- during the organization and planning of transport in the company, a GPS system in vehicles was introduced and a vehicle monitoring system is implemented on an ongoing basis, with the help of which the company has the ability to keep records of time, route travelled, kilometres travelled and consumption, which affects not only the efficiency of logistics processes,
- the company maintains current documentation and records of the routes travelled and fuel used for individual cars in a complete manner,
- when planning routes, pay attention to the possibility of the most frequent right-turns of the vehicle in the city, which will allow for faster movement and reduce fuel consumption,
- reconfiguration of the owned fleet over 5 years of age, in which the vehicles that do not meet the current exhaust emission standards and are characterized by high fuel consumption should be replaced (e.g. heavy goods vehicles, the oldest passenger cars),
- the enterprise, employing qualified staff with appropriate courses and training, allows you to implement eco-driving techniques,
- when hiring new staff, the company pays particular attention to the experience and qualifications of drivers and equipment operators, and organizes all necessary and appropriate courses and training for new employees
- thanks to the introduction of a vehicle fleet maintenance program in the Company through the purchase of fleet fuel, which reduces maintenance costs and rationalizes the use of individual vehicles or the work of drivers. Fuel cards offer considerable savings in the purchase of fuel only and the cost of accounting for expenses.

In terms of transport policy, the enterprise is well developed and properly conducted. The vehicles belonging to the company's fleet are monitored by the GPS sensors installed in them, and fuel consumption by fuel cards and vehicle cards. The employed persons are properly trained and have appropriate qualifications.

Summary

Over the past few decades, one of the main goals of energy and climate policy has been to promote the reduction of energy consumption in energy-intensive sectors such as road transport. The goal of reducing energy consumption without disturbing the flow of traffic requires increasing fuel economy. Such improvement, however, means lowering the marginal costs of the energy service, which in turn may stimulate an increase in its demand. This phenomenon, or the so-called rebound effect, is associated with an increase in energy consumption which may partially or fully offset the expected increase in energy efficiency. If the magnitude of this effect is not negligible, policies to reduce energy consumption by promoting energy efficiency may not be fully effective. A rebound effect may also have unexpected economic or environmental effects, such as higher GHG emissions than expected. This article shows that while there is a large theoretical and empirical literature on the rebound effect, the concept has not been sufficiently researched for road transport.

To fill this gap in the literature, an empirical analysis of energy efficiency in the road transport industry was carried out in a model company. The obtained results show an average fuel efficiency of 78%. It was also analyzed by simulating that during three years of the fleet's use, the reduction of environmental impact may not be achieved after efficiency improvement. From a European perspective, the results indicate that additional benefits can be gained from policies that encourage fuel economy in countries that are relatively fuel inefficient, not least because of improved fuel efficiency. These policies should be linked to the appropriate price signals in the sector, i.e. applying specific taxes, promoting intermodality and, where possible, providing alternative and environmentally friendly modes of transport such as rail.

Abstract

The development of tourism in rural areas is limited by the lack of financial resources. The study was conducted expertise of tourism infrastructure over the 2010-2015 years in the community of Tuchów. Shows the net cost of the sale of tourist services, net income from the sale of tourist services, subsidy budget to secure the provision of tourist services and the gain (loss) on sale of tourist services, and prepared SWOT analysis contains a number of factors significant for the development of the community. The analysis can be seen that tourism in the community is not propagated. To enrich the tourist attractiveness should modernize existing tourist facilities and to finance the creation of new attractions.

Keywords: cost assessment, organization, infrastructure, management

Introduction

The local community is the essence of rural tourism, which is rich in many elements. Rural tourism is detailed with the advantages of a given area, its inheritance and culture, rural activities and life, tourists choosing the period of searching for a valuable and authentic price from the rural and local community (http://ksow.pl/, access date: 26.10.2020).

Currently, agritourism is one of the most important tourist areas in the countryside. Its development in Poland began in the early nineties of the last century. In the table, a rural farm was used as accommodation. Agritourism is about providing the prices of hospitality on the farm, as well as accommodation options, food, participation in the production of fruits, their purchase and spending free time in the bosom of nature. It is a unique educational opportunity for people living in big cities and industrial agglomerations (Firlej 2002).

Summarizing the purchase prices, agritourism should be interpreted as a search taking place in a provincial area, where accommodation and a holiday list related to the farm or its holidays (nature, production and service) are provided. Agritourism in its form is one of the components of the multifunctional development of the Polish countryside (Firlej 2002).

The development of the integration of functions in the territorial area has been carried out for over a dozen years in the country: The rural region, the state of its development is not appropriate and does not affect their political development. Numerous benefits from the development of tourism obtained by the townspeople, tourist services, as well as explanations on tourist support, as well as support for the inhabitants of local communities, to the limits of the fragments of problems bothering the countryside, need to intensify this process. They prove the experience of countries with long traditions of rural tourism, as well as the experience of those regional tools and rural communes in Poland, which were the first to notice development through tourism.

In Poland, the development of rural culture has great opportunities. This is favored by, among others. in. picturesque and preserved in an intact landscape, large areas of technical support (national parks, landscape parks, nature reserves), great courses of forests and water reservoirs, rich cultural resources, large and unused labor resources, unused housing resources, village holiday traditions. Alternative tourism, including agritourism and ecotourism, is

Cite this Article as: Maciej GLINIAK, Piotr WALĄG and Sabina WIATR " Cost Assessment of Tourism Infrastructure Functioning in Village Commune" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

becoming more and more popular among city dwellers. This phenomenon has a large impact on the development of rural tourism (Sikorska-Wolak 2007).

Rural tourism in areas outside the city center and areas with unfavorable agricultural management conditions has a significant impact in mobilizing local communities. Agricultural production is difficult here due to the negative soil and natural conditions for its development (lowland areas) and terrain (mountain areas). In areas particularly rich in natural resources, rich in natural areas, constituting a pile in the country and the international system of protected agriculture, agriculture is limited by regulations and plans for their protection. They are in areas with valuable values (Sikorska-Wolak 2007).

López Olivares (2009) distinguishes four support groups facilitating the development of development functions in rural areas:

1. A new tourism-recreational relationship analyzed in a postmodern society, which is a stretch for too much urbanization, is manifested by an interest in assets found in the open air, in contact with nature, ancestors (eg Grandparents) and tradition.
2. Modernizing the public opinion in relation to the areas and their natural, cultural and EU resources.
3. Increase in accommodation base in rural areas and the legal and organizational regulations covering it (on the regional and national lists).
4. Various urban processes of rural space manifested by the expansion of the accommodation base, as well as the commercial space, as well as the increase in the number of so-called "Seconds", which resulted in the emergence of a new, multi-functional tourist space for the reception, meeting the expectations of homes.

The idea of dynamism of rural areas in terms of tourist choice from the search and choice of rural tourism. For rural tourism, only a part of rural areas as economic entities is useful. Objective criteria films, eg by geographers, copyright use. The divisions and standardizations proposed in the public opinion may be of auxiliary nature for the tourist product. The subjective opinion of tourists is more important, about what is the possibility of development and this should be the main criterion for its evaluation. The image of rural tourism is approximately different dimensions of "ruralness" constructed socially, not only by experts: idyll, tradition, hospitality, escape from stress, healthy lifestyle, unpolluted environment, tranquility, contact with nature, intimate scale. It is these elements that determine the tourist potential of rural areas in Poland (Program ... 2015).

The absolute majority of rural areas in Poland manage the potential for the development of rural tourism. However, multi-agency cooperation and substantive, organizational and financial support are necessary and projects in rural areas (Program ... 2015). The main functions of rural areas in Poland, in terms of the frequency of occurrence and the orientation towards satisfying external needs, are among the bioproductive functions - commercial agriculture and forestry, technical and production - industry, and among the service functions - tourism and recreation and residential (residential) (Palka 2010).

Among the diverse categories of non-agricultural activity, tourism is a real source of income growth in many areas of Poland. The dynamics of the growth of the tourist function depends on a whole set of factors, among which both external and internal factors play an important role. Summing up, it is also worth noting that apart from many factors supporting the activity supporting the development of tourism in rural areas, there are also barriers resulting from the economic situation in the country. Thus, the influence of factors supporting the development of tourism is reduced by the existence of many barriers on which economic success depends on overcoming. In order to accelerate and intensifying the development of tourist services in rural areas in Poland, it is worth increasing farmers and entrepreneurs' access to cheap sources of financing ensuring, inter alia, investments (Palka 2010).

Material and Methods

The analysis of information on tourism and tourist traffic in the commune of Tuchów in 2010-2015 was carried out in 3 stages. The first stage of the research was to obtain data for analysis from the Tourist Information Office in Tuchów, which is located in the Municipal Cultural Center. The second stage of the research was to obtain and analyze financial information from the Tuchów Commune concerning tourism (section 630 of the commune's budget). To analyze the financial statements, a simplified financial result account was used in accordance with the Accounting Act (Dz. U. 2016, item 1047), which is described by equation (1):

$$Z = D - K \tag{1}$$

where: Z - profit (loss) from the sale of tourist services, D - net income from the sale of tourist services, K - net costs of sale of tourist services

Due to the specificity of the issue, which is part of the promotion and strategic activities of Tuchów, the provision of tourist services in the analyzed years was subsidized from the Commune's budget. Due to the above situation, to calculate the real profit (loss) from the provision of tourist services in the Tuchów Commune, the method of analyzing financial statements was modified by extending the equation (1) by the amount of subsidy for the implementation of tourist services included in the budget of the commune, giving the equation (2):

$$Z = (S + P) - K \tag{2}$$

where: Z - profit (loss) from the sale of tourist services, S - budget subsidy to secure the provision of tourist services, P - net income from the sale of tourist services, K - net costs of sale of tourist services

The last stage of research on the state of tourism in the Tuchów Commune is to define the prospects for its development in the coming years. The analysis is based on strategic documents regarding the possibilities and directions of the commune's development. A SWOT analysis was used to present these possibilities. The first step was to identify strengths (current actions are considered effective in relation to present and future needs) and weaknesses (presence of weaknesses in relation to present and future needs). The next step was the identification of external factors, on the basis of which opportunities were defined (the scope of activities that can be supported by the anticipated concepts

and have a positive impact on the development of the commune) and threats (activities that will have a negative impact on the development of the commune). The SWOT analysis covers the diagnosis of the situation of the Tuchów Commune.

Results

Presented in Fig. 1 net costs from the sale of tourist services (e.g. purchase of construction works or services, architects' fees) are on the average level of PLN 6,500.00. The increase in costs recorded in 2011 by 700% in relation to the remaining analyzed years resulted from the receipt of a subsidy by the Tuchów Commune for the creation of a tourist information point in the MSIT network. When analyzing the volatility of net costs from the sale of tourist services (Fig. 3), their annual increase by approximately PLN 990.30 was observed.

Fig. 1: Net costs of selling tourist services

Presented in Fig. 2 net income from the sale of tourist services (e.g. accommodation, meals) is around PLN 5,000.00. Similarly, to the net costs from the sale of tourist services, in 2011 there was an increase in the net income of the commune, which resulted from the creation of a tourist information point in the MSIT network in the commune. When analyzing the volatility of net income from the sale of tourist services (Fig. 4), their annual increase by PLN 990.30 was observed.

Fig. 2: Net income from the sale of tourist services

Presented in Fig. 3 the budget subsidy for securing the provision of tourist services (e.g. subsidies for tourism) is at the level of PLN 3,500.00 per year. The ranking highlights the year 2011, when the subsidy was increased by PLN 85,000.00 due to the reorganization of the tourist service provision system in the Tuchów Commune (construction of the MSIT center). When analyzing the variability of the budget subsidy for securing the provision of tourist services (Fig. 3), their annual increase by approximately PLN 1,100.00 was observed. In 2012 and 2013, the budget subsidy for securing tourist services amounted to PLN 0.00.

Fig. 3: Budget subsidy to secure the provision of tourist services

Presented in Fig. 4 the loss on the sale of tourist services in the years 2012-2013 (e.g. ticket sales at tourist facilities) is at the average level -1300.00 PLN. The presented amount proves the low profitability of tourist services in the region and requires additional funding from the commune budget. The increase in profit recorded in 2011 by 700% was due to the fact that the Tuchów Commune obtained a subsidy for the creation of a tourist information point in the MSIT network. When analyzing the volatility of profit from the sale of tourist services in 2014-2015 (Fig. 4), their annual increase by approximately PLN 109.70 was observed.

Fig. 4: Profit (loss) on the sale of tourist services

The SWOT analysis presented as a result of presented short tourism infrastructure economy contains a number of factors important for the development of the Tuchów Commune, divided into 4 categories:

1. Strengths:
   - ability to obtain external funds,
   - natural and landscape attractiveness,
   - an extensive network of hiking, cycling and horse-riding routes, Nordic walking routes,
   - cyclical events of a supra-local nature,
   - favourable conditions for the development of organic farming, vegetable and horticultural production and fruit growing,
   - a high level of activity of non-governmental organizations and informal groups (including sports associations and clubs, Rural Housewives' Clubs, Volunteer Fire Department, folk groups and orchestras) in the implementation of projects related to meeting the needs of the local community,
2. Weaknesses:
   - lack of sufficient investment funds,
   - insufficiently developed infrastructure of the free time offers and the poor technical condition of some routes and tourist and recreational facilities,
   - no integrated system for promoting the leisure offer in the commune,
   - lack of a coherent system of visual identification (including information boards and markings of routes, trails, historical places, tourist points),
   - low level of space aesthetics in connection with the existing advertisements and signs
   - poorly developed promotion and sale of local products, including handicrafts and crafts,
   - no educational offer based on local heritage,
   - poorly developed accommodation and catering infrastructure (including agritourism and regional cuisine),
   - a small number of organizations and informal groups operating in the field of tourism,
3. Chances:
   - availability of external financing sources, including new financial perspective of the European Union for 2014-2020,
   - viticulture as a chance for the development of agriculture and wine tourism (enotourism),
   - fashion for weekend activity, active and cultural tourism,
   - great interest in local products,
   - popularity of folklore, traditions and folk art,
   - pro-ecological policy

Summary

The stay of tourists in the commune is limited mainly to one or several-day visits. The parking and accommodation facilities are an important object of tourism development and constitute an important supplementary product to the area's basic tourist products. The assessment of a given place by a tourist is shaped to a large extent by the assessment

of the gastronomic offer. Technical infrastructure is the main factor that enhances attractiveness and accessibility of the region's tourist offer. For this reason, the increase in infrastructure largely determines the spectacularity and perception of a commune as a tourist market, and affects its assessment. The perception of the uniqueness of the tourist offer will depend on the possibility of coming to the region, i.e. communication convenience and the internal network of transport connections to services, tourist and recreational attractions located in the region. Tourism may become one of the most important areas of the local economy of several villages in the area. In order to increase the tourist traffic and extend the stay of tourists, it is necessary to use the rich natural, cultural and landscape resources adjacent to rural areas and to create new attractions for tourists there, as well as to implement an appropriate information policy.

In order to improve the tourist attractiveness in the commune of Tuchów, it is necessary to take the following actions:

1. Inventory of the technical condition of roads, tourist routes and bicycle routes, road markings, including those running through the area's most frequently visited by tourists.
2. Development of transport services in the region (including increasing the number of accommodation places
3. and parking at tourist, sports and recreational facilities).
4. Extension of the current tourist facilities.
5. Building new tourist attractions (e.g. Rope Park, Amusement Park, Water Park).

Abstract

Public transport is most often reduced to the functioning of urban transport. Its problems are considered in the context of energy consumption, time of use, improvement of user mobility or improvement of the quality of the environment related to limiting the traffic of passenger vehicles. This article presents the main features of the various methods of organizing transport that are currently used to organize public transport around the world. As a result of modelling the public transport strategy, tariffs, transport identification systems and connection patterns are created. In this respect, the simplest system is found in Vienna, London and Seoul. The most important element of the transport organization system is the tariff system. Its shape and functioning result from the continuous learning of the system, the efficiency of information processing and the degree of adaptation to errors.

Keywords: Transport, Mechanical Engineering, Organization.

Introduction

Public transport is most often reduced to the functioning of urban transport. Its problems are considered in the context of energy consumption, time of use, improvement of user mobility or improvement of the quality of the environment related to limiting the traffic of passenger vehicles (Utsunomiya 2015, Vuchic 1999, Knoflacher 1996). It is a global trend triggered by social change. These changes are aimed at a significant reduction in the ownership of vehicles, improvement of the natural environment and the need to ensure high-quality public transport (Davis and Dutzik 2012, Dalan and Doll 2010).

The essential aspect of public transport is its organization and institutionalization. They result from the high labour and cost consumption and the mass character. The concentration of transport organization is based on economic efficiency, mutual relations between operators and public institutions, privatization processes and the development of international transport. Well-organized public transport should be useful and easy to manage. This is an important issue that will be assessed by potential passengers. One of the examples of a systemic approach to the organization of transport is Verkehrsverbund. The organization systems developed in Germany, Austria and Switzerland are based on the multifactorial improvement of the traveller service (Krause 2009, Pucher and Kurth 1995). However, due to the high individualization of travellers, the methodology for improving the organizational structure cannot be defined in a framework.

Organizational changes in public transport are one of the manifestations of its development and adaptation to the current needs of users (Koike and Wada 2012, Kaiser 2008). In historical studies, the authors rarely describe the organizational issues of transport. Currently, the issues of functionality analysis (Bekken et al. 2006, Bayliss 2002, Costa 1995), comparisons of different ways of functioning (Gwilliam 2008, Brons et al. 2005, Docherty et al. 2004, v.d. Velde 1999) or case studies (Mouwen and Rietveld 2013, Tang and Lo 2008, Engartner 2008) are discussed in the field of public transport. The main reference in these issues, which proves the organizational structure of transport, is operational or economic efficiency. Examples of such studies are the works of Roy and Yvrande-Billon and Roy (2006), Piacenza (2006) Badami and Haider (2007), Iseki (2008), in which the issues of organizing bus transport were discussed. Most often, in published scientific papers, the authors describe transport from the perspective of carriers or local and institutional authorities.

This article presents the main features of the various methods of organizing transport that are currently used to organize public transport around the world.

Public Transport Modelling Methods

In the history of public transport, many business modelling methodologies have been developed. Each of them had its advantages and disadvantages as well as a strictly defined operating framework. Organizational modelling of transport is often schematic. Most of them have been in use for over 100 years, but with technological development, new organizational tools have emerged. They are based on the issues of operations research, business process analysis and resource management.

In the literature on the organization of transport to date, the most extensive review of business methods has been presented by Haga (2011). He based his considerations on the computerization of decision-making processes used in static and dynamic modelling. A dynamic process refers to flows such as labour or capital. This modelling has a well-defined start and end as well as input and output data. The flowchart is one of the common forms of modelling this kind of process. The cycle of this process is faster compared to static methods and allows simultaneous analysis of parallel processes. Static models refer to functions that do not often change over time.

Organigram is one of the oldest methods of business modelling. Organization charts have a long tradition and were used in their original form until the mid-19th century. A change in this system was proposed in 1855 by Daniel McCallum and George Holt Henshaw, who developed the Erie Railroad Company organizational chart (McCallum and Henshaw 1855). The authors decided to change the existing linear approach to the map approach. They presented a diagram of the stations and railway lines with technical facilities in the form of a map. The individual elements of the scheme were connected by lines according to individual network managers. Elements accompanying connection handling are marked with circles of various sizes. The presented solution was to present the organizational and operational structure of the railway, which was one of the first modern branches of industry and required clear management systems (Wolmar 2010, Yamanouchi 1998). Based on railway studies, Vuchic (2005) made a similar model solution for local transport. They based their concept on the division of transport into three levels representing the dependencies of hierarchy and relationship. According to them, a local transport company is classified into three layers - strategy, tactics and operations. The strategy refers to the achievement of long-term goals that result from political decisions. According to van de Velde, it should be quantified in terms of modality, profitability, coverage and connectivity with other modes of transport. The tactic layer determines the mid-term planning. They define the basic features of the services provided (e.g. ticket prices, route schedule, departure times from stops, purchase of rolling stock). The operation level should represent the sale of services and its derivatives. They include, among others ticketing, public information, infrastructure management, vehicle maintenance, staff turnover.

Application Examples

The most common examples of modelling the organizational structure of public transport in the UML system are Vienna, London, Seoul and Tokyo. They are considered model cities because the organization of transport in them is structural. In modelling the transport system in the analyzed cities, the needs of the system users are important. During organizational analyzes, the so-called utility as aggregation of a series of dependent variables. These include, among others ease of use by passengers, intuitive operation, speed of implementation of the assumed algorithms, time needed to recreate the saved system paths, error analysis (e.g. wrong ticket purchase, wrong connection selection, wrong direction of travel) and satisfaction with the use of solutions.

Since 1983, the public transport system in Vienna has been integrated with the Verkehrsverbund Ost-Region. Currently, together with the federal ministry and Vienna, VOR acts as the local transport authority coordinating public transport services offered in the region. It is operated by the Vienna city operator as well as many private bus companies as well as the national railway company. VOR and other authorities propose a uniform line identification scheme: for example, the symbol 'U' plus a number is used for underground railways, 'S' plus a number for suburban railways, and three numbers for regional buses. VOR offers a unified (integrated) tariff system applicable to all means of public transport in the region. The organizational structure of the services offered is quite complex, but from the passengers' point of view it is quite simple and intuitive.

In London, the urban transport system reports directly to the authorities of the Greater London Authority (GLA). In London, the underground rail service is carried out as an internal activity of the municipal transport authority. The operation of bus lines and other rail services (e.g. commuter trains) is outsourced to private companies. The GLA coordinates the tariff system, its line and service identification scheme, and the brand, and users don't need to be concerned about the fact that the operators on each line are different. There are two different fare systems - one for rail-based modes (metro and commuter train) and one for road-based modes.

In Seoul, Seoul Metropolitan Government is the central body for Transport with its affiliated organizations. Transport is mainly carried out by mass transit by rail (underground and suburban railways) and is carried out by a wide variety

of public sector operators. The buses are operated by around 86 different private companies but coordinated by BusAssociation. The buses are divided into four colour groups - blue for city lines, green for suburban lines, yellow for district services, and red for regional lines. In this system, users need to recognize two systems - Seoul city subway and the bus system - and not each operator.

The organizational structure of transport in Tokyo is complex. There are Japan Railway city services, seven large private railway companies with bus subsidiaries, two underground rail operators, several mixed public and public-private operators. Basically, each operator makes its own transport decision, although the Ministry of Transport (at national level) and the Tokyo Metropolitan Government, as well as the surrounding prefectures, are taking steps to standardize the system. From a passenger's point of view, there are many different systems, often serving different parts of an urban agglomeration, but sometimes competing with each other. There are many tariff systems and line and service identification schemes. Frequent problems faced by many passengers are different and incomplete lines and service identification schemes.

The public transport strategies in Vienna, London and Seoul are created by the needs of local authorities, considering the satisfaction of supra-regional needs of a given country. In each of these cities there is a separation between the authorities and transport operators. In Seoul and London, operators are centrally managed by city officials. The opposite of this solution is Tokyo and Vienna. In Tokyo, transport operators are private companies that have reserved themselves to operate independently of decisions made by city officials. The most complex system is in Vienna, where there are both local and supra-regional operators who have different managing and substituting institutions.

Summary

As a result of modelling the public transport strategy, tariffs, transport identification systems and connection patterns are created. In this respect, the simplest system is found in Vienna, London and Seoul. These cities have integrated tariff systems for various means of communication and operators. Due to the simplicity of the organizational system and the unification of the visualization system, orientation is very simple. The opposite of this solution is the Tokyo transport system. There are several tariff systems in the city, many carriers and a fragmented system of unification of carriers.

The most important element of the transport organization system is the tariff system. Its shape and functioning result from the continuous learning of the system, the efficiency of information processing and the degree of adaptation to errors. Complex tariff systems often hinder the functioning of the system and limit its learning abilities, as well as increase the risk of errors in the form of incorrectly purchased tickets. The most optimal solution is to connect operators who provide services in the same utility zones. This solution improves the operational capability of the system and its coherence, and increases the transparency of the system for passengers who make fewer errors. In this respect, Tokyo has the most complex transport system - it has several independent tariff systems. Vienna and London have a differently organized zonal tariff system. In Seoul, there is one tariff zone based on the distance the passenger wants to cover. Additionally, in the analyzed cities there are special contactless cards for saving tickets.

Building Life Cycle Analysis as A Tool Supporting Environmental Decision-Making Processes

Maciej GLINIAK
University of Agriculture in Krakow, Mickiewicza Av. 21, 31-120 Krakow, Poland,
e-mail: maciej.gliniak@urk.edu.pl (corresponding author)

Abstract

The building sector is important in global greenhouse emissions and electricity consumption. The purpose of this Master's thesis is analysis a Life Cycle Assessment (LCA) for an office building, at the design stage, which can be a tool supporting comprehensive assessment and decision-making processes of the environment. The scope of work includes a literature review of assessment methods and applications of LCA in construction. The research part includes conducting the LCA analysis in the One Click LCA program for the research office building and interpretation the results obtained. The assessment of the life cycle of the analyzed object allows to develop which stages and structural elements of the office building contribute the most to the environment. The assessment covered various impact categories. The LCA analysis can be used as a tool supporting decision-making environmental processes, including by choosing more environmentally friendly materials.

Keywords: transport, organization, efficiency, energy, mechanical engineering.

Introduction

Increasing public awareness of the importance of environmental protection made it possible to promote the concept of sustainable development, the tool of which is the life cycle assessment. It is helpful in identifying and understanding the environmental impact of a given product or service. The assumptions of the life cycle assessment method are close to the broader concept of life cycle management. LCA is primarily a technique that determines the size and type of environmental impacts throughout the life cycle of a given product, process or organization, as well as striving to minimize the negative contribution (Kurczewski 2010; Soust-Verdaguer et al. 2016). The use of LCA is related to the analysis of many data concerning the company or product, providing information of an environmental nature and thus supporting the decision-making process. Marketing activities can be another function of Life Cycle Assessment. In this way, the promotion of the company or its products may take place through the environmental labeling system, preparation of environmental statements or environmental product declarations, e.g. a construction object (PN-EN ISO 14040: 2009). LCA can be an independent tool for identifying the most important environmental issues, as well as an integral part of the company's environmental management system. The LCA method is described in a series of international standards, mainly PN-EN ISO 14040: 2009 and PN-EN ISO 14044: 2009 (Nitkiewicz 2015).

The construction industry is responsible for the high level of consumption of various products and energy, and thus also generating a large amount of pollution. It is estimated that, both in Poland and in Europe, the construction sector is responsible for approximately 36% of the total greenhouse gas emissions and 40% of the electricity consumed (Milewska 2016). The concept of "green building" was launched in the early 1970s in order to minimize the negative impact on the environment and save energy. The interest in new solutions in construction engineering resulted primarily from the energy crisis and significant environmental pollution, which began to be addressed. In this sector, long-term assumptions should be based mainly on the gradual development of the design and construction stage of facilities that will meet the assumptions of sustainable development and the integrated design process (Juchimiuk 2011).

The research of Sharm et al. (2011) cover a wider range of buildings' existence as well as their environmental impact. In this work, a variety of building structures, both residential and non-residential, were reviewed. They were compared in terms of energy consumption and greenhouse gas (GHG) emissions depending on the building type as well as the phase of the facility's life cycle. It has been observed that commercial buildings have a greater environmental impact than residential buildings. The difference is mainly due to the much higher demand for electricity in non-residential buildings. The key factors for energy use in the life cycle of buildings are the sourcing of raw materials, transport and production of construction materials during the construction phase. However, during the use of the facility, it is the consumption of electricity, HVAC (heating, ventilation and air conditioning), water consumption, waste generation and use of natural resources, as well as the recycling of explosives in the decommissioning phase of the facility. Over

the entire life cycle of a building, the impact of the construction process is relatively small (0.4–11%). In turn, the environmental load during the use phase of a building contributes to 52% of the total global warming, 66% of the total acidification and 71% of the total photo-oxidant formation potential, respectively. Such a significant impact of the operation phase makes it necessary to look for alternative and sustainable building design methods.

The LCA analysis of an office building located in Bangkok, Thailand with a gross area of 60,000 m^2 was performed by Kofoworola and Gheewala (2008). The study covered the entire life cycle of this facility, including the 50-year service life adopted at the design stage. Three categories of environmental impact of the office building were assessed as significant, namely the global warming potential (GWP), the acidification potential of water and soil (AP) and the photo-oxidant synthesis potential (POCP). In the 38-storey building, concrete and steel turned out to be the most significant materials, accounting for 80% and 5.6% of the weight of all materials used for construction, respectively. These products, however, led to 17% and 64% of greenhouse gas emissions and the formation of between 30% and 45% of the factors affecting photochemical smog and acidification in this module. At the same time, the production of cement, which requires less energy, contributes to around 42% of the GWP of the entire life cycle of the test facility. The life cycle of the analyzed office facility is focused on the operation stage, which is strongly related with the demand for electricity. It is the longest-lasting phase of a building's life, therefore it has the greatest environmental impact in all 3 impact categories.

The aim of the work is to analyze a construction object, which is an office building, in the entire life cycle "from the cradle to the grave". The possibility of using LCA analysis as an effective tool supporting the comprehensive evaluation of an office building and environmental decision-making processes was also presented.

Materials and Methods

The construction object under study is model office building in typical open space office architecture. It refers to the architecture of the surroundings in which it was erected and agrees with the local spatial development plan. The facility is an office building intended for rent. The space for users' work has been designed as an open space. The building has an area of 15,297.8 m2 and consists of 6 overground storeys and 1 underground level, which is intended for parking spaces. It has the shape of a single cuboid with a frame structure made of reinforced concrete. On the south side there is a facade of the building, which has been fully glazed, while the remaining facades are made of alternating windows and cover panels. The roof is made of green construction in order to protect the biologically active surface. The analyzed office building is in the final stage of the construction process.

The life cycle assessment of the building under study was performed using the One Click LCA software. It was realized and introduced to the market by the organization Bionova Ltd. The software is used in certification processes, incl. BREEAM, LEED, CEEQUAL, HQE. It is also compliant with European and international standards, i.e. EN 15978, ISO 21931-1 and ISO 21929-1. It is used not only for the life cycle analysis of the building, but also for life cycle cost analysis and estimation of emitted CO2 and other negative environmental factors. Verification of the impact of construction products on the basis of their life cycle analysis is carried out by type III environmental declarations (EPD), developed in accordance with the PN-EN 15804 standard. It is a document detailing the product's environmental impact during the entire life cycle. Thanks to this, One Click LCA allows for a precise analysis of a building for a specific region in which it is built, from the design and construction stage, through operation, to demolition. The software enables a large selection and change of the building materials used and their source of origin from the local data bank, and the simulation of methods of reducing environmental pollution. One Click LCA is therefore a tool that offers solutions for the construction industry, allowing the design and construction of greener and at the same time economical residential, office, industrial and other buildings.

The analyzed office building has been divided into structural elements that include specific materials used during its construction. Most of them occur in the material production phase (A1-A3) and their transport (A4) and in the last phase of the building's life (C1-C4). Selected products are also present during the use of the building (B1-B5).

Results

One Click LCA allows you to determine the environmental impact of a building in different pollutant categories. In the analyzed case, the obtained results allow to estimate the impact of both a given life stage of an office building and individual groups of materials. The environmental impact of the tested object is assessed by the emission of various factors, such as: carbon dioxide (CO_2), sulfur dioxide (SO_2), phosphates (PO_4), trichlorofluoromethane (CFC-11), ethene (C_2H_4). The figure below shows the percentage share of the successive stages in the life cycle of an office building in the emission of pollutants.

Fig. 1. Percentage share of building life stages in individual environmental impacts

At each stage of the life cycle of a building object, the most significant factor is electricity consumption, which accounts for approximately 75-90% of the total environmental impact in each category. The CFC-11 emission is an exception, for which over 50% is caused by the production phase of building materials. In this category, 30% of all ozone depleting substances are due to the energy related phase B6. Relatively small, but significant is also the construction phase, which mainly affects the destruction of the ozone layer, equal to 11.9%. These three phases in the entire life cycle of an office building are the most environmentally responsible. The remaining life cycle modules, i.e. transport, maintenance and servicing, water consumption and building demolition, play a relatively small role in pollutant emissions in each category. The results in this category are inconsistent as the LCA analysis of a building located in Krakow showed that the production of materials is primarily responsible for the destruction of the ozone layer. Of the impact categories considered, 2-6% is waste management at the end of the life cycle, a small but significant environmental impact. According to the results of this study, the A4 and A5 modules have a negligible influence. Similarly, the phase of material production and building operation is responsible for over 90% of the formation of photochemical oxidants. The results also showed that electricity consumption is the dominant factor in building use and is equally burdening the environment. On the other hand, the maintenance and demolition phase of the facility is the least significant, accounting for approximately 0.1% of GHG emissions. Figure 2 shows the impact of individual groups of materials on the effects of the tested object on the environment.

Fig. 2. The share of individual structural elements in terms of the building's environmental impact

The group of materials used to create internal walls and non-load-bearing structures of the building constitute the greatest environmental burden. It contributes to 72-83% of CO_2 emissions and substances that cause eutrophication, acidification or depletion of the ozone layer. The exceptions are emissions responsible for photochemical smog, the main source of which are the load-bearing vertical structures of the office building with a result equal to 42%, and 30% are the materials used for the construction of internal walls. In addition to these elements, the external walls and the facade are also important in the entire structure of the building. In the final analysis of the facility, One Click LCA

software assesses its impact on a seven-level emissivity scale from A to G, where A is the building with the lowest emissions and G the most polluting for the environment. The result of the analysis is shown in Figure 3.

Fig. 3: The building's emission class, converted to CO2e

Based on the entered data, the analyzed office building obtained a result of 160 kg CO2e/m^2, thus being classified as level A in the emissivity scale of buildings commercial. It is an annual value for an assumed building lifetime of 99 years, including module A1-A4, B4-B5, C1, C4.

Summary

The functioning of the idea of sustainable development in various branches of the economy requires appropriate methods and tools to measure and compare the environmental impact of individual products or services. These impacts include emissions to the environment and consumption of non-renewable resources as well as land use etc. (Sharma et al., 2011). An environmental management technique can be LCA, which assesses environmental hazards throughout the life cycle of a given product. Considering all the ecosystems and its components affected by each element of a building structure, it is possible to comprehensively estimate its impact on the natural environment. For this reason, creating a building that is environmentally friendly depends on the knowledge of its impact at each stage of the life cycle (Grzesik 2006).

The purpose of this study is to assess the life cycle of an office building, which can be used for effective environmental management. Cradle to grave analysis covers the entire life cycle of a facility, from the production of building materials to facility demolition and waste management. The data was used to determine the impact of the building in various environmental categories caused by individual building components and specific building materials. It has been observed that the most harmful to the environment is the electricity consumption in modules A4 and B6, in 4 out of 5 impact categories it is responsible for 75-90% of total pollutant emissions. Such a large share of this module in the pollution of the environment with harmful gases may result from the nature of the Polish energy sector, which is based on fossil fuels. These results are also confirmed by the studies discussed above, such as Ylmén et al. (2019) or Kofoworola and Gheewal (2008). At the same time, building operation is the longest-lasting stage in the entire life cycle, in which energy consumption by HVAC systems, office equipment, lighting, etc. it is very big. Therefore, it is crucial to reduce the impact of the use phase on pollutant emissions. At the same stage, it is important to proper management of the building and installed systems. Nevertheless, reducing the impact should start with a building design that complies with low carbon standards. The construction of such facilities is possible through the use of building materials that meet specific parameters and requirements, e.g. very good thermal insulation, tightness of the building structure, elimination of thermal bridges. Such activities will allow, among others to reduce electricity consumption, including by HVAC systems, where technological solutions are also important. Apart from the B6 module, it is the building materials and the construction stage that contribute the most to environmental pollution, according to the LCA analysis. The A1-A3 module generates more than 50% of ozone-depleting compounds, while in the remaining categories its share is between 8% and 16%. Therefore, the choice of building materials is important not only in terms of the further use of the facility, but also in terms of emissions during the production and construction process. The construction of low-emission buildings is often associated with a higher initial environmental burden, e.g. by higher consumption of certain raw materials and products ready for construction. Ultimately, however, this translates into economic and ecological benefits in the subsequent stages of the building's life cycle. The remaining phases of the office building are of little importance in relation to the energy consumption and the product phase.

In the case of the construction groups of an office building, the dominant influence is on the internal walls and non-load-bearing systems. They are responsible for 30% of the emissions of gases causing photochemical smog, but in

the remaining categories a total impact of 70-85% is observed. Other significant groups are also: pillars and load-bearing structures, as well as external walls and facade, as well as land development. The pollutants emitted by these groups may result primarily from: the use of large amounts of non-renewable raw materials, the consumption of large amounts of electricity for their processing and the need to use a large number of finished products at the construction stage. The reduction of the generated pollution can be achieved by using recycled materials for construction, or by managing demolition waste to create another facility. Due to the high environmental impact of the construction sector, the introduction of the idea of sustainable development is of key importance. The results of the LCA analysis allow the identification of impacts, the assessment of the impact and its systematization, and the comparison of different buildings at each stage of the life cycle. Determining ways to minimize the impact of a building object is possible through a comprehensive analysis of environmental aspects, which allows to identify places that generate the greatest load. The results of the analysis also allow for the comparison of the materials used, giving clear guidance when choosing alternative raw materials and finished products. The information provided by LCA is extremely important for building designers, constructors and the client. Environmental management using LCA allows you to plan and make better material choices and make appropriate decisions that will make your building more environmentally friendly. It also enables economic and ecological optimization of each stage in the building's life cycle, including the dominant phase of operation.

Abstract

The current competitive environment and the constant pressure of customer requirements cause a growing need for a quality marketing strategy, which is already a necessary element of the long-term existence of companies. Businesses must strive to meet customer needs and create new and effective marketing strategies that ensure that business goals are met. In the field of management, certain methods can be used to create a marketing strategy, which can provide certain benefits and speed up or simplify this extensive process. The primary goal of this work is the analysis of selected management methods and their use in creating a marketing strategy for the company. These methods are the Business Canvas model, the Balanced Scorecard, and Porter's model of 5 forces. The aim was to describe the possibilities of using management methods in areas essential for the creation of a marketing strategy and also to derive the benefits of these management methods. Within this work, methods of analysis, synthesis, induction, deduction, and comparison of the issue were used, based on which specific conclusions were drawn. According to the performed analysis of individual management methods, we determined the areas of their use in the process of creating a marketing strategy and we also determined the benefits provided by these management methods. Based on clear processing in the form of tables, companies can use these management methods in a specific area of the process of creating a marketing strategy.

Keywords: marketing strategy, Business Canvas model, Balanced Scorecard, Porter's model of 5 forces

Introduction

In a successful business, the company must achieve predetermined goals through the use of marketing strategies. Setting the right marketing strategy is, therefore, a key factor in meeting the company's goals. Without a properly planned, designed, and implemented marketing strategy, a profitable business entity would probably disappear. The development of marketing strategy over the years has shown that authors dealing with this issue in the past have often limited themselves to creating a marketing strategy based only on internal information of companies, without taking into account the influence of the market and competition. Today, the influence of the external environment on the marketing strategy and its creation is a matter of course, and it is a time-consuming and personnel-intensive, and complex process.

Marketing strategy is the marketing logic by which a company achieves its marketing goals. The marketing strategy consists of decisions on marketing costs, the marketing mix, and the allocation of marketing resources about expected environmental and competitive conditions. The marketing strategy builds on the basic policy and goals of the company, which also helps to shape and determine and is the result of a comprehensive analysis of competition, environment, demand, but also its own strengths and weaknesses. (Jakubikova, 2012)

In his study, Varadarajan (2010) comments on defining a marketing strategy and explains it as an integrated model of an organization's decisions that specifies its critical product, market, marketing, and marketing resources in creating communication and delivering products to companies that offer value to customers, in exchange, thus enabling this integrated model of the organization to achieve specific objectives. The main goal of the marketing strategy is to state the optimal variant and direction of the company to ensure the sustainable development of the company. Strategic management plays an important role in achieving the set goal of the organization, as it forms the basis for the

Cite this Article as: Anna KUBJATKOVA and Margareta NADANYIOVA " Three Selected Management Models As Supportive Quality Tools In Creating A Marketing Strategy" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

application of management, and provides a starting point for the area of the most important and long-term oriented management activities. We can consider marketing strategy as one of the most important tools for the strategic management of a company operating in a highly competitive market environment.

The author Lesakova (2011) claims that the correct formulation of individual marketing strategies leading to the achievement of set marketing goals becomes a prerequisite for the success of the company in the long term. However, the basic process for formulating strategies should cumulatively meet the following requirements for business management:

- respecting the mission of the company and following the basic corporate marketing direction, which covers all corporate units and activities,
- high awareness of the results of marketing situation analysis,
- the use of marketing situation analysis as a key starting point for formulating a strategy,
- unconditional respect for the primary and secondary goals, for the fulfillment of which the individual strategies are formulated.

The specific marketing strategy of the company should work in a balanced way, focus on the long-term goals of the company, and respect the internal and external conditions to achieve the expected market effect. The task of the marketing strategy is to select the market segments on which the company will focus and help it achieve its marketing goals. (Kotler, 2007)

Available global resources define marketing strategy as the effort to develop effective responses to the changing market environment by formulating market segments, developing and locating product offerings for target markets. (Hooley et al., 1998) A marketing strategy can act as a plan in which product decisions, placement, and promotion are tools to help a business respond to market changes. It represents market orientation and satisfying customer needs and marketing concepts to indicate how the overall strategy of the company should go and how these needs will be met. It also introduces the company's philosophy of how to carry out its marketing activities efficiently and effectively, is primarily focused on the customer and his needs, influencing the customer through various influences, such as classic marketing mix tools or the use of modern tools such as media and social networks (Gavurova, Bacik, Fedorko, Nastisin, 2018). Focusing on the customer and increasingly creating private labels is key for companies that are focused solely on achieving a certain level of profit (Gregova, Dengov, Tulyakova, Mustafaev, 2020). To achieve the required level of profit, in addition to focusing on customer requirements, it is necessary to determine the optimal price of products, which is an integral part of the process of creating a marketing strategy (Oliinyk, Kozmenko, Wiebe, Kozmenko, 2018). The essence of the marketing concept is for the company to focus primarily on profit instead of sales volume and for the customer to return to the product and also to acquire new customers based on references from existing customers (Goeldner et al., 2014). The professional literature states that the marketing concept is based on 4 pillars, while each element of the marketing concept adds value to the following element:

- focus on the market,
- customer orientation,
- coordinated marketing,
- profitability. (Jakubikova, 2012)

For a quality marketing strategy, it is necessary to know what the real needs and wishes of customers are and to be able to anticipate them in time, for example, anticipate the customer's future needs and understand trends. As with chess, the company must be able to predict future market developments and deploy its forces ahead of time in strategically advantageous locations. The company should evaluate the profitability of the project, the complexity with which it will be implemented, possible vulnerability, and make sure that it does not lose more than it can gain. (Tručka, 2013)

Rajnak et al. (2007) argue that pricing is the essence of pricing and is a complicated process. A properly designed price is the quickest way for a business to maximize its profits. An appropriately priced price can even increase profits faster than increasing turnover. Of all management decisions, price decisions are the most visible and have a significant impact on the overall profitability of the business.

Methodology

Creating a marketing strategy is a complex process in which it is possible to use many procedures, models, and methods from various areas. In the field of management, it is possible to use various methods to support and create a marketing strategy. These selected management methods are:

- Business Canvas model,
- Porter's model of 5 forces,
- Balanced Scorecard.

Business Canvas model

It is a simple tool for designing, analyzing, and innovating a business model created in graphical form and designed by Alexander Osterwalder. This model is best described based on nine building blocks that show the logic of how a company wants to make money. These nine elements cover four main areas: customers, supply, infrastructure, and financial viability. We can, therefore, perceive the business model as a detailed plan of a strategy to be fulfilled through organizational structures, processes, and systems. This model helps companies to coordinate individual activities and provides a relatively comprehensive view of the business. This tool is popular with entrepreneurs because it presents room for improvement and innovation in the company. By consolidating the view of activities and aspects related to business, it enables the discovery and subsequent elimination of non-profit parts of the business plan and the depiction of opportunities for business growth. (Osterwalder, Pigneur, 2012)

The basic components of the Canvas business model are:

- customer segments,
- added value,
- channels
- customer relations,
- sources of income,
- key resources,
- key activities,
- key partnerships,
- cost structure.

Porter's model of 5 forces

Porter's five-force model is a tool that examines the competitive environment. Porter assumed that the profitability of an industry depends on five dynamic factors that affect prices, costs, and the necessary investments of companies in the industry. The aim is to enable an understanding of the forces operating in this environment, to identify those that are most important for the company in terms of its future development and which may be affected by strategic management decisions. It should also be noted that in individual sectors factors of equal importance because each industry is unique and has its own specifics. (Srpova, Rehor, 2010)

These 5 forces include:

- the rivalry between current competitors,
- the threat of entry of new competitors,
- the threat of substitutes,
- bargaining power of suppliers,
- bargaining power of customers.

In a competitive environment, it is important to identify the competitive advantages that a company could use to gain market leadership. Valaskova, Kliestikova, and Krizanova (2018) argue that knowledge of the customer's preferences is key in determining the purchasing power of consumers, which is crucial for the competition and its position in the market. According to Chetthamrongchai and Saengchai (2019), gaining customer loyalty is therefore essential for companies in the competition, while goodwill or company image also derives from customer loyalty (Kliestik, Kovacova, Podhorska, Kliestikova, 2018), (Tuan, Jusoh, Mardani, Streimikiene, 2018). According to Podhorska, Gajanova, Kliestikova, and Popescu (2019), goodwill and its key value indicators are important in the competition, especially to ensure the growth of its market value.

The acquisition of a competitive position in the market is preceded by the acquisition of information and analysis of the competitiveness of the company itself using various analyzes and indices (Parobek, Palus, Kalamarova, Loucanova, Krizanova, Repkova Stofkova, 2016). It is important to note that gaining a competitive position is not as important as maintaining that position in the market. To maintain a competitive position in the market, companies use a large number of marketing tools, and in today's environment, not only the media and innovation but also respect for the environment come to the fore. According to Moravcikova, Krizanova, Kliestikova, and Rypakova (2017),

therefore, the relationship between the company's sustainable competitive position on the market is inextricably linked to the principles of green marketing.

Balanced Scorecard

Balanced Scorecard (BSC) is a strategic management tool. It is also referred to as a system for measuring the performance of the organization or a system of balanced performance indicators of the organization. The set of balanced indicators is the basis of the Balanced scorecard, and we can compare these indicators with each other. BSC emphasizes that financial and non-financial measures must be part of an information system available to employees at all company levels. Frontline employees must understand the financial implications of their own decisions and actions, and senior management must understand the drivers for long-term financial success. BSC's goals and measures are more than just an ad hoc set of financial and non-financial performance measures but are derived from a vertical process given by the company's mission, vision, and strategy. BSC should accompany the company's mission and strategy into tangible plans and gauges, as it is more than a tactical or operational system of gauges. This strategic management tool translates the company's vision and strategy into goals and indicators, which are contained in the following four perspectives (Kaplan, Norton, 2007):

- financial perspective,
- customer perspective,
- the perspective of internal processes,
- the perspective of learning and growth.

According to Krylov (2019), we can consider the Balanced Scorecard to be a sufficiently tested management tool that is known to all market participants in the world.

Implications of management models to creating a marketing strategy

There are a large number of possibilities to use the mentioned management methods in creating and shaping the company's marketing strategy. In the following table we have created an overview of the areas of use of individual management methods in creating the company's marketing strategy:

Table 1: Areas of application of management methods in creating a marketing strategy

Area of application	Methods	Business Canvas Model	Porter's model of 5 forces	Balanced Scorecard
Customers		Breakdown of customers into customers that the company wants to reach and those that it wants to ignore, emphasis on segments, channels, and customer relationships	Efforts to prevent the growth of customers' bargaining power	Focus on creating value for the customer and the investor
Competition		Focusing on added value and finding a competitive advantage	The greatest emphasis on competition, focusing on an existing and a potential competitor	Focusing on competition analysis for the learning needs to move forward in value create
Resources		Determination of sources for financing, analysis of sources of income	Determining the sources of financing to ensure the most suitable competitive position	Identifying resources to achieve the company's vision and strategy and resources to make the company more attractive

Information	Emphasis on information from the environment of resources and innovation	Emphasis on information to gain a strong competitive position in the market	Emphasis on information to ensure long-term growth and improvement of the company
Communication	Selection of communication channels based on selected and ignored customer segments	Improving communication with customers, but also with suppliers	Detecting business process imperfections based on a thorough communication network
Product	Creating a specific offer based on the definition of customer segments	Prevention of substitutions, emphasis on originality and quality	Emphasis on the attractiveness of the product not only for customers but also for investors

Source: processed by authors

The advantages of individual management methods and their use can be stated based on theoretical knowledge and a processed table as follows:

Table 2: Advantages and use of Management Methods in Creating a Marketing Strategy

Methods	**Business Canvas Model**	**Porter's model of 5 forces**	**Balanced Scorecard**
Use	promoting understanding, discussion, and creativity in creating a marketing strategy	thorough and detailed analysis of the competitive environment in creating a marketing strategy	measuring the performance of the organization and putting goals and strategies into practical and achievable tasks to support the creation of a marketing strategy
Benefits	clarity and time-saving	brevity and complexity	practicality and perspective of the future

Source: processed by authors

Conclusion

The issue of creating a marketing strategy for organizations is currently considered one of the most important. Theorists and practitioners agree that the existence of a strategy is a basic prerequisite for the survival of the organization, the specification of its position in the market, and its development. When formulating the marketing strategy of the company, it is possible to use various theoretical and methodological sources, while the resulting strategy of each company has a unique character. Among other things, many methods from the management environment can be used to support the marketing strategy, using which companies can make the necessary decisions necessary for the formation of the final business strategy. The essence of creating a marketing strategy is primarily complexity, systematicity, and an effort to make the most of the possible synergistic effect of all implemented decisions.

Management methods analyze the company from different perspectives and allow a comprehensive overview of the internal and external environment of the company, as well as changes affecting it from both of these environments. These methods and models, therefore, help the company in obtaining information for a comprehensive creation of a marketing strategy. It follows that management models and methods are an integral tool to support marketing strategy, and their use helps to make decisions that shape a comprehensive marketing strategy of the company.

Each of the selected models has a significant contribution to the creation of a marketing strategy. The use of the Business Canvas model in the creation of a marketing strategy allows companies to quickly and clearly graphically arrange all the elements needed for improvement and innovation in the company. This model also evokes creativity

and encourages collective work in the process of creating a marketing strategy. Porter's model of 5 forces provides a brief overview of the various impacts on society, while its biggest advantage can be considered a comprehensive assessment of the competitive environment, which is very important in creating a marketing strategy. The Balanced Scorecard also has very practical use in creating a marketing strategy, where it provides companies with measurable and achievable tasks as a result of goals and strategies, while this model provides companies with a perspective of the future.

Individual management methods help in creating the company's marketing strategy, especially by creating an information base in various areas. These methods can be combined and complement each other, as well as other methods to support the creation of a marketing strategy, thus helping companies to create a comprehensive and integrated strategy.

The Role of Innovative IT Systems, based on GPS Services, in Human Resource Management Processes Which Takes Place in a Job Performed by a Football Coach

Wojciech LEWICKI

Faculty of Economics, West Pomeranian University of Technology Szczecin, Poland.
e-mail:Wojciech.Lewicki@zut.edu.pl

Abstract

The article presents a research study on the role of innovative IT systems, based on GPS services, in human resource management processes which take place in a job performed by a football coach. The literature on the subject emphasizes that the issues of human capital management are not only limited to enterprises and management staff. There is a strong tendency to transfer the issues of human capital management to other organizational forms, such as sports clubs or coaching staff. In the case of sports coaches, one of the key tasks involves management using monitoring of physical parameters. Today, this process uses the data obtained by means of innovative services and information technologies based on positioning systems. In the study, the data from the football match was collected using the innovative CATAPULT IT system equipped with GPS transmitters. One of the key parameters of the coaches' assessment was analysed, i.e. the intensity of the player's run depending on the phase of the game, i.e. attack or defence. The study covered players in the major football league in Poland in the autumn of the 2018-19 season. The aim of the article was to evaluate the hypothesis that on average the attack in the offensive phase cover longer distances than in the defensive phase and that the distance covered during intense running as well as peak speeds are higher in the first and not the second half of the match. Not only does this research study make an important contribution to the literature by providing up-to-date information on the aspects of human resource management in terms of commitment, but also on the data analysis and its use for training methods in sport. The study results are an important element of R&D in a job performed by a professional trainer.\

Keywords: Human Resource Management, Involvement, Data, IT System.

Introduction

The literature emphasizes that human resources are of great importance to the effective operation of any organization. They do bring tangible results (Schuler,1992). In the book by Griffin (2012) human resource management, or "personnel management", as it is sometimes called, used to be a secondary task in many organizations, but in the last two decades its importance has grown enormously. This results from the increasing complexity of the legal matter, and recognition that human resources are a valuable means of improving efficiency, as well as realization of the costs associated with their inappropriate management.

Many authors (Casico,1992; Bratton & Gold 2012;Mathis & Jackson 2011; Mishra, Sarkar & Singh 2012) emphasize that human resources include knowledge, skills, experience and attitudes identified as commitment. Currently, many researchers in the field of human resource management acknowledge the fundamental role of the latter postulate (Kuimet et al. 2015; Naeem et al. 2019; Kein, Brinsfield & Cooper, 2020). By emphasizing it in the knowledge-based development, the importance of behavioural levers grows, including the employee's commitment, which is an important determinant of how their potential is fulfilled. Therefore, it is necessary to change the traditional model of human resource management in order to build and develop a management model based on commitment.

The available literature mentions that football is a sport characterized by physical involvement (Drust, 2010). One of the researchers emphasizes that it requires unique qualities and skills from the players (Akenhead et al. 2013). Their complexity is determined by a variety of behaviours on the pitch, such as variability of the speed of movement during the game (e.g. walking, running, sprint), or sudden changes in the direction of runs, e.g. (transition from attack to defence) (Morgans et al. 2014). According to the available studies, a player performs an average of 150-200 different actions during one match. Apart from the aforementioned changes in the speed and directions of runs, this type of effort includes, among others, jumps, accelerations or slowdowns (Ferraz, Tillar & Marques 2017). In the literature on the subject more and more emphasis is put on the role of players representing the attack as those who have a decisive influence on the result of the match (Goumas, 2017). The analysis of the available research studies shows that players in the forward or wing positions cover the longest distances during

Cite this Article as: Wojciech LEWICKI "The Role of Innovative IT Systems, based on GPS Services, in Human Resource Management Processes Which Takes Place in a Job Performed by a Football Coach" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

sprints, i.e. when they run at the highest level of intensity (Mohr, Krustrup & Bangsbo 2003). In addition, other authors emphasize that the vast majority of goal-scoring situations is preceded by a forward's or winger's sprint, which means that this type of a running action has an impact on the result of the match (Kermarrec 2015). Therefore, the assessment of running abilities at the highest level of intensity may be crucial for a football coach in human capital management processes (Faude, Koch, & Meyer 2012).

Therefore, it is important to analyse the distance covered during sprints (an activity at the highest level of intensity), both in the offensive and defensive phase of the match.

Although analyses based on the Global Positioning System (GPS) are widely used by professional football clubs, and provide an insight into commitment (physical activity during training), the application of these systems to analyse physical characteristics of particular formations in a real match is still an open research question. (Neville et al. 2012; Scott, Scott, & Kelly 2016; Coutts & Duffield 2010; Wisbey et al. 2010). In particular, it is applicable in the field of research on human resource management in a job performed by a professional football coach.

The analysis of the literature on the subject shows that no studies on this issue have been carried out yet (Larsson 2003; Varley, Fairweather, & Aughey 2012; Theodoropoulos, Bettle & Kosy 2020), which additionally emphasizes the grounds for examining it in terms of science and practicality.

The aim of the study was to evaluate the hypothesis that on average the attack in the offensive phase cover a longer distance than in the defensive phase and that the distance covered during their runs with the highest running intensity and the peak speeds are higher in the first half, and not in the second half of the match.

The paper is organized as follows. Chapter 2 provides a detailed description of the research approach to answer research questions. Chapter 3 describes the results of the experimental research. Chapter 4 contains their interpretations. Chapter 5 presents final conclusions of the research, indicating their limitations, a practical application and future directions of research in this field.

Research Approach

Design and Procedure

The literature emphasizes that the use of innovative solutions based on GPS technology enables to conduct an assessment of approximately 500 to 1,500 physical parameters (Theodoropoulos, Bettle & Kosy 2020). The complexity of the physical process, which takes place during a football match, required an innovative approach from the authors. The variables which were crucial for the research and the subsequent analysis included the distance covered by the player while sprinting in the offensive and defensive phase; the peak speed during highly intense actions in both phases of the game; development of the values of these characteristics in the first and second half of the match. For the purposes of the research, it was assumed that sprint is a situation in which the player runs at a speed of over 7 m/s. The offensive phase is a situation in which the team of the player under study has possession of the ball, while the defensive phase is a situation in which the team loses control of the ball and makes attempts to win it.

Instrument

The crucial data for the research was collected using innovative IT systems devices in the CATAPULT OPTIMEYE G5 (10Hz) system equipped with GPS transmitters. Observation of the game reality shows that these technologies are more and more frequently used by the training staff of the largest football clubs for defining commitment and conducting an assessment of the physical potential of particular players (Brewer et al. 2010). All information was collected during football games played on grass pitches. The study covered 19 matches in the autumn of the 2018-19 season of Ekstraklasa (a Polish major football league).

Participants

Affirmative actions were taken with regard to the correct selection of people for the research. It was assumed that the study would cover 18 forwards playing in the major Polish football league in the autumn of the 2018-19 season. The average age in the study group of players was 25.9 ± 3.5 years, while their average height was 185.5 ± 5.9 cm. The research results are presented in tabular and graphic form.

Results

The analysis of the collected data (Table 1) showed that in the group of forwards the average sprint distance covered during the match in the offensive phase (93.6 ± 40.2 m) is 21.4% longer than this distance covered in the

defensive phase (77.1 ± 30.7 m). The highest value of that parameter for one player in the period when his team had possession of the ball was 160 m, while the lowest value was 82% less and equalled 28.8 m. In the defensive phase, the highest value of the parameter under study was recorded at a level of 139.4 m, which was 876.7% more than the minimum value (15.9 m) for this phase (Table 2).

Table 1: Average ($\bar{x}$±SD), minimum and maximum distance [m] covered by the forwards at a speed of >7 m/s, broken down by game phases

Game phase	1. half			2. half		
	$\bar{x}$ ± SD [m]	Min.	Max.	$\bar{x}$±SD [m]	Min.	Max.
Offensive phase	51.25±33.35	0	108.62	42.35±28.44	0	101.92
Defensive phase	38.75±24.87	0	80.1	38.35±24.02	0	72.58
Both phases	90±40.15	0	132	80.7±34.66	0	147.82

Table 2: Average ($\bar{x}$ ± SD), minimum and maximum distance [m] covered in the match by forwards at a speed of >7m/s

Game phases	Entire match		
	$\bar{x}$ ± SD [m]	**Minimum**	**Maximum**
Offensive phase	93.6±40.22	28.79	159.98
Defensive phase	77.1±30.71	15.9	139.38
Both phases	170.7±41.13	88.91	232.94

The peak speed reached by the players under study in both phases of the game is presented in Table 3. The average I ts value calculated on the basis of the data collected in the offensive phase was 8 ± 0.41 m/s, and was 1.1% less than its average value noted in the defensive phase (8.09 ± 0.45 m/s). The peak value of the crucial parameter for the offensive phase was 9.36 m/s, which was 37% more than the bottom value of 6.83 m/s. The highest value of the peak speed measured in the defensive phase reached a level of 9.43 m/s, which was 37.7% more than the lowest value of the parameter observed for the forwards in that phase of the game (6.85 m/s) (Figure 1).

Table 3: Average maximum speed ($\bar{x}$ ± SD) [m/s] recorded by the forwards, broken down by game phases

Game phase	1. half	2. half	Average for both halves
	$\bar{x}$ ± SD [m/s]	$\bar{x}$ ± SD [m/s]	$\bar{x}$ ± SD [m/s]
Attack phase	8.11 ± 0.63	7.9 ± 0.53	8 ± 0.41
Defense phase	8.23 ± 0.76	7.95 ± 0.52	8.09 ± 0.45

The data analysis showed that the average value of the distance covered in the forwards' sprint was significantly higher in the first half than in the second half for each of the game phases (Table 1). In the offensive phase, the distance covered for running with the highest intensity in the first half of the match was on average 51.3 ± 33.4 m, and was 21% more than the distance covered in the second half of the game (42.4 ± 28.4 m). In the defensive phase, the average sprint distance covered in the first half of the game was 38.8 ± 24.9 m, and was 1% more than the distance covered in the second half (38.4 ± 24 m).

However, the highest value of the parameter for the results achieved during the first half in the defensive phase was 80.1 m, and was 10.4% more than the highest value achieved by the forwards in the second half of the match (72.58 m). The top values for the distance covered in the first half during sprinting in the offensive phase reached a level of 108.62 m, which was 6,6% more than in the second half of the game (101.92 m) (Table 1).

The average peak speed measured in the offensive phase was recorded at a higher level in the first half of the match (8.11 ± 0.63 m/s) than in the second half (7.90 ± 0.53 m/s). The difference was at a level of 2.7%. As for the defensive phase, the results were similar, with a 3.5% difference between the average values of the parameters. For the first half, in this phase of the game, the average value was 8.23 ± 0.76 m/s, whereas for the second half it equalled 7.95 ± 0.52 m/s (Table 3).

The highest value of the peak speeds reached in the first half (offensive phase) was 9.43 m/s, which was 7.3% more than the peak value in the second half (8.79 m/s) (Figure 1).

Fig.1: Minimum and maximum values of the peak speed [m/s] recorded by the forwards, broken down by game phases

Source: own study

The lowest values for the time when the team was in defense were 6.85 m/s (first half) and 6.88 m/s (second half). The difference was 0.4%. In the first half in the offensive phase the highest peak speed was 9.36 m/s, which was 3.8% more than the highest value for the second half in the phase of the game under study (9.02 m/s). The lowest value of the parameter under study before the break was 6.87 m/s, which was 0.6% more than after the break when the lowest value of the peak speed was 6.83 m/s.

In order to perform our analysis objectively, the players' results were included in the test only after they had played for the entire duration of the match. After each game played, the average values of the characteristics of the players analysed in both halves of the game were calculated. Then, the obtained values were averaged for the entire population under study. The application of an appropriate statistical tool supported by Excel allowed to present differences between the sprint distance and the peak speeds reached by the forwards both in the offensive and defensive phase, as well as show how the values of these parameters change in each half of the match.

Discussion

One of the main elements of modern concepts of human resource management is the management of the employee's commitment (Cox, Zagelmeyer & Marchington 2006). As other researchers point out, commitment is a kind of reflection of the willingness and ability to perform work. It may be looked at from different aspects, e.g. commitment to the organization or work (Zhou, Fan & Son, 2019). There are many factors which have influence on the level of the employee's and the organization's commitment (Seeck & Diehl 2017). It remains true, however, that in the case of a sports discipline such as football, this commitment has a physical dimension (Friedrich & Mason 2017). Innovative IT systems based on GPS services are tools that can be used to assess and measure the

physical involvement of particular players. Currently, no one doubts that the trainer is responsible for measuring and evaluating this commitment. The aim of the research study was to evaluate the hypothesis that on average forwards cover a greater distance in the offensive phase than in the defensive phase of the match. Moreover, the study aimed at discovering whether the distance covered during highly intense runs and the peak speeds reached by the study group of players were determined by higher values in the first or the second half of the match.

The research results allowed to confirm the hypotheses formulated by other researchers (Miñano-Espin et al. 2017; Di Salvo et al. 2007; Andrzejewski et al. 2016) that on average the study group of forwards covered longer sprint distances in the offensive phase than in the defensive phase, and that the values of an average distance covered in the sprint as average peak speeds were higher in the first half of the game than in the second half of the game. At the same time, the study rejected the hypothesis promoted in the literature that forwards reach higher peak speeds in the offensive phase than in the defensive phase of the match (Ferraz et al. 2017; Lago et al. 2010). The authors put forward an argument that in the case of forwards the defensive phase is primarily an attack on defenders and a quick return to defence after offensive fragments of the game. One of the researchers emphasizes (Carling,2010) that in such situations larger spaces are created on the pitch, which results in longer and faster sprints. Additionally, it should be taken into account that forwards often dribble in the offensive phase, which may affect their peak speed.

Our analyses allow to state that the forwards who played in the autumn of the 2018-19 season covered a much longer distance on the field (21.4%). During the offensive phase their running was the highest in intensity. It is normal, because players in this position should have special skills for the offensive game (Tenga et al. 2010). The differences between extreme values of the analysed parameter for each phase of the game were at a relatively similar level, but it is worth noting that on average the distance covered during a single sprint was longer in the offensive phase, which was confirmed by higher extreme values of the parameter under study.

The results of the comparative analysis, broken down by two halves of the match, were also confirmed in the research studies conducted by other authors (Gregson et al. 2010). The values of the parameters covered by the study (average distance covered in the sprint, average peak speeds) were higher before the break.

The results of the analyses provided interesting data on the average distance of the forwards' runs that were the highest in intensity (sprints). They were longer by 21% before the break (offensive phase) compared to the game after the break. However, for the corresponding periods of the defensive phase the difference to the advantage of the first half of the game was only 1%. In the future, the relationship of this particular parameter with the result of the match should be analysed in detail. As for the change in the level of average peak speed values depending on the half of the match, they were at a higher level before the break in both phases of the game. In the offensive phase this difference was 2.7% to the advantage of the time on the field before the break, while in the defensive phase it was 3.5%. Therefore, it should be noted that similar decreases in the value of these types of variables took place, which shows that in both phases of the game the forwards were able to maintain runnig at a similar level of efficiency and intensity with regard to the parameter under study.

Some extremely interesting research results were obtained by analyzing the average values of the peak speeds calculated for each phase of the game (Varley, Fairweather, & Aughey 2012; Bush et al. 2015). It would seem that an offensive player, who is a forward, should achieve much better results for this parameter when his team is in the offensive phase than in the defensive phase. However, the data analysis shows that slightly higher average peak speed values were reached in the defensive phase of the game. This may mean that forwards do not fulfil their maximum physical potential in the offensive phase of the game (Wrigley, et al. 2012; Dellal et al. 2011). This information regarding their real physical abilities may be crucial for the players themselves and their coaches.

Conclusions and practical implications

The analysis of the data collected using the innovative CATAPULT IT system equipped with GPS system transmitters from the players of the attack who play in the Polish Premier League clubs in the autumn of the 2018-19 season points to the following conclusions:

- During sprints (> 7m/s) the study group of forwards covered a longer average distance in the offensive phase than in the defensive phase. The difference was 21.4%. This is in line with the originally adopted hypothesis. Forwards are more involved in the offensive actions of their teams.
- For the group of players under study, the average distance covered and the average peak speeds reached during sprints in the match were higher in the first half than in the second half, which confirms the hypothesis. The growing fatigue, as the match progresses, means that the forward usually has weaker physical parameters in the second half of the match.
- The average sprint (> 7 m/s) distance covered by the group of forwards in the offensive phase was longer by 21% before the break than after the break. The difference was only 1% to the advantage of the time on the field before the break for the defensive phase in particular periods of time in which the parameter was analysed. In

the future, it will be necessary to conduct an additional research study on the impact of the match result and changeable tactical guidelines.

- The average peak speeds for the study group in relation to the halves of the match in both phases (offensive and defensive) remained at a higher level before the break. In the offensive phase the difference was 2.7%, whereas in the defensive phase it was 3.5%. Both differences are therefore comparable.
- The players in the attack reached higher peak speed values in the defensive phase than in the offensive phase. The differences were 1.5% for the first half, and 0.6% for the second half. The reasons are that in the offensive phase a forward often runs with the ball by his foot and has to focus on avoiding being offside, which translates into a slightly lower peak speed compared to the defensive phase.

The research study on building physical commitment shows that increasing the level of physical commitment in a team is an important organizational challenge in a job performed by a football coach.

The issues related to the analysis of the physical commitment of footballers are an important factor which has its influence on their sport achievements and financial success (Swayne & Dodds 2011). Monitoring of commitment also influences other requirements, such as knowledge, skills, health, or motivational processes. Therefore, involvement in human capital management grows in importance, as is the case with modern information technologies based on GPS services. Without a doubt management skills are required from the management team, or they are important competences of a professional football coach. Although the results of this study provide interesting conclusions for football coaches, more research is necessary to take into account other factors such as changes in tactics after conceding a goal, changing positions on the pitch, or losing a player. This data may provide a broader context and insight into the relationship between the effects of the parameters of running and developing innovative training methods. Therefore, an analysis of the data obtained from innovative IT technologies based on GPS transmission services related to the purposes of coaching will be the subject of future studies on the improvement of the optimization of human resource management.

Abstract

This article deals with creative accounting and specific handling techniques, which are widespread throughout the world and thus in the Slovak Republic. The situation that Enron started has gradually spread around the world, as evidenced by the scandals of WorldCom, Tyco, etc. Techniques began to be used to manipulate accounting documents and records, putting companies in a better position, managers being able to meet the goals originally set by the company's management, thus enriching themselves in the form of rewards, but achieved illegally, which later stands the company name. customers or, in the worst case, the whole existence. These techniques need to be pointed out because they have a negative impact on companies, employees, customers, donors, but also on the region in which the company operates or on the state. The article also presents methods to detect this illegal activity, which can ultimately and with timely interventions can once again steer companies in the right direction, ie in a direction without manipulation. No country in the world can avoid manipulating accounting documents. People are resourceful and want their businesses to make a profit. The combination of these two aspects always exists with manipulation, so it is necessary to inform the general public about this phenomenon. The aim of the article is to reveal the current situation of using techniques for manipulating financial statements and to describe the methods of their detection.

Keywords: Creative accounting, Purposeful manipulation, Detection models, Accounting documents

Introduction

Fraud has been here in the past and continues to this day, and therefore seems to be part of human nature. We encounter ethical dilemmas ourselves almost every day. These dilemmas often concern not only our personal lives, but also our professional lives. From current and past events, such as the so-called decline of Enron, we can observe that this dilemma also applies to companies. Business fraud is committed mainly for the personal benefit of the perpetrators or society as a whole, but often has devastating consequences for the surrounding economic environment. But there are always two sides of the coin. On the one hand, there is fraud, on the other hand, tools for combating this fraud, or doing everything possible to prevent fraud from occurring. In this article, we will try to describe the actions of companies that lead to fraud, but also methods that can detect this fraudulent behaviour of companies and thus reduce the number of companies that do not operate under the rules of applicable law and are destroyers of the reputation of the country where they do business.

The aim of this article is to point out the manipulation techniques and methods by which we can detect these techniques. The article is divided into several parts. In the Literature review chapter, the opinions of various authors of various studies are on how they understand manipulation, also where people can encounter manipulation everywhere and what the consequences are associated with manipulation. In the next chapter, the reader will read about possible techniques for manipulating accounting documents. We focused on several techniques, which we also described, so that the reader can imagine what kind of manipulation he is writing about. In the following chapter, we focused on methods of detecting creative accounting, ie how to detect a manipulative company. There are various methods that include world-renowned fraud detection models. In the chapter Result and discussion, the reader will

learn the conclusions that arise from the use of manipulation techniques. This chapter also discusses the current situation, which is largely affected by the Covid-19 pandemic. Finally, in the Conslusions chapter, we described a possible scenario for the development of a pandemic and the impact of the pandemic on the economies of the Visegrad Four.

The aim of the article is to describe the manipulation techniques used by companies to manipulate their statements, which then do not show the correct values, and so companies can change their obligation to pay taxes.

Literature Review

Fraud is committed in companies that seek to cover up their large revenues in the form of profits, whether from the subject of business in limited liability companies or from stock exchange trading, which is characteristic of joint stock companies. At the end of their accounting period, all these companies seek to make a profit that can help their companies manage them, or use this profit to expand the company, use it to expand into a new business or country, or redistribute it between company owners and employees, in the form of bonuses. The authors of Siekelova & Podhorska (2020) explain that "profit is the final effect of a company's business and at the same time often a measure of whether a company is successful or not." Company performance data is one of the cornerstones of further business planning and decision making. "The authors of another study, specifically Siekelovaet et al., Agree with this statement. (2019).

This has also been noted by Yang & Lee (2020), whose research may expand this knowledge as corporate fraud risk management strategies are increasingly becoming a sustainable business development goal. Recent reforms in forensic accounting technology to manage the corporate fraud risk around the world have opened up new avenues for the implementation of corporate governance and internal control mechanisms. Liao et al. (2019) found that the fact that the use of manipulation is expanding is hampered by a single factor, and that is women in financial management that reduce the likelihood of their businesses engaging in accounting fraud. Furthermore, this fact has shifted not only to private companies but also to public ones, where we can see the same trend of non-participation in the fraud. In an article by Wang et al. (2019), we can learn more about how investing in mutual funds also reduces accounting fraud. The study focused on the bivariate probit model, which examines the relationship between mutual funds and accounting fraud between 2007 and 2014. The authors found through their research that open-end mutual funds outperform closed-end mutual funds in detecting accounting fraud and reduce fraud commissions. An interesting finding was made by Beneish et al. (2012), who found that companies with a higher probability of manipulation, based on the M-score, achieve lower returns in each portfolio of deciles sorted by: Size, Book-to-Market, Momentum, Accruals, and Short-Interest. The M - score is also used as one of the tools for detecting manipulation of financial statements, as evidenced by the article by Blazek et al. (2020), who in their study focused on the Beneish model and examined the use of creative accounting in the conditions of industry A - Agriculture, forestry and fishing in Slovakia. Manipulation of financial statements can mean an advantage for the company in the area in which it However, manipulation is a fraud, a criminal act that can very quickly turn against the user and later, exactly as described in their study by Wang et al. (2019) that this information is gradually entering the capital market, which may have devastating consequences for the company, in particular for companies operating in the capital market. Such...

Gray (2008) writes in his publication that "Forensic accounting investigations include litigation services related to a variety of situations, including the following: business purchases, valuation of divorce assets, property damage, lost profits due to embezzlement and other illegal acts, tax evasion, and money laundering schemes." Goel & Ansari (2015) noted that companies use creative accounting to inflate stock prices. Subsequently, shares are held that hold overvalued prices. The "misuse" of creative accounting, in the case of Satyam Computers Limited, was possible due to a failure of the audit and a general failure of the CG's system. Okoro & Okoye (2016) argue that creative accounting helps organizations mitigate year-on-year changes in profits by shifting profits from. Stlowy & Breton (2004) argue that accounting manipulation is well known to companies and can be found in the literature under various designations, such as income smoothing, big bath, creative accounting, earnings management, creative bookkeeping, or window dressing. As can be seen, many authors have tried to describe manipulation, explain how manipulation occurs, or why it still persists.

Possibilities of editing accounting documents

This chapter of the article is devoted to techniques of manipulation of accounting data, documents. Here, the reader can, in a brief overview, read about the most used techniques of manipulation of accounting documents in the Slovakia.

Techniques for manipulating accounting documents

Volkánová (2014) explains that the most serious types of misstatement of financial statements include:

- "sudden changes in sales, market share or profit margin,
- unattainable target values of key indicators, especially short-term ones,
- Indirect pressure caused by linking the motivational component of management's salary to certain financial indicators."

Through the application of thoughtful manipulation techniques, we can indicate data manipulation. These techniques can be divided according to the degree of difficulty.

Embellishment of financial statements

Simon Constable (2014) in his publication he defines window dressing as the creation of cosmetic arrangements of the portfolio before the end of each quarter. It is about improving the position of the company, covering up mistakes so that the owners look more successful. The purpose of this technique is to get the results in the reports that managers want to see. Among the most popular handling techniques we include, for example:

- **Failure to comply with the precautionary principle**

In this case, the entity does not recognize revenue that is indeterminate. However, if it has possible losses, it is obliged to account for them and subsequently report them in the financial statements.

Off-balance sheet financing

According to Krupová (2001), the definition is as follows: "This is the financing or refinancing of business activities that may not appear on its balance sheet in compliance with legal requirements and accounting principles."

Exchange of financial leasing for operational

Leasing is considered to be an easily available source of external financing. At present, we can rank leasing among the most used methods of financing, especially for long-term tangible assets. Leasing is a mutual obligation. It is a relationship between the lessor and the lessee, where the lessee rents the lease and is obliged to pay the lessor in advance. Leasing is divided into:

a) **Financial leasing** (or even financial leasing): in terms of time, we incorporate it into a long-term lease. The lessee may use it to refinance the acquisition costs even though he is not the owner of the leased object**,**
b) **operating lease** (or also operating lease): in terms of time, we include it in the short-term lease. It is intended mainly for those business entities that need the need to finance seasonal needs.

Failure to report liabilities arising from outstanding receivables

A provision for a receivable is created mainly for a receivable for which it is reasonable to assume that the debtor will not pay it in full or in part, and for the disputed receivable from the debtor with whom the recognition dispute is pending. Based on § 26 par. 3 of Act no. 431/2002 Coll. on Accounting, as amended (hereinafter referred to as the Accounting Act), the accounting entity is obliged to adjust the valuation of assets, create provisions and depreciate assets in accordance with the date on which the financial statements are prepared with accounting principles and methods. This means posting a provision the receivables belong to the closing accounting cases. The creation, drawing as well as dissolution of provisions is specified in entrepreneurs, accounting in the double-entry bookkeeping system in § 18 of the accounting procedures. From the accounting point of view, we create provisions for receivables for costs, in the full or partial amount of the outstanding receivables.

Creation of reserves

A reserve is a liability with an uncertain timing or amount. The creation and accounting of reserves or the tax assessment of reserves is regulated by:

- Accounting Law,
- measure of the Ministry of Finance of the Slovak Republic on 16 December 2002 no. 23054 / 2002-92 laying down the details of the accounting procedures and the general chart of accounts for entrepreneurs accounting in the double-entry bookkeeping system,
- Act no. 595/2003 Coll. On income tax, as amended.

The provision is created by the entity on the basis of the precautionary principle for possible risks and losses. A provision is a liability that represents an entity's existing obligation arising from past events, it is probable that it will reduce the entity's economic benefits in the future, and if the exact amount of the obligation is not known, it is estimated to be sufficient to meet the existing obligation at for which the financial statements are prepared taking into account risks and uncertainties. Under the Accounting Act, an entity is required to adjust the value of assets, create provisions and depreciate assets in accordance with accounting principles and accounting methods as at the date on which the financial statements are prepared. "

Incorrect selection of depreciation method

An entity is required by law for accounting to depreciate tangible assets other than inventories and intangible assets other than receivables in accordance with accounting principles and accounting methods. Exceptions for fixed assets are land and objects made of precious metals, which are classified as non-depreciable fixed assets. Depreciation represents the actual rate of depreciation of fixed assets used by the entity, but not exceeding the amount of the valuation of the assets in the accounts; they are accounted for on a monthly basis on the basis of a depreciation plan. By choosing the depreciation method, an entity may affect the amount of operating costs to some extent and thus the profit or loss. It has occurred since 2020 in the Slovak Republic, a change in the depreciation of assets. The accounting entity is obliged to classify tangible fixed assets into one of the 7 depreciation groups. A different depreciation period applies to each depreciation group (Table 1).

Table 1: Depreciation period for individual groups

DEPRECIATION GROUP	DEPRECIATION PERIOD (IN YEARS)
0	2
1	4
2	6
3	8
4	12
5	20
6	40

Source: own processing according to the Income Tax Act, Act no. 595/2003 Coll.

The change, which became effective in 2015, says that for depreciation groups 1, 4, 5, 6, the entity can no longer arbitrarily decide which depreciation method to choose. It can only use the straight-line method. For the two groups (groups 2 and 3), he can still choose the straight-line or accelerated depreciation method. Since 2020, the number of depreciation groups has been expanded by depreciation group 0. Here, the same rule applies as for depreciation groups 1, 4, 5 and 6, ie an entity can only use the straight-line method.

Multiple depreciation groups, and a stricter definition of the depreciation method for separate depreciation groups, may to some extent discourage entities from applying creative accounting, as these measures have reduced the scope for excessive creativity.

Fictitious Invoices

It is a relatively common practice in creative accounting to issue fictitious invoices. This is the invoicing of unrealized trade. This shop only exists on paper and entrepreneurs help each other with this method, especially at the end of the year when the so-called they incur costs in order to be able to reduce their tax liability. A viable way to detect such invoices is through certain common features that these invoices show. These are invoices that are issued for services or various advice. In such activities, it is difficult to prove whether this service was actually performed, in contrast to invoices for goods and the like. The texts of the invoices are relatively brief and there are no attachments to the invoices. These invoices are issued only sporadically.

Methods of detecting creative accounting

We have several methods for detecting fraud that will help detect economic crime. We divide them into financial and non-financial.

Procedures for detecting possible accounting delays are based on analytical models. These are mostly complex statistical methods or techniques of obtaining data, through which we can identify hidden, unusual patterns that indicate fraud. These analytical models therefore serve to detect various errors and fraud in accounting.

Beneish model

It is a mathematical model by Professor Messod Daniel Beneish of the University of Indiana (1999). The model includes eight variables and we can use it to identify the data manipulation based on financial statements.

The model works with two accounting periods and can be performed on a monthly, quarterly or annual basis.
Mantone (2013) writes in his publication that he correctly identifies Beneish's model, 76% of revenue manipulation cases.

Furthermore, Mantone (2013) argues that the model is an excellent tool for the person performing the audit or control of financial statements not only by providing overall control of the financial statements, but each part of the model also provides control of individual details of the financial statements by measuring changes that occur between periods. These indices provide some guidance as to which area the audit or control person should focus on in the subsequent review of the details of the documentation.

Jae (2010) described the model as a summary of the following eight variables:

DSRI (Days' Sales in Receivables Index)	$\dfrac{\frac{receivables_t}{sales_t}}{\frac{receivables_{t-1}}{sales_{t-1}}}$	(1)
GMI (Gross Margin Index)	$\dfrac{\frac{added\ value_{t-1}}{sales_{t-1}}}{\frac{added\ value_t}{sales_t}}$	(2)
AQI (Asset Quality Index)	$\dfrac{1-\frac{current\ assets_t - PPE_t - equities_t}{total\ assets_t}}{1-\frac{current\ assets_{t-1} - PPE_{t-1} - equities_{t-1}}{total\ assets_{t-1}}}$	(3)
SGI (Sales Growth Index)	$\dfrac{sales_t}{sales_{t-1}}$	(4)
DEPI (Depreciation Index)	$\dfrac{\frac{depreciation_{t-1}}{PPE_{t-1} + depreciation_{t-1}}}{\frac{depreciation_t}{PPE_t + depreciation_t}}$	(5)
SGAI (Sales, General and Administrative expenses Index)	$\dfrac{\frac{fixed\ costs_t}{sales_t}}{\frac{fixed\ costs_{t-1}}{sales_{t-1}}}$	(6)

LVGI (Leverage Index)	$\dfrac{\dfrac{current\ liabilities_t + long-term\ commitments_t}{total\ assets_t}}{\dfrac{current\ liabilities_{t-1} + long-term\ commitments_{t-1}}{total\ assets_{t-1}}}$	(7)
TATA (Total Accruals to Total Assets)	$\dfrac{\dfrac{operating\ profit_t - CF_t}{total\ assets_t}}{\dfrac{operating\ profit_{t-1} - CF_{t-1}}{total\ assets_{t-1}}}$	(8)

The main definitional relationship is based on the equation:

$$Mscore \quad -4{,}84 + 0{,}92 \cdot DSRI + 0{,}528 \cdot GMI + 0{,}404 \cdot AQI + 0{,}892 \cdot SGI + 0{,}115 \cdot DEPI - 0{,}172 \cdot SGAI + 4{,}679 \cdot TATA - 0{,}327 \cdot LVGI \quad (9)$$

According to Tumpach (2015), "if the value of M is greater than -2.22, this indicates a high probability of manipulating the financial statements. Conversely, if the value of M is less than -2.22, the probability of manipulating the financial statements is low."

Modified Jones model

Dechow et al. (1995) decided to modify the Jones model, namely the change in sales ($_{\Delta}$REV), which they replaced by a change in receivables ($_{\Delta}$REC). The authors found that if the model was created using revenues, an error rate occurred, so they decided to change, which was to reduce the lack of EM detection. The first stage remains unchanged, the change occurs in the second stage, where the NDA is expressed as follows:

$$\frac{NDA_{it}}{A_{it-1}} = \frac{TA_{it}}{A_{it-1}} \qquad \alpha_0 \frac{1}{A_{it-1}} + \alpha_1 \frac{\Delta REV_{it} - \Delta REC_{it}}{A_{it-1}} + \alpha_2 \frac{PPE_{it}}{A_{it-1}} + \varepsilon_{it} \qquad (10)$$

Where:

NDA_{it}	non-discretionary accrual in year t;
TA_{it}	total accrual in year t;
A_{it-1}	total assets in year t-1;
ΔREV_{it}	year-on-year change in sales in year t;
ΔREC_{it}	year-on-year change in receivables in year t;
PPE_{it}	tangible fixed assets in year t;
α_0, α_1, α_2	coefficients,
ε_{it}	prediction error.

In this part of the article, we have introduced some of the world's most recognized methods of detecting business manipulation. There are also other models, such as the model from the authors Svabova et al. (2020), who in their study tried to create a discriminant model of the detection of earnings manipulators in the conditions of the Slovak economy.

In their research, Susanto et al. (2019) focused on empirical evidence on the impact of tax aggression, which is one of the key objectives of manipulation.

A similar idea was addressed by Hoang & Joseph (2019), who examined the adoption of new rules that approach International Financial Reporting Standards. Working together, they found that there had been an improvement in the quality of revenues since the companies moved to the new accounting regime. Huynh (2019) also analysed Vietnamese companies, arguing that in analysing earnings performance, accountants and managers should think deeply about the vicious link between revenue quality and financial performance and mediating the organization's reputation. Khanh & Thu (2019) also described a number of facts in their study.

The authors of Kliestik et al. (2020) also applied other statistical methods in their study, which sought to identify a significant monotonous trend in the manipulation of earnings in the V4 countries.

Valaskova et al. (2018) used multiple regression analysis in their study, where they tried to identify statistically significant determinants that affect the future financial development of the company, which can again be attributed to the list of methods that seek to detect manipulation.

Result and Discussion

In this section, one of the models that can detect manipulation is applied. Benford's law will be used. This law states that each digit should be represented in the form of a percentage. This proportion is shown in the table below.

