements; the possibility of data distortion due to the growth of investment activity during periods of tax incentives due to its artificial decrease on the eve of the introduction of benefits and a potential reduction after the cancellation of benefits; differentiated libation of tax incentives depending on the characteristics of the company.

Limitations of stylized approaches to tax incentives for investment in the Russian Federation

The limitations of scientific research on tax incentives for investment in the Russian Federation are related mainly to the peculiarities of empirical data used to substantiate recommendations. In other words, the critical flaw that unites many Russian works on this issue is the abstract presentation of the research subject. As a rule, we are talking about 'approximate' investor companies without specifying the industry, region and financial profile, including the problem of the availability of external financing for investment activities.

Evidently, investment theories are also based on macroeconomic data. For example, the problem of transforming savings into investments is analyzed in the context of institutional sectors of the economy. However, the conclusions about the drivers of business investment activity, based on these theories, require clarification. For example, it is curious that the approximate investor is usually viewed as a mature company by default. However, we have found that the stage of a company's life cycle is an essential factor in its investment activity (Ivanov et al., 2018; Ivanov et al., 2019a).

At the stage of intensive growth, companies aim to actively form fixed assets, attracting external financing, despite high interest rates for young and not enough creditworthy businesses. Having reached maturity, companies show restrained investment activity, mainly focusing on the adopted corporate strategy, which becomes indifferent to the influence of factors that could be influenced by traditional investment tax incentives. Ageing companies are losing their selectivity in finding significant investment targets.

The results obtained are a powerful argument in favour of a differentiated approach to tax incentives for investment activity in Russian business. However, these results are difficult to adapt for tax policy correctly. Assessment of corporate age in models of investment activity is somewhat arbitrary. These are the most uncomplicated scoring characteristics based on the indicators of the financial statements of companies (scoring models for assessing corporate age are widely used in financial research (for Russian enterprises, see, Cherkasova and Smirnova, 2012); in the author's research, an original modification of the corresponding model is introduced, which, however, does not eliminate the identified problem). As a result, in the conditions of the economic downturn, there is a widespread "ageing" of organizations. It does not fully correspond to the concept of the life cycle and comes into conflict with the tasks of stimulating investment.

At the same time, it is curious that the models of investment activity of Russian companies have an industry specification. According to the authors, it is the industry specifics that should attract priority attention when suggesting a differentiated approach to tax incentives for investment. In addition, the spatial aspect cannot be ignored. Let's reveal the regional features of the investment activity of Russian business in more detail using the example of the regions of the North.

Regional features of the investment activity of Russian business on the example of the North regions: formulation of the question

Russian regions differ significantly in terms of economic (Fedotov and Pokrovskaia, 2017), social and even climatic conditions. Equal development of regions is one of the priorities and common challenges for the Russian Federation. Moreover, a feature of Russia is its location close to the North Pole. Almost two-thirds of the country's territory is located in the permafrost zone. The climate is characterized by one of the lowest temperatures among all countries in the world. These facts determined the choice of regions for this stage of the study. Almost the entire territory of the country belongs to the territory of frosty winters. 65% of the country's territory belongs directly to the territories of the Far North (Abramov, 2008). Geography imposes significant restrictions on livelihoods on this territory. Part of the population lives on the territory permanently; part of them work on a rotational basis. The delivery of essential goods, raw materials, materials, equipment requires significant material costs. So, additional to the general national problems of investment activity, there are also features associated with regional development.

In contrast to international discourse (in the literature of other countries, issues of the economy of the North and the Arctic regions attract less noticeable attention; this is partly due to the fact that of the countries with geographic characteristics similar to Russia, only Canada can be noted – however, the northern territories of Canada are not so densely populated, and the issues of arranging these territories are not so acute), the issues of economic development of the northern regions are actively discussed in Russian literature. In particular, Uskov (2016) writes in his article about the exhaustion of the potential of the raw material industries as a source of economic growth in the country and the regions of the North. Many authors (see, for example: Matveev, 2015; Bykovsky, 2002) point to the advisability of increasing the efficiency of raw material enterprises and the development of state industrial

policy in this regard. At the same time, it is undeniable that a whole range of measures should be aimed at increasing the investment attractiveness of the region and increasing the investment activity of local businesses.

The following regions of the North were analyzed to assess investment activity: Arkhangelsk region; Murmansk region; Republic of Karelia; Komi Republic; Primorsky Krai; Khabarovsk region; Amur region; Kamchatka Krai; Magadan Region; Sakhalin Region; Zabaykalsky Krai; Chukotka Autonomous District; The Republic of Buryatia; Saha Republic; Krasnoyarsk region; Tyumen region.

These regions, although they belong to the regions of the North, are nevertheless not homogeneous in terms of population, area, level of industrial production, etc. For example, the population of the Tyumen region (including the Yamalo-Nenets Autonomous District and the Khanty-Mansi Autonomous District) is 3.76 million people as of January 01, 2020, while only 50,288 people live in the Chukotka Autonomous District as of the same date. Consequently, the previously identified problems are aggravated by the heterogeneous development of the regions of the North.

Under the purpose of the study, we analyzed the largest companies in terms of revenue in the indicated regions. The sample obtained by sorting the data by revenue in descending order included 10,000 companies from different industries. It should be noted, however, that the sample was not limited to large companies, including several medium, small and micro-organizations. Thus, we can conclude that in these regions, the total number of large companies does not exceed 10 thousand.

The analysis of the investment activity of companies was carried out in the regions of the Russian Federation. As an indicator of characterizing investment activity, the volume of funds spent for the acquisition of tangible assets was considered. Statistics for this indicator are kept in the Spark-Interfax database. Besides, the ratio of newly acquired assets to existing ones was analyzed.

Results of assessing the investment activity of Russian business in the regions of the North

According to the results, 5 out of 16 analyzed regions of the North have a negative volume of investments. It is mean that the material and production base of business is being destroyed (tab.1).

Table 1: Acquisition of fixed assets by companies in the regions of the North based on the results of 2019 in a regional context

Registration region	Number of companies	2019, Purchase of fixed assets, million RUB*	Contribution of each region to overall growth of fixed assets, %*
Amur region	433	11,413	2.72
Arhangelsk region	472	38,438	9.16
Zabaykalsky Krai	272	-9,042	-2.15
Kamchatka Krai	317	23,541	5.61
Krasnoyarsk region	1,631	-41,991	-10.01
Magadan Region	193	-2,841	-0.68
Murmansk region	360	-42,992	-10.25
Primorsky Krai	1,219	85,685	20.42
The Republic of Buryatia	223	-5,775	-1.38
Republic of Karelia	291	1,541	0.37
Komi Republic	344	83,466	19.89
Saha Republic	467	9,975	2.38
Sakhalin Region	488	29,246	6.97
Tyumen region	2,354	231,054	55.06
Khabarovsk region	881	5,234	1.25
Chukotka Autonomous District	55	2,672	0.64
Total	10,000	419,622	100.00
Note*: a negative number means that there was a decrease in the value of the corresponding assets			

Source: Authors' calculations based on the SPARK-Interfax.

55% of the total amount of investments falls in the Tyumen region, the largest of the northern regions. It should be noted that this region is considered together with the autonomous regions. Relatively large volumes of investments characterize Primorsky Krai and the Komi Republic. In other regions, the share of investments is 10% less in their

aggregate value in the regions of the North. At the same time, we emphasize that the object of analysis in this study is the largest enterprises in each of the regions – the situation in smaller companies is presumably even more difficult. The results of assessing the renewal of assets are presented in the table. 2.

Table 2: Share of newly acquired assets in total assets in the regions of the North at the end of 2019 in the regional context

Registration region	2019, Purchase of non-current assets, million RUB*	2019, Total Assets, million RUB*	Purchase of non-current assets to total assets ratio, %*
Amur region	11,413	494,567	2.31
Arhangelsk region	38,438	1,490,077	2.58
Zabaykalsky Krai	-9,042*	320,711	-2.82
Kamchatka Krai	23,541	382,472	6.15
Krasnoyarsk region	-41,991	6,066,852	-0.69
Magadan Region	-2,841	519,253	-0.55
Murmansk region	-42,992	834,803	-5.15
Primorsky Krai	85,685	9,317,915	0.92
The Republic of Buryatia	-5,775	150,634	-3.83
Republic of Karelia	1,541	292,457	0.53
Komi Republic	83,466	1,406,809	5.93
Saha Republic	9,975	1,683,547	0.59
Sakhalin Region	29,246	606,241	4.82

Total	419,622	44,813,004	0.94
Note*: a negative number means that there was a decrease in the value of the corresponding assets			

Source: Authors' calculations based on the SPARK-Interfax.

As it is shown table. 2, the maximum share of new assets characterizes the Sakhalin Region, while the largest region, the Tyumen Region, lags behind in this respect by almost three times. The average share does not exceed 1%, which is a relatively low indicator.

Conclusion

The study once again confirmed that tax incentives for investment activity in Russian businesses require a differentiated approach. Stylized approaches to justifying recommendations in this area are unacceptable and should be reviewed. Some aspects of criticism should be recognized, but it is challenging to consider. For example, the adjustment of the tax system which considers the stage of the life cycle of taxpayers. Nevertheless, the industry, regional and financial specifics of the business deserve due attention. At this stage, we substantiated this conclusion in more detail concerning the regional determinant of tax incentives for investment activities of Russian business, which we considered using the example of the regions of the North.

It was revealed that most of the companies represented in the northern regions of Russia operate in material-intensive industries. Thus, they need regular and timely updating of the production base. However, the analysis of empirical data showed that the volume of investments for this is insufficient. It is evident that the lack of proper attention to this issue leads to the aggravation of the already difficult working conditions. Further ignorance of the problem can cause undesirable economic and social consequences, so the continuation of research in this area does not lose its significance.

Abstract

This study regards rural accommodation enterprises (RAE) and how much of their business is made online and what can be done to improve it.
This work focus on 10 enterprises from the northeast of Portugal, since it is a more deprived and isolated region and far from the touristic centres. As such, these companies need to attract the visitors through their online presence.
We analysed their use of ICT, if they had a digital marketing strategy and what could be done to improve their presence and their results through online marketing tools.
It was possible to understand that the majority of the companies only have a minimal investment in online presence through the Booking platform and with their website. They do not work efficiently the social networks and they do not use, or know, most of the marketing online tools.
As a result, even though the studied companies are willing to evolve digitally and to enhance their presence in a more efficient way, this is limited to the investment that is required since they all feel they cannot invest at the time.
It is clear that for these companies and specially in these regions it is vital to bring European funds to help them evolve to the digital market in a knowledgeable and efficient way.

Keywords: Rural accommodation enterprises; Digital marketing; Online tools.

Introduction

It is not a new situation, however, more than ever, all over Europe there are countries that registered a severe loss of people in rural regions. These regions, in terms of tourism attraction, face difficulties due to distance from touristic centres, lower accessibilities, lower attractions, and so on (Johansson, Nilsson, and Westlund, 2019; Valdivia, 2018).

Even though economic sustainability, in regions with these characteristics, is very hard to maintain, there are still companies that continue their activity and remain there and, therefore, need to attract visitors to the region and to their businesses.

This study focus on 10 rural accommodation enterprises (RAE) located in the regions Douro and Terras de Trás-os-Montes, in the northeast of Portugal. It is the intention of this study to understand if these RAE use the information and communication technologies (ICT) available, if they have an efficient presence online, and if they have a digital marketing strategy in order to attract visitors to the regions.
The study is structured as followed: first an introduction is presented, secondly the theoretical framework that sustains the study is described, the third section describes the study, and finally, the conclusion is presented.

Rural accommodation enterprises and online presence

In rural areas, particularly those that are characterized as isolated, depopulated or deprived regions, tourism is viewed as a tool to economically sustain and even promote its development. However, even in these regions the touristic activity has to be up to date with market mechanisms, specifically with communication and promotion techniques since they dominate the competitive market (Pilar, Pina, and Delfa, 2005).

Currently, the internet is present in every aspect of our lives and has a growing importance in the consumers' information search and buying process. According to Hérnandez-Maestro (2020) companies need to pursue a more active role regarding their online presence and their reputation. It is important to understand that customers appreciate and are influenced by the management interaction and response.

Furthermore, the companies, more than the necessity to be online, in order to appear in customers' search and have a possibility of being selected and their services bought, they need to understand the data that digital tools can give them in order for the companies to improve their services, direct their services to their target audience, and understand what the customers want. Data analytics are forcing enterprises to evolve in their operation activities, not only to respond to the demand of the customers, but also to allow enterprises to see new business possibilities. It can have a major impact in the performance of enterprises located in rural regions (Krói, 2019).

It is important, in order to plan the development, in an economic and social perspective, for a region, to know the characteristics and predilections of the consumers that are attracted to the region (Pilar, Pina, and Delfa, 2005). The same is valid for the enterprises. For them to develop an effective marketing strategy and digital marketing strategy, the enterprises have to understand how the customers perceive the region and the rural accommodations (Wang, Li, Wang, and Jin, 2020).
Due to the internet importance as the primer source of information, it is a marketing method, and companies understand that tourists search for relevant information about their destination and also share their opinion (evaluation) with others in their social networks (Wang, Li, Wang, and Jin, 2020).
Rural tourism establishments are not considered the most experienced in using effectively the internet or analytical tools, in fact, they usually use them less than other businesses that operate online (Krói, 2019).

The fact is that for a small rural business to be competitive it needs to have a market oriented strategy and the use of information and communication technologies have a positive influence in the results obtained (Peña, Jamilena, and Molina, 2011). However, not only the knowledge to use the internet and digital tools is sometimes harder to find, even the physical support can be a challenge, since rural and more isolated regions usually have a worse internet telecommunications and have more difficulties in using the full potential that digital tools allows (Roberts, Beel, Philip, and Townsend, 2017).
Even with all the influence and importance, already recognized, of marketing and digital tools for businesses, it is important to understand how companies located in more isolated areas can use these resources, or even if they are available to be used. More so, in the touristic area, to attract visitors to these regions and to bring them to their establishments, it is essential to have a presence online.

The case of the rural accommodation enterprises of Douro and Terras de Trás-os-Montes

The regions in study are Douro and Terras de Trás-os-Montes. Both the regions are located in the northeast of Portugal and are defined as isolated, deprived regions with an galloping aging population.
The region Douro comprises 19 municipalities – Alijó, Armamar, Carrazeda de Ansiães, Freixo de Espada à Cinta, Lamego, Mesão Frio, Moimenta da Beira, Penedono, Peso da Régua, Sabrosa, Santa Marta de Penaguião, São João da Pesqueira, Sernancelhe, Tabuaço, Tarouca, Torre de Moncorvo, Vila Flor, Vila Nova de Foz Côa, Vila Real – and has an extension of 4,032 km^2.

Terras de Trás-os-Montes (TTM) comprises nine municipalities - Alfândega da Fé, Bragança, Macedo de Cavaleiros, Miranda do Douro, Mirandela, Mogadouro, Vila Flor, Vimioso, Vinhais – and has an extension of 4,370 km^2. Both regions have approximately 30% of their inhabitants with more than 65 years of age (INE, n.d.).

In terms of touristic offer, in the latest record, in the Douro region there were 164 touristic companies, with the rural accommodations representing 38% of the total, with 63 units, and 23% were agritourism units. In Terras de Trás-os-Montes the official records identified 149 touristic companies, of which 87 (58% of the total) were registered as rural accommodations and 28 were agritourism units.

In both regions the majority of the tourism companies were located in the capital of the region, that were also the most populated municipalities. However, most of the 28 municipalities on both regions are not highly populated or even in touristic routes. The majority is located in the isolated and underpopulated areas.

This study focus on rural accommodation companies located in three municipalities with severe indicators, regarding economy, population, and tourism, namely Vila Flor, Freixo de Espada à Cinta and Torre de Moncorvo. In these municipalities, in 2016, 98% of the registered businesses were micro companies with two employees, on average (CIM-TTM, 2014; INE, 2018).

Objective, data treatment and analysis

This work regards the analysis of 10 rural accommodation enterprises with the intention to understand in what stage of engagement the enterprises were regarding their marketing strategy, digital marketing strategy and ICT overall presence on their businesses.

To do so, the methodology followed was a qualitative research with semi-structured interviews. With the qualitative approach it was possible to closely interact with the individuals involved, using informal language. Through the inductive process, after analysing the collected data, we present the reality perceived (Creswell, 2013). After an initial in-depth interview with the 10 enterprises' managers involved, it was made an in-depth follow up with each company in order to understand in loco how they used ICT, what marketing strategies they had, and finally if they were present online and had a digital marketing strategy.