Tab. 2: Probability of occurrence of the number D in the first place

NUMERAL	FREQUENCY OF OCCURRENCE OF THE FIRST NUMBER
0	-
1	30,10 %
2	17,61 %
3	12,49 %
4	9,69 %
5	7,92 %
6	6,69 %
7	5,80 %
8	5,12 %
9	4,58 %

Source: own processing according to Durtschi et al. (2004)

The percentage of each digit is given by the formula:

$$P\ (D) = \log\ (1 + \frac{1}{D}) \qquad (11)$$

Tab. 3 : Probability of occurrence of the number D in the first place in Slovak companies

NUMERAL	FREQUENCY OF OCCURRENCE OF THE FIRST NUMBER
0	-
1	25,51 %
2	20,30 %
3	12,96 %
4	9,62 %
5	8,37 %
6	7,12 %
7	6,17 %
8	5,73 %
9	4,22 %

Source: own processing

For the research, we chose all companies in the Slovak Republic that have a large and very large designation in the Amadeus database. Based on the application of Benfod's law, we found that companies are trying to manipulate, because the differences between the actual representation and the table, which is higher, the results do not differ significantly and therefore we could say that in Slovakia companies do not resort to manipulation. However, to better

capture, manipulation, we recommend combining Benford's law with one of the Beneish or Modified Jones models, which are world-renowned and achieve good results with their application.

In the article, we have listed some of the possible techniques that have been discovered in the world and are also used in the conditions of the Slovak Republic. Of course, there are certainly even more techniques. In a study by Kou et al. (2004), we read that there are other techniques such as credit card fraud, telecommunications fraud, or computer intrusion and third-party data transcription. In another study by Blazczynski et al. (2020), it is written that credit card fraud has reached a higher level and is therefore no longer a card fraud but in the form of a car loan. The authors argue that, a car loan is a significant financial product that has not yet been examined in the literature, in contrast to, for example, the misuse of credit cards. In view of the recent increase in fraudulent car loan application transactions, their article is testing a new data set for car loan applications using a technique that has not yet been examined to predict financial fraud, namely the dominance-based set of balanced rules (DRSA-BRE) and after him."

In order to avoid the use of manipulation techniques, it is necessary to use manipulation detection methods. As mentioned above, there are several world-renowned models that are widely used. But people who use these models also cannot go unnoticed. These people are auditors, whether internal or external. In their article, Zhang et al. (2007) define the work of the auditor, as well as his independence, and also try to describe the weaknesses of internal control, as internal control and audit are not the same. Firms are more likely to be identified as an internal weakness in control if their audit committees have less financial knowledge or, more accurately, less accounting financial knowledge and non-accounting financial knowledge. They are more likely to be identified with a weakness of internal control if their auditors are more independent. In addition, companies with recent auditor changes are more likely to have weaknesses in internal control. According to the results of Felo et al. (2003), it can be said that it may be beneficial for investors to require more expertise in audit committees than just to require one expert in the audit committee. But we cannot blame internal auditors. Of course, many auditors are unaffected and do their job to the best of their knowledge and belief. Prawitt et al. (2008) state that internal auditors often perform work that is important to the financial reporting processes of their hosts.

Conclusions

As we can see, it follows from this article that companies resort to the manipulation of their accounting data, statements, documents and have a wide range of possibilities for this, which they can use to "beautify" their accounting. Fortunately, there are studies that allow us to identify businesses that are behaving illegally. Such companies are usually punished in the form of financial fines, arrests of directors, bankruptcy and even the bankruptcy itself.

The current situation regarding the global pandemic caused by Covid -19 is not conducive to business. Many companies are currently reaching the bottom of their strengths. We can see it e.g. in the Slovak Republic, but also close to the borders, as neither the Czech Republic, Poland, Hungary, Austria nor Ukraine are doing well. The gastronomy industry is destroying. Similarly, there are fitness centres, theatres, ... Kwasny et al. (2019) also describe industrial clusters that are key players in economic growth and innovation in the global economy, which needs very suffer. All these institutions are doing very badly, as their operations have been closed. Many companies have also been affected by this, as they are now unable to repay their liabilities, which they would otherwise be able to repay. The closure of the plants has disrupted the existing supply chain. Another big problem is that employment (even in these sectors) is falling and it is estimated that unemployment will rise by 12 million for the whole of Europe, which is a very critical figure. As movement has been restricted (closure of airports, borders leading to disruption of supply routes), export-oriented economies are suffering. Slovakia, the Czech Republic and Hungary suffer most closely from the Slovak Republic, where total exports represent 80% of GDP (in Slovakia, exports of goods and services represent 96% of GDP). All these aspects will lead entrepreneurs to engage in manipulation, as there is a high probability that businesses will not be able to survive this period and will be forced to disappear.

Univerzitna 1, 010 26 Zilina, Slovakia
anna.siekelova@fpedas.uniza.sk

Abstract

The article deals with the theoretical side of the transfer pricing issue. Based on the globalization trends and related changes in legislative, transfer pricing is the current topic. Until 2015, transfer pricing was an unknown term within smaller enterprises doing business across the territory of the Slovak Republic. Since 2015, the obligation to keep documentation for transfer pricing has begun to apply also to smaller enterprises doing business only in the Slovak Republic. Since then, the legislation in the field of transfer pricing has been changed. It can be stated that transfer pricing is subject to international regulations, which also apply in Slovakia. The aim of the contribution is to present transfer pricing issue as a tool for eliminating the purposeful influence of the tax base. Authors dealt with the theoretical background of transfer pricing issue, as well as the determination the usual price on the market and compare it with the transfer price between related entities focusing on committing transfer pricing rules. The article contains the historical development of transfer pricing, definitions of basic terms as well as methods usable in the process of transfer pricing. The practical part presents a model of the use of transfer pricing as a tool for the tax base influence elimination.

Keywords: Transfer Pricing, Related Entities, Earning, Earnings Management

Introduction

Based on the globalization trends and related changes in legislative, transfer pricing is the current topic. Until 2015, transfer pricing was an unknown term within smaller enterprises doing business across the territory of the Slovak Republic. Since 2015, the obligation to keep documentation for transfer pricing has begun to apply also to smaller enterprises doing business only in the Slovak Republic. Since then, the legislation in the field of transfer pricing has been changed. It can be stated that transfer pricing is subject to international regulations, which also apply in Slovakia. (Kliestik et al, 2020; Khanh and Thu, 2019)

Companies are focused on the ways to influence its profits. The tax reducing can be one of this way. In an effort to increase profits by reducing tax obligation, multinational corporations can shift their profits or losses among related entities. The tax burden tends to be at different levels in different countries, it is the reason that profits are often transferred between related entities in different countries. (Fama, 1970; Healy and Wahlen, 1999; Vrbka et al, 2019). In order to avoid purposefully influencing the tax base, individual states, including the Slovak Republic, have applied transfer pricing rules into their legislation. The essence of these rules is that the tax base achieved in transactions between related entities should be the same as in comparable transactions in comparable circumstances between unrelated entities. (Sumiyana, 2020; Susanto et al, 2019; Svabova and Durica, 2019)

The aim of the contribution is to present transfer pricing issue as a tool for eliminating the purposeful influence of the tax base. Authors dealt with the theoretical background of transfer pricing issue, as well as the determination the usual price on the market and compare it with the transfer price between related entities focusing on committing transfer pricing rules.

Theoretical Background of Transfer Pricing

The following part of the contribution is focused on theoretical background and literature review of transfer pricing issue.

Transfer Pricing – Definition

For the purposes of transfer pricing, the related party means:

- a close person,
- an economically, personally or otherwise connected person or entity,
- a person or entity that is part of a consolidated group for consolidation purposes.

1. According to the Civil Code, *a close person* is a direct relative.
2. *Economic connection or personnel connection* according to the Income Tax Act means the participation of a person in the property, control or management of another person or the mutual relationship between persons who are under the control or management of the same person, his close person or in which this person, his close person or entity has a direct ownership interest or an indirect ownership interest. Participation in property or control must be at least 25% of the share capital, voting rights or profit.
3. The third group of related parties are *persons belonging to one consolidated group*. It is a group of parent companies and subsidiaries.
4. *Another connection* means a relationship established between two persons for the purpose of reducing the tax base or increasing the tax loss. Even if it is not an economic, personnel or close connection, or persons who are part of a consolidated group, if significantly favorable conditions are used, it is possible to define an agreement between the two parties to reduce the tax base or increase tax loss. This relationship of persons can also be described as a relationship between related entities.

The entrepreneur should deal with transfer pricing and related obligations when he plans to start doing business transactions with his related parties. The term *"controlled transaction"* has to be defined. According to the Income Tax Act, a controlled transaction means a legal relationship or other similar relationship between two or more related parties, at least one of whom is a natural person with business income or a legal person who archives income from the business activity or disposal of property. On the other hand, uncontrolled transactions are business or financial operations between unrelated parties. (Watts and Zimmerman, 1978; Whittle et al, 2019)
Entrepreneurs are also obliged to provide information on controlled transactions with related parties in the tax return. (Svabova et al, 2020; Whittle et al, 2019; Brabenec, 2010; Copeland, 1968)

Transfer pricing – definition and development of legislative

United States legislation has begun to regulate the pricing rules between related entities in the 1930s. The basics of transfer pricing can be dated back to 1928, when the rules of transfer pricing were codified in the United States. Section 45th dealing with the allocation of income and deductions stated that "*in any case of two or more trades or business (whether or not incorporated, whether or not organized in the US, and whether or not affiliated) owned or controlled directly or indirectly by the same interests, the Commissioner is authorized to distribute, apportion, or allocate gross income or deductions between or among such trades or businesses, if he determined that such distribution, apportionment or allocation is necessary in order to prevent evasion of taxes or clearly to reflect the income of any such trades or businesses*". (Revenue Act, 1928)

Since 1935, regulations have utilized the *"arm's length"* standard as the means to fulfill the provision. It can be defined as the main tool in international taxation that allows an adequate allocation of profit taxation rights among countries that conclude double tax conventions, through transfer pricing, among each other. Transfer pricing issue can be found also in the US War Revenue Act of 1917, as well as the US Revenue Act of 1921. However, the provisions in these acts cannot be considered sufficiently precise. In 1968 International Revenue Code came into force in the US. It provided further guidance to transfer pricing issue in the 482 section.

Transfer pricing regulations issued in 1968 provided further guidance on the application of the arm's length standard, including pricing methods and additional rules for certain intercompany transactions. However, the United States recognized that the effective application of transfer pricing rules requires international cooperation. Otherwise, there is double taxation. Therefore, campaign aimed at the widespread adoption of the principle of an independent relationship as an internationally recognized standard was launched a coordinated by the US. The culmination of this campaign was the year 1979, when the Organization for Economic Co-operation and Development issued the report *"Transfer Pricing and Multinational Enterprises"*. Transfer pricing and the arm's length principle was one of the focal points of the Base Erosion and Profit Shifting project developed by the OECD and endorsed by the G20.

So far, the last update of the OECD Guidelines was issued in July 2017, adding changes that were passed in the two previous years and from 2013. The main changes are focused on the areas, e.g. transfer pricing for commodity transaction, inside-group service with low added value, new allocation system within transfer pricing documentation, application of the transactional method of profit sharing, including examples, the principle of an independent

relationship and its application, safe harbor rules, redefined categories, functions and risk within tangible assets, cost sharing agreements. (Transfer Pricing And Multinational Enterprises, OECD, 1979)

A significant milestone in the area of transfer pricing in the Slovak Republic was the accession to the Organization for Economic Co-operation and Development in 2000. In the Slovak legal and tax system, the OECD Directive has recommendatory nature, the Slovak legal and tax code does not refer to it. On the other hand, the Slovak Republic declares the acceptance of this OECD Directive.

The Slovak Republic acceded to the Convention on the elimination of double taxation in connection with the adjustment of profits of associated enterprises (the so-called Arbitration Convention) in 2006. It is one of the directives of the European Union on direct taxation. The EU Arbitration Convention establishes a procedure to resolve disputes where double taxation occurs between enterprises of different Member States as a result of an upward adjustment of profits of an enterprise of one Member State. The Convention provides for the elimination of double taxation by agreement between the contracting states including, if necessary, by reference to the opinion of an independent advisory body. The Convention thus improves the conditions for cross-border activities in the Internal Market. The Arbitration Convention guarantees the settlement of disputes within 3 years, which has a significant benefit over bilateral double taxation conventions. (The Arbitration Convention)

The Arbitration Convention was successively extended through the Convention on the accession of the Czech Republic, the Republic of Estonia, the Republic of Cyprus, the Republic of Latvia, the Republic of Lithuania, the Republic of Hungary, the Republic of Malta, the Republic of Poland, the Republic of Slovenia and the *Slovak Republic* to the Convention on the elimination of double taxation in connection with the adjustment of profits of associated enterprises. Transfer pricing in the Slovak Republic is regulated by the Income Tax Act. It stated that tax based within related parties include the difference by which the prices or conditions in the controlled transactions differ from the prices or conditions which are applied between unrelated entities in comparable transactions. This difference reducing the tax base or increasing the tax loss. (Income Tax Act, 2003) Other paragraphs define the basic rules of transfer pricing. The Income Tax Act defines an obligation for the taxpayer to keep records of controlled transactions containing the method used to determine transfer prices. The content and scope of this documentation is determined by the Ministry of Finance of the Slovak Republic. The Income Tax Act describes following methods for transfer prices determining based on price or profit comparison.

- The independent market price method.
- Resale method.
- Method of increased costs.
- Profit sharing method.
- Net trading margin method.

Use of the selected method requires the consent of the tax administrator. A detailed description of transfer pricing methods can be found in the OECD Guideline. Chosen methods are described in more detail in the next part of this paper.

Methodology

The aim of author's contribution is to present transfer pricing issue as a tool for eliminating the purposeful influence of the tax base. This chapter describes following transfer pricing methods:

- The independent market price method.
- Resale method.
- Method of increased costs.
- Profit sharing method.
- Net trading margin method.

The Independent Market Price Method

The independent market price method is based on a comparison of the price in a controlled transaction to the price in the uncontrolled transaction. These transactions have to be comparable. This method should be used in the cases where comparable transactions can be found between unrelated parties, or if there is an internal comparable uncontrolled transaction with an unrelated company. The use of this method always takes precedence over other methods. Precondition for its use is a sufficient number of comparable uncontrolled transactions.

Resale Method

Based on the resale price method, price is determined from purchase price used in controlled transaction between related parties. Subsequently the product is sold to unrelated company. This price is reduced by the usual market margin of comparable unrelated sellers. The transfer price is calculated by deducting the sales margin from the price at which the distributor sells the product to an independent customer. This transfer price must be compared with the purchase price of the product. The resale price method is recommended by the OECD Guidelines mainly for distribution and brokerage activities, or for marketing activities.

Method of increased costs

According to the increased costs method, price is determined from direct and indirect costs within controlled transactions. These costs are increased by a reasonable profit margin compared to the profit margin achieved in the same uncontrolled transactions. The OECD Guidelines recommend the use of this method mainly in transactions involving the production, sale of materials, semi-finished or finished products, whether goods or services. It is most often used in the valuation of long-term contract production. The transfer price is calculated as an independent price plus the supplier's profit margin.

Profit sharing method

The profit sharing method is based on the distribution of profit in a controlled transaction achieved by the related parties and the distribution of profit in an uncontrolled transaction achieved by the unrelated companies. Profits should be distributed objectively and fairly between related parties. Thus, this method is applicable when data from comparable transactions between unrelated parties are not available.

Net trading margin method

Net trading margin method is focused on the achieved net profit within controlled transactions. This method can be compared to the method of increased costs and the resale price method. In contrast, no gross but net profit margin achieved by comparable companies in the market is examined. Two types of net trading margin methods are distinguished:

- *Net trading margin method based on costs*

Transfer price is calculated as follow. Costs directly incurred on products, goods and services sold are added to other operating costs. The result is multiplied by the sum of the margin and the number 1.

- *Net trading margin method based on sale price*

Transfer price is calculated as follow. The independent price is multiplied by the difference between the number one and the profit margin. Subsequently, operating costs are deducted from the result.

The profit margin achieved in transactions with unrelated party should be the same as in transactions with related party. If the company does not perform such transactions, it is possible to use the profit margin of a comparable company in comparable transactions. Only financial data that is directly or indirectly related to the controlled transaction and of an operational nature should be used in determining net profit. However, some items that cannot contribute to the determination of the net profit ratio should be excluded here. These are:

- Costs and revenues that are not related to the relevant managed transaction
- Profits from transactions that are not similar to the audited transactions examined
- Non-operating items (interest income and expenses, income taxes)

The net profit ratio is usually measured by assets, sales or expenses.

Results and Discussion

Transfer pricing is realized on a model example of a selected company using selected method. The transfer pricing model consists of the following parts.

1. Company selection

Selected company is the members of the multinational group of companies According to the ownership structure, it is clear that selected company is an economically, personally or otherwise connected person or entity vis-à-vis another company. It can be stated that these companies are related parties as was defined within theoretical part of the contribution.

2. Method selection

Transfer pricing methods were described within the methodology part of the contribution. According to OECD Guidelines, there are some factors, that have to be considered in the process of method selection. These factors are as follow:

- *Suitability of the method based on the nature of the controlled transaction.*
- *Availability of reliable information needed to apply the selected method.*
- *The degree of comparability between controlled and uncontrolled transactions, including the reliability of comparability adjustments that may be necessary to eliminate significant differences between controlled and uncontrolled transactions.*

If the traditional transaction methods can be applied as well as traditional transaction methods, traditional transaction methods are preferred. The independent market price method is considered as the best method for transfer pricing. Due to the fact that in many cases price data are not publicly available, the method cannot always be used.

The OECD Guideline further recommends the use of the net trading margin method, mainly for distributors. The transaction method of the net trading margin examines the net profit achieved by the taxpayer in the controlled transaction. Net profit can be calculated from publicly available information. The income statement is published on the website of the Register of financial statements. Following the above, the net trading margin method was chosen to verify the principle of an independent relationship of the chosen company to its related parties.

3. Comparable companies' selection

The search strategy, as well as the qualitative analysis, were based on the provisions 3.38 of the OECD Guidelines. Basic search criteria are as follow:

- Company activity - companies actively doing business activities should be considered.
- Geographical factors - companies doing business in the same market should be considered.
- Relevant market - companies doing business in the same sector should be considered.
- Shareholders - companies doing business with their parent companies should not be considered.
- Subsidiaries - companies doing business with their subsidiaries should not be considered.
- Type of accounts - companies with non-consolidated accounts should be considered.
- Quantitative indicators - it is necessary that comparable companies have the operating profit indicator available in all of the monitored years. The operating profit indicator is required to calculate the net distribution margin.
  The TP Catalyst database can be used for comparable companies selection.

4. Calculation of the profitability indicator for comparable independent companies

An indicator the share of Operating P/L and Sales was selected and calculated. Profitability data of independent comparable companies can be used either for a period of one year or for a period of several years.
The next step in the profit analysis is to create the usual profit margin. In general, statistical theory says that aggregate results are spread around the median. Results that are either higher or lower than the median are just as representative as the median value, and thus there is no specific reason to limit yourself to this single point. However, points that are at opposite extremes of the curve run the risk of being anomalous and therefore unrepresentative for establishing an independent relationship. There are several approaches. Arm's Length Range, interquartile range, Interpercentile range, a single comparable transaction can be also used, the result is not a margin but a single point that can be considered an independent price in certain specific situations.

5. Calculation of the profitability indicator for selected company

An indicator the share of Operating P/L and Sales was also selected and calculated for selected company.

6. Comparison trading margin selected company to comparable independent companies

The value of the net trading margin of selected company for the distribution of goods purchased from dependents is compared with the usual trading margin of comparable independent companies ascertained.

Conclusion

The aim of the contribution is to present transfer pricing issue as a tool for eliminating the purposeful influence of the tax base. Authors dealt with the theoretical background of transfer pricing issue, as well as the determination the usual price on the market and compare it with the transfer price between related entities focusing on committing transfer pricing rules. The practical part presents a model of the use of transfer pricing as a tool for the tax base influence elimination.

Abstract

The article aims at presenting the reader with a proposal of implementation of the Blue Ocean Strategy and The Staged Self-Directed Learning Model (SSDL) in higher education distance programs in order to provide students an environment where they can obtain skills necessary for their future career. First, the reasons why students of all specialties are in need of acquiring basic entrepreneurial skills by creating innovative projects and startups, using Blue Ocean Strategy, are provided. Second, the challenges of transforming the educational process in higher education due to meeting the needs of Generation Z' students will be discussed. Third, the implementation of the Staged Self-Directed Learning Model will be proposed in order to create a convenient learning environment for modern students using distance teaching methods and new ways of communication via social networks. Fourth, the results of pilot implementation of this method of creating distance learning process in "The Blue Ocean Open Polytech Entrepreneurship Competition" in the Saint Petersburg Polytechnic University of Peter the Great with the support of The Russian-German Center for Innovation and Entrepreneurship "Polytech Strascheg" and Graduate School of Technology Entrepreneurship will be discussed by the way of analyzing online questionnaire with 120 responses with the purpose of measuring effectiveness of distance learning process created with the use of the SSDL model.

Keywords: The Staged Self-Directed Learning Model, Blue Ocean Strategy, eLearning.

Introduction

Literature Review

Freeman M.A., Johnson S.L., Staudenmaier P.J. and Zisser M.R. (2015) mentioned that entrepreneurs create the vast majority of new jobs, pull economies out of recessions, introduce useful products and services, and create prosperity. Rising need for entrepreneurs and innovations leads to the rise in demand for entrepreneurship education. In a research study by Valliere D., Gedeon S.A. and Wise S. (2014) it is clarified that universities respond to this demand by creating new programs and institutions dedicated to entrepreneurship.

In the book by Weindorf-Sysoeva M.E., Gryaznova T.S., Shitova V.A. (2020) the educational environment is developing as well and it should meet the requirements set up by the needs of the new generation of students and the market as well.

Jajal, T.D. (2018) mentioned that the current world is constantly on the brink of disruption, and these conditions require companies and startups to open new market spaces instead of using already existing demand and fiercely competing for it within an industry. The studies of Kim W. Ch and Mauborgne R. (2005) and also Yurkovlyanets D., Simchuk M.M. and Klimin A.I. (2019) show that in order to create new market space, there should be a value innovation in the core of a product or service. It is discussed in the research of Dehkordi, G.J., Rezvani, S. and

Cite this Article as: Maria M. SIMCHUK, Diana YURKOVLYANETS, Anastasii I. KLIMIN and Sergey V. SALKUTSAN "Implementation of The Staged Self-Directed Learning Model in The Creation of Distance Student Entrepreneurship Competition About Blue Ocean Strategy" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

Behravan, N. (2012), that according to the Blue Ocean Strategy, industries which have not yet been defined and currently do not exist are called Blue Oceans, where there is no competition so far. Value innovation' concept focuses on both creating a higher consumer value and lower costs, according to the article of Kim and Mauborgne (2004). Authors of the Blue Ocean Strategy emphasize in their books (2015, 2017) that anyone can create value innovation if they know the basics of Blue Ocean Strategy and apply step by step a set of greatly explained instruments.

According to the article of Three Day Startup' team (2017), mentioned basic entrepreneurial skills would benefit students of all specialties. They will learn how to think outside the box and create innovations that would develop the market and economy. The authors of this article suggest creating a student entrepreneurship competition in order to provide an opportunity for students of all specialties to learn the basics of startup development with the use of Blue Ocean Strategy. This learning framework is developed from the integration of digital environment with entrepreneurship competition and the SSDL model, which is greatly described in the research of M.F. Ali, L.M. Tahir, M.N.H.M. Said, J. Junaidi, N.A. Atan and A. Hahsan (2017). There is a great opportunity to create a new form of distance teaching and learning the basics of entrepreneurship, using convenient for generation Z' students digital tools. This is the main goal of this paper.

Organization of eLearning process from the perspective of Generation Z' theory and the SSDL model

Currently, due to the coronavirus pandemic, the education system is rapidly moving to a natural information environment for generation Z, actively using distance learning technology, which are discussed in the research of Dubgorn, A., Abdelwahab, M.N., Borremans, A. and Zaychenko, I. (2019). Representatives of generation Z have a number of strengths that are quite difficult to implement in the framework of distance learning format at the university. Generation Z students are team players, multi-taskers, highly entrepreneurial and "intrapreneurial". According to Barclays' report (2013), they are more likely to want to run their own businesses while working "with" organizations. In the table below we present the overview of the portrait of a modern student, who belongs to generation Z, based on the results of researches from tutorial book of Weindorf-Sysoeva M.E., Gryaznova T.S. and Shitova V.A. (2020).

Table 1. The portrait of a modern student

Characteristics	**Portrait of a student - Generation Z (born after 1995)**
Problems in traditional university education	The student does not have a complete understanding of the subject, perceives the material in portions, strives to get a mark, not knowledge, and is limited in time.
Problems in distance learning	Lack of self-organizing skills, often does not know how to work in teams on the same problem.
Familiar ways of communication	Uses hand-hold devices to solve educational issues (forums, social networks, chats).
Recommended learning format	Interactive learning in a familiar environment (social networks), team competitions, consistent development of self-motivation and self-organization on practise.

Nowadays teachers are quite conservative in their views, and the transition to a new educational environment often causes difficulties. Teacher's age only affects the speed of mastering modern technologies and decision-making, so it is important to provide teachers with professional support and adapt them to the new environment.

It is discussed in SkillsCenter' team report (2020) , that the methodology of the higher education learning process should take into account the characteristics of representatives of different generations and ensure comfortable and effective work based on students' needs. Conducting interactive educational competitions will involve both students and teachers in the process of a new format of education, which includes both learning new concepts and creating big ideas and projects in teams.

Furthermore, according to the article of Schawbel (2014) generation Z is more focused on working for themselves, more ambitious and is poised to become the most entrepreneurial generation we've ever seen. It is important to give students the necessary knowledge in the field of entrepreneurship, to help to obtain competences that will be useful

in their career. Particularly popular today is the Blue Ocean Strategy, which is actively taught in the USA in a format of entrepreneurship competition with currently more than 720 participants from all over the world.

Blue Ocean Strategy is convenient for teaching students basics of entrepreneurship because of a set of tools and models, by using which people with different backgrounds can learn how to create new market spaces step-by-step. We decided to teach students a path of creating a startup' business model with the use of six basic instruments of Blue Ocean Strategy. Some of these instruments are greatly described from the perspective of students in the article of Bravo and Pintado (2020):

1. As-Is Strategy Canvas shows basic analysis of current industry offering and trends from the perspective of a customer.
2. The Buyer Utility Map outlines the full range of customer experience and problems that arise in certain steps of customer cycle.
3. Formulation of hypotheses about target audiences that could be engaged to the industry as additional demand, using Three Tiers of Noncustomers.
4. Marketing research conduction to find opportunities to engage new demand to the industry, using the Sixths Paths Framework for expansion of market boundaries.
5. The Eliminate-Reduce-Raise-Create Grid helps to redistribute resources to create an innovative product or service, in order to simultaneously increase the consumer value of the product and reduce the cost of its production and operation.
6. Creating the unique selling proposition for the selected target audience groups (noncustomers) using the To-Be Strategy Canvas.

The volume of theoretical material is extensive, usually this strategy is taught partly in different subjects during the whole term. In conditions of distance learning, the main goal was to make the process of learning the Blue Ocean Strategy as simple and understandable as possible for a large number of students.

The solution to the problem, as was suggested by the authors of the article, was holding a student competition "The Blue Ocean Open Polytech Entrepreneurship Competition", where students can learn the basics of Blue Ocean Strategy, try to solve real company problems using it and create their own project which can later they can develop as a startup. The competition was open for students from different universities and fields of study.

In order to provide an opportunity for students to learn step-by-step complex material and get not only knowledge, but also practical experience, we used the SSDL model, described in a research study by Grow. G. (1991), for creating competition's scenario. We suggested that using this model we would be able to create a distance learning environment, in which students could move from dependency to more self-directed learning and become capable of creating ideas and projects in their daily life, using Blue Ocean Strategy.

Developed entrepreneurship competition consists of 4 stages, which include all of the stages of the SSDL model. In the table below we provide main information about the scenario of the competition, and how participants, teachers and organizers should interact in each of these stages with each other. Also, we provide information about the usage of what distance learning instruments we were able to provide these formats of interaction.

Table 2. The scenario of the online entrepreneurship competition based on the SSDL model

Stages of the competition and the SSDL model	Roles of students as participants and teachers and organizers according to the SSDL model	Instruments, used for providing students needed facilities for accomplishing certain stage of motivation
1. Introduction to Blue Ocean Strategy basic theory and instruments. Relates to Stage 1: Learners of Low Self-Direction	Students: High level of dependency. Need guidance and authority who would provide them with a clearly organized explanation of the subject and competition rules. Teacher and organizers ("Coaching" stage): Provide a clearly-organized approach to the subject. Prescribe clear-cut objectives and straightforward techniques for achieving them. Mostly one-way authority communication.	1. Introductory webinar about the basics of Blue Ocean Strategy theory. With small discussion by guidance from the experts. 2. Case-learning webinars with structured path of implementation of this strategy in real companies. 3. Providing a guide with detailed explanation of a path of creating a startup or project using already mentioned in previous webinars Blue Ocean Strategy' instruments. There are provided more details and step-by-step techniques.

2. Real problem-solving case of partner company "Beeline" for teams, using Blue Ocean Strategy instruments. Relates to Stage 2: Learners of Moderate Self-Direction.	Students: Are interested in the subject, willing to do assignments if they see motivation for it. Need two-way communication with feedback on their ideas. Teacher and organizers ("Motivating" stage): Inspire and motivate to go through obstacles and see purpose in the tasks, provide teacher-led discussions.	1. Additional materials, such as articles describing real successful stories of implementation of Blue Ocean Strategy. 2. Q&A sessions with experts on the subject of their tasks. 3. Q&A session with representors of the partner company, where students can ask questions and get insights. 4. Creating common chat in Telegram messenger where participants can communicate with each other and organizers. 5. Additional motivation includes special prizes from the partner company.
3. Creating own projects in teams, using Blue Ocean strategy. Relates to Stage 3: Learners of Immediate Self-Direction.	Students: Have enough knowledge in skills needed to start their own path in learning Blue Ocean Strategy' concepts and applying it according to their needs and interests. Teacher and organizers ("Facilitating" stage): Provide equal communication, support them in their own process of learning. Share experience with them, provide new insights and tools.	1. Introductory webinar with mentioned ways where to find an idea for a project. 2. Links to additional materials where students can learn more about Blue Ocean Strategy by themselves. For instance, online mini-course, YouTube-channel of international Blue Ocean Strategy competition with examples of other students' projects. 3. Personal consultations in Zoom with all teams, which want to discuss their initial ideas and get insights whether their ideas applied to Blue Ocean Strategy and what they can also improve in their project. 4. Additional motivation includes cash prizes, additional points to final scores for Polytechnic University' higher education programmes on technological leadership and entrepreneurship.
4. Sending students' projects for international competition. Relates to Stage 4: Learners of High Self-Direction	Students: They set up their own goals, find resources for implementing them. They take responsibility for achieving these goals and acquire help from tutors if needed. Teacher and organizers ("Delegating" stage): empower students' ability to learn on their own practical experience by providing them new ways and opportunities when they can gather this experience.	1. Personal consultations for those who would like to send their projects to the international Blue Ocean Strategy competition. 2. Notification about various entrepreneurship competitions and hackathons, in which students can also present their projects or train their knowledge of Blue Ocean Strategy in other projects and tasks. 3. Providing opportunity from the University to write their diploma based on their startup' ideas.

The competition was organized fully in online format with the usage of the most popular in Russia social media "VKontakte", according to the research study by Klimin A.I., Tikhonov D.V. and Efimov A.M. (2017). We used it as a platform for keeping all necessary information, recordings of webinars, one-on-one communication with participants. Therefore, "Zoom" was used for providing online webinars. It allowed us to cut costs for organizing this competition greatly, with no need to create and maintain a special site or a platform for this competition. Students have been interacting with the competition in social networks which they commonly use in their daily life.

To evaluate the effectiveness of the proposed method of learning and scenario, created with the SSDL model, we conducted an online questionnaire after the 2nd round of the competition. In this survey took part 120 respondents who finished 1st and 2nd round of the competition and were going to participate in the 3rd round too. There were 3 questions about characteristics of our participants and their teams, and other 5 questions were supposed to evaluate the effectiveness of the proposed method of distance learning that was created using the SSDL model. Fig.1 presents the information about the ages of the participants, this data was analysed from the first question of the mentioned questionnaire about team's names and data from the initial registration form of all participants of these teams, which was completed before the competition has started.

Fig. 1: Ages of the participants of the competition

According to data presented in the Fig.1, the majority of the participants (97%) were born in 1995 year and later. According to the theory of generations they are assumed to belong to a generation Z. The minority of the participants (3%) belong to generation Y. It is important to mention because the main goal of our study is to evaluate the effectiveness of developed methods of creating a framework for efficient learning according to the needs of those students who belong to generation Z.

Results of the study

Fig. 2 and 4 consists answers for questions related to clearness and convenience of learning such complex material as Blue Ocean Strategy using teaching methods mentioned in the table 2. The Fig. 2 shows the clearness of the presentation of the materials in online webinars from the perspective of participants (from scores “1” to “5”).

Fig. 2: The clearness of the presentation of the materials in a format of online webinars

Results show that this method of teaching was rather clear and even in online format it was convenient for students to learn about complicated Blue Ocean Strategy theory. Along with webinar’s recordings we provided timing which students can use in order to easily navigate through videos while searching for a different part of the webinar. Beside webinars, we provided students with additional resources and would like to know what kinds of them were helpful in the process of solving a case (Fig. 3).

Fig. 3: Additional resources that were used by students

As a result, we approved our suggestion that additional resources should be provided in order to help students get a deeper understanding of a subject without an information overload in online lectures. The most useful material was Blue Ocean Strategy' detailed instruction. This PDF-file consisted of detailed but basic description of Blue Ocean Strategy' instruments and road maps with step-by-step described path of how to use these instruments in order to create an innovative idea.

64% of respondents valued additional resources presented in social networks, such as articles and posts about Blue Ocean Strategy and competition, designed according to current trends of social networks. More than a half of respondents (56%) pointed out that it was helpful for them to receive feedback on their questions. Furthermore, 3% of respondents added that they valued open communication with organizers, who helped them to solve their problems and overcome obstacles as soon as possible.

Fig. 4: Which sources students used during solving a case of 2nd round

Based on the research, students most often used such methods of self-study as reading the instructions for creating a Blue Ocean, watching online webinars and searching for information on the Internet. The most popular methods were those that were prepared in advance by the organizers of the competition and did not require much time from students to search for additional information.

Graphs 5-6 provide information about the team composition and their previous team working experience.

Fig. 5: Team composition by belonging to the same group/field of study/university

Based on graph data (Fig. 5), the majority of participants (65%) created a team together with their group mates. 16% of the participants study in different specialties with their teammates. And only 5% of participants formed teams with students from other universities.

Fig. 6: Have team members had an experience of working together in a team before

According to the study, the majority of participants (51,7%) already had experience working in one team. 37,5% of participants knew each other before competition but did not work together. This format of learning still allows students to develop teamwork skills within the competition. Although most people still prefer to work with team members that they have already known and had shared experience of working together before.

The graph (Fig. 7) shows the ratio of students' mentions of the opportunities at the 2nd stage of the competition that they were most interested in.

Fig. 7: What students find the most appealing in the 2nd stage of the competition

According to graph (Fig. 7), during the 2nd stage of the competition students liked to develop a solution for the company's existing problem, as well as develop creative projects in a team. This confirms the assumption that modern students are interested not only in learning new concepts, but also in applying knowledge in real practice. They have a chance to benefit from their activities while studying at the university and gain valuable experience.

Figure 8 shows an initial assessment of learning effectiveness at the 1st and 2nd stages of the competition in terms of preparing students for the difficult 3rd stage where they will create their own project using the Blue Ocean Strategy.

Fig. 8: Do participants have an idea or a project for a 3rd stage of the competition

Based on the results of graph (Fig. 8), the majority of students already have an idea or project that they will work within the next stage of the competition (67%). 30% of them came up with an idea during the competition. At the same time, we should pay attention to the 33% of participants who do not have an idea or project yet. In order to help them with this choice, at the 3rd stage of the competition, we have prepared additional materials, studying which students will be able to come up with an idea for their project. Materials contain articles that describe how to create innovative ideas, as well as examples of Blue Oceans that were created by students. It was done to inspire students who doubt their abilities by the stories of other students and convince them that not only for professional businessmen can create a Blue Ocean.

Conclusions and Discussions

Based on the results of the study, we can make a conclusion about the effectiveness of using the SSDL model to form a methodology for education in a digital environment, using distance learning technologies. The process of studying entrepreneurship consisted of learning theoretical material about the basics of the Blue Ocean strategy and using it in solving real cases and creating own projects in teams.

We emphasized that special attention should be paid to three aspects of learning in a digital educational environment:

1. Carefully build the educational process taking into account the needs of end users, in this case, generation Z students.

This makes it possible to increase the effectiveness of educational programs that are aimed at developing students' soft and hard skills, and to create more effective methods of teaching students. In our experiment, we consider the need for generation Z students to develop self-organization skills, motivation, teamwork, and information perception piecemeal.

Instead of long lectures in text format, we offered students a piecemeal learning process: series of posts in social networks, designed with usual SMM trends in the social network “Vkontakte", three webinars, that gradually described the theory with real examples and timing for easier navigation. According to the results of our research, these methods of presenting information were highly appreciated by students and were actively used in case solving.

2. Active use of distance learning technologies, social networks, and trends in the fields of copywriting and design.

Firstly, the education process transferring to students' usual information environment will increase the information perception through new formats of its presentation (posts, videos, articles visualized in the A4 format with 5-6 images). These methods are actively used in online courses development, which are especially popular in the context of distance learning. We suggest implementing this practice in higher education as well, in order to modernize traditional education.

Secondly, it will give an opportunity to build more personal communication between teachers and students, outside of the classroom. Such communication in messengers or social networks allows students to ask clarifying questions, discuss ideas, and create projects together. The importance of timely feedback and support is confirmed by the results of our research and 1-3 stages in the SSDL model.

3. Organize the process of receiving feedback from students about education formats in order to get a complete picture of the effectiveness of the proposed subjects’ structure and methods used.

In the educational process, it is important to take into account the vision of the teacher and the students. Emerging problems are always an opportunity to make the course even better and clearer for the next stream of students. Our suggested interactive learning format involves both students who are engaged in organizing and developing the competition methodology from the perspective of end users and teachers as experts. Such interaction allows to simplify the transition process in a distance learning environment for teachers who are used to traditional offline formats of education.

Nevertheless, we should highlight several issues that require further study in order to obtain more data about the effectiveness of the SSDL model in the development of distance learning programs and the methods of teaching generation Z students:

4. Due to the active transition of the traditional education in universities to the information environment, more research is required to evaluate the effectiveness of different methods of organizing the educational process, which would be focused on the needs of the modern students. We should analyze the effectiveness of other interactive teaching methods in order to understand which methods are applicable in various cases during the distance learning process.

5. As part of our experiment, we need data from the 3rd and 4th competitions' stages in order to accurately assess the effectiveness of using the SSDL model. We also need to track students' progress of applying knowledge in their further learning process and developing their startups.

6. The research does not contain information about those students who registered but refused to participate in competition before 1st or 2nd stages. During the effectiveness evaluation of the considered methods, it is necessary to take into account the opinions of students who, for one reason or another, decided to participate, but later refused it.

7. There is an open discussion about the implementation of this method of creating a design framework of other formats of teaching for different disciplines, and the costs needed for its realization.

8. From the perspective of the developed entrepreneurial competition, which includes problem-solving tasks for students from companies, there is a question of how to establish further partnership with development of generated and investically promising ideas. This topic includes the regulation of intellectual property rights between students and companies and the ecosystem in the university which would help participants to grow their business further. Our developed entrepreneurship competition is focused on teaching how to create an innovative idea and business model from the perspective of value innovation. There is a question in which format should be organized the process of teaching the basics about further development of a startup, from generating and testing an MVP to getting investments, registering a company and so on.

Appendix A. Questionnaire

1) Write down the name of your team.
_____

2) Rate from 1 to 5 the clearness of the presentation of materials at the webinars?
1. 1
2. 2
3. 3
4. 4
5. 5

3) Which formats of support were the most useful for you?
1. Additional resources and materials provided in social networks
2. Blue Ocean Strategy' detailed instruction
3. Opportunity to ask questions to organizers and experts during solving a case
4. Opportunity to ask questions to the company's representors
5. Other_____

4) What sources did you use while you were solving a case?
1. Recordings of online webinars
2. Blue Ocean Strategy' detailed instruction
3. Books about Blue Ocean Strategy
4. Searching relevant information in the Internet

5) Choose the sentence which more likely describes your group?
1. We are from the same study group
2. We are from the same specialty
3. We are studying in different specialties
4. We are studying in different universities

6) Have you worked with your team members before?
1. We've worked together before
2. We knew each other, but didn't work together in a team before
3. We didn't know each other before

7) What did you find the most appealing in the 2nd stage of the competition?
1. Creating a solution to a real problem-solving task for company / society
2. Opportunity to communicate with company and get a feedback on your idea
3. Developing a creative ideas and projects in a team
4. New knowledges and real practical experience of creating a startup

8) Do you have an idea or a project for the 3rd round of the competition?
1. I have an already existing project, for which I will create a Blue Ocean Strategy
2. I have an idea, it was created before the competition
3. I have an idea, it was created during the competition
4. I don't have an idea or a project yet

A Framework of Visual Literacy Competences for Engineering Education

Abstract

Visual literacy is essential for engineers and technical professionals. Across the higher education curriculum and VET training, students are required to use and produce visual materials, and they must be prepared to do so.
We present in this paper a framework for the development of Visual Literacy competences required for engineers and technicians. Its objective is to provide adequate resources to develop their Visual Literacy competences and then contributing to improvement of engineering and VET education. This guide therefore intends to provide a reference for engineering education institutions as well as technology educational programs in general.
The methodology used is supported by the conviction that it can be provided a presentation to Visual Literacy for engineering and its particular competences according to a rigorous academic research but also accessible and useful. Teachers, educators and HE/STEM stakeholders can find it directly relevant to the opportunities and challenges they face. Our goal is to understand, catalogue and communicate the Visual competences, skills and abilities specific to engineering that most contribute to engineers' creativity and productivity.
ETCS establishes generic as well as specific competences. Goal of this research is to establish the set of Visual Literacy competences specific to engineering. In this Framework it is established the relationship between visual literacy and engineering education and undertaking an assessment of what represents competence attainment.
We expect that the VLEE Competence Framework shall be a new element of teaching for Higher education as well as VET organizations.

Keywords: Engineering Education, Vocational Education and Training, Visual Literacy, Visual skills and abilities.

This section should follow keywords. This section should provide background of the study and highlight research motivation.

Introduction

Visual Literacy is acknowledged to be of great importance in engineering (Henderson, 1995) (White, 2015) (Martin-Erro, 2016) (Keller, 2018). Engineers are problem solvers who interpret, process and create visual information of many types and different abstraction levels. Technical drawings, electronic schemes, computer graphics, freehand sketches as well as physical models are resources that engineers applies to ideate and share concepts. These are expressed in a visual language, which is made up of symbols, standardized pictorial representations and annotations. This language is specific to the engineering domain and requires an expertise level. To envision ideas and find problem solutions by handling visual information is also fundamental for engineers, and particularly, three-dimensional shapes (Sorby, 2000). Engineers also need to interpret and express analytical information. They use graphic representations of data in all of the development stages of a product or a system. This is also an important part of engineer´s Visual Literacy.

Cite this Article as: Alfonso MARTÍN ERRO, Silvia NUERE MENÉNDEZ-PIDAL, Raúl DÍAZ-OBREGÓN CRUZADO and Adela ACITORES SUZ "A Framework of Visual Literacy Competences for Engineering Education" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

Visual literacy competencies are therefore of great importance for modern engineers and all technicians. Engineers must be visually literate to be successful engineers (Miller & Bertoline, 1991), therefore it must be taken into account in educational programs. Engineering Graphics (EG) are the subjects where Visual Literacy was traditionally developed in engineering education. The main objectives of these subjects are to teach the technical visual language and develop three-dimensional visualization abilities, which are required for problem solving (Miller & Bertoline, 1991). The first is covered by teaching how to interpret and create engineering drawings, according to standards. The second, visualization, is developed by practice, for instance, drawing from dihedral projections to axonometric perspective and vice versa.

With the objective of enhancing the Visual Literacy of engineers and technicians, The VLEE project was set up in 2019. It includes representatives from Poland (West Pomeranian University of Technology in Szczecin-ZUT & Federation of Associations of Scientifically Technical Notes-NOT), Spain (Universidad Politécnica de Madrid), Denmark (Technical Education Copenhagen), Ireland (Momentum Marketing services limited) and United Kingdom (Canice consulting limited), covering the scope of Higher Education and VET organisations.

VLEE (Visual Literacy for Engineering Education) takes the approach to foster the Visual Literacy by applying innovative training resources into Engineering Education and Vocational Training. It recognizes that the possibilities for developing these competences have grown exponentially, thanks to the proliferation of digital technology." The results of the work of the VLEE project were divided into three intellectual Outputs. The first one is a framework which identifies the visual competences specific to engineering.

Definition of Visual Literacy

The first step of VLEE project was to agree what we understand as Visual Literacy. Academic and grey literature review showed a plenty of definitions. Since John Debes (Debes, 1969) wrote the first one, Visual Literacy definition evolved from simple to more detailed, in order to take into account its complexity, as well as the continuous innovation on Visual resources, such as digital media. The fact is there is neither a common nor an agreed explanation of what Visual Literacy is. That results on a difficulty for researchers (Braden (1996), cited by Avgerinou, (2011)). Arslan (Arslan & Nalinci, 2014) concluded the difficulty to enclose in one definition all skills related to Visual Literacy. Therefore, it suggests that a common Visual Literacy definition cannot list and describe skills or abilities, doing that better in a framework.

Another important question is where these skills or abilities are expressed or perceived. Many definitions mentioned the term "images". As it could be valid for the early definitions, the innovation on visual resources demands to take into account a broader term. In that sense, other definitions applies "visuals", "visual media" or "visual materials" (Brown, 2015).

In her analysis of Visual Literacy definitions, Maria Avgerinou indicated that the terms "skill", "ability" and "competency" are applied as if they had the same meaning. Most recent definitions use the term "ability", such as the one proposed by the ACRL (ACRL, 2011) and the "operational definition" by Maria Avgerinou (Avgerinou, 2007):

"In the context of human, intentional visual communication, visual literacy refers to a group of largely acquired abilities, i.e., the abilities to understand (read), and to use (write) images, as well as to think and learn in terms of images."
Since the term "ability" is adequate in the academic context, according to our project goals, we used the term "competence". In addition, the concept of Visual Literacy is not completely treated in reviewed definitions. In most of the cases, it just only relates it with communication (Metros, 2008), as well as other takes into account the idea of learning (Debes, 1968). Maria Avgerinou (Avgerinou, 2003) indicated that Visual Literacy is clearly linked to communication, thinking and learning. Therefore, these three aspects must be taken into account.

From our point of view, a common and valuable in time definition of Visual Literacy must be concise but precise in the terms, mentioning the cognitive processes involved but not in detail, and not only talk just about images but in a broader sense to mention Visual Materials, which enclose images, pictures, mock-ups, digital visuals and other resources which are to be developed in the future). Our proposal of Visual Literacy is the following definition:

"Visual Literacy means the competences to understand (read), to create (write) as well as to think and learn using images, pictures, graphics or any kind of Visual Materials. "

This definition comes from reviewing Averignou's operative definition of Visual Literacy (Avgerinou, 2007)

Competences

Identifying VLE competences was our main research goal, so it was of great importance to clarify this term. For this project, we adopt the definition of competence as it is specified by in the EFQ definition (Recommendation 2008/C 111/01):

"The European Qualifications Framework (EFQ) defines Competence as 'the proven ability to use knowledge, skills and personal, social and/or methodological abilities, in work or study situations and in professional and personal development. In the context of the European Qualifications Framework, competence is described in terms of responsibility and autonomy'"
It is important to take into account the difference between the term "competency" and "competence". "Competency" appears in definitions (Debes, 1969) as well as in frameworks (Wagner, E. & Schöau, D., 2016) and was a term usually treated interchangeably between "abilities" or "skills" (Avgerinou, 2003) without specifying differences between them. We adopt the term "competence" as more adequate, following Edward`s clarification: "competence and competences refer to broad capacities; in contrast competency (plural competencies) is a narrower, more atomistic concept used to label particular abilities" (Edwards et al., 2008).

Research

The development of the VLEE competence framework was led by UPM partners from the VLEE project. They coordinated and performed the required research, with the support of the rest of the project partners. Research was mainly qualitative. The goal was to identify skills, abilities and knowledge involved on Visual communication and Visual Thinking which allowed to define competences as well as the definition of a competence model and rating scales.

The methodology consisted of the compilation of visual skills, abilities and competences identified from an in-depth analysis of selected works. To specify these according to the engineering domain. A Visual Literacy in Engineering Theoretical Basis was generated.

This work was performed from a literature review, by selecting and analyzing academic papers related with this topic. The theoretical Basis pursued to agree a definition of Visual Literacy, to clarify what we understand as "competence" as well as to find the main characteristics of Visual Literacy in engineering. These elements gave the guidelines for mapping the Visual Literacy competences specific to Engineering.

A list of VLE skills as well as key competence areas was then elaborated from an in-depth literature analysis of selected papers which were closer to our goal (e.g. (Edwards et al., 2008; Keller et al., 2018; White et al., 2015) and other more general (Avgerinou, 2007). In these cases, Visual skills and abilities were extracted from lists included in these works, and in other were identified according to a thematic analysis of relevant papers (e.g. (Ferguson, 1994; Miller & Bertoline, 1991; Ullman, 2002). This analysis gave a previous list of specific competences and skills of Visual Literacy in Engineering.

To define the framework structure an analysis of selected competence guides such as DigComp (2020), DigCompEdu (2020), ACRL (ACRL, 2011), and CEFR-VL (Wagner, E. & Schöau, D., 2016) was made. In-depth analysis of Framework inventory was conducted for commonalities, similarities of skills, competences and subcompetences, taking into account Visual Literacy for engineering theoretical basis. Outcomes was a competence list, the addition or deletion in case of any preidentified skills or competences from the in-depth literature analysis.
Research ended with an empirical work focused on VLEE target groups. Surveys were deployed to engineering educators and students, as well as VET institutions and VET trainers. Goal of this research was to have a perception of the presence of Visual Literacy in these institutions as well as how it is valued. This information gave an important feedback on the effectiveness of the competence framework as we ensured that covers the needs of students and teachers. Survey´s results also indicated guidelines for the identification of new pedagogical strategies and resources.

The Visual Literacy for Engineering Education Competence Framework

As a result of the research, a draft of the competence Framework was written and sent to a selected group of experts for their feedback. Final version of the framework was then generated including details according to the comments and suggestions from the expert`s review, expecting to have reached our goal to provide a comprehensive guide for developing Visual skills and abilities for the engineering students, that allow them to be considered as "visually literate".

The Visual Literacy for Engineering Education competence framework intends to offer a reference for technology educational programs for both Higher education and VET training. Its contents describe visual skills, abilities and knowledge that shapes a list of competences and how can be assessed.

VLEE framework is conceived to cover all of the Visual competences for engineers, educators, trainers and students. They can select some of its elements, in order to cover their specific educational needs. It is structured in six different areas, taking into account the different characteristics of the engineering processes, which requires the involvement of Visual Materials. These key competence areas are shown in Fig. **1**:

Fig. 1: Graphic Summary of the VLEE competence framework

VLEE areas focuses on the general engineering processes for product development across all engineering domains. In addition, competence areas are interrelated to the Visual Thinking processes as it was defined by Robert McKim (McKim, 1972): (See-Imagine-Draw) (Fig 2). For the step of the Visual Thinking process: "See" are related the competence area 1 (Use) and competence area 2 (Interpretation). Competences into this key competence area cover the skills and abilities for perceiving, interpreting and reading visual messages. For the step of the Visual Thinking process: "Imagine", are related the competence area 3 (Analysis) and area 4 (Solving). Competences into these competence areas cover the skills and abilities for visual reasoning, visualization and creative ideation. For the step of the Visual Thinking process "Draw", are related the competence areas 5 (Creation) and competence area 6 (Communication) which covers the skills and abilities of expressing visually.

Fig. 2 : VLEE competence framework related to engineering & Visual Thinking process (McKim, 1972)

Competence area 1: Use

This area covers the effective use of images, graphics or objects for engineering tasks. It is expressed in the ability to use visual media in an effective way, not only enhancing individual capabilities, but also for their professional

exchanges with colleagues and other interested parties. Also, it is useful for their individual professional improvement and for the collective optimal and permanent innovation in the enterprise and the engineering profession. In doing so, existing images, graphics and objects become resources to help reaching specific goals according to the engineering process. This competence area therefore describes the act of dealing with visuals as resources.

Table 1 Competences for area 1: use

Select	Identify effectively the adequate visual resource for a concrete purpose within the engineering process. Identify, assess and select digital resources to support and enhance teaching and learning.
Use of Visual technologies	Use the required graphic tools for engineering practice, able to use every graphic technique, use visual media effectively.

Competence area 2: interpretation

This area englobes the competences related to perceive and understand visual information: interpret the technical meaning of visual resources, understanding of the product through ideation and graphic expression as well perceiving means to use the senses to create internal ideas based on external stimuli. The initial stimulus is compared with mental representations and leads to recognition. That requires previous technical knowledge for understanding the function of the part/assembly as well as the meaning of all the standardized symbols, dimensions and graphic representations. Design intent, the purpose of a visual engineering representation to be interpreted is covered in this competence area.

Table 2 Competences for area 2: Interpretation

Interpret (forms)	Interpretation of an object/assembly using engineering means and developing a specific understanding of the object through creation. Understand the meaning of an object/assembly in terms of technological purposes.
Interpret (graphics)	Interpretation of an engineering graphic representation. Process a graphic representation to find meaning.
Interpret (data)	Interpretation of all available data representations expressed by visual means such as diagrams, tables, equations, graphs, as well as 3D FEM/CFD models

Competence area 3: analysis

The competence area 3 enlist those for analysis of visual information. Analysis is closely related with the competence area of interpretation. It comprises a further step following the perception/interpretation of a part/assembly. It is a set of methodological competences, particularly with respect to methods in engineering education.

Table 3 Competences for area 3: analysis

Identify	Identify visually the characteristics of engineering designs. Critical analysis of visual information.
Evaluate	Evaluation of images and Visual information. Evaluating Visual data, information and Visual digital content.

Competence area 4: solving

This area of competences treats about how to find problem solutions with the help of visual means. One skill involved is visual thinking, to conceptualize solutions to problems. Also, competences for ideation using visual

means are considered. Visualization, Spatial abilities, Visual Association and Visual reasoning are implied in this competence area.

Table 4 Competences for area 4: solving

Visualize (Solutions)	Generate an image of the problem solution in the mind. Manipulate mental images (combine, modify) for problem solving. Use various forms of visual communication and visual imagery to solve technical problems. Use visual techniques to solve a given problem.
Explore	Using graphic representations to solve problems. Develop an idea or concept by visual perception and the mental processing derived by exploring and reflecting involves searching and exploring of alternatives and idea variants

Competence area 5: creation

The area of creation covers the competences for the generation of significant visual resources as well as the production of images and objects for idea's expression. Create means to process and give form to the concept intended to be expressed using selected methods and resources. In may be related to creative process depending on the intention and or function of creating (e.g. to express graphically, to present, to study or to visualize). That means to express creatively through digital media and technologies. Creation includes how to generate knowledge with the support of digital visual tools. This area is closely linked to methodological competences for handling different visual materials and media that are applied during the creative process. It also depends on technical rules (conventions, regulations, standards) as well as knowledge related to using media, materials and tools.

Table 5 Competences for area 5: creation

Envision	Generate images in mind from perception and from visual images earlier visual impressions.
Create (forms)	Intentional production of components/assemblies.
Create (data)	Create visual media that represents data.

Competence area 6: communication

This area enlists competences which uses visual resources to share meanings between people or to exchange information. Communicating involves knowledge from all areas in the competence model: technical as well as cultural and creative knowledge and skills, but also knowledge related to media and its possibilities and an attitude that is directed to others.

Communicating by visual means requires an understanding of how to combine different modes (visual, verbal, auditory) and of specific problems of understanding. Communication also means knowledge of visual grammar and syntax as well of technical visual vocabulary, that included the knowledge of the basic components of visual language. As well as visual conventions (signs and symbols) and their socially agreed meanings (within the western culture).

Table 6: Competences for area 6: communication

Share	Share ideas/concepts, narratives, or arguments with visual media. Exchange visual technical information.
Describe (functionally)	Describing perceived design intent on engineering drawings and function of machines and engineering elements.
Express (realise)	Implement, execute or put into service an idea of an engineering design. That means to implement an idea for an external representation
Express (present)	Communicate the final creation of a component/assembly, taking into account that is perceivable to others

Competence Assessment

In order to evaluate the progress degree in the development of visual competences, a gradation in levels has been established. VLEE thus provides a measuring resource for evaluating student's progress. The levels correspond to the specific scope of a target in relation to an ability or skill. In some cases, activities related to competence at a specific level are also described.

VLEE competence framework applies a three-level scale for the proficiency progression of competences: "Basic", "Intermediate" and "Proficient". Bloom's revised taxonomy was taken into account in competence levels definition as is in line to the cognitive phases of any learning development: "Remembering", "Understanding", "Applying" "Analysing", "Evaluating" and "Creating". Therefore, Bloom's first stages "remembering" and "understanding" corresponds to Basic proficiency level. The Intermediate level with the stages "Applying" and "Analysing", and the Proficient level to "Evaluating and creating".

In the basic level, engineers assimilate new information and develop basic Visual and Graphic practices. At the Intermediate level, engineers apply, further expand and reflect on their graphic and visual practices. Finally, in the proficient level, engineers pass on their knowledge, critique existing practice and develop new ones.

Conclusion

Visual literacy is agreed as a critical area for student learning across the higher education curriculum and VET training. The Visual Literacy Framework for Engineering Education (VLEE) is the result of an international European multidisciplinary research group of engineering education and digital teaching resources to help covering this need. This is the first time to present visual literacy skills and abilities specific to engineering.

The research provided a revised definition of Visual Literacy, a clarification of what competence means as well as to confirm the needs for learning resources that focus on Visual communication and Visual Thinking. The main conclusion of the research is that specific components of Visual Literacy in engineering have to do not also with the Visual language of engineers, but with the thinking processes, which engineers applies for problem solving and ideation.

This competence guide is proposed for all those involved in technical tasks, since Higher Education institutions of engineering, as well as VET organizations, including professional engineers and stakeholders willing to take new learning initiatives. The VLEE competence framework brings teaching resources to help educators enhancing the visual skills and abilities. VLEE project works responding to the needs of Higher Education where students can have opportunities to enhance their capabilities for problem solving, communication and creativity. VET trainers and organizations shall have a support for updating their pedagogic strategies enabling the use of digital technologies. Professionals also can be benefited as they can improve their skills in this area. It is expected these organizations and institutions as well as stakeholders are motivated to introduce this new teaching initiative.
The competence framework here presented may be used complete or partially, depending on specific needs and the engineering domain. It is intended to include its contents in the engineering subject's educational programs as Visual Literacy competences are implemented.

It is also expected that this Visual Competence's guide become a resource for the development of innovative teaching, focusing on the web-based and digital tools.

Notes

Resumen

El estudio sobre perfil emprendedor en estudiantes universitarios, sobre todo aquellos que ya están por últimos ciclos, son subjetivos y complejos de entenderlos pero no imposibles.
La Universidad Nacional Micaela Bastidas de Apurímac alberga estudiantes en distintas especialidades, siendo Administración una de las carreras en la que se llevan cursos de Emprendimiento con más énfasis en los últimos ciclos. Pero en mayoría los estudiantes de los últimos ciclos de IX y X, sólo piensan en ocupar puestos laborales del sector público o privado y pocos son los que deciden emprender. Eso significa que el estudiante no se siente realmente capaz de confiar en sí mismo y asumir riesgos para tomar decisiones y liderazgo para designar tareas a sus colaboradores con el fin de alcanzar y lograr lo que se llama perfil emprendedor óptimo. Según (CURRÍCULO DE ESTUDIOS, 2017), muestra, que el 8% de los egresados logran tener negocios propios; el 45% opta en trabajar en entidades privadas y el 37% opta por laborar en el sector público (p. 28) Este estudio es de tipo básico, enfoque cuantitativo y diseño transeccional- descriptivo, se utilizó la técnica de la encuesta aplicándose a una muestra de 83 estudiantes entre mujeres y varones, asimismo obteniendo resultados, que generalmente existe un nivel alto de perfil emprendedor en 48 encuestados con una representación porcentual de 57,8%, en referencia a ello se puede evidenciar que casi la mitad de encuestados poseen un perfil emprendedor bajo y moderado.

Palabras clave: Emprendedor, Emprendimiento, Perfil Emprendedor

Introducción

Según los estudios de Bonilla & García (2014), quienes realizaron una tesis, en la Universidad Autónoma de Manizales, Colombia; denominada "Caracterización del perfil emprendedor en graduados de la maestría en Administración de Negocios: Un análisis empírico en la ciudad de Manizales" con el propósito de determinar las características del perfil emprendedor de los graduados de la maestría en Administración de Negocios de la Universidad Autónoma de Manizales, llegando a la conclusión de evidenciar el alto desarrollo de las características personales que tienen los graduados de la Maestría en administración de negocios, esto ha reflejado en manejo de niveles de autonomía, capacidad para la toma de decisiones racionales, comportamiento guiado por la responsabilidad y capacidad creativa e imaginativa, como aspectos fundamentales para el desarrollo de actividades de emprendimientos. Asimismo otro estudio según Benavides & Tupayachi (2015), realizaron la tesis "Emprendimiento y perfil del emprendedor en la Escuela Profesional de Ciencias Administrativas de la Universidad Nacional de San Antonio Abad del Cusco, periodo: 2014-2015", con una muestra de 170 estudiantes, el propósito de estudio fue describir la situación actual del emprendimiento e identificar perfil del emprendedor del estudiante y en la que se llegó a la conclusión, las experiencias laborales de los alumnos están centradas en el campo laboral dependiente representado por un 60%, mientras que el 40% de los estudiantes tiene la expectativa de emprender un negocio propio, esto se explica principalmente, porque en las economías con mayores ingresos per cápita hay mayores oportunidades de conseguir empleo, por ende los emprendimientos tienden a disminuir, por ello las instituciones en

Cite this Article as: Naysia QUISPE LUDEÑA, José A. SOTOMAYOR CHAHUAYLA and Mario AQUINO CRUZ "Perfil Emprendedor En Los Estudiantes De Ix-X Ciclo De La Escuela Académico Profesional De Administración De La Universidad Nacional Micaela Bastidas De Apurímac, Sede Abancay, 2019" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

la que se vienen desarrollando programas de fomento emprendedor deben apoyar en este sentido a desarrollar emprendimientos, así mismo los eventos académicos extracurriculares deben motivar a los estudiantes a desarrollar nuevos emprendimientos e incrementar el porcentaje de titulados bajo la modalidad de caso empresarial, es por esta razón que los estudiantes de la Escuela Profesional de Ciencias Administrativas aún tienen un perfil emprendedor **medio**, con un promedio de 17,14 y 16,93 puntos para las mujeres y varones respectivamente, caracterizado por buscar oportunidades, tener iniciativa, fijar metas y también correr riesgos.

Cabe señalar, que los resultados de la preparación y enseñanza en emprendimiento se ven influenciados por la condición de su entorno, algunas características de su personalidad y psicológicos del estudiante universitario y he aquí la investigación se realiza porque se desconoce y existe desinterés sobre el perfil emprendedor en los estudiantes de IX y X ciclo de la Escuela Académica Profesional de Administración de la Universidad Nacional Micaela Bastidas de Apurímac, sede Abancay, 2019; teniendo en cuenta las afirmaciones de Montoya, Marulanda y Vélez (2014); (Serida, Guerrero, Alzamora, Borda y Morales, 2018, p. 51) y (Soto, 2012, pp. 85-95), sobre la importancia del emprendedor y para su estudio existe la necesidad de conocer el perfil emprendedor y de acuerdo a ello plantear propuestas que sirvan como mecanismos para mejorar los problemas que más adelante pueden ser perjudiciales para los estudiantes y la Universidad misma.

Es necesario ser parte del problema y analizar de forma consciente la realidad con distintos problemas renuentes, porque sirven como aporte y antecedente para realizar otras investigaciones basadas en emprendimientos.

Marco Teórico

Este trabajo de investigación según su criterio teórico, desarrolla el estudio del perfil emprendedor a partir del modelo propuesto por William B. Gartner, quién clasifica en características personales, sociales y psicológicas, que permitirá explicar después en los estudiantes de IX-X ciclo de la Escuela Académico Profesional de Administración de la Universidad Nacional Micaela Bastidas de Apurímac, sede Abancay, 2019. Cuyo objetivo consiste en conocer el perfil emprendedor en los estudiantes de IX-X ciclo de la Escuela Académico Profesional de Administración de la Universidad Nacional Micaela Bastidas de Apurímac, sede Abancay, 2019.

De acuerdo a los estudios realizados para esta investigación se tomó en cuenta el enfoque de los rasgos de personalidad que analiza al emprendedor desde lo que es, para así llegar a entender cómo estos rasgos influyen en el espíritu empresarial. Por lo tanto Gartner (1988), define que las características de la personalidad del empresario son auxiliares a los comportamientos del empresario, además que los emprendedores se diversifican por su iniciativa personal, que es un rasgo importante de las personas que emprenden su propia empresa (Quispe, 2016, p.23). Además se menciona que los primeros estudios e investigaciones se centraron en el análisis de las características resaltantes de la personalidad del emprendedor.

Adicionalmente, Gartner, (citado en Restrepo, Tapasco y Vidarte, 2016) afirma, que un emprendedor posee las características personales, sociales y psicológicas, ubicando dentro de cada una de ellas un conjunto de competencias que ante su eficiente desarrollo configuran un perfil orientado al emprendimiento.

A continuación se muestra el modelo conceptual de Gartner, en la siguiente figura:

Figura 1: Características de un emprendedor según Gartner

Fuente: Gartner (2002)

Las características mostradas que conforman el perfil del emprendedor se encuentra dentro de los procesos del emprendimiento que tiene cada persona. Por lo tanto, se presentan y desarrollan a continuación las siguientes características.

Características Personales.

De acuerdo a Bonilla y Garcia (2014), definen que las características personales hacen referencia al conjunto de cualidades que forman el carácter y la personalidad de un emprendedor, y que le permiten movilizar y mantener su gestión empresarial. Dentro de estas características se pueden encontrar la autonomía, toma de decisiones, responsabilidad y creatividad.

Autonomía

Según Carter, Gartner, Shaver y Gatewood (2003), "mencionan que una de las razones para comenzar un emprendimiento es la autonomía, la cual representa un deseo individual de libertad, control y flexibilidad en el uso del tiempo por parte del emprendedor."

Toma de decisiones.

Según Estrada (2007), "menciona que las decisiones que se toman en el ámbito delos negocios son importantes mientras puedan ser efectivas y conseguir resultados. Por lo tanto el autor afirma que en la toma de decisiones se presentan tres etapas:"

- Encontrar coyunturas en las que se presenta una decisión a tomar, lo que se puede vincular con una inteligencia en el contexto castrense.
- Inventar, desarrollar y analizar diferentes posibilidades, lo que podría calificarse una acción de diseño.
- Elegir entre las opciones posibles simbolizando una acción de "opción/elección" u "optativa".

Asimismo, este autor afirma también, que las decisiones corporativas no son independientes, sino más bien son ejecutadas en función a coyunturas específicas, como modificar procedimientos de marketing, comunicaciones, acrecentar las ventas, disminuir gastos, permitir estímulos, entre otras.

Responsabilidad

"Es una cualidad que implica una relación entre personas de índole social, la cual se caracteriza por tener como objetivo un fin en común" (Preziosa, 2005).

En un principio a responsabilidad social se dedicaba a ser filantrópica, actualmente el concepto ha cambiado y se practica la Responsabilidad Social Empresarial (RSE). En este sentido, las empresas deben desarrollar relaciones responsables con sus grupos de intereses para lograr su objetivo de crear valor, así como poder transferirlo" (Cancino y Morales, 2008).

Creatividad.

De acuerdo a Filion 1994 citado en Orrego (2008), define "La creatividad es el núcleo en el que se basa el emprendimiento, además establece una visión de las metas después de identificar los medios para su consecución"
Se refiere a que el centro naciente para dar inicio un emprendimiento es la creatividad, ya que a raíz de ello se puede llegar a concretizar con acciones."

Características Sociales

Una de las características que presenta el emprendedor y que muestra un acercamiento al conocimiento de su perfil son las características sociales."

Liderazgo

El liderazgo es considerado la habilidad para persuadir, guiar, motivar a un grupo de personas u organizaciones. Por ende mantienen una connotación positiva a diferencia del concepto de autoridad o de dirección. Asimismo, los

gerentes pueden planificar, coordinar proyectos, resolver problemas; en cambio, los líderes además de ello pueden inspirar a otras personas a un objetivo en común y lograr cambios positivos en la organización (Quispe, 2018).

Tras los estudios de estos autores, infieren que, fortalecer el liderazgo debe ser una estrategia de comportamiento eficaz, para aquellos emprendedores que desean obtener el compromiso por parte de sus equipos para competir con otras firmas que tienen un mejor posicionamiento en el mercado y mayores recursos."

Trabajo en Equipo

"Es la habilidad que tienen las personas para el logro de un objetivo en común, priorizando los objetivos grupales sobre los individuales (Robles y Zárraga, 2015).

El trabajo en equipo exige complementariedad, compromiso y comunicación, condiciones que gran parte de universitarios no tienen. Esta característica debe ser inherente en la praxis administrativa, ya que ella implica transferir autoridad y responsabilidad a posiciones inferiores de la jerarquía, proceso conocido como la delegación de funciones.

Solidaridad

Según Moenne (2010), la solidaridad parte de la naturaleza misma del ser humano, mostrando que las personas interactúan con otros. En este sentido, desean vivir en un entorno compartido, debido a la naturaleza social del ser humano. Por ello, el ser humano no puede desvincularse de sus semejantes o tratar de desarrollar sus competencias de forma individual."

Características psicológicas

"Las características psicológicas están dadas por la influencia de valores culturales y sociales Liñan (citado en Bonilla y Garcia, 2014).
Por tanto se presentan las características psicológicas relacionadas con el emprendedor."

Necesidad de logro

El autor David MacClelland, señala que, si la necesidad por el logro es alta, posiblemente habrá más personas que se comporten como emprendedores, actuando para producir más de lo que consumen."

De esta forma, el emprendedor suele aparecer a los ojos de los demás como alguien guiado internamente por un imparable deseo de lograr sus objetivos, como alguien que busca la excelencia. Su fuerte carácter competitivo le lleva a aceptar ciertos riesgos y a perseguir objetivos que le motiven."

Minimización de temor al riesgo

De acuerdo a Cantillón (citado en Rodríguez, 2009), "el emprendedor se caracteriza por asumir riesgos en condiciones de incertidumbre. Por tanto, clasifica a los productores de la economía de mercado en""contratados", que perciben salarios y rentas fijas; y los "emprendedores" que obtienen beneficios variables e inciertos. Asimismo, señala que el emprendedor opera en una sociedad mercantil donde la competencia y la incertidumbre son relevantes al momento de tomar decisiones que impliquen un determinado nivel de riesgo."

Metodología

El estudio investigativo es de tipo básico, enfoque cuantitativo y diseño transeccional- descriptivo, se realizó una encuesta a los estudiantes de IX y X ciclo de la Facultad de Administración en la Universidad Nacional Micaela Bastidas de Apurímac de la provincia de Abancay, región Apurímac. Se aplicó el muestreo no probabilístico, de tal forma que se seleccionó a 83 estudiantes de la misma cantidad de población, entre mujeres y varones."

El cuestionario tuvo 36 preguntas distribuidos de la siguiente manera; 15 ítems para la dimensión Características personales, 12 ítems para la dimensión Características Sociales y 09 ítems para la dimensión Características Psicológicas. Donde el instrumento tuvo una escala de distintas categorías (1=Totalmente en desacuerdo; 2= En

desacuerdo; 3= Ni de acuerdo, ni descuerdo; 4= De acuerdo; 5=Totalmente de acuerdo), seguidamente para el respectivo análisis y procesamiento de datos se empleó el software Excel y SPSS23 y así la obtención de resultados a través de las tablas de frecuencias y la prueba estadística."

Para determinar la confiabilidad del instrumento, además del juicio de expertos, se determinó estadísticamente haciendo el uso del coeficiente de alfa de Cronbach en la que se mostró como resultado 0.913, coeficiente que indica "excelente", por lo tanto se pudo deducir que el instrumento utilizado para este trabajo de investigación es aceptable, que dicho sea de paso pueda servir para posteriores investigaciones que se requiera realizar."

Resultados

Descripción de las tablas de frecuencias de la variable Perfil Emprendedor

Tabla 1

Frecuencia y porcentaje de la variable perfil emprendedor en los estudiantes de IX-X ciclo de la Escuela Académico Profesional de Administración de la Universidad Nacional Micaela Bastidas de Apurímac, sede Abancay, 2019.

Perfil del emprendedor					
		Frecuencia	**Porcentaje**	**Porcentaje válido**	**Porcentaje acumulado**
Válido	**Bajo**	12	14,5	14,5	14,5
	Moderado	23	27,7	27,7	42,2
	Alto	48	57,8	57,8	100,0
	Total	83	100,0	100,0	

Fuente: Elaboración propia, 2019 según instrumento (cuestionario) procesado en el SPSSV23.

Interpretación

En la tabla 3, se puede observar de los encuestados, que 12 de 83 estudiantes poseen un perfil emprendedor bajo, seguido de 23 estudiantes que aducen tener moderado y mayormente 48 estudiantes señalaron tener un perfil emprendedor alto. Por lo que se puede decir que generalmente existe un indicador alto del "Perfil emprendedor en los estudiantes de IX-X ciclo de la Escuela Académico Profesional de Administración de la Universidad Nacional Micaela Bastidas de Apurímac, sede Abancay, 2019"

Descripción de resultados de las tablas de las dimensiones del perfil emprendedor.

Tabla 2

Frecuencia y porcentaje de la dimensión "Características personales en los estudiantes de IX-X ciclo de la Escuela Académico Profesional de Administración de la Universidad Nacional Micaela Bastidas de Apurímac, sede Abancay, 2019"

Características Personales					
		Frecuencia	**Porcentaje**	**Porcentaje válido**	**Porcentaje acumulado**
Válido	**Bajo**	4	4,8	4,8	4,8
	Moderado	15	18,1	18,1	22,9
	Alto	64	77,1	77,1	100,0
	Total	83	100,0	100,0	

Fuente: Elaboración propia, 2019 según instrumento (cuestionario) procesado en el SPSSV23.

Interpretación:

En la tabla 4, se puede observar de los encuestados, que sólo 4 de 83 estudiantes tienen características personales de nivel bajo, seguido de 15 estudiantes que aducen tener características personales de nivel moderado y mayormente 64 estudiantes señalaron tener características personales de nivel alto. Por lo que se puede decir que generalmente existe un indicador alto de "Características personales en los estudiantes de IX-X ciclo de la Escuela Académico Profesional de Administración de la Universidad Nacional Micaela Bastidas de Apurímac, sede Abancay, 2019"

Tabla 3.

Frecuencia y porcentaje de la dimensión "Características sociales en los estudiantes de IX-X ciclo de la Escuela Académico Profesional de Administración de la Universidad Nacional Micaela Bastidas de Apurímac, sede Abancay, 2019"

Características Sociales					
		Frecuencia	**Porcentaje**	**Porcentaje válido**	**Porcentaje acumulado**
Válido	**Bajo**	6	7,2	7,2	7,2
	Moderado	19	22,9	22,9	30,1
	Alto	58	69,9	69,9	100,0
	Total	83	100,0	100,0	

Fuente: Elaboración propia, 2019 según instrumento (cuestionario) procesado en el SPSSV23.

Interpretación:

En la tabla 5 se pudo observar de los encuestados, que sólo 6 de 83 estudiantes aducen tener características sociales de nivel bajo, seguido de 19 estudiantes que aducen tener moderado y mayormente 58 estudiantes señalaron tener un perfil alto. Por lo que se puede decir que generalmente existe un indicador alto de "Características sociales en los estudiantes de IX-X ciclo de la Escuela Académico Profesional de Administración de la Universidad Nacional Micaela Bastidas de Apurímac, sede Abancay, 2019"

Tabla 4.

Frecuencia y porcentaje de la dimensión "Características psicológicas en los estudiantes de IX-X ciclo de la Escuela Académico Profesional de Administración de la Universidad Nacional Micaela Bastidas de Apurímac, sede Abancay, 2019"

Características Psicológicas

		Frecuencia	**Porcentaje**	**Porcentaje válido**	**Porcentaje acumulado**
Válido	**Bajo**	7	8,4	8,4	8,4
	Moderado	16	19,3	19,3	27,7
	Alto	60	72,3	72,3	100,0
	Total	83	100,0	100,0	

Fuente: Elaboración propia, 2019 según instrumento (cuestionario) procesado en el SPSSV23.

Interpretación:

En la tabla 6 se puede observar de los encuestados, que solo 7 de 83 estudiantes aducen tener características psicológicas de nivel bajo, seguido de 16 estudiantes que aducen tener moderado y mayormente 60 estudiantes señalaron tener un perfil alto. Por lo que se puede decir que generalmente existe un indicador alto de "Características psicológicas en los estudiantes de IX-X ciclo de la Escuela Académico Profesional de Administración de la Universidad Nacional Micaela Bastidas de Apurímac, sede Abancay, 2019"

Conclusiones

1. Con respecto al objetivo general, el 57.8% de los encuestados poseen un perfil emprendedor en un nivel alto. En consecuente se puede concluir que generalmente existe un indicador alto de perfil emprendedor en los estudiantes de IX-X ciclo de la Escuela Académico Profesional de Administración de la Universidad Nacional Micaela Bastidas de Apurímac, sede Abancay, 2019; siendo un número exacto de 48 estudiantes, lo que indica que aún permanece la mitad de estudiantes que no se sienten suficientemente capaces de poseer esas características emprendedoras y abismarse al campo de acción sin ningún tipo de prejuicios que obstaculicen sus objetivos y metas y por ello al culminar su carrera u otros hasta sin llegar a concluir deciden buscar trabajo y en en el trayecto se queden muchos desempleados o en proceso de búsqueda.

Con respecto a los objetivos específicos:

2. Con respecto a las Características personales, de acuerdo a Gartner (1988) son un conjunto de cualidades que forman el carácter y personalidad de un emprendedor y que permiten movilizar y mantener su gestión empresarial; en consecuente los resultados de esta investigación muestran que el 77.1% de los estudiantes poseen un nivel alto de características personales. Esto quiere decir que los estudiantes al estudiar la carrera de Administración y estando en los últimos ciclos ya tienen la seguridad de sí mismos de asumir responsabilidades y consecuencias luego de tomar decisiones para emprender o elegir rumbos de manera independiente, eso es la autonomía, conocerse lo suficiente para asumir responsabilidades y aceptar las consecuencias que cada acción trae consigo y de esa forma asumir decisiones (de forma racional) para elegir la mejor alternativa que permita realizar sus actividades logrando alcanzar sus metas y en caso se presente algún problema situacional saberlas manejar de manera inteligente, razonable y profesional, como administradores que son.

3. Con respecto a las características sociales, según Gartner se componen de los siguientes indicadores; el liderazgo, siendo uno de ellos, según (Quispe, 2018), es considerado como una habilidad para persuadir, guiar, motivar a un grupo de personas u organizaciones, además de ello pueden inspirar a otras personas a un objetivo en común y lograr cambios positivos en la organización, por otro lado se encuentra el trabajo en equipo, según Alles (2008), define como la capacidad para colaborar con los demás, formar parte de un grupo y trabajar con otras áreas de conocimiento que no son nuestra especialidad, todo en búsqueda de trabajar una estrategia y conseguir los objetivos trazados y por último la solidaridad, que según Moenne (2010), comenta que es parte de la naturaleza misma del ser humano, mostrando que las personas interactúan con otros. En ese sentido, desean vivir en un entorno compartido, debido a la naturaleza social del ser humano. Seguidamente, para hacer más convincente y válido lo mencionado en el anterior acápite, los resultados muestran en un nivel alto que 69.9% de estudiantes poseen características sociales, por lo que se puede concluir que en el caso de los estudiantes en el indicador del liderazgo, destacan más, debido a que existe la tendencia social de liderar, tomar el mando y dirigir a cierta cantidad de personas, logrando captar su atención para luego señirse en cumplir los objetivos en común, sin embargo también los demás indicadores como el trabajo en equipo y solidaridad complementan pero en menor medida.

4. Finalmente con respecto a las Características psicológicas, Liñan (citado en Bonilla y Garcia, 2014), menciona que se da por la influencia de valores culturales y sociales. Al respecto David MacClelland, define uno de los indicadores que es necesidad de logro, caracterizando a una persona la forma de cómo ejerce el control sobre los medios de producción y tiene la capacidad de producir más comparado con lo que él pueda consumir, con el objetivo primordial de obtener ingresos individuales, además considera que los individuos fuertemente motivados por el deseo del triunfo muestran mayor desenvolvimiento e iniciativa que los otros. Asimismo varios autores comentan acerca del siguiente indicador que es la minimización del riesgo, de los cuales mencionaremos algunos postulados de los siguientes autores como Cantillón (citado en Rodríguez, 2009), define que todo emprendedor se enfrenta a asumir riesgos en condiciones de incertidumbre. Por otro lado Bucardo et al (2015), señala que el emprendedor se caracteriza por ser un tomador de riesgo, no sólo por arriesgar su patrimonio, sino también por arriesgar su imagen social y los costos psicológicos que impliquen un posible fracaso en su emprendimiento. Es así entonces que tras obtener los resultados, que el 72.3% de estudiantes poseen un nivel alto de características psicológicas, se puede concluir en el caso de los estudiantes que tiene mayor primacía en la necesidad de logro debido a que existen necesidades para que luego estén satisfechos y esas necesidades son mayores expectativas de superación profesional y obtención de algo que en el momento mismo no posee, pero sí después, concuerda con el postulado de David MacClelland; mientras más alto es el nivel de la necesidad de logro , posiblemente habrá más personas que se comporten como emprendedores, actuando para producir más de lo que consumen en el momento.

Reconocimiento

Cabe señalar que el presente estudio de investigación se realizó gracias a la facilitación accesible de información por parte de la Escuela Académico Profesional de Administración, asimismo a los estudiantes universitarios de los ciclos

IX y X de la Facultad de administración, que permitieron hacer posible a través de sus respuestas en el llenado del cuestionario recopilar información necesaria para su diagnóstico, investigación y generación de resultados.

Abstract

Successful management of the regional development in the EU countries is based on the concept of "smart" specialization and technology of "smart" benchmarking. At the same time, these instruments are based on the need to determine the most promising types of economic activity in terms of their contribution to regional development. In Russia, this task could be implemented by creating interregional clusters - unions, whose enterprises are located on the territories of several constituent entities of the Russian Federation. At the same time, it is believed that the development of a constituent entity of the Russian Federation occurs through the growth of indicators of economic efficiency of enterprises belonging to the interregional cluster. In this work, we tested the hypothesis that the effective operation of an interregional cluster is an important tool for regional strategizing, realizing the potential for the development of promising specialization of territories. Studying the results of the activities of the Russian interregional clusters, as well as the analysis of the geoinformation systems in Russia in the field of regional development, the authors empirically proved the formulated hypothesis, and also substantiated the relevance of creating a platform for finding potential partners in order to build added value chains in different regions, taking into account their specializations.

Keywords: Strategizing; Region; Interregional Clusters; Promising Specialization; "Smart Benchmarking".

Introduction

Over the past ten years, the EU countries have been successfully implementing regional development management based on the concept of smart specialization and smart benchmarking technology, which have become the main principles of building the European Plan 2020 (Foray et al., 2009). The approach to the formation of the economic structure of the territories, presented in the concept of smart specialization, is based on the need to determine the most promising types of economic activity in terms of contribution to regional development. Speaking of smart benchmarking, we note that this technology of strategizing involves preliminary identification of structurally similar territories, called "identical regions." At the same time, the determination of the development priorities of the object under study is based on borrowing the successful experience of regions that are identical for it (Dubrovskaya et al., 2018).

Thus, when working out development strategies in the EU countries, firstly, the specialization of the studied territory is taken into account; secondly, the level of development of this industry in neighboring regions is investigated; thirdly, only the experience of those regions is taken into account that are identical to the studied one in terms of socio-economic development (according to smart benchmarking). The first two of the three dimensions we identified as those which reflect the concept of smart specialization; the third one embodies smart benchmarking technology.

It is important to note that smart specialization has also spread outside the EU and is now used in the developments of the The Organisation for Economic Co-operation and Development (OECD, 2012b, 2013b) and the United Nations Economic Commission for Europe (UNECE, 2014, 2015).

The development of regional strategies in Russia, taking into account the specialization of territories, begins with the approval of the Strategy for Spatial Development of the Russian Federation for the period until 2025, which assigned to

Dubrovskaya "Peculiarities of Regional Strategizing in The Light of The Promising Specialization of Territories" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

each subject of the Russian Federation the so-called "promising industries of specialization". According to this document, the strategy of regional development should be carried out within the framework of promising economic specializations.

At the same time, the processes of spatial development, taking into account their promising specializations, should not proceed spontaneously. Coordination of potential participants in the implementation of promising interregional investment projects is required, usually within the framework of interregional clusters.

In most developed countries, interregional clusters are an effective mechanism for interaction between economic agents located in different territories. A feature of such clusters abroad is that the cluster members are located on the territory of different countries. A large number of interregional clusters are located on the territory of the Scandinavian countries: Service cluster Denmark (Denmark, Sweden, Finland, Great Britain); Media evolution (Sweden, Denmark, Austria); Cluster of aluminum technologies Aluklaster (Denmark, Sweden, Norway), etc. (Stryabkova and Lysykh, 2019).

Despite the wide spread of interregional clusters abroad, a large number of studies in the domestic literature have not been devoted to the research of interregional clusters. This is partly due to their small quantity. So, in 2019, there were only 7 interregional clusters in Russia: the industrial cluster of fiber-optic technologies "Photonics", the industrial cluster of metro car-building enterprises, the national aerosol cluster "Arnest", the pump-building cluster, the composite industrial cluster "Composites without Borders", the oncological cluster of nuclear and photodynamic medicine, a cluster of electronic devices, materials and components. These clusters include about 80 industrial enterprises based in 14 regions (Belgorod region, Voronezh region, Moscow, Ivanovo region, Lipetsk region, Moscow region, Perm region, the Republic of Tatarstan, Saratov region, Sverdlovsk region, Stavropol region, Tver region, Tula region, the Udmurt Republic) [11].

It is theoretically assumed that the cooperation of enterprises localized in various constituent entities of the Russian Federation is an important tool for realizing the potential for the promising specialization development of the territory (Song, 2007; Fritsch, 2003). It is important to note that most of the interregional clusters in Russia were organized in the last 3 years, this fact does not allow for an objective assessment of their operational functioning.

In practice, potential participants in an interregional cluster experience difficulties due to the need to overcome organizational and administrative problems, the need for universal methods for assessing the economic benefits of cooperation, as well as the lack of opportunities for enterprises participating in clusters to bear additional labor, financial and investment costs for organizing a large, but non-transparent project considering its effectiveness.

Thus, the purpose of the study is to analyze the effectiveness of the interregional cluster as an important tool for regional strategizing, realizing the potential for the development of promising specialization of territories.

Methods

Such methods as a comprehensive analysis of statistical data, a comparative analysis of various theoretical concepts, a grouping method, as well as systematization of research results were used in the research. The authors used analytical data on the results of the Russian interregional clusters activities within a period from 2014 to 2018. The following units of enterprises currently operate in the status of an interregional cluster in Russia: 1. the industrial cluster of fiber-optic technologies "Photonics" (Perm region, Sverdlovsk region, the Udmurt Republic); 2. industrial cluster of metro-car building enterprises (Moscow and Tver regions); 3. national aerosol cluster "Arnest" (Stavropol region, Tula region); 4. pump-building cluster (Voronezh and Lipetsk regions); 5. composite industrial cluster "Composites without borders" (the Republic of Tatarstan, Moscow and Saratov regions); 6. oncological cluster of nuclear and photodynamic medicine (Moscow, Ivanovo region); 7. cluster of electronic devices, materials and components (Stavropol region, Belgorod region).

The interregional industrial cluster of fiber-optic technologies "Photonics", which unites enterprises of the Perm region, the Sverdlovsk region and the Udmurt Republic, was chosen as the object of research. The hypothesis of the study is the assumption that the effective activity of an interregional cluster is an important tool for regional strategizing, realizing the potential for the development of promising specialization of territories.

Results

One of the reasons for creating an interregional cluster is to get co-financing of their projects from the state. However, it becomes difficult to find potential partners on the territory of one region, since one of the conditions for obtaining co-financing, according to the current legislation, is the requirement for the percentage of cooperation of cluster participants to be at least 20%. To reach this threshold, participants have to go beyond the territorial boundaries of their subjects in search of cooperative ties. At the same time, when searching for potential partners, it is important to know the specialization of the region where the enterprise is located.

For example, let's consider the industrial cluster of fiber-optic technologies “Photonics”, which unites enterprises of three subjects of the Russian Federation (Perm region, Sverdlovsk region and Udmurtia). Cooperation of enterprises within the interregional cluster of these three regions is not accidental. The analysis of the specializations for the regions indicated in the Spatial Development Strategy showed that the specializations of the regions under consideration coincide in 14 types of economic activity. At the same time, a total of 24 specializations are assigned to the Sverdlovsk region, 20 to the Udmurt Republic, and 21 to the Perm region. Note that all three regions have such specialization as "production of computers, electronic and optical products", which is the main activity of the “Photonics” cluster.

Currently “Photonics” is implementing several projects in various fields. In the educational sphere we are to highlight the project called “Engineering Elevator”, which consists in step-by-step training of highly qualified personnel starting from an early age (3-7 years) and gradually increasing children's interest in this profession. The social sphere includes preparing for re-profiling of the secondary schools and formation on its basis of the Polytechnic school “Photonics”, which should become an educational center of professional self-determination of students in the engineering field and campus. In the industrial sphere, we have to mention a set of measures to strengthen the position of the Perm region in the field of fiber-optic technologies in international development (Dubrovskaya et al., 2017).

At the same time, the “Photonics” cluster is interesting to us, first of all, as an Association of enterprises localized in various regions of the Russian Federation, that is, as an interregional cluster, and also the effectiveness of its activities is interesting. The effectiveness of the interregional cluster will confirm the relevance of this study.

The authors have analyzed the performance indicators of the cluster functioning for the period from 2014 to 2018 (Table 1). It should be noted that the innovation-territorial cluster “Photonics” received its status in 2014. The status of an interregional cluster was assigned in 2017. And the agreement on joint activities between the enterprises was signed on 03.02.2016.This determines the adequacy of our comparison of the dynamics of changes in the performance indicators of cluster participants in 2015 to 2014 and in 2018 to 2017. Also, before proceeding with the analysis of the panel data presented in Table 1, we note that the systematization of indicators was carried out for the following cluster members: Perm Scientific and Production Instrument Making Company JSC (Perm), Inkab LLC (Perm) , LLC PNPPK-Electron-Contract (Perm), LLC Inversion-Sensor (Perm), LLC PNPPK - Marine Electronics (Perm), LLC PNPPK - Kvantek (Perm), Okey-Cable LLC (Perm), Kedron LLC (Perm), MetTechnology LLC (Izhevsk), Modern Production LLC (Izhevsk), TochMekh LLC (Yekaterinburg).

According to the data presented in Table 1, the effectiveness of the decision to merge enterprises located in various constituent entities of the Russian Federation is obvious. Thus, according to all five indicators, there is a positive growth trend during the period of the cluster functioning in the interregional status. And, conversely, during the period of the cluster's activity, which was a cooperating enterprise of only the Perm region, the dynamics of a number of indicators was negative (the number of employees in organizations participating in the Cluster who underwent professional retraining; the amount of work and projects in the field of research and development carried out jointly by two or more organizations - members of the Cluster).

Table 1: Analysis of performance indicators for "Photonics" cluster functioning from 2014 to 2018

N п/п	Cluster performance indicator	2014	2015	2016	2017	2018	2015/2014	2018/2017
1	2	3	4	5	6	7	8	9
1	The number of employees in organizations - members of the Cluster who have undergone professional retraining in additional professional programs in the field of innovation management (people)	131,0	108,0	120,0	122,0	123,0	-17,6%	0,8%
2	The amount of work and projects in the field of research and development, carried out jointly by two or more organizations - members of the Cluster (million rubles)	4808, 7	4542, 4	4815, 4	7 082, 9	9 073,2	-5,5%	28,1%
3	Productivity per employee of the organization (mln rubles)	1,825	2.076	2,114	2,573	3,118	13,8%	21,2%
4	The volume of innovative products of its own production shipped by the organization, as well as innovative works and services (million rubles)	6252, 2	10410,5	6287,6	10042, 9	12576,0	66,5%	25,2%
5	The total revenue of the organization from sales of products in the external market (thousand rubles)	4254, 4	5136,5	5511,6	6165,1	6819,1	20,7%	10,6%

Thus, the solution of the currently actualized problem of cooperation between enterprises localized in various constituent entities of the Russian Federation is not only an important step towards increasing the efficiency of the functioning of interregional clusters. The solution to this problem is the most important priority of regional strategy (Dubrovskaya et al., 2018). This assumption is due to an objective increase in the efficiency indicators of enterprises in the cluster. Consequently, real cooperation of enterprises operating in various constituent entities of the Russian Federation will also increase the GRP of the territories where cluster enterprises are located, which in turn will lead to an increase in GDP (Dubrovskaya et al., 2017). Thus, the organization and development of interregional interaction of the subjects in the Russian Federation entails an increase in GDP.

Such a small number of interregional clusters suggests that in practice it is difficult for potential enterprises participating in an interregional cluster to organize and come to an agreement with each other. These difficulties are caused by the objective problem of their misunderstanding of the advantages connected with working as a single cluster, their unwillingness to bear additional labor, financial and investment costs for organizing a large, but non-transparent project in terms of efficiency.

At the same time, as the advantages of working within a single cluster, one can note, at a minimum, the possibility of obtaining state support, as a maximum - the expansion of cooperation and trade ties, the capitalization of the company, an increase in financial stability and performance. Receiving subsidies is regulated by the Decree of the Government of the Russian Federation No. 779 dated 15.07.2015 (amended on 02.08.2018) "On industrial clusters and specialized organizations of industrial clusters".

In practice, determining the list of organizations that are potential participants in an interregional cluster is a time-consuming task, the solution of which involves determining the specializations of the territories were enterprises are located, as well as studying specialized databases. For example, such databases include the Network Edition "Information Resource SPARK" (Online publication "SPARK Information Resource", 2020), RUSLANA (National database "Ruslana", 2020), IAS "FIRA PRO" (First Independent Rating Agency, 2020), etc. Access to such databases is paid, which objectively complicates the process of cooperation of potential participants in interregional clusters. An alternative to obtaining paid information is the systematization of data about enterprises contained in publicly available electronic maps (for example, Yandex Maps, Google maps, etc.), as well as in specialized geographic information systems (for example, a map of HSE clusters (Map of clusters of Russia, 2020), state information system industry, geographic

information system of industrial parks, technoparks, clusters (Geographic information system “Industrial parks. Technoparks. Clusters”, 2020), etc.).

Let us dwell in more detail on the specified specialized geographic information systems. Firstly, the HSE project “Map of Clusters”, which is a unified interactive database of domestic clusters and their projects. The practical use of the Map lies in the ability to receive not only general information about the clusters, but also professional information, giving an idea, including about their specialization, products (services), development priorities. Also, Map users have access to information about the participants and partners of clusters, governing bodies, implemented, current and promising projects. The key documents of the clusters regulating their activities are posted in the public domain (Map of clusters of Russia, 2020).

Secondly, the geographic information system of industrial parks, technology parks and clusters of the Russian Federation. It is a system for entering, storing, organizing, analyzing and graphically visualizing spatial data on a schematic map and related information about industrial parks, technology parks and clusters of the Russian Federation. The system was developed as a part of the State program "Development of industry and increasing its competitiveness" implementation (Geographic information system “Industrial parks. Technoparks. Clusters”, 2020).

Thirdly, the state information system of industry, created by order of the Ministry of Industry and Trade of the Russian Federation for the implementation of industrial policy, the goals of which are: the formation of a high-tech, competitive industry, ensuring the transition of the state's economy from the export-raw-material type development to an innovative type of development; ensuring the country's defense and state security; ensuring employment of the population and improving the living standard of citizens in the Russian Federation.

However, these platforms contain information about existing clusters. At the same time, enterprises and authorities need information about enterprises that are possible participants in clusters. In other words, it is necessary to create a platform, i.e. a system for analyzing and graphically visualizing data on enterprises operating in different industries and on the territory of different regions on a geographical map. However, the map shows only those businesses whose activities are closely related to each other. It means that enterprises in these industries can be potential suppliers/buyers of products for each other. Thanks to such a platform, the spatial boundaries of economic activity will expand: it will be easier for enterprises to identify target markets and then unite in a cluster, and for state authorities to see the spatial specialization of the country's territories outside the borders of regions.

Previously, the authors developed a Web application (http://ruclusters.ru), in which enterprises that are potential participants in interregional clusters are displayed on a geographical map (Dubrovskaya et al., 2019). The Web interface contains a map and 2 drop-down lists: the first drop-down list contains a list of reference clusters, which we called "specialization of an interregional cluster"; the second list is a set of activities included in each specialization of interregional clusters. When you select a specialization, the map shows regions that are potential cores of interregional clusters in red, and regions that are potential participants of an interregional cluster in yellow. After selecting the type of activity you are interested in (or several types of activities), business entities are filtered at the user's request (by clicking the "Find" button). Depending on the scale, the map displays information about the number of companies specializing in the selected type of activity, as well as their contact details.

Our comparative analysis of the capabilities of individual geographic information systems allowed us to identify and systematize the advantages of the author's Web application. Only this Web application developed by us allows displaying potential clusters and satellite regions, and it is the only one of all geoinformation systems that allows displaying a complete list of enterprises at a time.

Conclusion

As a result of the study, based on statistical data, the effectiveness of the interregional cluster “Photonics” has been proved. Combining enterprises located in different regions of the Russian Federation is important for improving the efficiency of interregional clusters. And the development of inter-regional relations is the most important priority of regional strategizing.

Taking into account the analysis of geographic information systems, the authors proved the relevance of creating a platform for searching the potential partners in order to build value added chains in different regions, taking into account their specialization.

The analysis of the "Photonics" interregional cluster effectiveness proved its importance as a tool for regional strategizing, realizing the potential for the development of promising specialization of territories.

Scientific justification for determining effective interregional clusters can become a significant factor in stimulating economic activity in the territories of individual regions, as well as a factor in the development of the entire national economy.

Abstract

The aim of the work is to study the convergence of regions according to the main socio-economic indicators, taking into account digital aspects and spatial location. The following hypothesis is tested in the article: there is a conditional and unconditional β-convergence of the readiness levels for digital transformation as regards the social and housing infrastructure in the Russian regions. To test for unconditional β-convergence, the empirical model specification proposed by Barro and Sala-I-Martin. The most important parameters of the social infrastructure development, such as health care and housing and communal services, taking into account the spatial location of the regions, were chosen as the analyzed indicators. The authors used estimation of β-convergence for the data of the period from 2009 till 2017. Global and local indexes of Moran's spatial autocorrelation were calculated, spatial scattering diagrams were constructed by the analyzed parameters based on the tools of spatial econometrics. The study used a matrix of inverse distances and a boundary matrix of weights. A regional unconditional β-convergence of the healthcare level was revealed, as well as a positive global spatial autocorrelation in terms of per capita living space for all analyzed periods. Based on the study, it was concluded that, firstly, the distribution of the selected indicators of regional activity is determined by their spatial location, and secondly, the regions, demonstrating convergence processes, are ready for a full digital transformation.

Keywords: Spatial Heterogeneity; Digitalization; Convergence; Interregional Inequality; Empirical Estimates.

Introduction

The digital transformation of the economy, launched during the fourth industrial revolution, is designed to form a new infrastructure in which "smart" objects with artificial intelligence systems will dominate. The creation of so-called "smart" cities is already on the agenda, the concept of creating which represents a managerial approach, which made the city management system flexible and adaptive to people. The main goal of building smart cities is to improve the quality of life of citizens, and not the race for inventions. Therefore, to implement the innovative practice of the "smart city", the government of the Russian Federation approved the Project of Urban Economy Digitalization as a part of the national project "Housing and Urban Environment" (Vasilenko and Egorova, 2019).

The introduction of modern intellectual solutions in various spheres of public life, including health care, housing and communal services, as well as the expansion of the distance interaction scale in the field of education, will reduce the importance of location factors and physical distance, and therefore will inevitably lead to a spatial organization transformation of the economy.

At the same time, it has already been proven that the penetration of broadband into the economic activity of economic entities significantly decreases with the physical increase in the size of their localization territories (Cruz-Jesus et al., 2012). Therefore, the urgent problem to study the prospects for the social infrastructure transformation under the influence of digitalization in relation to large territories remains, such as the USA, Canada or Australia, where access to reliable and fast digital connections is experiencing intermittent failures, remains actual (Freeman et al., 2016). The territory of the Russian Federation is even more difficult in this regard to ensure reliable operation of ICT and the quality of communication

At present, the issue of spatial heterogeneity and interregional inequality is acute in Russia. Thus, interregional differentiation in terms of the levels of spatial socio-economic development, living standards of the population, the level of healthcare development and education, is one of the highest in the world (Dutta and Lanvin, 2019). The state

Cite this Article as: Elena V. Kozonogova and Julia V. Dubrovskaya "Assessing the Convergence of the Social Infrastructure Development in the Context of the Economy Digitalization: Spatial Analysis" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

is trying in various ways to solve this problem. For example, the goal of the Strategy for Spatial Development of the Russian Federation for the period until 2025 is to reduce interregional differences in the level and quality of life of the population, as well as accelerate the pace of economic growth and technological development. However, in official statistics it is difficult to find information on why some regions are developing faster than others, and vice versa.

In our opinion, the geographical position of the region plays an important role. Extensive empirical evidence suggests that the rates of economic growth in different regions of one country vary significantly. At the same time, there is probably a spatial correlation between regional growth rates (Ivanova, 2014). At the same time, not only the volume of mineral deposits or the presence of access to the sea, but also the proximity of the federal unit with other entities, as well as the distance to, possibly, more developed units due to the different activities and structure of economic processes are important. The study of the influence of the region's neighbors on the growth rate is of particular research interest.

Thus, the aim of the work is to study the convergence of regions according to the main socio-economic indicators, taking into account digital aspects and spatial location.

Methods

The β-convergence model suggests that there is a negative relationship between the initial level of the indicator under study and its average annual growth rate over a certain period. To test for unconditional β-convergence, the empirical model specification proposed by Barro and Sala-i-Martin (Barro and Sala-i-Martin, 1991):

$$\frac{1}{T}\left(\ln y_{i,T} - ln\, y_{i,0}\right) = \alpha - [\ln(y_{i,0})][(1 - e^{-\lambda T})/T] + \varepsilon_i, \quad (1)$$

where $y_{i,0}$ — value of the studied indicator in region i in the initial period (2009), $y_{i,T}$ — value of the studied indicator in region i in the last considered period (2017).

To evaluate the convergence rate of regions by the considered indicator (λ), it is necessary to estimate the coefficient β in the regression $\frac{1}{T}\left(\ln y_{i,T} - ln\, y_{i,0}\right) = \alpha + \beta \ln(y_{i,0}) + \varepsilon_i$, and then we can count:

$$\lambda = -\frac{\ln(1+\hat{\beta}T)}{T} \quad (2)$$

If λ (or $\beta < 0$), then this means that regions with a lower value of the studied indicator grow faster than regions with a higher income, i.e. unconditional β-convergence takes place.

Unconditional β-convergence implies that all regions strive for a single path of balanced growth. Conditional β-convergence suggests that different regions have different balanced growth paths that are determined by specific regional development factors (Kolomak, 2010), including factors of the spatial arrangement of regions relative to each other. Consequently, the basic convergence model is limited because it does not take into account interdependence between regions. Recent studies of scientists (Ertur et al., 2006; Rey and Montouri, 1999) show that the non-inclusion of the spatial relationship between regions in the model can lead to ineffective and / or biased evaluation of the coefficients. Therefore, to take into account the interdependence between the regions, it is necessary to take into account their position relative to each other.

To verify the assumption that the distribution of the regional indicators considered by us is explained by the spatial arrangement of the regions, we will use the Moran global spatial autocorrelation index.

Thus, according to our assumption, the rate of convergence of regions according to the studied indicator will depend on their spatial location: the rate of convergence across the country will be lower compared to the rate of convergence of groups of regions with similar values of the studied indicator.

The study covers the period from 2009 to 2017. The objects of the research are the subjects of the Russian Federation.

Results

Evaluation of unconditional beta convergence models in Russia for 2009–2017 was carried out in the statistical package Stata 13. Evaluation of models where the logarithm of the growth rate for the living area per 1 inhabitant acts as the endogenous variable, the logarithm of the growth rate of the population per doctor for the period 2009-2017 gave the result presented in the table 1.

Table 1: Evaluation of unconditional convergence models for 2009-2017

Variable	Coefficient	Standard error	t-statistics	p-value
The logarithm of the growth rate for the living area per 1 inhabitant (ln(home_2017/home_2009))				
Const	0.0229814	0.0153946	1.49	0.140
Ln(home_2009)	-0.0028684	0.0049442	-0.58	0.564
Coefficient of determination				0.0044
Logarithm of population growth rate per doctor (ln(doc_2017/doc_2009))				
Const	0.1688025	0.024387	6.92	0.000
Ln(doc_2009)	-0.0315033	0.0045404	-6.94	0.000
Coefficient of determination				0.3847

As it can be seen from the obtained values, there is no statistically significant relationship between the GRP growth rate, as well as the growth rate of the area of residential premises per 1 inhabitant and their initial state. Therefore, it is impossible to conclude that there is unconditional convergence, or divergence. However, a statistically significant relationship was found between the growth rate in the variable "population per doctor" and their initial state. Consequently, between the regions of Russia there is convergence in terms of the healthcare development.

The results of calculating the convergence rate and the time to overcome half the distance separating the regional economy from the balanced growth trajectory are presented in table 2.

Table 2: The results of calculating the rate of convergence and the time to overcome half the distance that separates the regional economy from the balanced development trajectory

Indicator	Convergence rate λ, %	Time to overcome half the distance hl, year
Population per doctor	3.7	18.7

According to the data obtained, in about 19 years, the regions of the Russian Federation will go half way to the path of balanced growth.

Next, we will check whether the distribution of the regional activity indicators studied by us is explained by their spatial location. For these purposes, we will use the Moran global spatial autocorrelation index. The following matrices were used as weights: the binary neighborhood matrix (Wn) and the inverse distance matrix (Wd).

Table 3: Dynamics of the global Moran index by the studied indicators

Year	Living area per 1 inhabitant		Population per doctor	
	Wd	Wn	Wd	Wn
2009	0.087***	0.378***	-0.112***	-0.060
2010	0.089***	0.385***	-0.101***	-0.052
2011	0.085***	0.371***	-0.100***	-0.044
2012	0.097***	0.380***	-0.100***	-0.004
2013	0.109***	0.343***	-0.093***	0.020

2014	0.101***	0.363***	-0.104***	0.011
2015	0.086***	0.358***	-0.086**	0.057
2016	0.090***	0.374***	-0.080**	0.074
2017	0.115***	0.400***	-0.064	0.093

*Note: ** p<0,05; *** p<0,01*

The results of the calculation of the global Moran index indicate the presence of a positive global spatial autocorrelation in the area of living quarters per 1 inhabitant for all studied periods. According to the indicator "Population per doctor", negative spatial autocorrelation was found when using the matrix of return distances in 2009-2016.

Comparing the results described in tables 2 and 3, we note that if there is regional convergence, then according to the indicator under study, there will be no "constant clusters" during the study period of time (the presence of statistically significant spatial autocorrelation).

For each studied indicator, we divide the regions into 4 groups according to spatial scatterplots (Fig. 2).

a) Living area per 1 inhabitant, 2017 (Wn)

b) Population per doctor, 2016 r. (Wd*)

Figure 2: Spatial diagrams of scattering by analyzed indicators

Check the convergence of the analyzed indicators in homogeneous groups of regions (Table 4).

Table 4: Evaluation of conditional convergence models for 2009-2017.

Index	Quadrant of spatial dispersion diagram	Number of regions	Regression coefficient $\widehat{\beta}$	Convergence rate λ, %	Time to overcome half the distance hl, year
Living area per 1 inhabitant	High-High	34	-0.0271243**	3,11	22,29
	High-Low	4	-0.0268443	-	-
	Low-High	7	-0.0306938	-	-
	Low-Low	30	0.0048247	-	-
Population per doctor	High-High	29	-0.0492863***	6,51	10,64
	High-Low	6	-0.0878388	-	-
	Low-High	28	-0.0433167***	-	-
	Low-Low	12	-0.0350628	-	-

The analysis showed the presence of conditional β-convergence in all studied parameters. The convergence rate of the "rich" regions in terms of the "Population per doctor" indicator exceeds the country value, while the "rich" regions will go half the distance separating their level of health care from its stable state in about 10 years, when as a region all countries have more than for 18 years. In terms of housing provision, there is no convergence across the country as a whole, however, among the group of "rich" regions, the convergence rate is only slightly more than 3%.

Thus, on the basis of our study, we can conclude that the distribution of the indicators of regional activity that we are studying is determined by their spatial location.

Conclusion

Despite the awareness both of the scientific community and the leaders of individual states about the importance of digital changes, so far most researchers do not have a clear understanding of the socio-economic consequences happen due to modern technological innovations and what measures should be taken by authorities in order to increase the welfare of the population in the context of the ongoing spatial transformation.

In addition, the groundless declaration of the need for the widespread dissemination of information and communication technologies is not based on a scientific study of the spatial organization of territories in terms of their readiness for digitalization. In particular, there are no comprehensive studies defining the possibilities and directions of improvement on the basis of ICT development of such basic subsystems of the spatial organization of regions as housing and communal services and the social infrastructure system.

An attempt is made in the issue to evaluate the readiness of the social and housing infrastructure of the regions for digital transformation. Global and local indexes of spatial autocorrelation of Moran were calculated, spatial scattering diagrams were constructed by the analyzed parameters based on the tools of spatial econometrics. As a result, a regional unconditional β-convergence of the level of health care was revealed, expressed in the indicator "Population per doctor". The results obtained also indicate the presence of positive global spatial autocorrelation in terms of the living area per 1 inhabitant for all analyzed periods. Based on the study, we can conclude that, firstly, the distribution of the selected indicators of regional activity is determined by their spatial location, and secondly, the regions of Russia, demonstrating convergence processes, are ready for a full-fledged digital transformation.

Homelessness in The European Union Law - Between Poverty and Social Exclusion

Ewelina CALA-WACINKIEWICZ

Abstract

The main purpose of the research is to demonstrate effectiveness (of lack thereof) the European Union's legislative activity in the area of preventing (limiting) homelessness. Implementation of this purpose will be reaffirmed by confirming or falsifying the research hypothesis according to which without firm legislative activity to combat homelessness (*sensu stricto* approach) and without combating poverty and mitigating social exclusion of certain social groups (*sensu largo* approach), it will not be possible to limit homelessness effectively, which is one of the most telling manifestations of undermining the dignity of the person. Homeless persons, as a social group which requires special legal protection, need support of states and the international community. Without their systemic action intended to assess properly in normative terms the rights and freedoms of homeless persons, which are based on regulations dedicated to this social group *explicite*, it will not be possible to counteract this occurrence or, all the more so, to protect their rights.

Verification of the above hypothesis will outline the scope of further reflections carried out on the basis of the analytical method and the method of interpretation of applicable law, supported by the statistical method.

Keywords: Homelessness, Poverty, Social Exclusion, Homelessness, European Union Law.

Introduction

Saying that homelessness is a form of violation of human rights is like saying that due to its immanent coupling with poverty it undermines the inherent dignity of every person which is a fundamental category of human rights. There is no doubt that dignity as such is not only the essence of the person, but most of all it is a source of human rights and freedoms, afforded to anyone, regardless of the state authority or any other political circumstances. The concept of dignity deriving from Latin "dignitas" is nothing else but "a sense of one's own worth and respect for oneself" (Słownik Języka Polskiego PWN). As seen by V. Niemi and E. Ahola "homelessness is a difficult social problem. It is an extreme violation of human rights and basic human needs" (Niemi, Ahola, 2017, p. 39).

Even due to the lexical meaning of the concept of dignity, it is reasonable to say that homelessness *per se* is in opposition to human rights. Therefore, no specific research or extended explications are necessary to conclude that the fact of depriving homeless persons of rights afforded to them and of the possibility to protect these rights, in its essence undermines human dignity. Human rights have a specific function which comes down to the obligation, encoded in them *implicite*, to protect human dignity. Therefore, as it is seen by S. Zieliński, dignity of the person should be a foundation of interpretation of all human rights, as well as all regulations which are intended to implement human rights and freedoms in the system of the law. Thus, this leads to a conclusion that in consequence the applicable and planned regulations alike should be subject to a test of compliance with the principle of human dignity (Zieliński, 2019, pp. 123-124). In this approach dignity is not only a certain abstract notion, but - which is especially valuable from the normative perspective - a principle which is an axiom of democratic states and their legal orders.

The above solutions of an introductory nature substantively outline why now protection of human rights *in genere* is so crucial, and also (or perhaps most of all), protection of these social groups which for various reasons are doomed to be socially excluded, including homeless persons. Support of this statement may be found in global statistical summaries, according to which "no less than 150 million people, or about 2 percent of the world's population, are homeless. However, about 1.6 billion, more than 20 percent of the world's population, may lack adequate housing" (Chamie, 2017). The said exemplification of the scale of homelessness throughout the world is unfortunately accompanied by European trends. As emphasized by the European Parliament, "an estimated 700.000 people were

Cite this Article as: Ewelina CALA-WACINKIEWICZ "Homelessness in The European Union Law - Between Poverty and Social Exclusion" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

homeless in the EU in 2019, with numbers rising across Europe, except in Finland, which reported a decrease of 45%. Latvia saw an increase of 389% between 2009 and 2017, and homelessness in Ireland increased by 203% between 2014 and 2018" (Commission statement, 2019/3013(RSP)). These statistics, therefore, make it legitimate to generalise that not only the mere essence of the problem of homelessness is particularly important (the fact of being homeless), but the scale of the occurrence is also concerning. If, additionally, we were to take into account the temporal element, as this year it will have been 10 years since the European Union announced 2010 to be the Year for Combating Poverty and Social Exclusion (Decision No 1098/2008/EC), the above factors (substantive, statistical and temporal) are a sufficient stimulus to undertake actions dedicated to homelessness. It needs to be remembered that on the ground of European Union's legislation, the category of homelessness is presented usually jointly with the issues of poverty and social exclusion. These categories in their essence are interrelated in terms of cause and effect, which is clearly evident.

Given the above, research aiming to outline to what degree (and in what scope) legislative activity of the European Union in terms of preventing (limiting) homelessness is effective and to what degree there is still room for things to be done must be considered particularly desirable. Depriving homeless persons of effective legal protection affects their legal and human status. There are no doubts that homelessness is one of these social problems which cannot be reduced without effective and firm systemic actions from states and the international community.

The relation of homelessness with poverty and social exclusion presented above has its *ratio* in the approach of the European Union itself, which addressed the issue in question. The European Commission emphasized that "homelessness and housing deprivation are perhaps the most extreme examples of poverty and social exclusion in society today. Although access to affordable accommodation is a fundamental need and right, guaranteeing this right still represents a significant challenge in several Member States Developing appropriate and integrated responses, both to prevent and tackle homelessness, shall remain an important element of the EU's social inclusion strategy" (point 3.1 of the Communication). What is interesting, the European Union invokes the category of "social inclusion" in the context of homelessness, which convenes with the noticeable (recently) trend of presenting certain categories in a positive approach (inclusion of socially excluded persons). Such perception of specific phenomena gradually pushes out the negative narrative which talks about social exclusion as such, though unfortunately the latter has a rather founded place in the said perception and social awareness.

Therefore, if one were to assume that homelessness and housing exclusion (housing deprivation) are one of the most severe forms of poverty, leading to lasting marginalisation of these persons in society, the proclaimed assessment of efficiency of preventing (limiting) homelessness by the European Union must be done not only on the basis of the analysis of regulations focusing on homelessness *explicite*, but also those which in their content address the subject-matter of poverty and social exclusion. This observation allows outlining a substantive framework of his study, bringing reflections devoted to the discussed categories down solely to the ground of regulations adopted by the European Union, both those of a binding nature and those which do not have such a status (the example of which includes the described so-called soft law which greatly shapes the matter in question).

The said framework of the study, determining the scope of research, allows specification that their main goal is to recognize the efficiency (of lack thereof) of legislative actions of the European Union in terms of preventing (limiting) homelessness. Implementation of this purpose will be reaffirmed by confirming or falsifying the research hypothesis according to which without firm legislative activity to combat homelessness (*sensu stricto* approach) and without combating poverty and mitigating social exclusion of certain social groups (*sensu largo* approach), it will not be possible to limit homelessness effectively, which is one of the most telling manifestations of undermining the dignity of the person. Homeless persons, as a social group which requires special legal protection, need support of states and the international community. Without their systemic action intended to assess properly in normative terms the rights and freedoms of homeless persons, which are based on regulations dedicated to this social group *explicite*, it will not be possible to counteract this occurrence or, all the more so, to protect rights of homeless persons.

Verification of the above hypothesis will outline the scope of further reflections carried out on the basis of the analytical method and the method of interpretation of applicable law, supported by the statistical method.

Given that the issue of homelessness has not been the subject of considerable scholarly or judicial analysis and that the literature presents this category in various semantic concepts (Pawlik, 2015; Luba, Davies, Johnston, Buchanan, 2018; Robson 1994; Stoner, 1995), quite a concise definition of this notion was adopted for the purpose of this study. It involves a "literal" understanding of the concept of homelessness and brings its essence down to the lack of "a roof over one's head" or not having "one's own" housing (I. Kaźmierczak-Kałużna, 2015, p. 21), without going into details such as reasons for being homeless, duration of this homelessness or types for homelessness, with the underlying diverse legal and factual situation of homeless persons. For this reason, the issues associated with the fact of having residence in the territory of one of the EU states or with the right to housing as such cannot be omitted in this study.

It needs to be remembered that homelessness "has become one of the biggest social problems facing the world in the twenty-first century" (Alowaimer, 2018, p. 1).

Homelessness in binding European Union law

Homelessness is a normative category which does not always feature independently in the European Union's primary legislation. Sometimes EU treaties only refer to the other discussed categories, i.e. poverty and social exclusion, which is why it is so important to present at the outset the interrelations between then and to prove that they are of interest to the European Union. In order to make the analysis comprehensive, it is worth remembering that the problem of homelessness is emphasized particularly in the context of the right to housing or the requirement of having residence in the territory of one of the EU states, which shall be discussed later.

The above-mentioned assumptions are to a certain degree reflected in the Treaty on European Union (hereinafter TEU) which is part of the Treaty of Lisbon amending the Treaty on European Union and the Treaty establishing the European Community, signed at Lisbon, 13 December 2007. Therefore, the need to eliminate poverty was enumerated among the goals of the European Union, i.e. in Article 3(5) TEU. According to it, in external relations the Union upholds and promotes its values and interests and contributes to the protections of its citizens, contributing i.a. to eradication of poverty and to the protection of human rights. The provision was expanded in the part of the Treaty devoted to internal activity of the European Union, its Article 21(2)(d) to be precise. It states that the Union defines and pursues common policies and actions, and works for a high degree of cooperation in all fields of international relations, in order to i.a. foster the sustainable economic, social and environmental development of developing countries, with the primary aim of eradicating poverty. The Treaty (Article 3(3)) enumerates combating social exclusion and discrimination and promotion and protection of social justice among the aims of the European Union. However, the Treaty on European Union does not refer to homelessness directly, it does not address the right to housing or other issues associated with residence within Member States of the European Union either.

The case is similar in the second treaty that forms the Treaty of Lisbon, i.e. the Treaty on the Functioning of the European Union (hereinafter: TFEU) Its Article 208(1) points out that the main objective of the Union's cooperation policy involves reduction and, in the long term, eradication of poverty, whereas Article 9 TFEU stipulates that in defining and implementing its policies and activities, the Union takes into account i.a. requirements linked to the fight against social exclusion. The discussed category is also addressed in Article 151 of the Treaty, which invokes the combating of exclusion under the framework of the European Union social policy. However, it is worth specifying that combating social exclusion was inscribed by means of Article 153(1)(j) TFEU in the framework of competence of individual Member States whose activities the European Union is obliged to support. Moreover, which cannot be overlooked, the Treaty conditions the array of rights afforded to the Union's citizens on having residence in one of the EU countries. This is seen in the following provisions of the Treaty, in which the enumerated rights each time are subject to having residence in one of the EU Member States: a right of access to documents of the Union's institutions, bodies, offices and agencies (Article 15(3) TFEU), the right to vote and to stand as candidates in elections to the European Parliament (Article 20(2)(b) and Article 22(2) TFEU), the right to address a petition to the European Parliament (Article 227 TFEU) or the right to file complaints at the European Ombudsman (Article 228 TFEU).

In primary legislation of the European Union direct references to the phenomena in question may also be found in the Charter of Fundamental Freedoms appended to the Treaty of Lisbon. Its Article 34(3) stipulates that in order to combat social exclusion and poverty, the Union recognizes and respects the right to social and housing support to ensure, in accordance with principles established in the Union's law and national legislations and practices, life in human dignity. However, one cannot overlook the fact that the Charter refers multiple times to the requirement (obligation) to have residence, which inspires a reflection about homeless persons. It is done so in the case of rights afforded to the citizens of the European Union, i.e. the entitlement to social security benefits and social services (Article 34(1) of the Charter), the right to vote and to stand as a candidate at elections to the European Parliament (Article 39 of the Charter), a right of access to documents of the institutions, bodies, offices and agencies of the Union (Article 43 of the Charter) or the right to petition the European Parliament (Article 44 of the Charter).

In the Union's secondary legislation, the categories of homelessness, poverty and social exclusion are invoked directly, as seen in the example of Regulation (EU) No 223/2014 of the European Parliament and of the Council of 11 March 2014 on the Fund for European Aid to the Most Deprived. When outlining the objectives of the European Union, the Regulation (Article 3) names the need to reduce the number of persons at risk of poverty and social exclusion by at least 20 million. According to its provisions, the Fund should contribute to alleviating the worst forms of poverty which most quickly result in social exclusion, such as homelessness, poverty among children and food shortages.

When it comes to combating poverty and social exclusion and also access of homeless persons to services relating to health care, employment and education, notice must be given to the provision of Regulation (EU) No 1304/2013 of the European Parliament and of the Council of 17 December 2013 on the European Social Fund and repealing Council Regulation (EC) No 1081/2006, which, like the former Regulation, is an express form of the European Union's striving to reduce significantly the phenomena in question.

Homelessness in non-binding European Union law

The category of homelessness is also present on the ground of non-binding European Union law, which, as needs to be remembered, is rather diverse in its form and content. A brief analysis alone of legal acts adopted by EU institutions inspires a reflection that the category of "homelessness" occurs within them much more frequently than in the primary EU law, but more than anything in much more diverse semantic contexts.

It may be seen in the example of the European Parliament resolution of 14 September 2011 on an EU Homelessness Strategy. Pursuant to this resolution, homelessness was recognized as one of the most extreme forms of poverty and deprivation which has been showing growing trends recently and requires a comprehensive political approach. Its provisions are referred to in another European Parliament resolution on an EU homelessness strategy, resolution of 16 January 2014, which proves a certain consistency of the European Parliament in treating homelessness against other social problems as a priority.

A similar stand, though much more complex and multidimensional, was taken by the Committee of the Regions, which saw the role of local and regional authorities in taking practical and vigorous action to combat homelessness, understood as an extreme form of poverty and social exclusion. The Committee emphasized that homelessness afflicts individuals of various level of education, cultural background or previous economic circumstances. It is increasingly affecting women and children, who have often no power to change their situation. In the Committee's opinion, which cannot be disagreed with, homelessness, involving personal tragedies, impedes economic development of many countries. It also violates the fundamental rights of the individual and their human dignity and the right to control their own life (Opinion of the Committee of the Regions of 6 October 2010 on 'Combating homelessness').

It is also worth invoking the position of the European Economic and Social Committee of 27 October 2011 on 'The problem of homelessness' (own-initiative opinion), which clearly emphasized that policies to combat homelessness must be based on complete respect for human rights, which include the right to affordable, adequate housing. The Committee thus associated being homeless with violation of human rights by inability to ensure the right to housing and also noticed that although at the EU level there is no common functional definition of homeless persons and homelessness itself is diverse in personal and material terms (many types and groups of homeless), reasons for homelessness are also often complex and interrelated. In the context of the research hypothesis set out in the beginning, special notice is due to the Committee's observation that the existence of this right is a basis for initiating and developing effective policies to combat homelessness (Opinion of the European Economic and Social Committee). This thought should be borne in mind when formulating conclusions.

Summary

As has been shown in the research, on the ground of the European Union law homelessness does not often feature independently. Coupling it with categories of poverty and social exclusion expressed in the EU's legal acts (both binding and non-binding) complements it with normative content always where it needs to be particularly emphasized that without systemic actions intended to protect the homeless as a special social group, protection of their rights and freedoms will not be possible. Observations made in this study, therefore, allow one to confirm the research hypothesis formulated at the outset which stresses the need for firm legislative actions in terms of combating homelessness.

However, it needs to be highlighted that primary and, as a rule, secondary legislation of the European Union (which has primacy in application and a direct effect on the ground of legislations of individual Member States) do not sufficiently protect homeless persons. The normative requirement (obligation) to have residence in the territory of one of the Union's states adopted on the Treaty ground (Treaty on the European Union, Treaty on the Functioning of the European Union and Charter of Fundamental Rights) is not only counter-productive in the context of protection of homeless persons, but more than anything - having the status of a *sine qua non* requirement - deprives homeless persons of any power to exercise the rights and benefits afforded to them. It is not permissible to grant rights on the one hand, and on the other hand to formulate the conditions for exercising them in such a way that legally and factually this implementation is not possible.

Absence of residence as such predetermines that a homeless person cannot exercise - in the context of the analysed provisions - an array of rights stipulated for in the European Union law, implementation of which requires having residence. This, in turn, does not only lead to discrimination of homeless persons (and it is discrimination on the ground of the European Union law), but it also deepens their social exclusion, contributing to increased poverty. Taking this as the basis, it needs to be postulated that firm legislative actions should be taken and that this fundamental problem should be focused on. Without normative estimation of rights and freedoms of homeless persons combating their problems will not be possible. This, in turn, referring to the test of compliance of regulations with the dignity of the person invoked in the beginning, will result in a conclusion that homelessness, constituting a form of violation of human rights, undermines the inherent dignity of every person. This is why it is so important for regulations which undermine rights of homeless persons to be amended as soon as possible since they do not meet the requirements of the said compliance test. Dignity is not only a foundation of human rights, but, in this approach, it is also an element of harmonization and ordering of legal norms that shape the system of the law of the European Union.

The Most Common Myths and Challenges Connected to Knowledge Management – Between Theory and Practice

Teodora PÎRȘOI

PhD. Student, Craiova, Romania, t.pirsoi@gmail.com

Abstract

The objective of the current article is to emphasize and interpret the major myths that have developed over the recent years regarding knowledge management, as well as the fundamental challenges that the executives have to overcome in order to succeed in leading a successful organization. The evaluation is carried out by analysing and debating the main differences between theory and practice through the means of both previous research works and particular experiences. The findings have a peculiar importance in building up a fair overview concerning the authentic meaning of knowledge management and the challenges connected to the process of applying its main principles within a firm. The conclusions prove that knowledge management still represents a huge challenge for the contemporary managers who are looking for attaining a competitive advantage by creating, developing and exploiting their organizational knowledge.

Keywords: knowledge management; knowledge creation; managerial challenges; managerial myths; intellectual capital.

Introduction

Ever since 1597, the famous philosopher Francis Bacon stated the fact that *knowledge means power*. His assertion has certainly withstood the passage of time and its significance has become progressively valuable in the last decades. The concept of *knowledge* might seem common at a first glance, but, from the scientific point of view, it surely has a considerable number of diverse and complex meanings. From a managerial perspective, short while ago, knowledge started to be considered and understood as one of the most important resources within a company.

Peter Drucker, the so-called father of management thinking, in order to define a specific category of activities, used the avant-garde notion of knowledge work for the first time in 1959. This peculiar advanced division of workers primarily gathered scientific researchers, programmers, systems' analysts, academic professionals and so on. The importance of knowledge constantly and substantially has increased in the last years of the 20th century, as a newly re-discovered managerial resource, to the extent of becoming the most influential capital for an executive.

For nowadays managers, knowledge management (KM) represents at the same time an unique growth opportunity and an utmost challenge. Alongside with the unequivocal advantages achieved by implementing the main principles of KM within a company, the one running an organization gets to deal with many threats that need to be taken care of. The myths that have arisen over the last century actually illustrate, in a precise way, some of the most frequently debated topics concerning the typical transformations that such a managerial behaviour can produce.

The opinions according to which one would be able to guarantee the most appropriate data and information usage, sharing and/ or exploitation, make the best use of the employees' experience or store the intellectual capital, through the specific means and methods of KM, have been partly invalidated by the results of several previous research studies. Carol Hilderbrand (1999), Yogesh Malhotra (2000) or Matthew Parsons (2004) are only a few of the researchers within the KM field who brought into attention these ideas and discussed their certain probability of realization. Their preliminary work represents, however, only a limited segment of a far more complex research process, essential to be conducted in order to comprehend KM's challenges fully.

The main objective of the present research article is to carry out an objective analysis of the most common myths that have evolved throughout time about knowledge management (Burlea-Schiopoiu, 2007). By utilizing the critic analysis as the main research methodology, the current report outlines not only some of the most prevalent misunderstandings of the concept itself, but also the particular challenges that an executive needs to overcome through the medium of his/ her managerial skills and behaviour. In the contents of the paper, we investigate the level of reality of each perception on the given subject and discuss the most appropriate ways of conducting a business within the modern economy.

The first section of the study depicts the preeminent theories concerning the knowledge creation and its best usage for the benefit of the contemporary organization. The approaches used for exploiting data and information have an indisputable role in the managerial process, so we are going to focus on the most constructive methods of taking advantage from these unique resources. The theoretical framework will also be oriented towards the main connection existing between the basic knowledge sources and the company's performance, that is to say the intellectual capital.

Is there any managerial pattern that could guarantee the best usage of the information collected or accumulated experience? Does the classic strategy of the right time, the right person in charge or the right place truly work in case of knowledge management? Is it possible to store human intelligence or professional experience through the means of knowledge management? Which could be the greatest challenges one would encounter when adopting this innovative managerial behaviour? To answer these questions, we have employed plenty of scientific works based on a qualitative research of KM and its fundamental implications.

Depending on the observations of the current analysis, we establish a framework for the modern organization based on knowledge, within which the intellectual capital has a leading position. Both the operational and strategic objectives are to be achieved through the means of intelligence - innovative concept that defines the work based on awareness, continuous learning, observation, knowledge, expertise and complex interpretation of all of the above.

Knowledge management (KM) development

Ever since 1911, Frederick W. Taylor asserted the fact that, from the scientific point of view, the fundamental objective of management should be to achieve the maximum prosperity for the employer as well as for each employee. Due to this reasoning, a considerable number of research works were centred on the idea of understanding the concept of *prosperity* as *the development of every branch of the business to its highest state of excellence*. A firm's prosperity should not be perceived only as the significant material gains of its manager, but also as learning the most convenient way of exploiting its tangible and intangible resources, so that its growth can become permanent. Likewise, the employees' benefits should not be exclusively focussed on earning higher wages, but on their development, in order to reach their maximum point of efficiency.

The attitude of each employee towards his/ her professional duties and the principles on which Maslow developed his hypothesis regarding the pyramid of needs, determined Douglas McGregor to advance two completely antagonistic theories, namely X and Y theory. The first one points out the managers who are likely to develop a pessimistic view on their employees, presuming that the workers are naturally demotivated and/ or generally detest their job responsibilities. X theory's main principles are commonly expected to be applied within the businesses involving repetitive tasks and/ or staff members avoiding to respect their obligations, circumstances under which the managers are typically required to adopt a "carrot and stick" approach. This certain way of managing a firm's activity is based on a large number of controls, supervision at every step of the process and forced work delivery, strategy that often calls for according additional rewards in order to complete the specific tasks.

On the other hand, managers who have a positive opinion regarding their people, so that the management style used can be certainly described as a participative one, characterize Y theory. The employees are generally considered to be self-determined, work on their own initiative and take full responsibility of their actions, in which case the obstacles are overcome in an efficient and creative way. Given the fact that this type of management is generally associated with little need of direction, it has become more and more suitable among the modern organizations (Burlea-Schiopoiu and Idowu, 2016).

Throughout the years, most of the research studies on the matter have concluded that a more convenient alternative of efficiently administrating the modernized societies is to combine essential principles of the two theories mentioned above. The successful manager is the one who succeeds in adapting his/ her behaviour towards the company's workforce capabilities, according to their involvement, experience and knowledge; for new starters there would certainly be needed a lot of guidance and strict controls of most of the process's phases, while in the case of experts, a

supervisor should allow them to work under their own initiative, so that the relation established between the two sides involved would be predominantly based on collaboration, not control.

Further studies on the issues of the intellectual capital (Drucker, 1959; Burduș and Căprărescu, 1999; Lazăr, 2002; Burlea-Șchiopoiu, 2003; Maslow, 2007) place the human resource, as part of the intellectual capital, on the very first place when it comes to the leading factors of the firm's development. Nowadays, the intellectual capital of any company/ institution is considered one of its most important resources. It practically represents the only real potential that a manager could benefit from, by creating and exploiting knowledge at the organizational level.

Ichijo and Nonaka consider that an authentic success of the contemporary organization can be determined exclusively by the extent to which its leaders succeed in forming and developing a reliable intellectual capital by creating and disseminating knowledge globally. The emphasis on the overall change of the business environment places the knowledge management among the essential measures that companies need to adopt and optimize in order to cope with the rapid changes generated by globalization. Thus, the managers of the new world have to identify, verify, confirm and, finally yet importantly, respect a series of principles of knowledge management, based on the intellectual capital had at their disposal.

The art of management has undergone many inherent transformations over time, knowledge management proving to be one of the recently individualized branches and, at the same time, intensely capitalized on the current entrepreneurial environment. In accordance with the principles that correspond to this particular way of managing resources, the organization came to be understood as a functional multilevel system, which is generally organized on two distinct dimensions, namely the leading subsystem (managerial level) and the managed one (human resource), solidly tied through a connection of synergetic nature.

Based on the permanent interaction developed between the two levels, the implementation of knowledge management and its principles ensures a continuous communication flow within the organization. The main responsibility of the human resource engaged in the production process is to disseminate truthful and verified data and information to the managers, complex resource that strengthens the administrators' capacity to adopt specific or general decisions, on the short, medium or long run. However, an optimal pursuance of the embraced decisions would not be possible in the absence of the three types of knowledge developed within the organization's internal and external environment, which are to say: implicit (social) knowledge, tacit (intuitive) knowledge and explicit (rational) knowledge.

KM fundamental principles

Starting from as early as 1998, Thomas Davenport perfected part of his research work in the management field by delineating five fundamental principles of the knowledge-based work. This peculiar scientific contribution has represented the cornerstone of the managerial behaviour adopted by the most successful executives up to the present day. Through analysing, understanding and assimilating the essential conditions, which have to be complied with in order to create and genuinely exploit organizational knowledge, the representative of the scientific community claimed that KM's leading lines are established in accordance to the following principles:

- Promoting awareness of the real value of the exploited knowledge, as well as the desire to constantly invest in the process of generating it
- Identifying the key workers who are responsible for capitalizing the pieces of knowledge that can be combined in a joint merger effort
- Highlighting the inherent creative potential, in the context of the complexity and diversity of ideas, considering the differences as positive elements, and not as potential sources of conflict, as well as avoiding the formulation of simple answers to complex questions
- Clarifying the need for constant knowledge resources, by the means of encouraging, rewarding and directing it towards a common goal
- Introducing new measures and benchmarks of success that fully reflect the authentic value of knowledge, compared to the simple balance sheet accounting procedure

KM myths and challenges

The administrative approach based on exploiting data, information and/ or personal experience, which is to say the actual process of implementing knowledge management within an organization has provided a large number of questions, myths and challenges. Aiming to fully comprehend the great majority of the emerged beliefs, the studies of

several experienced researchers (Hilderbrand, 1999; Malhotra, 2000; Parsons, 2004; Garfield, 2017; Nakamori, 2020) summarized the most frequently met myths, as it follows:

1. *Knowledge management's implementation could guarantee the usage of the right piece of information, to the right person, at the right time*

The most important goal to be set when implementing any type of management within an organization is to maximize the results, by using the minimum amount of resources. However, applying the fundamental principles of knowledge management in order to ensure efficient access and use of data and information, at the most appropriate time and by the most experienced worker is considered an unlikely approach. Since both the technological evolution and informational revolution were the main factors to influence the unprecedented market transformation, they also determined an indisputable development of knowledge management. Nowadays, through KM, managers are given the opportunity to develop their abilities of predicting upcoming challenges, by observing and analysing the past situations overcome and experience gained over time.

The functional characteristics of the modern entrepreneurial environment highlight the fact that the new business development model is characterized by a fundamental, but not a quantitative change, this current trait being in full accordance with the evolutions of the information age. The decision-makers of the contemporary organizations are increasingly using long-term business planning strategies, focusing on flexible forms of arrangements, through which they have the opportunity to prevent or counteract any potential challenges (Burlea-Schiopoiu, 2008). Under these circumstances, it is practically impossible for the company directors to manage the set of available resources by using system thanks to which they could permanently designate the most suitable person to solve a task or choose the right time to do it. The same applies when talking about their ability to certainly determine which data and information would have the highest potential for creating and capitalizing the knowledge required in order to overcome the given obstacles.

As probably, the most accepted of the myths that have arisen regarding knowledge management, the model based on applying the pattern of the right person in the right place at the right time proves to fail in guaranteeing an increased efficiency in real life. The perspective of the referred model remains predominantly just a theoretical pattern. Practically, most of the entrepreneurial environment representatives proceed to developing the capacity of constantly adapting to the new conditions of the profile markets, as well as to the consumer behaviour's evolutions.

The need for such a fundamental managerial change, based on the organizational knowledge has become increasingly visible within many important areas of activity at the national level. According to the Romanian national security experts, for instance, the management model recently adopted within the intelligence services has experienced a major paradigm shift, moving from the need to share action model to a more proactively one, characterized by the need to know. Thus, the paradox of the innovative metamorphosis of the managerial act is given by the very recognition of the reforming opportunities of the classical principles of this art of knowledge-based resource management, stated centuries ago by the English philosopher Francis Bacon (16th century), according to which science means power".

2. *Through knowledge management, both experience and human intelligence can be stored*

The informational and technological contemporaneity of the business environment gave managers the chance to store the data and information with a high potential of influencing the development/ improving the results of their company very easily. The main issue that remains though is the fact that, especially in the case of large corporations, the space occupied on the hard drive can reach values of terabytes. Even the most developed databases or software applications do not have the ability to store the whole complex of ideas generated because of the human intelligence contribution, that is to say the evaluations, analysis, synthesis and connections made through the previously stored information. In addition, over the time it has been demonstrated that the information itself is very subjective, in terms of each individual's perception, as it is usually appreciated in various different ways. According to Hilderbrand (1999, p. 51), the way in which data and information are understood by their intermediate or final beneficiaries can vary considerably depending on the context (context-sensitive).

The fact that each of its recipients can understand the same data and information corpus in a completely different way remains a universally valid truth, matter that explains the main reason why the competitive companies within the entrepreneurial environment are easily differentiated and classified by consumers. Conforming to the specialists in the field, one can interpret and exploit identical knowledge elements in an entirely particular manner at certain moments in time, compared to previous situations and depending on the context of their knowledge. The decisions made or the

actions taken because of their perception on peculiar informative aspects can experience a vast diversity, even for the same individual considered at various time circumstances.

Knowledge, defined as the sum of a person's understanding and experiences, is generally stored only in the form of static representations, which are usually characterized by a unique degree of veracity. The output obtained by using a certain volume of data and information is considered authentic and genuinely effective only in a number of situations, for the resolution of which the entire set of resources available at that time was managed. With every such challenge, regardless of the degree to which the organizational objectives are achieved, its human resource accumulates new experience and knowledge. Although the additional learning could be easily recorded within the appropriate databases, IT systems do not have the capacity to make the necessary connections in order to fully develop and individualize correct and complete solutions that might prove vital in case of the critical situations through which an enterprise can pass.

According to Lewis Platt (the executive director of Hellwett Packard), in the current century a company can achieve a certain success level only if its manager succeeds in capturing, storing and applying their employees' knowledge. The idea regarding the possibility of storing knowledge and/ or experience by using specific software programmes or hardware devices remains only a unconfirmed myth, since the availability and ability to capture, manage, analyse and evaluate data and information are features which exclusively characterize the human intelligence, the indispensable resource of any company. Despite the fact that, due to the recent technological progress, the aspects learnt as a result of the passed over experiences can be archived to some extent on various servers or databases, human intelligence remains the main source of creating knowledge and undoubtedly represents the cornerstone of knowledge management and its development for the next coming decades.

3. Human intelligence can be distributed / shared by implementing knowledge management

In accordance with the definitions attributed to the concept of knowledge management since its early stage of individualization, one of its main characteristics has been established to be represented by the distribution/ share of knowledge within the organizational team. The opinion above is mainly promoted by a significant number of specialists within the field (Davenport and Prusak, 1998; Ichijo and Nonaka, 2006; Burlea-Schiopoiu, 2009; Drucker, 2012; North et al., 2018), but it should not be mistaken by a potential possibility of sharing human intelligence as being assured by implementing the scientific management model based on knowledge.

The idea of sharing the human intelligence tends to be conventionally refuted given the above-mentioned principle regarding the impossibility of storing and/ or transferring knowledge, understood as the ability of each individual to identify, analyse and exploit the resources available at a certain moment in time. Even though the members of a team can surely take advantage from the experiences shared, enriching their knowledge, in case of a future problematic situation, each of them will generate distinct ideas and solutions, regardless of having the same information input. The counterstatement of the hypothesis regarding the managerial ability to intuit who is the most suitable employee to solve certain tasks and which is the optimal data and information needed in order to achieve his goal, as a result of implementing knowledge management represents an additional counter-argument of the idea of the possible human intelligence sharing process (Burlea-Schiopoiu et al., 2017).

One of the most important efforts carried out in order to develop the organizational knowledge through the managerial act is to entirely concentrate the information resources, whether primary or processed during similar situations, which were previously overpassed, in a common database, accessible to all team members. However, several experiences related to this practice have shown both the contemporary entrepreneurs and researchers that, unlike knowledge, human intelligence has a unique character of singularity, which is impossible to be virtually shared, regardless of the team members' degree of involvement in the processes performed with the aim of achieving a common goal (Burlea-Schiopoiu and Remme, 2017).

According to the idea advanced by Hilderbrand (1999, p. 50) and retaken by Malhotra (2000, p.11), the major advantages of implementing knowledge management within any organization are unquestionably represented by the creation and substantiation of a common vision, namely the use of the newly developed technologies, by focusing on increasing the firm's efficiency. The researchers also emphasized over the fact that the entire information set can be archived using the most modern technologies in the field, but these "repositories of knowledge" continue to be static and, most often, taken out of context, since the data storage mechanisms do not have the capacity to renew existing knowledge or to create new ones in the absence of human intelligence.

By ensuring a correct and multilateral managerial approach, the knowledge acquired during the specific activity development within an organization can generate a real benefit and guarantee a competitive advantage on the market. Still, the two benefits cannot be earned in lack of human intelligence, indispensable intangible resource within the process of any society's development. As knowledge management represents a scientific branch in full expansion, the specific strategies developed so far are mainly based on its fundamental principles, which are likely to confront plenty of interpretations, criticisms and challenges on the medium and long run. The only possibility to confirm the veracity of the existent myths regarding the advantages and disadvantages conferred by its implementation depends on each entrepreneur and their degree of reluctance or openness towards innovation.

Drucker (1997), Davenport (2005) and Nakamori (2020) believe that knowledge management's implementation can provide the advantages of both rapid and continuous growth, but it also implies several potential inconveniences or difficulties. This factors mishmash explains the alternation of progress or decline periods in the life cycle of a company. Yoshiteru Nakamori (2020, p. 72) retakes the idea originally issued by Thomas Davenport (2005, p. 43) regarding the so-called decline of knowledge management and its main triggers, analysing the whole process through databases and information stored in order to provide the raw material needed in order to create knowledge. The two researchers' opinion underline the idea according to which during its existence on the market, any economic entity can accumulate knowledge in all areas adjacent to the activity performed. In other words, contemporary managers are given the opportunity to gain knowledge both as a result of observing the socio-economic behaviour of their competitors and/ or the evolution of the consumer preferences, as well as the effect of exploiting their own "lessons learned" or using information resources such as best practices.

Despite the benefits secured by adopting knowledge management as an essential tool for organizing and conducting specific activities within an organization level, whether for each individual or for a whole team, the beginning of the 21st century revealed a significant number of cases where its implementation was not a full success. According to Davenport (2005, p. 44), the main reasons why some companies have experienced a partial fiasco when applying the above mentioned administrative method can be summarized by the following aspects:

- Insufficient physical time which is needed by the employees endowed with a significant level of intelligence to systematically record and organize the knowledge created as a result of the work and efforts;
- The complexity and difficulty in using archives and databases, amid the assiduous storage of all available information resources, respectively the uselessness of this huge volume of data, if the company in question has reduced its capacity or area of expertise.

The contemporary managers can successfully complete the prevention or counteraction of these risks / challenges' materialization by using certain alternative techniques in order to improve/ increase intellectual productivity, the level of operational efficiency, as well as the degree of knowledge sharing process. Considering the studies developed by certain researchers within the field (Davenport, 2005; Nakamori, 2020), some of the most practical techniques could be the following:

1. Groupware - defined as the method of forming a complex closed-loop information system that allows associate members to communicate and collaborate effectively, actively encouraging the transfer of knowledge and the sharing/ exchange of ideas and experiences between participants. A recent example with significant relevance in terms of the changes related to this technique is the creation of digital platforms used for sharing or requesting proper data and information in order to create knowledge or identify optimal solutions meant to overcome uncertain situations.

2. Implementing an intelligent management system – a technique that has a high degree of applicability especially in the decision-making process with multidimensional impact. It is based on the creation and use of a complex mechanism ensured by fulfilling the functions of collecting, storing and retrieving the data and information representing the basis for the organizational knowledge's creation. Setting the objective of obtaining results as close as possible to the team leaders' desideratum, the information resources held and processed according to the requirements of each experience overpassed by the representatives of the executive level are accessible to all members of the group.

3. The creation of a database and the establishment of its means of exploitation - remains one of the most useful techniques related to knowledge management. Given that data is generally collected in a raw, primary format, its "storage" in archives can generate real benefits only if the persons responsible for its use possess the

qualities needed to ensure its maximum exploitation. Since, most of the times, the volume of data is huge and implicitly difficult to manage, the first requirement of the proposed management model is to store it according to a series of criteria (division into specific categories, organization according to time points of registration etc.), in order to facilitate the access and exploitation processes by any of the team members. The following step needed to be understood, mastered and completed correctly in order to achieve the set objectives is data mining. The data mining process, as it is called within the scientific community, indicates, in fact, the structural technique of extracting useful knowledge from the created database, because of the numerous searches, selections or processing of the primary form under which it was stored.

4. The implementation of a documents' management system is an imperative feature, especially for the large corporations' representatives. Nowadays, in addition to collecting or accessing an impressive amount of data, managers of many companies frequently come into the possession of a significant number of documents that require to be examined correctly and in a comprehensive approach. In this context, the digitization of the official documents created for an easy and efficient use or management is one of the basic needs of the modern management. The implementation of this normative particularity can be easily ensured through the creation of a system that allows both storage and administration of the documents, which are indispensable to the organizational progress.

Conclusions

For most of the managers of the present day, knowledge management can easily become either a great opportunity to achieve an important competitive advantage within the market or a burdensome challenge that could actually damage the whole company. Depending on their own approach towards the specific tasks to be accomplished, the supervisors can generate certain favourable circumstances so that the managed human resource would be constantly motivated and boosted in terms of performance or they would simply not get involved in the process, leaving the company to run passively.

The myths and challenges associated with knowledge management's implementation process emerged in the last decades have mistakenly correlated its application to the assurance that the right piece of information given to the right person at the right time would succeed in solving a problematic situation. The great majority of the studies previously carried out on the subject by a considerable number of researchers have illustrated the fact that implementing knowledge management as the main administrative pattern gives an executive more chances to succeed, but it does not guarantee the actual success. The quintessence of the managerial process still remains the leader's ability to motivate its human resource, increase and exploit their knowledge and experience.

Since the most frequently presumed strategy of the right data – right person – right time does not always secure an optimal usage of an organization's resources in terms of knowledge, one might believe that the technological boom and/ or the remarkable progresses made due to the information era and globalization could help with storing/ sharing the organization knowledge. Unfortunately, the assumption is only half correct. Human intelligence can be exploited in teams, can be shared with the team members, but it cannot be stored within any software or data bases. One can make useful connections or perform complex analysis, processes that eventually lead to making useful decisions in order to overpass a problematic situation, can share his/ her experience with the team members, but in case a future such event, each of them would develop different solutions, based on their own knowledge and experience.

Knowledge management still has a lot of unexplored treasures to be found and a lot of challenges to be faced, but it is for sure one of the most useful and valuable administrative strategies that a manager could adopt within nowadays society. Its implementation can be a demanding process and there could be many easy paths that could prove to be leading towards less or poor results than expected, but one thing is for sure: (organizational) knowledge is essentially based on human intelligence, an intangible individual resource that cannot be stored or completely shared. The complex managerial process is still evolving and as all the great goals to be achieved, it equally demands great efforts, time and involvement.

Abstract

The publication aimed to compare the Polish housing market situation with the situation in other European Union countries. The authors verified the hypothesis that Poland's situation is one of the worst in the EU when it comes to overcrowding, the number of young people without their own dwellings, housing availability, housing standards, and accessibility of mortgage.

Keywords: Housing, Real Estate, European Union.

Introduction

It is intended that this publication provides an analysis of the current housing situation in Poland compared to other European Union countries and the answer to the question of whether, after 16 years of membership in the European Union, Poles are facing a similar housing situation to the other Member States. This research also analyses the number of new developments and their purchase prices to assess the availability of dwellings for Polish residents.

The research hypothesis put forward in the paper assumes that the situation in Poland is one of the worst in the European Union. The circumstances in the housing market will be analyzed from the point of view of numerous criteria: overcrowding, the number of young people living with their parents, the number of dwellings per 1,000 inhabitants, the number of completed dwellings, housing availability in terms of residents' income, availability of financing tools.

Literature Review

According to Mayo and Stein (Mayo, Stein, 1995), after the Second World War, Poland had an extremely low level of available dwellings, and for 60 years the centrally planned economy failed with the reconstruction of housing to the level observed in other countries (Morton, 1979). Presently, the situation on the Polish market still remains far from the European average, but the authorities have pursued many initiatives to improve it. During the economic transformation in Poland, the investment costs for building a house could be deducted from tax (Merill, 2000). The early 2000s saw the construction of TBSs (Social Construction Associations), which admittedly did not offer to acquire ownership, but allowed rental for a relatively low contribution equal to 1/3 of the dwelling value (unfortunately, some of the TBSs had low-quality projects, built of cheap materials, with thin walls and poor thermal insulation). The next step of the authorities were mortgage financing programs (Radzimski 2014, Kierzeniowski 2008, Glocker, Plouin, 2016) which promoted the purchase of dwellings and mortgage financing. Unfortunately, attempts of governmental assistance, targeted in particular at young people for the purpose of gaining independence and moving away from parents, and in the long term starting a family, does not take into account the very low earnings of many young people and work on "junk" contracts that prevent them from purchasing a dwelling (Baranowska-Rataj, 2011). Quite often, young individuals cannot even afford a mortgage (Świąder, Szewrański, Kazak, 2017). It is nothing uncommon when young people have to financially support their parents, as the pension system in Poland does not ensure a decent life in retirement (especially in the case of workplace accidents or disability). Thus, social inequalities and low wages translate into low effectiveness of government aid programs, which mainly help relatively wealthy people. Then there are also the high construction costs of dwellings in Poland which, due to the climate, must be made much more robust than in countries with higher winter temperatures. In Poland, it is not possible to build houses with single glazing or thin insulation, because the costs of heating in winter would exceed the financial capacity of the residents (heating a flat in Poland during the winter often costs the equivalent of the national average

salary, but is spread over the entire year, so heating is settled in installments). Apart from that, due to the dramatic increase in real estate prices in the last 20 years, dwellings have become a common way of investing capital, which further increases their prices (Olszewski et al., 2019, Dąbrowska, 2019). Wealthy people purchase dwellings for rent or as an investment, which means that the prices of not only dwellings, but also land in cities are constantly on the rise. In many cities there is already a shortage of construction properties (e.g. Cracow), and those that are available reach very high prices. It is estimated that there is still a deficit of approx. 2.5 million dwellings in Poland (Kubow, 2016, Napiórkowska-Baryła, 2020). For many young people, the only chance for their own dwelling is to emigrate and save sufficient capital to purchase a dwelling in Poland (Krzaklewska, 2019). It is claimed that a vast number of young Poles looking for a job in the UK (and finding it thanks to the high quality of their work) was one of the main reasons for Brexit (Favell, Barbulescu, 2018). Even though the increasing number of people considers the prices to be excessively high and forming a speculative bubble, they do no cease to increase (Siemińska, Krajewska, 2019, Czerniak, Kawalec, 2020).

Conclusions from own Research

The research conducted for the purpose of the publication was analytical and comparative. The objective was to diagnose the current situation on the Polish market against other European Union countries. Chart 1 demonstrates the share of public housing expenditure in total GDP in 2018. As the chart makes clear, expenditure for this purpose in Poland represents 0.7% of GDP, while the EU average is 0.6% of GDP, and 0.5% of GDP for Western European countries. In percentage terms, Poland ranks ninth in the EU in terms of public housing spending (after: Bulgaria, Cyprus, Romania, Croatia, France, Hungary, Latvia and Great Britain). In amounts, Poland ranks sixth (behind France, Great Britain, Germany, Italy and Spain). That is not bad, but the comparison of social rental housing spending statistics gives a substantially worse picture, as shown in Figure 2. Expenditure for this purpose in Poland is around 0.08%, while the EU average is 0.5%, and for countries such as Germany, Great Britain or France it is 1% of GDP (OECD, 2020). To conclude, it is significant that expenditure on housing construction is one of the highest in the European Union, but expenditure on social housing is one of the lowest.

Fig. 1: Housing and community amenities, central government expenses as a percentage of the GDP, Eurostat, [gov_10a_exp]

Fig. 2:Recent trends in public spending on social rental housing in selected EU % of GDP (2015, 2018), OECD, [PH4.1.]

A further aspect of assessing the situation on the housing market in Poland is the overcrowding rate. The overcrowding rate is defined as *the percentage of the population living in an overcrowded household. A person is considered as living in an overcrowded household if the household does not have at its disposal a minimum number of rooms equal to: one room for the household; one room per a couple in the household; one room for every single person aged 18 or more; one room per pair of single people of the same gender between 12 and 17 years of age; one room for every single person between 12 and 17 years of age and not included in the previous category; one room per pair of children under 12 years of age. (Eurostat).* As shown in Figures 3, 4 and 5, this rate for Poland was 26.2%, which put it in eighth place among the EU countries. Even for the upper quantile of the income distribution, this rate exceeded 20% (for 25% of the highest-earning Poles), while for the lower quantile (25% of the lowest-earning Poles) it was over 35%. The situation was virtually identical for both rural and urban areas (where the overcrowding rate approached 40%), and somewhat better for small towns and suburbs, while it was worse in Bulgaria, Romania and Slovakia, but unfortunately Poland was one of the top countries with the worst-case scenario in this respect (however, overcrowding rate has decreased by 13.4% in the last 10 years (Czajkowska, Raczkiewicz, 2020, p. 41).

Fig. 3: Overcrowding rate in the European Union, 2018, Eurostat

Fig. 5: Overcrowding rate by the degree of urbanization, 2016, [%], Eurostat

If one looks at the composition of household types among young people aged 20-29, it is worth drawing attention to the considerable share of people living with their parents. This indicator in Poland is close to 60%. That said, this is not a record result in the entire European Union, as the highest share belongs to Italians, where this value exceeds 70%. Slovakia and Greece are just behind Italy, followed by Slovenia and Spain, Portugal, Luxembourg, Ireland and Hungary. Nevertheless, if these figures are compared with countries such as Denmark, Finland or Norway where the percentage is close to 10%, there is an evident difference, caused by the financial situation and housing prices rather than the voluntary choice of more than half of the population.

Fig. 6: Percentage of people in the age of 20-29s living with parents in 2017 [%]

The number of dwellings per 1000 inhabitants also implies numerous dwellings deficits in Poland, where there are 387 dwellings per 1000 inhabitants. As shown in Figure 7, this result is much lower than that of all Western European countries except Great Britain. Given the above, the statistics mentioned previously showing that there is a shortage of 2.5 to 1.7 million dwellings in Poland are not surprising.

Fig. 7: The number of dwellings per 1000 citizens, 2018, Eurostat

Figures 8 and 9 show the pace of development of the housing market in the European Union countries. Concluding from these figures, in 2018 there were 5.41 completed dwellings per 1,000 inhabitants in Poland, which makes it one of the highest scores in the EU. Only Norway, France and Luxembourg ranked a larger score than Poland. Equally high for Poland is the indicator of initiated dwellings, which amounted to 6.18 dwellings per 1000 inhabitants. A higher indicator for the EU countries could be observed only in Luxembourg, where it was 8.92 dwellings. Nevertheless, Luxembourg is the seat of many institutions of the European Union and at the same time a very small country, therefore such a high rate of construction was rather a matter of foreigners rather than the housing needs of Luxembourg citizens.

Fig. 8. Housing development intensity, index of completed dwellings per 1000 citizens, 2018, Eurostat

Fig. 9. Housing development intensity, index of the number of initiated dwellings per 1000 citizens, 2018, Eurostat

Figures 10 and 11 demonstrate the measures of housing availability for residents of a given country. Figure 10 portrays the relationship between the average annual gross salary in a given country and the price of a 70-meter dwelling (the average national price of a dwelling). Given the results indicated above, one can see a considerable intermingling of the old and the new Union countries (convergence process is well documented in Kucharska-Stasiak et al., 2020). There is no clear division into countries of Western Europe and Central Europe. That said, Poland appears to be in the group of countries with a high ratio, approaching 8, while for Belgium or Portugal, the ratio is around 4. This proves high purchase prices for dwellings, which may be due in part to dwelling shortages and enormous demand.

Fig. 10: Affordability of own housing, multiple of annual gross salaries to purchase a 70 sqm dwelling

Theoretically, Poland's housing prices (Figure 11) are not very high compared to those in other EU member states. The average price of a 120-meter dwelling in 2018 did not exceed EUR 3,000 per square meter, but it represents a several-month gross salary of an average Pole (and it is known that over 50% of Poles do not earn the average national salary at all). Therefore, prices may be attractive as investments for Western Europe's inhabitants but are often prohibitive for the inhabitants of Poland and other Central European countries. This is likely to cause a huge number of investment funds allocating assets in construction in Poland. They represent a considerable share of companies listed on the Warsaw Stock Exchange. Such an investment demand for residential real estate in Poland makes them more expensive, regardless of the financial capabilities of many Poles.

Fig. 11: The average price for 120 sq m dwelling in the most important city in a given country, 2018, [euros/sqm]

The last criterion for assessing the situation in the housing market in Poland is housing conditions. It follows from Figures 12 and 13 that in 2016 about 40% of Poles lived in poor housing conditions (according to European Union standards), and for as much as 14%, these were substandard conditions. If one compares Poland to the rest of the European Union countries, Poland takes 16th place (out of 27 member states (Ulman, 2019, p. 70)). Merely around 10% of Poles used a mortgage, as the rest could not afford such a loan. An extensive group (over 65%) of citizens were owners of dwellings without an outstanding mortgage or housing loans, which, however, cannot be regarded as a satisfactory outcome in the face of the huge housing deficit in Poland. A severe problem that is worth putting into the analysis are the types of dwellings popular in Poland. In 40% of cases, these are dwellings (smaller, cheaper) and over 50% of houses (expensive, larger). Due to their size, if not overcrowded, houses provide better conditions for having children, so it would seem that the proportions are quite favorable, but the age of individual dwellings is not shown here - many houses were built by older generations, and they are not accessible to young people. The majority of people working in cities (and more than 60% of Poles live in cities) purchase dwellings due to the poorly developed road infrastructure, which makes commuting to the city center difficult, even from the outskirts of the city. Therefore,

Poles who work in cities usually purchase small dwellings because daily commuting to the workplace is completely unprofitable. This strongly increases dwellings' prices in cities and restricts the scope of space where new dwellings are built.

Fig. 12. Population distribution by tenure status, 2016 [%] of the total population, Eurostat

Fig. 13. Distribution of population by dwelling type, 2016 [%] of the total population, Eurostat

Conclusion and Ending Remarks

Concluding the considerations included in this paper, it appears that there are no grounds to reject the hypothesis that the housing situation in Poland is among the worst in the European Union countries. Moreover, it seems that there is a fairly clear division of housing issues between Western Europe and Eastern Europe. In Western Europe, there is no strong growth in housing because the inhabitants of these countries do not experience a shortage of dwellings. The problem there is rather the renovation and modernization of existing dwellings and perhaps concern for the fate of the poorest, while in Poland and Central European countries, the issue is the lack of a place to live and the need to live in substandard conditions. Admittedly, Poland is not the worst country in terms of the analyzed indicators, but in practically every category (except for the number of completed dwellings) it is one of the worst states in the European Union. If we look at the figures, the number of square meters per capita in Poland is 2/3 of that value for the entire European Union (28 square meters and 39.6 square meters per capita, respectively). The aforementioned relation is much worse when comparing Poland with the average for Western European countries.

Poland is continually incorporating more and more radical housing subsidy programs for young people; however, it seems that housing prices are rising faster than government aid. The average housing price growth rate for the last 20 years is about 20-25% annually. It is worth noting the periods when prices of building materials grew by nearly 50% during the year. This induced the bankruptcy of many construction companies in Poland, which entered government tenders where prices had been fixed in advance and could not be renegotiated. Losses in tenders were so high that companies that had been operating for more than half a century were forced to apply for bankruptcy.

Abstract

The world is currently experiencing a health crisis over SARS-CoV-2 disease. It is therefore important to follow up and monitor the patient on the disease. The study conducted is a review of the scientific literature, which includes 158 articles from the databases; EBSCO Host, IEEE Xplore, Medline Full Text, ScienceDirect and Scopus. According to our inclusion and exclusion criteria, 30 articles were systematized. Showing the digital technologies that facilitate the control, follow-up and monitoring of the disease in patients.

Keywords: Monitoring and Control, Digital Technologies, Systematic Review.

Introduction

SARS-CoV-2 (called Covid 19), is a disease that generates various symptoms to the patient's body, including shortness of breath, tiredness, malaise, chest pain or pressure, etc. When the symptoms become very serious, it can even lead to the patient's death. Those in charge of public health do not keep an adequate control or follow up of all the patients, causing some patients to die. (Shaw, Kim and Hua, 2020).

Therefore, the aim is to learn about the use of digital technologies, to facilitate proper control, follow-up and monitoring of infected patients and improve response times between one patient and another, this prevention in practice saves lives. (Lee et al., 2020).

The review of the scientific literature, allows to look for or to solve the problems that at the moment the dependencies of the public health suffer on the control, pursuit and monitoring of the patient on the disease. (Kamel and Geraghty, 2020).

Methodology

A. Type of Study

For the elaboration of the article, the systematic review of the scientific literature will be used. Yordanov et al., 2020.

B. Research Questions

The proposed research questions are as follows;

RQ1. What digital technologies allow a better control, follow-up and monitoring of patients diagnosed with the disease?

RQ2. What digital technologies can be used for the control and monitoring of patients diagnosed with the disease, from public health centers?

Cite this Article as: Cristobal Mondalgo-Rodriguez and Michael Cabanillas-Carbonell "Analysis, In the Monitoring and Follow-Up of Covid 19 Patients, Using Digital Technologies. A Review of The Scientific Literature" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

C. Search Strategies

To answer the research questions, a search was made of articles published in the main databases EBSCO Host, IEEE Xplore, Medline Full Text, ScienceDirect and Scopus. Where 158 scientific articles were collected.

When applying the search for our research, the following keywords have been considered: “covid-19 technology”, “monitoring patients with covid 19 using ti”, “tracing patients with covid 19 using ti”, “covid information technologies”, “covid-19 monitoring patients”, “covid-19 AND monitoring” “covid 19 AND patient”, “covid 19 and monitoring”, “covid 19 monitoring software”, “covid it”, “covid-19 and technology and monitor patients”.

Fig 1. Prisma Diagram Methodology

D. Inclusion and Exclusion Criteria

For the systematic review study, the following inclusion and exclusion criteria were applied in the following table.

Table 1: Inclusion and exclusion criteria

Criteria		
Inclusion	I01	Articles related to digital technologies for the Covid 19
	I02	Medical articles related to technologies for the Covid 19.
	I03	Articles related to the monitoring of patients Covid 19.
Exclusion	E01	Articles not related to the technologies used in Covi 19
	E02	Articles not related to the monitoring of patients Covid 19.
	E03	Articles related to patient monitoring, but does not make use of digital technologies.

Results

We analyzed 158 articles found in the databases related to the research topic, of which 20 duplicated articles were discarded or did not contribute similar topics to the research. After reviewing the articles, 30 were selected, excluding 108 according to the exclusion criteria and that did not contribute to answer the research question. Obtaining 30 articles for the systematic review.

Categories	Articles
Mobile Application	(Azad et al., 2020); (Cheng and Hao, 2020); (Islam et al., 2020)
Technological tools	(Abuhammad, Khabour and Alzoubi, 2020)
The Internet of Things	(Siriwardhana et al., 2020)
Contact tracking technology using mobile equipment	(Naik et al., 2020); (Nijsingh, Bergen and Wild, 2020); (Mbunge, 2020); (Gomez et al., 2020); (Leslie, 2020); (Taiwo and Ezugwu,

Categories	Articles
	2020); (Wu et al., 2020); (Martínez et al., 2020); (Martínez et al., 2020); (Gerke et al., 2020); (Walrave, Waeterloos and Ponnet, 2020); (Annis et al., 2020); (Kleinman and Merkel, 2020); (Wang, Ding and Xiong, 2020); (Cascón, 2020); (Coghlan, Cheong and Coghlan, 2020); (Culnane, Leins and Rubinstein, 2020); (Culnane, Leins and Rubinstein, 2020); (Van De Beek et al., 2020); (Lucivero et al., 2020); (Urbaczewski and Lee, 2020)
Technology and Health Policy	(Shaw, Kim and Hua, 2020); (Lee et al., 2020)
Digital Technologies	(Kamel and Geraghty, 2020)
Telesurveillance	(Yordanov et al., 2020)

The following table shows the classification topics of articles according to the results found.

Table 3: Classification of articles according to categories and topics of functionality

Themes and functionality	References
These articles argue that mobile applications allow control and monitoring of patients with the disease, as long as it is connected to a health control system.	(Azad et al., 2020); (Cheng and Hao, 2020); (Islam et al., 2020)
These articles argue that technological tools allow the control and monitoring of patients with the disease using technologies in general.	(Abuhammad, Khabour and Alzoubi, 2020)
This article argues that the use of the technologies of the Internet of things allows to develop and to lean on the technologies of the telemedicine, telehealth, etc.	(Siriwardhana et al., 2020)
These articles argue that the use of contact-tracking technology using mobile equipment allows for the control of patient follow-up using data privacy.	(Naik et al., 2020); (Nijsingh, Bergen and Wild, 2020); (Mbunge, 2020); (Gomez et al., 2020); (Leslie, 2020); (Taiwo and Ezugwu, 2020); (Wu et al., 2020); (Martínez et al., 2020); (Martínez et al., 2020); (Gerke et al., 2020); (Walrave, Waeterloos and Ponnet, 2020); (Annis et al., 2020); (Kleinman and Merkel, 2020); (Wang, Ding and Xiong, 2020); (Cascón, 2020); (Coghlan, Cheong and Coghlan, 2020); (Culnane, Leins and Rubinstein, 2020); (Culnane, Leins and Rubinstein, 2020); (Van De Beek et al., 2020); (Lucivero et al., 2020); (Urbaczewski and Lee, 2020)
These articles argue that the use of technology and health policies used in patient care should be supported by technology in the use of disease control and monitoring systems.	(Shaw, Kim and Hua, 2020); (Lee et al., 2020)
This article argues that the use of Digital Technologies allows the automation of	(Kamel and Geraghty, 2020)

Themes and functionality	References
processes related to the control and monitoring of patients diagnosed with the disease.	
This article argues that Telesurveillance allows the patient to be seen through the internet from a mobile device, pc, etc. In order to be able to control and monitor the disease.	(Yordanov et al., 2020)

Discussions

In this systematic investigation of the scientific literature, the aim is to answer the proposed questions;

RQ1. What digital technologies allow a better control, follow-up and monitoring of patients diagnosed with the disease?

According to Figure 5, it can be seen that the articles related to our topic in mention come from the continents of Asia, North America and Europe (from highest to lowest). This result indicates that there is a greater knowledge of the technologies related to the control and monitoring of patients diagnosed with the disease.

According to Figure 6, it can be seen that the articles related to our topic in mention come mostly from the countries of the USA and China. This result indicates that there is greater experience in the control and follow-up of patients diagnosed with the disease.

According to figure 7, it can be seen that the articles related to our topic in mention use the technology of; contact tracking, health policies, mobile application, etc. This result indicates that these technological categories allow controlling the follow-up of patients diagnosed with the disease.

According to Table I, you can see the categories of articles related to our topic in mention use the technology of "Contact Tracing using Mobile Equipment". This result indicates that this category is one of the most used to control the follow-up of patients diagnosed with the disease.

RQ2. What digital technologies can be used for the control and monitoring of patients diagnosed with the disease, from public health centers?

According to figure 7, it can be seen that the articles related to our topic in mention use the technology of; contact tracking, health policies, mobile application, etc. This result indicates that these technological categories allow controlling the follow-up of patients diagnosed with the disease.

According to Table I, the categories of articles related to our topic in mention use the "Mobile Application" (The mobile application must be connected to a matrix health system which provides patient information). This result indicates that this category is one of the most used to control the follow-up of patients diagnosed with the disease.

According to Table II, we can see the functionalities of the categories of articles related to our topic in mention, using "Technology and Health Policies". This result indicates that this category related to the use of systems interconnected to mobile applications allows to control the follow-up of patients diagnosed with the disease. Since it allows the use of systems.

Conclusions

After having made the systematic investigation of the scientific literature of 30 articles related to the topic in mention, it is concluded what;

The tools or technologies that allow a better control in the follow-up and monitoring of patients diagnosed with COVID 19 disease, are the technologies associated with "Contact Tracing using Mobile Equipment", "Technology and Health Policies" and "Mobile Applications" connected to a health control system.

In addition, most patients accept the implementation of technology in contact tracking to track COVID-19 disease, as long as privacy data security is applied. Therefore, the use of technology in "contact tracing" should be tempered with a focus on data privacy and cyber security.

The results of this systematic review may be helpful for future research on finding technologies that allow the monitoring and follow-up of COVID 19 patients using digital technologies.

Abstract

Animal abuse is an issue that is known worldwide and is one of the most serious problems of society, which despite the times continues to emerge until today. There are several ways to prevent it, but not the complete disappearance of it. To prevent animal abuse, information and communication technologies are used (ICT). This research is a systematic review of the literature and aims to make an analysis of ICT tools. For which, a compilation of 45 articles was made and systematized, which were taken from databases such as Scopus, IEEE Xplore, Ebschost, Scielo and Sciencedirect. The result of this work is that there are three tools that stand out: artificial intelligence, Internet of Things (IOT) and applications. These tools promote in great quantity the decrease and control of the animal mistreatment (Abstract)

Keywords*:* Animal abuse, tools ITC, systematic review, preventing, society.