Descriptive analysis

For the 10 establishments studied no distinction was made regarding their type, if they were rented by room or whole-house rental, due to the fact that only two were whole house rental but also had separate rooms to rent. All the 10 RAE studied were of small size - one only had one room, another three rooms, four of them had four rooms, three had six rooms, and only one had 10 rooms - and were family owned and explored. The information was obtained through the owner or responsible for the touristic activity, since they were considered as the ones that had a broader view of their business and since they are the ones that can approve and implement improvements that could arise from this study.

The first aspect that was analysed was the use of information and communication technologies, described in seven topics, starting from the existence of basic equipment until the use of specific software, as presented in Table 1.

Table 1: Use of information and communication technologies

Enterprise	yes	no
The company has informatic equipment?	10	0
The company has a printer?	9	1
The company has internet connection?	8	2
The company uses billing software?	7	3
The company uses a specific management software?	2	8
The company has their own server?	0	10
The company uses ERP software?	2	8
The company uses CRM software?	0	10

Table 1 shows that most of the studied companies only had the minimum requirement to have their company running. One can see that they all have a computer, almost all have a printer, however two of them don't have internet connection. From the 10 enterprises, seven already uses a billing software and two of them also use a management software. Regarding Enterprise Resource Planning (ERP) software, two companies already used it and were the only ones that knew about it, the rest never heard about this tool. Customer Relationship Management (CRM) software not only was not used by any of them, they never even heard about it.

Regarding their marketing strategy, some aspects were selected to better characterize the companies in this element and are summarised in Table 2.

Table 2: RAE's marketing strategy

Enterprise	yes	No
The company has a logo?	8	2
The company has a corporate identity?	7	3
The company invests in advertising and merchandising?	8	2
The company has a differentiation strategy?	8	2
The company has a brand positioning strategy?	9	1
The company has a segmentation strategy?	7	3
The company reaches different segments?	9	1
The company has a digital presence?	10	0

As can be observed in Table 2, the majority of the companies has a logo, a corporate identity and invests in advertising and promotion. Almost all have a brand positioning strategy. Even though only seven believe they have a segmentation strategy, they are aware that they have customers from different segments. All 10 companies stated that they have a digital presence, if not with their own website through digital platforms. The existence of a website and its potential was also an aspect that was considered during the study (Table 3).

Table 3: Rural tourism companies' website

Enterprise	yes	No
The company has a website?	6	4
The website is user friendly?	5	1
The website link is easy to type?	4	2
The website is multi device compatible?	2	4
The website has connections to official public websites?	0	6
The websites has connections to other online pages?	0	6
The website is updated regularly?	3	3
The website has special promotions regularly?	1	5
Is it possible to buy in the website?	6	0

In Table 3, it shows that only six companies have their own website. The remaining companies were not considered in the other aspects regarding the website.

Of the ones that have own website most of them regularly analyse the statistics about access and interaction of the visitors. However, in some cases they recognize that the website's address is not easy to type and that the website is does not enable visits using different devices. None of the involved companies has connections from the site to other online locations, not even to public entities such as the Portuguese Tourism website. Although it is possible to buy directly in the companies' website , most of them are connected with online booking platforms and almost 90% of their business is made through those platforms. This is the main reason why there usually are no special promotions in the website.

After this approach to their online presence, it was intended to understand if the companies had a deeper knowledge about the potentiality of the online services. Table 4 resumes it.

Table 4: Marketing strategy

Enterprise	yes	No
The company is aware of who visits the website?		6
Does the company analyse the website statistics?	6	0
The company uses search engine optimization?	2	8
The company knows about how to get better search results?	1	9
The company knows how google ads work?	5	5
The company is present in social networks?	10	0
The company sends emails marketing to clients?	0	10
The company send newsletters in a regular basis?	0	10

In Table 4, since there were four companies that stated that they did not have a website, in this table the first two aspects are reduced to the other six companies that do have a website.

As is observed in Table 4, the majority of the companies does not know who visits their website, however, all the companies stated that they analysed the website statistics. Mostly concerned to number of visits, number of contacts and number of reservations achieved. Also, almost all the companies were not aware of the tools available online, nor were they aware of what those tools could do for the company, in terms of visibility, best search results, and so on.

Regarding social networks, they are all present in Facebook, but only three are present in other social networks (such as Instagram or Twitter). Even though, currently Facebook may be the social network that the majority of their clients use, since they are more elderly individuals, with families, in the future they have to evolve to newer social networks or they will not reach new publics.

Another aspect that came to light from the study was that none of the companies build a client data base, and so, they did not send any marketing emails to the clients nor did they send any newsletter.

After the study, the conclusions were presented to the 10 companies with suggestions to improve their online presence and to help them develop a digital marketing strategy. The suggestions were very welcome by the companies particularly those that did not required an investment, such as increase the content of the website, update the information, interact more in social networks, or give more feedback to clients. The suggestions regarding the digital marketing had more resistance since the companies feel that to achieve the expected results they had to invest in more support, such as a professional manager for the online presence. In fact, the companies need to know who their clients are and need to define a digital marketing strategy for the target audience in order to attract their attention and facilitate their action to buy.
However, they all sustained that it was not possible to currently invest in online improvements due to budget constraints and they were hopping for the next European Union funds to improve their conditions.

Conclusion

This study presents a reality of 10 rural tourism companies in a rural and deprive area. These companies face several problems regarding their location, far from the touristic centres and with difficult road accessibilities in some cases.

Although the majority already has a digital presence, with a website, present in some social networks, and through the online booking platforms, they do not have a digital marketing strategy that could allow them to be more efficient online.

This study registered what the companies already had, in terms of ICT and digital marketing, and presented several actions and measures to be taken in order to improve their presence online and to have a better search results position when potential customers search online. However, it was also clear that the measures that implied an investment from the companies would hardly see the light of day, since most of them almost only makes just above breakeven point. As such, it would make great difference if these type of companies could have access to European funds to update their marketing strategy and their online position. This would represent a broader dissemination of the region and the companies and would increase the awareness of potential customers.

Acknowledgements

This study was funded by CiTUR - Centre for Tourism Research, Development and Innovation and supported by the Portuguese Foundation for Science and Technology and the Portuguese Ministry of Education and Science through national funds.
The present work was developed under the CRECEER project receives financial support from the European Regional Development Fund (ERDF) through the INTERREG V-A Spain-Portugal program (POCTEP) 2014-2020.

Abstract

The end of the 20th and the beginning of the 21st century has brought the technological revolution and the extremely present digitalization. Great advance in the field of information technology, but technology in general, is fundamentally changing the concept of the business environment and work ecosystem. In such a turbulent time, when one cannot keep up with the accelerated development of technology, and implement all innovations to improve the quality of life, there is a need for active involvement of business entities in creating new systems. The laws of the market testify that it is high time for us to adapt or to remain in oblivion. The same also applies to the human resources sector, which is the first to hit the new demands of employees, but also the market in general. Current topics are the new economy, the economy of knowledge, the economy that is global, but also the economy that brings completely new professions and occupations that we meet for the first time, and which are constantly emerging and disappearing. The human resources management sector, i.e. potentials, constantly strives to cope with all these changes, despite the factors of uncertainty, change and constant adaptation to new business conditions, through the development of employees at the organizational and individual level. Important issues that will be examined in the paper, in the part of the primary research through the survey of experts in the field of human resources in this context are: what are the key factors that determine the career path of employees; if employees' expectations are different, concerning seniority; how to adequately consider the differences between the markets of the Republic of Serbia and the countries in the region, when it comes to expectations, salaries and living standards of employees. Finally, we examine the part in which the most prominent factors are presented, from the above, which are crucial for the business of a company, as well as predictions for future trends in the human resources sector.

Keywords: human resources management, employee development, information technology, earnings, expert survey, new professions, employer branding

Introduction

The broader field of labor research is the transparency of companies in the region and how these practices can inspire the HR sector of Serbia to improve its current work methodology. In the market of the Republic of Serbia, there is a belief that salary transparency has a negative effect on the methodology, satisfaction, but also the career development

RISTIĆ, Aleksandra HADŽIĆ, Dušan STOJAKOVIĆ, Goran RADIĆ and Milena ILIĆ "Employee Development Management - HR Methodologies and Practices in The Western Balkans Region, Expert Survey" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

of employees.

The paper presents research on the differences between the human resources market of the Republic of Serbia and the countries in the Western Balkans region. The attitudes of professionals in the human resources sector will be examined through the analysis of the research, both on the Serbian market and in the countries in the region. The aim is to prove the belief that there should be transparency of salaries in creative agencies since it is counterproductive if it does not exist and if it is not communicated with employees. Besides, it will be discussed what other differences between the observed markets in terms of expectations are.

Employee Career Development

Employees and their skills are the basic resource of any organization in a business environment. (Ranković, et al. 2020). Based on these main and secondary criteria, the contribution of professional staff to achieving the goals of the observed organization is assessed. Certainly, the word resource should be humanized and understood that it does not only imply the technical abilities of the individual, but also includes the subjective assessment of creativity, innovation, as well as the motivation of individuals and entire teams. Certainly, this includes the characteristic features by which each individual stands out in a unique way from the others in the company. (Ilić, 2018)

Strategic human resource management is a direct witness that the competencies of professionals in the human resources sector evolving. Moreover, as emphasized in the previous paragraphs, the phenomenon of strategic human resource management can be seen as a term that arose due to the conditional digitalization of traditionalist companies, which required a certain system to adapt to emerging market demands. The one of the characteristics of this phenomenon is the appearance and the spread of this term at a time when international pressure was exerted on many companies in Western economies due to non-competitiveness. Thus, it directly required the formation and establishment of new ways of working, as well as the search for staff to establish them.

Certainly, this interpretation only applies to a recognizable version of human resource management. Today, in everyday work, a freer use of the term that refers to any form of approach to workforce management is also used. In a wider, more general use, employment decisions can be made "ad hoc", can be reactive and short-lived. They can also include a so-called “value-based approach” or it can be calculative and multi-variable. Hence, only the field of strategic management can have more meaning or variation in setting a "strategy". It can be a plan, a pattern, a position, a perspe□tive, or an internal tri□k (Mintzberg, et al, 1998; Mintzberg, Lampel, 1999).

In the Republic of Serbia and the region of the Western Balkans, the human resource is organized within three types of sectors, the so-called administrative sector. "Human Resources", the Human Resources Department and the Employee Training and Development Sector. (Pržulj, 2002)

Technological development has caused an expansion of software solutions, which, as such, serve human resources professionals in performing day-to-day activities. Also, the new laws create new needs and the administrative sectors are now divided into more and more branches to be able to cover all those needs within the firm. Often, at this time there is no formal education and it cannot be said that someone has been trained for new occupations in this sector, but that does not mean that experts have not paved the way for future colleagues who will soon come to their places, ie created space for development. new professions. Besides, they will seek, up to one, real knowledge about business and the implementation of new strategies within organizations (Ristić 2020)

In terms of employee development, organizations can only decide to develop a higher level of management: top managers, senior managers and employees with extremely high development potential. Middle managers, most responsible for motivating and rewarding employees, are not included. Another possibility is to involve all employees of one organization in the development process, by redefining the development budget for each employee, which is a democratic principle that is fair but does not offer much in the scope and quality of training. Some organizations opt for traditional forms of education, ie for formal educational programs that are intended for the specific needs of the organization, such as courses, MBA programs, and others still choose more modern methods. (Ilić, 2018)

Chamorro-Premuzic, gave advice on how companies can identify high employee development potential (Fast Company, 2014):

- Clear criteria for promotion should be set that explicitly define which behaviors, achievements the company equates with the definition of an employee with great development potential;
- Strive to use objective and reliable methods to assess employee performance, while maintaining transparen□y, if not in terms of all parameters, at least within those measurable;
- Companies are advised, where possible, to clearly set and provide development support to those who do not

achieve the set goals on a personal and / or organizational level, despite attempts - the potential can be trained and enhanced;

- Don't focus only on past or current performance: personality is a better indicator of people's potential for a new role, especially when it involves managing people in the form of human resource management;
- What is obvious is that performance appraisals and supervisor nominations are not reliable methods for identifying employees with a high degree of development potential. They reveal people who can "look" like a future leader, but this is based on the perception of existing and past performance, but also the subjective assessment of the individual.

According to Hogan, the personality assessment test is an ideal empirical basis on which to build, ie according to which a certain program intended for the career development of employees with high development potential in a certain company can be created (Sage People, 2019). Hogan's high-potential model identifies leadership potential in three dimensions. Basics of leadership: the degree to which people can manage their careers, are rewarded for what they do, and who are good organizational citizens. The emergence of leadership: the degree to which people stand out from their peers, build strategic business relationships, exert influence and are seen as leaders. Leadership efficiency: the degree to which people can build and maintain high-performance teams and guide those teams toward organizational success. Hogan believes that this multidimensional approach to assessment paints a comprehensive picture of each person - their work habits, ideal job type, leadership potential - far beyond the information available in the traditional process. Most employees develop their careers through different work experiences and acquiring work habits. This includes interpersonal relationships, conflict resolution, responding to requests, tasks and dealing with other aspects of the job that employees face in their workplace (Bogićević Milekić 2015).

Gaining work experience during the career of employees takes place through the processes of increasing the job, rotating jobs, moving employees, promotion, but also moving to lower jobs. Also, employees can be temporarily sent to work in other organizations to break the monotony and gain new perspectives for doing the job. It is obvious that employee development is not only a matter of the scientific discipline Human Resource Management but also that many other sciences and scientific disciplines are gaining in importance, such as sociology and psychology (Ilić, et al 2019)

Research of differences between Serbian markets and countries in the region - Human Resources sector, Expert survey

Research Setting

According to an anonymous survey, after graduation, 52.4% of students see their future in a domestic company, and 77.1% want to get a job in a foreign company. Among the respondents, 50.4% are entrepreneurs, while 33.2% of students would be engaged in freelance work. The reason why a foreign company is more interesting than a domestic company in Serbia are standards, approaches to solving problems, but also the possibility of career development. Career development is the most mentioned reason (OpenIT, 2020)

Again, depending on what the seniority is, what the experience is, what the employees are striving for, this type of education is adapted to their development. Companies are ready to do that and that is the practice. Technologies change very quickly and only constant education can help to follow and see what it is where an individual can be found.

The maturity of our markets in terms of introducing new technologies into everyday business is an indicator that our market is still lagging behind the countries in the region. A large amount of research shows that for someone to be able to implement technology, they have to get acquainted with it in some way. Since companies are primarily acquainted with technologies, they must either have some experimental work or get some directive, a client initiative. That experimental work is something that requires a certain amount of time and investment in something like that.

Certainly, to implement everything, before education, it should be developed awareness about the need for constant, lifelong learning on the part of the human resources sector and the part of employees, but also from the perspective of companies as organizational units. Definitely, we are late, but an indicator of the community, people who talk about relevant topics, and even the students themselves, can show the initiative for change and shake the Serbian market to move towards positive change. The primary research in the form of a survey was aimed exclusively at HR professionals, both in the human resources market of the Republic of Serbia and in the countries in the region.

The conducted survey, addressed to HR specialists, was structured in such a way that it did not contain inappropriate questions and that they did not represent an attempt to reveal or disclose business secrets of companies backed by HR

professionals. Therefore, the survey is anonymous. A five-point Likert scale was used for individual attitudes, and a mean score was used to process the results. The questions are grouped into 4 segments: socio-demographic issues, a methodology of the HR sector, career development of employees and HR, EB & marketing.

Survey of the attitudes of professionals in the HR sector

The primary research was conducted in the form of an online survey. The survey was addressed exclusively to HR professionals from the Serbian market, but also to countries in the region to compare HR methodologies.

In order to reach the target group, the survey was set up within two groups that include exclusively HR professionals, on two different platforms - Facebook and LinkedIn. The first is a Facebook group called "HR Corner - HR community", whose founder is Katarina Šonjić, Employer Branding Specialist. The second group is "HR Tech Community", founded by Nikola Mijailović, the founder of the Joberty platform. The survey was posted on September 19, 2020. in the HR corner, while 22.9. also set up in the HR Tech Community, a community of HR professionals on the LinkedIn platform.

The survey lasted from 15.9.2020. until 25.9.2020, when it reached the number of 25 respondents - experts in the field of human resources management. At that point, the survey was closed, as the sample collected was sufficient for the relevance of the sample

Table 1 Socio - demographic sample characteristics

Demographic variables	n	%
Working status		
Employed	24	96%
Unemployed	1	4%
Country		
Serbia	20	84%
Serbia and Montenegro, cluster business	1	4%
Country in the region	3	12%
Education		
No school, unfinished primary school and primary school	0	0%
High school, grammar school and specialization	2	8%
Higher-education school, faculty, faculty +	23	92%
Length of work experience in the HR sector		
>1 year	1	4%
1 year	2	8%
2 years	1	4%
3-5 years	7	28%
5+ years	14	56%

On the first question about education, out of twenty-five respondents, 52% stated that they had completed basic professional or basic academic studies. Then, 40% of the respondents stated that they had completed master's studies, while the lowest percentage of 8% indicated that they had finished high school, high school and specialization. Another issue concerned the current employment status of employees. For the most part, as many as 92% of respondents are currently employed, while only 4% of respondents stated that they are not currently employed.

The third question is selective in this survey and it consists of two parts. Employees in the human resources sector could mark whether they operate on the domestic market (in Serbia) or abroad, ie in one of the countries in the Region. The third answer was recorded, which referred to the cluster of Serbia and Montenegro. 84% of respondents are from Serbia, while 12% said they currently operate in a country in the region.
The fourth, and last question in the first segment of the survey, in which general data were collected, provides answers regarding the work experience of employees in the HR sector. The majority of respondents, precisely 60.9%, stated that they have more than 5 years of work experience, which induces better first-hand insight in the form of digital transformation that they have experienced during their career.
HR sector-work methodology.

The fifth question, in the part of collecting general data, shows the way in which employees come to the current

knowledge and methodology that they apply in their daily lives. This serves as a starting point to clarify the question - how to get into the HR world? Is there a need for formal or non-formal education? Is it a professional practice, the advice of more experienced colleagues or the feedback of people who have already had interviews with the HR team at some point. It was necessary to opt for one or more methodologies and approaches to work that helped HR professionals in HR to get a job, but also to advance in their current job.

Experiences are various, and respondents could mark multiple responses, which they felt related to. For most, one of the choices was formal (48%) and non-formal education (56%). With the help of colleagues, the answer is the most ticked with an exceptional 60%. They are followed by items such as self-initiated education, which is commendable (44%), then professional practice in an agency and / or company (28%), feedback from people interviewed (10%), while less than 10% occupy items volunteer work (fairs, conferences, NGOs, NGOs, etc.) 16% and individual development plan (4%).

Graph 1: Overview of the methodology of work in the HR sector (author)

The sixth question in the survey, and the second in general, which refers to the methodology of work, is the individual position on the issue of the importance of employees for the success of the company. We start from the position that workers are not working capital and that they can identify their ideology with company values, which it presents to the public. It involves an individual's subjective assessment of the importance of the role of employees in the company in which they work.

It is encouraging that, on a scale of 1-5, from Not at all important to me to Extremely important to me, most of the respondents chose 5 (88%), while a few chose 4 (22%). However, it is exceptional to see from the sample that there are no neutral responses, nor the attitude that employees are not important in the organization. The average score for this question is high and it is 4.88.

Based on the seventh question, it is found out what is the priority for employees from the point of view of HR. This was a multiple question, and it was possible to mark more than one answer. It was necessary to decide on one or more options that have emerged as a result of previous work and insight, what is the priority for employees directly in employment, but also during employment in the company. It can be based on the information created in a company or personal opinion.

Somewhat logically, on the priority scale, the team (72%) and the salary (88%) are at the very top. After that, the benefits tailored to the individual (e.g. New Year's packages for employees who have children) and teleworking due to the newly created global situation (44%) were equally checked. Also interesting, clear communication of values (Identification of values and ideology with the company) is considered to be very important to employees (40%). Half of the HR experts pointed out that insurance is certainly extremely important for employees, which is a more uncertain economic situation (private health, pension and similar insurance - 52%). The product we are working on is inspiring for a third (28%), while the annual vacation is in one of the penultimate places, as much as 20%. There are also added answers that carry a couple of percentages (4%) and refer to the opinion that the answer to this question depends on the level of knowledge (junior / senior), from the industry - it is very individual from person to person (4%); as well as the possibility of advancement (4%)

Graph 2: Presentation of priorities of employees from the angle of HR sector (author)

The eighth question is an introduction to more complex qualitative issues which will be quantified below. Experts shared in the survey the way they can check with employees whether the current conditions suit them. It is an individual choice for one or more options that have emerged as a result of previous work and insights. It can be based on information created in the company or personal opinion.

The interview is certainly the most prominent answer, since the half of the respondents wrote this option, 13/25 of them (44.8%), with a complement. Variations of the interview were as follows: one-on-one interview, career interview, face-to-face informal interview, open interview, interview with employee and / or manager. Furthermore, 9/25 (31%) of the respondents stated that it could be through a survey, with a complement (internal survey, satisfaction survey). The rest of the answers were based on the atmosphere and mood (24.1%), with variations on the topic, such as employee engagement research, motivation, the response in group activities, communication with colleagues and management, "employee experience", atmosphere in the workplace.

Graph 3. Overview of how to evaluate the benefits of current employment conditions (author)

The ninth question was quantitative and it is related to the expression of subjective assessment. The goal was to, on a scale of 1-5, determine the importance of a bad recommendation on a decision to hire a candidate. The question specifically referred to whether references from former colleagues and / or employers influence the selection of that candidate. Suppose it fits all other standards, but the only inconvenience is the reference, which is bad. No details were given, but it was necessary to determine the position on a scale of 1-5, to what extent this parameter affects the final decision on the next round of selection or potential employment. It could be based on information created in the company or personal opinion.

Interestingly, almost half of the respondents expressed a neutral attitude on the scale (44%). However, opinions ranged between "Yes, it can be crucial", five on the scale (20%) and "Yes, it is important to me, but not crucial", four on the scale (20%). Overall, 16% of the remaining respondents divided opinions into one and two on the scale, which initiate that it is not crucial to them, in the sense that it has other priorities (8%) or that it does not matter to them, but can take into account (8%). The mean score for this question is 3.36.

Graph 4: Overview of the impact of poor reference on employment (author)

Question 10 deals with the challenges that the HR sector faces in its daily life. The goal is to find out - what are the new or existing challenges. It can be based on information created in the company or personal opinion. What is definitely the biggest fear that experts of this profile face is the departure of good employees and the remaining of bad employees (68%). Experts are leaving for better opportunities, and those who have not yet come to their positions are not professional enough. The next choice, which, in some cases, is actually the reason why experts leave the company, is the so-called headhunting, ie theft of staff by competitors (48%). It's not discussed much, but it certainly exists. And there can be a lot of pressure and an aggressive approach on employees who are "targeted".

Next, we come to equally divided opinions that tend to almost half of the respondents. Lack of resources for the HR sector (financial, material, etc. - 44%) always lingers when it comes to the human resources sector, which is further disturbed by the fact that employees are simply not interested in education or training (44%). These two factors follow the next two which also pull 40% each. It is about the fact that the existing reward system is inadequate or does not exist (40%), which is caused by a somewhat lack of resources for the HR sector (financial, material, etc.) (40%).

On the one hand, some HR professionals say that the HR sector is left out of the strategic planning process and has no impact on the organizational structure (40%), and on the other hand, some believe that other sectors are still not sufficiently involved in the HR sector (selection, recruitment, induction) (28%). This is accompanied by a balance between adjusting employee requirements and company culture (24%).

Interestingly, transparency and wage reporting are not a challenge at all, when it comes to the human resources sector. So it seems to be up to the employer to keep the trade secret about the payment of each individual employee. Only 12% of respondents claim that this is a challenge for them.

The least marked answers are oriented towards the fact that colleagues from other sectors interfere too much in the work of the HR sector (2%). There are also a couple of individual answers, which are very interesting. They concern mainly internal processes, in terms of inadequate monitoring of internal business processes (4%), then the adaptation of new generations to the work environment (4%). Adaptation has been accompanied by very remarkable more comprehensive responses that affect this phenomenon of young people adapting to the new context of the work environment. It can easily come to the reduction of clear values from the top through HR that will not be passed on to young employees because they don't want to accept them. This can be further accompanied by unclear setting of career path of employees by management and lack of performance management and thus hampering the progress of employees (4%). Finally, there is the inevitable work-life balance, in the sense that it is necessary to provide "work-life" balance to employees, ie focus on feeling good in your own skin (4%).

Graph 5: Overview of challenges faced by the HR sector (author)

The eleventh question, refers to the recognition of how rising talents are recognized in the organization, which can at one time possess the necessary knowledge and skills. The goal is to find out what are the parameters that can "reveal" the candidate that there is potential for work in the company. Whether these are the processes that will follow after that, such as testing, certain tests, tasks; Whether the research of a person's profile on social networks included, both in terms of personal life (social networks) and in terms of professional life (online portfolio, previous work experience) or are these some other little things that decide that this candidate is the perfect choice for company and to show that it can thrive. It can be based on information created in the company or personal opinion.

Graphic 6*:* Overview of ways to recognize rising talents in an organization (author)

The twelfth, also the last question in the second segment of the survey, aims to collect the necessary data on the turnover of employees who were in practice during their studies and / or remained in the company. What is needed here is not a comprehensive answer, but an individual position on whether there is a position for students who want to enter the professional world through professional practice for further training. It can be based on information created in the company or personal opinion.

Employee career development

The topic of the third segment of the questions within the online survey was the topic of career management, at the organizational and individual level, then mentoring. The starting point for forming the question was that only real employers will properly treat their people and be a role model and inspiration for career advancement. However, through answers to the following questions it is found out-whether it is a burden for employees to constantly work on themselves or find inspiration in their work environment to progress.

The thirteenth question concerned subjective assessment regarding employee career management, management at the organizational or individual level. The question is based on a general, personal assessment and respondents were able to express an opinion on a scale from 1 to 5, where 1 is exclusively at the organizational level and 5 exclusively at the individual level. Mean score is 3,2.

64% of respondents had a neutral attitude on this issue. This attitude is further followed by 16% of HR professionals who believe that management is conducted mainly at the individual level while 12% stated that it is still at the organizational level. A few stated that it was exclusively on an individual level.

Graph 7. Overview of employee career management methods (author)

The fourteenth question is descriptive and related to the thirteenth question. If there is a plan in the organization where HR professionals, who filled out the survey, work, at the organizational and individual level for managing the career of the employees in the organization, then brief information on how the survey is conducted is needed here. However, if information of this type is exclusively and completely retained and no superficial answer is possible, respondents could declare that they do not have an answer (11,5%).

Substantially, it is an individual development plan that is part of the performance process (30,8%). “Growth framework” is also mentioned as a system and in more detail it means that the management is done on the basis of the individual development plans. Both employees and the manager are responsible for the organization, as well as the HR. Additionally, a training plan tailored to the position, individual needs and the potential of the employee leads us to the next group of responses, related to instructions, programmers, trainings and talent management plans (26,9%). This segment of the responses also means that the career of employees could be managed through lists of knowledge, competences, skills and results for each position, that are clearly defined and accessible to everyone, as well as the opening trainings for acquiring them.

Two large groups of responses follow a couple of more specific ones related to the HR sector strategy (11,5%), management at the organizational level (3,8%), but also that the management is based on matching the visions of the company and of the employee (3,8%). The HR team is here to define the guidelines but the responsibility for the career of the employees is accepted by the management and the specific employee. Everyone has an insight into how they can thrive within the company, not just departments-meaning available positions, necessary skills and knowledge and available resources.

Vision matching is complemented by the perspective in which the employee finds himself-whether he is in the company because he has too broad ambitions for ascent or he is there only to receive a salary. In this sense, the question of whether career development is important to that individual is still being worked out. The management sector itself can stimulate the team to be successful as well as the employees to advance in their career, and yet, on

the other hand, if driven by ambition it could remain at the individual level. Finally, the remaining 11,5% of respondents still believe that it is not managed at all.

Graph 8: Overview of employee career management methods (author)

Within the fifteenth question, the starting point is that experience is not necessarily measured by age or the number of projects. On the contrary, by engaging, ie. by job rotation and diversity of experiences, dynamics can be brought into everyday work. A subjective assessment in response to this question was made on the basis on data related to previous experience on employee rotation for the sake of learning or their career development. No result is required if it turned out well, but only the primary information whether it is done or not, based on personal opinion.

Most of the respondents stated that they rotate employees for the sake of learning. They are monitored by HR experts who rotate them only if they wish that (24%). The next 24% keep this in mind as an option but do not implement it. Only 12% of respondents stated that they do not perform rotation while 8% of them are willing to do research and individual interviews with employees before the rotation.

Graph 9: Overview of the implementation of employee rotation for learning (author)

Concerning the sixteenth question, it was necessary to provide only positive or negative answer to the question whether there are mentoring programmers in the organization. It did not go into the manner of their implementation. It is based on personal opinion. The majority stated that monitoring programmers exist and are being implemented in the organization (84%) while the minority was against it. Only 4% said it depended on the sector.

Graph 10: Overview of the presence of mentoring programs in the organization (author)

The seventeenth question aimed to provide answers regarding the way of conducting training quality evaluation and/or mentoring programmer. A vast number of respondents stated that this was through evaluation forms, questionnaires or formulas (40%). Furthermore, it is learned that the evaluation is done in written form, after the training is completed. The next type is the evaluation of the success of the application of newly acquired skills and knowledge. It is noted that the questionnaire solution is short-term while the long-term form of evaluation is visible through the work results. Furthermore, there are questionnaires containing qualitative and quantitative questions. Finally, defined patterns are also mentioned as one of the methods.

The next one is direct feedback (20%) and then conversation (16%). In one variation, it is thought on the basis of the report of the mentor and the feedback of the unemployed while other variations show that it is the feedback of the trained person, as well as the line manager. The general conclusion is that the feedback should be discussed with the employees, at the end of the training, and after a month, a questionnaire is to be sent to the employees to assess whether he has had the opportunity to apply the acquired knowledge so far.

A smaller percentage opted for the survey (8%) while the answers that accompany this one are self-evaluation (4%), then meeting, interview (4%), Kirkpatrick three levels and sometimes the fourth one (4%). The last option is that there is no evaluation in a particular company (4%).

Graph 11: Overview of the type of implementation of training quality evaluation and / or mentoring program (author)

The eighteenth question deals with the subjective assessment of experts in this sector, when it comes to choosing the most sought-after profession, according to their experience so far. Undoubtedly, the majority belongs to the information technology sector (36%) in combination with professional engineers and technicians of various profiles

(32%). These two large fields are followed by three smaller ones that relate individually to economists (8%), e-business, marketing and sale (8%), but also to artisans and workers, people who are experts in specific fields (8%). Mass positions are the least sought after, warehousing and delivering (4%), while a few think it all depends on the industry (4%).

HR, EB & marketing synergy

The HR sector knows the target group of candidates best. That is somewhat logical since they have been there with them since the selection process to everyday life, work obligations and tasks. On the other hand, they are familiar with the culture and values of the company, which further provides knowledge about innovations that would be good to implement. The issue of synergy of HR, EB and marketing sector is very complex, given that one majority claims that they operate separately, while the other side stick to it that they should remain separate sectors. The question-how can this synergy improve the strategy of the human resources sector-will be addressed below.

The nineteenth question referred to the possibility of cooperation between the HR and EB sectors. Most of the respondents stated that there is a possibility of cooperation between these two sectors and that it is realized on a daily basis (64%). When it comes to the inevitable synergy between the two sectors, there is an opinion that quality cooperation between these two sectors can significantly affect the results of attracting candidates. HR knows what kind of employees/candidates the company needs while EB can attract the attention of such people with its creativity and good ideas for campaigns. This is confirmed by the increased form of applicants which requires additional energy in the pre-selection and selection of candidates. Employer branding can help the HR sector in this process by spotting certain specifications that betray a good future employee. The possibilities are certainly enormous. This synergy should be productive in the future.

On the other hand, a segment of respondents who believe that EB is part of HR activity (28%), emphasizes that EB is often not a sector unto itself. Thus HR plays an active role in forming and maintaining branding. There is certainly an opinion that EB must be in HR because HR knows people while marketing, as a tool, is what helps HR in that. Despite these examples of good practice, a minority of respondents also stated that there is no EB sector in their company (8%).

The twentieth question deals with the way in which HR can help in Employer branding strategy, that is what kind of initiatives and results of HR can help Employer branding. For example, if there is a deficit of certain candidate profiles, should investments be made in setting up an EB strategy (if any) and see it as an investment in the long run in order to reach new candidates. It is believed by 48% of respondents that HR helps EB activities and vice versa. Further, there is the creation of organizational culture as well as the creation of internal and external communications (16%). Only 12% of them remained restrained.

Graph 13: Overview of HR initiatives and results that aim to help Employer Branding (author)

Within the twenty-first question, people are definitely in focus of the HR sector, without equal (32%). Other answers and explanations are mostly people-oriented in the sense that 28% of respondents believe that development and inclusion of employees must be in focus which can lead to their professional satisfaction, in such a way that it will

have a direct impact on business goals.