Introduction

Despite the times, animal abuse is still heard today, are still easy targets of abuse, violence and aggression, is considered a crime in all countries of the world, where a person with irrational attitudes and behavior abuses an animal either physically, psychologically or sexually , in our society where we live the animals as much as domestic animals or abandoned, they are vulnerable since there are many cases that when people hurt or mistreat an animal mostly is not denounced, in addition that the denunciations by mistreatment animal is very difficult that is carried out to prosecute since the animals do not speak nor can be defended by themselves(Parfitt y Alleyne, 2018).

However, there have been many cases of people who unfortunately have carried out a frequent violence or aggression on the same animal, either psychic or physical, reaching numerous cases where even get to kill the animal itself(Jaurrieta Ortega, 2019).

The Information and Communication Technologies (ICTs) today have a great relevance for everything, for this topic even more, since thanks to the "ICTs" we can use them for the benefits of the animals, preventing the animal mistreatment with the use of the technologies, grouping together elements and systems attributed in the method and transmission of information, they are tools that can be taken advantage of to help prevent and avoid the mistreatment and to generate a well-being for our society (Hernández et al., 2014). As well as the use of social networks, websites or mobile applications with which people who are in favor of animals and love animals can give talks and advice to other people what to do if they live an animal abuse in their area and what measures to take about it, so this research aims to analyze the use of ICT tools to prevent and avoid animal abuse in our society. Therefore, the following question will be asked in order to answer: How much do we use ICT tools to help prevent animal abuse in our society?

Methodology

A. *Type of study*

This article will be elaborated with the use of the systematic review of scientific literature defined in the PRISMA guide (Prefered Reporting Items for Systematic Review and Metaanlyses).

Cite this Article as: Pierre Ortega-Zapata, Nelson Campos-Gutierrez and Michael Cabanillas-Carbonell "Analysis of ICT Tools to Prevent Animal Abuse: A Review of The Scientific Literature From 2013-2020" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

B. Review Questions

The research questions according to our criteria are the following:

RQ1. What are the ICT tools that are used to prevent animal abuse?
RQ2. Which of the technological tools benefits animals the most?

C. Search Strategies

With the intention of generating an answer to our questions that were raised for the progress of our research, we searched for scientific articles in databases such as: Scopus, Sciencedirect, IEEE Xplore, Scielo, Ebschost. We found 45 scientific articles from 2013-2020.

When the articles were searched in the 5 databases mentioned, they were searched using key words such as: "animal violence", "animal abuse" "tools TIC", "technology and animals", "The Tics", "animal cruelty", "animal defense technology".

Fig. 1 : Prisma Diagram Methodology

D. Inclusion and Exclusion Criteria

The following table shows the criteria for inclusion and exclusion from our research.

Table 1: Inclusion and Exclusion Criteria

CRITERIA		
Inclusión	I1	Articles related to ICTs with animal abuse.
	I2	Articles published between 2013-2020
	I3	They were found in English and Spanish.
Exclusión	E1	Some articles are not associated with the study variables
	E2	Some articles do not apply to engineering, social science and computer science.
	E3	Identical articles in different databases
	E4	Articles in languages other than English and Spanish

Results

The following result was made by means of the investigations that were found in 45 articles obtained in different data bases, next, the process of analysis that was made will be shown:

E. Extracted and analyzed articles

Sixty-five articles from different databases were reviewed, in which 20 articles that did not meet the criteria for inclusion, repeated articles, or did not match the questions asked earlier were excluded. Finally, as a result we obtained 45 articles that did meet the inclusion criteria so that they could be reviewed and systematized.

Fig. 2: Prisma Flow Diagram

F. Distribution of the databases found

Fig. 2 shows the number of articles reviewed by percentage according to the database from which they were extracted. It shows that mainly articles from the IEEE and Sciencedirect databases were used.

Fig. 3 : Distribution of the databases

G. Number of selected items per year

According to the articles collected, we can see in Fig. 4 the number of articles published during the period between 2013 and 2020, where we see that in 2020 a greater number were published.

Fig. 4 : Number of items per year

H. Number of articles per year and its database

We identified through the results in Fig. 5 that the IEEE and Sciencedirect databases have a greater range of articles related to the main theme in the years 2019 and 2020.

Fig. 5: Number of articles per year and its database

I. Number of items per year and continent

According to Fig. 6, the most predominant items are found in the continents of Asia and Europe between 2019 and 2020.

Fig. 6: Number of items per year and continent

J. Number of items per category

In Fig. 7 we see the different percentages according to the categories assigned to the different articles, standing out among them the use of technological tools in animals with 37%.

Fig. 7: Number of items per category

K. Number of items per category and continent

The following Fig. 8 details that according to each continent obtained is contrasted with the categories raised in which we see Europe predominating in the use of technological tools in animals.

Fig. 8: Number of items per category and continent

In the 45 articles, the following classification is made by categories of each one of them according to the content, it will be reviewed which technological tool was used.

Table 2: Classification by article categories

CATEGORIES	ARTICLES
Animal abuse	(Jaurrieta Ortega, 2019), (Hawkins y Williams, 2020), (Joo, Jung y Chun, 2020), (Newberry, 2017), (Monsalve, Ferreira y Garcia, 2017), (Parfitt y Alleyne, 2018), (Bright *et al.*, 2018), (Chan y Wong, 2019), (Monsalve *et al.*, 2019), (Burchfield, 2020), (Guazzaloca, 2020), (Matijczak *et al.*, 2020), (de Juan García, 2020).
Use of technological tools in animals	(Wada, Yamamoto y Watanabe, 2015), (Demir y Erman, 2018), (Budianto y Yunus, 2017), (Cheng, 2019), (Hammam, Soliman y Hassanein, 2019), (Naik *et al.*, 2020), (Volk *et al.*, 2015), (Oh *et al.*, 2014), (Sierra *et al.*, 2015), (Vimalajeewa *et al.*, 2019), (Krause *et al.*, 2013), (König von Borstel y McGreevy, 2014), (Verhaegen *et al.*, 2018), (Hennessy, Zhang y Bai, 2017), (Tang *et al.*, 2020), (Shanahan *et al.*, 2020)
Use of Tics in other subjects	(Bakieva y Muradkasimova, 2019), (Sun *et al.*, 2019), (Hernández *et al.*, 2014), (Oregi *et al.*, 2015), (Villa-Henriksen *et al.*, 2020), (Yoon, 2017), (Biere Arenas y Arellano Ramos, 2017), (Álvarez-Rodriguez, Bellido-Márquez y Atencia-Barrero, 2019)
Animal Welfare	(Zin *et al.*, 2016), (Olmez y Karaarslan, 2019), (Mitrovic, Milosevic y Greconici, 2019), (Odeón y Romera, 2017), (Neethirajan *et al.*, 2017), (Winter, 2020), (Golicz *et al.*, 2019), (Hammond *et al.*, 2020)

Table 3: Classification of Technological Tools

TECHNOLOGICAL TOOL	ARTICLES
Artificial Intelligence	(Hammam, Soliman y Hassanein, 2019), (Budianto y Yunus, 2017), (Cheng, 2019), (Bakieva y Muradkasimova, 2019), (Hernández *et al.*, 2014), (Yoon, 2017), (Álvarez-Rodriguez, Bellido-Márquez y Atencia-Barrero, 2019)
The Internet of Things	(Villa-Henriksen *et al.*, 2020), (Naik *et al.*, 2020), (Sierra *et al.*, 2015), (König von Borstel y McGreevy, 2014), (Verhaegen *et al.*, 2018), (Hennessy, Zhang y Bai, 2017), (Tang *et al.*, 2020)
Geolocation technology(gps)	(Demir y Erman, 2018), (Krause *et al.*, 2013), (Biere Arenas y Arellano Ramos, 2017)
Applications	(Wada, Yamamoto y Watanabe, 2015), (Sun *et al.*, 2019), (Volk *et al.*, 2015), (Oh *et al.*, 2014), (Vimalajeewa *et al.*, 2019), (Oregi *et al.*, 2015), (Shanahan *et al.*, 2020)

Discussion

This systematic review research sought to determine through different articles which are the information technology tools to prevent animal mistreatment and which of these tools benefit animals the most.

According to the information obtained from Fig. 7 we can ensure that, together, the category Use of technological tools in animals and Use of tics in other subjects add up to a total of 55% of the articles reviewed, giving us a substantial range of tools used in each. In addition, in Fig. 8 we can find that Europe is the continent that makes more use of technological tools in animals, followed by Asia.

RQ1. What are the ICT tools that are used to prevent animal abuse?

According to Table 2 we see the articles corresponding to each revised category. According to Table 3 we can see the technological tools used against animal abuse, being 4 used which are: artificial intelligence, internet of things (IOT), geolocation technology (GPS) and the applications.

RQ2. Which of the technological tools benefits animals the most?

As identified in Table 3 we can realize that there are 3 tools that stand out which are: artificial intelligence, Internet of Things (IOT) and applications. These tools promote in great quantity the decrease and control of the animal mistreatment

Conclusion

This document presents a systematic review of the literature on ti tools to prevent animal abuse that have been used during 2013-2020. As a conclusion, it was obtained that the main tools used to prevent this problem are artificial intelligence, Internet of Things (IOT) and applications, which are very effective and if applied together in new projects against this problem would result in excellent ways to help prevent animal abuse. Besides we can assure that the continents that make more contribution with respect to the topic treated with Europe and Asia. For the next researches the interested parties could focus on the following questions: How could one work with artificial intelligence, Internet of Things (IOT) and applications, all this together in order to provide a better opportunity to decrease animal abuse to a great extent?

Impact of ICTS On Mathematics Education: A Review of The Scientific Literature Between the Years 2015-2020

Juan Buitron-Luna
Universidad Autónoma del Perú, Lima, Perú, jbuitronl@autonoma.edu.pe

Michael Cabanillas-Carbonell
Universidad Autónoma del Perú, Lima, Perú, mcabanillas@ieee.org

Abstract

The importance of academic performance is a problem that is seen in many educational institutions, becoming the main problem for students and teachers. ICTs provide us with multiple ways of representing problem situations that allow students to develop problem-solving strategies and better understanding of mathematical concepts that are worked on during an academic session. The present document is a systematic literature review which was systematized 50 documents collected from BD IEEE Xplore, Eric, Microsoft Academic, ScienceDirect, Scielo.

Keywords*:* "ICT", "mathematics education","Augmented Reality", "Learning Process"

Introduction

There are different reasons to affirm that education is key in the development processes of individuals and of the societies in which they live and the incorporation of Information and Communication Technologies (ICT) can contribute to improving access to the educational system and the quality of school results (Abdullah, A. H., 2016).

The objective of mathematics in the first years of schooling is to develop in students abilities that will allow them to function adequately in everyday situations. This initial training can condition their job opportunities and monetary income during adulthood (Aguirre, A. M. G., 2018).

ICTs have a great contribution to the pedagogical approaches to education, which try to take advantage of every last interactive, didactic and innovative resource that it offers to the learning of students. (Arguedas-Méndez, S. M., 2016). Learning with TICS methods helps students to be able to explore content without having to be in class or at home, at the time and in the order that interests them the most. This combination allows students to convert any place as a learning setting (Arnaldo, F., 2019).

The use of information technology has not reached all institutions, it can be said that there are few, organizations that have risked implementing this new strategy in their student processes (Ávila, C. M. V., 2019).

Methodology

A. Type of study

The systematic review of the scientific literature defined in the PRISMA guide (Prefered Reporting Items for Systematic Review and Meta-analyzes) will be used.

B. Research Question

The proposed research questions were as follows:

RQ1: What is the impact generated by the use of ICT in mathematics education?

RQ2: What ICTs are used in mathematics education?

Cite this Article as: Juan Buitron-Luna and Michael Cabanillas-Carbonell "Impact of ICTS On Mathematics Education: A Review of The Scientific Literature Between the Years 2015-2020" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

C. Search strategies.

In order to provide an answer to our research questions, a search was made for scientific articles from the following databases: IEEE Xplore, Eric, Microsoft Academic, ScienceDirect, and Scielo, where 50 documents were collected considering the period 2015 - 2020.

Figure 1. Study database

D. Inclusion and exclusion criteria

In the studies, the inclusion and exclusion criteria were applied to be able to filter the articles according to each defined criterion.

TABLE 1. INCLUSION AND EXCLUSION CRITERIA

Research Criteria		
Inclusion	I1	Articles related to the use of ICTs in mathematics education
	I2	Articles published from 2015 to 2020
	I3	Articles published in Latin America, USA and Europe
Exclusion	E1	Articles that do not meet the research line.
	E2	Similar articles in various databases.
	E3	The search results were not scientific articles

Results

The results of the investigations are oriented to the findings of the investigations. The analysis process that was carried out was as follows.

A. Articles extracted and analyzed

Based on the results of the research, they revolve around the research findings, the scientific journals, and their stratification by names and year. The analysis process that was carried out was as follows.

Figure 2. Items extracted

The 50 selected articles met the established inclusion criteria. Now we will carry out the final count of articles per database:

TABLE 2. RESULTS FOUND IN EACH DATABASE

No.	Database	No. of items
1	IEEE Xplore	30
2	Eric	15
3	Microsoft Academic	20
4	ScienceDirect	13
5	Scielo	18

B. Distribution of articles by year

The following figure shows from the base obtained, the number of articles since 2015 according to the source of origin. Demonstrating that the most used article sources for research were obtained from the years 2015, 2017 and 2018.

Figure 3. Number of articles per year

C. Distribution of publications by continents

The graph below shows the number of publications that were made according to the continent of origin. Where you can see SOUTH AMERICA and ASIA above the rest of the continents.

Figure 4. Publications by continents

D. Publication type by continent

The following figure shows us the type of publication that was made according to the continent of origin. Where it is appreciated with superiority that Journals is the type of publication that is being used the most in research.

Figure 5. Publication by continent

E. Most used font

The following figure shows us the percentage of sources used in the research, with IEE XPLORE with 42% being the most used source followed by Scielo with 48%.

Figure 6. Most used font

F. Classification of articles according to technology.

In this table we can see the list of categories and in which articles we can see it.

TABLE 3. RESULTS FOUND IN EACH DATABASE

Analyzed Technology	Articles
Social networks	(Qi, L, 2017)
Augmented reality	(Ávila, C., 2019), (Brito, M., 2019), (Chen, H., 2015), (Fernández-Abella, R, 2019), (Abdullah, A., 2016), (Mann, M. D, 2017), (Nagaraju, K, 2015), (Paris, E., 2015), (Roberto, P., 2015), (Reinante, Y., 2016), (Reséndiz-Balderas, E., 2020), (Rueda, R., 2018)
Moodlee	(Arguedas-Méndez, S., 2016),(Frade, B., 2015), (Liu, R., 2018)
Computer game	(Abdullah, A., 2016.), (Cahyono, B., 2018), (Cortés, J., 2016), (Giubergia, M., 2017), (González, L., 2018), (Han, S., 2015), (Harris, J. L., 2016), (Hartono, M., 2017), (Hernandez, R., 2017), (Kukey, E., 2019), (Li, Q., 2015), (Sun, Y., 2017), (Szabo, P., 2018), (Téliz, F., 2015), (Triana-Muñoz, M., 2016), (Vasanti, G., 2015), (Venter, M., 2015), (Vértiz-Osores, R., 2019)
Cloud Computing	(Bhatti, A., 2017)
Educational software	(Moeck, P., 2019)
Web system	(Mota, L. F., 2017), (Muñoz, M., 2019, (Sergey Pozdnyakov, A., 2018) (Steegman, A., 2016)

G. Study of the technologies analyzed

The following graph shows the percentage of technologies analyzed in the research obtained on the topic of ICT as an impact on mathematics education. This figure allows us to know the most influential technology for research, being then, Augmented Reality and Computer Games, the technologies that generate the most impact in mathematics education.

Figure 7. Technology analyzed

H. Study of the impact of ICTs in mathematics education

TABLE 4: CATEGORIZATION OF THE STUDY OF THE IMPACT OF ICT IN MATHEMATICS EDUCATION.

Impact of TICS on mathematics education	
Impact of ICT in primary education	(Ávila, C., 2019), (Brito, M., 2019), (Chen, H., 2015), (Fernández-Abella, R., 2019), (Abdullah, A., 2016), (Lynch, T., 2017), (Mota, L. F., 2017), (Muñoz, M., 2019), (París, E., 2015), (Qi, L., 2017), (Roberto, P. 2015), (Reinante, Y., 2016)
Impact of ICT in secondary education	(Hartono, M., 2017), (Kukey, E., 2019), (Steegman, A., 2016), (Triana-Muñoz, M., 2016), (Vasanti, G., 2015), (Venter, M., 2015)
Impact of ICT on higher education	(Moeck, P., 2019), (Nagaraju, K., 2015), (París, E., 2015), (Roberto, P. 2015)
Impact of ICTs on teachers	(Cortés, J., 2016), (Escueta, M., 2017), (Kukey, E., 2019), (Lynch, T., 2017), (Mantri, A., 2019)

The table shows us some impacts of ICTs where we classify the articles according to the content of reference, 12 articles in primary education, 6 articles in secondary education, 4 articles in higher education and 5 articles that reflect the impact of ICTs on teachers.

Figure 8. Impact of the use if ICT

These articles argue that ICTs in mathematics education generate a positive impact, significantly improving learning and academic performance, even the use of new technologies helps the teacher in the progress of their students.

Discussion

In this investigation of the systematic review, the study of which would be the best technologies and strategies to use as support in mathematics education and, in addition, the impact that these technologies generate on students was determined.

According to the literature review, The present shows us that access to ICT is an important requirement to participate in a technological society. The adoption of ICT in the medium, as access and continuity, will have as a starting point, breaking with the digital gaps, of a society that still does not comply with the dynamism of adaptation. The teaching-learning process in the classroom, making use of ICT, requires a set of competencies that the teacher must acquire with the logic of adding a methodology capable of taking advantage of technological tools, where teacher training should be considered one of the first options before facing new educational challenges.

As indicated in Figure 7, a greater scope of the analyzed technology can be appreciated where augmented reality and computer games are the topics of most interest when using ICTs as an aid in the teaching-learning process within a classroom.

As can be seen in Table 4, it shows us the impact that ICTs generate on the educational scale where primary-level students have a greater interest in participating and learning about technology, achieving better academic performance, likewise ICTs help the teacher in the student progress.

Conclusion

This research demonstrates the importance and impact of ICT in mathematics education. Since, reviewing the literature obtained from 50 articles since 2015, we can show that no matter the circumstance or place where an analysis was carried out on the impact of ICT in education, it is always favored by methodologies related to technology.
We also conclude that the best technology to promote learning are tools related to Augmented Reality together with computer games since they provide a higher level of interest in the student when learning. These presented results will serve for future related research.

Trends in Smart City Service Initiatives – A Systematic Literature Review From 2014-2020

Luis Cabanillas-Carbonell
Universidad San Martin de Porres, Lima, Perú, luis568@gmail.com

Michael Cabanillas-Carbonell
Universidad Politécnica de Madrid, Madrid, España, mcabanillas@ieee.org

Abstract

In recent years the Smart city model has been defined as an immediate solution to the problems facing a city, however, the problems a city faces are different according to its socio-cultural level, economy and geographical location. In this document a systematic review of the literature was carried out, of the initiatives regarding the services of the Smart city model towards the citizen; using the Prisma methodology we approached this bibliography considering scientific articles between the years 2014 to 2020 from the IEEE Xplore, Scopus, Science Direct and Ebshost databases, having as object of study 155 articles and obtaining as result the categorization in Domains of Services, location and study of the main initiatives of services of the model Smart city for 46 countries, as well as, which continents have more developed each one of the initiatives based on their particular problematic.

Keywords: Smart city, systematic literature review, services, Prisma.

Introduction

Urban growth and global overpopulation are the current problem facing all cities worldwide, in 2050 almost 70% of people will live in cities (Cities, no date), (Clohessy, Acton and Morgan, 2014); urbanization leaves aside open spaces and brings the problem of managing a process of transformation to not only meet the needs of citizens, but also to effectively carry out this process with clear indicators to measure management, sustainability and continuous improvement. The Smart City was born in the 90's (Aljowder, Ali and Kurnia, 2019), (Hernandes, Pellenz and Calsavara, 2018) and has been developed with several hypotheses and definitions, especially in the last years as a methodology or framework to solve this inconvenience, both in the public and private sector (Sundari et al., 2019), (Julieta Cedillo-Elias et al., 2019). However, there is no single definition or single method to implement it, we have ISO norms and international standards, but they all fall into one of these 3 categories:

Table 1: Categories of Smart City Initiatives (Heaton and Parlikad, 2019)

Strategic	It establishes strategies, plans and objectives, provides a high-level framework.
Processes	Supports the development of a framework to aid interoperability with data standardization and categorization.
Technical	Technical support and guidance on the development of the digital infrastructure including protocol and sensors.

Likewise, there is a contradiction in terms of its implementation between the less developed and more overpopulated countries and the more developed countries with smaller populations (Neirotti et al., 2014); it is the latter that have more initiatives on the Smart City model (Organização das Nações Unidas, 2018).

Cite this Article as: Luis Cabanillas-Carbonell and Michael Cabanillas-Carbonell "Trends in Smart City Service Initiatives – A Systematic Literature Review From 2014-2020" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

Figure 1. Estimated and projected urban populations of the world, the more developed regions(Organização das Nações Unidas, 2018)

The most accepted definition for a Smart city means using the ICT infrastructure to efficiently and sustainably manage the city's resources and citizen services (Kazmi, Serrano and Lenis, 2019). As we know there are several models around the Smart city, however the most used dimensions are 6: People, Government, economy, mobility, environment and living (Hirtranusi et al., 2019)(Anthopoulos, Janssen and Weerakkody, 2015), (Aljowder, Ali and Kurnia, 2019), it is the responsibility of political leaders to choose and implement it. For this research paper we will also use the categorization in 3 service domains: Smart Economy, Smart Society, Smart Environment that a citizen receives.

Within each Smart city Service Domain, Smart city service initiatives are classified.

Table 2: Smart City Services Domain (Firmansyah *et al.*, 2017), (Tay *et al.*, 2018)

Smart Economy	Industry, Economy, Payment and Banking, Small Business, Startup, Tourism, Mobility, Commerce
Smart Society	Safe and Security, Health, Government, Education, Smart Generation, Open Data
Smart Environment	Energy, Environment, Water, Solid Waste, Region management

Within the Smart Cities model there are 3 facilitators: ICTs, which are the technological support, People, with their education and acceptance of change, and Government through governance (Alawadhi and Scholl, 2016), (Lopes, 2018) to implement holistic, transparent and sustainable policies.

Finally, this document aims to review the literature on the methodology of a Smart city, locate and catalog the service initiatives that have been developed in different parts of the world and in turn enrich knowledge about the Smart city with the various previous research worldwide. The methodological aim is to contribute to policy makers' leaders in their location and suitability with respect to the development of these services.

Methodology

This document is based on the systematic literature review approach, in accordance with the framework defined by B. Kitchenham (Kitchenham, 2004) to recapitulate the various Smart City initiatives. It consists of three phases: planning, implementation, and reporting.

A. Stage1: Planning

Two research questions have been formulated to begin research based on the adoption of Smart City initiatives and the geographic context where they are located and/or developed.
The questions asked are written below:
RQ1. ¿ What are the main Smart city service initiatives?
RQ2. ¿ Where these Smart City service initiatives are most developed?

B. Stage 2: Executing

The automated search was carried out within scientific databases containing more relevant references on the subject of the research. The main sources are Scopus, ScienceDirect, EBSHOST, and IEEE Xplore.

For this purpose, we use the following search string: "smart city" or "smart cities" and "services" and "model"; furthermore, we have limited the publication years from 2014 to 2020.

The search was carried out between June and August 2020. The filters were applied only to the titles of the articles in order to make it more relevant and detailed on the subject of this research. This resulted in 1086 documents. A high volume due to the recent growth around the Smart city context. Next, we filtered the non-service publications that agree and classified them in Table II, also the duplicates were removed and the results are according to their relevance and agreement with the topic, finally we started with the reading of the titles and summaries of the remaining interesting articles. Finally, there are 155 articles published.

Table 3: Inclusion / Exclusion Criteria

Inclusion	I01	Articles related to services smart city.
	I02	Articles published from 2014 to 2020.
	I03	Articles written in English and Spanish.
	I04	You can download the full version of the document
Exclusion	E01	Articles not related to services smart city
	E02	Articles after 5 years of research.
	E03	Articles written in a language other than English or Spanish.

C. Stage 3: Reporting

Of the 155 articles chosen for this research most of 75% are from the BD IEEE XPLORE, since we have unrestricted access as members of this organization, followed by 11% of Scopus, 8% of EBSHOST and finally 6% of Scient Direct.

Figure 2: Investigations analyzed according to database

Throughout the research process, the Mendeley desktop tool was used to read, sort, classify and remove duplicates, as well as an Excel database to make the tables and graphs.

Results and Discussion

For the systematic literature review (SRL) phases of this document, we use the PRISMA 2009 flowchart method (Preferred Reporting Items for Systematic Reviews and Meta-Analysis), which is a minimal set of evidence-based elements that helps the researcher to make transparent his/her research on a wide range of systematic reviews and meta-analyses described in Figure 3.

Figure 3: Prisma Flow Diagram(Bonfill, 2011)

From the selected documents we answer the questions formulated in section II of this research.

1) Number and demographics of the selected documents

Asia with 46% has the highest number of publications on the service initiatives provided by the Smart city model, Table 4.

The global trend is represented in Figure 4, the graph shows the positive trend in the number of documents from 2014 to 2018 but by 2019 you can see a slight decrease and by June 2020 there are still very low number of articles published yet, is understood as one of the main causes of the pandemic of COVID 19.

Figure 4 : Numbers of documents per year of publication (Bonfill, 2011)

Table 4: Number of Documents Analyzed by Continent

ASIA	46%
EUROPA	38%
AMERICA	13%
AFRICA	3%

In 2014 and 2015 the greatest number of documents are in the European continent. In 2016 there is a tie for both continents and in 2017 the greatest number of documents published are in the Asian continent with 12 publications against 9, In 2018 the Asian continent is in first place with 20 publications and in second place Europe, however, by 2019 we can see a slight decrease in publications from 20 to 18 in Asia and from 13 to 11 in Europe, on the other hand we can see that in the American continent for the years 2017 to 2019 the trend is upwards from 1 to 9 publications. Fig 5.

Figure 5: Number of documents per year and continent

2) Smart city services domains

Of the 155 selected Smart city service initiative documents, they have been classified into the 3 major service domains: Smart Economia, Smart Environment and Smart Society.

Table 5: Classification of Documents in Service Domain

Smart Economy	(Ji *et al.*, 2014) (Vagnoli *et al.*, 2014) (Pla-Castells *et al.*, 2015) (Farkas *et al.*, 2015) (Bouali *et al.*, 2015) (Belhajem, Ben Maissa and Tamtaoui, 2016) (Salvi, Tufo and Natale, 2016) (Soliman and Elsaadany, 2016) (Malagund, Mahalank and Banakar, 2016) (Mohamad Mezher and Aguilar Igartua, 2017) (D'Silva *et al.*, 2017) (Makarova *et al.*, 2017) (Mallus *et al.*, 2017) (Mangiaracina *et al.*, 2017) (Horažďovský and Svítek, 2017) (Casino *et al.*, 2017) (Araújo *et al.*, 2017) (Chen and Englund, 2017) (Vakula and Kolli, 2018) (Kanteti, Srikar and Ramesh, 2018) (Lazaroiu *et al.*, 2018) (Satyakrishna, 2018) (Kalašová, Kristián and Kubíková, 2018) (Sotres *et al.*, 2018) (Liao *et al.*, 2018) (Igihe.com, 2018) (Chang and Chang, 2018) (Raja *et al.*, 2018) (Chiariotti *et al.*, 2018) (Dhatrak and Gandhe, 2018) (Ibrahim, Driss and Rachid, 2018) (Lin *et al.*, 2018) (Zenkert *et al.*, 2018) (Malik, Shah and Khattak, 2018) (Tan and Leon-Garcia, 2019) (Khattak *et al.*, 2019) (Rizvi, Zehra and Olariu, 2019) (Choi *et al.*, 2019) (Casillas Mora, Ochoa Ruiz and Aguilar Lobo, 2019) (Al-Shariff *et al.*, 2019) (Herrera-Quintero *et al.*, 2019) (Liao *et al.*, 2019) (Garcia-Perez *et al.*, 2020)
Smart Environment	(Menniti *et al.*, 2014) (Zeiger and Huber, 2014) (Delfanti *et al.*, 2015) (Imteaj, Chowdhury and Mahamud, 2015) (Yusoff *et al.*, 2015) (Ceuca

	and Corsiuc, 2015) (Wen *et al.*, 2016) (Idwan, Zubairi and Mahmood, 2016) (Jokinen, Latvala and Lastra, 2016) (Saputra, Supangkat and Iqbal, 2018) (Sikder *et al.*, 2018) (Mohamed, Al-Jaroodi and Jawhar, 2018) (Gambin *et al.*, 2018) (Ravi and Jawahar, 2018) (Chaudhari and Bhole, 2018) (Duangsuwan *et al.*, 2018) (Faheem *et al.*, 2019) (Bingol, Kuzlu and Pipattanasompom, 2019) (Mahesa, Yudoko and Anggoro, 2019) (Shelestov *et al.*, 2019) (Bran *et al.*, 2020) (Kim *et al.*, 2020) (D'Alpaos and Andreolli, 2020) (Dos Reis, Tonkoski and Hansen, 2020) (Yoon *et al.*, 2020) (Jovanovska and Davcev, 2020)
Smart Society	(Clohessy, Acton and Morgan, 2014) (Mirri *et al.*, 2014) (Ghafoor, 2014) (Tei and Gurgen, 2014) (Lin *et al.*, 2015) (Djahel *et al.*, 2015) (Lijing, Yanrong and Jianhua, 2015) (Priano and Guerra, 2016) (Effendi *et al.*, 2016) (Srinivasan, 2016) (Deng and Zhou, 2016) (De Filippi *et al.*, 2016) (Bork *et al.*, 2016) (Seeliger *et al.*, 2016) (Benfares, El Bouzekri El Idrissi and Amine, 2016) (Ahlgren, Hidell and Ngai, 2016) (Javidroozi *et al.*, 2016) (Gascó, Rosenthal-Sabroux and Negre, 2016) (Ahn *et al.*, 2016) (Gongora and Bernal, 2016) (Samani and Zhu, 2016) (Alawadhi and Scholl, 2016) (Navidi and Hashemi, 2016) (Yang and Huang, 2016) (Firmansyah *et al.*, 2017) (Terán Tamayo *et al.*, 2017) (Alghanim, Rahman and Hossain, 2017) (Sajjad *et al.*, 2017) (Mishbah, Sensuse and Noprisson, 2017) (Khatoun and Zeadally, 2017) (Bryant *et al.*, 2017) (Islam *et al.*, 2017) (Malik and Shah, 2017) (Lohokare *et al.*, 2017) (Anthopoulos, 2017) (Torrinha and Machado, 2017) (Postranecky and Svitek, 2017) (Ruhlandt, 2018) (Hayar and Betis, 2018) (Lopes, 2018) (Fuchao, 2018) (Amer *et al.*, 2018) (Hernandes, Pellenz and Calsavara, 2018) (Quero *et al.*, 2018) (Sarabia-Jacome *et al.*, 2018) (Kesswani and Kumar, 2018) (Tay *et al.*, 2018) (Goldberg and Zhang, 2018) (Kazi *et al.*, 2018) (Muhammed *et al.*, 2018) (Achmad *et al.*, 2018) (Maria De Fuentes *et al.*, 2018) (Wibowo, 2018) (Mehta *et al.*, 2018) (Mohsin, Ali and AlKaabi, 2019) (Lou *et al.*, 2019) (Kazmi, Serrano and Lenis, 2019) (Mardones, Reyes-Chamorro and Chandia, 2019) (Lee, Kim and Seo, 2019) (Shetty *et al.*, 2019) (Sundari *et al.*, 2019) (Camboim, Zawislak and Pufal, 2019) (Keshvardoost *et al.*, 2019) (Hirtranusi *et al.*, 2019) (Qiu *et al.*, 2019) (Heaton and Parlikad, 2019) (Sundaravadivel *et al.*, 2019) (Seidi, Eshghi and Kelarestaghi, 2019) (Yuan *et al.*, 2019) (Yadav *et al.*, 2019) (Abbasi-Moud, Vahdat-Nejad and Mansoor, 2019) (Larasati, Handayaningsih and Sumarsono, 2019) (Bouzguenda, Alalouch and Fava, 2019) (Lim, Edelenbos and Gianoli, 2019) (Anagnostopoulos, Ntalianis and Tsapatsoulis, 2019) (Jiang, Geertman and Witte, 2019) (Julieta Cedillo-Elias *et al.*, 2019) (Aljowder, Ali and Kurnia, 2019) (Dobre and Marcu, 2019) (Dattana, Gupta and Kush, 2019) (Samarakkody, Bandara Dilum and Kulatunga, 2020) (Fang *et al.*, 2020) (Romero *et al.*, 2020) (Rani *et al.*, 2020) (Adiyarta *et al.*, 2020) (Tan and Taeihagh, 2020)

Figure 6 shows that 56% of service initiatives are in the Smart Society domain, 27% in the Smart Economy domain and 17% in the Smart Environment domain.

Figure 6: Percentage of documents by Service Domain

Likewise, when analyzing according to the continent where the publications originate, Europe, Asia, America and Africa are developing more initiatives of the domain Smart Society, which is an indicator that globally the service initiatives Smart city are oriented to solve the problems of Safe and Security, Health, Government, Education, Smart Generation, Open Data in second place we see the domain Smart Economy (Industry, Economy, Payment and Banking, Small Business, Startup, Tourism, Mobility, Commerce), finally the domain Smart Environment (Energy, Environment, Water, Solid Waste, Region management). Fig7.

Figure 7 : Number of documents per Domain Service and Continent

3) Smart city service initiatives

Smart city service initiatives are oriented to the service of the citizen or the conservation of the environment, which in the end is also a service to the citizen. The most developed Smart city service initiatives within the documents analyzed is Mobility (Herrera-Quintero et al., 2019), (Farkas et al., 2015), which consists of various services implemented and/or projects such as intelligent traffic, intelligent parking (Ji et al., 2014) and switching to renewable energy vehicles (Ibrahim, Driss and Rachid, 2018)

In second place are the models and/or frameworks that serve as a guide to implement a Smart city (Javidroozi et al., 2016); (Daneva and Lazarov, 2018) third place are the Health smart service initiatives (Lohokare et al., 2017) with projects such as cloud-based patient monitoring and predictive diagnostics (Yusoff et al., 2015); followed by Energy and Government, in last place we can find the Education and People initiatives.

Figure 8: Number of documents by Smart city initiatives

The Asian continent shows a greater number of developments in service initiatives for models and / or frameworks of Smart city, which gives us an important indicator for the implementation of the same, another service initiative with more developments is Health also with great importance for the Asian continent.

The mobility service has greater importance for the European continent, to solve problems of urban transport, environmental pollution and vehicle congestion, this is another good indicator if we want to implement these initiatives, followed by the initiatives of Energy (Dos Reis, Tonkoski and Hansen, 2020), (Faheem et al., 2019) for the management of renewable energy, controlled and predictive energy consumption.

On the American continent there are few well-defined service initiatives we can rescue those of Mobility and Health. Fig 9.

Figure 9: Number of documents service initiative and continent

The country with the most research on Smart City service initiatives is India with 11%, followed by Italy with 8%, China with 7%, and Indonesia in fourth place with 6.45%.

Figure10: Number of documents by country

When analyzing in more detail we find that the Mobility service initiative has more research in India with 7 publications, the largest development of models or frameworks of Smart city has Indonesia with 6 publications, Energy, Italy with 4 publications, Health, United States with 4 publications, this provides a clear and important idea about which countries developed or have more projects in terms of each initiative and what models we should make an analysis when adopting any Smart city project.

Table 4 shows a summary of the countries and number of developments in a service initiative.

Conclusions

This research presents a systematic review of the literature on service initiatives in a Smart city model, finally we will proceed to answer the research questions:

RQ1. What are the main Smart city service initiatives; we have found that the main Smart city service initiatives are Mobility, Models, Health, Energy; leaving aside the Environment initiatives, we recommend that greater attention be paid to the problem of the environment, recycling and waste management, which makes the Smart city model sustainable.

RQ2. Where are these Smart city service initiatives more developed; the development of the Smart city service initiatives has been increasing however in the last year 2019 we have seen a stagnation in the number of publications, the continent with the highest number of investigations is ASIA, with the domain of Smart Society service, within this we can see that the most developed and researched service initiative is Mobility, and the countries with more publications are India and Italy; then follows Smart city Models or Frameworks in Indonesia.

Finally, it is important to understand that in order to start any Smart City service project, several examples must be studied and even then, adaptations must be made according to the reality where they will be implemented

Value Perception of Private Educational Institutions' Students on Co-Taught Virtual Entrepreneurship Courses

Khan RAHATULLAH Muhammad

Effat University; Jeddah; Saudi Arabia
mkhan@effatuniversity.edu.sa

Abstract

Concrete and widely available evidence for effectiveness of virtual co-taught classrooms from most important stakeholder i.e. the student is lacking. It is the student who receives the education the way policy makers' desire. However, this paper provides an insight into student stand point on such courses. This paper provides student perception on the effectiveness of virtual co-taught courses from pedagogical and diverse angles to help faculty and policy makers. The study is based on quantitative survey carried on www.surveymonkey.net and the analysis using the SPSS and MSexcel of 55 participating students in a co-taught course delivered over one semester at two institutions in USA and Saudi Arabia. The students were asked the questions related to existing pedagogy, role of technology in education, co-teaching over internet and others. It was designed to understand the benefits, challenges and future role of such courses from student perspective. Results show virtual classrooms co-taught by instructors from diverse cultural backgrounds, locations, expertise and approaches is indeed a success. Virtual classrooms will stay and define our future teaching pedagogy and learning.

Keywords: Virtual teaching; Student perception; Co-teaching.

Introduction

How can we teach students if we do not know how they learn and their understanding of effectiveness of the teaching strategies and pedagogies we apply to help them learn, improve, be a better person and contributor to the society. It is the learner who is, for the most part, in charge of what he/she learns. Our job as academics and planners is to keep innovating strategies aimed at maximizing the learning experience of the students.

Use of Internet in teaching is common and widely acceptable and practiced. However, co-teaching in a virtual class room to students of two different institutions is new. We also do not have concrete and usually available evidence for its effectiveness from the most important stakeholder i.e. the student. This study aimed to understand efficacy of strategies employed in two courses co-taught virtually in a Saudi (Effat University and US (Hope College) Institution. The course taught was "Inter Cultural Communications at junior and sophomore levels for undergraduate degree in business. Both the institutions are members of the Global Liberal Arts Alliance (GLAA). The co-taught courses are announced and coordinated by the GLAA.

The two instructors from these institutions exchanged the syllabi and made minor adjustments in the study and teaching plans to fit requirements students from both institutions. The details of the students' performance and brief profile were exchanged. The course was taught over the use of internet through skype sessions. Each week 2 sessions of 1 hour each were held. Each session led by instructor of respective institutions.

The students were distributed in mixed groups where they carried out assignments together and presented virtually by the group. The course topics were equally divided among the faculty who delivered teaching during their respective sessions. The course coordination was carried out by the instructors. Student questions were answered mostly by both the instructors during the live skype video calls.

Cite this Article as: Khan RAHATULLAH Muhammad "Value Perception of Private Educational Institutions' Students on Co-Taught Virtual Entrepreneurship Courses" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

The results show that virtual class rooms co-taught by the two instructors from diverse cultural backgrounds, locations, expertise and approaches are indeed a great success. These classrooms are here to stay and define our teaching pedagogy and learning in the 21st century. This study will set a path and help guide strategists to develop future plans and tactics to commence co-taught virtual learning courses.

Literature

The traditional classroom has been dominated over the past 50 years by a teacher-centered approach to teaching (Roland 2014; Feden, 1994). Lecturing, modeling, instructing, illustrating, demonstrating, and coaching have remained the main teaching strategies-of teacher centered approach (Brown, 1998; Castling, 1996). These strategies mainly involve the teacher in making a formal exposition of a desired teaching content.

On the other hand a student-centered teaching approach focuses on empowering the learners by providing them with sufficient guidance, practical experience, meta-cognition, and self-evaluation through small-group interaction (Withycombe et.al. 2016; Kliegl & Weaver 2014). Its teaching strategies may include group discussions, debates, simulation games, role-playing, case studies, projects, field trips, cooperative learning, and problem based learning. These strategies are however 'process oriented problem based, contextual, interdisciplinary and meta cognitive in nature' (Brown, p.49)

As professional teachers, academics are facing a difficult challenge from learning technologies, as they have to renew and develop their model of the learning process well beyond the traditional transmission model (Essed et. al. 2018; Schön, D. A. 1987). Exploration of an innovative strategy requires a teaching approach to turn academics into reflective practitioners as professionals in teaching and research Wenger, E. (1998).

A new teaching and learning approach is fast becoming reality with the help of Internet Min Wu, et.al. (2008). It is an open, flexible and technologically accessible means of dissemination and communication. It is also a powerful tool for breaking the limitations of time and space that exist in traditional forms of teaching and learning Peter, M. Y., James, N. C., (2006). Hence the term virtualization is gaining ground. Virtualization of the learning process through the use of IT equipment based on Internet is becoming popular (Sabo et. al. 2015 and Uceda & Senén, 2010). They also assert that as online teaching and learning is faculty-delivered instruction via the Internet. Two parallel processes take place in such an environment and these are that students become more active and reflective learners and students and teachers engage in learning through the use of technology. This helps them become more familiar with technology.

Online teaching and learning is most effective when delivered by teachers experienced in their subject matter (Imbernón, et.al. 2011, Bersin, 2002). The online teaching and learning approaches of 'synchronous' and 'asynchronous' (which is learning takes place any time anywhere) are known; Berge, Z, L., 2002; Feenberg, A., 1998 and http://www.emoderators.com/moderators/teach_online.html). Synchronous learning includes live chat, audio and video conferencing etc. Whereas, asynchronous learning methods use the time-delayed capabilities of the Internet including e-mail, threaded discussion (Roland 2014 and Mark, T., 2012). Web based Learning Primer, available at http://www.c2t2.ca/landonline/primer.html). Online teaching and learning may also help to adopt student-centered teaching and learning and help students become more versatile learners (Withycombe et.al. 2016; Berge, Z, L., 2002 and Bersin, J., 2002).

Another form of teaching and learning approach is collaborative learning. It helps the students become more active participants in the learning process with easy access to global resources. It helps the students to easily access online databases in the online classroom (Donald C., et.al. 2010, Uceda & Senén, 2010). Experiential learning through multimedia presentations utilizing new technologies can be used to engage and motivate the students (Kliegl and Weaver 2014 and Brian T., 2012).

Teaching online offers the advantages like the opportunity to think about teaching in new ways; provide ideas and techniques to implement in traditional courses, expand the reach of the curriculum, professional satisfaction for instructors and instructor convenience (Laurie, P., 2011). Some of the challenges for instructors of teaching online include familiarity with the online environment, capacity to use the medium to its advantage, being available to students on an extended basis electronically, providing quick responses and feedback to students (Massy, W., 2002, Castling 1996).

On the other hand De Vry. et.al. (2000) posit that the three primary challenges associated with online teaching are effectively structuring online courses, creating community in virtual classrooms and facilitating and encouraging online discussions. Structuring an online course includes course planning, course organization and communication.

Bruner, J. S. 1960 asserts that the pedagogy is the science and art of education. Its aims range from the full development of the human being to skills acquisition and different techniques and tools applied by teachers to help students learn. According to Lawrence, C, R., (1999) it is important to develop online communities in the classes being taught. Creating community includes student-to-student interaction, faculty-to-student interaction, allowing students to post student-to-student communication to get answers to questions, pair each student with a "buddy" in the course, encourage peer response, structure opportunities for personal interaction.

Another interesting and pertinent report by Regalbuto, J., (1999) on "Teaching at an Internet Distance: the Pedagogy of Online Teaching and Learning", a sense of group and community among electronically assembled individuals can be created by a combination of team building activities, facilitation skills, and conferences for specific groups and tasks. It suggests that faculty-to-student interaction and principles of good practice highlight the importance of faculty-student interaction in promoting learning in such environments.

Gaps

This discussion shows use of Internet in teaching is on the rise and widely acceptable and practiced. However, we do not have the concrete and widely available evidence for its effectiveness from the most important stakeholder i.e. the student, the customer and especially in entrepreneurship related courses.

Keeping the literature in view the researcher aimed to carry out a detailed survey of the students who have taken virtual co-taught courses. Two such institutions were identified. Their names are not revealed due to permission not granted from institutions to use their names. However, the consent was given to conduct the survey, analyze the findings and provide recommendations.

Researcher intends to bridge the knowledge gap on student value perspective on the virtually co-taught courses. The higher education institutions spend huge funds on providing the right education to the students. They carry out expensive research and develop the curricula to enhance student experience and achieve certain learning outcomes. However, we have limited knowledge on student perspectives that how can these learning outcomes be better achieved. This study aims to seek answers of following questions.

- What is student value perspective on virtually co-taught entrepreneurship courses?
- What is the student perspective on knowledge acquisition through such courses?
- What is the student perspective on benefits for students of such courses?
- What is the student perspective on acquiring intended learning outcomes?

This paper based on the following methodology will attempt to understand the perspective of the students of co-taught virtual entrepreneurship courses on feasibility as teaching pedagogy and learning mechanism.

Methods

Research Design

A business cannot succeed unless it is customer centric. Therefore, in order for the co-teaching to succeed, the researcher planned to reach out to the customer (students) to know their perspective and identify the triggers of satisfaction on this relatively newer concept. If faculty does not know the standpoint, needs, expectations and requirements of the students from such courses, these might not succeed.

Design Stages

The following table shows the stages of research this study went through.

Table 1: Research stages

.Stages	Explanation
Exploration	The study explores the literature on co-taught courses to develop a scholarly view of the co-taught courses in higher education.
Identifying Gaps / Conceptualizing	The next stage was to conceptualize the research. Identifying gaps and developing execution strategy.
Execution	Detailed look at methodology is provided to develop appraisal of the appropriate methods to investigate and analyze the results.
Data presentation and Discussion	At this stage the data had been collected with the help of the international counterpart. The data was then analyzed and presented with the help of statistical tools including SPSS.
Conclusions and Recommendations	The data analysis and discussion assisted to draw conclusions and make recommendations in light of the findings.

Validity and Reliability Issues

It is a repeatable, systematic procedure to produce validation results. The specific aspect of validation methods as opposed to a general view of methods is that user validation always starts with an objective and assessment criteria. The analysis of the research methods is completed by a validation exercise carried out in order to assess the content and face validity of the results through measures stated below.

- Validity of measure in quantitative research
- Questionnaire design effects, problems and considerations

At the end of the course an online survey was conducted and 55 out of the 59 involved students responded giving more than 93% response rate. The questionnaire was developed on 5 ratings scale of, Do not agree (1), May be (2), somewhat agree (3), Agree (4) and fully agree (5) with the statement. The aim of survey was to understand students' standpoint on a variety of issues related to a co-taught entrepreneurship course in virtual settings including following.

1. Attributes of Teaching and Learning in a co-taught virtual classroom
2. Benefits of virtual class room learning
3. Challenges that arise in the virtual class room for the students, including effectiveness of the use of IT and Internet, the use of multicultural teams for assignments and projects, teaching and Learning across cultures and borders
4. Pedagogical approaches and their effectiveness in virtual classroom, it includes Teaching Strategies adopted and which ones could be more successful, skills development in virtual classroom setting and what to do in order to help students acquire knowledge. It also identifies the effective learning methods and role of virtual classroom in developing Cognitive skills of the students and what do students think of the experience of such an environment
5. Accruing opportunities for students, faculty and partnering institutions
6. Overall success of the virtual Teaching and Learning

The entrepreneurship course of "starting new business" was co-taught in virtual online environment. The survey instrument was placed on www.surveymonkey.com and the students of both the class rooms in Saudi Arabia and USA participated. The data was then downloaded in SPSS for analysis and presentation.

A pilot study for survey was conducted and seven Saudi Institution students participated and minor changes asked for were incorporated. The survey was placed online on December 11th and results obtained on December 30, 2012. The students were sent emails and were reminded twice during this period. As the names of the institutions cannot be revealed, the institutions are located in Saudi Arabia and the USA. The institutions would be labelled in the following sections as Saudi and US institution.

Data Presentation

The degree duration of the students from Saudi Institution was five years whereas it was four years in respect of the students of US Institution. Majority of students from Saudi Institution were from year 1 and year 3, whereas, from US Institution year 3 and 4 students attended these courses. The number mix of the student maturity seems normally distributed at the different levels of the degree, i.e. except 2 students from year 5 at Saudi Institution all other respondents were from among year 1 to 4.

Level of Studies * 'Student At' Crosstabulation

Level of Studies	Student At		Total
	Saudi Institution	US Institution	
Year 1	10	3	13
Year 2	5	4	9
Year 3	9	10	19
Year 4	2	10	12
Year 5	2	0	2
	28	**27**	**55**

Students at Hope College USA | Students at Effat University Saudi Arabia

Results and Discussion

This section shows results and discusses the possible implications of the answers. The results and discussions will be carried out on teaching and learning attributes, benefits, challenges, pedagogy, classroom experience, skills development and opportunities. Correlations are carried out in the end between the benefits and challenges and pedagogy for further clarity.

Teaching and Learning Attributes

The following table 2, figure 2 identify the student perspective on the attributes of the co-taught virtual classrooms. It shows that the majority of students are of the standpoint that in the virtual classrooms the workload gets heavy for them. However, there is also a notable population of respondents disagreeing with the majority.

Table 3: Teaching and Learning Attributes in a virtual classroom

Descriptive Statistics		
	Mean	Std. Deviation
The argument and evidence becomes norm	2.9111	1.20269
The workload can get heavy	3.2000	1.05744
The course becomes concept central	3.3111	1.16428
Principles and concepts are practically looked at	3.4000	1.09545
There is more active interaction	3.7500	1.22237
Course content becomes linked to real life	3.8222	1.13396
Valid N (listwise) 54		

Figure 2: Teaching and Learning Attributes in Virtual Classroom

Majority of the students (with little variation from norm in the answer pattern realized from standard deviation) express their belief in such courses and suggest that these are very practical and applicable to the real life. Similarly, responses also suggest that the interaction in the class and the practicality of the concepts is central to the teaching and learning in these environments.

Benefits of the co-taught virtual class room

The figure 3 shows the viewpoint of the students regarding possible benefits they gained from co-taught virtual classrooms.

Figure 3: Benefits of Virtually Co-taught Courses

Looking at the numbers 0 to 30 are the student respondents, it seems that gaining experience and new knowledge, enhancement of the learning opportunity and learning of new culture have been identified as major benefits of the co-taught virtual courses. Looking at the student learning stage, it shows that the students seek acquiring of 'new knowledge and knowing culture' as more important benefits. The students also regard it as important experience. Comparatively smaller number of students regard it as opportunity to make new friends, gain experience and learn new culture.

This is perhaps due to the fact that the co-taught virtual courses are organized across boundaries and when such an opportunity arises it assists the students to expand their horizon and learn more. The students response seemed a little cautious in making friends, this is may be owing to the fact that they require more time to acquaint themselves with each other and that knowing better each other may require meetings as well other than online.

Challenges in the co-taught virtual classrooms

The following chart in figure 4 shows that the students think that managing differences in different cultures is a challenge. The virtual co-teaching is supposed to happen in two different institutions and in this case it was two countries with a time difference of 8 and nine hours in summer and winter timings. The students pointed out that managing the time difference is another challenge, the policy makers and colleges and universities contemplating such alliances may take into account. Such a big time difference can mean that students and instructor(s) of at-least one institution have to make sacrifice of their time and they might need to be compensated for it.

Similarly, the students note the issue of internet connectivity, online meetings and sound system. There were a number of assignments to be completed in a team. This increased workload on the students and they also found it hard to find time and get connected with the colleagues in two different countries because of the time difference.

Figure 4: Challenges of the c-taught virtual classroom teaching and learning

This future virtual classroom would need to be better equipped and time differences should be managed. Likewise, it is important that the institutions collaborating must take into account the difference of the time zones they are in.

Table 4: Challenges of the co-taught Virtual Courses

Challenges	Mean	Std. Deviation	Level of Studies				
			Year 1	Year 2	Year 3	Year 4	Year 5
			Mean	Mean	Mean	Mean	Mean
Technologically well equipped class rooms	2.8889	1.24722	3.38	2.75	2.56	3.30	2.00
The Sound system	2.9556	1.31349	3.75	3.25	2.94	3.90	2.00
Getting connected with colleagues	3.0000	1.27589	3.63	3.50	2.76	3.44	5.00
Managing time difference between two countries	3.0222	1.48460	3.38	2.38	2.83	3.40	2.00
Coverage of course syllabus	3.0682	1.35368	3.38	2.88	3.17	3.00	2.00
The Mike system and apparatus	3.0889	1.14460	3.13	2.63	3.11	3.50	2.00
The Projector system and appratus	3.0889	1.18364	2.25	3.00	2.89	3.80	4.00
Time management during course	3.1163	1.33112	2.50	3.25	3.00	3.10	4.00
Existing skype experience	3.2558	1.19708	3.38	3.38	3.22	3.20	4.00
Managing differences in two diverse cultures	3.2889	1.19891	2.88	3.75	3.00	3.00	3.00
Skype or any other communication tool	3.3333	1.22474	3.00	3.57	3.00	2.80	4.00
Valid N (listwise)	55						

Table 4 shows that the younger students of year 1 and 2 consider the skype experience and technology as major challenge. They also think that due to this the completion of the course content may become difficult. This also shows their maturity level. Getting connected with counterparts from other institution is a challenge for students except the year 3 pupils who recognize it as comparatively less of it. The students from year 4 and 5 take the projector system, time difference and skype as main challenge. It means that students are fully aware of the issues and challenges that may arise in their class rooms and they feel cynical.

Pedagogical approaches and their effectiveness

The figure 5 shows that majority of the students agree that the co-taught virtual classrooms provide more opportunities to reflect and think about the subject matter and lecture topics. This could be because the co-taught virtual classrooms in disguise develop a sense of competition between students' from two distinct institutions. This can act positively in achieving course and learning objectives set. Similarly, the students agree that such courses provide more opportunities for in and out of class discussions and lecture becomes more interactive

Figure 5: The basis of co-taught courses / pedagogy (1)

The figure 5 reveals that less than 10% respondents' believe that co-taught virtual classrooms do not provide the better opportunity to learn. Overwhelming majority of more than 95% assert that these classrooms are more interesting and fun generating while educating with increased interaction from two instructors. The increases the confidence level of the students and the quality of both teaching and learning is enhanced. Correspondingly, more than 93% students responded that these courses added to the learning value and showed great deal of instructor – student commitment and students achieved more than in student / teacher centered lectures.

Table 4 – Pedagogy

Pedagogy, Teaching Strategies	Std. Deviation	Pedagogy, Teaching Strategies	Std. Deviation
Presentations	0.4341	Teacher - Student commitment	0.2362
Research	1.1481	Joint assignments	0.2505
Course Project	1.2898	More confidence to students	1.1119
More student - instructor interaction	0.3551	Higher interest from instructors	1.0745
Better achievements qualitatively	1.2177	Added Value to learning	0.1232
Learning from two instructors	0.4557	More interest and fun	0.2227
Better learning opportunity than normal class room	0.3169	Knowledge to be used practically	1.0908
Reflection	0.1947	More interaction	0.1862
Enhanced quality of teaching and Learning	0.3054	Opportunity to students to broaden their horizon	0.1985
Assignments	1.0869	Discussions with peers	0.2996
Perspective of two or more faculty	0.3409	Class Discussions	1.1160
Concept clarity by instructors	0.2362		

Students were asked to respond on their likeness of strategies adopted and possible benefits and reasons for liking. The table 4 above shows that new values accrue from co-teaching. The students seem to agree that the diversity of presentations, increased interaction with two instructors and learning from their experiences provided more room for reflection. The students also showed interest in joint assignments that led to understanding cultures and making friends across the borders. However, it is also evident that the students showed that the co-taught virtual or normal class room teaching and learning provides similar outcomes and generate interest regarding research and use of knowledge in practical life.

It is also evident that according to students these courses will develop their communication skills which may be because of several factors like discussions with partners from other institutions, amount of class room interaction and discussions.

Figure 6: Education Experience in Classroom – Pedagogy (2)

Looking at the number of students responding on x axis in figure 6 or in figure 7, the students were asked to opine whether and to what extent they agree that the knowledge acquired in the classroom is usable in practical life, such environment generates more interest for teachers and opportunity to research. The view of the students' show that respondents agree largely that the instructors show more interest and the knowledge students acquire is practical in nature that can be used in their practical life. Students also have agreed that such classes generate more opportunities for research for them. It may be because the instruction comes from two teachers who want their students to conduct investigation into diverse areas.

Figure 7: Pedagogy (4)

Achieving Skills Learning Outcomes

Similarly in order to understand the student opinion regarding skill development in a co-taught virtual classroom they were asked to rate if the class room experience provided them opportunities to develop communication and the interpersonal skills. However, it is not the case that interpersonal skill ability does not occur. It entails that students' better interpersonal communication happened interacting their counterparts

Figure 8: Skills development – Pedagogy

Opportunities presented by the co-taught virtual classrooms

The students shared their views on conducting such courses identifying that such courses may generate future collaboration opportunities for the institutions and develop better course materials. It is seen that majority of the students agree to the fact that these classrooms will generate collaborations at both the student and institutional levels. This identifies importance students attach to such an environment for knowledge acquisition

Fig. 8: Possible Opportunities to accrue from virtual classroom settings by two institutions

Value Perception

A number of benefits were identified by the students as shown in preceding discussions. In order to understand the student value perception of the virtual co-taught courses the benefits were correlated with certain value propositions as enumerated in the literature and developed by the researcher as possible values through brainstorming with students.

Table 5: Correlations between Benefits, Challenges and Pedagogy

Benefits	Value Accrued									
	More interest and fun	More interaction	Learning from experiences of two instructors	Enhanced quality of teaching and Learning	Joint assignments that led to more knowledge	Opportunity to students to broaden their horizon	Acievements were qualitatively better	Class Discussions	Discussions with peers from other institution	Concept clarity by instructors
Enhanced exposure in the area of the course	0.333	0.353	.427**	0.388	.237	0.418	0.319	.198	.217**	.262
	.312	.218	.005	.111	.131	.601	.594	.208	.034	.093
Gained experiences	0.384	0.481	0.31	.240	.559**	0.478	.256	.215**	0.363	.194
	.110	.108	.404	.012	.020	.201	.097	.016	.169	.211
Enhanced learning opportunity	.386**	.498**	.451**	0.603	0.299	.405**	0.513	0.411	0.459	.527**
	.010	.001	.002	.100	.484	.006	.890	.601	.802	.010
New knowledge	0.386	0.424	0.46	.418**	.139	0.503	.418**	.283	.150	0.342
	.106	.805	.800	.005	.375	.110	.005	.066	.337	.493
Learned about new culture	0.391	0.416	.460**	0.33	.079	0.508	0.375	.185	.266	.295
	.869	.100	.016	.287	.612	.990	.123	.231	.181	.052

N=55

**. Correlation is significant at the 0.01 level (2-tailed).

*. Correlation is significant at the 0.05 level (2-tailed).

The above correlations show that learning from the experiences of the two instructors enhances the student exposure even more. It also provides students with an opportunity to broaden their horizon, reflect, complete their assignments and course / project work in a better manner. This provides them with valuable experience and enhances their learning emanating from two instructors. The students also seem to suggest that this environment of learning and teaching is better in order to have concepts clarity and engage with their counterparts from participating institution(s). It can be implied that this provides students with new knowledge and presumably may augment student – instructor commitment. This satisfies what Bersin (2002) opined that the class discussions are considered vital in order to enhance learning, add value and achieve better quality in assignments and course work.

Since the quality of teaching is enhanced as two instructors provide their views, feedback and lectures. These are from different perspectives. Similarly, the class discussions are more diverse and multicultural. The assignments are completed by the students groups working together from across borders. The responses show that these help gain better experience for the students. The interest, interaction and learning from experiences of two instructors improves the learning experience. Similarly, new knowledge is acquired through class discussions and the virtually co-taught courses opened avenues to learn more about the new cultures.

Skill Development

Numerous higher education quality frameworks for the teaching and learning in higher education rate learning outcomes of 'communication' and 'interpersonal' skills (Nkhoma et. al. 2014; Havnes & Prøitz 2016; Rahatullah 2014) acquisition by the students as integral and important part of class room experience. The figure 9 below shows that students agree that virtually co-taught courses help increase interpersonal and communication skills.

Role of Virtual Class Rooms in Student Skill Development

Overall Ratings of the co-taught virtual courses by students

Students were asked to rate overall success of the co-taught virtual courses. Following table 7 and Figure 10 show that they highly rated the success of these courses.

Figure 10: Overall Success Ratings

In all forty eight students rates the course as acceptable to high and of very high advantage. There were however, 7 students who are unconvinced of the experience and they rate it of low advantage or of no use. Their percentage is 12.7. Nonetheless, the percentage of respondents who rate it successful is more than 83%

Conclusions

The above discussion reveals that the co-taught virtual class room experience is success. The academia has to develop the teaching strategies that can capture the pedagogies emphasized by the students as effective. Similarly, there is a great need to develop the technology infrastructure before embarking into this venture.

In such an environment the courses become more concepts central and linked to practical life experiences. Co-taught virtual classrooms are great source of motivation for the students as they learn about new cultures and it increases their exposure to the subject and provides opportunity for enhanced learning. The future virtual classrooms would need to be better equipped and time differences should be managed.

The study has answered the questions raised to an extent that warrants change in our approach to develop courses. The students seem to like the innovative approaches to the education and learning.

The practical courses where the students need to perform jointly in assignments and other forms of assessments, a co-taught virtual classroom would be a viable psoposition.

The co-taught virtual classrooms may offer blessing in disguise by developing a sense of competition between participating students' and help in achieving course objectives and learning objectives set. This could also help in determining and setting the strategies for deep learning and holistic education.

The sound systems, the video conference tools and associated technology need to be perfect. This environment is positive, more interesting for both students and teachers, generates research, collaboration and partnering opportunities.

Recommendations

If the student perspective is not taken into account and if the institutions randomly kept on developing co-taught courses without knowledge of the student perspectives the pedagogy might not deliver the anticipated results.

The co-taught courses are gaining momentum and this study can set a path and help guide strategists to develop future plans and tactics to commence co-taught virtual learning courses.

A similar survey on a larger sample involving more students and faculty as well needs to be carried out. The concept may be taken further.

Abstract

The business has gone through numerous evolutionary stages. However, the current industry 4.0 revolution promises a huge revamp of the business processes and the way the businesses are conducted. This paper analyses the adaptation of Accounting and Finance in retail sector in Industry 4.0 (Cyber-Physical Systems - CPS). It has been concluded that the accounting has also been impacted and especially in retail sector. It has changed significantly and industry would need more expertise and knowledge of soft-wares, analytical skills, leadership, economics, globalization and internationalization effects of the firms and a lot more. Similarly, block-chains would help collect and keep large volumes of information with its numerous types more quickly. The digital production and acquisition of data would positively affect the accountants and auditors.

Keywords: Industry 4.0, Retail sector, Accounting,

Introduction

The history provides evidence various revolutions through its course, impacting heavily the global geopolitical and economic landscapes. However, over the past 300 years, 4 major industrial revolutions have changed the economic scene of the world. Two of these events happened in last 50 years or so. The 4th industrial revolution is based on cyber-physical systems and required digital leadership at industrial and individual levels bringing disruptive changes. The Ptolemy project at Berkeley university describes Cyber-Physical Systems (CPS) as "integrations of computation, networking, and physical processes where embedded computers and networks monitor and control the physical processes, with feedback loops where physical processes affect computations and vice versa" at https://ptolemy.berkeley.edu/projects/cps/#:~:text=Cyber%2DPhysical%20Systems%20(CPS),affect%20computations%20and%20vice%20versa. The governments, conglomerates and SMEs have adopted the CPS through digital leadership in order to provide better services to their customers in cost and time effective manner.

This essay provides a critical analysis of the effect of the Industry 4.0 on our profession and accounting sector. It also discusses the likely future course of the sector in changing scenario and making conclusions. During the whole discussion the paper will benefit from understandings of digital innovation, how internal innovation model is applied and need and role (already played and future expectations) for action oriented vested and visionary leadership to achieve organizational growth through KPIs and realizing goals.

Accounting and Finance Adaptation of Industry 4.0

Accounting and finance are a basics of management field as in simple terms, it's a guideline / rules to operate a business and origination. Accounting has been around for 100 years, it's all about how to count things and keeping score. We add

Cite this Article as: Rahat SAMEEA Muhammad and khan RAHATULLAH Muhammad "Analyzing Adaptation of Accounting and Finance in Retail Sector in Industry 4.0 (Cyber-Physical Systems - CPS)" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

numbers in a book, and make sure they provide a logical and correct result in terms of numbers. For this we need human assistance to make sure we have added a right number and are useful in future.

Accounting has digitalized and changing during the course of Industry 4.0. It is becoming the lubricant of organization. Therefore, effective v1isionary leadership can provide right management approach necessary. The computerization has freed up our time and we can focus more on vital strategic organizational issues and help the firm make better decisions. We can now verify numbers and conduct extrapolations and predictions enhancing trust in the performance data. The data now travels in high speed like a block chain. This enables the transactions to be carried out in a more time and cost effective manner increasing confidence levels of both customer and the firm and has brought more efficiency.

The Institute of Chartered Accountants of England and Wales (ICAEW) website (https://www.icaew.com/technical/technology/block-chain/block-chain-articles/block-chain-and-the-accounting-perspective#:~:text=Block-chain%20is%20an%20accounting%20technology, the%20analysis%20of%20said%20information.) introduces the block-chain in following manner.

"Block-chain is an accounting technology concerned with the transfer of ownership of assets, and maintaining a ledger of accurate financial information. The accounting profession is broadly concerned with the measurement and communication of financial information, and the analysis of said information. Much of the profession is concerned with ascertaining or measuring rights and obligations over property, or planning how to best allocate financial resources. For accountants, using block-chain provides clarity over ownership of assets and existence of obligations, and could dramatically improve efficiency".

This use of new technologies is changing the future of accounting and finance. Some accountants are afraid that automation and artificial intelligence (AI) will replace their jobs but I believe that, that fear is misguided and unfounded for two reasons, i.e. firstly, Radmillo 2004; argues that new technology doesn't wipeout jobs but reinvents work opportunities and even create new openings. Secondly, automation cannot replace every aspect of an accounting job. Technology can only replace routine and non-creative tasks (Can et.al. 2019). Therefore, robots aren't coming for our job they're coming alongside and taking up our routine mind numbing tasks freeing us to move into a more advisory strategic role. I believe now the accountants would have more time to strategically analyze, interpret, strategize and recommend policies and systems to the organization. Thus providing more depth to their importance as a key player in organization growth and enhancing profits.

It will mean that accountants will likely redefine themselves as strategic advisors using technology and AI. Machine learning will automate routine tasks that take up precious hours of accountants and allow them to look at the bigger picture and delve into advisory roles. I understand and agree with Can et.al. 2019 that accounting firms of the future will use automation to become more efficient communicate key insights to clients and continue to build their reputation as trusted advisors.

Industry 4.0 Influence on Accounting Profession through Block Chain

Block-chain enhances the accounting profession by reducing the costs of keeping and reconciling ledgers. It offers certainty regarding the ownership and history of assets giving clarity to the accountants on available resources and accruing obligations of their companies. It frees up accountants' time to concentrate on planning and valuation, rather than only recordkeeping. It is a replacement for bookkeeping and reconciliation work. It prompts more value-based level bookkeeping, however, not by bookkeepers. Rather, future successful accountants will take a shot at analyzing the monetary translation through block-chained records, comparing, contrasting and evaluating the records for financial reality, adding overall value to the accountants' outputs.

The block-chain would help auditors to analyze and use their competencies to answer more important questions raised during the audit and assist the organization under review. Block-chain also impacts external audit as it has applications for it. Performing confirmations of an organization's money related status would be less essential assuming a few or the entirety of the exchanges that underlie that status are obvious on block-chains. This proposition would mean a significant change in the manner auditing is performed. A block-chain solution, with the help of data analytics, would assist the transactional level transactions during audit process.

How

Block-chain can assist the Accountants

Petrucci and Rivera 2018, said that it's crucial for all digital leaders to implement a digital roadmap outlining the business goals and identifies the digital initiatives, long term and short-term objectives. Essentially, it's the blueprint for actions that all aligned to the digital strategy.

I understand that the block-chain is to be further developed, stakeholders taken on board and necessary trainings conducted by governing bodies for their members to help the professional and practitioners understand the contemporary block-chain, its future and implications. This will help the block-chains further developed, standardized and optimized for greater impacts. A number of start-up businesses are developing the block-chains and its applications but majority are in their infancy stage. The biggest challenge I can identify is developing rules, laws, and regulations, codes of conduct and industry standards. This would direct and compel the accountants to learn technology, analytical and advisory skills, hence more value added.

Need for Digital Leadership Skills required for Successful adoption of Block-chain

Hernandez 2015, Twenge 2017 and Petrucci and Rivera 2018 identified a number of digital leadership skills and include the following that would be required to adopt and adapt the block-chain in our profession.

1. **Communication**
2. **Clear Vision**
3. **Digital Literacy:** Research from a Harvard Business Review with 1,000 CEO's, showed that 90% leaders believe their business is being disrupted or reinvented by digital business models. But when asked about their capabilities, 70% believe they do not possess the right skills, leader or operating structure to adapt.
4. **Strategy**: A robust strategy is required to complement the above skills
5. **Innovation**
6. **Risk-Taking:** Risk taking is crucial part of digital leadership. Mark Zuckerberg, stated that "the biggest risk is not taking any risk. In an ever changing world the only strategy guaranteed to fail, is not taking risks".
7. **Information Security**

Developing, adopting and adapting to a block-chain would require capability and people related leadership (Vested and Visionay) digital leadership which Foka, 2018 defines, as "the strategic use of a company's' digital assets to achieve its business goals". This use could be at organizational and individual level. At individual level, it is carried out by those responsible for overseeing the digital assets. According to Fisk 2002 and Rahatullah 2017, the digital governance and or management requires an effectual leader aware of the business goals and knows how their job responsibilities support it.

Whereas, Wade and Obwegeser 2019 suggest that at an organizational level the digital leader could for example be a company that has successfully taken advantage of their digital assets to gain and maintain a competitive advantage. Professor Stijn Viaene at Vlerick Business School in Belgium described the digital leader as shown below.

https://www.europeanbusinessreview.com/what-digital-leadership-does/

In contemporary world, digital leadership requires a unique set of skills to drive success for an organization and overall workforce. Deloitte identifies that "42% of major companies now believe to be more successful by use of enhanced digital tools employing digital leadership by adopting following skills.

Conclusions

The profession faces huge challenge which is a motivation in itself that we may well be working with robots and complicated digital systems. Therefore, accountants would need to comply with the expanding digital developments. It seems imperative to adopt to the block-chain to attain greater benefits and induce more professionalism.

The discussion above reveals that the accounting has changed and would change more significantly, therefore, we would need more skills and broaden our horizon out of accountancy and acquire additional skills and knowledge of soft-wares, analytical skills, leadership, economics, globalization and internationalization effects of the firms and a lot more.

As we know that the data size is dependent on magnitude of organization and the bigger the firm, the bigger the mass of data it produces. Block-chains help collection and keeping of large volumes and several types of information quickly. The digital production and acquisition of data would positively affect the accountants and auditors.

We will not need to acquire in depth knowledge of how block-chain works. What is necessary for us to understand is to know how block-chain works and how can we advise on its adoption and impact of block-chain on their businesses and clients.

"Block-chain is an accounting technology concerned with the transfer of ownership of assets, and maintaining a ledger of accurate financial information. This would spare time for accountants and gain clarity over the resources available and obligations of their firms. This will free their resources to concentrate more on planning and valuation and not recordkeeping.

Pie Paradise
Evolving Social Contract and Personal Commitment Produces Start-up Success in a Harsh Masculine Entrepreneurship Ecosystem

Khan RAHATULLAH Muhammad

Effat University; Jeddah; Saudi Arabia
mkhan@effatuniversity.edu.sa

Abstract

Saudi Arabia scores 36 in 'long term orientation' dimension in Hofstede's studies. People in such societies exhibit great respect for traditions. Similarly, Saudi Arabia is labelled as a collectivistic society where the hierarchies are recognized and followed. This is even true in families as the males dominate. Saudi Arabia therefore, is seen as an ultra-conservative society where the rights of women are often limited and they need male permission to perform any and every work or even study and travel. The driving ban on women has only recently been lifted. The society has started to evolve and the women are now asserting their skills and acumen. The traditions still remain very tightly followed. The national entrepreneurship ecosystem is also considered harsh as women participation is negligible. However, there are signs of cracks appearing in the old-fashioned tradition clad society. The women have been successful as start-ups. Having a faceoff with conventional elements is exceptional as this case narrates. It brings to light the changing nature and the role of society, family and determination of the start-up to face challenges and succeed. The case identifies the challenges, punitive and strict systems and social laws. It identifies evolution occurring in social contract where there seems an implicit agreement among the society to accept women in business fields among others. Case helps the reader understand the prowess of young female start-ups; how some of these young females are breaking fetters and taboos attached are blown. The role of personality characteristics and assertiveness are important in changing scenario.

Keywords: Female entrepreneurs; Saudi Arabia; Harsh entrepreneurial ecosystem; Leadership

Introduction

Pie Paradise was formally established in August 2015, however, the company was working for a few months casually and on order basis. It is a start-up specializing in baked pies' of a high quality sold on premium pricing. It is based in Jeddah Saudi Arabia and its owner Ayah Enani is a graduate with a business degree at BS level. The entrepreneur is married and expecting her first child in 2016. She does not belong to a business family and currently has two full time staff working with her. She is also a chef and has her own program on the TV channel, Fatafeat. The business sells online and has strong social media presence. Ayah talks about her startup and experience as "Having your own business is really easy nowadays with Internet, but the issue is how to maintain it. My experience so far was really good, and with marketing and adding new flavors consumers are more interested. Also it is considered the first Pie business in Jeddah, so the demand was really high, but with new entrees and competitors we are trying to keep our business with the highest quality and flavors, and best prices". Pie Paradise is currently skimming the market through high price and better quality. The company delivers the products for individuals, businesses, office and domestic parties.

The owner has typical start-up motives of becoming own boss, earning money, exploiting the opportunity available in the market and getting social recognition satisfying Maslow's hierarchy of needs concept leading to esteem needs. This is a little different than the push/pull or necessity/opportunity models. Here it seems a mix of the push/pull or the necessity/opportunity basis. The start-up seems to have been largely drawn into business to bring work-life balance, independence and flexibility, i.e., through mix of the circumstances.

Ayah is of the view that there are a number of challenges faced by the women start-ups in Saudi Arabia. She mentions issues related to setting, running and managing her business like, skills, knowledge of planning, including business, strategic, operations, financial, budgeting, HR etc. Since Saudi Arabia entrepreneurship ecosystem is evolving these startup, launching and operations related skills and knowledge related difficulties are being identified and an effort is underway to provide assistance to startups. Similarly, as reported in ecosystem study the information on Saudi labor and business laws also hinder the smooth startup and launching. Skills like communications, time management and sales also were identified as delaying and deterring factor. On the other hand the issues that always signify the Saudi society and culture did not seem to be of any significance when it came to the Pie-paradise. These included family

Cite this Article as: Khan RAHATULLAH Muhammad "Pie Paradise Evolving Social Contract and Personal Commitment Produces Start-up Success in a Harsh Masculine Entrepreneurship Ecosystem" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

issues, social taboos, education restrictions from family and husband and managing family and business together. Hence the main challenges can be categorized into startup, operational, skills and Knowledge related. Ayah successfully overcame these challenges as shown below.

Factors of Success

There are a number of factors for the success of the female startups. The start-up literature deliberates on about the education and its kind and level as a determining factor of success of the female start-ups. The occupational and sectorial expertise and prior business experience are regarded as a key to success. These are regarded important and underlying factor of success.

At Pie paradise the success has not been attributed only to these factors. The entrepreneurs' success has been realized by eight factors that helped overcome the challenges mentioned. It was Ayah's deliberate strategy to tune into these areas, get benefits and succeed. These factors could be termed as schemers.

- The entrepreneur also asserts contrary to literature on Saudi society. She says that the society has never been sarcastic or behaved in a restrictive manner. The people had been very receptive, open and agreeable to her concept of a pie business. This is in total contradiction to many studies and literature who pinpointed these as challenges but in the case of Pie Paradise these were unfounded. Instead Ayah found that the society at large was very receptive, full of support and encouragement. This was not possible a few years back but now the society has opened to new ideas and adopts to the latest trends and changes asserts Ayah.

  This has been a huge achievement of the Saudi society itself.

- The success has come through the entrepreneurial skills Ayah acquired in her studies, while hosting her program at Fatafeat and taking extra courses. She mentions the role of her studies and professors who assisted her in her endeavors both formally and informally. She proudly mentions that the role of education specially related to the entrepreneurial skills including development of communications, sales and negotiations helped her a great deal. She attended short courses on the leadership, team building and time management.

- Ayah identifies the role of coaches and mentors as special to her success. She has been advised by mentor on diverse range of issues. She says whenever she faced a difficulty she contacted her mentor and sought the advice. Her mentor is a seasoned entrepreneur who went through the similar challenges and problems. She has received the assistance in the areas of business planning, operations and launching of the startup.
- Ayah has been instrumental in exploiting the social media. She capitalized the facts that 58.84% of population uses internet and 29.58% population has social media accounts. Similarly, 173% of population has mobile phone accounts which means that a large majority of people have more than one phone. A considerable 25.72% of population has active mobile social accounts (http://www.smartinsights.com/social-media-marketing/social-media-strategy/new-global-social-media-research/). Her strategy of creating social media accounts and reaching out to clientele has worked wonders. She has presence on . As according to same website Saudi Arabia ranks 6th on g+, 23rd on Facebook, 13th on You tube and 3rd on Twitter. This showed the potential of generating traffic and securing orders for her Pies. Annual growth in the uses of these social media is above 20% and she is confident of the success in future as well.

- Ayah identifies assistance from both the strategic and institutional level entrepreneurship ecosystem stakeholders as important foundation of the success of her start-up. She particularly mentions services of the chambers of commerce, banking sector and other initiatives of the Saudi Arabian government providing a number of motivational and encouraging assistance to startups like that from Human Resource Development Fund (HRDF) etc.

- The entrepreneur also believed that the right market conditions that include the demand of the product, her own marketing and business development expertise, right pricing and affordability served as important elements to succeed as well. The per capita income in Saudi Arabia is $52, 800 according to the CIA fact book and it provides a lot of flexibility to such businesses. People have money to spend on expensive snacks and related items. A very clear market opportunity existed that was identified by Ayah and then fully exploited.

- Similarly, the role of family played an important and vital role in success. Ayah received a lot of moral assistance from the family. However, she neither required nor the family offered any financial or coaching or mentoring assistance.

- The role of husband has been undeniable fact in success of the Ayah's Pie Paradise. He has been her coach and mentor, helped her maintain a balance between family life and the business. He also fully supported the business with money and encouraged, motivated, guided and also provided moral assistance.

Ayah is confident that the coming years would be even more successful.

Conclusions

Since 2016 the Kingdom has witnessed huge changes and it seems the social contract is under evolution. This appears to be true as the case narrates the role of society, family and husband to be more accepting. The coaches and mentors who are mainly male also have been laying a positive role in grooming the female to start and manage their businesses. The ecosystem at the strategic level has been very helpful by developing new policies and procedures which are more gender specific and geared to assist female owned enterprise. These stakeholders have penned the laws, statutes and rules to develop right market conditions for startups in general and female startups in particular.

The Saudi women like their counterparts elsewhere are pulled into success by their personal commitment and skills. These away from norm attitude and behavior has assisted a great deal to the startups. The social media is abuzz and the businesses of all types benefit from it in the Kingdom.

Wellness Tourism:
Exploratory Analysis of Portuguese Consumers' Profile

Abstract

Wellness tourism is a recent and fast-growing trend globally that plays a significant role in the economic development of many tourism destinations around the world. Portugal already possesses a range of wellbeing activities to offer, for instance, the thermal springs that can constitute a more authentic tourism regional/local destination. This type of tourism offer can boost regional economies, improving both tourists' and residents' quality of life. In such a context, this research work intends to understand how the Portuguese residents understand the wellness tourism activities, particularly the thermal offer and to identify a customer profile. A questionnaire was conducted, to guide businesses into the comprehension of market needs and expectations according to the customers' profile, and an exploratory statistical descriptive analysis has been applied. The results allow designing a set of strategies according to the profile defined.

Keywords: Wellness tourism, thermalism, consumer profile, Portugal.

Introduction

According to the United Nations (2010, p.1), tourism can be defined as "a social, cultural and economic phenomenon related to people's movement to places outside their usual place of residence, pleasure being the regular motivation". By this definition, it is possible to comprehend that movement is the basis of tourism. A reason why the pandemic situation generated by the COVID-19 is having a massive impact on this sector of the economy since it has been leading countries to close its borders, implementing quarantine procedures and lockdowns to reduce movement as measures to lower the containment curve. Due to the COVID-19 outbreak, the UNWTO registered a 22% global decrease in the international tourist arrivals, only in the first quarter of 2020, with a possible reduction between 60% to 80% for the year (World Tourism Organization, 2020). Although the borders have been reopened, and travelling is allowed again, the sector's damage will probably be even more significant.

The current scenario demands tourism destinations to re-evaluate its strategies and adapt them to the current circumstances and market demand, to be able to overcome the negative impact of the pandemic. A proof of this trend is that some countries are studying the virus's influence in the consumer's behaviour, for instance, Portugal (Turismo de Portugal, 2020). This type of stimulation to the tourism comes from the fact that this sector represents a critical economic development source due to its impact on the economy, the environment, the local population of the tourism offer and the visitors themselves (United Nations, 2010). A fact that occurs due to tourism influence on the region/country's GDP, the increase in the employment rate, and the rise in tax revenues related to the tourist's spending in the destination (Romanova et al., 2015).

However, the formulation of special programs and action plans to support, stimulate and strategically invest in tourism is not something that emerges from the current crisis. It has been an international concern since globalisation has facilitated travelling. For instance, Portugal has designed a strategic plan named *Turismo 2020,* which is based on

Cite this Article as: Karen VILLARROEL and Alcina NUNES "Wellness Tourism: Exploratory Analysis of Portuguese Consumers' Profile" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

several trends related to economy, demography, culture, transportation, technology and environment, to increase its tourism revenue (Turismo Portugal, 2014).

From many different types of tourism, this research work discusses a modality related to an idea that has become a flourishing and profitable movement in the 21st century: the wellness tourism Global Wellness Institute (2019). With roots on ancient civilisations, wellness is a modern concept defined as the individual active chase of activities, choices, and lifestyle that lead to a state of health and wellbeing (Global Wellness Institute, 2019). Seen by some authors as a niche to be explored (Stara, Jana & Peterson, 2017) or as a product that evolved from a niche demand to a more mainstream holistic appreciation (Pyke et al., 2016), the fact is that wellness can lead to relevant economic developments in smaller tourism destinations.

The increased interest in wellbeing and a healthy lifestyle can be used by Portuguese businesses as an opportunity to boost demand on cities that have a wellness offer, such as thermal springs and resorts, and are located mainly in the central and northern regions of the country. However, before making investments to profit from this favourable market circumstances, private firms and public authorities must understand the wellness consumers' profile, needs, and expectations. By this understanding, it can be possible to formulate marketing strategies, increase awareness related to the concept of wellness tourism and then invest in innovative and differentiate products and experiences to enhance competitiveness (Fyall et al., 2013).

To guide the type of market profiling business could develop to study their consumers, this paper has created an online questionnaire to collect data about the tourism habits of the residents of Portugal. It was designed to analyse the participants' particular characteristics and evaluate the role they may play concerning the degree of familiarity with the concept of wellness tourism. The data collected through the questionnaire has been the object of exploratory descriptive analysis that allowed to start to understand the profile, needs and expectations of potential Portuguese consumers and therefore to begin reasoning about possible marketing strategies that boost the activity. The comprehension of the customers' market profiling allowed the development of a set of marketing strategies applicable to each particular demand and expressed the importance of collective work among private business and public authorities to create a complementary and unique offer in each wellness destination. A collaboration that can build a business opportunity and generate benefits for all parties involved, bringing economic development to the tourism destinations and increasing the quality of life of both tourists and locals.

The paper is divided as follows. Next section presents a brief literature review on wellness tourism for a better understanding of the topic. The section of literature revision is followed by a section that describes the methodology applied to obtain and treat the data. The results are presented in section 3. The paper ends with a section devoted to conclusions.

Literature Review

It is not only the nature of the trip that defines tourism, but it is also related to the journey's objective (Lickorish & Jenkins, 1997). As already mentioned, this study's object is focused on wellness tourism, which is a type of travel related to the seeking of maintenance or increase of personal wellbeing (Global Wellness Institute, 2018). For some scholars, this type of tourism can be understood as a subgroup of health tourism; however, this category emphasises medical-treatment-oriented activities (Lehto & Lehto, 2019), that travel to seek treatment for some medical condition. By contrast, as defined by Romanova et al. (2015), wellness tourists are generally formed by people on the pursuit of preserve or increase their health. The Global Wellness Institute (2018) explains that there are two types of travellers included in this tourism market. Primary wellness travellers motivated by wellness to travel or choose their destination based on its wellness offer. Secondary wellness travellers seek to maintain wellness or engage in wellness activities during any travel, representing the most significant part of the wellness travellers.

Wellness tourism is a type of travel that deserves attention for many different reasons, not only because it has become a health-conscious international trend (Stara, Jana and Peterson, 2017) that influences a person's wellbeing and due to its economic representativity. Even though the wellness tourism does not represent a leading type of tourism if measured in the number of tourists, it has a tremendous positive economic relevance on the segment due to the high costs usually attributed to this service (Romanova et al., 2015). According to the Global Wellness Institute (2018), this tourism segment represented a growth twice faster than general tourism in 2017, generating a $639 billion revenue among many elements of the global tourism industry in the same year. Moreover, the average expenditure of wellness travellers per trip is 53% higher than the typical international tourists and 178% more than domestic tourists.