Furthermore, there are divided opinions between experience, ie. employee satisfaction and the selection and retention of candidates (12%). The explanation is that people should be supported in order to feel satisfied in the company. It should be provided by setting up processes, nurturing organizational structure, giving feedback to management about employees and possible advice when making strategic decisions. On the other hand, selection of candidates who are most culturally suitable for the company, their development and retention, supports the creation of systems based on analytics that allows the same.

The penultimate 12% of them believe that it is still a strategic issue. It should be emphasized that each HR has a different strategy that is defined depending on the needs of the business. It is certainly common that all good examples should start from HR who is also responsible for providing support to those who need it. The remaining 4% of respondents have no answer to this question.

Graph 14: Overview of the focus of the HR sector (author)

The twenty-second question concerns the cognition of processes and sectors in which HR should be involved. Human resources sector should be involved in business transformation and strategic decision making that is considered by 25% of professionals. Internal communication and internal processes also require the involvement of the HR sector (25%). It is interesting that 20,8% of HR professionals believe that their sector should be involved in all processes or sectors in the company. In one of the companies surveyed, HR is in some way interwoven into all sectors by some part of all responsibilities. The processes are clearly set but the overall scope of HR is, actually, linked to many sectors.

This is followed by integration into the budget and finances. There are 8,3% of those who did not want to declare themselves, while the last process was Employer branding (4%). One should think in the direction of more flexible forms of employment or adapting existing models to the current needs of employees working from home. The optimization of these models is where the HR sector can get involved, because it is in direct contact with employees. The last explanation says that everything depends on the internal organization of the company (4%).

Conclusion

After conducting a survey with 25 verified experts in the field of human resource management, it is concluded that the HR market of the West Balkans is moving towards complete personalization, both products and services and a sense of personal satisfaction and fulfilment in a career light. Products and services are now intended for increasingly specific niches and working conditions are constantly adapted to people's needs, due to the new economic situation. Repressive systems become part of the past while the present is occupied by developmental ecosystems where creativity and further development and research have been nurtured, as opposed to outdated beliefs where it was important to satisfy management.

Three factors emerged as the main ones in the survey-career development of employees, employee satisfaction and salary transparency. One of them can be used to isolate another confirmation that the transparency of business leads to progress and better business of the company. Career development is mostly expressed through an individual development plan, made according to the needs of each individual, which is part of the performance process. Both employees and the manager are involved in their implementation, as well as HR. In addition, adequate trainings, programmers and talent management plans are provided through training plans that are adjusted to the position, individual needs and the potential of the employee.

The results of the survey testify that organizational culture, where creativity is nurtured, is also important, pointing out that management is based on matching the visions of the company and the employee. The HR team is here to define the guidelines, but the responsibility for the career of employees is accepted by the manager and the specific employee. Everyone has an insight into how they can thrive within the company, not just the department-meaning available positions, acquired skills and knowledge and available resources.

The comment that remains is that no matter how ideal the current situation on the Serbian market is, it is starting to change under the influence of various factors. Only this way of implementation of emerging trends can create a productive basis for further development of labor supply in the Western Balkans, primarily Serbia. The reason is that in non-transparent companies it is not possible to create a cultural climate that is adequate for progress and creative development, while in transparent business there are conditions for better strategic decision making, improvement of internal communications and processes but it is also an excellent basis for business transformation.

Rewards Management in Organizations - A Retrospective on What Organizations Have Set Out and Achieved, In Order to Identify Future Actions

Radu MARIN

National University of Political Studies and Public Administration, Bucharest, Romania
radumarin62@gmail.com

Abstract

The current paper objective is to highlight the idea that the companies should aim to implement an efficient total reward management, in order to attract, retain, motivate and improve the performance of its employees. Different types of rewards which can be offered to employees and the evolution over time of employees' preferences for every type will be analyzed. This evolution has led to the transition from the compensation model to total rewards management model. By analyzing the studies published so far, the paper will present ways in which total rewards management can be effectively used within companies. The paper will also demonstrate that total rewards management has a determining role for increasing the performance of companies. The paper aims to present the influence of the entire package of rewards that can be offered by companies to their employees, given the fact that many of the studies published so far have focused only on the analysis of one or several rewards. This paper also aims to identify the full package that will be most appreciated by employees based on cultural, gender and age differentials.

Keywords: compensation management, total rewards management, employee attraction, motivation and retention, company performance

JEL Classification*: J33, M52, M54.*

Introduction

The present paper will analyze which were the factors that influenced the personnel policies choosed by the companies and determined the transition from compensation management to total rewards management. The role of compensation management is to design and implement within companies the full compensation package. In the literature, this is also known as salary administration, payroll management, reward management, although, as we will see in this paper, these concepst are either restrictive or too permissive regarding the rewards that are administrated within compensation management. In our opinion, we consider the concepts of salary administration and payroll management as being limited. Although they still have an important role in employees' preferences, they represent only a fragment of the rewards that can be offered to employees. Also, this concepts have a lesser impact on employees in the modern economy, especially on highly qualified employees, who, in general, have attractive salary packages by default. In our opinion, the use of the term compensation management is due to the fact that employees perceive the rewards received from the organization as compensation for their efforts, as compensation for the time spent working, in the expense of personal life. From a semantic point of view, perhaps the term of compensations better defines the fact that the rewards they contain are practically something offered in exchange (a compensation) for the employees' activity. On the other hand, in the modern view, compensations contain only the basic salary, bonuses, profit sharing or the option to buy shares, meals at the companys' canteen, different types of free subscriptions offered by the employer (practically all those rewards that have a financial expression). Total rewards add additional categories of rewards to the ones included in the compensation, which can take a variety of forms: health insurance, retirement plans, sickness insurance, incapacity for work, unemployment, life insurance, paid leave and any other benefits that employers can provide (flexible schedule, personal development and career development programs, a good work-life balance, job recognition programs). In addition, the

difference between compensation and total rewards can also be seen in terms of time: while compensations reflect present or past rewards given for employees' activity, total rewards have an openness to the future. However, there are also organizations that have a broader view of the concept of compensation, including a number of benefits that generally exceed this notion, such as health and life insurance, retirement plans.

Research outline

We have aimed to analyse the studies published in the last two decades in order to identify the way in which employees' preferences have changed towards certain rewards and how companies understood to respond to those changes. Another goal of the study is to highlight how organizations' performance can be influenced in a favourable way by adopting the correct rewards package.

Gross and Friedman (2004, p.8) considered that the structure of rewards granted by the employer has changed due to the fact that employees' preferences for rewards have changed. Thus, if in the past employees were asking questions about how much they currently earn or how consistent their retirement plan will be, more and more employees are starting to ask questions about how much the whole rewards package will be over their entire activity in an organization. In the modern economy, based on knowledge and globalization, attracting and retaining a highly skilled workforce within organizations is essential in order to achieve the desired level of competitiveness and performance. In this regard, McCormick (2015, p.5) highlighted the opinion of successful companies that a comprehensive plan in terms of overall reward strategy can lead to differentiation from competition, attract highly qualified employees and increase the productivity, obtaining a better yield. This is why Bwowe and Marongwe (2018, p.2) consider that many organizations pay much more attention to the restructuring of the reward system, given its positive effect on employee motivation and retention. Rumpel andMedcof (2006, p.30) also consider that the implementation of a total reward system can bring the following functional benefits to the organization: attracting, motivating and retaining employees. Keeping the same approach, Adeoye and Fields (2014, p.345) considered that implementing a rewards management system allows the companies to gain a competitive advantage, due to the fact that they will attract qualified personel that can be transformed in a stable workforce. Moreover, Milne (2001, p.321) considers that, besides encouraging employee engagement, implementing a reward system will also contribute in an essential mode to the knowledge sharing behaviour among employees.

Another important aspect, in terms of the benefits gained due to compensation management, is analyzed by Greene (2014, p.7), which considers that the existence of a state of commitment, satisfaction and motivation among employees causes them to be more productive and more involved in relationship with the organization. The author concludes that, due to this fact, organizations have begun to consider employees involved in work as valuable resources. In the same direction, Maung and Walsh (2016, p.3) present the employees efforts as determinants for the success and survival of organizations and consider the reward system as an essential factor for obtaining employee motivation. We find the same idea presented by Bustamam and Abdullah (2014, p.393), which considers the implementation of a reward system within organizations as an essential management tool, which, by increasing employees' motivation and satisfaction, contributes to increasing the performance of the organization. In this regard, Adeoye, Atiku and Fields (2016, p.28) note that the main reason for awarding rewards is to shape employees' behavior in the direction that the organization needs them to go. Fernandes (1998, p.1) pointed out that, in order to increase productivity and ensure the attraction and retention of key employees, many employers have been forced to revise their reward policies. However, the author points out that certain rewards such as freedom, flexibility and delegation of decisions to employees can also lead to adverse effects, such as abusive entry into the employees' private space and the transfer of risks to the employee. Heneman (2001, p.ix) pointed out that, although the specyalised literature considers compensation policies to have a positive impact on the organization's efficiency, there is still very little information on how they can be linked to the organizations' business strategy. We find this idea also expressed by Dessler (2016, p.346), who stresed that a compensation package must be created in ordert to gain a competitive advantage, by modeling the desired behavior among employees, respectively to create a link between each type of rewards and a specific business objective. The author concludes that this is why many organizations use a total rewards strategy to support achieving their goals, noting that this strategy adds more challenging work, career development and recognition to the traditional rewards, such as payments, incentives, and benefits. Based on the theory of equity, the author considers that the award of compensation must be fair both externally, in terms of awarding rewards within the organization in relation to rewards for similar activities in other organizations, but also internally, respectively equity in terms of rewards for various activities within the organization. Awarded rewards should also be fairily distributed among employees performing comparable activities and the processes and procedures established for awarding compensation must be perceived by employees as being fair (Dessler, 2016, p.347). Day, Johnson and Barron (2014,

p.75) also present the fact that the resources allocation is generally influenced by three criteria, two of which are equality and equity. In the same direction, Bwowe and Marongwe (2018, p.3) find that, in order to promote fairness and correctness to different categories of employees, organizations must link performance rewards, otherwise it can become very difficult for organizations to offer the deserved recognition, which would lead to incorrectness.

Aksakal and Dağdeviren (2014, p.147) view rewards as what is offered in exchange for desired behavior, as a factor in motivating employees to have flexible and better performance and reward management, whose main goal must be to properly reward employees, must ensure the creation of the reward structure that operates within the organization. The authors believe that rewards management should focus on both financial and non-financial rewards. We can observe that, in the article, the authors believe that reward management must be based on two motivation theories: the theory of equity, because it emphasizes that its main objective is to properly reward employees and Skinner's theory, because considers the rewards to be a positive consolidation.

Findings

Reward packages evolution

Bussin and Van Rooy (2014, p.1) highlights a major problem that may arise if an unitary structure is to be implemented in terms of the reward policies adopted, namely the fact that, depending on the generation the employees are part of, certain types of rewards can be different. In today's organizations, with employees from multiple generations, choosing this type of unitary reward policies could lead to the impossibility of obtaining the desired result, namely the attraction, motivation and retention of employees. This, the authors conclude, could have a negative effect especially on labor markets with few highly and medium skilled workers, especially in the context of increased labor mobility (Bussin & Van Rooy, 2014, p.1).

Another aspect regarding the rewarding strategy is highlighted by the Worldatwork study (2015, p.3) which shows that HR specialists agree that the company's business strategy must be the foundation for implementing human resources policies and developing a strategy for rewarding employees. Khan, Aslam and Lodh (2011, p.90) considered compensation management to be very important so that organizations do not end up having problems and an important means that companies have at their disposal in trying to attract and retain valuable employees. Compensation policy is considered being part of human resources policies. The authors defined compensation as being represented by all forms of payment obtained by employees as a result of their work, but noted that the compensation includes both financial and non-financial rewards. The definition was taken from Dessler (2016, p.346) who considered salaries, incentives, commissions and bonuses as direct financial payments, and financial benefits such as insurance and paid leave as indirect financial payments.

Medcof and Rumpel (2007, p.60), based on the findings of previous studies, stated that total rewards include everything an employee appreciates in the relation with it’s employer, including payments, benefits, a challenging work, learning and career development and work / life effectiveness, but not limited to them. Therefore, they believed that establishing a package of total rewards should be based on an inventory of rewards that the organization has the opportunity to offer to its employees, but also on a study of the importance that each of these rewards has for employees (Medcof & Rumpel, 2007, p.62).

Martocchio (2017, p.3) considers compensation to be composed of intrinsic and extrinsic rewards received by employees in exchange for their work and membership in the organization.

Fernandes (1998, p.2-3) emphasized that employers should review their reward strategy so that, on the one hand, they can identify the most effective rewards and, on the other hand, strengthened the business objectives, showing that reward strategies must seek to motivate those employees who pursue both career-related aspirations, but at the same time pursue the achievement of the business objectives of the organization. In the same approach, Kaplan (2007, p.16) shows that the strategy regarding total rewards is "a holistic approach that aligns with business strategy and people's strategy", considering that it refers to everything that employees value in the relation with their employers. Gross and Friedman (2004, p.8) noted a paradigm shift in total rewards programs: while organizations initially viewed this type of program as an useful tool that can be used for attracting and retaining employees, over the timetime they began to aknowledge the role that employees have in achieving business objectives.

The study carried out by Alhmoud and Rjoub (2020), based on the finding that the current labor market is dominated by Generation X and Generation Y, sought to determine the extent to which different types of rewards impact employee retention. The authors divided the rewards into three categories: extrinsic, intrinsic and social. The conclusions of the study, although limiting as highlighted by the authors, given that the research was conducted in a single field of activity and in a single country, revealed that, in terms of retention among representatives of both generations, the role of the extrinsic rewards is decisive, neither of the two generations being influenced by the social rewards. The study concluded that, in terms of retention, intrinsic rewards are more appreciated by representatives of generation Y and are of no interest to those in generation X (Alhmoud & Rjoub, 2020, p.10-11).

Robbins, DeCenzo, Coulter and Anderson (2013, p.260) also believed that employees can be motivated to behave appropriately by applying a fair reward program, and based on previous studies concluded that not all employees thinks that the money are the most important reward. Based on a 2000 study conducted in Canada, the authors stated that, in terms of employee satisfaction, paycheck and benefits matter less than a reliable top management and a good work-life balance (Robbins, DeCenzo, Coulter & Anderson (2013, p.260). Based on these considerations, the authors proposed adding to the reward package employee performance recognition programs and performance-based payment programs, stock options and improved work-life balance (flexible work schedule, work sharing, telework). The paper presented by Pregnolato (2010, p.70-73) indicates that, in terms of employee retention, in the total reward package the components have the following importance: benefits (35.2%), performance and recognition (20%), remuneration (17%), the possibility to advance in career (10.3%), the learning opportunity (9.1%) and the work-life balance (8.4%). The paper found relatively small gender differences in preference for one or other of these components. With regard to age categories, it was found that, while for Baby Boomers and generation X the preferences follow the general rule, generation Y follows the general rule for four components, while in terms of work-life balance it is considered fourth in the order of preferences, while career advancement ranks last in importance.

Bussin and Toerien (2015) also conducted a study in South Africa, as in the previous study, but only on the workforce operating in the IT sector, considering the total rewards model developed by WorldatWork. The study found that there was an additional problem in establishing and implementing a total rewards package, due to the fact that employees' preferred rewards differed significantly in the three study scenarios, namely to join an organization, to be motivated within an organization and stay within an organization. However, analyzing the total rewards preferred by employees, the study found that the components of compensation (salary, incentives and bonuses) retain their predominant importance, benefits being also considered very important (health insurance, retirement plans) and also rewards related to work-life balance, life and flexible work schedule. Management quality has been identified as the most important reward in employee preferences.

Rumpel and Medcof (2006, p.27) shows the relationship between total rewards and compensations, The authors states that, in order to increase productivity, to reduce the employee desire to leave the company and to increase employee engagement, organisations can implement flexible working hours, training programmes, career development opportunities and a strong performance management and they can integrate them with monetary compensations. In this way, it can be achieved something that the authors define as “employee value proposition”, meaning all that the employees receive in exchange for their work within organization. (Rumpel and Medcof, 2006, p.28). In this respect, Jiang, Xiao, Q and Xiao (2009, p.178) states that rewards are a compensation received by the employee in exchange for it’s work and it can be monetary or it can be converted into a monetary form and also it can have non-monetary forms, such as: stable work place, good relationship with colleagues, decision making involvement, challenging tasks, development opportunities. Keeping the same approach, the authors define total rewards as being formed of monetary payments, benefits, flexible working hours, educational assistance and all the opportunities offered in order to achieve both professional and personal performance. The authors highlight that, although the term total rewards is assimilated to the one of total compensations, total rewards represents all the elements that employees appreciate in the relation with their employer and it is the most modern term related to rewards (Jiang, Xiao, Qi and Xiao, 2009, p.183). The authors started from the term total rewards introduced by Fernandes (1998, p.2), who defined it as "the sum of the values of each element in the employee's reward package".