Understanding the concept, the benefits and the demands of the market concerned with wellness tourism can help develop or strategically enhance products to fulfil this need. Being aware of this prosperous industry allows

companies, regions and countries to promote wellness activities and design a new market positioning related to this type of tourism (Stara, Jana, & Peterson, 2017). It is also an opportunity for business and tourism destinations to invest in creating a strategic advantage based on wellness orientation (Lehto & Lehto, 2019).

Based on the knowledge acquired about elements that contribute to traveller's wellness (Lehto & Lehto, 2019), marketers can detect a set of competitive advantages among location, quality of service, image, price (Romanova et al., 2015). To that end, it is necessary to establish an objective destination plan that should consider all factors of the internal and external environment, especially the human resources, which help to identify the uniqueness of the destination (Borseková et al., 2015). Moreover, the tourism staff, usually highly qualified labour, can be considered one of the essential sources for shaping the tourism offer's competitive advantage (Panasiuk, 2018).

When a product differentiation and positioning strategy is selected aiming to increase travellers' wellness by improving their personal experiences and expectations, an intangible tourism product is created (Lehto & Lehto, 2019; Romanova et al., 2015). Furthermore, positioning must consider target-consumers and attributes and the organisation's ability to communicate its offer to effectively create relevant differentiation aspects for their tourism destination brand (Brito & Pratas, 2013). Moreover, Brito and Pratas (2013) argue that tourism destination brands must have its concept well defined to meet the needs and desires of the tourist segments to target, using marketing concepts and tools to promote the tourism destinations. Another thing to remember is that wellness tourism offers have to be well advertised and diversified to avoid one of its main challenges: seasonality.

The travel process starts before the trip, while travellers are searching for information related to tourism destinations, mostly gattered online (Lehto & Lehto, 2019). A distribution channel that can also be an advantage when well-managed due its convenience, ease and comfort of purchase methods (Nizioł & Żeglen, 2017). A reason why the promotion of tourism destinations can make use of traditional and mobile websites (Romanova et al., 2015), offering the possibility of online booking and interactive communication (Lopes et al., 2013). It can also happen through partnerships with the destination's tourism authorities (Pongwat, 2017), and social media applications, which can provide a variety of multimedia information (Roque & Raposo, 2013). Digital brochures, printed media and television could also be considered (Brito & Pratas, 2013) if it suits the business purposes and size.

Another attractive option could be the design of "tourism packages" offering a variety of goods and services provided by the region around the main attraction that could serve many different purposes, expanding sales and increasing the economic development of that destination (Nizioł & Żeglen, 2017). Innovative strategies that can give wellness tourism providers a more effective method of reaching consumers create favourable conditions to provide complementary services and generate opportunities to cooperate with other stakeholders of the tourism area (Panasiuk et al., 2016). In the opinion of Pyke et al. (2016), the concept of wellness as a product has moved from a niche market to a more fundamental type of demand, representing an opportunity that offers potential economic growth for the tourism destination that includes it in their business strategies. Innovative and marketing orientated approach can promote wellness tourism destinations to develop healthy lifestyles and increase wellbeing to attract visitors who are willing to have this type of experience (Pyke et al., 2016).

Wellness tourism consumption is a business that brings benefits for all its stakeholders. Firstly, to the traveller through their worthwhile personal experiences. Secondly, it offers new possibilities for creating new job positions, increasing employment, attracting tourists and inhabitants, developing tourism orientated entrepreneurs, and stimulating the social-economic of the destination (Borseková et al., 2015). According to Romanova et al. (2015), health and wellness tourism are strongly influenced by social, national and cultural traditions and peculiarities related to geographic locations and local features. In addition to this fact, understanding the demands of the wellness market can lead its tourism sector to develop services and products to address the current trends of this market (Stara, Jana and Peterson, 2017). Furthermore, it allows business and countries to design and promote wellness tourism to attract tourists even out typic tourism high seasons.

Portugal is a country in the top ten wellness tourism market in Europe (Global Wellness Institute, 2018). The thermalism is one of the seven subproducts of health and wellness tourism that Portugal can provide, including Thalassotherapy, SPAS, Medical Tourism, Aesthetics Tourism, Holistic Tourism and Climatism (Silva & Carvalho, 2011). Significantly, the country is known for its vast and varied range of thermal resources, with a thermalism based mostly in the medicinal, therapeutic, and social aspects of this offer and SPAs and wellness facilities (Cavaco et al., 2008). The country's Northern region has the most significant quantity of thermal resorts and SPAs, 21 in the total, which represents 40% of the national offer (Porto e Norte Termas, 2016). Still, other areas in the country also provide a thermal offer, for instance, the Center region and Açores.

It is possible to understand that the concept of wellness provides various related products to be explored by the tourism sector, promoting a healthier lifestyle to visitors and an economic development to the destination as a whole. However, Portugal's thermal springs and resorts should understand the new expectations of tourists and follow recent international trends in wellness tourism, providing unique and creative experiences to visitors. Moreover, the atmosphere linked to structure, staff, and activities must be attractive and match the new market requirements for this sector. Another key to remember when rebranding the country's thermal facilities is to establish network connections and partnerships between the resorts and other tourism offers and products in the region where the company is based. Each area of the country has a different set of tourism particularities in its geography, variety of products and services, that make the place unique serving as a complement to the thermalism present in the same region can provide exclusive trips to customers. This one-of-a-kind services and goods package can help the destination to gain a competitive advantage in the market, which will increase the economic development of that particular place, and in a further instance, also improving the Portuguese income.

Above all, this joint effort must have the Portuguese national and regional tourism organisations' participation through policies and investments in the sector. Their central role should be the support of opportunities to businesses overcome financial constraints, design new national marketing strategies that can attract investors and create a diversified operational structure of networking, which may increase the chance of companies succeed in the market (Nizioł & Żeglen, 2017). Furthermore, the government plan strategies must increase investments in the education of tourism-related courses to provide better prepared and highly qualified labour force to the market, which would raise the quality of a significant part of production factors in the tourism economy (Panasiuk, 2018). As a wellness activity, the thermalism in Portugal has to meet new demands to change its image, innovate and conquer new markets, and survive and prosper. To be more competitive and attract more tourists, Portuguese companies must follow international trends in online access to information, quality and innovative infrastructure, plus propose an extensive and original range of programs, treatments and activities (Gonçalves & Guerra, 2019).

Methodology

In order to achieve the objective of this research work was necessary to collect primary data. The data collection relied on a questionnaire that was promoted online due to the limitations generated by the COVID-19 pandemic. The safety measures adopted to lower the contamination numbers lead to the temporary closure of many SPAs and thermal springs, making it almost impossible to apply the questionnaire with their customers. Furthermore, due to the social distancing required and mobility reduction during the pandemic, travels to question people in person had to be avoided. The questionnaire has been formulated with quantitative and qualitative questions, based on two questionnaires already tested and present in the literature review. The first is a questionnaire made by the Turismo de Portugal (2006) to analyse the profile of the consumer of health and wellness tourism in Portugal. This paper also selected some questions from Luo et al. (2018) that aimed to correlate the quality of life and the wellness tourism experience. Moreover, some items of those questionnaires were added, excluded, or adapted to fit this study's purpose.

The questionnaire was distributed randomly online, and it was asked to Portuguese residents answer it between September and October 2020. During two months was possible to collect 121 valid answers from all over the country.

The questionnaire's variables proportionate a better understanding of the tourist profile related to its gender, age, educational level, occupation, marital status, household income, nationality, and residence local. Furthermore, this research also aimed to gather information about their tourism habits, such as the motivation to travel, media used to find information related to the destination place, methods used to reserve and acquire activities and accommodation. Plus, for how long, when, and how many times the respondents prefer to travel, also answering if they are more inclined to do a solo or an accompanied trip. The last part of the inquire was designed to comprehend if the tourists know or would like to discover the concept of wellness tourism.

The data is analysed using descriptive statistics for the explanatory variable and the logistic regression method to define the Portuguese residents' profile statistically.

Results and Discussion

As explained, the questionnaire was divided into three different categories. The first two are general questions for all respondents. The last part leads to a particular set of items displayed accordingly to a positive or negative answer about being familiar with the concept of Wellness tourism.

The first stage of the questionnaire (Table 1) is related to the personal profile of the 121 participants.

It is possible to identify some peculiarities at this stage, starting with the difference related to gender in interest in answering a questionnaire associated with Wellness tourism. The number of female participants is almost double of the male respondents, representing 80 members (66,9%), which can illustrate that women are more sensitive to the appeal of this type of tourism. At the same time, 77 of the answers are coming from people that are more than 36 years old (63,6%). Concerning the level of education, 81 persons do not have an academic degree, which may connect with the oldest part of the mature participants. Regarding occupation, 66 people were employed (54,5%), while the rest were students, retirees or unemployed. A slightly most significant part of the answers received was from single or widowers participants, characterising 67 people (55,4%). The majority of the respondents earn less than 2.000€ per month (63,6%). Almost all participants were Portuguese, responsible for 106 observations (87,6%), while 70 responses (57,9%) came from the North of Portugal.

Table 1: Socio-demographic profile

Variable	n	%	Total (n)
Sex			
Female	80	66.1	
Male	41	33.9	121
Age			
Young (18-35)	44	36.4	
Mature (36+)	77	63.6	121

Other	15	12.4	121
Region - NUTS II			
North of Portugal	70	57.9	
Other regions	42	34.7	121

The next table (Table 2) also represents universal questions concerning the participants' tourism habits, a part of the questionnaire that aimed to understand, for instance, the respondents' motivation to travel, among other tendencies.

It was possible to identify that the seeking of wellness is not the first desire when travelling, corresponding to only 25 of the answers (20,7%), almost one-third of the first position related to discovering new places. Amongst the variety of information sources, with the technology advances, the internet is the top option of search by being the primary source of 61 people (50,4%) using the offers and destinies websites, plus 17 answers (14%) of people that use social media as a research tool.

Their acquisition or reservation of tourism attractions is also mostly done online, using the attraction's websites, related to 67 answers (55,4%). The first two positions among the participants' favourite options are nearly tied in which concerns accommodation since hotels with 4 or 5 stars have received 32 of the choices (26,4%) and hotels with 1 to 3 stars were the most used accommodation of 31 people (25,6%). Associated with the travel itself, 45 respondents (37,2%) do not have a preferred time to travel, the average length of 3 days to one week was the choice of 94 participants (77,7%) and half of the inquired people travel two times per year, representing 61 of the answers (50,4%). Moreover, their last habit questioned was related to travelling company, to which 90 people (74,4%) have answered that family is with whom they are used to travel.

Table 2: Tourism habits

Variable	n	%	Total
Which is your motivation to travel?			
Seeking of Wellness	25	20.7	
To discover new places and people	69	57.0	
To escape the routine	3	25.0

You usually travel with…			
Friends	21	17.4	
Family	90	74.4	
Alone	10	8.3	121

This study is relevant because it can guide marketing strategies to stimulate the interest on week points revealed by the survey. For instance, the seeking of wellness can be better promoted by companies that work in this field, such as SPAs, Thermals, meditations camps, etc. The approach also can be designed using this research as it has shown that most of the tourists search on the internet for information and acquisition purposes. It can help a business to understand where to concentrate the marketing investments. The preferred type of accommodation, the period for

travelling, the length of the travel, periodicity of the trips and favourite company can be used as a guideline to create promotions and tourism packages specially designed for each group of tourists.

Among the overall participants of this questionnaire, 74 have responded that they are aware of the concept of Wellness tourism (61,2%). The Thermals is responsible for 24 answers (19,8%) related to which wellness tourism attraction they have already done. Moreover, the primary reason for 47 people (38,8%) to choose a wellness activity was due to their personal initiative, and 61 respondents would like to repeat the experience. Furthermore, 41 participants (33,9%) answered that they had acquired the wellness activity with a tourism package. This information is pertinent to stimulate the collaborative work amongst tourism destinations that can create partnerships in that region, making the offer in that region a unique and exceptional experience for the tourist. This type of package can increase the income of that region, as shown in the literature, by being a win-win opportunity for locals, business and travellers.

From the initial 121 participants, 47 (38,8%) were not familiar with the concept of Wellness Tourism. However, 42 (34,7%) of them said they were interested in discovering this type of experience. Among the respondents, 35 people (28,9%) affirmed that they knew that thermals are a wellness activity even though they could not fully understand wellness tourism. Moreover, 28 participants (23,1%) have visited before a thermal facility and would like to repeat the experience. The number of negative answers can give to wellness activities business, especially thermals SPAs, the notion of how this type of tourism offer lacks promotion, proportionating to companies the necessary knowledge related to the formulation of new marketing strategies.

The profile of the participants that know what wellness tourism is is mostly formed by women (74,3%), mature people (60,8%), with an academic degree (71,6%), employed (56,8%), not married (60,8%), having an income lower than 2.000€ per month (56,8%) and predominantly from the Northern region of Portugal (51,5%). The group of the ones that know the concept and enjoy repeating the experience is composed generally by women (77%), mature participants (57,4%), that pursue an academic degree (72,1%), employed (55,7%), single or widowers (60,8%), who earn less than 2.000€ per month (62,3%) and are residents of the North of Portugal (51,7%).

The data clarifies that people that are familiar with this type of tourism and tourists that know the wellness concept and would appreciate repeating the experience is very similar. This characterisation can provide to business an idea of which type of approach to use with those consumers that already know and enjoy wellness activities, that could be more related to the reinforcement of customers' loyalty. By contrast, companies can develop strategies to captivate tourists that are unfamiliar with wellness offers or that for some reason do not wish to repeat a wellness experience.

People who ignore the meaning of wellness tourism but are interested in discovering are constituted by women (54,8%) and mature people (66,7%). Still, this time, tourists with no academic degree are more interested in learning this concept (71,6%). Employed people and not married are tied, each group, respectively, is formed by half of the respondents (50%). Simultaneously, the other variables remain similar to previous cases. Participants having an income lower than 2.000€ per month represent (78,6%) and are predominantly residents of the Northern region of Portugal (80%). Accompanying the negative answers related to the knowledge about the wellness concept, at the beginning of this questionnaire section, a definition of this type of tourism was given to allow the respondents to be familiar with the term. Among the 47 participants unfamiliar with wellness tourism, 42 were interested in trying it for the first time (89,4%). By having this result, companies can understand that a share of the market is willing to experience a wellness activity after learning the meaning of this particular offer. For instance, businesses can create special promotions for tourists with a low income or specific packages designed to people who are not married but would like to travel alone, with friends or family to profit from some time of relaxation.

Final Remarks

From the managerial perspective, for wellness tourism businesses established in Portugal, mainly if they are focused on the thermal segment, this type of market study is essential. It allows resorts and SPAs managers to understand customer' profiles, needs and expectations and formulate future strategies to first, increase the awareness about this tourism offer to then, through their satisfaction, motivate customers loyalty.

The knowledge related to the market demands associated with efficient marketing and managerial approaches can result in a better performance for the company, leading to a more remarkable economic development of the region if tourism businesses work in collaboration to proportionate to consumers a unique experience. All factors associated can increase the number of tourists returning to the wellness activities to profit from all offers available in that tourism region, generating a better quality of life for locals and visitors (Fyall et al., 2013). A reason why national and regional governments must invest in strategies and policies to develop public-private partnerships in tourism destinations, which can bring benefits to all wellness tourism stakeholders (Romanova et al., 2015).

Through packages or promotions, this unique product created by an association of regional wellness companies, accommodation and food sectors, can increase the competitivity of the tourism industry in that place. Among people familiar with wellness tourism, 55% had answered that when they acquired a wellness activity, they have purchased this offer with a tourism package, which illustrates the importance of this collaboration to increase product differentiation. Moreover, the creation of wellness services packages associated with other tourism offers can also increase the awareness of the meaning of this type of experience, boosting the level of interest in this variety and reach different market segments (Gonçalves & Guerra, 2019; Nizioł & Żeglen, 2017; Panasiuk, 2017).

When product differentiation and positioning strategies are adopted, marketers can define a set of competitive advantages, that can be chosen among image, location, quality of service, physical attributes and price (Romanova et al., 2015). For instance, a rebranding of the wellness thermalism could change the impression that this activity is only for the elderly with health problems. By promoting this experience as a source of relaxation and a healthy lifestyle focused on recreation (Boekstein, 2014), young people could be more interested in experiencing this tourism proposal. The wellness industry is also more associated with female public, as proved here - women are more aware of the wellness tourism concept. The diversification of products focused on male consumers, such as men-only SPAs or male-related types of treatments (Tawil, 2011), could work as an image transformer, raising men's interest in this segment. As 74,4% of the participants declared that they usually travel with their families, location and infrastructure can also play a role in promoting wellbeing initiatives (Pyke et al., 2016), when designed to entertain tourists of all ages and genders.

As analysed by this paper, the general perception is that wellbeing related types of tourism are formulated to upper-class consumption (Pyke et al., 2016), that has a better-understood concept among high-income people, as this paper has confirmed with the survey results. However, amid the group not familiar with wellness tourism, the most interested participants were those with income lower than 2.000€. Special promotions developed to target this group, as day-spas or weekend packages, could break the barrier related to the perception of a tourism offer only to elites and stimulate the low and middle classes consumption of wellness activities. Management actions can also help solve another challenge faced - the seasonality (Romanova et al., 2015). This kind of promotion can be offered along the entire year, to attract tourists with different activities even in the low season.

Even though the Northern region of the country is responsible for the second-largest thermal offer, its residents are less familiar with the wellness concept than the rest of Portugal, which illustrates the lack of promotion. Furthermore, the North of Portugal's thermalism lost 19,1% of its customers in 2014 (Turismo de Portugal, 2015), which demands a new approach if this type of tourism aims to be profitable and competitive. Another vital information given by this study is that if put together websites and social media, more than 64% of the respondents have affirmed that they use the internet as a primary source of information related to destinations and tourism activities. The internet, accompanied by word of mouth (the advice of friend or family) and their own experiences, is one of the main channels of communication for wellness businesses (Romanova et al., 2015), a reason why companies and destinations should increase their promotion on this media.

Abstract

Talent management has been recognized as an interdisciplinary field of research and practice that support strategic and/or global human resource management. The literature review on talent management and the critical review of relevant global surveys (of McKinsey in 2018 and Deloitte in 2020) developed in this field have proved the interest of exploring cultural influence on talent management activities. Started from these points, this article aims to highlight the influence of organizational culture plays to the complex and emerging field of talent management. The research is based on the qualitative evaluation which have underlined that organizational culture has a highly essential effect on managing talents, and that it is not enough to identify, retain, develop talented employees but also it is important to develop and nurture organizational culture that supports the development of talented employees. Thus, talent management provides a way to focus and facilitate its tools, which has started to install a talent mindset in the culture of an organization, with focusing on employee's engagement to develop a framework for streamlining the talent management process. This study concluded that organizational cultures that have a strong strategic vision and a strong focus on ethical high-performance behavior, have a strong effect on talent attraction and retention, are highly commitment to employees' career development and have a very strong motivating work system.

Keywords: Organizational Culture, Talent Management, Models, Strategic Human Resources.

Introduction

In the last twenty years, the "talent management" (TM) topic has become a growing one, most related to a new transformation in the human resource management (HRM) practices. The meaning and definition of TM is associated with "talent strategy", "succession management", "human resource planning", "strategic human resource management" or "global human resource" are often used interchangeably (Lewis & Heckman, 2006). It has been also recognized that the scientific discourse still largely views and understand TM as still a not very well defined an understand concept, lacking rigor and relevant empirical studies (Garavan, 2012; Sparrow & Makram, 2015; Gallardo-Gallardo & Thunnissen, 2016; Thunnissen, 2016; Sparrow, 2019; Berger, 2020).

Consulting companies and TM practitioners have recognized that employers are concerned of new technologies (e.g., artificial intelligence applications for talent acquisition, the use of cloud technologies (Albert, 2019; Sivathanu & Pillai, 2019)) and other innovative approaches in the field (as specialized algorithm or data mining technologies that

Cite this Article as: Gabriela Alina PARASCHIVA, Dana FATOL, Diana ROBESCU, Anca DRAGHICI and Larisa IVASCU "Organizational Culture Impact on Talent Management" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

could predict and anticipates employees behaviour, reactions (Mihalcea, 2017; Bai, 2019)). Undoubtedly, these new methods and tools for TM are not only shaking the traditional and well-established practice of HR but they could be considered as threats and/or opportunities for TM (Sparrow, 2019; Berger, 2020).

There have been recognized that TM focus in HR is no longer a "war for talent" (Michaels et al., 2001). Current in this field the battle is now about how to engage and retain valuable employees by offering them interesting and challenge work experiences (real and digital, too). Talent acquisition process is now being challenged to think differently about the recruitment and selection processes; once the person is accepted for the hiring process, TM becomes the organizational architect of the employee experience where the physical environment, technology and culture are integrated (Morgan, 2017). Thus, a win-win-win situation is generated for the employer, the employee, and ultimately the customer. Furthermore, there have been recognized that "TM practices are no longer meeting the needs of their workers. Instead, employers focus their attention on developing a meaningful employee experience to attract and nurture the talent they need. A new breed of talent management practitioners is developing an HR stack that includes other management frameworks such as design thinking, agile management, behavioral economics, and analytics to augment their HR competencies" (Claus, 2019).

The major changes that face TM have proved an extension of the filed by integrating knowledge from a large diversity of sciences, not limited to managerial sciences only. From the practical perspective, companies are now facing with the dilemma of how to address TM activities and reformulate strategies considering today's global pandemic and economic challenges (Fatol et al., 2020; Caligiuri et al., 2020; Berger, 2020).

In this context, the purpose of this paper is to apply knowledge from disciplines adjacent and cultural perspective to TM and look at how the new wave is currently impacted the organizational practices and how new approaches could be designed (perhaps no longer even called talent management or HR as anticipated by the study of (Claus, 2019)). Recent studies have anticipated a disrupted current of paradigmatic thinking (Liu et al., 2020; Praise & Kah, 2020), the present paper focuses on the debate of the impact that organizational culture can have on TM; the proposed reengineering referring to the analysis of some models and approaches from the dynamic space of TM practices. The analysis aims to identify new ways to integrate cultural dimensions in existing and adopted TM models by organizations in the desire to enrich the HRM field of science. This paper uses qualitative information collected by the authors through the study of literature in recent years in the field of TM. The structure of the research approach includes: (1) a brief literature review of the TM field through which it was wanted to identify the way in which the culture - TM relationship has been exploited so far. In addition, some models of characterization of the culture will be presented and some evidence from practitioners will be debated; (2) to proposes a new architecture for TM and a set of new competencies for TM (which must be held by practitioners in the field) to add value to organizations and the re-engineering of TM processes. Finally, the conclusions of the study will describe some broader issues that individuals, employers, and society need to explore and address in the future of TM.

Literature Review

In the next sessions there will be presented a brief overview of the literature in the field of TM together with some facts from global or international surveys developed by prestigious consulting companies.

A brief synthesis of TM

Generally, TM is considered a continuous process that involves attracting and retaining high quality employees (very talented in terms of the need of an organization), skills development and their continuous motivation to improve their professional performance (Schiemann, 2014; Kestilä, 2020). The main goal of TM is to create a motivated and continuously involved workforce that will remain within the organization in the long run (Momtazian, 2020; Berger, 2020). According to the proposed processual perspective in TM (or also known as TM process model or TM lifecycle model), Figure 1 described a related model. This perspective into the TM field has been associated with the implementation of organizational strategies to improve productivity through upgraded processes for attracting, developing, retaining and employing individuals with requisite skills and aptitude to meet contemporary and future business requirements (Kestilä, 2020).

Fig. 1: A processual model of TM (adapted from (Momtazian, 2020))

Furthermore, the processual model of TM has been defined in a variety of shapes and that is most because of the different context where it has been implemented. As supported by the literature and the practice, there is no standardized or general valid model for TM, some HR professionals have proposed excellent models that any organization can use to define their own TM framework and the following, the TM strategy (Thunnissen, 2016). Finally, there must be observed that the processual perspective in TM, the TM process model or TM lifecycle model are the first approaches in the field, and they were meant to define TM and to create a general framework of implementation (Schiemann, 2014; Kestilä, 2020).

Chronologically, the next approach has been defined by the "integrated model of TM" is another trend in the field, and it has been associated with HRM activities integration. This approach describes an integrated approach to recruiting, development, performance management, compensation, development planning, and learning. The goal in this approach was not only to make the HRM more effectively and efficiently, but more importantly to create an integrated system of methods and tools for managing the human side of enterprise which lets the organization rapidly and effectively respond to business needs (Egerová, 2013). The concept is almost 10 years old and it suffer different changes including a TM Maturity Model (as described in (Bersin, 2015a) published by Deloitte). This approach is still used for creating sustainable competitive advantage (Rabbi et al., 2015; Stoyanova & Stoyanov, 2019; Claus, 2019) or organization excellence (Berger, 2020). Table 1 presents a more actual form of this approach as supported by the research of (Minocha & Hristov, 2018).

Table 1: A framework of TM integrated model (a synthesis from (Minocha & Hristov, 2018))

ASPIRE →	ARTICULATE →	ACT →	ACCOMPLISH
Business imperatives Stakeholders experiences Metrics of success Values and culture	Industry / Job	Hiring Development Performance Succession, planning and retention	Workforce impact
	Competency model		Customers impact
	Individuals		Business impact
Define organization identity	**Translate organization's vision into TM requirements**	**Align and harmonize TM processes**	**Measure and evaluate results**

With this short overview of the main approaches in defining the TM model there could be concluded that: (a) TM processes and activities are strongly aligned with business strategy; (b) There is not explicitly considered the cultural perspective on defining a TM model or a related approach. Some authors weakly touch the subject by referring to organization identity and brand, in connection with the creation of performance-oriented culture that could stimulate TM.

TM from the organizational practice. Identifying the key role of cultural impact

This part of the research is based on a critical review of two global surveys developed in the field of TM. Debates were made by exploring cultural influence on TM activities, practices, and the potential of organizational cultural dimension for an effective TM.

a. The McKinsey Global Survey from 2018 supports the idea that TM has a positive effect on business performance and. The study results suggest three practices that are most closely link with effective TM (Table 2): rapid allocation of talent; HR specialists' involvement in developing exiting, interesting employee experience; a strategically minded HR team.

Table 2: Survey results on organizational practices that are most closely link with effective TM (extract from (McKinsey & Company, 2018))

#	Practices that are most closely link with effective TM	Standardize regression coefficient
1	Movement of talent among strategic projects as priorities arise and dissolve is fast or very fast	0.163
2	HR function ensures positive employee experience across employee life cycle	0.143
3	HR leaders have comprehensive understanding of organization's strategy and business priorities	0.114
4	Employees understand organization's overall strategy	0.094
5	Organization's executive team is moderately or very involved in TM	0.093

Respondents in the McKinsey Global Survey (2018) who say all three practices are in place (just 17%) are significantly more likely than their peers to rate their organizations' overall performance, as well as the total returns to shareholders (TRS), as better than competitors' (Figure 2). They are also 2.5 times more likely than others to rate their organizations' overall TM efforts as effective. The debate on the results of the McKinsey Global Survey (2018) has concluded that there have been identified several areas of TM that could be positively influenced by the organizational culture:

- Rapid talent allocation (related to internal agility of HR);
- Positive employee experience (currently considered as having a huge potential for TM and that could mobilize organization creativity for attracting and retaining young generation talents);
- Strategic HRM which cannot be separated from organization's mission, vision, and values and which emerge from the organizational culture.

Fig. 2: The relationship between TM and organizational performance (McKinsey & Company, 2018)

b. The recent **Deloitte (2020) study "Talent Edge 2020: Blueprints for the new normal"** (the second longitudinal survey series after the last one published in 2010) has exploring talent strategies, concerns of global companies, and unfolding employee trends as companies confront a new set of challenges that we expect will influence the next decade and beyond. Two key ideas have arisen from this study:

- "Nearly three in four executives surveyed predict talent shortages in research and development (R&D). Companies are increasingly challenged to develop the next generation of leaders: looking at the more complex and challenging global business environment and the pending retirement of Baby Boomers and senior leaders, many executives expressed concern over their companies' leadership development programs and pipelines;
- Executives who participated in this survey believe developing leaders and succession planning is the current top concern and talent priority. They also believe this will be the number one talent priority three years from now;
- More than four in ten executives surveyed (41%) rated competing for talent globally as one of their most pressing talent concerns— the highest of any answer in the category;
- Companies self-described as "world-class" have a clear sense of the pressing talent issues three years from now and are more likely to make investments in creating career paths and challenging opportunities for employees (46% for "world-class" firms vs. 36% for all others), developing leaders and succession planning (48% vs. 36%), and recruiting hard-to-find skill sets (42% vs. 29%);
- Companies with a retention plan reported they will ramp-up financial and non-financial incentives in the year ahead: 69% will "significantly increase" or "increase" their focus on compensation vs. 48% of those without a retention plan; 76% of those with a retention plan will expand benefits vs. 55% without a plan; and 70% with a plan in place will boost nonfinancial incentives vs. 52% of those without a plan".

Furthermore, Deloitte study (2020) has identified that companies (considered in the sample) differentiate themselves by culture, compensation, and future opportunities offer to their employees:

- "Most executives surveyed believe their companies are doing a good job distinguishing their employer brand in the talent marketplace;
- More than half (53%) believe their employer brand is an important differentiator in the talent market and 21% describe it as "world-class" (see Figure 3);
- When asked which talent retention initiatives to set them apart, surveyed executives led with company culture (28%), followed by benefits (27%), job flexibility (24%), compensation package (24%), and future career opportunities (23%)."

Companies' managers involved in the survey have recognized that they deploy different strategies to appeal to different generations, research results being synthesis in Table 3.

Fig. 3: How do you describe your organization's value proposition/employer brand?
(research results from (Deloitte, 2020))

Table 3: Most effective retention initiatives by generation (research results from (Deloitte, 2020))

Rank	Generation Y (under age 30)	Generation X (ages 30-44)	Baby Boomers (ages 45-64)	Veterans (over age 65)
1	*Company culture* (21%)	Additional bonuses or financial incentives (21%)	Additional benefits (i.e., health and pensions) (26%)	Additional bonuses or financial incentives (25%)
2	Flexible work arrangements (20%)	Additional compensation (19%); Strong leadership and organizational support (19%)	Additional bonuses or financial incentives (23%)	Additional benefits (i.e., health and pensions) (24%)
3	New training programs (19%) Support and recognition from supervisors or managers (19%)	Customized/individualized career planning (18%) Succession planning (18%)	Additional compensation (21%) Strong leadership/ organizational support (21%)	Flexible work arrangements (20%) Corporate social responsibility (20%)

The executives who participated in this survey looked favorably on a wide range of retention tactics. Still, one fact stood out - executives clearly believe different retention tactics appeal to different age groups within their workforces. As described in Table 3, the survey results demonstrate clear differentiations between the retention initiatives in the case of different generations:

- "When asked which retention initiatives would be most effective in appealing to Generation Y, non-financial incentives topped the list, led by company culture (21%), flexible work arrangements (20%), new training programs (19%), and support and recognition from supervisors or managers (19%);
- For Gen Y, additional compensation was ranked 14 out of 15 and "additional bonuses or financial incentives" was ranked 11 out of 15 (see figure 15);
- For Generation X, executives focused on financial incentives or career advancement opportunities, listing additional bonuses or financial incentives first at 21%, followed by additional compensation and strong leadership or organizational support (19% each), and customized career planning and succession planning (18% each);
- Baby Boomers were assumed to favor greater compensation and benefits, according to survey participants who cited additional benefits (26%), additional financial incentives (23%), additional compensation, and strong leadership (21% each). In addition to greater financial incentives (25%) and benefits (24%), executives believe Veterans are attracted by more flexible work arrangements and greater opportunities for community involvement through corporate social responsibility initiatives (both 20%)".

The Deloitte study (2020) confirms the already known characteristics of generations (from the perspective of their professional life), also argued by other authors. The most interesting thing is that Generation Y places great value on organizational culture when it comes to hiring, so it is obvious that TM practitioners must take this into account and be able to contribute to increasing the visibility of corporate culture (in collaboration with other specialists of HRM and communication and image at the company level). Thus, there could be imagine that using the Develop-Deploy-Connect model (Deloitte, 2017), organizational culture should be defined related to all three actions of TM, and this will positively impact organizational performance (Figure 4).

Fig. 4: Develop-Deploy-Connect model (adapted from Deloitte, 2017)

In different studies published by Deloitte during the last five years (Bersin, 2015b; Deloitte, 2017; Deloitte, 2020) some ideas have arisen when connecting organizational culture with TM. In the following there are presented a collection of this considerations (proved by the results of different studies developed by the consulting company):

- It is important to building an organizational culture of leadership and learning by providing development and learning opportunities to key talent segments and efficiently integrating leadership development with other areas of TM;
- Supporting a strong or high culture of learning;
- TM practitioners should encourage diversity and multiculturalism (e.g., in project teams) and support the development of an inclusive culture, through an inclusive TM initiative;
- Supporting a coaching culture which has been proved to be highly correlated with business performance, employee engagement, and overall talent retention;
- Strong interest in changing the culture to emphasize performance or develop a recognition culture. This type of cultural dimension must be implemented through the social reward systems (tools that give people points or kudos to reward to others), weekly or monthly thankyou activities, and a general culture of appreciating everyone from top to bottom;
- Encourages a culture of growth.

Furthermore, there can be observed that cultural perspectives in TM practices have been of great interest in the last five years and thus because the shift on generations at work that push HR specialists in finding new approaches, methods and tools for TM.

Integrating cultural dimensions into TM – a new proposed architecture

An overview of the current research about cultural influence on TM

Today, cultural challenges include cultural differences from country to country, the power of labor unions in different cultures, management style differences etc. Furthermore, multicultural dimension has been recognized as having a great impact on HRM (Liu et al., 2020; Caligiuri et al., 2020). Organizational culture theories have evolved in parallel with the globalization development. The culture of an organization represents the way things are done in the organization. It mainly revolves around the behavioral patterns and relationships. Culture is developed over a period in the organization by the people who work for it. To create a dynamic culture organization's core value and its vision is a fundamental requirement (Times, 2013). Corporate culture is an intensely rooted form of social control that influences employee behavior. Culture is omnipresent and works unconsciously. It acts as a glue that ties people

together and makes them feel part of organization. It motivates employees to internalize its core values as it gives them social identity. It helps employees understand organizational events, communicate more efficiently and reach higher standards of cooperation as they share common values (Schein & Schein, 2019). Furthermore, Mahajan (2019) associates several functions with organizational culture such as conflict resolution, control and coordination, motivation and competitive advantage. Furthermore, (Wombacher & Felfe, 2017) and (Canning et al., 2020) supported the idea that culture provides a sense of identity, generates organizational commitment as well as commitment to the organization mission and reinforces behavior standards. Authors also, emphasize that culture influences employee attitude and behavior in the organization which results in better commitment of employees towards organization and higher performance is delivered.

Organizations must face certain external (outside the organization) and internal (within the organization) challenges which call for a culture of external adaptation, internal integration and anxiety reduction. It is supported in the research of (Bhaduri, 2019; Mahajan, 2019) that organizations are not necessarily associated with only one type of culture, rather there will be different cultures depending upon the nature of task to be performed, determined goals, external environment, rules and regulations, policies and different types of employees. Furthermore, Mahajan (2019) has supported the idea that organizational culture impacts three TM components: recruitment, development and retention (considered as dominant activities in TM). Recruitment is the first point of contact for a candidate with the organization. Organizational culture is a determinant in attracting talent towards the organization (as supported previous by (Wilska, 2014; Wombacher & Felfe, 2017).

The organizational culture has a highly essential effect on managing talents, it is not enough to identify, retain, develop talented employees but also it is important to develop and nurture organizational culture that supports the development of talented employees. Thus, TM provides a way to focus and facilitate its tools, which has started to install a talent mindset in the culture of an organization, with focusing on employee's engagement (Al-Dalahmeh and Dajnoki, 2020). Also, AlDalahmeh and Dajnoki (2020) have concluded in their study that the literature focus on clarifying the relationship between talent management and organizational culture but most of the studies analyzed how organizational culture could affect the TM process and it found that they are deeply connected in an inverse relationship, which could be a further area for future research. As a conclusion, in the literature are presented few extended studies about organizational culture impact on TM and they recognized the importance of the culture but do not offer practical solutions or an existing framework. *3.2. A proposed architecture for TM*

In the new approach there have been preserved the idea that TM as a practice, involves a series of processes, arranged in a systematic manner for a streamlined execution (the TM lifecycle or the processual approach in TM). The traditional TM model is based on key HR activities and responsibilities as: selection, recruitment, TM, development and analytics, and performance management. The major flaw which renders this model obsolete in today's times is its operation in silo or isolation. This model lacked the element of integration and association with other organizational processes. Moreover, pertaining to today's dynamic, ever-evolving business scenario, the traditional model is deficient to deliver the elements of flexibility and accuracy as well (Aldrich, 2020; Berger; 2020).

A new TM architecture (considered as an evolute model) is one that is not only integrated with other business processes but is supported by actual technologies (Albert, 2019; Sivathanu & Pillai, 2019; Mihalcea, 2017; Bai, 2019)). The proposed TM architecture is relevant to today's times and adapts to the slightest shift in the business environment. Along with the use of emerging technology solution, the next-generation HRM tools like those using data mining and data analytics, artificial intelligence, online learning and training development (supported by digital libraries integrated into learning management system), neuroscience applications etc. also serve in this new approach. As described in brief in Figure 5, the architecture with a modernized way of functioning (e.g., using cloud technologies to share applications and databases, repositories) has integrated systems, systematic approach, accuracy, structured growth, and effective talent development. Future research should consider the TM architecture operationalization by considering a specific company or group of companies related to an industry, to develop in detail the specific methods and tools for an effective TM.

Fig. 5: A proposed architecture for TM

Conclusions

TM is facing new challenges from a large variety of phenomena that happen at the micro-, mezz-o and macroeconomic level. As we have shown in the literature analysis, there are still knowledge gaps that should be fulfil in the nearest future. In view of workforce trends, such as shifting demographics, global supply chains, the aging workforce and increasing global mobility, forward-looking organizational leaders must rethink their approach to TM to best harness talent (Bersin, 2015a; Bersin, 2015b). By doing so, leaders will be positively positioned to succeed in a highly competitive marketplace. In addition, organizational culture, employee engagement and leadership development have a significant impact on TM a tendence supported by the Deloitte studies in the last five years and other authors (Claus, 2019; Berger, 2020). Thus, TM could offer a pathway toward sustainable business success and performance. A critical analysis of TM approaches has underlined different knowledge gaps (Sparrow, 2019). Anticipated workforce changes and cost-effective ways to access talent are keys to the next generation of TM (Aldrich, 2020). Predictive workforce monitoring will lead to effective strategic talent decision-making. Factors such as flexible talent sourcing, customized and personalized rewards, distributed and influential leadership, and unified and compassionate workplace cultures will be important for successful TM (Claus, 2019; Caligiuri et al., 2020).

As demonstrating in this study, managing talent is incessant. The HRM must be vigilant enough to proceed according to the new architecture and assess its effectiveness alongside. The adequate TM model for a company must follow business goals and priorities. This requires HR professionals to erect strategies that recognize critical roles, responsibilities, and plan of action. Moreover, the proposed approach of TM needs regular upkeep to maintain its flexibility at the company level. Thus, it will be robust and dynamic enough to withstand evolving business scenarios. Effectual communication by HR to all management levels is fundamental to the executive TM exercises. A well-established combination of all such intricate processes, from recruitment to transition is what makes a real effective TM model. Future research should be developed in an interdisciplinary manner to better detail the proposed architecture and valorize the existing fact and tendencies from the literature and the global studies in the field of TM.

Abstract

The implementation of processes using BPM in companies greatly impacts all participants in the organization where it is implemented and the level at which it benefits each of them according to the processes carried out. The use of processes with BPM generates a positive impact in many aspects in organizations and improves communication between areas, thereby optimizing and making internal processes more efficient; the adaptability of the users is verified in a positive way to the processes with BPM, which does not generate any problem in the implementation and daily use. This research is a scientific review and its objective is to analyze the improvement obtained when implementing processes with BPM in a company. For this purpose, a compilation of 69 articles related to the topic in question was made and databases from the IEEE Xplore, Science, Scopus, Scielo and Redalyc were taken.

Keyworks: WorkFlow, BPM processes, Improvements with BPM, Adaptation of processes with BPM.

Introduction

Currently we see that more companies are migrating to a working mode based on process management and with this they automate the areas so that time, costs and productivity can be optimized in the areas, (BPM) is the set of methods, tools and technologies that make it possible for our process management to combine with information technologies. BPM is a collaboration between business people and technologists to promote effective, agile and transparent business processes since it encompasses people, systems, functions, businesses, customers, suppliers and partners

It should be noted that BPM is also defined as a management discipline aimed at improving business and academic performance, optimizing levels of competitiveness and productivity, with the goal of continuously improving and being supported by Information Technologies. BPM directly fosters an increase in the effectiveness of processes through adaptive automation and the coordination of people, information and systems

Companies, at a global level, tend to be more dependent on Information Technology (IT), not only for the operational maintenance of the organization's instances, but also for the increase of value to the company through exploitation data. We can realize that the (FCE) that affect BPM implementations and that the Critical Success Factors can be explained from the combination of three theories: a) contingency, b) dynamic capabilities and c) fit between tasks and technology.

Methodology

A. *Type of Study*

For the development of the following article, the search methodology in repositories and scientific databases that have antecedents on the implementation of BPM for process improvement was used

B. *Research Questions*

For the development of the research we ask ourselves the following questions:
RQ1. What difficulties arise when implementing the BPM methodology for process improvement?
RQ2. What are the benefits of implementing processes with BPM?

C. *Search strategies*

Cite this Article as: Neil Mancilla-Grau, Maicol Paredes-Lavado and Michael Cabanillas-Carbonell "Analysis of The Implementation of Business Process Management Processes, A Review of Scientific Literature From 2015-2020" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

In order to provide an evidence-based answer to each question posed for the development of the research, a search was made for scientific articles in the databases of IEEE Xplore, Redalyc, Scopus, Science, Scielo and finding a total of "69" articles comprised between the years 2015-2021.

For the search of these articles, the following keywords were considered according to the database: IEEE Xplore and Scopus: "WorkFlow", "BPM Processes" and "improvements with BPM". Scielo, Redalyc and Science: "BPM implementation" or "management by BPM processes".

Figure 1: Database Graph

Within the databases that were filtered we can find 69 articles which we can see in the following table.

Figure 2: Number of Items

A. *Results Found.*

TABLE 1: RESULTS FOUND FROM EACH DATABASE

No	Database	Number of Articles
1	IEEE Xplore	19
2	Redalyc	18
3	Scielo	13
4	Scopus	10
5	Sciencie	9

a. In the studies, the inclusion and exclusion criteria were applied to be able to filter the articles according to each defined criterion. Table 2 shows the criteria.

TABLE 2. INCLUSION CRITERIA

Criteria		
Inclusion	I 1	Articles related to the use of Business Process Management in Organizations.
	I 2	Articles published from 2015 to 2020.
	I 3	Articles that refer to the topic of workflow, Management by processes and Business Process Management..

TABLE 3. EXCLUSION CRITERIA

Exclusión	E1	Similar articles in different databases on Business Process Management in Organizations.
	E2	Articles published with the problem in previous years.

b. Criterion E1 applied in the first filter to reduce the number of researched articles. For the second filter, criteria E1 were applied, according to which 7 were eliminated, with criterion E2 they were filtered by articles related to the problem and 3. After determining criteria I1, I2 and I3, it was concluded with 69 review articles.

Results

126 articles taken from the various databases and repositories were reviewed, discarding and excluding 57 articles that were not taken by the parameters and the review that was given to the content of each one, 69 articles were obtained that do contribute to the analysis of the points The following are intended to be achieved in this review:

Figure 3. Search Process for article inclusion

Figure 4: Database quantity distribution

As a result, 69 articles were obtained that meet the inclusion requirements and above all that refer to the analysis of the present work, the searches were carried out in 5 databases that have worldwide repositories.

Figure 5: Representation of the repositories and the continents of each article.

Articles extracted and analyzed

The results of the investigations revolve around the findings of the investigation, the scientific journals and their stratification by names and year. The following graph shows the data obtained:

Figure 6: BPM article publications per year

Within the 69 articles, the following classification of each of them is made according to the content, the analysis of the implementation of Business Process Management, the methods, the benefits and the places where this method is most implemented will be verified

Discussion

In the present study and analysis of the various articles, the different aspects of the implementation of the processes with Business Process Management were identified.

As shown in Table 1, of the 69 articles the most popular aspects of studies related to processes with BPM, the investigations of the antecedents and predictions on processes with BPM and the most common methods in the implementations, these analyzes contextualize the advance and growth of organizations applying this work method.

RQ1: What difficulties arise when implementing the BPM methodology for process improvement?

In the Research Articles it can be seen that the implementation of BPM has a problem in the management of training. Here it puts the users and the systems in operation which pushes the processes into action in order to achieve the business objectives. In the training, it must be detailed that the process is the tool with which organizational success is achieved.

As we can see in Table 3 where the exclusion criteria are detailed, in E2 where Articles published with the problem in previous years are dealt with, we could observe that the problem basically began due to problems of resistance to change of some users.

With a BPM, you can bring together the systems, tools, methods, methods, process development techniques, and system process management, with the visibility and controls necessary to direct and fine-tune it

RQ2: What are the benefits of implementing processes with BPM?

In the articles of Investigation of the antecedents and predictions, he indicates that BPM facilitates the aims and business objectives of the Organization, with which we achieve revenue growth and performance improvement; There is also an increase in innovation, improved productivity, increased loyalty and customer satisfaction, and significantly improved staff efficiency.

In Figure 6 we see that in recent years interest in the research of the methodology has been awakened and it is that as can be seen in Figure 5, BPM is already found in the 5 continents and awakens a need for change in the organizations and private entities that want an improvement in their processes.

BPM incorporates the ability to align operational activities strategies and objectives; It focuses on the resources and work of the organization in creating value for customers. Additionally, it also allows a rapid response to change, thus promoting the speed necessary for continuous improvement.

Conclusion

The study carried out presents a systematic review of the literature on the implementation of processes with Business Process Management, as a result it was necessary that the implementation of processes with BPM, in organizations, private entities and companies generates a very positive result. The BPM allows to achieve better results in all the areas or departments of the organization or place where it is applied and in this way generates positive global results that benefit the organization at the macro level, leaving aside the outline of the objectives by areas or departments. On the other hand, it was also analyzed to what extent the workers of an organization or private entity can adapt to the use of working with Business Process Management processes and it is verified that the method cannot be implemented without problems of adaptation of the users. With future research can focus on some of the following questions. What other alternatives will be created to improve processes that can compete with Business Process Management? What are the positive and negative effects of process-based work with Business Process Management after the global pandemic? What is the impact in the future, will new methodologies be created for process improvement? With these questions, it will be possible to analyze the various changes, evolution and impact that the implementation of processes with Business Process Management can have in a positive way in organizations and Private entities.

Abstract

In recent years, tele-education has been catalogued thanks to the massification of the Internet as an accepted means of learning due to the acquisition of new technologies and access to large amounts of information for distance learning. The following work aims to specify the level of impact of tele-education during the learning process of students in a methodological environment of systematic review of literature and PRISMA strategy, we obtained a total of 82 articles which was reduced to 40 final articles found within the databases Scielo, Dialnet, IEEE Xplore, OEI, Redalyc, Researcher, ScienceDirect, Scopus, VirtualEduca and WOS. We obtained 29 articles (73%) that show positive impacts of distance education, 5 articles (13%) that show negative impacts and 6 articles (15%) that contain certain methodologies to obtain positive results during the online classes; that is why we recommend the inclination for the use of this modality of study which favors the learning of the students.

Keywords: Distance Education, Learning, Systematic Review.

Introduction

Education has been a determining factor for the evolution and transcendentalism of societies, allowing the human being to transmit his knowledge through time. Due to the acquisition of new technologies and the access to great amounts of information, the exclusion of education for distance learning becomes essential.

This educational modality is established in apogee in countries like Spain and the rest of the European countries; given that the norms established for the traditional education find a solution to the current formative needs, the conflict to attend regularly to a center or an extension to the superior education, everything aggravated as a whole to the inexorable necessity to update the content given to the students (Mora, 2004). Likewise, countries such as Peru have been forced to provide distance education. The need to overcome obstacles and the time it takes to carry out certain processes during face-to-face education; the alternative has emerged of improving the quality of education thanks to the constant advance of technology in relation to information and communication in general (Rama and Dominguez, 2011).

Virtual education in Latin America has been strengthened by the use of technologies brought about by online programs such as (Arboleda and Rama, 2020) In countries such as Colombia, Venezuela and Mexico, we can see the beginning of distance programs and the increase of computer tools focused on the development of practices and the maturity of skills, as well as in the environment of public online programs.

In the Peruvian case the scenario is somewhat better, since students are predisposed to soak up knowledge through the use of technology as mentioned (Alcántara, 2017) about the 30% annual increase in registration of places of study with distance mode, providing the opportunity to study to many young people.

With what has been exposed, it is reflected how important is the implementation of distance education, but there are still points to improve and thus take advantage of the resources to the maximum.

As it is stated (Dorfsman, 2013) the advances in the world of information, basically the education in the profession, is experiencing transformations that correspond to the obtaining of new abilities and that compete to the so called

Cite this Article as: Bernie Benavides-Benavente, Carlos Yacha-Genes and Michael Cabanillas-Carbonell "Impact of Distance Education on The Learning of University Students, Period 2009 - 2019: A Review of The Scientific Literature" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

digital dimension, linked to the effect that the factors of the world of information have in the learning and that will allow the formation of teachers to produce and to extend their content, to share their tasks and to design spaces of work, creativity, cooperation, meeting and reflection.

For (Abreu, 2014) the current society requires that everyone participate to guarantee the development and persistence, for that the professionals in education must be trained with a high level to guarantee a good performance as a professional.

The techniques for learning have changed over time as have the follow-ups to them. And for (Rama, 2017) "The distance education allows a greater individualization of the learning, more selective education to the particularities, follow-up and tutoring of the teachers and students, and better learning resources. Everything is conforming a scenario of better possibilities".

To achieve quality teaching and learning under the virtual education modality, universities must take the first step by changing to the virtual mode and where learning is focused on competition and that they are integrated with the plans of the institutions (Dominguez, 2013).

According to (Weller, 2002) online learning has foundations such as constructivism, resource environment, collaborative, problem-based and situated learning.

On the one hand (Kearsley, 2000), mentions that online education consists of characteristics such as collaboration, connectivity, student centeredness, community, exploration, shared knowledge, multisensory experience and authenticity. Developing in the student new skills and learning methods.

On the subject of how to evaluate students in the virtual mode (Ryan, Scout, Freeman and Patel, 2000), they suggest "a process by which students gain an understanding of their own competencies and progress, as well as a process by which they are graded.

For its part, international organizations such as UNESCO and the OAS support this mode of distance education, based on the results obtained worldwide and the opportunities it offers to form creative and visionary minds in all areas of knowledge, and for teachers to acquire another profile with virtual education.

Given the above, the research group seeks to answer the following question What is the level of impact of tele-education on the learning of university students in the last 10 years? Considering that the data obtained must be the most adequate having in mind the model of our research topic.

Thus, the study objective is based on determining the level of impact of tele-education on the learning of university students in the last 10 years through a systematic review. For this purpose, we resorted to the search of information in several articles and journals published in specific databases with previous analysis of this.

Methodology

Type of study

Systematic reviews consist of the best effort to collect and synthesize scientific evidence on a topic, using a model that guarantees that the limitations mentioned in the previous article of this series are the minimum possible. For (Beltran, 2005), Systematic review is defined as an integrative, observational, retrospective, secondary study, in which studies examining the same question are combined.

The documentary research work based on the PRISMA methodology is characterized, unlike other methodologies, by an extensive document detailing the explanation and justification of the 27 items established by PRISMA, as well as the elaboration process of each one of them. (Urrutia and Bonfill, 2010).

Research Questions

For the development of the investigation, we ask ourselves the following questions:

RQ1. In what way does Machine Learning determine the level of impact of distance education on students of the engineering faculty of the private university of the north, los olivos, 2020?

Search Strategies

In order to be able to search for information about our research topic; we had to perform certain word filters in the database search engines:

Keyword: keywords were used to search for "virtual AND education", "distance education", "e-learning", "educational virtualization", "online AND classes", "distance education AND learning", "e-learning AND learning" and "tele-education"; all of them in English and Spanish languages and in the Cielo, Dialnet, IEEE, OEI, Redalyc, Researcher, ScienceDirect, Scopus, VirtualEduca, WOS databases.

Date of publication: all articles and journals found had to be in the range of 2009 - 2019; prioritizing among them those recently published.

Inclusion and Exclusion Criteria

These sources mentioned above had to meet the following criteria in order to be included in our systematic review

- ✓ Longevity of studies no longer than 10 years, that is, covering the periods 2009 to 2019, in order to understand and analyze the changes that have arisen as a result of virtual education.
- ✓ Practical studies in the Latin American context of distance learning whose purpose is to find repetitive variables for later comparison and analysis based on the results.
- ✓ Studies of a methodological nature on proposals to enrich current research.
- ✓ The articles or magazines must be in digital presentation and in English and Spanish languages.
- ✓ The information found must belong to at least one of these databases (Cielo, Dialnet, IEEE, OEI, Redalyc, Researcher, ScienceDirect, Scopus, VirtualEduca, WOS).

Based on these inclusion criteria, all articles that do not comply with them, i.e. outside the publication year interval, language other than Spanish or English and others, would be EXCLUDED and would not be part of our list of articles/journals (TABLE 1) to be included in our research.

Results

Extracted and analyzed articles

After performing an exhaustive search of articles, journals or papers in some of the databases such as Scielo, Dialnet, IEEE, OEI, Redalyc, Researcher, ScienceDirect, Scopus, VirtualEduca and Wos; in search of providing the necessary basis to support our research topic, we obtained a total of 82 articles within an interval of years between 2009 and 2019. After counting on that amount of material, we started to apply our exclusion criteria, which are: suppressing articles that were less than the year 2009, suppressing articles that are different from the English and Spanish languages, and articles that are not found in a reliable database.

The final total number of 40 articles selected to present the results.

Fig 1: Selection process

Distribution of articles

These 40 selected articles have certain characteristics such as the year of publication, the type of study, the databases to which they belong, the language in which they are written, etc.

These data will then be presented as follows:

Figure 2: Number of articles by year of publishing

Figure 3: Number of articles published by type of study

Figure 4: Percent of articles published by database consultanted

Figure 1: Number of articles by language

Systematization of research

These 40 in 3 important groups: articles with positive impacts (29) in virtual education (73%), articles with negative impacts (5) in virtual education (13%) and articles with methodologies (6) that applied in distance education (15%). Each one of them contains categories that support their classifications.

A. Positive impacts on distance education

In this group 29 of the 40 articles show a positive impact by the distance education; which we can find them in 4 categories

Figure 6: Number of articles published by type of positive impact by distance education.

The first category is contained in 3 articles (10%) which refers to the flexibility of time, which is a point taken into account by many of the articles since it allows the student to arrange and organize their time to expand their educational spaces that would not only be reduced to the physical classroom, but also allows students to study other careers at the same time or perhaps work and study at the same time thanks to the use of this new modality of study. Below are the articles found in this category.

Table 1: Articles with positive contribution of time flexibility

Reference	Description of the contribution	Category
Gómez and Caicedo, 2015	The student has more time to study other courses.	Time flexibility
Almazán and Cárdenas, 2012	The student manages his time to study and work better.	Time flexibility
Falcon, 2013	The student has more time to study other courses	Time flexibility

A second category is contained in 15 articles (52%) that talk about the virtual tools that support virtual classes and get good results; that is, the interaction with digital tools produces the so-called "computer pedagogy" which is taken advantage of for the student. On the other hand, virtual environments and new technologies are capable of enhancing the processes of teaching and learning in education, becoming inescapable instruments for it. Another of the tools with which positive things were achieved was the desktop videoconference which has managed to increase the level of interaction to such an extent that 76% of students consider very useful for their learning, managing to establish a good academic relationship with the teachers who shared information through this tool.

It is important to mention that the use of the tics is also of great support in the formation of the students because they are effective and efficient tools in which the student understands much better the classes; that yes applying the technique and methodology adapted to obtain it. Next, it is shown the articles that are in this category.

Table 2: Articles with positive contribution of useful virtual tools

Reference	Description of the contribution	Category
Carlos and Gómez, 2011	Chat is a virtual social communication tool	Beneficial virtual tools
Amato and de Jesús Novales-Castro, 2014	Videoconferencing is a useful modality for your learning	Beneficial virtual tools
Quiroga and Padilla,2014	Students prefer to read texts in multimedia formats	Beneficial virtual tools
Quiroga and Padilla,2014	Virtual tools are capable of enhancing teaching processes.	Beneficial virtual tools
Tapia-Repetto, Gutiérrez and Tremillo-Maldonado, 2019	The students established a good relationship with the teacher through the videoconference	Beneficial virtual tools
Córdova et al., 2013	The student has the facility to obtain through the web	Beneficial virtual tools
Zhang and Bao, 2010	Students with disabilities benefit from virtual tools.	Beneficial virtual tools
Saleh and Farouk, 2013	Digital tools produce a "computer pedagogy".	Beneficial virtual tools
Medina-Gamero, 2019	The videoconference is the tool that achieves the interaction of the student	Beneficial virtual tools
Vidal Martínez and Aguilar Valenzuela, 2014	The tools improve interaction between students and teachers	Beneficial virtual tools
Mohammad et al., 2013	Provides methods to improve the quality of teaching through tics	Beneficial virtual tools
Marianela and González-Solano, 2009	Provides methods to improve the quality of teaching through tics	Beneficial virtual tools
María and Andrés, 2012	Provides methods to improve the quality of teaching through tics	Beneficial virtual tools
Vásquez Lopera, Ricaurte Avendaño and Arango Vásquez, 2011	Chat is a virtual social communication tool	Beneficial virtual tools
Peretó et al., 2010	The importance of the quality of the study material	Beneficial virtual tools
Cervantes, 2012	There are virtual spaces to acquire information and knowledge	Beneficial virtual tools

A third category is contained in 9 articles (31%) that deals with the development of the skills and strategies that students acquire thanks to virtual classes; as they are self-directed in the discovery, understanding and learning; managing to sustain their own learning pace.

In addition, these allow them to develop new skills and abilities, as well as strengthen the knowledge and enhance the thinking of the student. There is a greater satisfaction with the learning materials of the virtual environment, causing an immediate feedback and improving the capacity of analysis and synthesis.

Below are the articles found in this category.

Table 3: Articles with positive contribution of skills development

Reference	Description of the contribution	Category
Jasso Peña, Tamez Solis and Torres Reyes, 2019	The student self-directs his discovery and learning	Development of skills
Conde and Boza, 2019	The student develops new competences and skills	Development of skills
Abuchar Porras and Simanca Herrera, 2014	The virtual course strengthens the knowledge and potentiates the student's thinking	Development of skills
Abuchar Porras and Simanca Herrera, 2014	It empowers children in the successful conduct of their learning.	Development of skills
Abuchar Porras and Simanca Herrera, 2014	The use of interactive exercises improves the competence of analysis and synthesis.	Development of skills
Campillo-Serrano et al., 2013	Students better understand the classes through the platform	Development of skills
Fernández-Abella et al., 2019	Students improve memory and basic skills.	Development of skills
Durán, Estay-Niculcar and Álvarez, 2015	The students evaluated favorably in the virtual writing	Development of skills
Lozano Martínez and Tamez Vargas, 2014	Evaluates improvement in student participation and motivation	Development of skills

Finally, the fourth category is contained in 2 articles (7%) that refer to the training of teachers, which greatly influences the positive impact of distance education, since adequate teacher preparation generates better teaching and learning, in addition to favoring the development of innovative programs in the educational area.

Below are the articles found in this category.

Table 4: Articles with positive contribution of trained teachers

Reference	Description of the contribution	Category
Juca Maldonado, 2016	The quality and preparation of teachers improve the teaching and learning of students.	Trained teachers
José et al., 2014	The process of adapting teachers to publish material is described.	Trained teachers

B. Negative impact on distance education

In this classification we found 5 articles out of 40 total (13%) that show why distance education is not so favorable.

There are several reasons such as the lack of training of teachers, because the use of virtual tools is very complex, this affects the level of learning of students, another reason is the lack of immediate feedback and misinterpretation of information received generating a low understanding by the student.

Below are the articles found in this category.

Table 5: Articles with positive contribution of trained teachers

Reference	Description of the contribution	Category
Rosario Peláez-López, Johnny Morales-Roela, Cilda Lara-Vásconez, 2018	The use of virtual tools by teachers is complicated and affects learning.	Lack of training
De La Hoz, De La Hoz and Fontalvo, 2019	Students do not get better test scores.	Lack of training
González López Ledesma, Alvarez and Bassa, 2018	The information received is misinterpreted	Lack of training

Reference	Description of the contribution	Category
Barreto, 2011	The use of virtual tools by teachers is complicated and affects learning	Lack of training
Dorrego, 2016	The use of virtual tools by teachers is complicated and affects learning	Lack of training

C. Methodologies in distance education

There are 6 scientific articles (15%) where the variable of the methodology and style of teaching is highlighted. Under this model, (Costa, 2013) establishes methodologies for online teaching, emphasizing the use of printed material in correspondence with (Nora et al., 2010) where it is shown that 100% of printed materials were used. However, despite the use of printed material, the use of internet materials that was recorded was 94%. Considering the importance of didactic materials (Guerrero et al., 2010) based on 3 control groups, it shows an improvement in performance based on pragmatic materials (sounds, images, videos and different visual tools). Similarly, (Martín et al., 2014) points out the need for training teachers in video tools to improve the quality of the "teletraining" course.

Of the selected articles there is an incidence of the educational platform "Moodle" as a resource for the application of e-learning as it stands out (López et al., 2009) , where the preference of "Moodle" as a virtual platform is reported by the surveyed institutional entities. Similarly, (Guerrero et al., 2014) its use stands out because it contains various tools to address different ways to generate content.

Conclusion and Discussions

From the systematic review based on the objective of determining the level of impact of tele-education on the learning of university students in the last 10 years.

Attention is drawn to highlighting both the positive and negative impact and methodologies applied, as well as their respective level of impact on student learning.

We were able to identify the positive impact of tele-education as an accepted means of learning throughout the years due to its 4 beneficial factors: the increase in the speed of obtaining knowledge due to the flexibility of time, which represents 10% (see Table 1) of the articles with positive impact; the improvement of feedback due to the time of availability of the use of virtual tools, which represents 52% (see Table 2) of this group of articles; and the increase in the development of skills to maintain their own rhythm of study: self-learning, self-critical and analytical thinking thanks to feedback which represents 31% (see Table 3) of the total of this group and the last factor which is the adequate training of the teacher to interact correctly with the virtual platform and the students; these represent 7% (see Table 4) of a total of 29 articles based on positive impacts. With respect to the methodologies to be implemented in the virtual modality, it is recommended that teachers in charge of distance education be constantly trained in another type of pragmatic teacher-student interaction where the correct learning is sought with the use of didactic materials (video tools, sounds, images, among other visual tools) to improve the retention of the knowledge taught; this represents 15% of the total articles based on methodologies in virtual education.

In terms of learning and student-student interaction, tools that improve academic performance are highlighted, such as chat rooms that promote communication and interaction between students by encouraging group work.

Also considered are limitations in terms of the negative impact of learning (5 articles out of 40 which represents 13% (see Table 5) of the total) on distance education due to the lack of resources, as well as the lack of constant training of the teachers in charge of providing education and correct feedback of the session.

There are other systematic reviews that explore learning in virtual education, such as the study (Montagud, 2014) of which within the computer tools I use "Moodle" because of its diversity to generate content. (Trujillo, Echeverry, Eduardo, Heredia and Anselmo, 2009), mentions "Moodle" as a fundamental tool for e-learning.

Abstract

Modern society is characterized by the great diversity of information that is created and distributed at great speed thanks to technology. Due to this, artificial intelligence techniques are used in order to automate the work of classifying news for its veracity. The algorithms in the Natural Language Processing (NLP) family are especially used and studied with respect to this area. The tendency of information to be almost real time, sometimes prevents the correct analysis of sources, which can result in widespread misinformation by a news with false foundations, or half-truths. In this work 67 articles were systematized, from different databases (IEEE Xplore, Scopus, Science Direct, Scielo, Proquest). As a conclusion we can say that a large number of algorithms are useful for analyzing the veracity of news transmitted on social networks, also these can prevent the dissemination of false information, in addition to the algorithms in the family of natural language processing are especially useful for unstructured data environments such as social networks.

Keywords: Natural language processing, machine learning, social networks, fake news.

Introduction

Modern society relies on the use of a variety of algorithms for multiple purposes. Natural language processing algorithms are a group of special algorithms that are widely used for the analysis, understanding, correction and translation of natural language. They are involved in everyday activities such as detection and translation between languages, personalized assistance systems, classification, chatbots, information and keyword extraction, etc (Saquete et al., 2020). All these possibilities are thanks to the advance in technology and its availability (Toumey, 2016).

The exponential growth of technology in recent decades has allowed the application of machine learning techniques and the development of new branches related to this discipline, and the algorithms have become more complex and sophisticated. Machines are rapidly increasing the number of neurons (referring to those existing within a neural network), to the point of equating to the estimated brains of small insects (Martinez-Plumed et al., 2018). On the other hand, specialized artificial intelligence (AI) algorithms have been performing key activities in many fields in multiple aspects, from research to economy and recreation.

Compared to algorithms that are oriented to similar behavior of living beings, expert systems and other types of algorithms do not use massive amounts of neurons. They specialize in performing well-defined, one-off tasks, while manipulating large amounts of data, transforming them, processing them, and generating important information for the end user or an interpretable or comparable result (Hussein et al., 2020). Depending on their approach to the problem, natural language processing algorithms can process pieces of data in order to build a sea of knowledge, with which the content can be "understood". This gives NLP algorithms the ability to abstract information similar to a person.

A Review of The Scientific Literature From 2015 - 2020" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

Methodology

A. *Research Question*

RQ1: In what fields are the NLP algorithms most used?

RQ2: What do they contain? Do you do more research using NLP algorithms?

RQ3: Which database is the most suitable for research on NLP algorithms?

RQ4: What kind of NLP algorithm is the most used to detect false news?

After determining the research questions, articles published between 2015 and the present were searched in multiple databases, which are mentioned below.

B. *Search process*

The development of the research was carried out a review of scientific literature in different databases, using the keywords according to the scientific orientation of each database. The main electronic sources and databases consulted are listed below:

- IEEE XPLORE
- SCOPUS
- SCIENCEDIRECT
- PROQUEST
- SCIELO

It is also necessary to highlight that scholar (from google) was used as an alternative search engine, in the cases of not having results in the search engines of each database.

C. *Search strategy*

In order to get answers to our research questions, we search the databases mentioned above for articles, using keywords such as: "NLP", "Natural Language Processing", " Detection Fake news" "Natural Language Processing".

D. *Inclusion and exclusion criteria*

For this review, the following inclusion and exclusion criteria were applied as shown in the table below:

Table 1: Inclusion and exclusion criteria

CRITERIA		
Inclusion	I01	Articles related to the natural language processing algorithm
	I02	Articles published from 2015 to 2020
	I03	Articles related to false news detection
Exclusion	E01	Articles not related to the natural language processing algorithm
	E02	Articles published from 6 year to more
	E03	Articles not related to the detection of false news

E. *Application of criteria*

As part of the research, the main topics of the investigation were taken into account, as well as the key words and with these they were considered in the filters of the articles. They were evaluated in multiple databases, which were mentioned above, and after making the filters we were left with 67 articles.

Fig. 1: Prism diagram methodology

We analyzed 81 articles in the databases mentioned above, of these 14 articles were discarded according to the exclusion criteria and finally we were left with 67 articles.

Fig. 2: Flow chart methodology

Results

The results of the research allow us to understand the before, during and after data, and the status of the research topic. Next we proceed to describe graphic visualizations with the purpose of giving a more assimilable sense.

A. Choropleths map

This graph allows us to visualize the preference of the countries with respect to the databases. In this case IEEE Xplore is the database with the highest results for this research and the distribution shows preference for this database.

Fig. 3: Choropleth map of the distribution by country of the articles

B. Distribution by year of publication of the article

In this graph we can see that the distribution of the collected items tends towards the last years (representing the years 2020, 2019 and 2018 an accumulated 84% of the total items). These are limited to 2015 due to the time range chosen in the research.

Fig 4. Diagram of radial distribution per year of the articles

C. Algorithm type distribution by year

With this graph we show a predilection for the use of algorithms for classification and content extraction. The types marked as "other" refer to the accumulation of several types where algorithms are used outside the NLP branch, or in combination with others and masked within the scope of use of NLP algorithms, as well as those that indirectly use NLP algorithms after other processes have been addressed by other models.

Fig 5. Diagram of line distribution per year of the types of NLP algorithms used

D. Database distribution with per year

In this case we show the results obtained from each database with respect to the years reviewed. It is shown that the IEEE is the one that has more constancy through the years and in the general count.

Fig 6. Polygon diagram of the distribution of the databases with respect to the years

E. Distribution of articles by country

This graph shows the distribution of NLP algorithm types with respect to countries. India, China and the USA account for the majority.

Fig 7: Horizontal bar diagram of the distribution of NLP algorithm types with respect to countries

F. Distribution of articles by continent

In this case, the graph shows the predominance of the Asian continent with respect to the number of articles referenced in this work. Complementing the graph in the previous point, India and China position Asia in the first place.

Fig 8. Stacked column diagram of the distribution of items by country and continent

G. Relationship tables

Table 2: Relation of articles with the themes of the research

THEME	ARTICLE

H. Abbreviations and Acronyms

Multiple abbreviations and acronyms have been used to avoid repetition of long names or denominations.

NLP: Natural Language Processing
IEEE: Institute of Electrical and Electronics Engineers
USA: United States
Chatbot: System designed to answer questions in a similar way as a human would
AI: Artificial Intelligence

Fig. 9: Image representing the branching of artificial intelligence algorithms; because of the objective of the algorithm, it may or may not belong to the NLP family of algorithms

Discussion

RQ1: In what fields are the NLP algorithms most used?

They are mainly used in the analysis of big data and unstructured data. Because the most popular social networks have approximately 80% to 90% of unstructured data, NLP algorithms are very important for content extraction and classification.

RQ2: Which continent conducts more research using NLP algorithms?

According to our literature review we can conclude that Asia is the continent that carries out the most research with respect to NLP algorithms, with China and India being the main countries where the articles we take into account were published.

RQ3: Which database is the most adequate for research on NLP algorithms?

According to our research we can conclude that IEEE Xplore is indisputably the most used database in NLP algorithm research.

RQ4: What kind of NLP algorithm is the most used to detect false news?

Rating is the most effective type of algorithm. Naïve Bayes has proven to be effective, despite its simplicity.

Conclusion

The systematic review of scientific literature carried out in this work allows us to evidence that artificial intelligence as a discipline has evolved in an accelerated manner, spreading in multiple fields of study and application. Algorithms within the natural language processing family have been especially useful for solving problems related to large non-relational databases and unstructured data, such as social networks. In the latter, there is an exponential growth in the speed with which a news item spreads, which leaves a door open for false news, which due to the above, can cause problems in case they do not go through a verification process.

Abstract

In 2016, the Global Reporting Initiative transitioned from providing guidelines to setting the first global standards for sustainability reporting – the GRI Sustainability Reporting Standards, developed by the Global Sustainability Standards Board. According to the GRI Standards, general requirements for reporting the management approach cover the following disclosures: explanation of the material topic and its boundary, the management approach and its components, and evaluation of the management approach. The aim of the paper is to examine the non-financial reporting practices related to the management approach through analyzing sustainability reports prepared in line with the GRI Sustainability Reporting Standards by European healthcare services organizations. The aim was achieved by studying the GRI Sustainability Disclosure Database where non-financial reports are published, and performing a content analysis. The key findings are the following: (1) 17 organizations from only 4 European countries prepared their sustainability reports according to the GRI Standards; (2) 12 organizations communicated about all three aspects of the management approach. This research fills a research gap in the field of non-financial reporting practices related to the management approach in the European healthcare sector.

Keywords: Non-Financial Reporting, Sustainability Reports, GRI Standards, Healthcare Organizations, Management Approach.

Introduction

The Global Reporting Initiative promotes the use of sustainability reporting as a way for organizations to become more sustainable and contribute to a sustainable global economy. Being sustainable (socially responsible) healthcare organization is more and more frequently communicated by issuing non-financial reports containing information about CSR-related activities. Integrating sustainable health practices into strategic and operational activities and supporting the efforts for transparent and accountable sustainable change inside and outside healthcare organizations turn out recently to be one of the main challenges in healthcare sector (Block, 2016). Given the focus on health, safety and quality, questions have arisen regarding the practical application of sustainability concepts in healthcare facilities and whether such concepts can be compatible with healthcare outcomes (Zadeh et al., 2016). Effectively implementing sustainability in healthcare organizations presents a unique challenge because healthcare is one of the most complex and rapidly changing industries (Boone, 2012). Although many healthcare organizations include sustainable practices in their strategic and operational activities, non-financial reporting is still at the nascent stage comparing to organizations from other sectors. The aim of the paper is to examine the non-financial reporting practices related to the management approach through analyzing sustainability reports prepared in line with the GRI Sustainability Reporting Standards by European healthcare services organizations. The aim was achieved by studying the GRI Sustainability Disclosure Database where non-financial reports are published, and performing a content analysis.

The use of GRI Sustainability Reporting Standards in the healthcare sector

The Global Reporting Initiative (GRI) has been established due to the lack of a common sustainability reporting standard. Originally, the aim of the GRI was to elaborate and promote guidelines for sustainability reporting. Having achieved this, the GRI currently strives to make non-financial reporting a standard practice for all

Cite this Article as: Małgorzata MACUDA and Ryszard ORLIŃSKI "Sustainability Reporting of European Healthcare Services Organizations According to GRI Standards: Management Approach" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

organizations by offering a range of supplements developed to address sector-specific circumstances and challenges (Zinenko, Rovira, Montiel, 2015). "The aim was to create the first accountability mechanism to ensure companies adhere to responsible environmental conduct principles, which was then broadened to include social, economic and governance issues. The GRI envisions a sustainable future enabled by transparency and open dialogue about impacts. This is a future in which reporting on impacts is common practice by all organizations around the world. In 2016, the GRI transitioned from providing guidelines to setting the first global standards for sustainability reporting – the GRI Standards" (GRI's mission and history, 2020). The GRI Standards developed by the Global Sustainability Standards Board (GSSB) are the first and most widely adopted global standards for sustainability reporting, and remains currently valid.

The GRI Sustainability Disclosure Database comprises 2400 non-financial reports published by 629 healthcare organizations from all over the world, including 809 reports issued by 245 organizations delivering healthcare services and 1591 reports prepared by 384 organizations involved in manufacturing and selling healthcare products. The empirical analysis shows an increased interest in publishing non-financial reports over the last 10 years in the healthcare sector worldwide. Since 2016, in subsequent years a growing number of sustainability reports, prepared in compliance with the GRI Standards by organizations operating in the healthcare sector, appearing in the GRI Sustainability Disclosure Database may be observed.

In total, 275 sustainability reports in the worldwide healthcare sector (11,2%), published in the GRI Sustainability Disclosure Database, are complied with the most up-to-date GRI Standards, including 99 reports issued by 77 healthcare services organizations all over the world and 130 reports by 85 healthcare products organizations worldwide. In Europe, 29 reports are prepared by 17 European healthcare services organizations and 59 reports by 33 European healthcare products organizations. The rest 187 non-financial reports are produced by healthcare organizations from Africa, Asia, Latin America and the Caribbean, Northern America, and Oceania.

Results of the Conducted Research

The Table 1 presents the characteristics of European healthcare services organizations and their reports prepared according to the GRI Standards and issued in the GRI Sustainability Disclosure Database. It includes the name, size and type of European healthcare services organizations, the number of non-financial reports and their number of pages. A content analysis of these reports have been applied in order to examine the area of disclosures regarding the management approach. General requirements for reporting the management approach in line with the GRI Standards are the following:

1) Disclosure 103-1 Explanation of the material topic and its Boundary
2) Disclosure 103-2 The management approach and its components
3) Disclosure 103-3 Evaluation of the management approach

If management approach disclosures are combined for a group of material topics, the reporting organization shall state which topics are covered by each disclosure. If there is no management approach for a material topic, the reporting organization shall describe any plans to implement a management approach or the reasons for not having a management approach.

S - Subsidiary

As it may be noticed in the Table 1, non-financial reporting practices being in line with the GRI Standards in the healthcare sector in Europe are not very widespread. Only 17 organizations from four European countries prepared their sustainability reports according to the global standards. However, most of the healthcare services organizations disclosed the management approach. In total, 12 organizations communicated about its all three aspects: explanation of the material topic and its boundary, the management approach and its components, and evaluation of the management approach. One organization disclosed nothing related to the management approach. One organization presented only explanation of the material topic and its boundary. Four organizations informed about explanation of the material topic and its boundary, and the management approach and its components, but they did not disclosed evaluation of the management approach.

Conclusions

In the last two decades, non-financial reporting appears as a new trend in the European healthcare sector. The number of sustainability reports published according to the GRI Standards is growing and further countries start to communicate about their economic, environmental and social issues, including the management approach. This research contributes to a growing literature on the standardization of sustainability reporting in the healthcare sector by providing an empirical insight into the actual use of the GRI Standards. It fills a research gap in the field of non-financial reporting practices related to the management approach of European healthcare services organizations. The key findings are the following: (1) 17 organizations from only 4 European countries prepared their

sustainability reports according to the GRI Standards; (2) 12 organizations communicated about all three aspects of the management approach. The research sample is little, so in the near future, the European healthcare sector should be monitored and new non-financial reports, prepared in line with the GRI Standards, becoming available in the GRI Sustainability Disclosure Database ought to be studied. This research lays foundations for future research on the intra-organizational practices, structures and systems that are the result of standard compliance with the GRI Standards. Further studies might investigate the effects of its application on management practices by comparing the intended and actual implementation of the GRI Standards and their consequent influences on organizational processes.

Abstract

The objective of this research was to analyze the ecological behavior of business students in the context of a COVID-19 pandemic. The study was developed under a quantitative approach, descriptive in scope, non-experimental cross-sectional design. The sample consisted of 400 business students from a private university in North Lima. The instrument used was the Ecological Behavior Scale (ECE), which was adapted to the Peruvian reality; This questionnaire had a Cronbach's Alpha of 0.817. Likewise, said instrument had three categories: 1) water use, 2) energy use, and 3) household waste disposal. For the analysis and data processing, Microsoft Excel and SPSS tools were used. The study concluded that there is a positive / moderate ecological behavior in business students. Therefore, it is recommended that university institutions contemplate the insertion of this subject within their curricular structure.

Keywords : Pro-environmental behavior, ecological behavior, environmental behavior, environmental behavior.

Introduction

The increase in the consumption of products and the generation of waste in the last three decades is considered in the scientific literature to be one of the most worrying causes for the deterioration of the environment, which definitely compromises the lives of future generations (Severo et al, 2018).

For its part, the United Nations (UN) is seeking a solution to human, social and economic problems. For this purpose, in 2015, it presented the Sustainable Development Goals (SDGs) to be achieved in 2030. These goals should guide the actions of governments, civil society, academics, business, among other participants in society. All this implies the obligation to implement tools that allow the creation of an inclusive and fair society, at the service of the people of the present as well as of future generations (ECLAC, 2018).

To achieve the SDGs, the business world has a leading role, since it has political, economic and social power (Sachs, 2015). For this reason, it is necessary for this sector to commit itself to sustainable development by applying its strategic management for the care of the environment. In this way, both companies and consumers must carry out better environmental practices, to achieve a more responsible consumption, developing products that are friendly to the environment (Severo et al., 2018).

According to the aforementioned, it is important to know the pro-environmental profile of the future professionals in business administration that will lead the organizations in the near future, since they will be the ones who will implement the business policies, and will make the decisions regarding responsible practices. of caring for the environment. In this sense, there are some studies related to the ecological behavior of future professionals, as we can mention:

De Sousa et al. (2015) carried out a study whose objective was to understand the causes that influence the ecological behavior of business university students. To do this, it surveyed 486 students from public and private

Higher Education Institutions of the administration course, in the state of Piauí-Brazil; In this investigation, he detailed that similar results have been shown to the study carried out by Pato and Tamayo (2007); however, a difference is shown in the factors found. Since in the investigation of Pato and Tamayo (2007) they specified 4 factors such as: "Urban cleaning", "Energy", "Activism-Consumption" and "Recycling", and in the investigation of said author they determined 6 factors: "Savings of water ",“ Cleaning ",“ Activism-Consumption ",“ Saving energy ",“ Recycling "and“ Activism ". They came to the conclusion that their research served for decision-making in the university sector, helping future managers and student coordinators to contribute to their ecological behavior.

For their part, Camacho and Jaimes (2016) sought to recognize the correlation between environmental attitudes and behaviors, for which they scored 190 college nursing students in Colombia. Their results showed that ecological attitudes were positive, but they were not manifested in their behavior; That is why they recommended improvement in environmental training and their professional performance.

Vargas et al. (2017) studied the values, environmental knowledge, organizational commitment and job satisfaction of workers. Taking the case of the Bahías de Huatulco hotel in Mexico. His research sought to determine the determining components of ecological behavior. For this analysis, a questionnaire was applied to 178 hotel workers. The results reflected that the environmental knowledge that the workers had was developed based on the talks and training provided by the organization. The objective of which was to impart a culture and responsible participation, based on the reserve of natural resources and the promotion of ecological habits. They came to conclude the existence of a significant relationship between values, environmental knowledge and pro-environmental behavior.

On the other hand, Pincay et al. (2018) conducted a study in the city of Guayaquil, Ecuador, the objective of which was to determine the ecological attitudes and behavior of adult consumers. To do this, they interviewed 196 people between 18 and 45 years of age, from socioeconomic levels B and C. The results showed that some of the participants had an ecological conscience and that this was basically due to the media and concluded that the attitudes Ecological factors are detailed in three types of causes: Eco posture, Cognition and Ecoactivity.

Ecological Behavior

Different authors refer to ecological behavior as voluntary and true work or activity, which are committed to collective and personal requests, which results in environmental conservation (Páramo, 2017). Additionally, ecological behavior was being accepted; since, it had as objective to favor the ecosystem. In turn, he determined it as a favorable will and they use said term of ecological behavior to emphasize the behavior that benefits or harms the ecosystem (Rivera and Garcés, 2018). Pro-ecological behavior develops when an individual commits to employing actions that help conserve, protect and safeguard the ecosystem, as well as promote peace of mind for all human beings (Álvarez and Vega, 2009).

Environmental behavior was conceptualized as the different acts that an individual uses to be able to take care of the environment, that is; It not only intends to conserve its own environment, but also seeks to reduce the environmental problems and impacts that its purchases generate (Bianchi et al., 2019; López et al., 2015). Pro-environmental behavior could also be defined as the commitment to protect and prevent environmental deterioration (De Sousa et al., 2015).

Different authors agreed that sociodemographic variables are indifferent to be able to explain pro-environmental behavior, considering the psychographic and knowledge variables of greatest interest (López et al., 2015).
For their part, Corral (2010) and Flores (2019) specify the topics for the study of recycling such as: Recycling, Water consumption, Energy saving, Reading of environmental topics, Environmental aesthetic actions, Preservation of ecosystem.

Theories of Ecological Behavior

A theoretical model would be given by reasoned action which consists of pro-environmental behavior made up of beliefs. This theory supports two dimensions: 1) the individual's attitude towards behavior and 2) the perspectives based on the behavior that the individual observes in their social environment, which is classified as a normative social influence. This theory is supported by the individual's routine actions that would be associated simultaneously with the stimulation of acceptable behaviors, mandatory guidelines imposed by society called attitude and that shows a concordance to said behaviors, called subjective norms (Worchel, Cooper, Goethals , and Olson, 2009).

For her part, Flores (2019) supports the model oriented to ecological behavior developed in five indicators, which are: 1) personal values, 2) new ecological paradigm, 3) awareness of the consequences, 4) attributions of responsibility and 5) norms. personal.

Cerrillo (2010) points out a new ecological paradigm, opposite to the traditional environmental paradigm regarding the visualization of the planet. The peculiarity lies in the conviction that individuals developed regarding nature. This model shows the contribution of values, beliefs and effects on behavior. The model details the following dimensions: limits to growth, the very exceptional anti, environmental balance, environmental problems, and anthropocentrism.

After reviewing some background and theories, the study was carried out that aimed to analyze the ecological behavior of business administration students in the context of a Covid-19 pandemic.

Method

The research followed a quantitative approach, descriptive scope, non-experimental-cross-sectional design (Hernández, Fernández, & Baptista, 2014). The data collection was obtained through a self-administered questionnaire by university students who were studying business administration at private universities in North Lima. For the selection of the participants, the following inclusion criteria were defined: University students from the first to the tenth undergraduate academic cycle, who are studying a business career, who are enrolled in the 2020-2 school period and are willing to participate with the filling out the questionnaire.

The sample size was calculated for infinite populations, with a confidence level of 95% and a margin of error of 5%, where the individuals in the study should have been 385 students, however, it was possible to apply the questionnaire to 400 students, which generated a more representative and consistent investigation. The sampling was non-probabilistic for convenience. The sample was made up as follows: 63% female, 37% male, and 1% preferred not to say so. Regarding age, it was made up as follows: 66% were between 17 and 21 years old, 29% were between 22 and 26 years old, and 5% were between 27 and 30 years old.

Regarding the academic cycle, the sample was made up as follows: 8% of students belonged to the first cycle, 1% in the second and third cycles, 26% and 16% to the fourth and fifth cycles respectively, 12% in the sixth cycle, 8% at the seventh cycle, 15% at the eighth cycle, 4% at the ninth cycle and 9% at the tenth cycle.

To collect the information, the Ecological Behavior Scale (ECE) was used, which was developed and validated by Pato (2004) in Brazil. The scale consisted of 17 items, on the Likert scale (1 = Never, 2 = Almost Never, 3 = Sometimes, 4 = Many times, 5 = Almost always and 6 = Always). The items were distributed in 3 dimensions, related to: 1) Water use, 2) Energy use and 3) Disposal of household garbage. The instrument had to be adapted according to the cultural characteristics of Peruvian university students. And an analysis of the psychometric properties was carried out.