Although organizations have been trying for a very long time to align total reward management with the organizations’ business strategy, Deloitte (2018a, p.2), having as starting point the Bersin Deloitte Consulting LLP “High-impact Total rewards research” 2018 study, points out that only a small percentage of respondents perceive the rewards offered by organizations as very effective in driving business outcomes. The study revealed that respondents consider the rewards offered by their organizations to be "very effective" in driving business outcomes in the following proportion: alignment

with business goals (12%), talent retention (8%), talent attraction (6%), talent growth and development (5%) and talent motivation (3%). A possible response to these results was provided by Deloitte (2018b, p. 33-35) which found out that total reward packages do not align with employees' preferences in three aspects: 1. employees have a more favourable reaction to agile compensation granted more often than those granted on an annual basis; 2. organisations fail to create a wider range of rewards, which would lead to a more diverse workforce, because they do not try to better understand employees' preferences; 3. employees do not perceive many of the current reward programs as being fair.

Total Rewards Model Evolution

Armstrong and Brown (2006, p.14), consider that a functional reward model for the 21st century will have to focus on the growth of employee involvement as they should be motivated and productive. The authors believe that a reward system should be based on four core values: fairness (people should be rewarded based on their contribution to the organization, and employees should feel that the rewards are fair), equity (equal rewards for the same type of work), consistency (rewards are not set arbitrarily and do not differ in time or between different people) and transparency (employees understand how the rewards system works and how it will affect them) (Armstrong and Brown, 2006, p.16-17).

Brown (2018, p.14) developed a total rewards model, defining the terms of total rewards, total remuneration, total compensation and total cash. Total cash payed to employees have as rewards basic payments (basic salary, hourly salary) and short-term variables (annual incentives, individual bonuses, team bonuses). Adding to the total money the long-term rewards / incentives (stock/equity, profit shares) the total compensations are obtained. If passive benefits (retirement plan, health and well-being plans, paid leave) and active benefits (business car, professional memberships, discounts) are added to these, the total remuneration is obtained. All these classes of reward elements are considered by the author to be extrinsic and a monetary value can be associated with them. If an element containing extrinsic rewards is added to total remuneration, meaning engagement factors (quality of work, growth opportunity, enabling environment, work-life balance, inspiration/value), a total reward system will be obtained.

Milkovich, Newman and Gerhart (2014, p.13) defined compensation as being represented by "all forms of financial rewards, tangible services and benefits that employees receive as part of the employment relationship". Taking this considerents as starting point, they presented a total returns structure that employees receives in exchange for their work within the organization, structure containing two rewards categories: compensation (monetary compensation and benefits) and relational rewards. Monetary compensation is formed of: basic salary, periodic monetary compensations (with adjustment role, which can be both performance-based salary increases, with the role of providing similar payments for similar work, and increases with the role of rewarding developments in terms of experience or qualifications or to offset increases in living costs), short-term incentives (performance-based payments, granted on a regular basis and based on previously communicated criteria) and long-term incentives, respectively those incentives granted to reward efforts that employees made over a longer period of time (the option to receive or buy shares at a set price). Benefits consist of: 1. those measures taken to protect the income of employees (income insurance during periods when, for various reasons, the employee is unfit for work or loses his job, health insurance, life insurance, savings programs and retirement programs), 2. work / life balance (which allow employees to integrate employee responsibilities with those related to personal life) and 3. allowances (for accommodation, transport). Relational rewards are related to recognition and status, employment security, challenging work and learning opportunities (Milkovich, Newman & Gerhart, 2014, p.13-17).

Tropman (2001, p.61-189) considers total compensation as an equation with ten unknown exponents: 1. base pay or salary (which, as the author notes, represents for the organization the highest cost in total compensation); 2. augmented pay (representing those payments granted on a one-time basis consisting of overtime payments, incentive payments, profit sharing and stock options); 3. benefits (unemployment insurance, health insurance, social insurance and retirement fund set up by the employer); 4. providing work equipment; 5. offering discounts for the purchase of the company's products; 6. advancement opportunity; 7. development opportunity; 8. psychic income (emotional rewards or disappointments related in particular to work itself and to relationships with colleagues and superiors); 9. quality of life (representing the relationship between professional activity and personal life, the way in which they intertwine); 10.the factor named by the author factor X. This factor refers to the special needs and desires of specific categories of employees, needs and desires that redefine their expectations in relation to employers. The author considers that it is the role of the compensation manager to identify the specific needs defined by the X factor. He/she must be proactive and have the ability not only to solve employees' requests, but also to generate requests from employees, by consulting them on their preferences.

Armstrong and Taylor (2014, p.357) considered that the reward strategy and the business strategy must be integrated and they defined the need to establish a reward strategy. This was designed to help both establish the reward system that the organization wanted to develop in the future and the steps to be followed in order to implement this system. The authors pointed out that this reward system should lead to benefits for both the organization and its employees. The constructed model considered that the total reward package should encompass both the financial rewards, considered by the authors as representing the total remuneration and representing the transactional rewards, and the non-financial or intrinsic rewards, considered by the authors to be relational rewards. The first class of rewards included, in the authors' opinion, the basic salary, contingent pay and employee benefits, and the second the attractiveness of work itself, work experience, non-financial recognition, achievement and growth (Armstrong & Taylor, 2014, p.365)

It is very interesting how WorldatWork has developed models on total rewards. The original model was developed in 2000 and was based on the interaction of the total reward strategy with the organization's strategy and employee results. The model considered that the reward strategy is based on the following five components: compensation, well-being, benefits, development and recognition. The stated purpose of the model was to lead to a productive, inspired and commited workforce. WorldatWork believed that, in order to implement a correct total rewards model, organizations must also take into account external influences. WorldatWork has always sought to improve the total rewards model. The model published in 2006 changes the five components of the reward strategy. Compensation and benefits were maintained, adding work-life balance, performance / recognition and development / career opportunities. The implementation of this model was to contribute to the attraction, motivation and retention of employees. The last change was made to the model in 2015. The model was based on a six-component rewards strategy. The two components that remained unchanged were compensation and benefits. The other four components that complemented the reward strategy were: work-life efficiency, recognition, performance management and talent development. This reward strategy was considered to contribute to employee attraction, motivation, retention and engagement. What should be noted is that at each change to the model, WorldatWork presented a total rewards inventory that broadly defined the rewards that can be awarded within each component of the total rewards strategy.

Discussions

As a first objective, this paper aims to analyse the evolution of the categories of rewards offered by organisations. The research was based on empirical studies, surveys, reports and books that have addressed this topic in recent decades. The two concepts used by organizations to manage employee rewards were analyzed: compensation management and total reward management. Based on the research carried out, we can say that there is still a confusion in the literature between the term of compensation and that of total rewards, often considering the two reward schemes to be identical. We consider that, while the compensation package includes only salaries, bonuses and, in some approaches, a number of benefits, representing practically costs of the organization, made to reward human resources, the total reward system should be seen as a summation of the investment that the organization makes in its own employees (compensation, ensuring personal and professional development) with those factors that make employees appreciate the fact that they work for a particular organization, such as career advancement, flexible work schedules, a good work-life balance.

The second objective of the paper was to identify any differences in employees' preferences in terms of a particular type of reward, based on age and gender criteria. We considered this analysis to be important, taking into account that in the current labour market we find a great generational variety, and women are taking on an increasingly important role. The results of the research revealed that, while the rewards awarded under the compensation package still play a very large role, organisations will have to pay increasing attention to those rewards related to good effectiveness of both work and personal life, recognition of employees' efforts and performance, effective performance management and talent development.

The third objective of the article was to analyze a number of models on the total rewards developed in recent decades. The study of these models was done in order to have a better understanding on how they helped define and explain the contribution that current reward packages make to achieving employee satifaction and business goals. We believe that the total rewards model developed and continuously improved by the WorldatWork Association can be currently used successfully to implement total reward management. The total reward management can be adapted in the future, based on to the evolution that will take place in terms of rewards, bearing in mind both the dynamic relationship between employees and organizations and the external influences that are faced by organisations. It should be noted that the article did not intend to present all the models that were developed during this period of time, considering that it is sufficient to present only those models that have definitely contributed to the development of the management of total rewards.

Conclusion

The conclusions drawn from the analysis of the works published so far show that the need to implement a system of total rewards has arisen with the aim of supplementing and diversifying the compensation system. From an organization perspective, this was necessary in order to make the rewards system more financially sustainable and to help the organizations align the reward system with business goals, achieve an increasing degree of employee attraction, motivation and retention. The increasing diversification of the types of rewards awarded is also intended to ensure the satisfaction in the workplace of as many employees as possible from an increasingly diversified workforce.

The literature highlights two important factors in establishing reward systems. The first factor is based on analysing employee preferences for certain types of rewards in order to implement a reward system that meets the needs of as many employees as possible, but focusing on the preferences of employees with a high level of knowledge and qualification, which are basically the employees who have the greatest contribution in achieving the organization's performance objectives and ensuring a high level of competitiveness. The second aspect to be pursued in the construction of the reward system is that they must be based on the principle of internal equity (rewards to be awarded non-discriminatoryly according to performance, position within the organisation, responsibilities, experience and qualifications), on the principle of external equity (rewards granted to be similar to those granted in the labour market) and can be borne by the company's budget.

Surveys undertaken in recent decades show that, while there have been many organisations that have set out to introduce effective reward management, very few have succeeded in this endeavour. They also showed that few of the organisations that had implemented the total management had achieved the expected results from its implementation. We consider these issues to be very interesting themes for future research.

Forms of Spending Free Time by Generation Z of Consumers in Poland and Determinants of Their Choice

Jolanta TARAPATA

Military University of Technology, Faculty of Security, Logistics and Management, Warsaw, Poland, jolanta.tarapata@wat.edu.pl

Abstract

The paper presents the specificity of the group of consumers belonging to the so-called generation Z. Regardless of whether the biological or educational criterion of age is taken into account, this segment of the market requires detailed knowledge, as well as the determination of specific features that distinguish it from the adult part of society. The aim of the paper is to extend knowledge about the forms of spending free time by young consumers and the determinant of their choice. The study uses secondary sources of information, which made it possible to characterise free time, as well as aspects related to its quantity, deficit, and management by young consumers. Thematic books were used, as well as studies on the characteristics of the contemporary generation Z. To illustrate the considerations undertaken, reference was made to own research aimed at seeking a link between young consumers' preferred free time activities and their family environment, i.e. the material conditions of the family and the associated pocket money of young consumers, as well as their individual predispositions, i.e. their system of values and life goals, their interests and constraints, i.e. their time deficit. It has been assumed that these groups of factors have a decisive influence on the choice of activities undertaken by young consumers in their free time.

Keywords: Consumer Behavior, Free Time Spending, Generation Z.

Introduction

Free time is currently one of the scarcest and therefore valuable resources in human life. Today's young consumer gives it an extraordinary rank. Deciding on the choice of specific forms of free time management relates to his pursuit of specific goals and meeting needs. Most often this is done by consuming specific goods and services. Needs, motives, values and life goals are therefore the driving force behind the young generation of consumers (Naumovska (2017)).

In each society, young people are a separate and diverse group. A particularly interesting group of consumers manifesting increasing market activity is the generation Z, also referred to as the C generation, the multitasking generation, the quiet generation, generation@, generation V, or the Internet generation (Wyrwisz (2018)). It includes young people born between 1995 and 2009. They are one of the most active and influential consumer groups that is now entering adulthood and determining consumption trends. An important defining feature of the generation Z is the fact that the digital world has emerged and is growing up surrounded by it and that it actively participates in it. These people were born at a time when IT technologies were spreading rapidly and began to enter the everyday life of an ordinary person. The Internet slowly ceased to be a domain of so-called techno-elite and appeared in numerous households. Step by step, it began to transform the existing reality and invite you to discover the meanings of this new, virtual one (Jablonska (2018)).

Representatives of this generation do not know the world before the era of the Internet, smartphones, and Facebook, they are constantly online and their characteristic feature as consumers is their resistance to traditional advertising messages. Rather, they rely on the opinions of friends, influencers, and patterns from social media. Consumers of the generation Z are representatives of the information society. They are much more active than adults in using new technologies that are ubiquitous in all spheres of their lives (Immordino-Yang et al (2012)). Computer games, e-mail, Internet, mobile phone, instant messaging is an integral part of their lives. M. Prensky describes representatives of this consumer group as 'digital natives', claiming that they are 'native speakers' of digital language, computers, video

games and the Internet. As a result of the ubiquity of the digital world, its volume and interaction with it, today's young people think and process information differently from their predecessors (Prensky (2001)). This is important from the point of view of analysing their consumer behaviour and the related activity they undertake in their free time.

Looking at the representatives of generation Z, several important aspects of their relationship to free time can be identified. However, some differences should be pointed out, depending on whether they are representatives of the so-called first wave, i.e. the early generation Z (born after 1995) or the generation born after 2000.

The paper focuses on the second group of representatives of the young generation, school-age youth. The research was conducted in May 2019 in one of the Warsaw secondary school and covered 80 students (15-16 years old). The research had a pilot character and was based on a diagnostic survey method.

The paper is organized as follows. In section 2 the essence of youth free time has been explained. Section 3 contains analysis of secondary research deal with forms of spending free time by school children. Section 4 contains results of own research and deals with selected aspects of consumer behaviour of generation Z in free time.

The essence of youth free time

Free time is sometimes presented in different ways, because the issues of free time are dealt with by representatives of many scientific disciplines. Each of them considers free time from their own research perspective, paying attention to other aspects of it and formulating their own definitions.

In common thinking it is understood as free time from work, school, household duties, time in which we rest and can pursue our interests and hobbies. It is also associated with inactivity, lack of activity or passive activities. This concept is defined differently by the authors of scientific studies.

By analysing different definitions of free time, you can group them into three streams:

- free time in a "pure" form is the time when a person does not perform any obligatory activities and duties;
- free time interpreted through the prism of specific behaviours undertaken in it. These behaviours may manifest themselves in all activities that lead to rest. They are individualized and based both on individual preferences of the individual and on generally applicable social norms;
- the third dimension accentuates the spiritual dimension of free time. In free time, man satisfies the needs of a higher order, striving for self-realization, self-improvement, and development (Bombol (2008)).

As it results from the above-mentioned definitions, free time belongs to the private sphere of the individual, characterized by freedom of action and voluntariness. It is the individual who decides about the ways of spending free time according to his or her own hierarchy of needs and values and interests and preferences.

Free time, as an important category in determining the behaviour of young consumers, is treated very ambiguously. Some young people define their free time as time out of school (26%), time out of regular classes (28%), or time when there is nothing else to do (27%), and even as Saturdays and Sundays (Olejniczuk-Merta (2009)). According to (Sowa (2013)) the youth's free time is the time remaining after the realization of school duties, which consists of the time of freedom (completely free, which the subject can freely decide about the development of at any time) and partially free time, the development of which results from commitments, interests or relationships with other people (e.g. home help, care of animals, playing sports, playing the instrument, gainful employment and others). The qualification of activities to appropriate groups depends on the individual situation of the entity.

The way a generation of young consumers spend their time is different from the way adults use it. In the case of school youth this way is not arbitrary, it is subject to control and intervention of adults. It is also determined by schooling and homework.

Forms of spending free time by school children – analysis of secondary research

The problem of youth's free time has become the content of many research papers and scientific papers in recent years. Much of the research is focused on the ways of spending free time depending on the influence of various factors.

To take a closer look at the way young people spend their free time, empirical research relating to this issue is presented. Free time can take two forms - active and passive. In the study Young Europeans – Eurobarometer 2007

(Young (2007)) the young people of the European Union were asked a question about what they most often do in their free time. The most frequent activities undertaken by the respondents were sport (45%), meeting friends (40%), reading (25%), using the Internet (21%), watching TV (19%), listening to music (16%) and others such as: helping at home, shopping or taking up paid work. The results concerned young people from various European Union countries. Therefore, it can be assumed that they will look slightly different in Poland. Further discussion deals with secondary research in Poland in this matter.

Research carried out by M. Dragan in one of the secondary schools shows that young people prefer to spend their free time passively. Most often they sit in front of a computer (62%), go to the cinema (49%) and watch TV (35%). Much fewer students spend their free time reading books, meeting friends, or playing sports (Dragan (2013)).