The Kaiser-Meyer-Olkin test (KMO = 0.801) was performed. The reliability analyzes as internal consistency yielded a Crombach Alpha of 0.809, which implies that the scores have a very small error and are highly reliable.

Results

The results are shown below:

Table 1: Characteristics of ecological interest of business students

		Frequency	Percentage
Affiliated to an environmental institution	No	346	87%
	Si	54	14%
	Total	400	100%
Work in an environmental institution	No	391	98%
	Si	9	2%
	Total	400	100%
Environmental collaboration	No	317	79%
	Si	83	21%
	Total	400	100%

According to table 1, it can be observed that very few students are affiliated with an environmental institution or collaborate with the environment. The lowest percentage being those who work in an institution in this sector.

Table 2: Characteristics of ecological interest of business students

Behavior regarding energy use	**Mean**	**Median**	**Dev.**
1.I avoid leaving the lights on in environments that I'm not using	5.0	5.0	1.1
2.I avoid opening the refrigerator if I am not sure what I am going to use	4.7	5.0	1.3
3.I turn off the light every time I leave an environment	5.0	5.0	1.2
4.I avoid wasting electrical energy	4.7	5.0	1.5
5.I avoid having the refrigerator open so as not to waste energy	4.4	5.0	1.0
6.I avoid leaving the television on if no one is watching	4.9	5.0	1.6
7.I avoid connecting multiple electronic devices at the same time	3.3	3.0	1.2
Behavior regarding the use of water			
8. I avoid leaving the spout open when taking a bath	4.8	5.0	1.5
9. I avoid wasting water and other natural resources	4.4	5.0	1.5
10. I close the spout while brushing my teeth	5.2	6.0	1.0
11. I turn off the shower to get soap	4.6	5.0	1.6
12.I save water whenever possible	4.7	5.0	1.2
Behavior regarding garbage disposal			
13. I avoid disposing of all kinds of waste together	3.0	3.0	1.5
14. I have a can for each type of waste	2.7	3.0	1.5
15. I avoid buying products with plastic packaging	3.3	3.0	1.3
16. I separate the garbage according to the type of waste	2.7	3.0	1.3
17. Just the paper to later be recycled	3.3	3.0	1.6

If we consider that it is a six-point scale, the results indicate that in general terms the ecological behavior of the students would be located at a positive / moderate level (M = 4.16). However, after a differentiated analysis we can establish that the students have a more responsible behavior regarding the use of water in item 10 (M = 5.2), related to closing the spout while brushing their teeth. Items 1 and 3 (M = 5.0) are also rescued, where they demonstrate a more responsible behavior related to the use of energy, related to avoiding leaving the lights on in environments that are not being used and turning off the light every time they go out of the environment, which are indeed closely related.

The category where students demonstrate negative ecological behavior in almost all items is related to garbage disposal, where it can be seen that the lowest level is item 14 (M = 2.7) which has to do with with the fact of having a bin for each type of waste.

Discussion and conclusions

It also showed relevance in that the respondents were not affiliated with an environmental institution and did not work in it, nor did they participate in environmental issues in the last two years, which suggested that there is very little ecological interest in business students. It could be due to lack of knowledge due to the fact that the existing communication media in Peru do not promote said environmental awareness, of which Corral (2010) made mention of the importance of generating environmental awareness through all communication platforms; since this contributes to generate interest in different individuals regarding ecological problems.

The low level of ecological behavior may be due to the lack of ecological culture that were not reflected in their habits and behaviors, as mentioned by Palavecinos et al. (2016) in his study where he discovered a positive attitude in environmental care, but his behavior was not always consistently in favor of the environment.

Regarding the use of water, an inappropriate use was observed because on several occasions they made unnecessary waste of this natural resource. Also, the research by Vargas et al. (2017) developed an approach based on the importance of being able to transmit an adequate culture and collaboration focused on the preservation of natural resources, thereby developing appropriate environmental practices and customs.

A regular level was also seen regarding energy use, since the respondents avoided connecting different electronic devices at the same time or leaving them to charge for a long time; however, a continuous behavior is not visualized in them. The opposite was the case with the research by Camacho and Jaimes (2016) who saw that attitudes were not always related to action in behavior, despite the fact that the vast majority of their respondents showed good ecological attitudes.

Finally, in the household garbage disposal factor, an unfavorable level was observed in most of the items, this could be due to the fact that young people consider that it is a bit difficult to do this activity. The opposite case happens with the study carried out by Corral and De Queiroz (2004) who observed a development in ecological behavior according to good environmental practices regarding the separation of waste.

This research had as limitations the scarcity of studies under the same context, which is why it was decided to take as a reference research related to the topic addressed with other variables.

This study will serve so that organizations, universities that can implement and improve their curriculum regarding the teaching of ecological behavior because it is important that future professionals can be more aware of these types of concerns. This would generate new knowledge and new habits for future graduates who will lead companies where they will make decisions and apply practical actions within them. Also, this research can be taken as a reference for future research.

This work is part of the previous results of a general investigation. In which it will seek to deepen greater knowledge relating the variable of ecological behavior and environmental concern.

Research Funding in Polish Higher Education – Moving on To Highly Competitive System

Barbara GRABINSKA
Cracow University of Economics, Cracow, Poland
grabinsb@uek.krakow.pl

Abstract

Research funding plays a key role in directing the development of science and stimulating the research productivity, which is crucial in today's economy based on knowledge. Around the world, we can observe the growing dissemination of the model of research financing based on the composition of competitive grant funding for individual researchers and performance-based funding for subsidizing institutions of higher education. Poland has transformed in a relatively short period of time from a system of block-based research funding to highly competitive model of research financing, where substantial amount of total research resources is allocated for project funding and institutional financing is based on performance metrics.
The aim of the study is to present the evolution in the structure of revenues for research activity of public higher education institutions (HEI) in Poland with the focus on project financing distributed by two research agencies: National Science Center - responsible for basic research and National Centre for Research and Development - responsible for supporting applied and experimental research.
The study is based on the data from the financial statements of public HEI over the period 2011 – 2018. Conclusions are vital for the evidence-based policy regarding research funding.

Keywords: Higher Education; System of Public Research Financing; Project Funding; Poland.

Introduction

Financial determinants regarding both the level and mechanism of funds allocation are regarded as significant, if not crucial, factors of research development and quality. Therefore, it is not surprising that mechanisms and tools of financing universities attract attention from the part of researchers and policymakers.

Research funding systems around the world have undergone profound changes in the last decades. Reforms introduced in many countries have been based on two pillars: performance based funding systems for distribution of core institutional funding and competitive project funding for individual researchers. Lately, it has been common to include also a third source of financing in the form of excellence funding - providing a stable source of money for the best institutions. In recent years a shift toward greater participation of project funding in research institutional budgets has been observed. The pace of changes around the European systems of higher education is different and composition of research revenues of universities is diversified.

In this regard, Poland provides very interesting example transforming in relatively short period of time from a system of block-based research funding to highly competitive model of research financing, where substantial amount of total research resources is allocated for project funding and institutional financing is based on performance metrics.

The aim of the article is to present the evolution in the structure of research for research activity of higher education institutions (HEI) with the focus on project financing distributed by the research agencies (councils).

The study is based on the data from the financial statements of public HEI over the period 2011 – 2018. Conclusions are vital for the evidence-based policy regarding research funding.

Literature Review

One of the most significant changes in public research funding in recent decades has been a shift from an internal block funding model toward the system with performance based institutional financing and selective funding of research proposal of individual academics. The consequence of this reform has been an increase in the proportion of funds competitively allocated in relation to financing based on discretional, administrative decisions of policy makers. Competitive project-based financing via research agencies or councils has become an important way of distributing public resources for science in many countries and it is in line with New Public Management approach. It is perceived as more efficient way of research funding than institutional subsidizing. Selective funding of grant proposals employs quasi-market-like mechanisms in the system of higher education with the goal of stimulating competitiveness.

It is worth to mention however that studies on efficiency of selective grant funding, distributed by research councils usually after peer-review of research proposals, are not unequivocal. There are also problems with defining and measuring outcomes of science systems, as the research output is heterogeneous and should not be limited to the most frequently considered scholarly output e.g. highly cited publications, but also it should include patents or societal relevant knowledge.

Jacob and Lefgren (2011) provide evidence for relatively small impact of receiving grant on subsequent publications and citations in competitive US market for research funding. They find that receipt of an NIH grant in years 1980 - 2000, with an average value of $1,7 million, leads to 1,2 additional publication over the next five years, which corresponds to 7 % increase in scientific output comparing with unsuccessful applicants. This modest growth in scientific productivity is explained by the so called displacement phenomenon, which means that unsuccessful applicants shift to another source of funding. This is possible in the model of multiple funding agencies and a competitive market for research funding, in which rejected author can obtain financing from alternative agency, his or her institution or a co-author . The authors stress however that despite the small impact of NIH grant on the marginal applicant, there may be an aggregate positive effect of the agency support in the long run, if overall funding is in fixed supply.
Mongeon, Brodeur, Beaudry and Lariviere (2016) measure the relation between the amount of funding provided to nearly 13 thousands of researchers in one of the Canada's province - Quebec over the years 1998 to 2012 and their scientific output from 2000 to 2013. They conclude that in terms of both the quantity of papers produced as well as their scientific impact, the concentration of funding in the hands of relatively small and elite group of researchers generally results in diminishing marginal returns.

Sandstrom and Van den Besselaar (2018) point out that competitiveness in science system is usually defined and measured as the share of project funding in total research revenues (the higher the share, the more competition in a research system), but they notice also others factors: existence of performance based financing and national evaluation, which influence the level of competition. The authors examine data on input and output in 18 countries and challenge the popular statement that the higher the share of project funding, the higher the efficiency of the system. They find that a moderate to small, but negative correlation of about 0,3 between efficiency and the level of competitive project funding.

Győrffy, Herman and Szabó (2020) in their Hungary-based study observe an impressive 47 % increase in publication output following the receipt of basic research grant. They explain this radically strong effect by the fact that in emerging economies there are less sources of research funding than in highly developed countries and not receiving grant very often means that unsuccessful researchers have to wait till the next year call when they can resubmit the proposal.

Even larger complications arise in the case of international comparative studies, because of the lack of comparable data especially about inputs in research and many factors which have to be controlled when measuring differences in efficiency of national science systems (e.g. structural characteristics of science systems like: university autonomy, level of academic freedom, level of competition etc.) (Sandstrom and Van den Besselaar, 2018).

Country Setting

Higher education sector, which is at the center of public research system in Poland, has been subject to many reforms over the past 30 years since the economic and political transformation in 1989.

The main achievements of Polish higher education in recent decades are connected with impressive growth in access to higher education with gross enrolment rate at 12,9 % in academic year 1990/1991 and 46,2 % in 2018/2019 (Statistics Poland, 2005 and Statistics Poland, 2019). But on the side of quality of performed teaching and research,

Polish universities still stand out from the leading centers in Europe. The position of Polish universities in international rankings is weak. According to the Academic Ranking of World Universities 2020, only eight universities from Poland have been included in the top 1000 ranking, with our highest- ranked institution - University of Warsaw, in the fourth hundred of the list.

Government is searching to improve the performance of Polish universities and is looking at higher education system in Western Europe as the benchmark model.

In the academic year 2018/2020, there were 392 higher education institutions in Poland of which about one third were public. The private higher education sector in Poland is numerous, but it is made up of small institutions with students accounting for around 1/4 of total students and academic teachers accounting for around 12% of full-time employed academic staff (Statistics Poland, 2019).

Non- public higher education institutions are usually teaching-oriented and only a small proportion of them is engaged in research activities.

Public as well as private universities are entitled to state financing of research activities. Polish funding system is not diversified, with government dominating as by far the biggest funding provider. Poland has a dual funding structure with public financing of research provided through two routes: institutional core grants and competitive research council grants.

Organizational (institutional) funding is based on performance measures of research activity and it depends on the outcomes of nation-wide evaluation carried out by Committee for Evaluation of Scientific Research Institutions. Evaluation takes place every four years and it results in categorization of research units. The next evaluation in 2022 will be organized according to the new rules and it will be performed across the scientific disciplines, not across research units.

Different criteria and metrics are taken into account in the assessment process. The most important of them include: number and quality of publications, patents, revenues from cooperation with industry and other external sources of R&D funding, number of scientific degrees awarded.

Poland was in the early 1990s one of the first countries in Europe, which implemented the distribution of science funding based on assessment of research institutions. Over the years, the evaluation system has undergone substantial reforms. In 1990s. it was the peer review categorization of research institutions. In 1999 a new system was launched with significantly limited role of expert opinions, but based on a parametric assessment. From 2010 another phase in the history of evaluation was pronounced with setting up the board responsible for national evaluation (Kulczycki, Korzeń, Korytkowski, 2017). The first assessment after this reform was carried out in 2013, then in 2017 and the next one will take place in 2022.

The main objective of this system is to provide funding to scientific units according to their scientific achievements, with number and quality of publications as the most important component in the evaluated outcomes. The quality of a given scientific unit is expressed as one of four categories: A+, A, B or C.

It is worth to mention, that Poland belongs to the minority of European countries (together with UK), where the whole research component of basic state contribution is performance-based (ETER, 2019).

The second pillar of financing is project funding allocated to individuals or research groups on the competitive basis in the process of research proposal assessment.

In 2010, a major change was introduced in the area of project funding in Poland, which consisted in transferring the competence to allocate funds form the ministry of science and higher education to the executive agencies: The National Science Centre (NSC) and The National Centre for Research and Development (NCRD) (Supreme Audit Office, 2020).

NSC was established in 2011 and it is the most important funding mechanism for basic research in Poland. NSC invests in excellent research aimed at generating new knowledge with long-term benefits to Poland. Funding rounds occur several times annually and are divided into programs intended for researchers of varying position and seniority. During the years 2011 – 2018, in competitions organized by the National Science Center, about 90 thousand applications were submitted, of which nearly 17 thousand projects were selected for financing, with allocation of over PLN 7 543 723 thousand for their implementation.

About 6,5 thousand researchers benefited from the NSC funding and about 37 thousand publications were reported as output of these research projects. It is worth to underline that in the period 2011-2018, 76 % of all applications were submitted by researchers employed in HEI. So, the majority of public funding for basic research goes to higher education sector (Supreme Audit Office, 2020).

The functioning of the current project support system for scientific activity is overall assessed positively by the scientific community. The most common concerns are related to the following problems: over-formalization and ineffective system of application evaluation.

There is also a need of strengthening the mechanisms of management control executed by the agency over the funded projects. So far, the NSC audit procedure was largely based on the information provided by the beneficiaries without direct verification (Supreme Audit Office, 2020).

The second government agency - the National Centre for Research and Development (NCRD) was set up in 2007, although its role till 2011 was limited. The science and higher education reform adopted in October 2010 brought new legal regulations, which expanded significantly the responsibilities of NCRD as the main public institution financing R&D. It was also a breakthrough to take over from the ministry the role of the intermediary body in several European Union operational programmes supporting growth and knowledge economy (National Centre for Research and Development, 2012). NCRD's duty is to encourage Polish enterprises, research institutes, universities and other types of scientific units to create and implement innovative solutions based on the results of research carried out by scientists and innovators. Its role is to strengthen cooperation between science and business in Polish economy.

In recent years the enterprise sector has had the biggest share of the NCRD total funding (e.g. 39 % in 2018 and 71,5 % in 2017), but universities are still significant beneficiaries in funding distributed by this executive agency (National Centre for Research and Development, 2019).

Data, Results and Discussion

The majority of revenues of public HEI comes from teaching (77 % in 2018), while the revenues for research activities accounts for 14 % of all revenues in 2018. The overall negative tendency can be observed in the structure of financing with decrease in share of revenues from research activity from over 16 % in 2011 to 14 % seven years later. Taking into account the progressive decline in the number of students over the whole period, this can indicate a low priority of research in the budgetary system (Picture 1).

Picture 1: Structure of revenues in public HEI in years 2011 – 2018

Source: Own elaboration on Ministry for Science and Higher Education data.

In years 2011 - 2018 the revenues for research activities in public higher education sector have grown at a slow rate of several percent annually, however with a significant decrease of 11 % in 2016 (Picture 2). The fall of research funding in 2016 was mainly caused by a dramatic drop in EU funding caused by delays in the implementation of projects from the Structural Funds and from reimbursement of unused funds from HEI (Supreme Audit Office, 2017). In 2016 the expenditures of the EU funds budget in the budgetary section 730 Science decreased by 75 % comparing with the revenues from previous year, which translated into lower revenues of universities. The budgetary financing of NCRD, which acts as an intermediary institution in the distribution of EU funds for R&D, fell by 50 % in 2016 (Ministry of Science and Higher Education, 2017).

Picture 2: Revenues for research activities and its components in public HEI in years 2011 – 2018
Source: Own elaboration on Ministry for Science and Higher Education data.

Revenues for research activities consists of several categories (Picture 2) with the most important: statutory subsidy and project funding by two executive agencies (NSC and NCRD).

The most significant source of research revenues for public HEI remains still the government statutory subsidy allocated between institutions on the basis of defined performance criteria. This type of funding has a clear advantage over project funding, which is a stability of funding for HEI. Project financing's share is only slightly lower than subsidy financing. During the years 2011 - 2018 grants from two agencies accounted for about 1/3 of all research financing (Picture 3).

Picture 3: Structure of the revenues from research activities in public HEI in years 2011 – 2018
Source: Own elaboration on Ministry for Science and Higher Education data.

The share of project funding in research revenues is diversified and changing in time for different groups of HEI (Picture 4). At the beginning of the analyzed time period, technical universities were characterized by the biggest share of project financing in their revenues, while for the group of general universities this source of funding was relatively less important. But in recent years these relationships have reversed. The group of universities consists of big institutions with highly diversified areas of research activity and usually with strong research orientation. Therefore it is not surprising, that these institutions are gaining advantage over other institutions. In the case of technical universities, the fall of project financing share can possibly be connected with decreasing funding from NCRD. NCRD gravitates towards supporting corporate R&D and consequently technical universities, which used to be big beneficiaries of funding for applied research distributed by this agency, are now in relatively worse situation than a few years earlier. We can observe the big leap for medical HEI, which from 2016 have been much more active and efficient in gaining project financing. There is no clear pattern for economic universities over the period, but this group is relatively small and individual factors contributing to the success of one of the economic university, can influence greatly the picture for the whole group.

Picture 4: The share of project funding (NSC and NCRD) for selected groups of public HEI with regard to the classification of Statistical Office in Poland in years 2011 – 2018
Source: Own elaboration on Ministry for Science and Higher Education data.

The selective funding of research proposal together with dissemination of performance formulas in distributing research institutional subsidies cause that distribution of research financing is highly uneven. Relatively narrow group of institutions benefit from the selective procedures of allocations.

Table 1: Gini Coefficient of revenues from project funding agencies (NSC and NCRD) per teaching staff in public higher education sector 2011 – 2018

Year	Gini Coefficient	No of public HEI receiving grants
2011	0,7	91
2012	0,62	94
2013	0,67	93
2014	0,69	91
2015	0,8	88
2016	0,62	85
2017	0,6	88
2018	0,56	87

Source: Own elaboration on Ministry for Science and Higher Education data.

Gini coefficient is a frequently used measure of inequality of distribution. It is commonly used for presenting the inequalities in income and wealth distribution. As HEI in Poland are very different is size, the better measure of reflecting differences in their research project potential is to apply the measure of financing per academic staff.

A Gini coefficient takes the value from zero to one, where zero, in this case, implies a perfect equality, meaning that all universities receive the same funding per teaching staff, while a Gini coefficient of one implies the maximal inequality.

Table 1 presents a Gini Coefficient of revenues from project funding agencies (NSC and NCRD) per teaching staff in public HEI.

The scale of distribution inequalities seems to decrease with time with the largest annual decline in 2016 with coincide also with the significant drop in research funding provision. It can be explained by the fact that at the moment of introducing the new tool of allocating financing for research, only a minority of well- informed institutions decided to compete for funds and as time goes by more and more researchers from different HEI started to be active in submitting research proposal, which translated into their growing participation in research money per academic teacher. Still, the level of inequalities of funding per academic staff is significant and as experiences of developed countries suggest, it is doomed to remain at high level.

Conclusions

The patterns of funding research from budgetary sources are well established in developed countries. They are based on two pillars: institutional funding usually distributed on a basis of performance measures and project funding providing individual researchers or research teams with money allocated by research councils (agencies) on selective and competitive basis. Poland also adopted this mechanisms with setting up two financing agencies: in 2011 - the National Science Centre (NSC) responsible for basic research and in 2007 - the National Centre for Research and Development (NCRD) with focus on applied and experimental research. Within a decade since the implementation of project financing of science, Poland and Czech Republic stand out from other Central and Eastern European countries with a high share of funds allocated by financing agencies. It seems that in the future we should not expect a further increase in the share of project financing in universities' revenues, as institutions need in their research activity a good balance between competitive financing and stable and more secure sources of funding allowing to them to set research priorities in a long run.

The Markets for Economic Governance in Social Market Economy Policy

Piotr WALĄG
University of Agriculture in Krakow, Mickiewicza Av. 21, 31-120 Krakow, Poland,
e-mail: piotr.walag@urk.edu.pl

Abstract

This article presents the principles of interventionism in the light of the deliberations and actions of the Ordo Liberal economists - In Eucken. and L. Erhard - constructivist economic order. The consequences and coherence of the principles of economic order shaping economic policy are contrasted with the mistakes resulting from the discretionary practice of economic policy, within the framework of manifestations of state interventionism in the economy. In the conditions of globalisation in liberalising markets, the interpenetration of economic and political models (Anglo-American capitalism, the European model of the social market economy, Asian capitalism) is inevitable, in which the most important process is to direct economic interaction towards optimising economic and social utility. The organically shaped economic "order" (the rules of the market game) in liberalism differs significantly from the constructivist concept of conducting policy of shaping economic order in ordo liberalism. The creation of a legal basis, rules of deception for free, equal and responsible individuals was supposed to be a tool for reversing the process of self-destruction of liberalism, to which the effects of boundless freedom in the operation of individuals were to lead (freedom in an extremely liberal view is a threat to itself). The construction of a competitive economic order developed as the foundations of ordo liberalism is perceived by the author of this article as the creation of rules / principles necessary to achieve the pro-effective and free market system goal. Particular emphasis within the framework of interventionism is placed not on the policy interfering directly in economic processes, but on the policy setting the rules / conditions of market play. This article states that: economic transformation, seen in the light of the need for a faster pace of change, cannot be dissociated from the strong influence of the state in shaping economic order, and is therefore doomed to constructivism, and interventionism as the most effective but highly imperfect approach possible.

Keywords: Social Market Economy, Ordo Liberalism, Economic Governance, Systemic Transformation, Organic Constructivist Processes, Interventionism,

Introduction

Under the conditions of globalisation in liberalising markets, there is an inevitable interpenetration of economic and political models (Anglo-American capitalism, the European social market economy model, Asian capitalism), in which the most important process is to focus economic interaction on optimising economic and social utility. In an increasingly competitive environment, the approach of classical liberalism to shaping the rules of the game / market conditions through the actions of companies needs to be adapted / modified. The full freedom and unlimited scope of action of the farming units is intrinsically linked to their desire to eliminate all barriers to profit maximisation. Through this, the spontaneous inclination of companies to minimise market competition distorts the material aspect of management and the main social values (economic freedom of others / free market), which liberalism itself is supposed to serve. The organically shaped economic "order" (the rules of the market game) in liberalism differs significantly from the constructivist concept of conducting a policy of shaping economic order in ordo liberalism. The creation of a legal basis, rules of deception for free, equal and responsible individuals was supposed to be a tool for reversing the process of self-destruction of liberalism, to which the effects of boundless freedom in the operation of individuals were to lead (freedom in an extremely liberal view is a threat to itself). The construction of a competitive economic order developed as a foundation for ordo liberalism is seen by the author of this article as the creation of rules / principles necessary to achieve the pro-efficiency and freedom objective of the market system. Particular emphasis within the framework of interventionism is placed not on the policy that directly interferes with economic processes, but on the policy that sets the rules / conditions of market play.

Theoretical basis, methods, results and discussion

Organic and constructivist rules / rules of play in the markets.

The limitations of human knowledge, the incompleteness and asymmetry of information most often result in imperfect contracts or opportunistic behaviour of economic relations partners. A natural feature of the behaviour of profit-oriented economic entities is the desire to eliminate competition, which results in inefficiency. This imposes the need for restrictions - institutions - to ensure low transaction costs[1]. The purpose and effect of institutions is therefore to minimise transaction costs (Williamson, 1998, p. 31)[2]. Institutions are seen as "frameworks and forms of collective action". (Ząbkowicz , 2003) Institutions create a platform on which business entities acquire dynamism - entrepreneurship, risk-taking, flexibility, motivation to acquire knowledge on a permanent basis are supported.

By pointing to transaction costs as a risk mitigating and near-optimal factor, Figure 1 presents a model approach to the differences between D. C. North and J. Wilson's approach to transaction costs proposed by B. Martens (2004).

Fig. 1: *Ex ante* trading baskets and *ex-post* risk

Source: Own study.

The greater attractiveness of *Institutional Environment B results from a* lower level of risk for individual *ex-ante* transaction costs than in *Institutional Environment A*. An improvement in the incentive structure occurs both when, for a given level of *ex-ante* transaction costs, potential transaction costs (level of uncertainty) decrease, and when, for a given level of uncertainty, the amount of *ex-ante* costs accompanying the replacement decreases. Reducing transaction costs involves introducing better institutions. *Ax-ante* costs can be minimised by increasing *ex-post* risk (shift from A to B) or by introducing institutional changes (shifting the *institutional environment* to the beginning of the coordinate system). The shape of the *institutional* environment curve is influenced, in addition to factors shaping the efficiency of the institution, by the cost determinants of perception and information processing depending on the quality of the cognitive resources of the entity (human capital).

In D.C. North's economic theory, the analysis focuses on the relationship between the state, a type of socio-economic order that depends mainly on the system of property rights (North, 1997). The state as a system of institutions and organizations providing individuals and groups with protection of their rights as well as social and economic order is a function of legal and customary norms. According to D.C.North's economic theory, the real productive capacity of the economy is determined by structural rather than technical boundaries. The difference between these two boundaries can be very large, with serious losses of potential product and social welfare. The formalisation of the statements of D.C.Northa was proposed by R. Findley and J.D.Wilson, introducing into the traditional function of production, which describes the relationship between production,

Y, and labour input, L, and capital input, K, factor - economic order P, which in their analyses is derived from property rights. **Y = f(L, K) x p(G)**

It is an aggregate production function in which the economic order is created by the state. p(G) is a function of the production of the economic order (Eggertsson, 1999, pp. 317-358). In this modified function of production, the idea of D has been formally presented. C. Northa, where economic order (especially the structure of property rights) determines the productive effects of the economy. In the economic theory of the D.C.Northa model, the economic order presented in this way is the same as the structure of property rights. It follows that the economic order is presented in a rather narrow sense. The foundations for a broader economic order in economic theory were laid by F. A. von Hayek, where it is always a kind of adaptation, "adjustments to a great number of circumstances and events that are known to all members of society, taken together, but are not known as a whole to individual people. For such an order to exist, it is necessary 'that all individuals follow clear rules or that their actions are limited to a certain extent'. (Hayek, 1973, p. 44). The economic order understood in this way emerges as a result of the adjustment of institutions (formal and informal), market mechanisms and the behaviour of economic operators to changing economic factors and circumstances external to the economic system. W. Eucken argues that this approach to economic order does not safeguard the efficient allocation of production factors as a result of changes in the economic environment, and the application of the principle of laissez-faire in the area of shaping economic order is disastrous, as economic operators always look for sources of pension, thereby generating profits as a result of the transfer of losses to other operators. This is manifested by liberating themselves from market competition by creating monopolistic structures[3.]

The condition of economic order shows another feature of the economic order to impose certain restrictions on the behaviour of the holding units. This means that clearly defined rules of the market game must apply to everyone. Such a broad approach to the economic order makes it necessary to distinguish between the order of management rules and the order of the management process. Such a distinction in the analysis of the economic system is introduced by G. Gootmann and defines the order of economic processes as the degree of ordering the relations between the elements of the system - from which, in W. Eucken's theory of economic order, the primacy of economic freedom of the managing entities in economic processes results in achieving the highest possible economic efficiency, taking into account the superior social value, which is the freedom of the individual. Whereas the order of economic rules is defined as an external framework conditioning the economic process, which includes the so-called economic forms together with economic and social norms (Gootman, 1993, pp. 40-41) Such an approach to the role of the state is consistent with the economic theory of the state, which has been incorporated into the new institutional economy. This distinction between the order of management rules and the order of the process is of fundamental importance in constructing the principles of economic policy and its formal institutions in the concepts of the social market economy. Therefore, the order of management rules (economic order) in a broad sense will be presented as a structure of formal and informal institutions of a given economy, delimiting the boundaries of socially acceptable behaviour of the economic entities. The concept of order understood in this way is much broader than the concept of D. C. Northa, because the institution of property rights (property rights structure) is only a certain element of the management rules order, i.e. the structure of formal and informal institutions of the economy. The extension of this concept does not change the validity of the basic D thesis. C. Northa about the impact of the economic order on the macroeconomic activity and efficiency of the economy, because according to his theory, institutions not only determine the behaviour of the economic operators, but also reduce uncertainty in economic relations and reduce transaction costs. Given the broader concept of economic order in these considerations, the term economic institution structure may be replaced by the North's ownership structure. Thus, the aim of the state's economic policy would be to adjust the order of economic rules (economic order, economic order, structure of economic institutions) to the changing conditions of the economic environment if the economy is to be close to the technical limit of production capacity. This approach to the role of the state results from the economic theory of the Northa state, which has been incorporated into the new institutional economy. It is this approach to the role of the state that introduces and justifies the role of economic policy in creating the economic order and not in shaping the order of economic processes (if any), which is also consistent with the approach to the role of the state in shaping the principles of economic policy of W. Eucken. In this way, the state fills the gap that would arise in real production between real production achieved in a positive economic order and real production achieved in a negative economic order. The role of the state is to create a rational, efficiently functioning institutional framework for the economy - formal institutions which aim to create economic order. Therefore, it boils down to interfering in macroeconomic results only by intervening in the economic order, and under no circumstances in economic processes. It also emphasises the strategic importance of cohesion and consistency in the implementation of economic policy tasks.

The role of market rules/rules in shaping economic governance according to the economic policy concepts of Walter Eucken and Ludwig Erhard.

The inclusion of economic order in the issue of laissez-faire does not safeguard the effective allocation of production factors. The actions of economic entities under conditions of unbridled economic freedom have shown signs of destruction of the market system. The survival of liberalism was seen in the creation of rules of market play that were uniform for each entity. The creation of institutions in the economic policy concepts of the Ordo Liberalists is done in the constitution of a competitive economic order. The creation of an institutional framework for the operation of the social market economy is treated as a primacy over interference in economic processes. The approach of Ordo Liberalist is most often confronted in the literature with the views of F. von Hayek, who leaves it up to the market to regulate itself to shape the framework for economic activity. A distinction is made here between a liberal view of shaping economic order in an organic (spontaneous) manner and an ordo liberal view of constructivism as a method of building institutional order in the economy. Leaving the market the creation of an institutional framework for the operation of economic entities was seen by Ordo Liberals as a fundamental mistake, arguing that the operation of economic entities is driven by the internal need to exclude themselves from competition and the need to gain market power. This showed the inherent power of the market economy to move towards monopolistic and oligopolistic structures. Their economically unjustified presence on the market results in institutions which are the domain of the free market (such as property rights institutions) even having negative economic effects. A common element in the approach of W. Eucken and L. Erhard's approach, which distinguishes them from other advocates of ordo liberalism, is to see the market as unquestionably the most effective mechanism for organising the management process ("mechanism for optimising the allocation of resources and goods") and a way of creating and maintaining the freedom of the economic units (Pysz , 2008, p. 18). W. Eucken sees the state as an impartial arbiter who decides over the interests of (often contradictory) groups of market players or as a set of formal institutions safeguarding the observance of the rules of the market game. The role of the state as a night watchdog appears to him to be far from being a matter of course in the face of natural market forces aimed at creating monopolistic structures with economic power. Mr Erhard, in promoting the fight for economic freedom and responsibility, sees the state, like Mr Eucken, as the guarantor of the social order of the market economy, aimed at preventing any attempt to take a position of market advantage. Particular sensitivity can be seen in the distinction between interference by state institutions in economic processes and the establishment of a framework to safeguard the competitive operation of market players. Economic governance serves the material task of the economy and the realisation of social values and is an end in itself (Pysz, 2008, p. 40). The principles that make up economic governance need to be supplemented by regulating rules, according to W. Eucken, when other forms of market appear in some markets instead of competition. According to Mr Erhard, selective interference in management processes takes place by extending the scope of economic governance policy and extending the list of its objectives (social policy, responding to sudden negative external and internal shocks). W. Eucken's concept of competition policy takes the creation and maintenance of an efficient pricing system of perfect competition[4]as a guiding principle for economic governance, which is a 'fundamental principle of the institutional constitution of the economy' (Social market economy ..., 2003, p. 73-103). This is a move away from an economic policy that does not give in to any pressure, leading to distortions in the price system. It is important in a system of rules creating an economic order that this constitutional principle of economic policy be respected in all spheres of economic policy (fiscal policy, exchange rate policy) and there can be no exception to it. This principle is not just a ban, but is more related to the need to achieve the objective of creating a market of perfect competition. An efficient pricing system is a strategic point of the system created by W. Eucken. An efficient monetary policy, open markets, private ownership, freedom of contract, responsibility and a stable economic policy complete the construction of Eucken's economic governance. According to L. Erhard, competitive economic governance includes price competition (opposition to monopolisation of market power, adjustment of supply offer to the requirements of sovereign consumers), full employment, price stability and diversification of assets in society (Pysz, 2008, p. 103). W. Eucken's research into over a hundred years of economic liberalism has revealed the principles that constitute his theory of competitive order. The guiding principle of freedom is to ensure freedom and autonomy in decisions and actions, equality - no privileges or advantages of any economic entity, and responsibility - to bear the consequences of actions taken on the markets. Mr Erhard's concepts of social market economy governance combine the need for freedom and responsibility on the part of the economic operators, which is intended to grow from the principle of full employment, equalisation of opportunities through the possession of production factors and a sense of social security, provided not by state social benefits, but by strengthening the freedom and responsibility of individuals in the management process. Freedom at Ordo Liberals was seen not only as the freedom of action of individuals within the limits of the state-constituted social and economic order, but

also as an independent self-restriction of freedom to ensure freedoms for others (Wunsche, 2005, pp. 26-28). The importance of consistency and coherence of economic policy measures is also stressed by the Ordo liberal economists. They are opposed to the mistakes resulting from discretionary economic policy-making, which result in the loss of an overall view of the economy. Solving economic problems 'in sections' - in the short term and inconsistently - increases the creation of new complications and reduces the effectiveness of the framework of action created.

Creating economic governance as part of the economic transition process.

In the sense of the Ordo liberal economists, the institution of economic governance emerges in the complementarity of all the institutions that make up this governance - they all exist together, because neither of them can exist because one of them results from the other and if it exists it works in the opposite direction[5]. Apart from the transformation seen as a change in the economic system, the transformation is connected with the creation of a new economic order, secured by new rules of law. The transformation is treated as a change in the broadly understood economic order, an institutional reform. Therefore, it is treated as a change in the institutional structure creating the economic order understood in this way. The transformation of the economic order is the final form of adjustment of the system of formal institutions (property rights, contracts) to the challenges posed by changes in the internal and external environment. These adjustments are very deep in the case of Poland and other post-socialist countries, because the adaptation mechanisms of institutions operating within the broadly defined institution of the socialist economy have failed. The literature on the subject points out that due to the fact that the structure of these institutions has to change, the change of economic order entails the need to go through a period of chaotic adjustments (Hockuba, 1993). The condition of complementarity between the institutions which create the economic order is the most important consequence for the economic transformation treated in this way. Therefore, the lack of complementarity between institutions and their structures results in large losses in actual production and social injustice. Institutional governance in post-socialist economies is created in the process of introducing changes and implementing new systemic elements, as a result of the institutional disorder caused by the collapse of "continuity and stability of most of the institutional foundations of the social system". (Porwit, 2001, pp. 179-180). When considering transformation in the context of the types and duration of systemic transformation processes, in which organic and constructivist approaches are contrasted, it should be stressed that transformation processes are doomed to constructivism as the most possible but highly imperfect approach. Transformation in the light of the need for a faster pace of change cannot be dissociated from the strong influence of the state in shaping economic governance. Its shape, however, must take into account the preferences of the largest possible social group (Bałtowski, Miszewski, 2006, pp. 62-72). The transition from coordination of the activities of market entities through state administration to coordination through agreements has created the need for Polish enterprises and other market entities to create rules of cooperation appropriate to the newly emerging situation. Often, legal rules had to be replaced or supplemented with informal standards, which increased transaction costs resulting from the conclusion and enforcement of agreements (Lissowska, 1999). The process of economic transformation is also determined by non-institutional factors of change (e.g. the attitude of society to strategic economic reforms in the early 1990s). However, they are very difficult to grasp within the framework of state influence, and their evolutionary formation shows a high degree of spontaneity (Bałtowski, Miszewski, 2006, p. 40).

Summary

The first conservative revolution in the field of economic policy - the 'minimum state' revolution carried out by M. Thatcher and R. Reagan - showed the enormous potential of capitalism to raise the living standards of humanity. Many countries of the world have undertaken reforms towards a market economy, where capitalism has taken very heterogeneous forms. The mere introduction of a market mechanism does not ensure satisfactory results; rules and principles are needed within which economic entities that maximise their profit can move safely (Albert, 1994, p. 10). The effects of applying a liberal approach to solving economic problems (e.g. the Washington Consensus), in the absence of an institutional framework that would secure it, have brought about effects that were far from expected (Stiglitz, 2004). A poor understanding of the scope (the activity of the state in the economy) and strength of the state (the ability of the state to conduct policies and enforce laws transparently - the potential of the state and institutions) may give the opposite direction to actions resulting from potentially effective mechanisms (e.g. introduction of competition without proper protection of property rights) . The study on the impact of different dimensions of statehood on the development of economies carried out by F. Fukuyama shows that a limited range of functions of the state including high efficiency of institutions would be economically optimal (Fukujama, 2005, p. 25).

This would indicate confirmation of the recommendations of the Ordo Liberal economists to form strong and consistent rules for the market system. This is of strategic importance, especially in conditions where there are high transaction costs, for example, at a time of economic transformation, when the lack of organically developed principles of market interaction imposes the need for a strong, formal institutional foundation.

When analysing the two decades of transformation of Poland's economy, the fundamental importance of the rule of law must be irrefutably confirmed, and we cannot fail to notice the informal layer of market contacts, which either as a result of the imperfections of the legal and enforcement system or as filling a gap in the law become the basis for countless socially desirable market transactions.

[1] the economy is perceived by J.R. Commons as a 'stream of transactions between people', conditions of uncertainty as to the behaviour of others compound the incompleteness and asymmetric access to information, hence the conclusion of transactions must entail the costs of seeking, processing and transmitting information, constructing, concluding and enforcing contracts, i.e. transaction costs

[2] e.g. bill of exchange as an institutional tool to stimulate the mobility of capital, price lists reducing the cost of information, insurance reducing the cost of risk (North, 1997)

[3] This subject will be further elaborated in the next chapter of the minor article

[4] perfect competition, as W. Eucken understood it, occurs when buyers and sellers compete on the market, plan their business activities taking into account the existence of competitors, accept the prices formed on the market, do not have any influence on them - they are the recipients of prices

[5] ownership cannot exist without freedom of contract or free markets

The European Union in The Face of The Phenomenon of Relocation In the Process of Dustrialisation

Piotr WALĄG

University of Agriculture in Krakow, Mickiewicza Av. 21, 31-120 Krakow, Poland,
e-mail: piotr.walag@urk.edu.pl

Abstract

In debates on economic development in developed countries, the subjects of wage inequality, unemployment and falling living standards are often associated with the process of deindustrialisation and the accompanying phenomenon of relocation. Although only undesirable effects of these phenomena are politically exposed, it is important to show their economically positive consequences. In particular, due to the high short-term costs of deindustrialisation processes and the phenomenon of relocations in certain areas, the need for an active role for the state emerges, for example, in shaping a policy of industrial transformation towards a modern economy and innovation. The main aim of the article is to show deindustrialisation as a natural process of economic development and to take a critical look at the phenomena that accompany it, and particularly at relocations as part of the European Union's competitiveness policy. **The thesis of the article is that deindustrialisation and the associated phenomenon of relocation are desirable processes if economic development is to be marked by a transition towards economies with high levels of productivity and innovation. However, the EU's competitiveness policy should be conducive to this transformation.** The next parts of the article will show the process of deindustrialisation and the strongly related phenomenon of relocation, and then, using Eurostat statistics, will present the challenges facing EU economies as part of structural changes in industry and, in the final part, will highlight the opportunities and dangers arising from deindustrialisation and relocation which European Union policy faces.

Keywords: Relocation, Reallocation of Production Factors, Industrial Policy, Deindustrialisation, Competitiveness, Industrial Transformation, Innovation.

Introduction

Deindustrialisation is a feature of the economic development process which is inevitable if society is to benefit from the effects of economic progress (Fisher, 1945, p. 56); (Fisher, 1933). It is a natural process of transfer of production factors, and in particular the labour factor, at the appropriate stage of economic development, from the industrial sector to the service sector[1], dictated by the regularity of changes in the economic structure. However, deindustrialisation can be bought, as a result of slow structural adjustments, by socially undesirable phenomena such as unemployment, income inequalities, a slowdown in the growth of living standards, a reduction in social security. These phenomena may be exacerbated by negative supply shocks, as was the case in the 1970s in the UK, where deindustrialisation has shown itself to be an absolute decline in industrial production, with serious consequences for the UK economy. There has been an absolute decline in the volume of production as well as the number of industrial companies, leading to an absolute decline in industrial employment (Kilpatrick, Lawson, 1980). The emergence of deindustrialisation through economic phenomena such as investment, the collapse of old industries, declining trade union strength, the relocation of mature industries to developing countries, and wage differentials are evidence of a painful but desirable adjustment for further economic growth.

The flexibility of response to increasingly rapid economic change, forced by deindustrialisation, shows the capacity for structural adjustment as the most important feature of economies with a high level of economic development in the sequence of inevitable changes taking place in them. However, the symptoms of deindustrialisation, although their positive and negative effects could be balanced in theory and empirically, should be carefully analysed in relation to the economies of individual countries and economic groups, i.e. the European Union.

The European Union's policy on deindustrialisation is closely linked to measures to increase economic competitiveness and adapt to structural changes (Communicatio, 2003). The competitiveness of the EU economy has been highlighted as one of the priorities of the European Union's policy since the development objectives of EU

countries were set as part of the Lisbon Strategy in 2000. In order to stimulate competitiveness, efforts are being made to adapt EU economies to structural changes, to reallocate industrial activity to developing economies, to relocate jobs to new industries, and to take risks associated with the deindustrialisation process.

Competitiveness is mainly determined by the increase in productivity in individual sectors of the EU economies and, in particular, their capacity for structural adjustment.

In order to neutralise the negative phenomena brought about by deindustrialisation by developing higher levels of competitiveness, the EU is looking for ways to operate more efficiently in areas such as innovation, ICT, entrepreneurship, competition, education and training as those whose activation is a key condition for achieving the social and economic objectives of the Member States.

The main aim of the article is to show deindustrialisation as a natural process of economic development and to take a critical view of the phenomena accompanying it, and particularly of relocations as part of the European Union's competitiveness policy.

The thesis of the article is that deindustrialisation and the associated phenomenon of relocation are desirable processes if economic development is to be marked by a transition towards economies with high levels of productivity and innovation. However, this transformation should be fostered by an appropriate EU competitiveness policy.

The article consists of three chapters, the first of which deals with selected theoretical aspects of deindustrialisation. The second chapter illustrates deindustrialisation in the context of the challenges it poses to the EU economies. The final chapter of the article details the need for political solutions with regard to the risks and opportunities associated with the deindustrialisation and relocation process.

Theoretical Basis, Methods, Results and Discussion

Selected theoretical aspects of the deindustrialisation process.

It would seem unjustified, it would be unreasonable to pretend to understand the phenomena and problems presented in the introduction, related to the process of deindustrialisation, taking place in the economies of advanced countries, without first realising the fundamental evolution of the structure of these economies (Fourastie, 1972, p. 182).

Structural changes and the collapse of long-term economic trends were the subject of research long before the deindustrialisation processes in world economies actually came to light.

The process of deindustrialisation is inseparably accompanied by the phenomenon of relocations. This is linked to the law of industrial growth. The law of industrial growth indicates that industries mature when the main benefits of technology end, slowing down cost reduction, market expansion and sales growth, and making ageing industries sensitive to the competition of younger rivals with faster productivity growth (Alderfer, 1942).

As one of the sources of structural change, Lawrence mentions the possibility of the comparative advantages shifting over a long period of time as the production of mature products is shifted to low developed countries (Lawrence, 1984). This phenomenon was analysed by Vernon, who attributed each of the three stylised stages of product development to different locations in the world. In the first stage, a typical new product is developed and produced in large American cities, close to the necessary skilled workforce and market. At the second stage, a production acceleration is observed, partly due to fear of taking over the domestic market by foreign competitors (this pushes American companies to establish their branches in e.g. Europe). The third stage - the stage of maturity, is characterised by the possibility of production everywhere and high benefits resulting from low labour costs in the low-developed countries (this is mainly visible in the production of textiles, small electronics, etc.) (Vernon, 1966, p. 190-207).

The ripening phase of the industry and its main production centres, when the growth rate of the market is slowing down, when fundamental issues related to product design have been solved and when the necessary machinery has been constructed, is transformed into a dispersion phase. The key to explaining this process is work. Over time, when technological progress makes work largely routine, when a concentrated and highly qualified workforce is no longer necessary to carry out the production process, industries move to areas where wages are relatively lower and production conditions are more flexible than in the home production areas. However, this does not mean that the maturity of the industry, which is commonly combined with decentralisation, will or should result in the gradual dispersion of production. Indeed, at the same time, a permanent process of new industries is under way (Hoover, 1948, pp. 174-175).

Hansen has introduced a kind of *natural right to an ageing industry*. This can be explained as the disappearance of industries after they have undergone a phase of strong growth in investment activity, maturity and decline, which causes deep stagnation in the economy and may take a long time before a similarly strong economic force acting in the opposite direction appears (Hoover, 1948). Burns wrote in his *growth law that the* growth rates of individual industries tend to fall as the age of the industries increases. Unlike Hansen, Burns did not see the ageing of industries as a problem, but saw it as a natural part of the growth process. A more general approach to the problem of product ageing is the *maturity hypothesis* developed by Kindleberger and independently by Olson. Kindleberger's maturity hypothesis was aggregate in nature, referring neither to the life cycle nor the "S-shaped" growth of industry (*per capita* production tends to grow in the early stages of growth, then slow down as the economy reaches the economic maturity stage). Maturity here means an increasing capital-production ratio or a reduction in the savings rate, or both. Maturity may therefore presuppose the existence of a rich society, where consumption is made at the expense of investment. Olson points mainly to the political side of economic maturity, highlighting the role of interest groups. He stresses that the older the roots of industrial development are, the more time is needed to work out the efforts of individual interest groups to develop a climate conducive to business growth (Norton, 1996, p.2,19-20, 38-39).

Challenges of EU economies to the deindustrialisation process.

One of the most important challenges for the EU economy in the face of the deindustrialisation process should be to strive for its closure. By closing deindustrialisation we mean eliminating the absolute decline in industry in production and employment, and for deindustrialisation to take place in terms of the relative changes in the share of industry in employment with the relative share of industry in production remaining unchanged (or falling as little as possible).

Relative changes in industry's gross value added are revealed with a progressive decline in the percentage share of industry's value added in the value added of all sectors of the economy. Table 1 shows the evolution of changes in added value for selected EU and US economies.

Table 1: Gross value added in industry calculated as % of all sections and divisions (calculated at basic current prices and current exchange rate)

Countries	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018

Poland	26,7	26,1	24,9	24,6	24	22,5	22,3	23,7	25,2	24,7	24,7	23,3
Slovakia	31,6	28	27,5	29,7	29,2	28,5	26,8	28,9	30,3	29,4	28,6	30,3
Great Britain	25,6	24,8	23,3	22,3	21,9	20,6	19	17,7	17	17,4	17,5	16,6
United States	-	-	20	19,6	19,4	18,1	17,5	17,3	17	-	-	-

Source: Own calculations based on the Eurostat database.

The information in the table above clearly shows the decline in industrial value added in the EU-27, the EU-15, Ireland, France, the UK and the US. This means that there is deindustrialisation in terms of changes in the relative shares of industry in production. However, the newly acceded EU Member States are recording an increase in the share of added value in industry, which may explain the processes of convergence and relocation of mature industries from highly developed countries. It should be noted, however, that the relative decline in industrial value added occurs in current prices at the current exchange rate, while in constant prices, the share of industry in value added as a percentage of all branches should remain at least unchanged (taking into account the decline in the prices of industrial goods as a result of the increase in productivity in industry, as was the case in the 1970-1994 period in highly developed countries).

Kuznetz stresses that sustainable economic growth requires the emergence of new industries which, by achieving high growth rates, will 'compensate' for the inevitable slowdown in the spread of inventiveness and innovation in old

branches (mature industries). Therefore, the high growth rate of the whole economy is accompanied by significant shifts in relative importance between industries as old ones collapse and new ones emerge (Kuznetz, 1959, p. 33). The increase in employment in high- and medium-high technology industries may indicate a strengthening of the industrial base that is adapted to an increasingly competitive environment (more employment is due to the creation of more companies).

Table 2: Employment in high- and medium-high technology industries[2]
(% share in total employment = 100)

Countries	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018

Relatively high increases in employment in high- and medium-high technology industries in countries such as the United Kingdom, Ireland and Germany indicate that, although there is a decline in industrial value added, due to the relocation of mature industries, these economies are strengthening in high-tech areas. This phenomenon is not visible in the economies of selected Central and Eastern European countries, where high and medium-high technology industrial sectors have seen marginal employment growth. Therefore, we can conclude that the relocation to Central and Eastern European countries concerns mature low-technology industries from highly developed countries.

The key problem with the relocation of economic activities is the absolute decline in industry in production and, consequently, the absolute decline in employment. Meanwhile, employment in industry is determined by the relationship between the closure and creation of industrial enterprises. Table 3 shows the largest and smallest rates of business creation and bankruptcy, which, together with additional statistical information from Eurostat, is intended to assess the extent to which selected EU economies are coping with the creativity and destructiveness of the market system, and thus to assess the extent to which they are adapting to such deindustrialisation phenomena as well as investment and relocation.

Table 3: Largest and smallest rates of business creation and bankruptcy (actual establishment or bankruptcy of companies in a given year), calculated as the percentage of active companies operating in a given year.

Business failure rates				
Years	2009	2012	2015	2018
The biggest	Great Britain: 10,48	Lithuania: 13.43	Great Britain: 11,16	Great Britain: 10,87
The smallest	Finland: 6.76	Portugal: 4.36	Sweden: 5.16	Latvia: 3.87
Business start-up rates				
The biggest	-	Lithuania: 16.2	Romania: 18.74	Great Britain: 13,68
The smallest	-	Sweden: 7.03	Sweden: 6.07	Sweden: 7.02

Source: Own calculations based on the Eurostat database.

From the data in the table above, the example of the United Kingdom shows that the rate of company closures was lower than the rate of start-ups only in 2018, which undoubtedly led to a reduction in unemployment (4.8%, 2018) and an increase in the employment rate in high- and medium-high technology industries (42.39% of total employment for 2018). In Sweden, where the lowest rate of business creation has been recorded since 2012, a relatively high unemployment rate has been recorded since 2015 (5.6% - 2015, 6.3% - 2017, 7.4% - 2018).

Of the data available for the EU countries for 2009-2018, countries where more companies were established than Slovakia, the Netherlands, the United Kingdom, Spain, Italy, Luxembourg, Portugal, Romania, Slovenia, Finland, Sweden, have collapsed.

The greatest challenge for EU economies in the face of deindustrialisation and relocation processes is to ensure the conditions for the creation of as many high and medium-high technology industrial enterprises as possible. For their location, the classic comparative advantage has lost its importance in the age of industries based on human intellectual potential. Instead of physical capital, companies fighting for shares on world markets compete for qualifications and knowledge (human capital). These resources become the only source of comparative advantage and a strategic factor in the process of deciding on the location of economic activity (Thurow, 1998).

Changes in the relative values of sectors (individual branches) of the economy are a long-term process of economic development resulting from changes in consumption structure and technological changes. Therefore, processes of relocation of industry between EU countries seem desirable. The effect of this is the intensification of the forces of competition in the EU's single market, which forces the emergence of high-tech industries in economies from which mature industries are relocated. The high productivity generated in modern industries means that industry does not lose its relative share of production (or its decline is very small), but the relative share of industry in employment will disappear.

EU policy on risks and opportunities related to the deindustrialisation process.

Inability to act, external shocks intensified by poorly implemented policies, particularly evident in the 1970s and 1980s, have contributed in many countries to a situation where many industries have become areas that delay the development of the economy more than stimulate growth and structural transformation (Lall, 1992). An example is the UK economy, where in the 1970s there was an absolute decline in the number of industrial enterprises, an absolute decline in industrial production and therefore employment, with dramatically declining exports of industrial products in increasing international trade, causing economic stagnation. Such phenomena began to occur in a growing number of highly developed countries in the 1980s, where they were often referred to as the 'menopause' of Britain[2].

Despite the negative phenomena that deindustrialisation manifests itself, it is a natural and therefore desirable phenomenon. In order to eliminate or shorten the negative effects of deindustrialisation in the short term, a competitiveness policy would seem to be the most appropriate to close deindustrialisation to absolute change. Mitigating the negative effects of deindustrialisation is about increasing productivity through the creation of high-tech companies, which will reduce the absolute and relative decline of industry in production, and at the same time contribute to the increased absorption in services of the labour force freed from industry as a result of growing demand for services (productivity growth in industry will result in an increase in income, and the largest share of growth in income is in demand for services, increased demand for services at a much lower productivity in services than in industry results primarily in increased labour demand). The issue of structural change, which includes deindustrialisation processes, exposes the efficiency of factor allocation, which is closely related to competitiveness issues. As A. Fisher pointed out, in a dynamic economy, in order to generate high levels of social welfare, there must be a continuous transfer of factors of production in the most efficient way, under the threat of economic crises (Fisher, 1935, p. 18); (Fisher, 1945, p. 56).

Competition policy should, above all, be aimed at creating economic conditions (economic governance) which would force economic entities to increase their efficiency. The objective of increasing competitiveness as a priority of EU policy has been in place at least since 2000, when, as part of the Lisbon Strategy, EU Member States declared that they would make efforts to make the EU the most competitive economy in the world, capable of adapting to structural changes, relocating economic activity and reallocating production factors. In 2002, at the Seville European Council, the Competitiveness Council was set up to strengthen the implementation of the economic dimension of the Lisbon Strategy, reducing it to the framework of an integrated strategy for improving competitiveness, regularly monitored with regard to horizontal[3] and sectoral issues, and to be developed by the European Commission. The Lisbon Strategy, renewed in 2005, adopted a new direction, particularly strongly geared towards economic growth and employment, in which the EU economies are to undergo a process of adjustment to structural changes and strengthening in the pursuit of higher levels of productivity. The new Community Lisbon Programme since the 2006 European Council is based on four priority areas: knowledge and innovation, unlocking economic potential, investing in human capital and modernising jobs, energy and climate change. Unlocking economic potential can follow a number of paths, of which EU policy includes: implementation of the Small Business Act, reducing administrative burdens, simplifying procedures, strengthening the internal market, increasing competition in the services sector, and extending financial services market integration. It should be stressed, here, that the relocation of mature industries is also an important part of the process of releasing manufacturing factors, and the labour factor in particular.

The strategic task of the EU institutions is to create a framework for European companies to compete successfully on the intensely developing international markets. It is the task of the European Commission, and in the subsequent legislative stages of the European Council and the European Parliament, to examine the impact in economic, social and environmental terms of key legal proposals and to launch specific policy initiatives that will make it possible to stimulate competitiveness to the fullest possible extent.

The issue of competitiveness, seen in the context of the risks of a possible deindustrialisation process in the EU economies, has been particularly acute during periods of slower economic growth or periods of recession. Undoubtedly, the adjustment process associated with the changing structure of EU economies can be very costly. The good macroeconomic condition of the economies should, however, cushion the harmfulness of unavoidable structural changes, ensuring not only an improvement in productivity, international competitiveness and the ability to create new jobs in the industrial sector, but also support the creation of conditions for the development of the service sector (Communicatio, 2003). Research by (Blackman, E.N.Baumol and E.N.Wolff, 1989) has provided ample evidence that, as industry's relative share of employment decreases, industry alone will no longer be able to provide a reliable engine for growth as it has in the past.

Deindustrialisation and the relocation that is most strongly associated with it in Europe are the consequence of structural changes brought about by the economic transformation of Member States to ever higher levels of productivity and the challenges of globalisation. In the short term, they entail socially burdensome effects (mainly a fall in employment), but in the long term, surrendering to them is the only way to efficiently allocate productive resources from outdated industries, economic growth and social welfare.

Schumpeter's vision of development is achieved through painful structural changes. With brutal optimism, Schumpeter even saw the economic depressions as an indispensable element in clearing the economy of outdated practices and restoring efficiency (Schumpeter, 1939). Consequently, such creative destruction determines the growth of new industries. The reallocation of resources to areas increasing the potential for innovation and the human capital base in a given economy is a source of increasing labour productivity and strengthening the comparative advantage on international markets. The competitiveness of economies, which is defined by constant productivity growth, is affected by stimulating investment, intensifying market competition, strengthening the ability of enterprises to generate innovation through increased investment in research and development (R&D) and in human capital, facilitating rapid technological transformation, and The Commission is committed to the development and implementation of the European Research Area, to the development and implementation of the European Research Area, to the development and implementation of the European Research Area, to the development and implementation of the European Research Area, to the development and implementation of the European Research Area.

Industrial transformation entails changes in the distribution of employment between sectors (industry and services). Decreases in total employment caused by the relocation of mature industries to developing countries are offset by increases in employment in modern industries and services. The process of these structural changes is attributed to an increasing difficulty in the EU-15 in maintaining or regaining employment, especially for the low-qualified. However, it should be mentioned that this is about keeping or regaining employment for the low-skilled at the same level of real wages. Low-skilled workers who lose their jobs in mature industries can only be employed as a result of absorption by the service sector, where incomes measured in purchasing power parity are at a much lower level due to lower labour productivity than in industry. The persistence of employment in the economy must then lead to income differentiation, as was the case in the United States (Thurow, 1980). This segment of the labour force is particularly sensitive to structural changes in the economy. The continuing structural problems in highly industrialised economies such as those of the Netherlands, France and Germany are evidenced, among other things, by the high long-term unemployment rate[5], which in 2005 was 50%, 39% and 39% respectively (estimated figure). In these economies, expenditure on labour market policy in 2005 measured both as a percentage of GDP and as expenditure per person wishing to take up a job is among the highest in Europe, compared to the EU15 average (2.2% of GDP) of 3.363% of GDP and 18.014.2 in PPS, 2.524% of GDP and 11.765.2 in PPS, and 3.315% of GDP and 9.805.5 in PPS respectively. In the economy where deindustrialisation and relocation processes were observed the earliest, in the United Kingdom, after nearly 30 years, the long-term unemployment rate is one of the lower (from the available data), amounting to 19%, and estimated expenditure on labour market policy did not even reach 0.7% of GDP in 2005.

The process of structural adjustment can be particularly burdensome in local economies. Therefore, local policy is treated as a priority in EU policy as a whole, as evidenced, for example, by the over 35% share of regional policy expenditure in the EU's annual budget expenditure. Indicators of the high importance of local issues in EU policy are the amount of EUR 223 million spent in 2000-2006, EUR 41 billion absorbed by development projects in 2007 and the adoption of over 400 programmes supporting local development in the new phase of the 2007-2013 funding cycle. The following are particularly mentioned as objectives of local development in EU documents: equalisation of conditions for economic growth by modernising infrastructure and improving living standards in the least developed

EU countries, improvement of the social and economic environment for the development of competitiveness and the creation of new jobs, and strengthening fruitful cooperation between the border and interregional level. It should be noted at this point that it is precisely the processes of relocation within the EU that naturally lead to and promote the achievement of all the aforementioned objectives.

The migration of research and development activities from the EU is another threat to the future of the European economy, particularly in view of the relocation of businesses. Businesses are conducting more and more research outside Europe, especially in high-technology and research-intensive sectors (pharmaceuticals, biotechnology, electronics). Such activities are increasingly relocating to the United States, where they benefit from a more favourable regulatory, structural and financial environment and a more accessible skilled workforce (Communications..., 2003). This means that exports of high-tech products exceed the level of the United States (26.13% of total exports) only in Ireland (28.88% of total exports), Luxembourg (40.59% of total exports), Malta (54.61% of total exports) and the United Kingdom (26.48% of total exports), which may also indicate a low potential for Member States to generate high-tech goods within the EU.

Relocation reflects the changing comparative advantages of the location of different types of industries (mature and high-tech industries) and/or different business conditions. Better cost conditions (labour cost) abroad attract industries that are unable to produce internationally competitive products in the high-wage environment of modern industrialised economies. This contributes to the growth process of less wealthy economies of trading partners. It follows that relocation is limited to activities involving the use of low technologies and making strong use of labour in manufacturing processes. Relocation (in terms of labour liberation) in highly developed economies is often accompanied by the creation of new jobs mainly in services (design, marketing, distribution, leisure activities). At the same time, relocation (in terms of freeing up capital) contributes to the growth of investments (including the creation of new enterprises) in high and medium-high technology industries. The changes taking place between EU regions in manufacturing specialisation are a reflection of changing comparative advantages, where the more developed part of the EU retains those jobs that absorb human capital, high technologies and are characterised by high productivity and high real wages, while mature industries will be located in less developed regions (developing countries). Furthermore, the trade links between countries observed in the context of relocations of activities benefit not only the host countries, as they increase exports but also imports. Therefore, the countries of the highly developed part of the EU, which are losing some of their businesses as a result of relocations, are registering increased exports as a result of increased production and income in the countries receiving the relocated businesses. This increase in exports in the EU economies will make it possible to increase production and employment in other sectors. On the other hand, the share of imported industrial goods in the expenditure of the population of developed regions from which mature businesses are relocated will continue to be only a small percentage of total expenditure in these EU countries. Domestic goods, especially services, will continue to dominate domestic spending and maintain employment growth in this sector. However, there may be a situation where jobs will be lost in regions that are being abandoned by mature industries if they are unable to locate high-tech industries and produce internationally competitive goods, taking advantage of growing international trade flows fuelled by the growth in income of developing countries.

The countries to which the industries are relocated are developing countries (with less affluent populations than in developed countries), which means that they need to import capital and thus seek trade deficits. Trade deficits in these countries mean increased capital exports and trade surpluses for developed countries, including the EU (Pieper, 1999). Furthermore, the success of competitiveness policy should be supported by a favourable macroeconomic policy, the creation of an environment in which the cost of financial capital is low and the presence of export promotion (Singh, 1995). Reducing balance of payments constraints supports macroeconomic stability. Balancing current accounts at the desired rate of economic growth helps to avoid excessively sharp business cycles. This in turn reduces the cost of capital, as there is no need to reduce the current account deficit through fiscal and monetary restrictions. Macroeconomic stability, industrial policy and an evolving economic structure interact positively on the economic development path.

Summary

The last decades of development of world economies have been marked by the transition to highly productive economies. The reasons for this state of affairs are mainly seen in the intensification of competitive forces in individual markets[6], which force the introduction of new technologies. The continuous increase in the level of productivity in economically advanced countries proves that deindustrialisation in terms of relative changes in the share of industry in employment is a natural process of economic development (if societies are to benefit from technological progress).

Relocation within the EU should help to strengthen the competitiveness of EU enterprises, contribute to reducing production costs and prevent the movement of economic activity to China and India. It is an alternative to the painful desires of investment, because mature industry in highly developed countries is not able to generate competitively priced industrial products, as is the case in the developing countries to which these industries are relocated.

However, there is strong resistance from the politicians of the 'old Europe' to the idea of relocation. (mainly France and Germany, which are the worst affected by relocation), where relocation is seen primarily through the prism of job losses. Hence, action within the EU to set a minimum level of taxation on the profits of companies operating in the EU, to counteract the distribution of structural funds that encourages relocation, to halt the liberalisation of the EU services market.

The problem of relocation can be seen as one of the tools of domestic policy-making. The conclusion is that relocation is the cause of only around 4% of [7] all redundancies in European companies, which, in view of the much more serious consequences of the sources of job losses, such as mergers, restructurings and company closures, makes it a phenomenon which is relatively harmless to society.

Moreover, the problem for politicians in the 'old Europe' should not be relocation as such, but ways of dealing with the challenges posed by this phenomenon, such as developing tools to create more jobs than the number of job losses. Relocation should be an important tool in the competitive struggle of businesses. This is why the European Commission's policy, which prohibits the use of EU funds by companies which relocate their activities, seems undesirable.

[1] capital as a production factor is relatively less important in the service sector than in the industrial sector - Fisher A. G. B., Capital and the growth of knowledge, The Economic Journal, 1933, p. 384, after Kwiatkowski E., Teoria trzech sektorów, PWN, Warsaw 1980, p. 93

[2] The definition of high- and medium-high technology industrial sectors is based on the OECD definition, where this breakdown is carried out in relation to the ratio of R&D expenditure to GDP.

[3] the collapse of old and unsuccessful attempts at the successful functioning of new industries, the fall of TFP, the fall of production (Norton, 1996, p. 17)

[4] Actions for sustainable development in areas identified as particularly sensitive, i.e. equal opportunities, environment, information society, local and regional development

[5] People under 25 years of age who are unemployed for more than 6 months and people over 25 years of age who are unemployed for more than 12 months. Indicator calculated as a percentage of the total number of registered unemployed.

The Markets for The Ordo Liberal Concepts and Market Competition

Piotr WALĄG
University of Agriculture in Krakow, Mickiewicza Av. 21, 31-120 Krakow, Poland,
e-mail: piotr.walag@urk.edu.pl

Abstract

The last decades of development of world economies have been marked by the transition to highly productive economies. The reasons for this state of affairs are mainly seen in the intensification of competitive forces in individual markets[1], which force the introduction of new technologies and innovations. In view of this, it makes sense to ask what economic conditions are most conducive to strengthening the forces of market competition. The concept of competitiveness of economies is used to assess their economic condition and is analysed by looking for ways to achieve the highest possible levels of position and competitive ability. The competitiveness of an economy is determined by the strength of competition in its individual departments and branches. However, it is in the nature of economic entities to avoid the conditions in which they must be subject to the requirements of competition and to look for opportunities to benefit from a pension. The pursuit of the pension, however, lowers the productivity of the operation of the managing entities and makes the allocation of production resources sub-optimal. In conditions where none of the operating entities can take advantage of the market advantage, competition is born which forces continuous productivity growth. Otherwise, higher productivity is the result of competition, which eliminates the possibility of achieving a pension and forces a quick and effective reallocation of resources, as well as the search for and introduction of new technologies and innovations. In Ordo liberal concepts, economic governance is subordinated to the material purpose of management as well as to overarching social values. The ideas of ordo liberal, which are at the heart of the social market economy, constitute the freedom of the individual in social and economic life, which is achieved under conditions in which the decisions and actions of individual individuals give shape to economic processes. Securing economic freedom is achieved in a constructivist approach to creating a competitive economic order. Competitive economic order aims at creating conditions and securing full competition between entities, where economic profitability is achieved only as a result of increasing / increasing the level of productivity and innovation, while at the same time the low efficiency of economic entities, through bankruptcy, eliminates them from the market. In addition, the economic policy principles of the Ordo Liberal concepts meet the requirements of theoretical coherence and feasibility. The aim of this article is to present a competitive economic governance developed within the framework of ordo liberal theories as an appropriate approach to be applied to improving the competitiveness of the economy and the challenges of the new era. The first part of the article will present the approach to competitiveness, then the introduction to ordo liberalism as the theoretical basis for competitive economic governance, and the final part will specify the principles of competitive economic governance that serve / lead to the achievement of higher economic competitiveness.
The thesis of the article is that the basis for achieving a high growth in competitiveness is to strengthen the forces of competition by creating and safeguarding the conditions for the development of economic freedom.

Keywords: ordo liberalism, competitive economic governance, the phenomenon of misappropriation, principles that constitute economic governance, cost transfer, economic competitiveness, economic freedom, economic viability, innovation.

Introduction

An approach to economic competitiveness

The concept of competitiveness is emerging as a result of a changing environment driven by globalisation, advances in communication, the free movement of knowledge, ideas, values and practices between and within companies, an environment which, on the one hand, stimulates competition and, on the other hand, is a source of profit. Hence the need to establish the rules of the market game to encourage productivity growth and competitiveness.

It is not the purpose of this chapter to analyse competitiveness by definition. The category of competitiveness will be based on the concept developed by the institutions, probably using it to the fullest extent in practice - the European

Commission. The competitiveness of the economy adopted as part of work on the Lisbon Strategy is understood as the existence of conditions in which we are dealing with an economy with a high, sustainable productivity rate.

In order to increase competitiveness, efforts are being made to adapt EU economies to structural changes, to reallocate industrial activity to developing economies, to transfer labour and capital resources to new industries, and to risk the deindustrialisation process. Competitiveness is determined mainly by the increase in productivity in individual sectors of the EU economies, and hence, in particular, its ability to make structural adjustments. Therefore, in order to achieve higher levels of competitiveness, the EU is looking for ways to operate more efficiently in areas such as innovation, ICT, entrepreneurship, competition, education and training.

Theoretical basis, methods, results and discussion

The 'struggle' for increased competitiveness is manifested by the diversity of conditions in the individual economies of the Member States. Table 1 presents the productivity indicators for selected countries in the period 2007-2018.

Table 1: Labour productivity (GDP by PPP per person employed compared to EU-27, EU-27 = 100) for selected economies

Economic area	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018

Source: Own calculations based on the Eurostat database.

On the basis of the information presented in the table above, one can clearly point to the United States as an economy in which the objective of a relatively high and steady increase in labour productivity is being achieved. Although the euro area countries, Germany and the United Kingdom have shown productivity increases relative to those of the EU-27, their developments have been uneven and declining for recent years. Poland, the Czech Republic, Slovakia and Hungary record significantly lower productivity than the EU-27, although it is clear that productivity has been increasing steadily in the last three years.
The key issue is to distinguish between the general economic conditions under which the competitiveness of operators is measured.

Ordo liberal concepts of economic policy principles for increasing economic competitiveness.

From the point of view of the (role of the state) creation in the economy of the conditions most conducive to achieving a high, sustainable productivity rate, the following reasons speak for referring to the Ordo Liberal concepts:

1 - In recent decades, Keynesianism, despite the revival of its concepts, has lost its importance in economic debates. As well as, standing in opposition, monetarism M. Friedman's monetarism and the supply economy of the 1980s have not maintained their position. Liberal concepts as a theoretical basis for the formation of economic order were strongly criticised both in literature and in debates on economic policy (Sadowski, 2003). The criticism by J. Stiglitz of A. Smith's "invisible hand of the market", whose mechanism within the free market results in spontaneous achievement of high efficiency, should also be mentioned (Stiglitz, 2004).
2 - The creation of economic conditions through incoherent and isolated actions aimed at solving selected parts of current problems creates new problems. The lack of consistency, coherence and uniformity of policies reveals a high inefficiency of economic policy actions and leads to continuous interventions in the management process.
3 - Efficiency of management and the shaping of the order of competition not only requires the need to release spontaneous undertakings of economic entities in the spirit of liberalism, but also demonstrates the need for the state to introduce the main principles determining economic order. Such a constructivist approach to the creation of a

competitive economic order, Ordo liberalism as a higher development of liberalism, shaping its mission and further development, in which the freedom and spontaneity of economic entities and the operation of the free market are in the general interest, is aimed at overcoming the defects of liberal doctrine revealed today (Pysz, 2005).

Knowledge not only of the market effectiveness of allocation and coordination and its pro-efficiency motivation to act, but also knowledge of market failure in various situations which are increasingly recognised by science, forms the basis for asking ourselves whether achieving greater and greater competitiveness can be achieved if the shaping of economic governance, as well as the very course of the management process on the scale of the entire economy, is left to the decisions and actions of economic entities on the market. Classical liberals believed that in conditions of full economic freedom, market forces and mechanisms will themselves shape competition and competitive economic governance. However, according to the liberals' ordo , this was a fundamental mistake, because the motives of individuals guided by their selfish interests under conditions of freedom to shape the course of their own economic activity, as well as the rules of the market game, will push them to gain a dominant position in the market, which will allow them to find themselves outside the reach of the forces of market competition. It could be concluded from this that market competition is not a 'law of nature', since entities with market advantages will use the economic power thus gained to eliminate competition. This is because a market economy has the internal forces and conditions for the creation of monopolies or oligopolies that crowd out competition (Eucken, 1990). According to Ordo Liberal's views, the application of the principle of laissez-faire in the area of shaping economic governance was disastrous for capitalism, which was threatened by capitalists themselves. This issue was highlighted by W. Ropke, who claimed that economic operators actively seeking a pension generate profits by transferring losses to other operators. This happens when they want to free themselves from or avoid market competition by creating monopolistic structures (Ropke 1994). The representatives of the Ordo Liberal economy did not stop at saying that the process of shaping economic governance should not be left to the free decisions of economic operators, but they maintained that it should be the task of the state, as an impartial arbiter, within the framework of economic policy, which they sought to establish a theoretical foundation. Therefore, the main issue was to formulate the principles by which the state can pursue a policy of competitive economic governance. They accepted the thesis that economics is a servant science and should take up the challenges posed by management problems of major importance to society (Eucken, 1990). The definition and formulation of the rules of the economic game was intended to enable economic units to adapt to the challenges posed by industrialisation (Lippman, 1945). Today, economies are facing new and more complex processes. They have to face the challenges of globalisation of the world economy and major structural changes brought about by deindustrialisation and the need to adapt to an era where social existence will be based on knowledge and the production of services. The liberalism incorporated into the social market economy is achieved through the coexistence of competitive governance and an increase in employment and income from work. A key issue related to the social market economy in the context of developing higher levels of economic competitiveness seems to be competitive economic governance.

Competitive economic governance as a method of increasing the competitiveness of the economy.

The concept of competitive economic governance is based on the principles of the market game, which is a stabilisation and protection against any restriction on the economic freedom of individuals.

The principles which constitute a competitive economic order, built by Eucken on the basis of an analysis of more than 150 years of the history of the liberal economy, are based on three most important demands: freedom as the freedom to act and make decisions, equality as the lack of privileges and the functioning of the same rules for all economic entities, responsibility as the consequences for economic entities for their decisions and actions.

In the ordo liberal concept of competitive economic governance, the essence is to achieve an effective solution to the problem of the transfer of resources and the coordination of economic activity across the economy. As A. Fisher pointed out, if society is to benefit from the effects of economic progress, there must be a continuous transfer of production factors in a dynamic economy in the most efficient way, under the threat of economic crises (Fisher, 1935; Fisher, 1945). According to the creator of competitive economic governance, W. Eucken, the solution to this fundamental problem is to be based on the main principle that constitutes competitive economic governance - an efficient price system of perfect competition (Eucken, 1990). The effectiveness of the functioning of the price system - its information function, in the framework of which prices are to reflect the intensity of scarcity of resources is realized only in conditions of market competition and only then prices are objective market parameters. Under such conditions, economic operators have to adapt their activities to the scale of rarity reflected in prices, and this adaptation process results in an optimal allocation and transfer of resources throughout the economy. It follows that the launch of a functioning price system of perfect competition must be a fundamental criterion for assessing any economic policy action, with the aim of stopping economic policies which, under any pressure from a given situation,

distort the price mechanism, for example through credit expansion, state subsidies, price freezes or import bans (Eucken, 2003).

L. Thurow stressed that productivity growth is conditioned by the speed of factor transfer from low-productivity to high-productivity activities. However, this is not supported by any state interference that distorts the competitive price system (Thurow, 2001).
Any instability in the purchasing power of money causes the relationship between prices to be distorted, forces to achieve macroeconomic equilibrium to be shaken and productivity to be reduced due to inappropriate decisions made on the basis of incorrect economic accounts. Hence the constitution of another principle, which is the stabilisation of the value of money.

Any restriction of access to market supply or demand by the economic operators leads (serves) to restrict or even destroy competition. Restricted access to the market encourages and facilitates the creation of monopolies. If there is even free competition and the markets are closed, the lack of access to them from outside / their isolation distorts the mechanism for the desired allocation of resources in the economy. The most important consequence of closing markets is a weakening of the forces of competition, which forces an increase in productivity, and a reduction in the motivation to increase competitiveness.

Private ownership, which is essential to the existence of economic governance, under conditions of free competition, leads to a balance in the distribution of economic power between owners of the means of production. In a competitive environment, private ownership of the means of production does not give the owners of the means of production economic power, and by guaranteeing the free management of private means of production it serves the social interest. This is because the function of ownership depends on the form of the market that gives it its proper character. Within the framework of the competitive order, private ownership serves to increase productivity, because the market mechanism of competition will result in the loss of the right to dispose of the means of production of anyone who fails to maintain at least an average level of productivity on a permanent basis. This is because of the high economic efficiency of the competitive order.

The freedom to conclude contracts, as well as the right of ownership, can play different roles in the economy, depending on the form of the market, but the existing form of the market depends on the law (guaranteeing freedom of contract). On the one hand, the maintenance of competition requires that freedom of contract be guaranteed, while on the other hand, the freedom to conclude individual contracts, resulting from the need to ensure the smooth running of economic processes, must be exercised under conditions of competition. This is to safeguard it against being used against freedom (freedom of contract in the absence of full competition may be used to strengthen monopolistic structures in the economy).

The freedom of the individual who constitutes the competitive economic order of Eucken is inextricably linked to responsibility for himself and his environment. In order to prevent decisions that waste resources, economic operators should be responsible for their actions. This would be served by the need for thorough market research, which in turn would protect against the emergence of market structures that are destructive to competitiveness (monopolies, oligopolies, etc.).

Improving competition for the highest possible levels of productivity in the ordo liberal concept of economic governance must be complemented by responsibility as part of the process of 'free competition management'. Responsibility is essential in seeking to achieve higher levels of productivity through equivalent/equivalent management effects, and to smoothly remove from economic activity those who are inefficient in terms of their productive resources, which are reflected in their losses. Responsibility is linked to one of the most important conditions for increasing productivity - the speed of transition from low to highly productive activities and the exclusion of inefficient entities from the range of economic activities (Thurow, 2001).

When analysing productivity growth patterns, long-term investment is an important determinant of these, on which the attention of the Liberals' ordo was also very much focused. They considered the stability of economic environment parameters to be the most important determinant of investments geared towards a long payback / depreciation period. Knowledge of the scale of taxes due to the state, commercial and insurance regulations, etc., strengthens entrepreneurs' propensity to undertake investment projects. What is more, Ordoliberals also point to strong incentives for entrepreneurs to consolidate their capital in the conditions of instability of economic policy (observing the phenomenon of mergers of enterprises or their departments in the face of the search for ways to minimise the risk coming from the institutional and legal environment).

Table 2: Indicators reflecting the adaptation of selected economies to the principles of competitive governance

Table 2 is an attempt to present some principles for selected economies in order to illustrate their adherence to the ordo liberal principles of economic resource management. Countries	A system of prices able to fulfil resource scarcity index functions (State aid granted to the agricultural, industrial, - coal, transport sectors - in addition to railways and other services, as % of GDP, 2018)	Money value stability (inflation rate, 2018)	Openness of markets			Material liability of economic entities (recovery rate - number of cents per dollar)	Economic policy stability (volume of venture capital investments as % of GDP at market prices in 2018)	
			Business start-ups: number of procedures/quantity/cost as % of GNP *pre capita/minimum* capital as % of income *per capita*	Licensing: number of procedures /number of days/cost as % of income *per capita*	Closure period in years/cost of closure as % of assets		Investments to start up operations	Investments aimed at developing the company
Germany	0,36	2,3	9/18/5.7/42.8	12/100/63.1	1.2/8	53.4	0,011	0,033

Source: Own study based on the Eurostat database.

The data on State subsidies presented in Table 2 as State aid granted to the agricultural, industrial, coal and transport sectors in the countries with the highest productivity levels are very low, for example, 0.08% in the UK. In Germany, on the other hand, which was at a high level of productivity with high subsidies, there is a steady decline in productivity. However, among the countries selected in the table above, which are at a much lower level of productivity than economies such as Germany, the United Kingdom or the United States, we can observe that the highest productivity growth in the observed years was recorded in Slovakia, which had the lowest subsidies. In the case of the Hungarian economy, which has the highest productivity levels among selected post-socialist countries, large state subsidies and high monetary instability in relation to other countries are compensated for by the openness of markets. Hungarians have the smallest number of days and procedures to open companies and the smallest closure period, as well as one of the smaller opening costs and the smallest closure costs. Slovakia, on the other hand, which maintains the highest rate of productivity growth, has the lowest opening costs, which indicates that markets are very open. However, all these post-socialist countries are fundamentally different from the results achieved in highly developed countries, where open markets are characterised by a very low number of days and procedures for both opening and closing and extremely low or even zero (United Kingdom, United States) start-up costs. The cost of company closures is a reflection of the speed and quality of the desinvestment process, directly linked to the reallocation of resources in the economy. Low exit costs mean efficient design for investment, which translates into productivity growth in the economy (Thurow, 2001). The following dependency could emerge here: in countries where the cost of opening up and the minimum capital needed to start up a business is relatively low, where competition appears to be intense in most markets, productivity increases.

An important feature of Ordo liberal economic ideas is the responsibility of economic operators for their actions. Measuring this property of the economy with the rate of recovery of debts from a bankrupt company, it can be concluded that most cents per dollar are recovered in countries with high levels of productivity (Germany, the United Kingdom and the United States), which indicates not only an efficient system of bankruptcy law in these countries,

but also a relatively strong sense of responsibility. Likewise, the relationship is also with regard to another feature of ordo liberal economic governance - the stability of economic policy, measured by the volume of *venture capital* investment. The countries with the highest levels are Germany, the United Kingdom and the United States.

Concluding the analysis of the above table, one more observation comes to mind here that the structure of factors determining productivity growth and economic growth is appropriate (different) for each economy (Zienkowski, 2007) due to different market conditions. In order for companies to function, it is necessary to have a broadly understood infrastructure - a set of conditions necessary to conduct a given business activity. Infrastructure can be divided into heavy (e.g. roads) and light (which is the legal and institutional environment - rules of the game) (Pietrzyk, 2007). And since all companies when planning their activities refer directly to infrastructure, it is possible that a problem related to the phenomenon of misappropriation may occur. Therefore, building (creating) light infrastructure (legal and institutional environment) cannot be left to economic entities. When companies operating in a given industry want to develop, they have to make a number of investments in broadly understood infrastructure, the effects of which will be available to new companies entering the industry, for which the lack of this infrastructure may constitute a barrier to entry. If existing companies calculate that the entry of new companies will introduce so much competition that they will lose the opportunity to benefit from the pension and the profits lost to the benefit of the competition will outweigh the benefits of the investment, they will not be taken up. In such a situation we are dealing with the problem of misappropriation (Krugman, 2007). Companies prefer to give up their growth just to prevent the entry of new companies. The inhibition of competition leads to companies focusing on maintaining their position and benefiting from the pension instead of focusing on improving efficiency. One possibility of eliminating the effect of misappropriation is the creation of economic governance by the state, which automatically creates the institutional and legal infrastructure, and within this framework the infrastructure is effectively created in a broad sense, in accordance with the decisions taken by the managing entities. In this way, by creating an environment, the state will eliminate natural barriers to entry for new enterprises and create conditions conducive to the creation of economic order, securing competition and developing competitiveness.

Another attempt to show the close link between competitiveness and economic freedom is to present in Table 3 the levels of the competitiveness index for the 10 most competitive countries and the freedom index for the 10 best and worst economically liberal countries.

Table 3: Freedom index and competitiveness index for selected countries

Competitiveness index	**Index of freedom**	Place in the Freedom Index ranking (out of 157 classified countries) for 10 least competitive countries
(main factors of the competitiveness of the economy: functioning of the economy, efficiency of the government, efficiency of the company, infrastructure)	the index includes 10 freedoms: freedom to open, conduct and close a business, freedom of international trade, fiscal freedom - scale of the tax burden, size of government - construction of expenditure, monetary freedom - price stability, freedom to invest - free movement of capital, financial freedom - banking security and independence from government, property rights - ability to accumulate state-secured private property, freedom from corruption, freedom at work - freedom of interaction between workers and businesses, without state intervention)	
Competitiveness - the ability of the economy to create and maintain an environment conducive to maintaining the competitiveness of enterprises (private and public), where economic value and prosperity are created in the first place	Economic freedom includes the freedoms and rights to produce, distribute and consume products and services. The highest form of economic freedom provides the absolute right to property, the full exercise of freedoms in the movement of labour, capital and goods, the absence of any restrictions on economic freedom other than those necessary to protect and maintain freedom.	
10 countries with the highest index		
United States	Hong Kong	
Singapore	Singapore	
Hong Kong	Ireland	
Luxembourg	Australia	
Denmark	United States	
Switzerland	New Zealand	

Iceland	Canada	
The Netherlands	Chile	
Sweden	Switzerland	
Canada	Great Britain	
10 countries with the lowest index		
Venezuela	North Korea	148 [45]
Indonesia	Cuba	119 [53,9]
Croatia	Zimbabwe	113 [54,6]
Poland	Libya	83 [59,5]
Argentina	Burma	108 [55,1]
South Africa	Turkmenistan	57 [63,2]
Brazil	Iran	101 [55,9]
Turkey	Belarus	74 [60,8]
Mexico	Bangladesh	44 [66,4]
Ukraine	Venezuela	133 [51,1]

Source: Own study based on the Eurostat database.

On the basis of the analysis of Table 3, a certain pattern emerges - the countries where the highest economic competitiveness is achieved are also characterised by high levels of the freedom index. However, as can be seen from the above article - the assumptions of the ordo liberal concepts - the starting point for achieving sustainable productivity growth in the economy is to create conditions for economic freedom. Therefore, the countries which currently have the highest levels of competitiveness are those in which the overriding objective of economic policy has been and is to create conditions for the greatest possible economic freedom. However, the countries with the lowest levels of competitiveness are, at the same time, at the lowest positions in the index of economic freedom, or have a relatively short historical period of introducing and consolidating economic freedom. What could confirm the the thesis raised in this article is the fact that none of the economies that have a low position in the index of freedom has achieved a high level of competitiveness. Of the 10 least competitive economies included in the IMD study in Lausanne (World Competitiveness Yearbook), none of them significantly exceeded the freedom index at 70[2] (Argentina was the only country in this group to have a freedom index between 70.61 and 74.67), which means that they have moderate economic freedom, lack economic freedom or economic freedom is suppressed.

Summary

The main idea of the article is to show competitive economic governance as the most appropriate method for creating economic conditions conducive to achieving high levels of economic competitiveness. In its light, economic freedom is the foundation for building and maintaining economic competitiveness. Eucken's Ordnungstheorie (Ordnungstheorie) theories of economic governance have also created principles of economic policy which serve to implement the order of competition, under which the course of economic processes is left to the decisions and actions of economic entities, while the form and principles of market play are created and protected by the policy of shaping economic governance. A competitive market economy is not the 'law of nature', and it is in the selfish interest of economic operators that the desire to free themselves from the mechanism of market competition, called by Lippman 'the merciless dictatorship of the market', is imprisoned. (Lippman, 1945). Strengthening the forces of market competition is to be achieved by, among other things, such principles that constitute economic order as the responsibility of economic entities, open markets, stability of the value of money, and a permanent and not discretionary economic policy. In other words, according to the theoretical foundations of competitive economic governance, market competition is intensified by creating and securing conditions for the development of economic freedom.

Ordo liberal concepts include both the material purpose of management and overarching social values such as individual freedom and social justice, which have a timeless significance (Pysz, 2007).

Today's markets are increasingly expanding into global markets, but their lack of reliability remains. This state of affairs forces the introduction of a framework of action which, while suppressing the harmful elements of the impetuosity of economic freedom, does not eliminate its pro-productivity characteristics. Such conditions are recognised in the ordo liberal constructivism of the economic order.

Empirical observations also confirm the indications in theory, although the structure of the productivity factors varies from country to country, as W. Eucken pointed out when he said that the quality of the parameters of the economic environment corresponding to the ordo liberal rules depends on the specific characteristics of each country.

[1] Remarks by Chairman Alan Greenspan, *Structural change in the new economy*, Before the National Governors' Association, 92nd Annual Meeting, State College, Pennsylvania , July 11, 2000.

[2] the rate (percentage) of freedom in the range 80-100 indicates the existence of full economic freedom, 70-79.9 - dominant economic freedom, 60-69.9 - moderate economic freedom, 50-59.9 - dominant lack of economic freedom, 0-49.9 - suppression of economic freedom.

Abstract

The 2008+ crisis and its impact on the image of the euro area called into question the benefits of joining the monetary union of catching up countries. They incurred tremendous costs of the structural maladjustment of economies to the common currency area, which includes countries with strongly diversified economies: highly developed and catching up. The need to stabilize the situation in the euro area and counteract similar crises intensifies the discussion and actions aimed at deepening integration and strengthening the fiscal function in the EMU, i.e. creating the foundations of a fiscal union. These proposals are a challenge for countries with a derogation, including Poland. The authors considered it justified to prepare the assessment of Poland's economy adjustment to the introduction of the euro. Analysis of the catching up process and evaluation of the achieved level of convergence cover the years 2002-2019 and the following economies: Austria, Germany, France, Netherlands, Spain, Portugal, Slovakia and Poland. The average periodic indicators of changes in GDP, labor productivity, employment, investments, unit labor costs, TFP, unemployment, exports and inflation were used as well as indicators illustrating the situation in public finances, external equilibrium and measures of convergence. The empirical analysis was based on the OCA theory. The results of this analysis can be summarized as follows: 1) the catching up effect has been achieved by Poland; 2) nevertheless, Poland does not yet meet the criterion of real convergence with the euro area; 3) by resigning from its own currency, it could suffer economic shocks, and the greatest risk is a decline in the competitive advantage and exports, and consequently economic dynamics; 4) observing the economic problems of Spain, Portugal and Slovakia, this can be expected.

Keywords: Monetary Union, The OCA Theory, Economic Convergence Process, Poland's Catching Up Effects, Economic Gap as A Risk Limiting the Benefits from The Common Currency.

Introduction

By joining the European Union, Poland and other Central and Eastern European countries committed themselves to the introduction of the euro in the Accession Treaties. However, due to the lag in economic development in relation to the countries operating in the common currency area, the new member states from CEE obtained a special status allowing for the postponement of the euro adoption date. The official EU documentation terminology uses the name of countries with a derogation, which are obliged to pursue a policy accelerating the reduction of the economic distance in relation to more developed countries and a policy of structural changes driven by technological progress.

The adjustment of the economy to the effective functioning in the common currency area consists in reducing the economic and technological gap and catching up with countries with a higher level of development. As a result, the new member states have greater opportunities to permanently meet the treaty criteria of the monetary union. Even more important from the point of view of effective participation in the euro area, i.e. the possibility of achieving economic, but also social and political benefits, is the fulfillment of the conditions for participation in the monetary union defined by the authors of the optimum currency area (OCA) theory. In the conditions of high economic openness and increased interdependence of development processes in the global dimension, and the rising impact of the foreign exchange and financial market on the real economy, the interest of countries in more advanced monetary integration is growing. The free movement of capital and speculative transactions contribute to destabilization of exchange rates and financial markets. In the conditions of growing risk and uncertainty in doing business and

Cite this Article as: Bogumila MUCHA-LESZKOand Magdalena K. KAKOL" Appraisal of the Adjustment of Poland's Economy to the Introduction of the Euro" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

recurring financial and economic crises, countries without currencies of recognized international credibility are increasingly interested in joining monetary unions. For these reasons, some of the CEE countries adopted the euro (Slovenia, Slovakia, Estonia, Latvia, Lithuania), and Poland, the Czech Republic, Hungary, Bulgaria and Romania have retained their national currencies. On the one hand, these new premises support the introduction of the euro throughout the European Union, but on the other hand, the effects of the 2008+ crisis contributed to a decline in the interest of Poland, the Czech Republic and Hungary in implementing the euro.

In 2008-2009 there was a significant drop in investment and consumption demand, capital flowed away to home countries, the inability to pursue national monetary policy and the lack of mechanism of the nominal exchange rate limited the possibilities of intensifying adjustment processes and mitigating the effects of the crisis. Such a situation was interpreted as a weakness of the monetary union resulting from the incapability to adjust the countercyclical policy to the course of the business cycle in individual countries, and the greater possibilities of smoothing the business cycle in countries with their own currency were emphasized.

Another argument undermining the benefits of catching up countries resulting from joining the monetary union were the consequences of the 2008+ crisis in Greece, Spain and Portugal. They incurred high costs of the structural maladjustment of economies to the common currency area created by more developed countries. The effects of the crisis seriously damaged the image of the euro area as a group of countries in which the game of economic and political interests of countries prevail over the pursuit of greater economic and social cohesion and the improvement of the governance model of the common currency area. A noticeable change in the public perception of this situation was a significant drop in support for the introduction of the common currency in Poland. As a result, the interest of the national authorities in conducting a consistent policy aimed at abrogating the derogation concerning the accession to the third stage of EMU also decreased. There was also a polarization of positions on this issue among politicians and economists from academia and business. Taking into account the problems with maintaining the macroeconomic equilibrium in the euro area and the problems that have occurred in the global dimension as well as the growing economic and political uncertainty, as well as the EU strategy leading to the strengthening of the position of the common currency in the grouping's territory, it is worth asking two questions: *Has Poland already reached such a stage in economic development that ensures the realization of the benefits of belonging to the monetary union and has the 16-year membership in the EU favored the adjustment of the economy to the conditions of functioning in the monetary union? What are the biggest threats that may increase the costs of adopting the common currency?* Such questions are justified by the economic outcomes of Poland: high and sustained long-term economic growth and increase in labor productivity, TFP and exports.

Purpose and research method

The aim of the paper is to assess the adjustment process of the Polish economy in terms of the pace of reducing the development and technological gap with regard to ensuring the benefits of adopting the euro. The starting point for the implementation of the research objective is the assessment of Poland's economic position in relation to the euro area and its selected countries. A more detailed approach to the research goal is expressed in research questions: *What are the strengths of the Polish economy? In what areas is there the greatest risk of negative effects of giving up the national currency?* The analysis of the process of adjustment of Poland’s economy to the euro adoption and the level of convergence achieved within the EU is confronted with the experiences of Spain and Portugal. More broadly, the analysis of Poland's economic performance covers two groups of countries: catching up and highly developed. The first group includes: Poland, Slovakia, Spain and Portugal, and the second are the hard core countries: Austria, Germany, France and the Netherlands.

In the assessment of Poland's adjustment process to the adoption of the euro and its economic position in relation to the euro area and selected countries, the following average periodic indicators were used: growth/decline of GDP, labor productivity, employment, investment, unit labor costs, TFP, unemployment, exports, inflation and changes in general government net lending, balances on current accounts, public debt in relation to GDP and measures of convergence (GDP per capita according to purchasing power parity EA = 100). The analysis of the indicators was carried out with the distinction of three 6-year periods: 2002-2007 (relatively good economic situation), 2008-2013 (recession-stagnant), 2014-2019 (post-crisis recovery). The analysis is based on data obtained from the following databases: Ameco, Eurostat, OECD, The Conference Board and UNCTAD.

Preconditions of potential benefits of participation in the monetary union - theoretical introduction

The significance of exchange rates as the price of money and an adjustment mechanism in the process of restoring current account equilibrium gained importance with the development of international trade and the growing trade openness of countries. In the 19th century, customs unions and monetary unions were aimed at eliminating trade barriers and reducing the risk of exchange rate volatility. The theory of market and monetary integration began to develop intensively from the 1960s, when the creation of the European Economic Community was a confirmation of the commitment of France, Germany, Italy, Belgium, the Netherlands and Luxembourg in building a common Europe. Initially theorists of economic integration focused attention on the benefits of market integration. Pioneering contributions to the development of the integration theory were made at that time by B. Balassa (1962) and R. A. Mundell. The first of them presented the differences between the countries of the premises and goals of integration, but above all defined the stages of the gradual advancement of integration, emphasizing the legitimacy of sequentially achieving higher and higher stages. In 1973, in the conference materials, B. Balassa presented his position on the monetary union, claiming that in the common European market, the appropriate exchange rates should be crawling pegs, but the ultimate goal - the monetary union (Balassa 1973).

The author who initiated the most important discussion to date on the monetary union, known as the Optimum Currency Area (OCA) concept, was R. A. Mundell. He considered the optimum currency area to be a region which borders are determined by the internal mobility of production factors (labor and capital) and the lack of external mobility (Mundell 1961). The second pioneer of the OCA concept was P. B. Kenen and he did not agree with the criteria defining the limits of OCA presented by R. A. Mundell. He recognized that the optimal currency area can be created by countries diversified in terms of production and exports, but at the same time similar in terms of economic structure (Kenen 1969). Diversification of production and exports mitigates asymmetric shocks, as the fall in demand also varies depending on the spheres of the economy and product groups. Small countries with specialized economies are most exposed to asymmetric shocks. In contrast, the similarity of the structures of the monetary union's economies is important from the point of view of the possibility of unifying economic policies, but it is also treated as a criterion of the achieved level of economic development.

The third pioneer of the traditional OCA concept is R. I. McKinnon (1963). He considered trade openness to be the most important criterion for creating an optimal currency area due to the large impact of world prices on domestic prices, also as a result of changes in exchange rates. He argued that the monetary union and fixed exchange rates had the potential to stabilize prices. However, in conditions of low openness, floating rates are a more effective mechanism for achieving equilibrium.

In conclusion, it is worth noting that: 1) the traditional concept of OCA was created in the 1960s and originated from the Keynesian economy, 2) its authors focused on defining such OCA criteria that would reduce the costs of abandoning the economic policy instrument and the external equilibrium mechanism, which is the exchange rate, 3) the OCA concept was developed during the functioning of the monetary system established in Bretton Woods, that was based on fixed exchange rates and the dollar - losing its purchasing power since the beginning of the 1960s, which resulted in increased interest in the discussion on methods of limiting currency risk in international transactions, 4) traditional OCA concepts remained theoretical assumptions without the possibility of empirical verification.

The evolution of the monetary union theory, including the OCA concept, was influenced by: 1) changes in the situation in the world economy, 2) changes in the rules of the international monetary system, 3) destabilization of currency relations in the world, and 4) the acceleration of monetary integration in the EEC after presentation and adoption for implementation of the Werner plan (economic and monetary union 1970/71). In 1971-1973 the dollar-gold system collapsed. The transition of most countries to floating exchange rates (1973) brought about a fundamental change in the conditions of international trade due to increased exchange rate risk and price competitive advantage. The destabilization of monetary relations was deepened by energy crises and rising inflation. After the abolition of the golden dollar parity, the EEC established its own European Unit of Account (1975) based on a basket of the currencies of nine member countries. Changing the rules of functioning of the international monetary system, the effects of introducing floating exchange rates, high inflation and manipulation of exchange rates in order to increase the competitiveness of exports by the Member States of the Community threatened the development of mutual trade (Mucha-Leszko 2007, p. 49). In the ensuing situation, the priority was to stabilize monetary relations of the Community. The plan to establish its own zone of currency stability was negotiated and prepared in the second half of the 70s. It was justified by three basic factors (Swann 2000, p. 209): 1) general lack of acceptance of floating exchange rates after the collapse of the Breton Woods system, 2) favorable

impact of fixed exchange rates on cross-border business activity, allowing for real calculation of costs and income from exports in the national currency, 3) destabilizing impact of fluctuations in exchange rates, including especially the US dollar, on the real economy. As a result of decisive actions inspired by France, in agreement with Germany, in 1979 the European Monetary System (European Bretton Woods) was introduced in the EEC. In addition to the above-mentioned factors, the evolution of the concept of optimum currency area was influenced by the decline in the importance of Keynesian economics in favor of neoclassical economics.

F. P. Mongelli calls the 70s the period of reconciliation in the development of the OCA concept (Mongelli 2002, p. 11-14). The benefits and costs of joining the monetary union continued to be analyzed and assessed. The number of OCA criteria increased, the scope and degree of trade and investment ties between countries were taken into account, as well as the comparability of inflation. The research was deepened by estimating the benefits and costs of joining the monetary union as a whole and for individual countries. The largest contributions to the scientific achievements regarding the OCA concept were made in the 1970s by: Corden, Mundell, Ishiyama, and Tower and Willet. In 1973, R. A. Mundell revised his views on the monetary union, treating it as a way to limit the manipulation of exchange rates in trade policy and as an opportunity to create a currency reserve pooling that could absorb asymmetric external shocks (Verde 2009, p. 113). W. M. Corden (1972) considered the possibilities of absorbing demand shocks which countries may experience after joining the monetary union, when the real exchange rate rises and causes a decrease in export competitiveness. He came to the conclusion that the most effective mechanism for restoring external equilibrium is price and wage flexibility (Mongelli 2002, p. 12). I. Ishiyama (1975) argued that every country interested in functioning in a monetary union should estimate the benefits and costs from the point of view of its economic goals, taking into account the consequences resulting from conducting the welfare state policy. He also pointed out that optimum currency areas are at risk if one criterion is used as the justification for their creation. I. Ishiyama, like W. M. Corden, attached great importance to the comparability of inflation rates between countries aspiring to OCA. This was understandable because after the price-stable 1960s, inflation in many countries was double-digit and geographically diverse. The development of the OCA theory in the 1960s and 1970s did not increase the interest in empirical research in this field and the need for it was noticed by E. Tower and T. Willet (1976) (Mongelli 2002, p. 12).

After the second energy and economic crisis (1979-1982), monetary relations in Europe began to stabilize. The anti-inflation policy imposed by Germany within the European Monetary System contributed to the decline in inflation and the stabilization of exchange rates (from the mid-1980s). Currency stabilization in the world was much slower. The international monetary system, based on floating exchange rates and key currencies, did not ensure the effectiveness of the foreign exchange market adjustment mechanism. The expanding international financial market and the US monetary policy had an increasing influence on exchange rate movements. Current account imbalances required the coordination of monetary policies to prevent the growing diversification of benefits from international trade (Mucha-Leszko and Twarowska 2016). Despite problems with stabilizing currency relations in the global dimension, fluctuations in the exchange rates of the largest economies in the 1980s were smaller than in the previous decade. Due to the reduction of currency risk, the interest of economic theorists in the OCA concept decreased.

A decisive revival of discussions and research on the monetary union took place together with the presentation of an alternative approach to the OCA concept in the publication of the European Commission (Commission of the European Communities 1990). It was fundamentally different from the real OCA criteria. The authors of the new concept of the monetary union considered the nominal economic criteria determining the stability thresholds of prices, public finances and exchange rates for the EMU candidate countries as sufficient to create a common currency area. The countries' qualification for Stage III of the EMU took place under the conditions of sharp discussions between France and Germany regarding the introduction of the single currency in the economically weaker southern EU countries, which clearly formed a separate area, peripheral in relation to the countries constituting a coherent economic group of the EMU's hard core (Germany, Belgium, the Netherlands, France and Luxembourg). Political considerations prevailed and the euro area, established on 1 January 1999, included 11 countries. Theoretical achievements concerning the criteria which should be met in order to reap the benefits of the common currency,, including higher economic efficiency, were not of great importance. Moreover, the authors of the OCA concept formulated warnings that there is a risk of asymmetric shocks and economic problems in a monetary union that does not meet the OCA criteria (e.g. Mundell 1961, Haberler 1970, Fleming 1971). Examples of countries that did not meet the OCA criteria and adopted the euro were, among others, Portugal and Greece. Their economies were the most structurally unadjusted to the economies of core countries. Portugal joined the EMU with a large development gap expressed in low labor productivity (about 1/3 of that in Germany), a large share of traditional industries in the economy, and low competitiveness of exports based on labor-intensive products. Moreover, as late as 1995, Portugal did not meet any of the EMU criteria laid down in the Maastricht Treaty. This

goal was achieved as a result of an intensive anti-inflationary policy and budget savings, and thanks to general government revenues from the privatization of state-owned enterprises (Mucha-Leszko and Kąkol 2011).

In connection with the arrangements made on the implementation of the EMU at the meetings of the European Council in Strasbourg (December 8-9, 1989) and in Rome (October 27-29, 1990), nominal criteria were agreed upon to define the boundaries of the common currency area. They have been narrowed down to the stability of prices, exchange rates and public finances. These findings sparked an increased interest in research into potential countries that could create an EMU in light of the OCA criteria. The authors of this type of empirical analyses examined the degree of homogeneity of the potential currency area and identified groups of countries within the EMU in terms of similarities in the characteristics of economies. T. Bayoumi and B. Eichengreen (1992, pp. 34-36) investigated the correlation of demand and supply shocks between EU countries and compared the level of shock correlation between EU countries and US regions in 1963-1988. The obtained results showed: 1) greater idiosyncratic nature of demand shocks, 2) higher degree of correlation of demand shocks in the group of core EU countries, 3) larger fluctuations in demand and greater idiosyncratic nature of shocks in peripheral countries than in the EU's hard core. In addition, the authors of these studies found significant convergence in the scale and coherence of the demand shocks of Germany, France, Belgium, the Netherlands, Luxembourg and Denmark with the US regions. T. Bayoumi and B. Eichengreen (1996, 1997) and many other authors tested the economies of the EU countries in terms of meeting the OCA criteria (Artis 2002; Jager and Hafner 2013). Examination of the economic homogeneity of the common currency area and OCA properties, which accelerate adjustment processes in the event of asymmetric shocks (price and wage flexibility, labor mobility, financial market integration and financial transfers), was and is of fundamental importance in the conducted analyzes. Whereas, from the point of view of the risk level of asymmetric shocks, the following are essential: GDP per capita, GDP growth rate, level of labor productivity, unit labor costs, similar economic structures, trade openness, degree of specialization, intraregional trade. All studies conducted to assess the fulfillment of the OCA criteria by candidate countries to the EMU, and those already operating in the euro area, showed: 1) differentiation of countries in terms of GDP per capita, labor productivity and economic structures, 2) impact of this differentiation of economies on reducing the effectiveness of adjustment mechanisms and on increasing sensitivity to asymmetric shocks.

There is a conviction that the idea of European economic integration is still based on the endogeneity hypothesis, which was a real breakthrough in the discussion on the OCA criteria after it was presented by J. Frankel and A. Rose (1998). According to their position, the single currency contributes to the rise in the intensity of trade, and the growing economic interdependence results in an increasing synchronization of business cycles. As a consequence of these processes, the pace of convergence within the common currency area is enhancing and the OCA criteria can be met ex post. The 2008-2009 financial and economic crisis, prolonged economic stagnation (until 2014) and the scale of the crisis of public finances led to deepening of divergence processes in the euro area (Mucha-Leszko 2016). The hypothesis about the endogeneity of the OCA criteria did not defend itself, but contributed to the revival of the discussion on strengthening the governance of the euro area by means of monetary, fiscal and budgetary policy instruments. It is about strengthening the macroeconomic stabilization function. Symmetric shocks also destabilize the economies of the monetary union, so a common euro area budget could be used to mitigate cyclical fluctuations (Rosati 2020). Moreover, symmetric shocks may cause asymmetric effects resulting from the structural maladjustment of economies. For many years, P. De Grauwe has been among the advocates of the common budget of the euro area and the political union. He lists three basic elements of a political union (De Grauwe 2009, pp. 24-26): 1) the federal budget, 2) institutionalization of the coordination of policy instruments influencing the macroeconomic situation, 3) increasing the responsibility of the EU institutions for macroeconomic decisions, including the ECB. R. Baldwin and Ch. Wyplosz are also supporters of fiscal transfers, i.e. mutual compensation of the effects of asymmetric shocks in the EMU. They believe that the only solution is to accept the community and eliminate nationalist attitudes (Baldwin and Wyplosz 2009, pp. 337-340). The existing controversies in the literature regarding the OCA theory in the context of the functioning of the EMU focus on the problems of the scope of institutionalization of macroeconomic policy at the EU level (banking union and fiscal union) (Kąkol 2017), which may ensure higher efficiency of adjustment mechanisms and acceleration of real convergence.

Does Poland meet the criterion of real economic convergence with the euro area?

Long-term economic growth in Poland continued for almost three decades (1992-2019). As a result, the development gap in relation to the countries of Western Europe, which increased in the 1980s, narrowed significantly. The pace of the economic convergence process significantly accelerated with the accession of Poland to the European Union. At that time, the following factors had the greatest impact on the growth rate of the Polish economy: an increase in capital expenditure, labor productivity, investment in industry and infrastructure investment financed from aid funds. Domestic demand was also stimulated by cheap loans. The rise in GDP was also influenced by foreign direct investment, which in 2004-2019 ranged from 4.8% to 1.7% of GDP, except for

2013, when it amounted to 0.5% of GDP, tab 6. In order to evaluate the results of Poland's economic convergence process, tables 1-5 present the most important economic indicators with the division into three six-year periods (2002-2007), (2008-2013) and (2014-2019). This division is expected to show different convergence outcomes and their sources. In the case of Poland, such a division is of particular importance because the effects of the convergence process measured by the increase in GDP per capita in relation to the EA-19 average were the highest in the recession-stagnation period and reached 11 pp. But in the six years before the crisis, Poland's economic gap narrowed only by 6 pp (and by the same amount of 6 pp in 2014-2019). This means that in the period of crises and weak economic situation in Europe and in the world, the Polish economy not only remained on the path of economic growth, but also achieved a 3% increase in GDP (annual average), while in the euro area there was a decline of 0.2% of GDP.

Table 1: Main economic indicators of Poland and selected Euro Area countries,

annual averages in 2002-2007

Indicator/Country	**EA-19 Average**	Austria	France	Germany	Netherlands	Portugal	Spain	Slovakia	**Poland**
Real GDP growth rate (%)	**2.0**	2.5	1.9	1.3	2.0	1.1	3.4	6.9	**4.5**

The pace of the convergence process was lower in 2002-2007, as the GDP growth rate in all surveyed countries was positive, but varied considerably, the highest in Slovakia (6.9%), and Poland was second with an average annual result of 4.5% . The average annual GDP growth rates in Portugal (1.1%) and Germany (1.3%) were significantly below the average for EA-19 (2.0%). The main sources of Poland's economic growth in 2002-2007 were: an increase in investment (9.8%), labor productivity (3.5%) and exports of goods and services (9.9%). It is also worth paying attention to the increase in TFP, i.e. the total factor productivity (1.4%), which proved the reduction of the technological gap in Poland. Nevertheless, Slovakia achieved a higher pace of convergence, its GDP per capita increased by 13 pp against the EA-19 average while Poland's result was 7 pp (tab. 4). Among the remaining countries, the rise in GDP per capita compared to the EA-19 average was obtained by: Spain (6 pp), the Netherlands (2 pp), Austria (1 pp), Portugal (1 pp). Germany did not change its position, but France lost 4 pp. In summary, the effects of the process of Poland's convergence within the European Union and the adjustment of the economy to functioning in the common currency area, it should be noted that in comparison to Slovakia, Poland's results in 2002-2007 were modest. The main sources of the high dynamics of the Slovak economy were: foreign direct investment (in relation to GDP) which was much greater than in Poland, and the exceptionally high growth of exports (16.4% on average annually), as well as a greater increase in labor productivity and TFP (5.8% and 3.3%), tab. 1. Slovakia decided to introduce the euro as early as 2009, i.e. in conditions of a deep recession. The advantage of Slovakia over Poland also consisted in a greater reduction of the gap in terms of the level of labor productivity in relation to the EA=100, which in 2007 accounted for 63.3% of the euro area average, in the case of Poland it was 51.4% (tab.5). Labor productivity is the basis of competitive advantage in trade and its low level increases the risk of violating the external balance after adopting the common currency. This was especially experienced by the

peripheral countries, although their imports declined in the recessionary period and, consequently, the current account deficit decreased.

As was emphasized, Poland's great success in the crisis years 2008-2013 was the sustained economic growth and high dynamics of convergence. Poland's GDP per capita in 2013 increased to 62% of the average GDP in EA-19, i.e. by 11 pp. In Slovakia, the dynamics of economic convergence decreased and amounted to 6 pp, but the GDP per capita level achieved indicated an improvement in Slovakia's economic position in the euro area. It was already 72% of EA-19's GDP. In other countries, the losses of GDP varied in individual years, and overall, their economic positions in the euro area shifted throughout the six-year period. Austria and Germany were characterized by an increase in positions measured in GDP per capita. Both countries enlarged their advantage in relation to the average GDP per capita in EA-19 by 8 pp, and France by 3 pp (tab. 4). The Netherlands suffered major losses during the crises and its economic advantage weakened by 4 pp. But the greatest losses in the analyzed group of countries, as well as a significant weakening of the economic position and destabilization of public finances, affected Spain. The divergence process in terms of GDP per capita in 2008-2013 was as much as 10 pp, and in Portugal 2 pp.

Table 2: Main economic indicators of Poland and selected Euro Area countries,

annual averages in 2008 – 2013

Indicator/Country	**EA-19 Average**	Austria	France	Germany	Netherlands	Portugal	Spain	Slovakia	**Poland**

The high resilience of the Polish economy to shocks in the conditions of the global recession and the decline in GDP across the EU in 2009 by over 4% increases the weight of its 3% (average annual) GDP growth in 2008-2013 as compared to a decline of 0.2% in EA-19 . Compared to Poland, the GDP growth was significantly lower in Slovakia (1.9%). The several factors had a positive effect on economic growth in Poland: an increase in labor productivity, investment, TFP, employment and exports. When developing the issue of the sources of economic growth, it is worth emphasizing that the main factor creating domestic demand in Poland was public investment related to the need to use EU funds. Unemployment dropped significantly compared to the previous period, and the remaining macroeconomic indicators did not signal any serious imbalances. (tab. 2). Apart from the above-mentioned factors, positive impact on the dynamics of the Polish economy had low real exchange rate and low unit labor costs, which increased the competitiveness of exports and, consequently, the GDP growth rate (OECD 2014, p. 18). The inflow of FDI in relation to GDP (annual average) decreased from 3.35% to 2.17%, but it was stable, except for 2013 (0.5%), tab. 6. Foreign direct investment (annual average) in Slovakia decreased from 10.55% in 2002-2007 to 2.18% of GDP in 2008-2013 and ranged from 5.5% to - 0.6% of GDP. The data show that the reduced FDI could have caused a slight decline in the GDP growth rate in Poland. However, it had a major impact on the decrease in the GDP growth rate in Slovakia. Summing up, Poland's macroeconomic results in 2008-2013 provided positive evidence of potential opportunities to reduce the development gap. Nevertheless, the positive assessment of the adjustment process should also take into account the level of labor productivity in relation to the

EA-19 average, and in this respect Poland did not catch up with Slovakia. In 2013, these indicators were as follows: labor productivity in Poland accounted for 59.1% of EA level (EA-19 = 100), and in Slovakia 67.8%, tab 5. Considering all the analyzed indicators, it can be stated that in 2008-2013 Poland reached the contact level of economic homogeneity with the euro area.

Table 3: Main economic indicators of Poland and selected Euro Area countries, annual averages in 2014-2019

Indicator/Country	**EA-19 Average**	Austria	France	Germany	Netherlands	Portugal	Spain	Slovakia	**Poland**
Real GDP growth rate (%)	**1.8**	1.7	1.5	1.7	2.1	2.2	2.6	3.1	**4.2**
Real GDP growth rate (%)	**0.7**	0.6	0.9	0.8	0.2	0.1	0.5	2.1	**3.6**

The third stage of the analysis of the process of convergence of the Polish economy with the euro area was marked by a fundamental change in the EU's economic situation. From 2014, a sustained recovery began, spreading to all EU countries. Until 2019, in the group of countries studied, Poland maintained the highest average annual GDP growth rate, which was more than twice as high as the SE-19 average and amounted to 4.2%. The main factors of economic growth in Poland included: labor productivity, TFP, investment and especially exports of goods and services. It is also worth emphasizing the increase in the inflow of FDI, which on annual average amounted to 2.5% of GDP and proved stable. In Slovakia, the FDI inflow continued to decline and in 2014-2019 it decreased to 1.35% of GDP on average annually. Thus, Poland was a greater beneficiary of the inward FDI than Slovakia. The aforementioned factors made Poland the best result in the process of economic convergence. GDP per capita increased in relation to the average EA-19 from 63% to 69%, in Spain from 84% to 86%, and in Portugal from 72% to 74%. In the Netherlands, Austria, Germany and Slovakia divergence was recorded, while France's GDP per capita remained at the level of the average GDP per capita of EA-19. Efficiency convergence measured by the increase in labor productivity in relation to EA-19 = 100 can also be considered a great achievement of Poland – a rise from 59.4% to 68.6%. In Slovakia, the increase in the level of labor productivity in relation to the average SE-19 was 4.7 pp (from 68.6% to 73.3%). In the other countries surveyed, changes in this respect were slight or almost none. To sum up, in a subsequent period, Poland significantly narrowed the economic gap in relation to the average macroeconomic indicators which characterize the entire euro area.

We supplement the analysis conducted with a graphic presentation of macroeconomic indicators illustrating the level and dynamics of GDP growth and labor productivity in the surveyed countries in 2019 (fig. 1 and 2). These figures facilitate the assessment of the position and economic effectiveness of peripheral countries, including Poland, vis-à-vis selected, most important countries of the group that forms the hard core of the EMU. But most of all, they illustrate the dimension of economic heterogeneity in the euro area - income (GDP per capita) and productivity gaps. From the point of view of the OCA theory, this is a major barrier limiting the benefits of introducing the common currency.

Fig. 1: GDP per capita (as % of EA-19 level) and real GDP growth rate (in %) in 2019

Source: Own elaboration based on: Table 4 and Eurostat (2020).

Fig. 2: Real labor productivity per hour worked (as % of EA-19 level) and growth of real labor productivity per hour worked (in %) in 2019

Source: Own elaboration based on: Eurostat (2020) and OECD (2020).

When assessing the studied group of countries in terms of the homogeneity criterion, it should be stated: a large spread of GDP per capita from 69% of the EA-19 average in Slovakia and Poland to 121-120% in Netherlands and Austria. The dispersion of GDP growth rates is at first glance high, if we evaluate them on the basis of the spread of the rates between Poland (4.5%) and Germany (0.6%). After eliminating the extreme values, the differentiation of the growth rates is only 1 pp. The scale of differentiation in labor productivity is close to GDP per capita: from 67.0% of the EA-19 average in Portugal to 115.4 in Austria. Labor productivity growth rates indicate great potential for narrowing the gap between the core area and peripheral countries, especially in Poland (5.1%). The analysis of the level and rates of growth in labor productivity is important as it determines the competitive advantage in the monetary union and, as a result, the distribution of benefits from mutual trade, as well as affects current account balance and economic growth.

Conclusion

The study sought answers to research questions concerning: 1) Appraisal of the results of the adjustment process conditioning the achievement of benefits from the adoption of the common currency; 2) Assessment of 16-year membership in the EU in terms of creating favorable conditions for dynamizing the process of economic convergence; 3) Indication of the greatest threats that may result from the introduction of the euro; 4) Identification of the strengths of the Polish economy and the areas of the greatest risk of the consequences of giving up the national currency. Responding to the questions, it should be emphasized that the euro area does not meet the OCA criteria to a greater extent after the 2008+ crises than in the first years of its functioning. The effects of financial-economic and public finance crises were greater in the peripheral countries, and they deepened economic divergence. The experiences of Spain, Portugal and especially Greece constitute a serious warning of how risky the introduction of the common currency can be in economies that are characterized by a development gap: low GDP per capita, low labor productivity and trade competitiveness, and a large share in the economies of traditional sectors. The results of the analysis, the purpose of which was to assess the process of convergence of the Polish economy against the background of selected countries, indicate that Poland has achieved the catching up effect. Its GDP per capita as a percentage of the EA-19 average increased in the period considered from 43% to 69%, and in Slovakia from 48% to 69%.

Do not depreciating the high economic dynamics of Poland and the fundamental reduction of the gap in terms of labor productivity, it should be noted that in 2002-2007 the possibilities of catching up effect were not fully used. The advantage of the Polish economy is its high dynamics, large internal market and export growth, as well as ability to adapt in conditions of deterioration of the economic situation. Having macroeconomic policy instruments at the national level and the mechanism of a nominal exchange rate facilitate the achievement of economic goals. Despite the undoubted achievements in the process of catching up with the economically developed countries, Poland does not yet meet the criterion of real convergence with the euro area. Therefore, by resigning from its own currency, it could experience economic shocks, the greatest risk of which is the decline in competitive advantage and exports, and consequently in economic dynamics. Observing the economic problems of Spain, Portugal and Slovakia since the 2008+ crisis, one can be afraid of this.

Abstract

The purpose of this article is to answer the following questions: Does Chinese craftsmanship also have a future in the e-commerce space? How do Chinese craftsmen find their professional activity in the field of e-commerce? What issues related to Chinese crafts and e-commerce are the topics most often shown by scientific articles and the media? The research used an analysis of the literature on the subject, reports, and the works of Polish, English and Chinese journalists published on the Internet. The article describes the formation of the Chinese internet industry, which has surprised many with its dynamics and scale over the past 30 years. Chinese craftsmanship in the area of e-commerce was presented from the perspective of shaping the spirit of craftsmanship as well as changes and modern trends in the contemporary economy. This paper analyzes the profiles of the "young" generation of craftsmen, who show an openness to changes and introducing new solutions, as well as the willingness to follow the latest trends. The presented results are important for the scientific community, mainly due to the apparent lack of materials related to craftsmanship and e-commerce; as well as for groups of craftsmen planning to expand their business with activity in the e-commerce space. Research results can contribute to increasing the knowledge about the activity of craftsmen in the field of e-commerce, and exploring the information presented by the Polish, English and Chinese media.

Keywords: E-commerce, People's Republic of China, crafts, economic culture.

Introduction

Chinese craft is currently undergoing the so-called 'third wave' (Mignosa & Kotipalli 2019). This ongoing scientific discussion of craft has been reflected in papers written by: Sinikka Pöllänen (2009), Anzelika Smagina & Iveta Ludviga (2020), Daniela K. Rosner (2009), Ellya Zulaikha & Margot Brereton (2011), William M. Waite (1996), Bogna Gudowska (2020), Bill Lucas & Ellen Spencer (2016), Xenophon Zabulis et al. (2020), Oluwayemisi A. Abisuga-Oyekunle & Ian R. Fillis (2017), Qinglan Luo, Chunyan Wang, & Ying Zhao (2020), Zhu Qiandao & Yu Yan (2019). The value of craftsmanship has been appreciated mainly due to the quality of handmade goods and the consumption habits of customers. The second group of factors includes: cultivating the existing habits (this applies primarily to representatives of the older generation), paying attention to the small impact of the production activities of "an individual" on the natural environment (small-scale production often using natural materials) and a sentiment regarding tradition passed from generation to generation, promoting local practices and favouring regional demand (Zhang, Walker & Mullagh 2019, 5-6). The demand for products and services offered by craftsmen is also satisfied due to the personality traits of a trustworthy craftsman, diversified activities (including offer) and decentralized location – proximity and accessibility (Graszewicz 1973, 196-197). The benefits resulting from online sales, specifically, convenient availability in terms of location and time, favour the last of the above-mentioned elements even more. *Electronic commerce*, also known as *e-commerce* or *online commerce* is a new economic concept that has recently emerged and is becoming more and more popular with each passing year, also with regard to technical activities. Offering products and services via the Internet lowers production costs (including the use of commercial space and intermediaries, by using ready-made programs which facilitate the development of online business, etc.), and expands the market by enabling product targeting in a growing number of fields even during the COVID-19 pandemic. This method is also used to reach young customers, who have developed new consumption habits and intuitively use online resources.

Cite this Article as: Katarzyna MAZUR-KAJTA and Elzbieta KARAS" Chinese Craft In E-Commerce" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

Chinese craftsmanship, being a component of China's intangible cultural heritage and a permanent element of the economic structure (Graszewicz 1973, 179), clearly marks its presence in e-commerce, which provides new opportunities – primarily in the economy, but also in education and culture.

Research Aim

This article aims at answering the following questions:
– How does Chinese craftsmanship, associated with tradition and cultural heritage, fit into the economic concept of e-commerce?
– How do modern craftsmen in China find themselves in e-commerce?
– What issues related to Chinese craftsmanship and online commerce are discussed in Polish, English and Chinese scientific articles and media?

Material and methods

The research was based on a review of literature, reports of research institutions and articles provided by Polish, English and Chinese journalists published on the Internet. Despite the fact that craft it is not a new element of the economic structure, it has not been explored by economic researchers for years. Although technical descriptions and articles about innovative solutions are available on Internetwork, craftsmanship as a "whole" is rarely discussed. This applies to articles on both Polish and Chinese craft written in Polish, English and Chinese, which were analysed in this study. Along with the change in the attitude of the Chinese government, which now attempts to revitalise Chinese handicraft (Zhang, Walker & Mullagh, 7), some articles discussing this revival are now available on the Internet. However, these are very brief and general materials. Most frequently, these articles refer to the importance of the *spirit of craftsmanship* [工匠精神]. This category appears regardless of what specific topics are being researched. Therefore, this study is subject to a number of limitations which indicate the need for continuing research in the future.

Craftsman - A Definitional Approach

The perception of craftsmanship continues to evolve, therefore, the definitions which describe it are also changing. According to the Merriam-Webster dictionary definition, artisans are characterised as, workers involved in trade or craftsmanship, as well as skilful people, who demonstrate artistic skills (*Merriam-Webster Dictionary*). The Oxford Learner's dictionary describes craftsmanship as, having special skills in handcrafting beautiful things (*Oxford Learner's Dictionary*). Craft work also includes making products that are based on ready-made patterns and instructions (Pöllänen 2009). Anzelika Smagina and Iveta Ludviga defined craft entrepreneurship as "creating, organizing and managing a business venture that involves the use of human skills and manual labour as well as the creation of products or utility services accompanied with a certain extent of aesthetic value" (Smagina & Ludviga 2020). The definitions of craftsmen and craftsmanship also refer to the economic aspect of professional activity, e.g. running a business and performing work, which also includes investing time (Rosner 2009). Ellya Zulaikha and Margot Brereton emphasised the differences in defining the relationship between craftsmanship and manual labour (only or in some cases) and working with tools and / or machines, as well as in arts and crafts. According to these researchers, both craftsmanship and art can be associated with aesthetic values, however, they may differ in the degree of it. Craft is perceived as more decorative, richly visual and respecting the material and the process of creation. According to Howard S. Becker, it is also helpful to distinguish between artistic craftsmen and the so-called ordinary craftsmen. The first group emphasizes beauty and usability of their products, while the second group responds to the needs of customers (Zulaikha & Brereton 2011 [after:] Metcalf 1993; Zulaikha & Brereton 2011 [after:] Becker 1978). A craftsman is also described as an individual, who runs a business on one's own initiative, personally or together with family members (*PWN Encyclopedia*), most often as a micro, small or medium entrepreneur, although this may depend on the legislation of the country in which this economic activity is located.

Nowadays, the so-called "third wave of craftsmanship" becomes evident[1] (Gudowska 2020). Craftsmen sell their products both locally and more widely through online sales. The renaissance of the craft industry is connected with the digital economy and industry 4.0, which is associated with digitization and thus with the emergence of new consumption habits.

Chinese Internet Industry

The concept of online economy in China was introduced in the People's Republic of China (PRC) in the early 1990's. After 1993, the company Sohu.com [搜狐], which turned out to be the most influential provided services

related to online advertising, games and research. In 1996, the first e-commerce company specializing in business-to-business (B2B) solutions was established in China. In 1998, the Chinese Ministry of Information Industry was established, which was replaced by the Ministry of Industry and Information Technology [中华人民共和国工业和信息化部] in 2008. In 1999, the technology corporation Sina [新浪] was established. It provides such services as: social media platform Sina Weibo [新浪微博], Sina Mobile [新浪移动] – an online information portal which includes - Sina News, Sina Finance, Sina Sports, Sina Entertainment, Sina Blog and Sina.com [新浪网] offering online advertising and marketing solutions. The IT sector in China grew at a rate of 25% annually. In the years between 2000 and 2002, the IT industry faced a crisis which ended by 2003. Between 2005 and 2008 the IT sector grew by more than 40% annually. The following corporations dominated the market: Tencent [腾讯控股有限公司], Shanda [盛大互动娱乐有限公司] and Alibaba [阿里巴巴集团控股有限公司], which also includes the AliExpress sales service [全球速卖通], which is well-known in Poland (Du 2009, 1175-1178). In 2009, the Chinese Ministry of Commerce [中华人民共和国商务部] established the specification of the e-commerce model and the standards of online shopping services (Yue 2017, 3). Due to the fact that e-commerce promotes innovation and improves efficiency in production, the online sector was selected as a starting point in the process of restructuring and furthering the economic development of the PRC. Furthermore, according to some experts in China, E-commerce promotes corporate innovation, improves a company's internal organization, optimises supply chain operations and the performance of the external economic environment (Wang & Wang 2019, 3). In 2018, Alibaba was the strongest player in the B2B e-commerce. It owns Alibaba.com [阿里巴巴网], 1688.com [1688 网], Tmall.com [天猫网], Taobao.com [淘宝网] and Lazada.com [来赞达网]. In 2019, Alibaba continued to lead in the ranking of e-commerce retail sales with 55.9% share, followed by Jingdong.com [京东网] – with a 16.7% share (*China Ecommerce 2019*). As part of B2B industry, the following platforms are also active in the Chinese market: HC360.com [慧聪网] and VIP.com [唯品会网] (*E-Commerce in China,* 3-4). In terms of business-to-end customer relationships (B2C), Tmall.com, which covers more than half of the Chinese market, is followed by Jingdong.com, VIP.com, Suning.com [苏宁易购] and Pinduoduo.com [拼多多网]. China is also the largest mobile payment country in the world. Alipay, owned by Alibaba, dominates the online payment market. Alipay offers a number of convenient services which allow customers to collect a payment only after the ordered goods have been received (*E-Commerce in China,* 17-18). During her studies in the PRC, the author often bought fruit directly from wheelbarrows of visiting farmers, who replaced a price list with QR codes to be paid via WeChat Pay [微信支付] as part of Tencent. This proves not only the universal character of such solutions, but also the convenience of the service. The application allows the customers to make internal transfers, purchase tickets for events, and even occasional transfers, known in China as a *red envelope* [红包] which may be personalized (by specifying the amount assigned to a specific recipient) and randomised (with a specific total amount and number of recipients, the application randomly distributes funds, thus making symbolic transfers). In 2019, online retail sales in China generated nearly US $ 1.5 trillion, which is 1/4 of total retail sales achieved.

This has been reflected in the increasing competition in e-commerce, and thus the need to cover the costs of acquiring and maintaining customers. On average, Chinese consumers spend 44% of their time using social platforms, mainly WeChat and Sina Weibo.com microblogging [微博] – TikTok, they also watch, share and create short videos on Douyin.com [抖音短视频] and on Tencent video streaming services – Wetv.vip [腾讯视频] (Bu, Wang, Wang & Zipser 2019, 1, 3, 7, 10). It is estimated that by 2023, this continuing online activity will result in e-commerce sales accounting for 63.9% of total retail sales in China (*China Ecommerce 2019*).

Results and Discussion - E-commerce as part of Chinese crafts

China currently dominates the production of handicrafts around the world (*Global Market Assesment for Handicrafts* 2006). In the Chinese web portal *TianYanCha.com* [天眼查] under the heading *e-commerce crafts* [工匠电子商务], 328 companies are registered which provide handicraft services with share capital between 100,000 RMB [approximately US $ 14,688] and RMB 500 million [US $ 73,436,198]. However, most often customers search for these services online through e-commerce platforms – Taobao.com and Jingdong.com. There has also been a development of mobile handicraft applications for smartphones and tablets, enabling online shopping, communication, access to instructional videos and graphic tips. They include such apps as: *Do-It-Ymaourselfer* [手工客], *Funny Cut-Outs* [妙趣剪纸] designed to create traditional Chinese cut-outs, *Shicui* [拾翠] providing personalized traditional Chinese craftsmanship services, *Eastern Designers* [东家] and *Wowtao* [哇陶] devoted to ceramic modelling.

Along with online trade, e-commerce embraces other activities such as telling stories, sharing passions, conducting trainings, presenting both national/regional culture and documenting the process of creating products. As well as the use of other modern technology tools as part of embodied interaction; it can be used to enhance the learning

experience of intangible cultural heritage - by increasing understanding of cultural heritage by simulating the gestures and points of view of craftsman (Tan et al. 2019).

For example, the city of Jingdezhen [景德镇], also known as the hub of porcelain, organise online broadcasts which last several days showing the firing of ceramics. Live broadcasts attract over 3 million viewers to computer screens (*电商时代的工匠们*). It can be said that the craftsmen of the 21st century are becoming the celebrities of the Internet [网红工匠].

For example, the welder Geng Shuai [耿 帅] attracts over 3.6 million viewers by using a short video platform to showcase his inventions. Similarly, the designer of paper umbrellas Yu Wanlun [余万伦] presents the creation process and his products on the Internet (刘峣 2019). Chu Chengzhang [储诚长] uses e-commerce platforms to distribute tea, enabling the virtual planting of it. In this way, potential customers can learn about tea culture and develop an interest in drinking tea (王磊 2015). These types of activities are financially significant – through advertising and promotion they increase sales.

It is believed that this tendency will continue to develop. Moreover it has been estimated that live broadcasting will have an increasing impact on consumer shopping behaviours. According to the Coresight Research Report, in 2020 the Chinese e-commerce industry will focus on operations (including sales and e-customer service), using applications designed to create short films (10-20 seconds long), active online sales of previously owned goods, develop group purchases (cheaper purchases when ordering more goods), introduce mini-programs as a supplement to existing sales channels (launching additional functions within already used applications), accelerate deliveries (by modernizing the logistics infrastructure and increasing the capacity of customs warehouses), develop a data-driven C2M model (factories will become consumer-driven, which will speed up e-commerce), provide vertical e-commerce sites (sales platforms targeting specific customer groups which capable of cooperating in online community) and strengthen cross-border electronic commerce.

In some rural areas, specialized production centres have been established, focusing on traditional local crafts (*E-commerce in China. Opportunities for Asian Firms*, 16, 23). *Taobao villages* [淘宝村] are e-commerce hubs located in rural areas, such as the provinces of Zhejiang [浙江], Guandong [广东] and Jiangsu [江苏]. In 2013, there were 20 of them, and five years later – 3200 (*The "Taobao Villages" Phenomenon: How E-commerce (also) Redefines Rural Areas in China*). One example is the village of Aicun, which, through the development of e-commerce and crafts, created jobs for 800 people, increasing the annual income of its inhabitants by over 20,000 RMB (US $2992). *Taobao villages* boost the local economy, generating nearly 6.8 million jobs between June 2018 and June 2019. In 2019, 63 villages collectively generated approximately RMB 2 billion revenue (US$ 293,734,071) through online sales of handicrafts, agricultural produce and industrial goods (Wang 2019). The e-commerce market for Chinese and Indian crafts is distinguished by, among others, the fact that Chinese entities have more modern technology in the field of production and marketing (Renu & Anupama 2018).

In the Chinese articles, the issues of e-commerce and handicrafts are most often presented by referring to either the spirit of craftsmanship or handicrafts' changes and adaptation to modern trends in the contemporary economy.

Studies related to the *spirit of craftsmanship* aim at answering the question whether nowadays, in the age of globalization and broadly understood digitization, it is necessary to cultivate the *spirit of craftsmanship*. This concept not only proves the quality of services diligence, dedication and continuous improvement of a given professional group but also requires following an ethical path – maintaining high standards, gaining social respect and increasing craftsmen' social status. The spirit of craftsmanship, according to the assumptions of Chinese culture, is passed down from generation to generation, and is treated in China as a part of the humanistic wisdom for the great rejuvenation of Chinese culture (Gu 2019). This category gained particular importance in China in 2016, when Prime Minister Li Keqiang in one government report referred to fostering the spirit of craftsmanship of continuous improvement, and then, a year later this category also appeared in the reports of President Xi Jinping. The articles not only present socialist ideas, but also warn against false artisans operating online, who are defined as incompetent. According to the *Report on the Integrity of the E-Commerce Industry* [电商行业诚信度调研报告] presented in 2018, over 90% of consumers shop online, and more than half of them – 49% – have experienced unethical online behaviours. The unethical behaviours of false craftsmen manifest in deliberately suppressing a product's defects (an inability to see the goods before purchasing them), offering products that do not comply with what has been advertised, failing to meet pre-sale obligations, delays in deliveries (too long a waiting time) and unfair price manipulation. The importance of intellectual property protection is also emphasized through filing patents and promoting professional ethics. Spreading the *spirit of craftsmanship* starts in vocational schools, e.g. by

developing a university culture on campus [校园文化] (*浙江缙云县以"工匠精神"滋养学生职业教育*), as well as by its introduction during classes, among others (Luo et al., 2020):

- a serious approach to the learning of exercise - reliability study;
- working in concentration;
- working with dedication;
- persistence at work;
- evaluating the professionalism of activities;
- sense of responsibility;
- combining the science of theory with practice.

The second tendency promotes young craftsmen, who are China's new strength in supporting industrial innovation. Young craftsmen are described as more innovative, courageous, open to changes, and able to use the strength of the team and various marketing strategies in running their own profit-making activities. In order to develop such skills among the young generation of craftsmen and craft teachers, they can participate in training and competitions devoted to online craft activities. These include:

– *Bayu Craft* Competition [巴渝工匠], directed at vocational schools of the city of Chongqing, organized by the Chongqing Vocational School of Transport [重庆交通职业学院].The competition consists of three stages: decorating an online store, e-customer service and supporting the operation of the online store (*开网店 做运营"巴渝工匠"杯电子商务技能赛项开赛*);
– Competition for Vocational Schools in Hunan Province [湖南省], organized by the Hunan Department of Education [湖南省教育厅], Department of Human Resources and Social Security of Hunan Province [湖南省人力资源和社会保障厅], Provincial Cross-Border E-Commerce Association [湖南省跨境电商协会] and the Publishing House of Universities [高等教育出版社]. The competition concerns data analytics, visual marketing, marketing planning, online marketing, customer service, online store operations, product integration and teamwork (*【工匠文化节专题】2020 年高职电子商务技能竞赛我校两支代表队双双荣获一等奖*);
– Competition of Skills in *Mushroom Crafts* [菇乡工匠], targeting e-commerce people in Qingyuan County [庆元县] on tackling poverty and innovation in the development of e-commerce, organized by the Talent Group Office of the Qingyuan County Party Committee [中共庆元县委人才工作领导小组办公室].The competition includes: creating short videos, e-customer service, support activities for courier companies and e-commerce in rural areas. In addition to cash prizes, winners are awarded certificates of professional competence (*【青·关注】庆元县"菇乡工匠"技能擂台赛暨第六届农村电子商务技能比武大赛来啦！*);
– Competition for e-commerce lecturers *Putian Craftsman Cup* [莆田工匠杯], co-financed by the China International E-Trade Center [中国国际电子商务中心], the Local Government of Putian [莆田市人民政府], the Teaching Committee for Higher Education specialised in E-commerce [教育部高等学校电子商务类专业教学指导委员会] and the China Association for Continuing Engineering Education [中国继续工程教育协会] (*莆田工匠杯"第四届中国电商讲师大赛全国总决赛圆满收官*);
– Project of technical vocational videotraining [勒流街道 2020 年电子商务"视频制作"], organized by the Human Resource and Social Security Office in the Liuliu District of Foshan city [佛山市德区勒流街道人力资源和社会保障] (*勒流街道2020 年电子商务"视频制作"技术职业技能工匠班招生啦*).

Conclusion

The Chinese online industry has been growing consistently since the 1990's. It has been estimated that e-commerce sales will account for over 60% of total retail sales in China in a few years. Due to the development of information and communication technologies in the manufacturing sector, transformation towards digitization and automation has become evident (Xu, Chin & Cao 2020). This also applies to Chinese crafts. New online solutions are also used for craft services. Therefore, craftsmen use online sales platforms, become active online, create applications for mobile devices, etc., while maintaining the tradition which is inextricably linked with the essence of craftsmanship.

By offering their services through the latest communication channels, craftsmen continue to be tradition-oriented, share their passion, receive recognition (followers), and use short videos to talk about their works/products and methods of manual production. By doing so, they aim at developing and maintaining these specific interpersonal

and indirect relationships and establishing a sense of closeness and accessibility between the creator – craftsman and the final e-customer, which results in customers' interest in their work.

As part of Chinese craftsmanship, e-commerce is presented in the media mainly from the perspective of developing the *spirit of craftsmanship* – the features of an exemplary craftsman both in terms of ethics and a professional mastery, as well as the need to introduce changes and follow modern tendencies. Articles devoted to this issue are written in the spirit of political correctness. The presented profiles of young craftsmen show educated people, who gain professional experience in a plant or in industry, are open to changes and introduce new solutions, also in online sales. Owing to e-commerce, along with economic benefits, they can achieve educational and social goals and by establishing a relationship with customers from outside China they can also share knowledge about the history and culture of their country - cultural heritage.

Abstract

The continuous development of technology and the progress of Industry 4.0 have expanded the boundaries of production but also those of human relationships in a way that is distinct from everything we have experienced so far. In this sense, the paper aims to present the ontology of an IT system for selecting the most suitable candidates for specific positions in Industry 4.0, explaining the steps of conceptualizing the system. The paper starts with a section about ontology, conceptualization and brief immersion in its issues. In the following, a literature review highlights models based on ontologies, dedicated to such recruitment processes. In the third part of the paper, is presented a practical application based on testing procedures that frame as well as possible the candidates for specific jobs. The work ends with the presentation of the legal framework for the implementation of the proposed model.

Keywords: Industry 4.0, tests, skills, ontology.

Introduction

In the current context of Industry 4.0, in which employees are already selected based on specific skills, the problem arises that they can integrate into the so-called “Smart Process Era” (Sinur et al., 2013), so that they have the opportunity to communicate with smart devices in an unprecedented way. Industry 4.0 allows manufacturers to connect with each other, thus obtaining a synergistic link between the supplier, the factory, the product itself, the distributor, maintenance and after-sales service. Society needs to study the impact that digitalization has on the statuses and social roles of individuals and we can do this by studying the interactions between them as well as on each individual.

Through this paper, we intend to formalize and develop a model for skills evaluation ontology-based in the 4.0 industry. Recently, numerous ontologies have been performed in related fields, such as in the IT field, in the economic field, but we intend to make our own skills ontology especially for Industry 4.0, starting precisely from its base, namely from the process of staff recruitment and selection. One way to improve the integration process is to build the selection process by implementing methodological techniques based on the developed ontology. Such current practices represent an important step in streamlining the system for selecting and recruiting qualified staff for Industry 4.0.

Numerous studies have been conducted that have highlighted the importance of this massive digitalization and the role that the human factor plays in this "revolution." The proposed approach is an important step to improve and increase the efficiency of employees in Industry 4.0, taking into account the psychosocial environment, pursuing results on improving the quality, work efficiency, and implicitly of employees' lives, aspects then reflected in society.

Cite this Article as: Silviu Nicusor SURU, Gabriela PROSTEAN, Petra Lucia PROSTEAN and Radu Cristian TABUICA “A Model for Estimating Skills And Competencies in Industry 4.0” Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

Our proposal is a trust indicator factor that searches various information on resumes or CV'**s** and also relates them with Linkedin (Fig.1), where we can link to the professional network of the person and see their social status for a better personal evaluation, mainly after getting the person application and agreement for the use of personal data. Linkedin is a professional network where people have contact with other individuals or groups that share the same interest and that information. Linkedin users make profiles that include educational content, accolades and business. Linkedin is designed to improve users communicate with co-workers and peers, search for a job, and get business updates.

Given that the applicant's CV no longer provides enough data for him to be eligible for a testing process for recruitment, the research in this paper studies the problem of identifying additional information of a social and professional nature. In this case, it is also useful to access professional platforms such as Linkedin, where you can better study the skills, competencies and social role of the applicant.

In their paper *"A Formal Approach to Ontology-Based Semantic Match of Skills Descriptions"* the authors established an application of Ontology-Based Semantic Matchmaking in which Skills demand and supply were assembled and oriented to work in finding the best and more accurate way for a given task or project based on logical profile description that shared a common ontology. Their matching engine is based on Java servlets and their ontology is enriched of approximately 70 concepts, and they intended to expand their framework to include skills matching for the architecture of working teams (Colucci et al., 2003).

In the application *"Semantic Matchmaking for Job Recruitment: An Ontology-Based Hybrid Approach",* Maryam Fazel-Zarandi along with Mark S. Fox, presents an ontology-based approach to match job seekers and job postings alike, which uses a deductive intuitive model that can determine the match between a job seeker and a posting and can rank applicants. They focus on identifying and matching positions and individuals, propose a deductive model from which to determine the match between an individual person and a job posting, and then they determine the measure to use in order to rank the applicants (Fazel-Zarandi et al., 2009).

Also, in the paper *"An Ontology for Skill and Competency Management"***,** the authors focus on the problem of indexing human resources in a changing environment and present some motivating scenarios in which Informal Competency Questions were added for better human resource recruitment in the sense that they studied for identifying skill requirements for better performance and determining whether an individual possesses a certain skill. After that, they propose a systematic way to characterize activity performance and evaluating its quality. They also propose the subskill of to infer knowledge about many individual skills in the absence of other various data (Fazel-Zarandi et al., 2012).
The research *"Semantic Searching IT Careers Based on Ontology"* proposes an inductive searching model for the specific concepts based on a semantic annotations-based ontology, where it's used Web Ontology Language, which defines the terms of IT skill and IT education in associations with computer field knowledge (Minghwan et al., 2013).

In the paper *"DKDOnto: An Ontology to Support Software Development with Distributed Teams"*, the authors propose a knowledge base called DKDOnto, a domain-specific ontology for distributed development, aiming to help projects with a common vocabulary, allowing to assist better the distributed software development process". "The main classes of the ontology were created from the concepts used in Software Engineering, with the particularities for distributed teams", and the language OWL was used for the construction of the ontology (Rocha et al., 2018).

At the level of changes, due to the influence of increased digitalization, there are the following imperative requirements for all employees in Industry 4.0: lifelong learning, technical skills, detailed understanding of technical processes, media skills, learning programming languages, understanding cybersecurity, creativity, development of entrepreneurial thinking, solution orientation, conflict resolution, decision making, analytical and research skills, efficiency orientation, intercultural intercommunication and language skills, networking skills, ability to work in a team, interact and to cooperate, to transfer the information as well as the need for leadership skills, flexibility, desire for continuous improvement, adaptability, stress resistance, initiative, knowledge of standardization of the degree of protection in Industry 4.0 (Heklau et al., 2016)**.**

At the same time, in addition to studying the importance and development of the industry from ancient times to what is now Industry 4.0, the paper: *"Industry 4.0 for the construction Industry: Review of management perspective"* focuses on the German model and which involves the strict implementation of safety rules in any establishment (Maskuriy et al., 2019).

The paper: *"Are the leaders ready to embrace Industry 4.0?"* emphasizes the importance of training leaders in adapting and permanently assimilating the enormous information flow generated by the galloping development of Industry 4.0 (Nasir et al., 2019).

The research: *"An investigation of industry 4.0 skills requirements after making a brief immersion in what Industry 4.0 means for South Africa"*, systematizes the skills necessary for its harmonious development and proposes a conceptual model to meet the needs of adaptation to impressive technological development (Maisiri et al., 2019).

The authors of the paper: *"Industry revolution 4.0 skills and enablers in technical and vocational education and training curriculum"* propose an operational model for implementing a curriculum that incorporates the skills needed for Industry 4.0 and can make similarities with skills that are not required for this type of industry but can find a correspondent in it. It also outlines some limitations of the models found in the German literature (Amiron et al., 2019).

In the paper: *"Human Resources Readiness for Industry 4.0"*, a brief detail is made of the potential of the Czech people to adapt to Industry 4.0. Then the influence of digitalization and the Internet in society and of students seen as an important human resource is probed (Vrchota et al., 2019).

Explicit conceptual model for team building for an industry 4.0 specific project

The model goes through three steps, each including several procedures, presented below through the following case study:

Case study - Presentation of the situation

The research refers to the process of selecting the right candidates for the recruitment process, necessary for a project, which aims at production operations in the automotive industry. The essential skills of the candidates aim at competencies in the management of digitization algorithms, through the Internet of Things (IoT) and, respectively, managed with the help of the resource planning systems of the ERP type enterprise.

In general, such a project dedicated to Industry 4.0 encounters a series of unforeseen situations, which can cause delays in project completion or budget overruns, consequences that could be avoided in the case of a harmoniously formed team for a certain purpose, in which it can be triggered, synergistic action through effective communication between team members. Due to the necessary mix between the project team members presented above (analyst, developer, tester, IT engineer, beneficiary), the steps of the team formation framework model were applied for team selection and formation, as follows:

Step 1

The first step includes the conceptualization of 7 procedures, configured on topics specific to the team configuration process, through which filters are designed to select the required skills of potential members. Each procedure can be carried out by conceptualizing tests specific to the field of interest.

- **Procedure 1** contains successive tests for defining the team goals, as shown in Fig.2.

Fig. 2: Team goals defining

- **Procedure 2** contains successive tests for defining the fundamental rules, as shown in Fig.3.

Fig. 3: Defining the fundamental rules

- **Procedure 3** contains successive tests for defining how the candidate relates within the team as shown in Fig.4.

Fig. 4: „Karma" identifying for each candidate

- **Procedure 4** contains successive tests for defining ways of efficient collaboration as shown in Fig.5.

Fig. 5: Individual strategies for efficient collaboration

- **Procedure 5** contains successive tests for identifying the candidate's creative abilities as shown in Fig.6.

Fig. 6 :Creative abilities

- **Procedure 6** contains successive tests for identifying the candidate's operating style as shown in Fig.7.

Fig. 7: Operating style identification

- **Procedure 7** contains successive tests for identification of the candidate's digital skills as shown in Fig.8.

Fig. 8 : Digital skills

Step 2

The second step evaluates the results of the filters, applied through the selection procedures in step 1, for each candidate. The results of the filters will frame each possible candidate in a certain category of technical skills, time availability, respectively interpersonal skills (Fig. 9).

Our proposed model frames the completion of the first two steps in the stage called "primary selection of suitable candidates".

Fig. 9: Application of filters for the correct identification of each possible candidate

The major difference between skills and competencies is that competencies are a combination of skills plus behaviour and knowledge. On the other way, skills are specific learning activities. This we consider being important because competencies will have a higher status rank in the social point of view and it will be difficult to measure them in a formal way.

A resume or a CV is including a set of skills and competencies but there are many types of templates that are used for making them. A CV is seen like a detailed well-structured informative form about the professional experience or qualifications. The CV is mainly structured in chronological sequence and extensively point the work education, experience and achievements.

By reason of the of the document detailed nature, a CV mainly consists of minimum two pages. Moreover, contrasting a resume, a CV does not convert depending on the post for which you are registering. A resume provides an immersion of your education, work experience, and other similar information. A resume generally is no longer than a sheet of paper, and its data is mainly selected especially for the post for which you apply. For the reason that a resume is somehow customizable, it goes without to be in a chronological form or to document the entire professional experience (Amico et al., 2020).

It is desirable to formalize the experience in a curriculum but also there are some advantages and disadvantages for any form of template used. For example, the chronological curriculum, which is one of the most used, show the linear progress that was made thru years, increases of the task or of the career, promote the stability of a career, emphasized a logical order but its disadvantages are that is showing the lack of inactivity, the periods of changes of responsibilities and the lack of training or updates. Another example of a given template of the curriculum is the thematic or the functional one, which emphasized the skills, and its pros are that it is good for shadowing a period of inactivity, it shows adaptability and remove the age barrier but also have the disadvantage that recruiters can think that some information was hidden. On the other way, another type of curriculum is the combined or the mixed one, which is mixed of the first two presented above, and have the advantages that can empower skills and the experience and it shows all the periods even the inactivity and for that is not being noticed negatively, but it's a disadvantage is that it is not suitable for each position chosen.

The other type is the video CV, which is ideal for a communicative person or active ones, but its disadvantage is that because of its shortness it cannot collect much and effective information. The Euro-pass model is a widely known model of CV, and the principal advantage of it is that's formalized and standardized but the main disadvantage is that it is too strict and not so comprehensive like other types.

Step 3

The information configured and systematized for each candidate is stored in a Human Resources database, which is integrated in the conceptual model of the IT system proposed in this paper for estimating skills and competencies in Industry 4.0 (Fig. 10).

The target of the System designed for estimating skills and competencies in Industry 4.0. is to identify the correct profile of the requested candidate within a certain project, based on certain specific digital competencies and abilities, which are configured in the conceptualization module of the conceptual model in Fig.10. Within this module, the necessary characteristics for the requested candidates are extracted.

Fig. 10 presents the block diagram of our approach. Knowing these, we are going to make explicit these approaches and to establish the conceptual model that we propose for the project and that is the basis of the ontology that we will use. This ontology is made up of fundamental concepts, their properties, relationships between these concepts and particularizations for specific situations depending on the content of each project. We state that the profile of the ideal candidate is made following algorithms specific to Industry 4.0, which will help us to personalize the candidate's profile so that we can then establish his competencies. In the human resources database, we collect information about each candidate such as personal/factual data, his cognitive profile, competencies, specific abilities. We collect all this information after analyzing the CV and the Linkedin profile. Finally, after adjusting the profile through the skills filter, we will set up a database with applications for each job.

Fig. 10: Conceptual model for estimating skills and competencies in Industry 4.0

In general, the companies from Industry 4.0 approach their targets in a project vision, in which the teams are configured with employees for an indefinite period, having specific skills. There is also the possibility of employment for a determined period, so that, according to the specifics of the project, the correct profile of the necessary human resources is configured.

Taking into account the specifics of the procedures presented in this article, which integrate both psychosocial aspects and technical specifications, the proposed final model aims at a more accurate recruitment of human resources, suitable for each specific project.

To exemplify applications in Industry 4.0, we can detail the human resources with skills in intelligent systems for real-time optimization of selecting the most profitable options for production orders, taking into account the total number of orders, market price, number of machines, processing times and costs involved in the technological flow. Also, these resources must have all the necessary skills to use ERP information systems, through which the entire logistics flow can be optimized.

In conclusion, the proposed concepts and the relations between them are activated by all the procedures presented above, respectively the necessary filters, for the final decision.

The impact of European legislation on the implementation of the proposed model

Given the nature, characteristics and purpose of the presented model for skills evaluation, intended to process personal data in order to select and recruit qualified staff for Industry 4.0, it must be implemented in compliance with the provisions of the “EU General Data Protection Regulation” (GDPR or Regulation 2016/679).

The aforementioned Regulation, which entered into force in 2016 and implemented in 2018, representing the biggest change in the data protection law since 1995, establishes the obligation on operators who manage personal data of any kind, to carry out certain additional operations to protect individuals in this field, respecting in this way the specific principles introduced by the normative act.

The type of information that falls under the GDPR

By the generic name of "personal data", the legislative text refers to any information relating to a natural person likely to lead to its direct or indirect identification, whether such data are entered (in whole or in part) by automated means or are processed by other instruments that are part of a data record system or that are intended to be part of a data record system. Therefore, it is not covered by this law the anonymous information that is not related to an identified or identifiable natural person or to data of a person who is anonymized, so that the subject is not or is no longer identifiable, even if that data is used for statistical or research purposes. In other words, the principles of data protection apply only when the personal data leads to identification (of any kind) of a natural person, situation that overlaps with the one proposed by this paper.

Entities to which it is addressed

The main entities to which the stipulations of the GDPR are addressed are represented, on the one hand, by the operators who establish the purposes and means of personal data processing, and on the other hand, by the persons empowered with the responsibility of processing personal data in the name of a data operator. From a territorial point of view, the Regulation covers both operators and authorized persons established within the European Union (EU) and those established outside it, if they provide goods and services to the EU or if they monitor the behaviour of individuals in the EU.

Principles of personal data protection introduced by the GDPR

The European regulation stipulates the measures that personal data controllers must adopt, by establishing imperative principles. The presentation of this principles leads to the steps that must be taken by the personal data operator to be in accordance with the law in this field. Therefore, they must integrate the following concepts in the adopted measures, in order to comply with the law in force:

- *Responsibility*, meaning that the data controller is solely responsible for implementing appropriate measures for the protection of personal data and for the possibility of demonstrating this circumstance. This includes documenting these processes through appropriate policies and procedures, such as registries, analyzes, agreements with trading partners, documented consents, information to individuals.

- *Lawfulness, fairness and transparency*, concepts that impose the obligation to process the data of citizens of the European Union legally and correctly towards the natural person concerned. Meeting the requirements imposed by the GDPR means that the operator has to provide the necessary directions (lawfulness), performing the entire process explicitly, so that the person can understand the reasons and purposes of collecting his personal data (transparency) and last but not least, has to comply with the purpose presented to the natural person before taking over the data (fairness). It also includes the using of data only for the period indicated in advance.

- *Purpose limitation*, representing the obligation imposed on data controllers and data processors to comply with the purpose presented to natural persons at the time of data collection and data processing, without exceeding it and without using the data in other areas.

- *Data minimization*, which involves not processing data that exceeds the proposed "framework", collecting the minimum data needed.

- *Accuracy*, imposing the obligation to store always up-to-date data.

- *Integrity and confidentiality*, principles referring to the obligation of data controllers and data processors to protect by appropriate measures the data taken over by individuals, implementing efficient anonymisation or pseudonymisation systems to protect the identity of the individuals and security programs for the stored information.

Conclusions

The recruitment process for Industry 4.0 is specific to digitization skills and therefore the combination of skills and abilities for different dedicated teams, becomes a difficult process. Our proposal will be a challenge due to the socio-human involvement and the interdisciplinary approach of the recruitment mode for Industry 4.0. Of course, other researches have been undertaken in the field, but on the one hand there was no emphasis on the construction of a specific ontology to be assigned to artificial intelligence in a continuous development, and on the other hand the social environment was not surveyed. useful that a professional network such as Linkedin can provide.

For the construction of the program we will use Python language, and we conclude that will build a "dataMust" class in which to introduce an initialization function that contains the targeted skill variables. The representation function of this class will return the "dataMust" matrix that will contain the targeted skills. We also intend to build another class, which this time includes the concrete skills of the applicants.

We will call this second class "dataHave", and its representation function will return the "dataHave" matrix which will contain the actual skills of the applicants. Between these two classes we will undertake an analysis and implement the following functions: __eq__, __lt __, __ gt__, to discover the similarities and differences between them. The __eq__ (equal) function will return the similarity between the two classes, the __lt __ (less than) function will return what is missing from a class, and the __gt__ (greater than) function will return the largest class.
We also consider that if the number of skills consists of more than 10 elements it is necessary to link these elements in a decimal link and for each decimal link found after the above analysis to return a score.

Implementation of Work-life Balance in Companies of the West Pomeranian Province in Poland

Patrycja ZWIECH

University of Szczecin, Szczecin, Poland
E-mail: patrycja.zwiech@usz.edu.pl

Abstract

The purpose of this paper is to present the concept of work-life balance in the theoretical approach and research results demonstrating implementation of systemic solutions which make it easier for professionally active people to maintain a balance between their jobs and private lives and which facilitate combining various social roles to achieve satisfaction in both spheres of life in the companies of the West Pomeranian province in Poland.
The layout of the paper is dictated by the implementation of the objective. The first part introduces the subject matter of work-life balance. Then results of a research conducted among 601 employees from the West Pomeranian province in Poland are described. The research results show that about half of respondents, women slightly more frequently than men, declare that their companies implement programmes that facilitate reconciling work with a private life. At the same time, employees believe that good health, a happy family life, a good standard of living and a satisfying job are the most important factors for a successful life and if one were to sum up responses which refer to job-related factors it would turn out that a job is a factor that most determines a successful life.

Keywords: work-life balance, human capital, company, Poland.

Introduction

Negative consequences of absence of a balance between a private life and a professional life contributed to the emergence in the USA in the 1970s of the concept of a "work-life balance" (Sadowska-Snarska, 2014, pp. 33-34). At first, definitions of a lack of balance tended to focus only on the interface between work and private life (Resch, 2003), and with time this lack of balance was defined in broader terms as a harmonious interface between different life domains (Frone, 2003). Currently WLB is defined as an ability to combine work with other life dimensions, i.e. a family life, social activity, one's own development, rest and personal interests so that work does not appropriate life outside of it and non-professional life is not limited by one's work situation (Borkowska, 2011, p. 18; Sadowska-Snarska, 2014, pp. 21-46). Robak and Słocińska (2014, pp. 114-116) suggest that WLB should be understood as a continuous process of balancing work with a non-professional life. In turn Clutterbuck (2005, p. 26) defines WLB as a subjectively perceived state in which an individual manages the potential conflict between these two spheres of his life in the context of time and energy devoted to them and the sense of self-fulfilment. The work-life balance may be also defined as efficiency of the relation between work and private life or as systemic solutions which enable professionally active people to maintain a balance between their jobs and a private life and help in combining various social roles so as to achieve satisfaction in both life spheres. To sum up, WLB is defined in various ways and different authors refer in their definitions to: the ability to combine, the efficiency of the relation, a process, a state or to systemic solutions implemented by organizations.

At the same time, we need to define what is meant when we talk about "balance". Greenhaus, Collins and Show (2003, pp. 510–531) mostly point to the time devoted to the main areas of functioning of professionally active people, i.e. work and family. Great involvement in one's work often contributes to devoting maximum time to it, often to the detriment of other significant values, which makes the entire life style to adapt to the requirements of the job. In turn, Greenhaus, Collins and Show (2003) believe that WLB should refer to three different balances:

- time balance
- involvement balance
- satisfaction balance (equal satisfaction with work and family)

Cite this Article as: Patrycja ZWIECH "Implementation of Work-life Balance in Companies of the West Pomeranian Province in Poland" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

Kisil (2018) points out that we should consider an individual's resources of time, energy, thoughts and emotions which are difficult to divide into separate parts between work and private life as they are used in both these spheres.

It is also pointed out that the concept of balance may be inadequate and a different one should be suggested in its place – the concept of work and personal life *integration* or *interaction* (Warhurst, Eikhof, Haunschild, 2008). The term work-life *balance* implies that work and life are distinct spheres and that time should be split "equally" between work and private life. Rapoport, Bailyn, Fletcher et.al (2002) point out that people may have differing priorities in that regard, and that the aim is not always an even balance between the two. Apart from this, Campbell Clark (2000, p. 748) notes that not everyone wants to integrate the domains of work and family/personal life. On the contrary, some people balance their work and personal life by keeping the two strictly separate.

In this paper the author assumes that WLB does not mean an "equal" division of time, involvement and satisfaction between work and other activities, and similarly, the amount of time allocated to certain activities and their frequency does not constitute the importance of these activities to an individual. This results from subjectivism in the assessment of a relation between work and private life, which is a result i.a. of the individual's system of values, his family situation, job type, behavioural features, age, gender, health, social culture, socialisation and the company's organizational culture. WLB should, in turn, mean an optimal division for the individual.

The purpose of this paper is to present the concept of work-life balance in the theoretical approach and research results demonstrating implementation of system solutions which make it easier for professionally active people to maintain a balance between their jobs and private lives and facilitate combining various social roles to achieve satisfaction in both spheres of life in the companies of the West Pomeranian province in Poland.

The issue of reconciling work with private life – current knowledge

WLB is usually analysed in the context of a conflict between various requirements relating to involvement in one's work and playing other important life roles. There is a large body of literature examining the predictors and outcomes of work-family conflict based on the definition given by Greenhaus and Beutell (1985, p. 77). They defined WLB as "a form of interrole conflict in which the role pressures from the work and family domains are mutually incompatible in some respect". This definition stresses the bidirectional relationship. This conflict is understood on the one hand as work appropriating private life in a situation where non-professional life is carried out to the detriment of work (Borkowska, 2004, p. 54, Clutterbuck, 2005, p. 26). On the other hand, this conflict may be also understood in a contrary way, when private life appropriates work life. Family can interfere with work and work can interfere with private life. Recently, work-family enrichment and work-life facilitation concepts have stressed positive interdependencies, noting that work can also benefit private life and vice versa (Greenhaus, Powell, 2006; Grzywacz, Marks, 2000).

In the context of the theory of conflict, a balance between a professional and private life is defined as a state in which an individual manages the potential conflict between various demands on his time and energy so that his desire for well-being and satisfaction is met (Campbell Clark, 2000, pp. 747–770). Thus, an individual perceives WLB as a satisfactory state with a possibly minimal parallel conflict of roles.

The consequences of distorting the balance between family and professional life may be approached both in a broad social perspective and in an individual perspective (Borkowska, 2003, p. 15). The effects of lack of work-life-balance include i.a. burnout, diminished well-being, physical ailments, mental ailments, health issues, lack of satisfaction from work or life, stress, growing frustration, low self-esteem, family conflicts and problems with fulfilling family roles, divorce or addiction. The outcomes affecting an individual entail consequences to companies, such as diminished work effectiveness, fluctuation, disorganisation of work, increased backlog, missed deadlines, sickness-related absences, increased operational costs or deteriorated atmosphere at work. They also cause consequences to the state and society: they lead to declining birth rates, increase social inequalities, lead to family dysfunctions, cause a breakdown of social bonds, increase the health care system's burden with new patients suffering from heart issues, oncological diseases and neurological conditions or increase work-related passivity.

Integration of company goals with employee goals is the basis of effective company operation. Thanks to this, all actions which facilitate reconciliation of private and professional life of staff contribute to a greater efficiency of the company. Activities for work-life balance are, therefore, a manifestation of investing in human capital and at the same time contribute to increasing the company's competitive leverage. Usually these activities concern five areas (Cascio, 2001, p. 180):

- assisting an employee in looking after their children (including also increased access to child care places and dependent persons' facilities),
- flexible working conditions,

- occasional days off at the request of an employee,
- information services in terms of e.g. health, law, culture,
- ensuring broadly understood help and assistance for employees in non-professional spheres.

But one can also add to them preventing professional qualifications from getting outdated while being absent from work due to family obligations and promotion of male employees' greater involvement in family obligations.

When analysing detailed work-life balance tools, one can note that a great majority of them also act as a motivational stimuli intended to influence employees (e.g. admission to cultural or sporting facilities, organizing events for special occasions, vouchers that help employees financially or health care packages). Whereas supporting employees in reconciliation of professional and parental roles is far less frequent – here examples may include contributing to the costs of holidays for children, flexibility of work time, remote work, contributing to childcare costs, in-house nurseries, additional days off for families with children, longer maternal or parental leaves financed by employers. These tools also build an appropriate atmosphere at work, inspire creativity, attract valuable persons to work and build the company's reputation as an employer.

The WLB problem is an issue studied in many countries due to numerous consequences not only for the individual, but also companies and entire societies. Results of research carried out last year demonstrate that companies which offer WLB activities note cases of burnout and stress among their employees less often (Cascio, 2001, s. 192), which has a positive impact on work efficiency. Therefore, it can be concluded that creating an offer for the professional work-family life balance may contribute to building the company's competitive advantage. An employee's involvement in a professional career and family life at the same time leads to great tensions – especially in specific periods of life. Such a moment may include having to get more involved in family roles (looking after one's children, caring for dependent persons, caring for one's parents) in the course of a professional career at a time when an employee also steps into a particularly demanding stage due to an opportunity of promotion and taking up new responsibilities, which automatically entails increased involvement in the work role.

Research concerning WLB has also been carried out in Poland. A basic conclusion can be made on its basis that the issue of reconciling work and non-work life is not the strongest side of Polish companies.

A study carried out as part of the 6th edition of the Human Resources Management Leader competition organised by IPISS in 2006 shows that only 36.4% of organizations treat WLB as an element of the company's official policy, and 50% of them treat it as the employee's individual issue (Urbaniak, Bohdziewicz, 2006, p. 134; Buchelt, Jupowicz, 2008, pp. 154-155). The research repeated in 2008 as part of the 9th edition of the competition showed that 44% of organizations treat WLB as an element of the company's official policy while 56% as the employee's individual concern (Urbaniak, Bohdziewicz, 2008). Whereas research conducted in May 2006 by the Department of Labour and Social Policy of the University of Łódź concerning female employees shows much worse results. Only 14.5% respondents declared that they always or quite often saw manifestations of protection of the work-life balance from their companies, while close to 2/5 had never experienced this (Feliniak, Ratajczyk, 2008, p. 237). At the same time, this research showed that the larger the company, the less interested it was in problems of reconciling professional responsibilities with non-work life (Feliniak, Ratajczyk, 2008, p. 239).

Research carried out at the end of 2018 by Hays Poland shows that 38% of employees of large companies believe that the work-life balance is maintained at an average, bad or very bad level. At the same time, the said research shows that being able to maintain a healthy balance between work and private life is, from the point of view of the individual, one of the main reasons for considering changing jobs, and from the point of view of employers it is one of the elements which help the organization in attracting new talents (Hays, Mind&Soul Center, p. 4). Research carried out at the same time by Mind & Soul Center in cooperation with Mobile Institute demonstrates that 52% of respondents declare that their private life is subordinated to their work life, 50% declare that they work over 40 hours a week, 46% of companies contact their employees outside office hours, while 34% of respondents work after hours because the employer makes them (Hays, Mind&Soul Center, p. 7).

The most recent research conducted by the Responsible Business Forum at the turn of 2019 and 2020 entitled "Professional work and fulfilment of care-related roles by women and men in Poland" showed that employers in a vast majority meet employees' expectations offering them various solutions that encourage reconciliation of work and care-related roles. As many as 80% of employees who are also carers declared this. Employers offer on average 2-3 such opportunities (Baszun, Zamęcki, Joniewicz, 2020, p. 13). A detailed analysis showed that solutions most often offered by companies include being allowed to leave work upon request during the day for a short while with the possibility of covering this absence by using one's leave (36% employers), flexible working hours (22%), part-time employment (19%), working from home (16%), not reducing bonus due to taken leave, including sick leave (15%), banning overtime for parents of children under 4 (15%) and no shift work for persons with care-related responsibilities (13%). Opportunities such as: in-house nurseries or a nurse hired by the company to visit adults in

care of the company's employees were only applied by 3% of employers. Paying towards nurseries was applied by 6% of employers, payment towards care-related services - 5% (Baszun, Zamęcki, Joniewicz, 2020, p. 14).

Research Methodology

This study presents results of a survey of human resources management systems in companies of the West Pomeranian province carried out in the Institute of Human Capital Management of the University of Szczecin on a sample of 601 employees of the investigated companies (primary sources; for the adopted significance level (0.05) and admissible maximum error of estimation (+/- 4%) it was established that 598 units were the minimum sample to ensure reliability of research).

The research was carried out in the period between March and May 2017, and the territorial scope covered the West Pomeranian province in Poland. Employees in the companies were the research population. An individual company employee was the sample unit where the questionnaire could reach many employees in individual companies. Data from sample units qualified to the sample was gathered by means of a questionnaire consisting of 78 questions, including 10 in the bio data segment. A random sample unit selection method was applied. In the analyses of differentiation of declarations in selected groups of respondents, four categories of differentiation were identified for the needs of this study: company size, gender, position in the company and length of service. This study uses respondents' answers to 2 questions from the questionnaire addressing the investigated matter. Out of the factors deemed most necessary for a successful life 10 were selected for in-depth analysis: good health (X1), happy family (X2), good standard of living (X3), satisfying job (X4), respect among people (X5), a lot of free time (X6), education (X7), managerial position (X8), acting in accordance with religious teachings (X9) and political activity (X10).

Reconciling work with private life – Research Results

The investigated population were asked what in their opinion was most necessary for a successful life. A respondent could mark a maximum of 3 options. Table 1 presents the data in a general approach and in groups of respondents identified according to the company size criterion and the position held, length of service and gender.

Table 1: Factors declared by respondents as most necessary for a successful life in general and in groups of entities distinguished due to size and in groups of respondents according to their position, length of service and gender (in %)

	good health	**happy family**	**good standard of living**	**satisfying job**	**respect among people**	**a lot of free time**	**education**	**managerial position**	**acting in accordance with religious teachings**	**political activity**

Source: author's own compilation on the basis of research results.

Good health (26.6%), a happy family (24.8%) and a good standard of living (20.7%) were factors that respondents thought to be the most important for a successful life. If the responses pointing to good working conditions and a satisfying job were to be summed up, it would turn out that work is a factor that most determines a successful life. The other end of the summary (in a general approach) would include political activity (0.4%), acting in accordance with religious teachings (0.7%) and a managerial position (0.9%).

The same order was preferred by respondents identified due to the company size criterion, where it needs to be noted that those from micro- and large enterprises valued a good standard of living slightly more that those working in small or medium-sized enterprises.