The computer is a constant element that young people decide on in their free time. A large part of middle school students, because 80% of them sit in front of it for more than one hour. Some (about 20%) spend more than 4 hours in front of the computer. Most junior high school students, because almost every third student spends up to 3 hours using the computer (Dragan (2013)). The use of a computer is more and more often one of the main activities performed by young people in their free time. This is also confirmed by research conducted by E. Machowska. It results from them that most young people spend their free time more often in front of the computer than at meetings with friends in the real world (Machowska (2015)). These results are like those of other authors, according to which the average time of using a computer by youth is about 2 hours per day. According to the authors, there is no significant relationship between the time spent by youths on a computer and their environment. The youths from countryside use the computer only 6 minutes less than the youths from a big city (Rabisz et al (2014)).

Middle school students use the computer to a large extent for surfing the Internet, this group makes up 30%, then every fourth high school student uses it to watch movies. Less than 21% of junior high school students use a computer to communicate, whether by e-mail or any kind of communicator and Internet telephony (Dragan (2013)). Wide access to the Internet makes young people feel little need to leave home and meet with friends. The need for contacts with others is satisfied by communicators, social networking sites and telephones that have access to the Internet. Watching TV is also less popular, because many movies, series can be watched over the Internet anywhere and anytime. Most of the respondents spend their free time using the Internet 1-3 hours a day, but there are also people whose whole free time activity comes down to it. (Machowska (2015)). These studies confirm that new technological possibilities relate to the increased amount of time spent in the virtual world. Young people more often choose to interact with friends over the Internet than face-to-face meetings.

From studies carried out by Puciato and Szczebak (2011) result that 43.6% of junior high school students spend their free time at home, while 40.6% of them spend their free time at sports facilities, in the backyard, in front of their block of flats, preferably 15.6% of them. The vast majority of the surveyed junior high school students (62.5%) take up free time activities with high frequency. Occasionally 34.4% of the respondents do it, but never just 3.1%. However, the forms of physical activity are not usually institutionalized. Participation in a sports club is declared by only 46.9% of respondents. Physical activity of youth is also indicated by other studies. They show that the most common form of activity undertaken within the so-called free time is participation in games and movement games with peers. This is claimed by 67.8% of the surveyed junior high school students. The second place is occupied by time spent watching TV - 58.5%, while the third place is occupied by the form of spending free time on computer games - 53.7%. The authors also prove that regarding two forms, i.e. time spent on computer games and helping parents in running their households, there is a difference between young people living in town and in the countryside. Young people living in the countryside help in running the household more often, while young people living in cities spend their free time on computer games more often (Rabisz et al (2014)). Other studies conducted by M. Malareczka show that junior high school students, apart from surfing the Internet in their free time, playing sports, watching TV, also spend their free time helping their parents, listening to music or meeting with friends. Moreover, most of the students participate in extracurricular activities organized in or outside the school (Malareczka (2015)). The use of electronic equipment, including cell phones and MP3 players, also turns out to be popular among youth. The average time of using such equipment per day is about 1.5 hours (Rabisz et al (2014)).

Analysing the available studies, it should be noted that a worrying phenomenon may be that as many as 40.6% of schoolchildren declared that there was no excess of free time, 31.3% claimed that they had too much free time, and 28.1% of them had no specific opinion on this issue (Puciato and Szczebak (2011)).

The cited research is reported to school-age youth, young consumers who are unemployed and dependent on their parents/caregivers. The way they spend their free time is certainly different from the ways preferred by older, financially independent youth or adults.

Selected aspects of consumer behavior of generation Z in free time – own research

Research on selected aspects of free time management by representatives of the young generation was conducted on a group of school-age youth (15-16 years old). The aim of the research was to determine the factors influencing the way young people spend their free time and to learn about their free time activities. This part of society expresses an interesting attitude to the concept of free time and its management. The study assumes that the behaviour of the young generation in free time determines the system of values and life goals of young people, their interests, as well as external factors such as, for example, their peers or financial resources available to young people. The study involved 80 students, of whom 48% were girls and 52% boys. This group consisted of students in the last grades of junior high school and eighth grades of elementary school. In the study a diagnostic survey method was used. The tool used in the study was a questionnaire. The questionnaire in paper form was distributed to the surveyed students.

Young people, when asked to respond to a few terms about their values and life goals, were most likely to point to love and friendship (45%) and interesting work in line with their interests (41%). An equally high percentage of respondents indicated successful family life, having children (29%) and being useful to others (21%). The life goal, to which youth does not attach much importance, is to achieve a high professional position and make a career (10% of respondents). One can risk a statement that this is a far-reaching goal, which takes on importance later in the consumer's life. The division of respondents by gender did not show significant differences in the choice of life goals. Respondents differ significantly only in relation to the value of love and friendship. Twice as many girls (61%) as boys (31%) give this life goal more priority.

Representatives of the young generation show different interests which determine, among others, their membership in different clubs or associations. 58% of respondents indicated interest in sport - this applies to both girls and boys. 43% of young people are interested in computers and the Internet - here the advantage is on the boys' side and a little less (41%) has artistic passions, is interested in art, dance, music, film and theatre. This area of interest was indicated by girls in the vast majority (as much as 74% of this population). Literature and reading books are of interest to a comparable number of girls and boys (29% and 21% respectively). 13% of all respondents are interested in the automotive industry. These are mainly boys, representing 21% of this population. Unfortunately, research has shown that there are young people who do not have interests and passions.

The conducted research proves that the young generation uses many forms of free time, in which a significant position is occupied by those that are the result of globalization, or the product of mass culture, and that they are conducive to establishing contacts, cultivating friendships, and exchanging views (Figure 1.).

The most common activity of youth is listening to music. This form of activity was indicated by 59% of respondents. Music accompanies young people with homework, using a computer and contacting other people. It is an activity undertaken in free time and even during the performance of duties, constituting a background for the activities undertaken. By filling in their free time, young people (55%) establish ties with their peers. Meetings with colleagues remain a popular way of leading a social life, however, their directness is increasingly often replaced by virtual contacts. As often declared as a form of spending free time, young people include practicing sports. 51% of respondents participate in sports activities. This shows a significant correlation with the declared high interest in sport. The representatives of the generation Z also attributed a significant position to computer use and surfing the Internet (45% of the respondents). Apart from the above-mentioned activities, which seem to be completely voluntary, young people take up activities which relate to the realization of their duties, commitments, or passions. These activities include attending various extracurricular activities such as instrument playing, art classes, language courses, computer graphics (48%).

Fig. 1: Ways of spending free time by young people regarding their gender (maximum five activities per respondent were chosen)

A significant difference was observed between the preferences of girls and boys in the choice of selected activities. Girls, compared to boys, spend their free time more often with friends (71% of the girls' population). Only 40% of boys indicated this form of activity. Girls participate more often in extracurricular activities than boys (61% and 36% respectively). Boys, on the other hand, gain an advantage in the frequency of computer and Internet use (62% of the boys' population) over girls (26% of the girls' population). The Internet, which is used most often in free time, plays an increasingly important role in the use of free time, mainly due to its relatively low cost, universal accessibility or the benefits perceived by its users. It allows young people to relax, provides fun, or is a carrier of many information that the consumer uses. 31% of respondents spend about 2 hours on using the Internet during the day, 25% - about 1 hour, and 28% - up to half an hour. In the latter group there are girls in the vast majority (42% of the girls' population). There are also those who spend from 3 to 5 hours a day on the Internet (10%), and 8% of the respondents claim that they spend more than 6 hours a day on this form of activity - only boys belong to this group. For what purposes do young consumers most often use the Internet? The research shows that 59% of young people use the Internet to communicate with friends, e.g. through Facebook or chat rooms and e-mail. After 53% of young consumers listen and download music and watch and download movies and series, and 33% play online and social games. Around a quarter of young people search the Internet for information they need for school, study and as much as they browse through websites dedicated to their passions and interests. 14% of the respondents look at web shop sites and do shopping. A small percentage of respondents make new acquaintances via the Internet (8%) and read or download books and literary works (6%). The respondents of the female and male sexes do not differ significantly in terms of the purpose of using the Internet. The differences concern only two indicated purposes. As much as 82% of the girls' population and only 38% of the boys' population indicated communication with friends via the Internet, while 45% of the boys' population and only 18% of the girls' population indicated use of the Internet for online or social games. The results of the research indicating young people's approach to free time understood as doing nothing, resting or lazing are interesting. As many as 36% of the respondents claim that they spend their free time passively on doing nothing, relaxing or lazing. In view of the above, one can risk a thesis that there is a certain group of young people who identify their free time with passive rest, relaxation, but also a significant part of it fills it with activities related to pleasure and striving for self-realization. The choice of free time activities by the respondents, depending on the amount of money available to young people during the month, showed significant discrepancies for the selected forms (Figure 2). As the Figure 2 shows, there are activities that are undertaken only, or much more often, by young people who are financially less well-off or who do not have a fixed pocket money every month. These include attending

parish classes, watching TV, helping at home, going for walks. These young people meet with friends, do sports, spend time at the computer, listen to music or do nothing, less often than their more financially well-off peers.

Although most young people (97%) indicate their passions and interests, 21% say they do not belong to any circles, clubs, or associations. However, in most cases, the interests declared by young people translate into leisure activities. 20% of the respondents belong to sports clubs, including supporters, 14% to music groups and choir and 10% to dance groups and clubs. The last two activities are mostly chosen by girls. Similar activities are shown by girls and boys in areas such as: volunteering (11% of the total), scouting (5% of the total) and Catholic youth associations (4% of the total).

The aim of the study, in addition to learning about the forms of activities undertaken by young people in their free time, was to identify their preferences in this area, as well as to identify obstacles that make it difficult or impossible for them to spend their free time in their preferred way.

In terms of young people's preferences for spending their free time, some of them overlap with the forms of activity undertaken by young people. This mainly concerns meetings with friends, listening to music, using the Internet, or doing sports. There are also activities that the respondents would like to consider in their free time, and which for various reasons cannot be realized. 43% of the surveyed young people would like to realize their dreams connected with sightseeing and exploring the world, 30% read books, 28% go to the cinema, a little less, because 20% go to discos and youth clubs and 19% watch TV. After 11% of the respondents declare their willingness to go to the theatre and philharmonic and to develop their skills, e.g. in art, dance, vocal, etc. So, what is preventing young people from realizing their aspirations? Representatives of the Z generation increasingly often declare that they feel a lack of free time. The declaration of insufficient amount of free time for realization of preferred activities was made by the vast majority (66%) of young people taking part in the survey. The lack of free time is to a large extent a consequence of the increasing pace of life of young people. One of the reasons for the fast pace of life of the young generation is too many different activities that they perform in a unit of time and taking additional activities related to plans or dreams. This is confirmed by research, according to which a significant part of respondents (55%) claims that it is too much learning that prevents them from carrying out their preferred activities.

Fig. 2: Monthly financial resources (in PLN – Polish Zloty, 100 PLN ≈ 22,5 EUR) of young people and their preferred leisure activities

Another reason for feeling lack of free time can be the development of modern technologies, which instead of making life easier for consumers, often complicate them, detach them from learning, make it difficult to concentrate, e.g. constant signals of phone calls, text messages or notifications from social media. Young people often suffer from lack of time due to the desire to fulfil themselves in various social roles. They want to be good students, caring children for parents, available friends, people who care about their physical condition and appearance. This makes their free time insufficient. Other obstacles to their preferred free time activities indicated by young people are their parents'

lack of consent (28%) to undertake certain activities, i.e. going to discos, youth clubs and the related too young age of the respondents (16%) and lack of money (21%).
Among other aspects of the life of the modern young generation, the way in which they have their free time budget deserves attention. When asked about the monthly budget they have at their disposal to meet their needs, a quarter of them admitted that they receive between PLN 50 and 100 for their own expenses, 20% - over PLN 100 and 200, and 16% have between PLN 20 and 50 at their disposal (100 PLN ≈ 22,5 EUR). Among the respondents there are also people whose monthly budget is much higher - they receive over 400 PLN (15%), but there are also those who have up to 20 PLN (9%) or have no money at their disposal (8%). Significant differences between the sexes concern only budget ranges from PLN 51 to 100 and from PLN 101 to 200. In the first case, girls dominate (34% of the girls' population) over boys (17% of the boys' population). In the second case, boys (26%) over girls (13%). The increase in the value of time in the life of generation Z, as well as its continuous deficit translates into a growing interest of generation Z in eating meals or snacks outside the home. A wide range of catering establishments diversified in terms of offer, price, quality, location, makes it possible for everyone, even with a small budget, to find something suitable for themselves. Young people benefit from this type of services, especially those offering fast, tasty, and affordable meals. Therefore, as studies have shown, the Z generation spend most of their savings on food (75% of respondents). It does not matter what their gender is and what monetary budget they have (Figure 3).

Fig. 3: Monthly financial resources (in PLN – Polish Zloty, 100 PLN ≈ 22,5 EUR) for young people and directions for their free time activities

A large proportion of respondents (41%) spend their money on clothes, and 31% each on computer games and cosmetics. Respondents differ in terms of gender. As much as 65% of girls spend their savings on cosmetics, while only 2% of boys. In the case of computer games, the situation is different. It is more boys (55%) who buy them, while only 5% of girls spend their money on them. About a quarter of the respondents spend money on cultural activities (cinema, theatre, concerts) and 8% on stimulants (cigarettes and alcohol). The second group is dominated by boys. The above chart also shows that young people with a monthly amount of over 100 PLN spend more often on computer games than young people with less money. The same applies to stimulants (cigarettes and alcohol), which are purchased by more financially well-off youth.

Summary

Free time plays an important role in the life of the young generation. It has a function of relaxation, rest, fun and entertainment. It is of great importance in the process of socialisation of young people, as well as in the intellectual development of individuals. Young people have specific values, life goals and interests that determine the choice of leisure activities. How they manage it also depends on the financial resources they receive monthly from their parents to meet their consumption needs.

Research has shown that contemporary youth attach great importance to peer contacts, which they make in both direct and virtual relationships. A significant proportion of the respondents invest in their intellectual development by participating in various extracurricular activities improving their language, technical and mathematical skills, as well as developing their interests and artistic skills, during art, dance, music, etc. For many young people, the physical fitness that they acquire during their sport is not without significance. Young people are reluctant to read books and

even less often go to the theatre, cinema, philharmonic or concerts. Young people spend a lot of their free time in front of the computer, surfing the Internet, thus compensating for the decreasing intensity of direct meetings with friends, as well as participation in cultural life by watching films or listening to music. The consumption behaviour of young people is conditioned by both their financial background and their declared interests.

Nowadays, the accelerated pace of life, absorbing compulsory classes at school as well as overtime activities contribute to limiting the free time available to young people. Young consumers are confronted with the problem of a time deficit. They are also starting to lack time for activities they would like to do in their so-called free time.

Abstract

Extending from the existing literature that has highlighted the distinctive features of Asian companies, this study attempts to link these special features with their financing behavior from an agency theoretical perspective. Drawing on the evidence indicating that prominent features of Asian companies notably are concentrated ownership with extensive family ownership and dominance of controlling shareholders controlled by two main ethnic groups in Malaysia, namely the Chinese and the Malays, this study also attempts to investigate the effect of ownership and ethnicity on financing decisions of Malaysian family firms. This study employs literature on family business and explains the possible impact of family and business reciprocity coupled with the issue of ethnicity within a family firm that drives the uniqueness of the firm itself. It is believed that the special characters, such as strong family ties, undiversified family holdings, and a strong desire to hand over the company to subsequent successors and higher concerns to maintain family reputation tend to offer different incentive structures, at least in regards to capital structure. Agency theory suggests that family companies have lower agency problems because owner-manager interests tend to be more consensual, thus giving creditors greater confidence to lend. Although this study is qualitative in nature, but it is unique, because it deals with the determinants of capital structure that is almost not found in developed countries. This provides an alternative explanation for financial variation and provides evidence of the capital structure theory solitary.

Keywords: Family Firms, Ethnicity, Bumiputera, Leverage, Agency Theory.

Introduction

Since the scientific work by Modigliani and Miller (1958), the theory of capital structure has become an important topic of debate in many studies. Evidencing from that, many studies have sought to identify the determinants of firm's capital structure in various economic markets. Among the determinants include taxability, firm size, asset tangibility, growth opportunities and profitability. The more recent and deliberate literature strands focus on the impact of in-house firm-specific features such as ownership structure on capital structure choices (Masdiah, Azizah & Nur Atiqah 2015; Lean, Ting & Kweh 2015)

Studies on the determinants of capital structure focus on developed economies with mixed results. The impact of ownership structure on company financing decisions in emerging markets such as Malaysia has yet to be explored (Fan, Wei & Xu 2011). Majority of companies listed in emerging markets are family owned. Claessen, Djankov and Lang (2000) found that almost 68 per cent of the sample of their Malaysian companies is family-run and 28.3 percent of market capitalization is run by 15 families.

Given the prevalence of family businesses in Malaysia, it provides a significant platform to analytically propose how family ownership in the rearm of agency theory is related to financing decisions, specifically, the levels of leverage. Another area that left greatly unexplored is the effect of ethnicity on capital structure. One possible explanation why this area of study is not addressed in many previous studies is due to the absence of ethnic diversity in most of other countries. Nevertheless, in Malaysia diverse ethnics who dominate firm's ownership is prevalent. Therefore, this study aims to explore whether there is a possibility that family ownership and ethnicity have an impact on the firms' capital structure decisions.

Ownership Structure

Prior studies have grouped corporate ownership structures into two categories namely widely held and closely held firms. A major distinction between these two types of firms is that a widely held firm does not have any owners with substantial control rights. Meanwhile, a closely held firm is identified when its shares are owned by identifiable and "cohesive groups of insiders" (Claessens et al. 2000) that form ultimate control (Abdul Rahman & Salim 2009). These shareholders generally have long-lasting stable relationships with the company and typically a member of the company's founding families. Other forms of shareholders inclusive in this group are lending banks, government or other small groups of companies that are linked through cross shareholding, pyramidal ownership structure and dual class shares (Claessens et al. 2000; Manos et al. 2007). Cross shareholding and pyramidal ownership structure are common strategies extensively used by dominant shareholders to effectively exercise their control over the firm with relatively less direct stake in the cash- flow rights.

It is well documented in the literature that families are the most significant type of firm with concentrated ownership that shape a pattern of ultimate owners (Anderson & Reeb 2003; Abdul Rahman et al. 2009). Corporate ownership structures in the UK and US are more diffused as compared to ownership and control in Malaysian public corporations which are more concentrated and family dominant (Claessens et al. 2000). In Malaysia, family firms constitute for more than two-third of the total firms while the remaining is generally held by state or institutional investors or else categorized as widely held corporations (Driffield et al. 2007).

Previous research suggests that agency problems only exist in a firm with dispersed ownership structure (Fama & Jensen 1983). They argue that the separation of ownership and control is more likely to occur in the companies with dispersed ownership structure where shareholders have limited control over management activities. Therefore, the management will be more likely to practice more freedom in the use of companies' resources compared to companies that are managed by their owners. Consistent with this view, Jensen and Meckling (1976) and Fama and Jensen (1983) also agree that the issue of separation of ownership and control in the modern dispersed ownership corporations is the root of agency problems. In short, this view implies that agency problems will be minimized if the control of corporate wealth is concentrated in one or a few large shareholders.

Sharma (2004) suggests that research on family firms cannot be justified just because the existence of family owned companies has dominated most parts of the world. She suggests that study on family firms need to be more legitimatized by identifying unique features of family firms which make them different from other business organizations. Attributes of families, such as cohesive group of insiders, strong family ties, and feelings of loyalty and kinship obligations have been highlighted as features that distinctive to family firms (Miller & Le Breton-Miller 2005). It is expected that these unique features could benefited family firms to some extent.

Malaysia signifies insider ownership and control structure with concentrated shareholding dominated by families (Claessens et al. 2000; Abdul Rahman et al. 2009). One of possible explanation why Malaysian firms predominantly owned and controlled by families, in part, is due to poor legal system where the rights of minority shareholders are not well protected (Abdul Rahman et al. 2009). Consequently, non-family investors would not find the businesses as an attractive investment when their rights are less protected. As such, the business is more conducive for a family shareholder base but less conducive for a diverse shareholder.

Family Firms

Masdiah et al. (2015) demonstrate that family business dominates many emerging economies including Malaysia. Although ownership structure of firms in developed countries is rather diffused, the existence of family firms is still substantial (La Porta et al 1999). Unlike family firms in developed countries which typically employ professional managers, family firms in emerging markets are largely managed by inherited family members (Fan et al. 2011). These studies also reveal that ownership of family firms in the developed markets become dispersed more quickly after they become public, while ownership in emerging markets remains highly concentrated even long after going public.

Literature shows that there is a distinction between family and non- family firms. For example, Brenes et al. (2006) define family firms are firms that are dominantly owned and managed by a solitary root family. They further state that this family typically holds a significant proportion of equity stakes in the firms. Similarly, Driffield et al. (2007) find that in family firms, the management and ownership are rarely separated where firm leadership and top management team members are largely comprised of controlling owner and family members. The findings on Asian firms as reported by Fan et al. (2012) also support the definition put forth by prior studies. Fan et al. (2012) further add that since the controlling owner and management boards are members of the same family, it is expected that their interests are more closely aligned that leads to less agency conflicts.

An ambiguity exists on how practitioners (e.g. family business managers, consultants and fund providers) and researchers define family business (Chua et al. 1999). In an attempt to reconcile any conflict related to family firms, one must make a distinction amongst three fundamental elements that are ownership, control and management in defining family firms (Villalonga & Amit 2006). Although definitions vary, family firms would imply that family members own higher levels of equity in their firms, in which ownerships are symbolized (Fama & Jensen 1983). Family controlled firms are normally differentiated by ownership concentration as well as the existence of family-related person called 'Cronyman' (Driffield, Mahambare & Pal 2007).

According to Miller and Le Breton-Miller (2005) family business promotes stagnation, isolation, hereditary, cronyism, favoritism, disagreement, and nuisance leadership. However, they also suggest that unique characteristic of governance system such as cohesiveness, strong family ties, and loyalty and kinship obligations exist in family business. These unique features may help develop competitive advantages in terms of efficient investment decisions which enable firms to generate better performance and higher returns with low agency costs (Villalonga & Amit 2006; Maury 2006). Further, the interrelationship between family and business systems may offer some benefits such as low monitoring cost of management and better coherent in optimizing decision making.

Family firms have long been recognized as common organizational forms worldwide. For instance, a study on ownership structures by La Porta et al. (1999) on large corporations in 27 wealthy economies shows that relatively very few of these firms are widely held, but rather, these firms are usually controlled by families or government. Manos et al. (2007) report similar findings in which family is the dominant form of firms' ownership in developing countries due to prevailing market imperfections and information problems. Family firms are also found to dominate most of the East Asian corporations and have accounted significant amount of corporate wealth in the region (Claessens et al. 2000). Malaysia in particular, more than two-third of its companies comprise of family businesses. The contribution of family businesses towards economic growth is substantial. Ngui (2002) reports that family firms in Malaysia essentially contribute more than 50 percent of the country's Gross Domestic Product (GDP).

Although family firms as organizational forms have received a great deal of attention in recent years, studies that focus on financing-related issues in the context of family firms are still limited, particularly in the emerging markets (Colot & Croquet 2009). In emerging markets such as Malaysia the contribution towards this area of research is significantly less in numbers because studies on family related issues are still new in Malaysian setting (Amran & Che Ahmad 2009). Moreover, the contextual setting as indicated by Fraser et al (2006) reveal that Malaysian market comprises of many unique features (i.e., ethnicity, culture, political patronage etc.) that are left unexplored.

Sharma (2004, p. 9) states that "the intertwinement and reciprocal relationships between the family and business systems is being recognized as the key feature distinguishing this field of study from others". Additionally, the emphasis in the creation of unique resources (e.g. friend and family financing) and capabilities are also getting the attention of researchers in this field (Chrisman et al. 2003). The presence of unique features of family such as parsimony and personalism form its own governance systems that allow family owners to make decisions in ways that are largely unavailable to firms with other governance structures (Carney 2005). In sum, the preceding discussion of family firms suggests that unique attributes of family firms which potentially give rise to competitive advantages that serve interesting research setting to further explore the field.

Agency Problem in Family Firms

Agency relationship is a contract whereby the principal(s) engage another person (agent) to perform services on the principal's behalf (Jensen & Meckling 1976). This contract also involves entrusting some decision making authority to the agent. Due to incomplete contract between principal(s) and agent(s) and with the presence of residual control rights, the agent(s) may betray these rights to benefit his own welfare (Nwanji & Howell 2007). This betrayal contributes to the agency problem and it becomes a common issue of debate within companies. They also argue that managers who manage other people's money cannot be expected to monitor them with the same prudence as when they monitor their own.

Many prior studies often use agency theory as one of the most important research frameworks to explain the unique phenomenon in a family business. For instance, Morck and Yeung (2003) justify with evidence that the level of agency problems vary between companies with dispersed ownership and concentrated ownership. Shleifer and Vishny (1997) argue that narrowly held companies are expected to have lower agency problems as a result of better matching between control and cash flow rights. Likewise, Morck and Yeung (2003) suggest that agency problems might be lower in less diffused ownership such as those controlled by families. Therefore, the incentives of the controlling shareholder are more likely to favor the interests of other shareholders. They also reveal that much discussion of prior studies on ownership structure have shown the evidence that the presence of block shareholdings (e.g. family firms)

can assist the board to improve the effectiveness of monitoring in mitigating agency conflict. This issue of agency problem becomes more severe due to the significant phenomenon of the separation of ownership and control.

Fama and Jensen (1983) highlight that one major factor in determining the survival of any forms of organizations is a control of agency problems. These problems emerge because to set and enforce a contract among agents with conflicting interest is rather costly. Furthermore, Fama and Jensen (1983) show that agency problem which occurs in a firm with a separation of ownership and control, should be regulated by the firms' decision systems that separate the management and control. In discussing firms' value, Villalonga and Amit (2006) show that concentrated ownership should have a positive impact on the firm value because it can reduce the classical conflicts between owners and managers. Villalonga and Amit (2006) suggest that greater insider ownership is associated with better corporate governance. This is because the managers, who hold larger equity stake holding in the company, would prefer not to take actions that can reduce the value of their shares that affect their wealth. This shows that agency problem is low in narrowly held companies such as those controlled by families.

Nevertheless, agency problems could still exist in family firms due to conflict of interest between the controlling family and minority shareholders (Morck & Yeung 2003; Villalonga & Amit 2006). They argue that the coupling of ownership and control could result expropriation activities by the controlling families when they represent their own interests which may not coincide with the interests of other shareholders in the firms. Expropriation activities by the families have been found to affect the performance of the firms specifically when the families are able to extract wealth from the firms. Evidencing from literature, family controlled firms dominate Malaysian listed firms substantially (Claessens et al. 2000). Malaysia has unique corporate landscape resulting from its own historical background influenced by culture of various countries such as Britain that used to occupy Malaysia, and India and China that have had business practices in this nation (Eichenseher 1995; Haniffa & Cooke 2002; Johnson & Mitton 2003; Abdul Rahman & Salim 2009). Hence, Malaysian community is made up of different ethnics, religions, creeds, traditions and languages. These elements are expected to influence various expects of businesses, at least with regards to capital structure.

Ethnicity, Culture and Firms

As discussed in the previous section, Malaysia has a unique corporate landscape produced from its historical background that has evolved and influenced by the cultures of various countries such as Britain which once occupied Malaysia, and immigrants from India and China and brought their culture and traditions attached in business practice (Eichenseher 1995; Haniffa & Cooke 2002; Johnson & Mitton 2003; Abdul Rahman & Salim 2009). Therefore, Malaysian society is formed from various ethnicities, religions, beliefs, traditions and languages. Furthermore, the practice of affirmative action that occurs usually involves measures to increase the participation of less fortunate ethnic groups in a number of areas such as education and business can also influence enterprise financing decisions such as capital structure decisions.

One of the problems that often arise in most research related to capital structure is due to failure to explore cultural factors (Haniffa & Cooke 2002; Claessens et al. 2000). These factors can be explained by the various ethnicities that dominate family ownership. Haniffa and Cooke (2002) state that cultural factors are imperative because the traditions of a nation are embedded in its' society. Therefore, the value instilled can help explain why something happens as it is. Haniffa and Cooke (2002) also classifies the group multiracial into two main categories: 1) those who have a cultural affinity indigenous that comes from this region, classified as Malays or Bumiputera (literally means "sons of the soil"), and 2) those whose cultural affiliation is outside the indigenous group, which is classified as non-Bumiputera (consisting mainly of Chinese, Indians and others).

Since, Malaysia is a developing country with people of various races and backgrounds, ethnic issues can be debated in many fields of studies (CheAhmad et al. 2006). For example, studies by CheAhmad et al. (2006) and Yatim et al. (2006) show that ethnicity plays an important role in determining auditor choice decision and corporate governance practices and audit fees. Bates (1999) posits that in some countries the issues of ethnicity have shadowed political systems and have resulted in allegations of prejudice, discrimination, hostility and even violence. They both observe that ethnicity can generate impact on business and economic developments, particularly within East Asian countries. Bates (1999) argues that ethnicity elicits investment and the formation of capital and thereby enhances growth in developing communities.

As discussed by CheAhmad et al. (2006) and Yatim et al. (2006), corporate ownership in the Malaysian capital market can be clearly identified along ethnic and national lines, specifically Chinese, Bumiputera (Malays) and foreigners. This unique pattern of segmented capital formation is argued to result in differences in business organizations that can, in part, be explained by the ethnicity of the owners. Eichenseher (1995) argues that ethnic divisions across publicly

held corporations in Malaysia "can be linked to plausible variations in agency costs". One possible explanation to this variation is due to differences in business practices.

Although there are three main ethnic groups in Malaysia (primarily refer to Malays, Chinese and Indians) with a presence of various indigenous groups in the states of Sabah and Sarawak, only two major ethnic groups (i.e. Chinese and Malays) control the socio-economic and political environment of the country (Che Ahmad et al. 2006; Haniffa & Cooke 2002). Ethnic Malays (also known as Bumiputeras) are found to control the political administration while ethnic Chinese have heavily influenced the economic environment (Che Ahmad et al. 2006).

Weidenbaum and Hughes (1996) argue that Chinese is the most prevailing entrepreneurial ethnic group in the world. They empower the entrepreneurial exuberance in many nations including Malaysia, Thailand, Indonesia, Vietnam, and progressively in Japan (Ahlstrom, Young, Chan & Bruton 2004). Historically, and even at present, business in Malaysia has been dominated by ethnic Chinese (known as non-Bumiputera) even though ethnic Malays literally labeled as "son of the soil" account for more than 60 percent of the population. To tackle this continual socio-economic imbalance between ethnic groups (Malays versus Chinese), the government has made efforts to improve it through constructive and productive means. For instance, in the Eleventh Malaysian Plan (2016), the government has effectively created an environment of development based on growth with fair distribution of quality opportunities to stabilize the Chinese entrepreneurship domination in the country. One of the main thrusts of the National Mission is to ensure that Malaysia is capable of sustaining a positive growth impetus. This thrust emphasizes the philosophy of "growth with equity" to resolve socio-economic inequalities between two ethnic groups of Malays and Chinese (Eleventh Malaysia Plan 2016).

Family Firms and Leverage

Theoretical and empirical evidence confirms the existence of interrelation between family firms and financial structures. For instance, Margaritis and Psillaki (2010) investigate the relationship between capital structure, ownership structure and firm performance. They find that the firms with concentrated ownership (e.g. family firms) are highly levered and more efficient than the firms with dispersed ownership. This shows family characters of a firm can also play a significant role in determining level of debt. Further, Bopaiah (1998) suggest that unique features of "familiness" value in family firm provide incentives for behavior that reduce the moral hazard problems perceived by lenders. This implies that family firms can obtain loans more easily than non-family firms. Thus, it confirms the existence of debt level differential between family firms and non-family firms with regards to agency problems. In sum, based on agency theory, family firms are seen to have some motivations to reduce agency costs due to higher shareholding concentration (Anderson & Reeb 2003) where the separation of ownership and control is almost non exist.

Financing behavior of a family firm is a function of its characteristics (Colot & Croquet 2009). Debt level in family firms indicates an alternative means of financing which prevents the spread of ownership and loss of family control. Therefore, equity financing becomes the least preferred source of financing among family firms. Moreover, Jensen and Meckling (1976) suggest that family firms experience less severe classical agency problems compared to those in more diffused ownership, partly due to personal and familial ties between owners and managers. In line with that, when ownership structure of firms is highly concentrated and predominantly owned by families, these firms are likely to have greater concerns over family reputation and greater desire to pass the control of the business onto future generations. As a result this is likely to influence the financing decisions of the family firms (Maury 2006; Anderson & Reeb 2003).

Companies which are in an affiliated group (e.g. family firms) influence the way they are governed allowing them to increase capital (Khanna & Rivkin 2001). Therefore, leverage decisions in family firms are significantly different from one outside the affiliated groups (Manos et al. 2007; Chua et al. 2011). This signifies the uniqueness of ownership structure within the groups that creates its own virtual (or internal) capital resources among the members (e.g. family and friend financing). In addition, theories of market failure and policy distortion of business groups indicate that group-affiliated firms enjoy exceptional access to government and foreign loans (Manos et al. 2007).

Prior studies suggest that family firms comprise of a unique set of investors with undiversified shareholdings, thus reducing agency conflicts between controlling shareholders and management because shareholders (owners) are also managers (Anderson, Mansi & Reeb 2003). Consistent with the prediction of agency theory, when managers are also owners, managers are restrained from engaging in value-decreasing activities and they are likely to be more risk averse (Ensley and Pearson, 2005). As a result, debt defaults are likely to be lower for family firms and this leads to lower agency cost of lending, hence lower cost of debt (Anderson, Mansi & Reeb 2003; Chua et al. 2011). Bopaiah (1998) also provides evidence that family-owned companies have better credit availability because creditors consider them as

having lesser moral hazard problems than non-family firms. As such, borrowed funds may not be invested in value-destroying activities that could harm shareholders' wealth. Further, Bopaiah (1998) also reports that family-owned companies generally invest in relatively conservative investment choices, suggesting lower probability of debt default. As a result, creditors are more confident to lend to family firms as compare to its counterparts.

The preceding discussion shows that family firms whose ownerships and controlled are highly concentrated and in the hands of family members are likely to have higher levels of leverage than those firms whose ownerships are widely dispersed. The association between family ownership and leverage can be further explained in the context of Malaysian corporate landscape in which element of ethnicity is involved to help explain, if any, variations in leverage that may exist among family firms in Malaysia.

Ethnicity and Leverage

There are three major ethnic groups in Malaysian society, namely Malays, Chinese and Indians. These ethnic groups are commonly categorized as either Bumiputeras (i.e. majority ethnic Malays and other indigenous population) or non-Bumiputeras (i.e. mainly Chinese and Indian descendants). Historically, Malays and other indigenous population have been economically lagging behind compared to their non-Bumiputera counterparts. Back in 1970, the government instituted New Economic Policy (NEP) which primarily intended to reduce the socio-economic gaps particularly between ethnic Chinese and Malays. Among the initiatives included in the NEP programs were a number of economic and educational privileges accorded to Bumiputeras. Inequalities between Bumiputera and non-Bumiputera remain much in capital ownership and entrepreneurial spirit although gaps in areas such as educational achievement and occupational attainment have narrowed down (Nagaraj et al. 2007).

Fraser et al. (2006) and Johnson and Milton (2003) suggest that Bumiputera is ethnically-favoured and politically connected. This allegation is proven when the government has made continuous efforts to improve the socio-economic imbalance through constructive and productive means. For instance, in the Eleventh Malaysia Plan (2016), the government provides many privileges to Bumiputera firms such as awarding government contracts, providing greater access to capital resources, broadening opportunities to purchase privatised assets and extending substantial supplementary subsidies. With regards to access to financial supports, the government and its agencies such as Malaysian National Entrepreneur Development Corporation (PUNB) and Council of Trust for the Bumiputera (MARA) have established various funds in various forms including soft loans, grants, equity financing, venture capital, and financial guarantee schemes. In addition, Bumiputera entrepreneurs are given various business support services such as formal training, marketing channels, provision of business premises and technical guidance. All these privileges posit the government efforts and commitment to inculcate Bumiputera entrepreneurs, if not superior but at least are at par with Chinese entrepreneurs.

Further, the issuance of Lending Guideline established in 1988 by the National Central Bank (BNM) requires all commercial banks to extend at least 20 percent of the total loans outstanding of the preceded year to the Bumiputera community (Bank Negara Malaysia 1999). Following this guideline, statistic shows that bank loans extended to the Bumiputera community rise steadily and are used to finance wide range of business activities (Bank Negara Malaysia 1999, 2009, 2018). Given all these financial supports directed towards helping Bumiputera-controlled firms, it is predicted that these firms are likely to be highly levered compared to their non-Bumiputera counterparts.

Conclusion

This study is motivated by the unique corporate structure of Malaysian public listed firms whose ownership is dominated by a few largest shareholders and they are substantially family-owned. As suggested by agency theory, closely held firms specifically family firms can reduce agency problems because owner-managers' interests are likely to be more aligned. The dominant presence of family controlled firms coupled with unique corporate segments in which corporate boards and equity stake holding are dominated by two distinctive ethnic groups trigger this study to further explore whether family ownership and ethnicity can potentially offer evidence of capital structure variation that exist in these firms.

This study is unique because it deals with the issue of capital structure determinants outside developed countries. For instance, element of ethnicity has not been thoroughly investigated in the realms of capital structure in Malaysia and possibly none in other developed economies. This study offers an alternative explanation for the leverage variations and provides evidence on the universality of the existing capital structure theory. It enhances the body of knowledge pertaining to debt financing in shaping capital structure of Malaysian family firms

Evidencing on previous literature, this study will serve as a platform for authors to conduct empirical studies on this topic in the near future to further strengthen the relevant theories and arguments contained in the field.

Acknowledgment

Abstract

The subject of the research study is the measurement of the total investment risk through the statistical measures of dispersion (variance and the standard deviation), which give the investor information on the deviation of the realized annual return from average returns when making decisions on investing in company shares on the market. However, we should bear in mind the fact that the investor also wants to know how returns on investments in the shares of different companies move together. This cannot be determined by observing risk dispersion measures. Therefore, when making a decision on investing in securities, investors also use the measures of the degree of the linear relationship between the shares, such as covariance and a correlation coefficient.

The aim of the research study is to point out the fact that diversified investors strive to provide the least risky instruments in their possession on the basis of risk assessment through statistical risk assessment measures. However, the problem of assessing the risk of investing in securities is a complex concept, because it includes the interdependence of assessing the rate of return on securities and investment risk, based on which the investor considers a possible return offered individually by each observed security.

Keywords: statistical analysis, investment risk management, variance, standard deviation, diversification

Introduction

On the financial market, investors can choose between a large number of the shares and bonds of various issuers. Before making an investment decision, potential investors consider the possible return offered by each individually observed security. However, in addition to the assessment of return, the investor should also make an assessment of investment risk when making a decision on investing in securities. Measuring portfolio risk and measuring portfolio return are interrelated, which makes it difficult for the investor to assess them. Therefore, investors often use the statistical measures of dispersion (variance and the standard deviation) that give them information about the deviations of the realized return from the mean value (the arithmetic mean) of the companies "A" and "B". Dispersion measures aim to determine the dispersion of shares in one sample around the mean value, i.e. the higher the sample dispersion, the higher investment risk for a diversified investor. Variance is the deviation of the value of the return of one share from the average value of the return. The standard deviation is an even more precise measure of dispersion, because it is calculated as the root of variance. This measure is most often used by investors when making a decision on investing in securities.

In addition to the statistical dispersion measures, investors also use the measures that show the degree of the linear correlation of shares. There are a large number of linear dispersion coefficients in the literature, and two dispersion

RISTIĆ "Statistical Analysis of the Risk Assessment of Investors' Investments in Securities Portfolio" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

measures will be analyzed in this paper, these namely being covariance and a correlation coefficient. Covariance is a measure of the connection between shares between two companies. If it is positive, it means that stock prices are moving in the same directions, and if it is negative, a diversified investor can conclude that stock prices are moving in the opposite directions. A correlation coefficient is obtained when covariance is divided by the product of the standard deviations of such two companies, and it shows how much the two shares are interconnected, i.e. how they react to each other. It ranges from -1 to 1, and in case the value is equal to 0, it means that there is no connection between the actions, where the numerical value shows the strength of the connection and the sign shows the direction of the connection.

The concrete examples of two companies will be used in the paper to show the calculation of these statistical coefficients and, based on that, the potential investors' decision to invest in the securities portfolio. Statistical analysis is an unavoidable and comprehensive analysis, because it includes the assessment of risks and returns, as well as their interdependence, based on which potential investors choose the financial instrument which to invest their funds in.

Management of the Risk of Investment in Financial Instruments

Measuring risk is one of the most important phases of the entire financial instrument investment risk management process. The most commonly used risk assessment methods are dispersion measures (variance and the standard deviation) and the measures of common variation or covariance (covariance and correlation). The market return variance is the expected square deviation from the expected return. (Brealey, et al. 2020)

Suppose an investor has a choice between investing in the shares of the Company A and the Company B, with the following individual characteristics (Table 1):

Table 1: The expected returns and risks of investing in the shares of the companies A and B

	Investments in the shares of the company A	Investments in the shares of the company B
Expected return	0.630	0.120
Standard deviation	0.432	0.093
Correlation coefficient	1.980	1.230

There is a low investment risk with the shares of the company for which a smaller standard deviation of the return and a smaller variance are determined. The investments in the shares of company A have a greater standard deviation than the investments in the shares of the company B by more than 5 times (0.630 : 0.120 = 5.25). This means that the return on the shares of this company can vary over 5 times more than the investments in the shares of the company B.

The main manner to reduce the investors' general (market) investment risk is to diversify the portfolio. Diversification is a very old term. The saying "never put all your eggs in one basket" originated before economic theory. The diversification model was developed by the creator of said saying, Harry Markowitz, in 1952, for which he won the Nobel Prize in Economics. During the 1990s, for example, many investors were only investing in stock portfolios. They did not want to invest in stock, bond, and other financial instrument portfolios so as not to make a smaller profit, because technology companies were on the rise at that time. After the collapse of the technology sector, however, investors felt how dangerous it was to keep a portfolio only consisting of the shares of one single company or similar shares. (Bodie, et al. 2009)

When investors are concerned, even a small diversification can provide a significant reduction in variability. (Brealey, et al 2020)

The investor will reduce general market risk based on the analysis of the effects that the shares of each company may have on the risk of the entire share portfolio. Diversification seeks to reduce (if it cannot already eliminate such risk) the risk characteristic of a company's share. These are the risks of fluctuations in the return of the market price of a company's share under the significant influence of the market (macroeconomic) trends.

Diversification can eliminate specific risks, but diversification cannot eliminate certain risks – namely market risk. (Brealey, et al. 2020)

Figure 1. Diversification and risk (Brealey, et al. 2020)

In Figure one, risk is divided into two parts – a specific risk and a market risk. If an investor only had one stock, the specific risk would be very significant: on the other hand, if the investor opted for a portfolio of 20 or more shares, diversification would reduce the exposure to risk. For a well-diversified portfolio, only market risk is important. Therefore, the predominant source of uncertainty for a diversified investor is that the market will grow or that it will collapse, carrying with itself the investor's portfolio. (Brealey, et al. 2020)

Therefore, if an investor decides to form his portfolio from only one share, he will be exposed to company risk and general (market) risk. By diversifying a portfolio, i.e. by forming a portfolio from several instruments, the exposure of the securities (owned by the investor) to the influences within the issuing company is reduced because:

1. by investing funds in a diversified portfolio, the share of individual securities in the total portfolio is reduced. A reduction in the market price of only one of these securities will not have a significant impact (or any impact at all) on the market value of the entire portfolio. Conversely, if an investor owns a portfolio of only one security, with a change in the market price of that (one) security, the total market value of the portfolio will also change.
2. the market prices of individually observed securities change (either upwards or downwards), depending on the financial performance of the issuer. If an investor has a diversified portfolio, a shift in the market prices of some securities may affect the overall market value of the portfolio. The impact will be smaller or larger in the value of the entire portfolio, depending on the percentage share of the securities whose prices have changed. Practically, if the number of the securities in a portfolio was to increase indefinitely, no change in the market price of a financial instrument would have any impact on the market value of the portfolio (although this cannot be the rule).

We will support the claim that portfolio diversification reduces the risk of changes in the market price of one security to the total market value of the portfolio, with a concrete example. At the same time, the effects of increasing the number of instruments (in a portfolio) on the variance of individual securities will be considered. This variance, even more so the covariance of the entire portfolio, provides an answer to the questions: Why can diversification reduce a risk? and How much risk does it reduce? (Brealey et al., 2009)

For example, an investor intends to form his share portfolio by buying shares from the companies A and B. Before making a decision on investing funds, the investor will perform a risk analysis of investing in these companies. He will carry out said analysis based on the business results of the companies A and B in the previous period, taking into account the view that the present is a sum of the past and that the future is the projected present. In other words, in the real life of the company, riskiness in achieving returns in the past is most often confirmed in its future life, which our investor believes in. Suppose these companies achieved certain rates of return thanks to the investments of funds made by one (same) investor in the past period from 2015 to 2020.

The return growth rates were calculated according to the following equation:

Return in the current year i.e. in the year in which the calculation is made) $= \frac{\text{The market price for a share in the current year} - \text{The market price for a share in the previous year} + \text{The dividend in the current year}}{\text{Market share price in the previous year}}$

Using this formula, let us determine the achieved individual annual returns, based on which the average returns of the companies A and B are calculated:

Table 2: The annual rates of the realized growth (decline) of the returns of the companies A and B in the period from 2015 to 2020 (in %)

Year	The return achieved in the company A	The return achieved in the company B
2015	11%	48%
2016	56%	-30%
2017	-12%	5%
2018	-10%	120%
2019	26%	124%
2020	32%	150%
Total	103%	417%

The realized average return (AR) and the average value for the companies A and B are as follows:

$$AR_A = \frac{103}{6} = 17.17\% = 0.172$$

$$AR_B = \frac{417}{6} = 69.5\% = 0.695$$

Based on the arithmetic mean, no information on the differences between the individual values in Column 1 (Table 3) is obtained. An estimate of the deviation from the mean is needed. (Bodie et al., 2009). Thus, the deviation of the first value of the company A is as follows:

$$0.11 - 0.172 = -0.062$$

The other deviations are calculated in the identical way, as shown in Tables 3 and 4:

Table 3 : The squares of the deviation of the realized annual returns from the average returns of the company A

Year	The realized company return by years (1)	The arithmetic mean (2)	The deviation of the realized return from the arithmetic mean of the company A (3 = 1 - 2)	The squared deviation of the realized return from the arithmetic mean (4 = 3^2)
2015	11% = 0.11	0.172	-0.062	0.0038
2016	56% = 0.56	0.172	0.388	0.1505
2017	-12% = - 0.12	0.172	- 0.292	0.0853
2018	-10% = - 0.10	0.172	-0.272	0.0739
2019	26% = 0.26	0.172	0.088	0.0077
2020	32% = 0.32	0.172	0.148	0.0219
Total	103% = 1.03	0.172	0.00	**0.3431**

The arithmetic mean of the return achieved by the company A is 1.03 : 6 years = 0.172, i.e. 17.2%.

The total sum of all the deviations from the mean value is equal to zero, due to the mutual cancellation of the positive and negative deviations. One way to avoid undoing the positive and negative deviations is to square each deviation and then calculate their sum. These deviations are now squared in order to calculate variance and the standard deviation. The variance was obtained by subtracting the mean value from each value and squaring the results. The sum of the square deviations from the arithmetic mean of the company A is 0.3431. Finally, the mean square deviation from the value of the arithmetic mean (the variance) is determined by dividing the sum of the square deviations by n-1, where n denotes the number of the years of the analyzed period. The return variant of the company A is as follows:

$$s^2 = \frac{0.3431}{n-1} = \frac{0.3431}{5} = 0.0687$$

Variance shows the deviation of the realized return in each of the years of the analyzed period in relation to the average return.

The square root of variance is called the standard deviation, which in this case is as follows:

$$s = \sqrt{0.0687} = 0.26 \text{ or } 26\%$$

The previous procedure is repeated for the company B.

Table 4 : The squares of the deviations of the realized annual returns from the average returns of the company B

Year	**The realized company return by years (1)**	**The arithmetic mean (2)**	**The deviation of the realized return from the arithmetic mean of the company B (3 = 1 - 2)**	**The squared deviation of the realized return from the arithmetic mean ($4 = 3^2$)**
2015	48% = 0.48	0.695	-0.215	0.04622
2016	-30% = -0.30	0.695	- 0.995	0.99002
2017	5% = 0.05	0.695	- 0.645	0.41602
2018	120% = 1.20	0.695	0.505	0.25502
2019	124% = 1.24	0.695	0.545	0.29702
2020	150% = 1.50	0.695	0.805	0.64802
Total	417% = 4.17		0.00	**2.65232**

The arithmetic mean of the return of the company B in the period from 2015 to 2020 is as follows:
4.17 : 6 = 0.69, i.e. 69%.

The return variant of the company B is as follows:

$$s^2 = \frac{2.65232}{5} = 0.53046.$$

The standard deviation is (Baker, Powell 2005) is as follows:

$$s = \sqrt{0.53046} = 0.72 = 72\%$$

Based on the data from Tables 3 and 4, Table 5 is created as a comparative overview of the average returns and the standard deviations for the shares of both companies:

Table 5: The average return and the standard deviations for the shares of the companies A and B:

	Company A	Company B