When analysing the responses in correlation to one's position, we can see that for people in highest positions the "respect among people" element is much more important than for other groups, while a "good standard of living" is statistically less important for them. Most probably this results from the fact that their needs of economic security (the sense of financial stability, securing income in the event of sickness or loss of income from the current job, having savings, insurance) are secured to a much greater degree than in other groups. According to A. Maslow's hierarchy of needs human behaviour is motivated by two principles: deficiency and growth. The first one assumes that man strives to satisfy an unsatisfied need and for people in higher positions the need of security is usually satisfied. Thus greater focus is given to the need for respect, desire to have good reputation and appreciation among other people.

Taking into account the length of service as the differentiating criterion, it needs to be concluded that employees with a shorter time of service overall more often point to the importance of the "a lot of free time" factor than other employee groups. Greater weight attributed to education is also noteworthy. In turn, employees with the length of service of over 10 years pointed to respect among people much more often than other groups.

The respondents' gender was the only factor that statistically differentiated their declarations. Good health, a happy family and a good standard of living were factors that both men and women thought to be the most important for a successful life. However, if we look at it closely it turns out that declarations of both genders differed significantly. Both a happy family and a good standard of living were statistically more often declared by women than men. The difference for a good standard of living reaches 5.4 p.p., while for a happy family - 2.6 p.p. At the same time, men statistically more often than women pointed to "a lot of free time" and "education". Political activity, acting in accordance with religious teachings and a managerial position were at the opposite end of the summary, though the order was different for both genders. As the research has shown, women found the following to be the least important: acting in accordance with religious teachings (0.3%), political activity (0.5%) and a managerial position (0.7%), while for men they were: political activity (0.3%), a managerial position (1.5%) and acting in accordance with religious teachings (2%). The resulting differences concerned women's and men's attitudes to acting in accordance with religious teachings and the managerial position factor. What is interesting, men needed acting in accordance with religious teachings more than women to have a successful life.

In addition, the research focused on whether companies are trying to solve problems of reconciling work and private life by offering organizational solutions such as programmes facilitating the issue in question. Table 2 presents the structure of respondents' answers to the question whether their companies implement programmes facilitating reconciliation of work with private life. None of the criteria differentiating respondents' declarations proved statistically significant.

Table 2: Structure of respondents' answers to the question whether their companies implement programmes facilitating reconciliation of work with private life in general and in groups of entities distinguished due to size and in groups of respondents according to their position, length of service and gender (in %)

Source: author's own compilation on the basis of research results.

About half of respondents declared that their companies implement programmes that facilitate reconciliation of work with private life, with women pointing to it marginally more frequently than men (52.2% and 48.5%, respectively). Implementation of such programmes was also statistically more often pointed to by employees of micro-enterprises, lower-level managers and employees with a length of service between 0.5 to 1 year.

Conclusion

Contemporary economic and social changes result in increased problems and challenges associated with striving to shape appropriate relations between work and non-work life, including harmony between time and involvement devoted to the main spheres of functioning of professionally active people, that is work and family, giving the individual specific satisfaction from roles they play. The research conducted in Polish companies shows that activities undertaken by employers for mitigating the work-life conflict only do so for selected problems. Employees believed that good health, a happy family life, a good standard of living and a satisfying job are the most important factors to have a successful life and if one were to sum up responses which point to a good standard of living and a satisfying job, it would turn out that a job is a factor that most determines a successful life. At the same time, the research showed that only half of employees declared that their companies implement programmes facilitating reconciliation of work with private life.

Combining work with care-related responsibilities is a common thing among Polish employees, both male and female, therefore the employer's implementation of activities that support these persons in combining such roles is necessary. Meeting their expectations may prevent withdrawal from the labour market of people that are valuable to employers and may reduce employees' stress which inevitably translates into work efficiency.

Data Mining in Logistics – choice or challenge?

Krzysztof WOJTKOWIAK

Nicolaus Copernicus University in Torun, Faculty of Economic Sciences and Management, Poland
k.wojtkowiak@umk.pl, ORCID: 0000-0003-3295-3271

Abstract

The article is focused on the identification of data mining logistics processes and describing them. The development of digital technologies such as Web 2.0, Internet of Things, and Industry 4.0 (Govindan, Cheng, Mishra, Shukla, 2018) resulted in data mining gaining more attention nowadays. The article indicates theoretical aspects of data mining and relates to numerous examples of data mining usage in logistics (especially in transport and supply chain management) described in literature and papers. Logistics, as a data-driven branch of science (Lekić, Rogić, Boldizsar, Zoldy, Torok, 2019) can significantly benefit from introducing operations on large datasets. The main aim of the article is to identify examples of logistics operations that were possible to introduce because of the data mining application and therefore, synthesize theoretical, conceptual, and empirical literature in which data mining procedures are used as logistics tools, from the general to the specific. The set goal is accompanied by the following research questions: What are the potential challenges in using more data mining operations in logistics? The systematic literature review method was used to identify the literature on data mining in logistics. The research was carried out following the methodology described in the publication of Tranfield, D., Denyer, D., Smart, P., Towards a Methodology for Developing Evidence-Informed Management Knowledge by Means of Systematic Review, 2003, British Journal of Management 14(3), pp. 207-222. The author conducted research in 3 stages, i.e. defining the plan of the literature review and main aim of the research, selecting publications, and analysing the content. Full-text foreign databases such as Springer Nature Journals, Web of Science were analyzed. The author concluded the article by developing a summary of examples described and suggesting the possible direction of future research.

Keywords: data mining, logistics, big data

Introduction

The rapid development of digital technologies enables collecting and accumulating data at a dramatic pace which results in the growth of huge databases which are called Big Data. It is worth mentioning that this term also describes computing strategies and technologies developed in order to handle such databases. The dataset is considered large when the data included in it is too large to process by traditional tools or a single computer (Lekić, Rogić, Boldizsar, Zoldy, Torok, 2019). This phenomenon of data growth is visible in all areas of human presence. From well-known examples such as shops transaction data, telephone calls details, credit card usage records (due to the dynamic growth of the cashless payments (Polasik, Jakubowska, 2018) to the more exotic ones like medical records or images of astronomical bodies (Hand, Mannila, Smyth, 2001). Creating the possibility to extract previously unknown and potentially useful patterns from these huge databases was the reason why the idea of data mining was born (Hussan, Sayal, Raju, 2019). Nowadays, it is a very active research area and there are actions to bring data mining, statistical analysis, and artificial intelligence together to address some of the issues (Bhojani, Bhatt, 2016). However, before one is able to present the results of the data mining process, several conditions must be met. Firstly, one has to make sure that input data is complete (there are no blanks), secondly one has to choose the best calculating method for each case. The last condition that has to be met is checking the visualization for mistakes and eliminating them (Wojtkowiak, 2020). Big data has become a very important trend in logistics, as the optimization of service properties like delivery times, resource utilization, load placement, or warehouse management are continuous challenges in this science field. The results of optimization are dependant on quality, accuracy, and availability of information. Access to such information is the condition of effective cooperation between members of the supply chain. Another important advantage of using data mining methods is that it provides insight into the global flow of goods that is serviced by logistics operators which enhances analysis of customer experience. Logistics is naturally associated with collecting and storing large sets of data, for example, origin, destination, size, and content of shipments. With data mining techniques, we are able to discover new values. To underline the potential of introducing more data mining into

logistics, it is worth adding that only a part of logistics, transportation, consumed 60% of oil worldwide in 2011 and the number is increasing (Paul, Saravanan, Thangaiah, 2011). Logistics is also going through an important strategic shift – from product-related to information related services (Mehmood, Graham, 2015), which requires modern information technologies to be fully effective.

Methodology

For the systematic literature review, the author chose the procedure proposed by D. Tranfield, D. Denyer, and P. Smart (Tranfield, Denyer, Smart, 2003), who divide the methodology into three stages. During the first stage, the author defined a detailed plan of the literature review, established the aim of the research conducted and research questions. The next stage consisted of choosing basic literature, selecting publications for analysis, and creating the publication database. The last stage (bibliometric analysis), which included analysis of the number of publications and quotations, was carried out using search engine tools in the following full-text databases: Springer (Citations.Springer.com) and scholar.google.com. Additionally, databases such as academia.edu and reserachgate.net were used for obtaining access to more sources. For analysis, the author picked 21 sources (both foreign and Polish books and papers) which are presented in the "references" section. The last (third stage) is the presentation of the results of the review.

Data mining in Logistics – a theoretical framework

The author decided to split a theoretical framework about the usage of big data and data mining in logistics into several paragraphs as it is such a large field to discover, beginning from general applications, to detailed usage in supply chain management, transport (cargo and costs reduction), costs optimization, warehousing, production civil services, CRM and e-commerce.

In the research conducted by Mikavica, Kostić-Ljubisavljević, and Radonjić-Dogatović (2015) the authors mention the increasing possibility of improving operational efficiency, customer experience, and creating new business models, through properly-implemented big data analytics. However, several key conditions have to be met in order to fully use the huge potential of big data analytics. The first one being match big data projects with corresponding business functions, the second one is determining whether this way of conducting analysis would provide information that is not available through traditional analytics. Moreover, it requires a cooperative team of business and technology experts.

In the previous paper (Wojtkowiak, 2020), the author indicates numerous examples of data mining benefits for DHL which is the world's leading logistics company, employing 380,000 people in over 220 countries. The company is said to deliver 1,588,000,000 parcels per year, as of 2019. The author synthesized real-life examples of data mining procedures from the company's report "Big Data in Logistics: a DHL perspective on how to move beyond the hype". The main reason behind introducing Big Data mentioned in the report is optimizing the last-mile, which is the final stage in the supply chain and it is connected with the majority of the cost. The company utilizes 2 different approaches to this process. The first one is to process a massive stream of information to maximize the performance of a conventional delivery fleet and is achieved by real-time optimization of delivery routes. The second approach utilizes data processing to control the new last-mile delivery model which allows for the replacement of a highly optimized workforce with just the raw capacity of a huge crowd of randomly moving people. Besides the mentioned processes, Big Data enables solving travelling salesman problem, which is strongly connected to every cargo transporting action, by providing correlated streams of real-time events for combinatorial optimization procedures which allow to re-route vehicles on the go by updating onboard navigation systems. In the case of DHL, Big Data may also be a suitable way of utilizing the data provided by other participants of the road network such as taxi drivers or commuters. Increasing the number of such associates allows taking the load off the delivery fleet. However, it still has to be incentivized. This process will require extensive data processing capabilities, answered by big data techniques like geocorrelation or complex event processing. DHL also uses data mining techniques in optimizing utilization of resources (to improve the reliability of planning and the level of detail), strategic network planning (by gathering more information for creating scenario modelling techniques and advanced regression), improving and perfecting the customer service and CRM systems performance (by identification of the most valuable customers by clustering, semantic text analytics, and natural-language processing). Small and medium enterprises can also benefit from DHL's use of big data by utilizing the extracted data which would not be possible otherwise, because of the lacking capacity to conduct their own research. What is more, they could use DHL Address Manager, the software that uses daily freight, express, and parcel delivery data to verify addresses which may not seem like an issue in industrialized nations but it is a noticeable problem in developing countries. All aforementioned examples come only from one enterprise which perfectly sums up the versatility of big data and data mining techniques.

Another example of using data mining analytics in transport is presented by Paul, Saravanan, and Thangaiah (2011). The authors conduct the clustering-based experiment which leads to the conclusions that some of the shipments researched are handled as air freight (because of the high total distance of 3,000 miles, relatively short travel time of 24 hours, latitude and longitude values). Similar analyses are applied to characterize the remaining clusters which enable indicating the distinctive features of shipments.

Data mining methods are used in the study conducted by Nohuddin, Zainol, Lee, Nordin, and Yusoff in the beginning stage in the attempt of developing a methodology for knowledge acquisition from an input source culminating in a knowledge base for the development of intelligent systems. In the presented case study of Malaysian Army logistics, the authors use frequent pattern mining and association rule mining to discover that, for example, ordnance items are the frequent items that have been distributed between January and December (during the time of the research).

Big data and data mining in logistics can also be used for setting up the rank values in comparisons. In the study conducted by Grochowski and Zwierzchowski (2015), data mining allows for scattering analysis of key factors of the market competing in researched enterprises. The most important factors are identified as quality and brand of the product, level of costs of the enterprise, adjusting the offer to demand. These are the factors that were pointed out in more than 50% of the answers. Then, the analysis of scattering is conducted to identify that dominating in quality and brand of the product is enough to maintain the market advantage, as it has 76,03% value in the analysis of scatter. The authors add that such methods can be used in solving other business problems.

The study conducted by Lekić, Rogić, Boldizsar, Zoldy, Torok (2019) includes very interesting observations on the topic. The authors analyse business information provided by the warehouse about how many shipments were made, to which countries and cities. Date, time, volume, and weight were recorded and stored in an Excel spreadsheet. Through the data mining, the authors were able to present the following conclusions (about the studied case), concerning quantity: the company needs less time to prepare for smaller quantities, most of the quantities came to the warehouse in January and August (in the researched period of time from March 5, 2018, to June 7, 2019.). Through analysis of data connected to the volume of shipments, the authors come to the conclusion that springtime was the time when the most significant value of volume comes to the warehouse. Finally, they discover that the most significant value of weight comes at the same time as volume, in spring. Such a conclusion may greatly contribute to the overall efficiency of the warehouse, for example, by using such data in planning space for future shipments.

In their study, Mojaveri, Mousavi, Heydar, and Aminian (2009) compare some machine learning techniques and support vector machines with traditional methods in forecasting demand in the supply chain of an Iranian automobile components supplier company, a time-series with the trend and seasonal patterns, in the attempt to reduce the bullwhip effect. Before creating the forecast, the data that affect customer demand was identified by cluster analysis. During the second part of the research, the effectiveness of an artificial neural network with three layers and three middle units and support vector machines is compared to moving average, exponential smoothing, and exponential smoothing with the trend (traditional methods). Results show that an artificial neural network can forecast precisely better than other methods. It proves that, when given extra time and resources, big data methods can prove more valuable than the traditional counterpart.

Mehmood and Graham (2015) extend the usage of the Markov logistics model to present the integration of big data and smart cities in the health-care transport sharing aspect. Their model is designed to illustrate how sharing transport load (and capacity) in a smart city can improve efficiencies in meeting the demand for city services. Conducted research proves that using large scale databases is more effective to replicate the perspective of city-network rather than using individual health care transport schemes, which may lead to inefficiency. The research is said to be carried on in the near future.

Several high-quality examples of using data mining in warehouse logistics are given by Reining, Bousbiba, Jungen and ten Hompel (2017). They mention the paper that present approach to improve the efficiency of order picking systems by finding associations between orders. The associations are the basis for heuristics to minimize the travel distance. Another example is utilization of data mining to find relationships among customer orders. The identification of relationships helps to determine rational storage locations to minimize the picking effort. Moreover, an approach to use machine learning for predictive inbound logistics planning was presented. It facilitates the system's adaptation to future scenarios. Their approach is based on the development of a logistics information structure (ontology). Another example introduces an approach to predict the workload of order picking zones based on past data. The forecast can be used to determine the required number of employees and their assignment within the warehouse in a rational manner.

In logistics, the potential of big data and data mining is not only limited to transport or warehouse related activities. In his study Weiland (2017) identifies big data as a source of information in the e-commerce sector. The author points

out that the information is the effect of data turning into it during the course of processing. In the paper, the author implicates that the data should be considered as all forms of unstructured facts about an object or event. These unstructured facts such as results of observations, raw statistical data, or various records can become meaningful when being transformed into information. For e-commerce, this data can be obtained from sources like Social Media, mailing systems, Google Analytics, or advertising systems. It is stated that small and medium enterprises are usually not able to conduct research using data mining methods on their own (as the author mentioned in earlier cases). Such situation creates an opportunity for developing information logistics which can help SMEs to build a competitive advantage, as the author suggests. The main role of information logistics is to help the decision-making process to improve not only the company's efficiency but also the customer's satisfaction. The author signalizes the very important advantage of the data collected from the mentioned sources – it can be used for regulating the price of the product on the go. By comparing prices on price-comparison websites or applications, not only the company knows about its logistics costs but also can benchmark the price with the competition. Another strong point of using data mining and big data tools in e-commerce is learning about the clients and their preferences. Weiland, in his paper, stated that *the analysis of data acquired through such systems as CRM, Google Analytics, AdWords, and AdSense, it is possible to get a holistic perspective on the client's sphere of interests*. Such a perspective can be useful when introducing a new product, which would be adjusted basing on the customer's perspective or when the already existing product needs reworking and a destination for this process has to be found. Knowing the client's interests has another value in the process of creating a personal offer. Google analytics influences the website of the shop in a way, where the customer sees a well-suited variety of products based on his or her requirements or the previous activity on the website. For example, thanks to big data, we know that customers who bought a new graphics card may also be interested in buying a new computer monitor. It helps to create a network of associated products. The access to large datasets of transactions in e-commerce may also prove useful in locating the weakest link in the process of completing a purchase. Fixing that link would result in a decrease in failed orders and lead to better optimization.

The paper by Migut (2004) puts across the procedure of using cluster analysis (data mining tool) on the data provided by custom relationship management software (CRM). 8995 records of customers of the department store in the USA were obtained, every case included 14 variables such as income, sex, age, occupation, education, language, number of children, marital status. The analysis is conducted with the aim to identify market segments and identify the unique features of customers belonging to each segment. Because there are no starting conditions, the cluster analysis is chosen as a tool. The result of the study is as follows: the group was divided into 3 clusters, in the first one customers with average income are grouped, the second one includes the most well-off customers and the third one gathers customers with the lowest income. As the importance plot shows, the most important variables for this example process are marital status, age and the least important are sex and language.

Conducting procedures connected with big data or data mining can only be effective if the software that is used in the process fulfills the requirements of an organization. The review of software that is used to conduct big data or data mining procedures is the main aim of the paper published by Chuchro and Piórkowski (2010). The paper is focused on describing the features of the 8 applications that can be used in data mining processes. For the research, the following software, both commercial and open source has been chosen: Weka, Statistica, R, Clementine, Rattle, RapidMiner Community Edition, Matlab, MS SQL Server 2008 (Analysis Services). For testing the features of the software, the basic effectiveness data has been collected from sewage farms in Polish cities Baranów Sandomierski, Kraków, Sandomierz, Tarnobrzeg, and Warszawa Research procedure consists of 3 stages. The first one being the standardization of input data, the second one is creating the model, classification, and forecasting. For forecasting tools, an automatic neural network has been chosen (unsupervised learning). The authors conduct data mining with all aforementioned applications and identify the differences between them. For example, Rapidminer is easier to use because of the clear graphical user interface, Statistica and Clementine can import data from various file formats, Weka has large, well-written documentation. Another example of software used in the process is DBMiner, which is well-described in the paper by Han, Wang, Fu, Koperski, Chiang, Gong, Li, Lu, Rajan, Stefanovic, Xia, Zaiane (1999). The authors conduct several basic data mining procedures in the software, for example, multiple-level characterization, the discovery of discriminant rules, multiple-level association, classification. The system has been said to *provide a user-friendly, interactive data mining environment with good performance*. The authors suggest that DBMiner should be further enhanced in the field of power and efficiency of data mining in relational database systems including the improvement of system performance. In addition, integration and merge of several less interesting rules are advised. Finally, the authors recommend expanding data mining techniques available in the application to special-purpose database systems and the internet information base. It should be added that from the time of publication of the paper, DBMiner has been significantly upgraded.

The subtle variability should be carefully considered whenever choosing the optimal tool for the task. The manager of SMEe would prefer open-source software to minimize costs, when the person connected with large companies would appreciate the versatility of, for example, Statistica or R environment.

Summary, conclusions, implications, limitations

Undoubtedly, the enormous success of various logistics application areas of data mining is the main reason why it establishes itself as the major upcoming analysis tool in the future. It has shown potential for future developments, especially when datasets are growing bigger and bigger. One of the biggest direction would be web mining because of the dynamic growth of e-commerce and information logistics due to the pandemic. It would be reasonable to say that big data and data mining will remain the main focuses of research all over the world, mainly because of its versatility. Only in logistics, it is possible to find examples of the practical and theoretical uses in transport, warehousing, e-commerce, production planning, and more. The further rapid development of digital technologies allows presenting big data processes in a more approachable way, mainly through more visible GUIs and more developed documentation.

On the other hand, there are still many concerns. Maximum privacy and safety of the data must be ensured, due to the amount of data, there is still a need for better performance of software, especially in the field of optimization for older computers. This technology is still relatively new and the previously-existing software needs to be adjusted. The is also a need for better cooperation between the companies and new IT sections which will eventually conduct big data analysis which may require investments and changes in the organizational structure of an enterprise.

Undoubtedly, the mentioned issues will eventually be eliminated, because of the cost-decreasing big data potential. Nowadays the companies simply have to follow new trends if they want to survive and maintain profitability. One can conclude that now not only the amount of data is important, but how it will be used and what one can do with it. Especially when modern enterprises will compete in generating information, rather than collecting raw data.

Employment Quality in CSR: Evidence from Poland

Patrycja ZWIECH

University of Szczecin, Szczecin, Poland
E-mail: patrycja.zwiech@usz.edu.pl

Abstract

The purpose of this paper is to identify additional areas of employment quality and to present their characteristics for Poland. The layout of the paper is dictated by the implementation of the objective. The first part introduces the subject matter of employment quality. The next part describes results obtained for Poland from research focused on 4 areas of employment quality, i.e. safety in employment (including: work in hazardous conditions and accidents at work); equality in employment (including: access to employment, vertical segregation, inequalities in remuneration, wage gap, discrimination, mobbing); employment guarantees (including: type of contract, employment in temporary employment agencies and being self-employed and working for one client only) and work-life balance (including: working time and work-life balance). The presented results show that companies in Poland face a number of challenges in terms of improving employment quality.

Keywords: employment quality, human capital, CSR.

Introduction

According to the concept of corporate social responsibility (CSR), organizations do not only take economic and ecological issues into account voluntarily in their activity, but also social ones. The voluntary nature in this concept is understood as an option, not an obligation. CSR has evolved from philanthropy to informed planning of socially responsible conduct strategies. A new approach to CSR has begun to emerge in the 21st century, in which the concept of social responsibility is defined as a company's responsibility for its impact on society. This concept intends to maintain a balance between the company interest and the social interest. Company welfare cannot be contrary to social expectations. Therefore, CSR is a philosophy of conducting business activity in which the company takes into account the interest of stakeholders (Haliżak, Kuźniar, Symonides, 2004, p. 284). On the one hand, a socially responsible company is such an organization which stays open and listens to its environment (by conducting dialogue with various groups of stakeholders, that is actors which can affect the operation of the company or actors which are affected by it), and draws conclusions and takes relevant actions on the other.

Employees are one of the important groups of stakeholders. According to the CSR concept, companies must ensure good relations with employees while taking into account the fact that their involvement largely determines the survival and success of the organization. The undertaken actions should go beyond legal requirements which are only a certain minimum of building ethical relations in the company-employee line. Therefore, corporate social responsibility assumes that an entrepreneur will take into account in his activity the welfare of his own employees, having regard to social justice and absolute prohibition of infringing human dignity. Creating an atmosphere of cooperation and mutual trust at all levels of the organization in not only a management style, but also an indispensable requirement of building a learning organization and the entire knowledge-based society in the long run.

A derivative of the obligation to implement the said values in the economic activity involves caring for employment quality. Fair employment terms should be the basis of the CSR strategy of companies. According to M. Olędzki (1981, p. 26), employment quality may be defined as a social value resulting from individual, merged substantive satisfaction, determined by qualifications and predispositions to good work and achieved work results, but also material and social conditions of the work environment adapted to contemporary social standards of employment quality.

When addressing employment quality it needs to be emphasized that it refers to spheres such as quality of life, social policy or regulations relating to the labour market. Besides, employment quality is a multidimensional concept. It includes both the quality of the post (type of work, requirements it sets for an individual or quality of outcomes: products, services, activities performed) and the quality of the work environment: social, organizational

or physical. The purpose of this paper is to identify additional areas of employment quality and to present their characteristics in Poland. For analyzing the mentioned aspects for the case of Poland we used as source for data The Central Statistical Office in Poland.

Literature Review Regarding Employment Quality

Employment quality is dealt with on the international arena by i.a. the International Labour Organization, the Organisation for Economic Co-operation and Development (OECD), the European Commission, the European Foundation for the Improvement of Living and Working Conditions (Eurofund) or the United Nations, whereas in Poland by the Chief Labour Inspectorate, the National Labour Inspectorate, the Central Institute for Labour Protection, the Institute of Occupational Medicine and the Ministry of Labour and Social Policy.

The United Nations are suggesting that the following areas be taken into account as part of investigating employment quality. Safety and ethics of employment (that is in particular: safety at work, child labour and forced labour, fair treatment in employment); income and benefits from employment (income and non-wage pecuniary benefits); working time and work-life balance; security of employment and social protection; social dialogue; skills development and training; employment-related relationships and work motivation (United Nations, 2015, p. 5).

The author identifies the following basic research areas in the framework of employment quality in this study:

- safety in employment (including: work in hazardous conditions and accidents at work);
- equality in employment (including: access to employment, vertical segregation, inequalities in remuneration, wage gap, discrimination, mobbing);
- employment guarantees (including: type of contract, employment in temporary employment agencies or self-employed persons working for one client only);
- work-life balance (including: working time and work-life balance).

Safety in employment is related to health and physical safety of employees. Safe work which does not pose a risk to life or health is a basic requirement inscribed in all CSR principles, but also one resulting from provisions of the law. Evaluation of the status and monitoring of changes concerning risk factors arising in the work environment are crucial to ensuring that working conditions of employees are compatible with applicable standards. Situations of people working in hazardous conditions and accidents at work are investigated in the framework of this issue. People working in hazardous conditions may be at risk of:

- harmful factors associated with the work environment (e.g. noise, industrial dust, cancerous or fibrous substances, including carcinoges and mutagens, electromagnetic fields, vibration, hot or cold microclimate, ionizing, laser, ultraviolet, infra-red radiation);
- difficult work conditions (e.g. forced bodily posture, heavy exertion, insufficient lighting of the work station);
- mechanical factors related to operation of particularly dangerous machines.

Another issue that falls under employment quality is **equality in employment.** Equal access of individuals to employment and to adequate pay are essential elements here. In this case, the problems concern inequalities in employment and disfunctions in managing human capital. Inequalities in employment may be illustrated by:

- access to employment,
- vertical segregation,
- pay inequalities,
- pay gap,

whereas dysfunctions in managing human capital may be illustrated by:

- discrimination,
- mobbing.

Access to employment is associated with arbitrary limitations of access to certain jobs (legal regulations), characteristic profiles of candidates (e.g. their qualifications, experience, social competences, motivation for work) and a problem of equal opportunities of candidates from various groups in access to employment. In the employee selection process such situations may result from the lack of opportunity to demonstrate their skills, inadequate specification of requirements of the position (descriptions of positions drawn up wrongly, including the positions' qualifying profiles), inadequate specification of personal requirements, inadequate establishing of terms and

conditions of employment and selection criteria, and also being guided by stereotypes and discrimination. Access to employment may be illustrated by employment rates, unemployment rates and long-term unemployment rates different for individual social groups.

Vertical segregation boils down to much lower participation of specific social and economic groups among decision-makers (e.g. women, immigrants or national minorities). For various reasons, not in all jobs and not in all positions are persons from individual social groups accepted. It is easy for persons from certain groups to enter low-paid jobs which offer little opportunity for promotion, whereas many highly-paid or prestigious professions are unattainable for them or this access is very limited. In this case, employment of various groups of persons in managerial positions is examined. When investigating vertical segregation for groups of women and men one can use various indicators, such as the vertical gender segregation indicator S_{pw} or vertical gender segregation relational index RS_{pw} (Zwiech, 2013, p. 425). The vertical gender segregation indicator S_{pw} demonstrates by how much the share of women in the professional group of managers is greater (for negative values) or smaller (for positive values) than the average share of women among total employed persons. The RS_{pw}, in turn, demonstrates by how many per cent the share of women in decision-making circles is greater or smaller than the average share of women among the employed.

Inequalities in rearnings may be illustrated by comparing average monthly and hourly gross remuneration for individual groups. The pay gap, in turn, serves to compare the earnings between individual groups of persons. This indicates by how many per cent the earnings of the investigated group is different than the earnings of another social group (GUS, 2017, p. 6).

Dysfunctions in managing human capital are contrary to CSR principles in the area of human rights and employee rights. Discrimination involves violation of the principle of horizontal equality of society. This principle means identical treatment of people regardless of their characteristics and orders equal treatment of people with similar social and professional and demographical features (Zwiech, 2011, p. 17). Pursuant to Convention No. 111 of the International Labour Organization, discrimination in the labour market means "any distinction, exclusion or preference made on the basis of race, colour, sex, religion, political opinion, national extraction or social origin, which has the effect of nullifying or impairing equality of opportunity or treatment in employment or occupation". When discussing discrimination on the work grounds, it is worth identifying the following types (Zwiech, 2011, pp. 17-20):

- employment discrimination – referring to the right to the same opportunities of employment and equal criteria of selection;
- profession-related discrimination – referring to the right of choice of a profession and employment and to permanent work and equal work conditions;
- post-related discrimination – referring to the right to promotion;
- discrimination in access to training – referring to the right of access to training;
- wage discrimination – referring to the right to equal remuneration for work of the same value.

Council Directive 76/207/EEC of 1976 mentions direct and indirect discrimination. Direct discrimination involves treating somebody worse due to their characteristics, while indirect discrimination involves application of universally recognized criteria, which, however, cannot be met by a considerable social group.

Mobbing is another problem in the framework of equality in employment. Mobbing is a systematized form of mental abuse that co-workers direct at their victims. Acts of psychological violence include threats, intimidation, verbal insults (offensive remarks, using profanity, name-calling, mocking), hostile behaviour (shouting, yelling, shaking one's fist, spitting), offensive and provocative gestures, boycotting and ignoring the presence of an employee, ostentatious silence in the presence of the victim, creating and spreading rumours and false information, passive aggression (threatening body posture, hostile gaze), physical aggression towards objects and items belonging to the victim (hitting their desk, throwing objects, slamming doors), vandalism and damage to employee or company property (Chappell, Di Martino, 2006).

The third research area of employment quality is **certainty of employment.** Employment guarantees may result from CSR principles applied in the company, but in Poland they mostly result from labour law and in-house regulations between employers and trade unions. The following types of contract have weaker employment guarantees: fixed-term contracts, employment in temporary employment agencies and being self-employed and working for one client only.

Another issue of employment quality related to social responsibility of companies involves **work-life balance**. This problem has become one of the key challenges of our times. In-depth understanding of this issue requires knowledge of the social and cultural environment. Activities for work-life-balance are a manifestation of investing in human capital and at the same time allow for increasing the company's competitive leverage (Cascio, 2001, p. 180). Reconciliation of professional and family life covers three interrelated areas in terms of everyday life and social policy alike. These areas concern:

- work life and employment policy;
- work life and social policy;
- differences concerning the division of roles due to gender, gender equality and roles attributed to men and women at work and in families.

In the first area, ways to facilitate reconciliation of work and family obligations are sought. The following solutions are suggested: teleworking and mobile working, remote work (home office), flexible organization of work time, shift work, flexible working hours, tasked-based work time, part-time work, annual settlement of work time or shared work time. As part of the second area, the following are postulated: increasing access to childcare facilities (creches, nurseries) and senior-care facilities and preventing professional qualifications of parents (father, mother) from being outdated during a gap in the working time resulting from fulfilling family obligations. The following are pointed out in the framework of the third area: promoting greater involvement of men in family functions and mitigation of stress resulting from having to reconcile work and family roles.

Employment quality in Poland - research results

The first investigated area is **safety in employment.** Situation of persons who work in hazardous conditions and accidents at work are being analysed under this aspect. In 2019 82,400 companies employing 6.1 million people in Poland were investigated in terms of working conditions. 442,500 people in this group worked in hazardous conditions, which accounted for 7.3% of employees in the investigated companies (GUS, 2020b, p. 11). The indicator "number of people employed in hazardous conditions per 1,000 employed persons in the investigated population" is a significant measure informing about the scale of employment in hazardous conditions. It takes into account changes in the group of people working in hazardous conditions and in the total number of people employed in the investigated companies. The number of people working in hazardous conditions per 1,000 people employed in the researched companies was 72.9 (GUS, 2020b, p. 12).

In 2019 in Poland, 258,300 persons were exposed to risks arising from work environment, which was 4.3% of the total number of investigated employed persons (GUS, 2020b, p. 13). The risks arising from strenuous work in 2019 were the second biggest group of harmful factors affecting employed persons. In the investigated period 111,4 thousand persons worked in strenuous conditions. The smallest group were the risks associated with particularly dangerous machinery, which affected 72,900 employees (GUS, 2020b, p. 14).

Additionally it must be noted that that employees may be simultaneously exposed to several physical health risk factors in their workplace (i.e. risks arising from work environment, strenuous work or particularly dangerous machinery). Taking into account the data on people employed in hazardous conditions counted as many times as the number of risk factors these persons were exposed to, in needs to be emphasized that in 2019, the number of people working in hazardous conditions reached 532,3 thousand, most of whom were exposed to risks arising from work environment – 316,4 thousand people (59.4%), 132,4 thousand people were exposed to risks arising from strenuous work (24.9%), and 83,6 thousand people (15.7%) were exposed to particularly dangerous machinery.

Among the factors associated with work environment noise was the greatest risk, with 186,4 thousand people exposed to it. The number of employees exposed to risk factors arising from noise was close to three times more than employees exposed to risk arising from industrial dusts (50,4 thousand people). Among harmful factors arising from strenuous work, excessive physical exertion was in the majority (GUS, 2020b, pp. 15-17).

The analysis of risks arising from physical health risk factors shows that in 2019 in Poland the greatest risks occurred in mining metal ores. A high risk also marked certain branches of manufacturing. In the majority of the section, the highest ratio concerned risk factors arising from work environment; more risks factors arising from strenuous work were only noticed in the following sections: manufacturing and electricity, gas, steam and hot water supply, transportation and storage, information and communication and education (GUS, 2020b, Table 1 and Table 3).

An accident at work means a sudden incident caused by external factors resulting in injury or death which occurred in connection with work. When investigating accidents at work the accident rate is analysed. It means the number of

injured persons per 1,000 employed persons. In the first half of 2020 this rate was 1.77. 24,040 persons injured in accidents at work were reported, including 58 fatalities and 127 persons seriously injured (GUS, 2020c, pp. 1 and 4). Highest accident rates were reported in the following sections: mining and quarrying (5.34), water supply; sewerage, waste management and remediation activities (4.52), human health and social work activities (3.10), manufacturing (2.75), transportation and storage (2.20), agriculture, forestry and fishing (1.90), administrative and support service activities (1.81) and construction (1.51) (GUS, 2020c, pp. 4-5).

The second investigated area is **equality in employment.** In the framework of this area the following are investigated: access to employment, vertical segregation, inequalities in remuneration, pay gap and dysfunctions in human capital management (discrimination and mobbing).

The employment rate of people at the working age in the second quarter of 2020 in Poland was 74.1% where this rate was 69% for women and 78.6% for men. The following rates applied to individual age groups: for persons aged 15-24 it was 27.9%, for persons aged 25-34 - 80.2%, for persons aged 35-44 - 84.7%, for persons aged 45-54 - 82.3%, and for persons aged 55-59/64 - 62.5%. Among the identified age groups the highest unemployment rate, 9.5%, was reported for persons aged 15-24. Whereas the highest number of unemployed persons was observed for the 20-24 age group. The lowest intensity of unemployment was reported for university graduates, and the highest for graduates of basic vocational schools. Unemployed persons with education no higher than lower secondary looked for work for 10.1 months on average, those with basic vocational education - 9.1 months on average, secondary vocational education - 8.3 months and general secondary education - 8.2 months, while for those with tertiary education it was 6.9 months (GUS, 2020, Table 4, 3.6, 3.14). These rates looked different when broken down according to gender or nationality.

When investigating vertical segregation for groups of men and women indicators such as the vertical gender segregation indicator S_{pw} and the vertical gender segregation relational index RS_{pw} can be used (Zwiech, 2013, p. 425). For Poland, the vertical gender segregation indicator S_{pw} went up 2.8 in 2018, which means that the share of women in decision-making circles in the sphere of professional work was lower than their share in employment by 2.8 percentage points. In turn, the RS_{pw} indicator in 2018 was 5.6, which means that the share of women in decision-making circles was by 5.6% smaller than the share of women among the total employed persons. In 2010 these indicators for Poland were 4.4 and 9.2, respectively (Zwiech, 2013, pp. 425-440). At the same, investigating the structure of earnings broken down by occupations showed that in 2018 8.5% of employees (in companies in the entire national economy which employ at least 10 people) were classified in the "Public officials, senior officials and managers" group, where this rate was higher for men than for women by 1 percentage point (9.0% vs 8.1%).

Inequalities in remuneration may be illustrated by comparing average monthly and hourly gross earnings for individual groups. The average monthly total gross earnings in October 2018 was PLN 5003.78. Average earnings received by men were higher by 8.9% than the country's average (i.e. higher by PLN 443.46); women's earnings were lower by over 9.2% (i.e. lower by PLN 460.42). This, in consequence, means that average male earnings were by 19.9% (by PLN 903.88) higher than average female earnings (GUS, 2020d, p. 14). At the same time it needs to be noted that average hourly gross earnings amounted to PLN 27.79. Average hourly earnings received by men were higher by 6.0% than the average hourly gross earnings, while women's earnigns were lower by 6.7% compared to the average. Therefore, average male hourly gross earnings were higher by 13.6% (by PLN 3.53) than average female hourly gross earnings (GUS, 2020d, p. 13).

Compared to the average monthly earnings in the national economy, average monthly earnings for individual occupational groups constituted between 52.5% (for hairdressers and beauticians) and 295.6% (for managing directors and chief executives) (GUS, 2020d, p. 14). Whereas, when analysing proportions between employees of the higher level, i.e those in managerial and specialist positions, and employees of the minor and lower levels, i.e. technicians, service workers, workers who deal with elementary occupations, it may be concluded that these proportions amounted to the following for the national economy: 1.8:1; for women – 1.7:1 and for men – 2.0:1; for employees of the private sector – 2.0:1 and for employees of the public sector – 1.4:1 (GUS, 2020d, p. 18). At the same time it needs to be noticed that 66.0% of all employees received gross earnings lower than or equal to the average gross monthly earnings (i.e. ≤ PLN 5003.78). Women prevailed in this group (share of women - 53.0% , where 60.9% of men and 71.2% of women earned this much) and so did employees in the private sector (72.5%) (GUS, 2020d, p. 22).

Employees in the public sector earned on average more than private sector employees. In the public sector, average total monthly gross earnings were higher by 4.4% than in the private sector and they were 3.0% higher than the country's average (GUS, 2020d, p. 15).

The pay gap, in turn, serves to compare the earnings between individual groups of persons. This indicates by how many per cent the remuneration of the investigated group is different than remuneration of another social group (GUS, 2017, p. 6). For example, in 2018 the pay gap between women and men according to average monthly gross earnings was 16.6% and calculated on the basis of hourly earnings -12.0%. The pay gap for persons under 24 years of age compared to persons aged 65 or more was -49.9%, whereas the gap calculated for social groups examined in relation to their occupation – computed for persons working in elementary occupations compared to the public officials, senior officials and managers group was -68.7% (GUS, 2020d, p. 16).

Dysfunctions in human capital management will be illustrated by discrimination and mobbing. Most frequently quoted reasons for discrimination include gender, race, ethnic backgrounds, nationality, citizenship, religion, faith, belief, age, sexual orientation and gender identity, but they can also include personal features such as appearance, social origin and financial situation. Research commissioned by the Commissioner for Human Rights shows that 73% of people who experienced or witnessed discrimination in 2018 did not report it to any public institution while 28% of Poles do not know that discrimination is prohibited in spheres such as employment and the labour market. This may evidence high social acceptance for discriminatory behaviours and poor efficiency of legal and practical mechanisms of supporting the principle of equal treatment (RPO, 2018, p. 11).

At the same time, nationwide research in Poland shows employees' growing awareness of discrimination and mobbing. Research conducted by the Centre for Public Opinion Research (CBOS) in 2002 on mobbing demonstrates that 17% of employees in Poland were victims of harassment at a work place by superiors, and 6% of them experienced mobbing from co-workers (CBOS, 2002). Research conducted by W. Kisiel-Dorohinicki at the beginning of 2009 shows that 30% of respondents experienced mobbing in their professional work, of which 15% in the last five years, whereas research by M. Jędrzejko showed that 46% of respondents often experienced bad treatment and vulgar language from a superior, while 36% of employees noticed mobbing in their place of work (*Pracownik* …2011). Research carried out by the All-Poland Alliance of Trade Unions (OPZZ) in 2011 revealed that 43% of respondents declared mobbing in their work environment, while one third of them declared they did not experience such occurrences (OPZZ, 2011, p. 8). Different research conducted in 2014 by CBOS (2014, p. 2) showed that 17% of employees declared they were harassed by their superiors in the last five years, while 8% declared harassment by co-workers. At the same time, 24% of employees declared cases of harassment of other people by superiors in their work place, and 17% by colleagues. Another research carried out by the Faculty of Human Capital Management of the University of Szczecin on the sample of 601 employees in the period from March to May 2017 showed that 31.2% of respondents declared that they did encounter cases of mobbing at work, where this rate was slightly lower for women than for men (32% vs 29%) (Zwiech, 2019, p. 347). The most recent report of the Safe at Work Coalition (Koalicja Bezpieczni w Pracy, 2019, p. 24), referring to research conducted in July-August 2019, shows that 14% of respondents experienced mobbing multiple times, while 34% of them witnessed occurrence of it once or twice.

Despite such data, there are surprisingly few mobbing-related cases in Polish courts. For example, in 2014 the courts examined more than 14 million cases in total among which those related to mobbing amounted to 428 only, where only 10 people were awarded compensation and 8 people were awarded recompense for mobbing. In 2020-2014 2,384 mobbing-related cases were reported (Ministerstwo Sprawiedliwości, 2015, pp. 5, 7, 10 and 24). Reasons for this may be sought in the difficulty in proving mobbing and in the fact that witnesses (co-workers) refuse to testify in fear of losing their jobs.

The third research area of employment quality is **certainty of employment.** The following types of contracts have weaker employment guarantees: fixed-term contracts, employment in temporary employment agencies and being self-employed and working for one client only.

A fixed-term employment contract carries lesser employment guarantees than a permanent employment contract (due to limiting the period of employment and a shorter notice period). In the second quarter of 2017 21.4% of employees in Poland worked under such a contract type, where in the 15-24 age group it was as many as 61.3% and in the 25-34 age group – 29.1% (GUS, 2017, p. 17).

Limited employment guarantees also concern people employed by temporary work agencies. Such a form of employment applied to approximately 100 thousand people in Poland. Taking into account the age of the employee, the greatest share of temporary workers is reported for people under the age of 25.

Being self-employed and working for one client only, where the employee conducts an economic activity not on their own initiative but because they are forced to work in such a form and such a form is preferred by the mandator (usually due to lower employment costs) gives smaller or zero guarantees of employment. Being self-employed and working for one client only concerned 7.8% of all self-employed persons in Poland which do not have employees

(8% of women and 7.7% of men). There are many more such persons who come from cities than from villages (11.4% vs 5.2%)(GUS, 2017, p. 18).

When analysing another area of employment quality – **work-life balance** – it needs to be noticed that in Poland women are part of a group most affected by the lack of balance between work and family life. Traditional perception of roles of men and women in a family makes the burden of family obligation rest mainly with women, which in effect contributes to their unfavourable position in the labour market compared to men. This is evidenced by lower employment rates among women, higher unemployment and economic inactivity rates. The employment rate for persons in the working age (18-59/64) in the second quarter of 2020 was 69% for women and 78.6% for men. Unemployment rates for women and men were comparable (3.3% vs 3.2%) (GUS, 2020, Table 1.3). Whereas when analysing the population of economically inactive people, it may be observed that in the second quarter of 2020 their population was 13,471,000 and in the scale of the year a significant increase of these numbers among women in this group was noted, i.e. by 195,000 (that is by 2.4%) and a drop by 23,000 (i.e. by -0.5%) among men. The changes described above have contributed to the depth of the disproportions between people not economically active broken down by gender. In the second quarter of 2020 women accounted for 62.1% of economically inactive people. At the same time it needs to be noticed that the most frequent reasons for this inactivity were: family responsibilities (34.1%), education and training (25.0%) and illness and disability (23.4%) (GUS, 2020, p.11).

Combining work obligations and family life requires relevant management of time devoted to professional work, domestic work and rest. An average weekly working time in Poland is 40.3 hours (41.9 hrs for men and 38.5 hrs for women). 5.3% of women and 17.6% of men work professionally more than 50 hours a week. At the same time women more often than men worked part time, though not on their own initiative (2.3% vs 0.9%) (GUS, 2017, p.11).

Women devote more than four hours a day to domestic work, while men more than two hours. Thus, 125,000 men and 725,000 women point to family and household responsibilities as a reason for being economically inactive (GUS, 2020, Table 4.4). Family responsibilities were the reason for 8.6% of economically inactive men resigning from work and for as many as 33.4% of women. The different distribution of burden relating to professional and domestic work between the two sexes in Poland results from tradition, social and cultural norms and stereotypes.

Conclusion

CSR is a dynamic process that inspires creativity in companies, which is manifested in innovative solutions which satisfy society's needs. Caring to ensure employment quality may be treated as part of more broadly understood corporate social responsibility.

4 areas were analysed in the framework of assessment of employment quality in Poland. First off, when analysing safety in employment the situation of persons who work in hazardous conditions and accidents at work were analysed. 7.3% of employed persons worked in hazardous conditions, of whom most cases involved risk factors arising from the work environment and risk factors arising from strenuous work. Among the risk factors arising from the work environment the greatest risk factor was noise, whereas among the risk factors arising from strenuous work, excessive physical exertion prevailed. When investigating accidents at work, the accident rate was analysed which was lowest in the following sections: mining and quarrying, water supply, sewerage, waste management and remediation activities and human health and social work activities.

The second investigated area was equality in employment. In the framework of this area the following were investigated: access to employment, vertical segregation, inequalities in remuneration, pay gap and dysfunctions in human capital management (discrimination and mobbing). Access to employment was determined by age, gender and education which was demonstrated by the employment rate and the unemployment rate. Vertical segregation demonstrates women's worse position in the labour market as shown in the vertical gender segregation indicator and the vertical gender segregation relational indicator and the different share of men and women in the occupational group receiving highest earnings, i.e. the public officials, senior officials and managers group. Inequalities in earnings and the pay gap revealed the worse position of women, young persons and persons working in the private sector. In turn, dysfunctions in human capital management were illustrated by discrimination and mobbing. The research showed that more than 70% of persons who experienced or witnessed discrimination did not report this fact to any public institution and at the same time 30% of respondents declared that they did encounter incidents of mobbing in their work place.

As part of the analysis of the third area it was revealed that groups most at risk of absence of certainly of employment include persons aged 15-24. More than 60% of these persons are employed under a fixed-term employment contract. Persons younger than 25 also prevail among those employed by temporary work agencies. At

the same time, more and more employees are forced to resign from employment contracts in favour of being self-employed and working for one client only.

When analysing another area of employment quality – work-life balance it was noticed that in Poland women are part of a group most affected by the lack of balance between work and family life. This results in greater economic inactivity of women, since major reasons for this inactivity among women included family and household responsibilities. The different distribution of burden relating to professional and domestic work between the two sexes in Poland results from tradition, social and cultural norms and stereotypes.

Abstract

The purpose of the article is to substantiate logistics outsourcing as an effective mechanism for improving the efficiency of the enterprise. The authors summarize the arguments and counterarguments in the scientific discussion on logistics outsourcing as one of the best methods of optimizing resources in the activity of enterprises, one of the important factors of modern business. Systematization of the results of the research of scientific sources made it possible to identify the problems of outsourcing use in various spheres of activity of economic entities. Systematization of studies of aspects of enterprise management on the basis of logistic approaches, has allowed to formulate the statement that special value all over the world in logistics is devoted to outsourcing. For many years there is a tendency in this area to transfer a part or all of the logistics functions to specialized companies and outsourcing of logistics services is used by the vast majority of enterprises. Because, as higher the level of consumption in the country, there is more need to involve in the supply a chain the goods of qualified logistics operators and transfer part of their operations to logistics outsourcing. The authors estimate the logistic outsourcing of the enterprise of PE "VEGA LTD" for the method of Zhelinskiy Yu.A., which combines the change of income and expenses of the enterprise. Based on the calculations, it is proved that outsourcing for PE "VEGA LTD" is profitable. Therefore, it is advisable to use outsourced services not only for transport logistics, but also for other logistic activities of the enterprise.
In the process of investigating the problems of logistics outsourcing and its impact on the efficiency of foreign economic activity of the company, the authors proved that outsourcing in logistics is one of the most modern business models. The use of this approach makes it possible to achieve significant competitive advantages in the activity of the enterprise. The main motives that drive outsourcing of logistics functions are: the desire to make the business manageable, reduce transaction costs while obtaining quality service and profit. The results of the study are of practical importance and may be useful to scholars interested in the study of logistical outsourcing, as well as to the enterprises where outsourcing is most commonly used.

Keywords: Logistic Outsourcing, Types of Outsourcing in Logistics, Logistics Providers, Operators, Forms of Cooperation of Enterprises, Logistics Services.

Introduction

Competition aggravation and intensification in the different business processes, new information technologies development and its universal using in all types of life and business activity, transaction speeding up, life cycling obsolescence and abbreviation, consumers' demands and strictness rising have made the Companies to look over their strategies of business acts. These challenges caused qualified firms attraction that some part of its own business functions including logistics were passed on.

Logistics outsourcing has taken a place in a practice of the many Companies independently from the scale and type of activity that had taken an attention of the researches.
Today, the logistics outsourcing market is being under development wave because the quantity of the new Companies have been founding and some percentage of them are looking for qualified specialist which could logistics functions manage outside of the Company (Hrytsyna L.A., Koshivska M.V., 2018).

The article matter – motivating factors research, outsourcing advantages and disadvantages implementation in Enterprise logistics and managing decisions using improving concern of logistics functions passed to outsourcing on.
The research object is logistics activity of Vega Ltd. logistics system.

The subject research is a logistics outsourcing as an effective Enterprise activity rising.

Literature Review

The terms and conditions of logistics outsourcing were widely described in the Western scientists works such as Bagchi, P. & Virum, H. (1996), Langley, J. (2018), Sahay, B. S., & Mohan, R. (2006). By these authors a content was opened and scientific-theoretic issues summarized for all types of logistics outsourcing implementation as an effective enterprise activity mechanism.

One of a popular resources optimization method in the different activity spheres and basic business providing factor is an outsourcing.

The problems of outsourcing implementation providing in a different types of Enterprise activity were researched by number of local scientists, it was described in the works of the next scientists as Dovba M.O. (2011), Krasnoshapka, V.V. & Trohumets, I.I. (2015), Tryfonova, O.V. & Trushkina, N.V. (2019).

The outsourcing in logistics has special mean all over the world. In this sphere a tendency has been monitored of a partial or all the logistics functions transfer to specialized companies and outsourcing of logistics services is used by the enterprise majority.

As high a demand in a country, a need arises for goods network organizing involve of qualified logistics operators and transfer to ones of the operation parts for logistics outsourcing.

The researches of an enterprise management on a base of logistics in Ukraine were concluded by the next scientists: Glushenko, T.M. (2014), Krasnoshapka, V.V. & Trohumets, I.I. (2015), Zavgorodniy, K.V. (2016).

Notwithstanding to a number of scientific work concern to logistics and outsourcing cohesion in the aspect of enhancement of enterprise competition rising and expenses decline in present, innovative development model searching still is actual and one of this model presumes an implementation of logistics outsourcing in an enterprise management.

Pasichnyk A.M., (Pasichnyk A.M., et al.2014)Bilovskyi K.E. (2016), Hrytsyna, L.A. (Hrytsyna, L.A., et al. 2018) Tryfonova, O.V. & Trushkina, N.V. (Tryfonova, O.V., et al. 2019) were involved into research of transport logistics, logistics outsourcing and its development in transportation system, a transfer of logistics functions to outsourcing with a term of enterprise management optimization.

Transportation, storage and assembling are main points have been transferred to logistics outsourcing in Ukraine. These three logistics activity spheres make 85% of profit to logistics operators.

Hryniv, L.V. (Hryniv, L.V., et al. 2010) states that logistics is a key factor to enterprise management improvement, the transportation flows as a local and international, including Ukrainian transit potential.

Mykhailiv, H.V. (Mykhailiv, et al. H.V., 2017) researched outsourcing implementation by the local Ukrainian enterprises like a new type of cooperation that will permits to provide economic activity more effective, to release an additional resources and direct it for enterprise development and to strengthen the market competition positions.
Tkach, O. (Tkach, O., et al.2017) researched outsourcing as a modern method of different economic subjects cooperation that permits to obtain the mutually beneficial results within short period and long period of time.

Methodology and Research Methods

In this article the research had been concluded concern to management decisions effectiveness justification of logistical outsourcing implementation. In the process of logistics outsourcing expediency researches the methods of scientific knowledge of phenomena and processes in economic activity, such as comparative analyze. Within local and foreign scientists work summarizing, historical method (for logical outsourcing means specification and with a purpose for driving forces and problems with logical servicing raising in a modern enterprise activity; formal logical method and summarizing method (by the types of logistics providers definition and definition of cooperation

by PL-provider with a range of services); analyze and synthesis (within estimation of possible risks from taken decisions concern to outsourcing using); induction and deduction (within typical model of definition concern implementation of managing decision about logistics outsourcing possibility using by foreign trade activity).

The Results

In the modern changeable, dynamic, compatible terms of external environment there are many of the Companies are looking for the ways of improving all of the activity spheres. This also concern to its logistics. Basic point of enterprise activity is a delivery network management of the products and information current guarantee along the whole enterprise delivery network. Thus, they are more concentrated and specialized with a help of outsourcing activity, which is far away from its basic business.

For bigger number of the enterprises logistics is not a major business competence but logistics needs a lot of resources and attention due to keep logistics Department (Dpt.) functioning. Use to be an own logistics Dpt. – does not mean a high level of logistics servicing and low level of logistics expenses. In addition, hired managers demand wages constantly raising up that does not confirm desired results and manager competences. As a result, sometimes more profitable is to pass logistics outsourcing out.

Outsourcing in logistics activity means passing this activity out to a third part, as a logistics servicing supplier. As an outsourcer can be as separate enterprise or several Companies, thanks to them, it is a possible to decline the expenses to logistics.

With a time some enterprises came into conclusion that without a cooperation of the knowledgeable logistics specialists to improve the business process in this sphere is practically unreal. Once the logistics were developed by the enterprise having invested money into the workers, the warehouses and so on, but with a time they came into conclusion that logistics outsourcing is more optimal way for expenses decline. Outsourcing of logistics activity makes effectiveness rising from 9% to 15% capacity and quality rising (Glushenko, T.M., 2014).

The enterprises in logistics use to be take one of the two alternatives – either to provide logistics functions by them or pass it out. The number of enterprises does not pass logistics services out concern to some reasons. They establish own Dpt. It is usually happen in the enterprises where for the owner is important to keep the logistics schemes in unique.

Due to define the mean of logistics outsourcing some samples had been invented in a literature. For example, Sink and Langley (1997) and Millen et al (1997) sais, that logistics outsourcing is an external supplier using for conducting some or all logistics services of the firm which are provided by the firm. Those definitions are being kept by (14), which added that logistics outsourcing is getting more force tendency in the modern enterprise because of the number of priorities are brought by. In the presented research all different propulsions and problems have been estimated with a connection of logistics servicing rising (Liginenko, L.O., & Frolova, Yu.Yu.,2000).

Outsourcing is one of the successful business models which include passing non basic functions enterprise out and all the connected activities to outsourcer management.

With connection of several profiles of this point such as logistics outsourcing (outsourcing of logistics decision) is vied from the following theories:

1. Resources bound theory.
2. Network theory.
3. Transaction cost economy.
1. Resources bound theory (RBT).

RBT looks at the Company like resources totality which spread heterogeneous (Tryfonova O.V., Trushkina N.V., 2019). Hereby, mean of logistics is defined as management optimization by the material and related its information and financial flows. Term “resources” concerns not only material resources such as warehouses, equipment and factories but also non-material actives such as knowledge, know-how and organizational activities. According to this theory the Company needs to ensure right type of resources effective flow from its surrounding with a purpose of survival on the market, competition rising and stability (Krasnoshapka, V.V. & Trohumets, I.I., 2015).

Logistics servicing transfer to outsourcing permits the Company to get an access to wide not owned resources spectrum, to keep competition on the market and to obtain an access to additional resources. By the way, the fact of

the additional resources access does not explain the reason fully why the Companies transfer own logistics servicing to the suppliers of logistics that takes to Network Theory (NT).

2. Network Theory (NT).

The effectiveness of logistics activity is defined by component elements synergies effect of right established logistics network, logistics system and also system cooperation. The theory NT stipulates that outsourcing permits the Company manage by the supply network as a whole through relations forming and network coordination. Thus, a need is occur by the resources exchange between of the Companies (Pasichnyk A.M., Lebid I.H., Kutyriev V.V., Buherko K.M.). This theory points out that thanks to system establishing, links creation and cooperation between the Companies, they can obtain necessary (and absent) resources. Attention concentrates on alliance forming between the Companies.

3. From the point of economy cost transaction theory view the Companies logistics servicing transfer was based on a sum of transaction minimization and production expenses. This theory is based on a point that supplier logistics servicing outsourcing is to be happened when there was a possibility to decline transactional expenses.

Stipulated principles are explained (Bilovskyi K.E., 2016) and noticed that in a case of low transactional expenses the Company will face to outsourcer service, if these expenses will be high the Company will provide this activity by itself.

Hereby, this theory does not explain all the logistics processes and the connected decisions with it.
Basically, the reasons that make the functions transfer to outsourcing are following:

- Own resources absent;
- Limitation expenses needs;
- Basic types of activity concentrated necessity;
- Competitive advantages obtaining desire.

Necessary to recall next two reasons:

a) Company management does not know how to act;
- There is not future perspective of further development of a present activity direction;
- The Company is starting to lose an own market advantage;

b) Management of the Company is not able to formulate an exit from a current situation.

In a whole, outsourcing is effective by following terms;

- Is worked out process with history of the successful and profitable contracts;
- Gives a chance to obtain improvements which are not achievable by any of the departments;
- Improves a Company activity and defined process;
- Proposes expenses surveillance which is not possible by internal Dpt. acts;
- unpredictable expenses limiting;
- servicing quality improvement;
- permits to be a competiveness;
- gives a possibility to concentrate on the basic types of activity and the sources of profit;
- is an effective method of corporative culture changes;
- proposes not reachable by inner Dpt. quality level;
- foreseen a flexible attitude to workers quantity;
- Gives an opportunity to improve own knowledge.

Very often mean of “outsourcing” is used in the context of problem solving “to produce” or “to buy” (https://studme.com.ua/1595021014291/logistika/autsorsing_kak_instrument_servisnoy_logistiki.htm.). But today the mean of outsourcing coming out from its common means – as a method business providing when second types Company activity are passed on to external organization. This organization is able to use all given resources by the interests of the Company’s customer.

The present experience testifies that outsourcing implementation has a reason in the following cases:

- need has occur as for labor and material resources;
- activity of the Company in different directions is not connected between each other;
- job accomplishment requires to use an experience and professional knowledge;
- Company activity is undo survival of different market fluctuation that led to high expenses for stuff education;
- Technology is changing so fast, that demands big investments.

In addition, outsourcing is considerable expenses control. Its realization insures:

- more serious expenses transparency for business management and its process;
- service-provider involves the own stuff for the projects realization as necessary;
- cooperation of organization with service-provider ensures expenses decline which are used for infrastructure and tools etc.

The specialists use to separate some type of outsourcing as following:

- business-process outsourcing: foresees the tasks delegation that are not concern to a main type of work for implementation by another Company;
- productive outsourcing: for instant, new product creation with an implementation by another Enterprise service;
- IT outsourcing;
- Bookkeeping outsourcing;
- Out staffing; submitting the stuff for a period to some separated tasks providing.

Commonly, outsourcing is used for entrepreneurs support and development. These are:

- Scientific research and analytical work organization according Company points;
- Entrepreneurial education;
- Infrastructure organization development program had been invented for small and medium business support;
- Inventing practical manuals and training materials by the special directions.

Due to stipulated work algorithm a Contract between Company - Customer and outsourcing Agency has been accomplished where following information is mentioned:

1. Names, addresses of the Parties; terms of the Contract; description of the Customer acts are transferred to management by accepting Party.
2. Management manual, rights and obligations are confirmed for each manager.
3. All types of characteristics are to be passed on to responsibility of the Supplier according the Contract including Dpt's are to be leaved in client organization.
4. Contract terms for validation and termination.
5. Negotiations terms concern to the Contract prolongation.
6. Risks / profit distribution terms.
7. Problems solving terms which could arise under the acts of external (force majeure) acts, for instance, low change and the ways of influence toward Contract implementation.
8. All payments and compensations characteristics are belong to service supplier and Client.

Outsourcing is a new progressive activity management organization which ensures the not related to basic production functions transfer to the specialized Companies with qualified stuff (Zaloznova Yu.S., Trushkina N.V., & Kocheshkova I.M., 2018).

Local Enterprises outsourcing implementation is:

- A new type of production which permits to the Enterprises to provide economic activity more effective, to release additional resources and direct it for Enterprise development and make strongest competitive position on a market.
- The point of economic effectiveness outsourcing implementation improvement needs to be further developed including Ukrainian law system development in these directions and also mechanism of outsourcing supplier reliability settlement.

Outsourcing is in the beginning level in Ukraine and gives a possibility to use it as a base for system management improving of the number of the Enterprises which have not been providing a similar experience.

We think that logistics is more perspective sphere which is enriched by progressive and aimed to oriented professionals which are ready to adapt to new management instruments implementation and to risk with a matter of strategic targets achievement.

Outsourcing is a modern type of different economic subject cooperation that gives a possibility to obtain positive mutual results within short time and long time periods. In the developed countries and Ukraine so on this cooperation has rising the chances and perspectives of high economic development. By this, is important to define for any of the Contract and terms an outsourcing which means optimal type.

In Europe the value of logistics functions are transferred to outsourcing Companies such as 61% transportation service; 35% - warehouses; 25% - information system; 15% - revers logistics; 13% - fleet management; 11% - costs

minimization; 8% - supplier management; 6% - order scheduler sheets; 5% customers support (http://ukrstat.gov.ua/operativ/menu/menu_u/tr.htm).

The main obstacle for outsourcing development in Ukraine is lowest state support, impossibility for effective control for an outsourcing provider and its economic status. One of a drawback is partnership relations which happened could be unreliable.

Also the obstacle in the process of logistics outsourcing can be logistics infrastructure absence. Logistics infrastructure development gives to the Western Countries not only to ensure own needs by transport - logistics servicing but also gives them to another Countries. Ukrainian transit potential is used only for 60%. The income from transit and coherent servicing complex are 6% GIP. Because, ineffective using of Ukrainian potential occur that the Country did not received 2.5 mln. usd. (Sharchuk, T.V. 201).).

In addition, outsourcing progression state support is pretty important in the modern economic conditions. (Hryniv, L.V., & Vachil, O.P. 2015). For example, India and Ireland are the world leaders on outsourcing market thanks to the State support and state structures of development. Despite for the obstacles on the outsourcing development way in Ukraine there are some advantages which support the outsourcing operations providing, thus low wages compare with Europe and USA, high unemployment rate of qualified stuff; ability to communicate by foreign languages.

Outsourcing is influential factor concern to Companies effective operations. It is main element for expenses reducing. Also outsourcing influence concern to enterprise competitive position.

Priorities and disadvantages of outsourcing are stipulated concern to economic activity (Glushenko, T.M. 2014).
Common advantage of logistics outsourcing includes following points:

- Risks clear distribution;
- Business-process and ways of its effectiveness rising;
- Expenses quantity shorting thanks to stuff quantity reduction.

These are management advantages of logistics outsourcing:

- Management control improving capability;
- Growing potential definition possibility and all the possible obstacles cancelation;
- Perspective to locate attention and necessary resources on the main activity like a customer demands and company targets concern to the technical-technological advantages necessaries;
- High level mission accomplishment access and necessary technology using;
- Reliable servicing and its quality rising.

Due to implement logistics outsourcing in Ukraine is necessary to avoid the obstacles that cause for its unfavorable development (https://yellow.com.ua/rList.aspx?r=1008).

These obstacles can be: uncertainty concern to Company secrets announcing by involved stuff, uncertainty concerns stuff professionally. Thus, the managers are not able to trust to other Companies do not take into consideration that these Companies thanks to narrow specialization are supported by the qualified stuff which have been cooperating with many other Companies and implement their experience in the different spheres of activity.

In a case of implemented decision by the Board of Directors is necessary to understand how will tide the Company up with the future Partner. It means what kind of cooperation the Company has been looking for: for hierarchical or market oriented.

By hierarchical cooperation very tide interdependence is aroused, on practice it means cooperation between main and daughter Companies.

In case of mutual work organized by the type of external partnership its being qualified as a market oriented.

Very important is the fact for what period these links are established: long term or short term or it can be made for once (Mykhailiv, et al. H.V., 2017).

It is necessary to consider: as much number of the Enterprises are to be involved into cooperation (Dovba, M.O. 2011). Additionally, in case of long term cooperation to conceal the Contract is more difficult. It can be possible only in case of big expenses costs.

Necessary to consider, the decision about outsourcing cooperation is big influence to enterprise structure. That is important to be prepared properly and estimate all advantages and risks properly.

In this cooperation the Contract forms are very important because in case of nonfulfillment obligations the Parties will require losses compensation. (Hrytsyna, L.A. & Koshivska, M.V. 2018)

All expenses are aroused within some business-project conducting control could be estimated only approximately and this is big drawback. The quality problems can be regulated basically by a number of acts implementing toward quality management for example logistics data.

Some instruments are to be involved for the expenses analyzing due to display the separate expenses for each provided decision and evaluate it.

Logistics providers – enterprises make logistics servicing complex. Different providers are different by technological level and servicing range (Langley, J. 2018).

Fig. 1: Interconnection of the PL-providers with services range. (2)

First level logistic is called internal logistics where all transportation, storage service and other operations are to be concentrated inside of the organization – Customer. 1PL-providers are not logistics intermediary, because all functions are to be made by cargo owner.

Second level logistics are external (2PL) and make ordinary servicing range which link to transportation and storage. 2PL-providers are logistics intermediary.

For above mentioned could be: transportation Companies; custom brokers; expeditors; custom warehouses; temporarily storages; agents; warehouses complexes and the cargo terminals.

2PL providers have a narrow specialization but nevertheless they have checked data base and work experience in some sphere. Second level providers work on the local or regional markets.

Third level logistics (3PL) are external logistics that cooperates to all logistics services into one complex and includes additional services such as cargo storage, invent and design of different information systems with helper using servicing.

3PL-provider commonly called an intermediary which gives the logistics services complex to the customer. This type of the Enterprises take into own control some or all logistics functions. These logistics intermediaries commonly work within interregional areas on the base of long terms Contracts.

Fourth level logistics (4PL) cooperate by external and internal logistics. 4PL providers main difference from 3PL system attitude implementation toward all customer logistics process management. These logistics providers work on the world market on the terms of strategic partnership.

Fifth logistics level (5PL) – internet logistics. 5PL provider submits the whole complex of the service for account of world network using. This is vertical partner: from one side he has all information about the network member's capabilities, from another – IT product which gives a possibility to create the optimal network inside of the logistics systems.

Logistics services suppliers' differentiation is made on the basis of partner's qualification definition of the separate sector and all different type of aroused situation. On the beginning of the cooperation stage the logistics services supplier are being held as the subcontractors, in innovative attitude in a process of cooperation they look like "co-authors" and "designers" or "managers" of delivered network. On the picture 2 the characteristic of the main logistics services basic supplier were presented.

Fig. 2: Logistics services type's supplier characteristics.

Source: developed by the authors.

Having being existing scientific theses analyzed the researches testify that main attention is made toward the Companies consume the logistics services, but not big attention are to be paid to outsourcers are providing these services. Logistics effectiveness and Enterprise effective activities are defined by a term of effective cooperation by all the processes parties.

Foreign trade activity foresees the Enterprise activity out of the native country, that has being accompanied by the risk and uncertainty rising. These are defined for foreign market logistics outsourcing using.

In case the Enterprise has trade-economic connections with the foreign trade suppliers or has a plan to come out to the foreign markets with own product the necessity has been aroused for stuff looking out which able to provide the above processes. In case of Enterprise strategic orientation to foreign markets is necessary for own Dpt. establishing with the international specialists in it. But in case, when the necessity of foreign trade activity is aroused only sometimes, to keep working this Dpt. is unjustified expensive.

The best way to dissolve this problem is foreign trade outsourcing (https://tsl.kname.edu.ua/index.php/en/8-glavnaya/26-logistic-outsourcing.).

Foreign trade outsourcing has foresees organizational and technical processes transfer connected with imported goods buying and export sale to aside Company – outsourcer. This method priority is additional recourses release of the Company (financial, labor, timing) which can be directed to production and business. In nature, logistics outsourcing means to authorization specialized aside Company all the type of the works connected with foreign trade activity.

Outsourcing advantages by foreign trade activity:

1. Better understanding of the market and consumers market features (tastes and consumers preferences).
2. Expenses shortage for Company establishing, office opening and wages, taxes payments.

3. Wide range receiving of the logistics services.
4. Products sale rising and sale Enterprise foundation as a result.
5. Deduction (nonpayment) of some foreign currency payments, customs procedures.

Logistics servicing providing by foreign trade activity:

- Foreign supplier selection and commodity buying;
- Paper work;
- Commodity storage organization with a complex of satellite services;
- Balance keeps checking in real time;
- Foreseen and readiness for demand growing;
- Commodity moving control by WMS on line system;
- Transportation logistics and commodity insurance by foreign trade operations are to be made by outsourcers;
- Foreign Contracts preparing and management;
- Customer and brokers servicing;
- Export and import permission preparing;
- Commodity certification;
- Most trading effective scheme selection;
- Work with regulated bodies;
- Foreign currency regulation;
- VAT payments and another type of payment.

Custom clearance needs professional and experienced stuff. This complex permits to invent the best version of deliveries organization and custom clearance (Tkach, O.V. & Voloshchuk, I.A., 2017)..

Thus, logistics outsourcing permits to the Company to minimize expenses, to raise a work effectiveness concern to foreign partner searching, to speed the process up thanks to transportation points solving by complex .

Taking into consideration validity and difficulty of this point, taking management decision concern outsourcing implementation into enterprise foreign trade activity needs to be carefully weighted and justified. This management decision implementation process is made in the terms of uncertainty. It makes the process more difficult and reduces effectiveness of the accepted decision (Tryfonova, O.V. & Trushkina, N.V. 2019).

Within a need stipulation by logistics outsourcing a model decision making is proposed about logistics outsourcing implementation by foreign trade activity providing (Fig. 3).

Fig. 3: Management decision making concerns to logistics outsourcing implementation possibility by foreign trade enterprise activity.

Designed by the authors on the base of (Zavgorodniy, K.V. 2016).

According to the fig 2 this decision making process has to be made in two stages – preparatory and basic. On the preparatory the tasks are to be defined including foreign trade activity development; enterprise expenses optimization thanks to logistics outsourcing implementation, additional outcome receiving and foreign partners searching. All these tasks can be solved successfully by outsourcing implementation.

On the stage of existing enterprise advantages is necessary to define logistics functions and activities ranges which can be passed into outsourcing out, besides this concern to transportation logistics, foreign partners searching and custom clearance. These functions transfer can be full (all enterprise logistics functions passing out into outsourcing) or partial (only some functions, for example, transportation logistics).

Next stage requires perfect estimation of possible risks from decision making concerns to outsourcing using and also from its economic validity. Within these instruments can be used Mc. Kinsey model: “Price watehouse Coopers” methodology, BCG model (proposed by Derting), Khlebnikov outsourcing matrix, Y. Mitrophanov proposed matrix, M. Tatjanok Methodology, Y. Zhelinskyj methodology.

Table 1: Compatible characteristic methodology of evaluation management decision making concerns to logistics outsourcing.

Name of methodology author	Characteristic	The parameters that the technique takes into account
Mc. Kinsey model (Bagchi, P. & Virum, H. 1996)	Outsourcing is to made on the basis of: 1. Export evaluation of involvement to technological network for consumer's value creation. 2. Profitability of non profile activities from the view of the clear expenses and Enterprise outcome contribution . Thus, business process separation according to the reasons: "profitability" and technological process involvement". This methodology gives a possibility to reveal non profile and unprofitable process and Dpt.	Displays two criteria's: non profile actives involvement to technological network concerns to consumer value creation
Price waterhouse Coopers (Liginenko, L.O., & Frolova, Yu.Yu. 2005)	Matrix has two factors: active importance and active strategic importance. Options of these facts combinations in the matrix give four options of a solution. Combination of a low strategic importance and competition actives importance transfers the Dpt. functions factors to an aside organization	Analyze had been made on the basis of comparison parameters – "active compatible importance" and "strategic importance of Dpt. for Enterprise and separates four types of decision making
BCG outsourcing matrix (Pasichnyk A.M., Lebid I.H., Kutyriev V.V. & Buherko K.M. (2014)	Permits to provide business processes separation expedien-cy outsourcing analyzing according to following elements – strategic influence; financial influence, business – influence; business - risks	Analyzing is to be provided on the basis of five elements: financial elements; strategic influence; business – influence, business – risks
D. Khlebnikova (Liginenko, L.O., & Frolova, Yu.Yu. (2005).	Two factors instruments analyzing: the analysis is to be made by two basic factors: "strategic importance" and "competencies quality compare with competitors and market totally" which are estimated by three levels. This matrix of outsourcing is a method of object review separation to 3x3 matrix segments, by which can be a separate proceedings Dpt., type of work toward to a separated specialist, the carrier of a competence. This method is to be differenced by estimation criteria scale. In case of data separation by the matrix field the variants are to be produced of decisions making.	In the two measurements matrix were given: strategic importance, competences quality /works/, the results compare with existed on the market. Strategic importance has own components: technological involvement which consider some type of Enterprise activity: profitability factors; owner intentions; social – economic and political aspects of possession. Outsourcing matrix horizontal scale is – competences quality/works/ results compare with existed on the market. Due to estimation the matrix is necessary: To understand that the Company makes the goods are buying; To know which competency confirms the business and to answer to a key question: why makes important to analyze real stuff competencies; To analyze competitive environment; On the infrastructure analyzing base to define of market terms; To give a possibility to make a transformation
UBS ((Liginenko, L.O., & Frolova, Yu.Yu. (2005).)	Business functions separation on decision to outsourcing is to be made with a decision making matrix invented by IBS consulters. By axis X the matrix is made service value relation inside of the Enterprise to the value of the same value on the market; by axis Y – business-functions quality characteristics compare with the market. By this result, the matrix is being divided for nine segments, each of the segment confirms one from fourth conclusions: Outsourcing implementation - Refusal from the own Dpt. and buying the same goods on the market; - Development – improvement of	Outsourcing matter is to be considered by four important aspects: Strategic priorities economical effectiveness; Services management transferred to outsourcing; Reliability and risks

	business functions for the quality raising services or cost reducing; - Development or outsourcing – two decisions are possible (advantages depend from Enterprise policy to considered business-functions separation – business function is compatible and can be separated in different business for profit receiving.	
Zhelinskogo methodology (Źeliński, J. A. 2008)	Outsourcing effectiveness is a sum of outcome and expenses in a separate sphere of activity. The changes could be positive and negative but sum of the needs is to be more then 0. Difference between total incomes and expenses after outsourcing implementation needs to be bigger from difference of the profits and expenses	Enterprise profits and expenses analyzing

The methodology method permits to make estimation by the parameters complex. It's not consider human being factor within transferring of the own Company management functions to the management by aside Enterprise.

The risks (the disadvantages) of logistics outsourcing implementation are to be arisen by the following cases:

- Big value of the expenses rising with a connection of a process and the functions to outsourcing;
- Big value of expenses are used with a purpose of survival cooperation with the suppliers which supply outsourcing services;
- Non foreseen ability of outsourcing Company bankruptcy;
- Professional ability improving of the another Enterprise than own stuff;
- Limitation of logistics outsourcing juridical regulation definition.

By definition of logistics outsourcing effectiveness is necessary to consider alternative value that is possibility of released finance using for another Company activity. It is advisable to use only partial transfer (some separate logistics functions) to logistics and to rise the activity in future by a term of effective cooperation. Besides, on all levels of outsourcing implementation in logistics is necessary to use a comprehensive control and results evaluation of logistics outsourcing implementation.

The most important factor by Enterprise logistics system outsourcing is effective organization of economic activity.

According to management decision making invented model concerns to logistics outsourcing implementation by enterprise activity calculates outsourcing implementation effectiveness. For this we used Zhelinstskiy Y. methodology (13).

According this methodology for outsourcing effectiveness evaluation the sum of incomes and expenses needs to be calculated in the enterprise activity spheres after and before outsourcing implementation. As a result the difference between total incomes and expenses after outsourcing implementation needs to be more from difference of incomes and expenses before outsourcing implementation.

A formula is to be developed:

P_1 – total incomes before outsourcing implementation;
V_1 – total expenses before outsourcing implementation;
P_2 – total incomes after outsourcing implementation;
V_2 – total expenses after outsourcing implementation.

Logistics outsourcing evaluation of Vega Ltd. provides with a method where changes of Enterprise incomes and expenses are combined.

This methods group confirms to common attitude for result evaluation on the base of incomes and expenses changes and is very simple for use.

Private Enterprise Vega Ltd. has been established at May 08, 2008. The main activities consist of: whole sale of wheat and animals feeds, vegetable oil for technical purpose and truck service. 20 workers work on this Enterprise.

The Enterprise sales the products as in the internal market and provides foreign trade activity. Export of the commodities has been providing to Lithuania, Estonia, Poland, Czech Republic, Belorussia and Moldova but not

exceeding the products sale on external market because of tough policy and EU quotas. In EU Countries a biodiesel is produced from vegetable oils and from second raw materials such as a press an animal feeds are made which afterwards are coming back to Ukraine as a premixes and a protein – vitamin mineral supplements.

Additionally, the Enterprise gives a service of trucking of liquid, bulk, cargo and assembled cargos to the countries such as: Austria, Germany, Nederland, Greek, Bulgaria, Romania, Czech Republic, Slovakia, Poland, Latvia, Estonia, Moldova, and Belorussia. The oils, juice concentrates, jams, wheat, wood products, parts of furniture, fire wood and the pallets are exported from Ukraine. The mineral fertilizers, metal sheets, animal feeds are imported into Ukraine.

Among the basic negative factors influences to Enterprise work are: corruption on a custom, Ukrtranssecurity corruption that connected to Poland and Austria issuing permission; credits involvement with a high rate.

The Enterprise has an intension to make transportation logistics outsourcing with a Polish Company which provides dispatching services, minimizes an empties trucks running that influenced toward transportation Dpt. within long period of time and expenses caused. In the future this Enterprise plans to pass goods sales out to a foreign market for outsourcing.

Due to understand a reason and main of transfer some function by Vega Ltd. to outsourcing let's see the following example:

A truck (type DAF and truck tanker) makes move for a rout – Chortkiv (Ukraine) – Orkhly (Moldova) – Voljkersdorf (Austria). From Moldova to Austria a juice concentrate is transported.

To calculate an expenses: 24mt. x 110 euro (1 mt. transportation cost) = 2640 hrn. x 26,9 (euro exchange rate)

1. Fuel – 1000 km x 0,38 (consuming with cargo) x 26,9 (exchange rate) = 10222 hrn.
2. Insurance (green card) = 2000 hrn.
3. Permits:
- Moldova (1 pcs.) = 500 hrn.
- Transit via Moldova through Ukraine = 2690 hrn.
- Poland (1 pcs.) = 190 hrn.
- Czech Republic (1 pcs.) = 170 hrn.
- Austria (2 pcs. – entrance/exit) = 610 hrn.
4. Payment a truck transit with ecological secure class not lower than Euro 5.
- Moldova – 0 hrn;
- Poland – 880 km x 0,27 zl. = 338 zl. x 6,357 (exchange rate) = 1513 hrn.
- Czech Republic 340 km. x 3 cor. = 1020 cor. X 1,07 (exchange rate) = 1091 hrn.
- Ausria 202 km. x 0,4 euro = 81 x 26,9 (exchange rate) = 2179 hrn.
5. Driver wage – 71016 x 0,14 (percentage wage) = 9942 hrn.
6. Taxi driving – 1000 km. x 0,22 (fuel consuming without cargo) x 26,9 (exchange rate).
7. Truck amortization for a one route – 4810 hrn.
8. Bookkeeping, director's wages, 2 mechanics wage, office manager wage with taxes – 750 hrn. per one route.

Total expenses for the route is 42 588 hrn. Before Enterprise was planning to transfer logistics to outsourcing the truck had been returning to Ukraine without cargo that was making the profit lower and caused the losses sometime.

Thus, calculate an outcome before transferring logistics to outsourcing:

71016 – 42585 = 28431 hrn. cleaned profit.

The trucks are coming back with the other loads after faced to outsourcing. Let's look at the sample: the truck is backed from Austria and Czech Republic was loaded by glycerol 24 mt. x 95 euro/mt x 26,9 (exchange rate) = 61 332hrn.

A route Volkerscdorf (Austria) – Znajmo (Czech Republic) – Dybno (Ukraine).

Expenses calculation:

1. Tank cleaning - 140 euro x 26,9 (exchange rate) – 3766 hrn

2. Expenses for the route Volkerscdorf (Austria) - Znajmo (Czech Republic) = 170 x 0,22 (fuel consuming for 100 km without cargo) x 26,9 (exchange rate) = 1006 hrn.
3. Expenses for the rout Znajmo (Czech Republic) - Dybno (Ukraine):
905 km x 0,38 (fuel consuming for 100 km with cargo) x 26,9 (exchange rate) = 9251 hrn.
4. Custom duty for entrance to Ukraine – 620 hrn.
5. Driver wage – 8300 hrn.
6. Tank cleaning 2 – 1600 hrn.
7. One route track amortization 4810 hrn.
8. The wages of bookkeeper, director, two locksmith office manager, mechanic with the taxes – 750 hrn. per one route.
9. According of the logistics outsourcing Contract N1608/18 dd.01.08.18. outsourcer receives 10% of profit from the cargo founded by him without expenses connected to truck taxi to a place of loading.

Thus outsources profit is 61332 – 1006 (gas consuming for the rout Volkerscdorf (Austria) - Znajmo (Czech Republic) – 60326 x 10% - 6033 hrn.

Gross expenses for this rout are 30576 hrn.

Cleaned profit for this rout is 28431 + 30756 = 59181 hrn.

E = 59187 – 28431 = 30756 hrn.

From above mentioned – the profit is growing after logistics transferring to outsourcing. It means for Vega Ltd. outsourcing is profitable.

Let's make a forecast for Vega Ltd. to 2020 with two variants of development – without transportation logistics transfer to outsourcing (variant 1) and in case of outsourcing Contract implementation to Enterprise transportation logistics (variant 2).

The truck for one month makes 4 routs. Per one year the truck works 9 months. For this period the truck makes 4 x 9 = 36 routs.

In case for one rout the profit is 59187 than one truck for 36 routs makes 59187 x 36 = 2130732 hrn.

Enterprise transportation logistics effectiveness calculation is submitted in a table 2 with a possibility of any type of development.

Table 2: Two variants of the Enterprise logistics activity data.

Data	Variant 1	Variant 2
Expenses (1 rout) hrn.	42585	30756
Cleaned profit (1 rout)	26431	59187
Cleaned profit (a gear)	1023516	2130732

In winter months with a weather matters the truck will not be involved for any of the services. The first working month would be – a march. For March and April the truck makes routs. Thus, (picture 4):

Variant 1 (blue line) the Enterprise would get a profit – 26431 x 8 = 227448 hrn.
Variant 2 (red line) the Enterprise would makes a profit 59187 x 8 = 473496 hrn.
By the same way Enterprise approximate profit to another months: up July and October.
July:
- Variant 1 26431 x 20 = 568620 hrn.
- Variant 2 591187 x 20 = 1183740 hrn.

October:
- Variant 1 – 28431 x 32 = 909792 hrn.
- Variant 2 – 591187 x 32 = 1893964 hrn.

So, the outsourcing is profitable for Vega Ltd. That is why it is a reason to outsources services using not only concern to transportation logistics, but for another enterprise activity.

Conclusions

During the research of the logistics outsourcing and its influences to foreign trade Enterprise activity the following conclusions were made:

1. In logistics activity the outsourcing is a modern business - model. This implementation attitude gives a possibility to get utmost competitive advantages in Enterprise activity. Basic motives caused for logistics functions transfer to outsourcing are: to make business more manageable; to reduce the transaction costs and within this to obtain a profit.
2. Due to define a necessary of second functions transfer to outsourcing is necessary to take into account all positives and negatives sides of this activity.

By the outsourcing process development the positive and negative factors have been operating as well. But there is a matter that the most important limitation has to be an economic profit and its using. Because, there are many cases when to transfer to external management other functions is not reasonable.

Possibility for the Enterprise - Customer to concentrate the trade activity by the own forces within basic directions of business is most advantage of outsourcing, that is only why the Enterprises second functions transfer to other specialized Companies lowering the servicing expenses of business-project; provision of favorable conditions and world class of services, outcome rising, foreign currencies welcoming.

3. For the modern Enterprises problem is actual logistics outsourcing implementation. The calculations were made concern to research Enterprise logistics transportation outsourcing effective using present the advantages of these steps.

The foreseen for 2020 year with two tips calculation (with using of outsourcing and without) indicates for bigger opportunity for profit dynamic of the Enterprise.

4. Thus, a transition to logistics outsourcing – is a strategy that is directed for profit and competitiveness rising by long term period. During outsourcing implementation in Enterprise logistics the Enterprise received a possibility to concentrate the resources within profiled business and do not be involved to establishing and supporting of an infrastructure unconnected with it.
5.

Fig. 4: Profit rising forecast to 2020 without outsourcing and by the logistics transfer to outsourcing.

In present, within a transfer of logistics business - process to outsourcing analyze is necessary for each of the case. The outsourcers - enterprises expenses present a necessity to account the number of terms and factors with a matter to make an outsourcing project successful for the Customer and Outsource – Company.

The concrete analyses help to clarify in which directions outsourcing implementation are more effective and resources saving with outsourcing help give a possibility not only to survive in the crisis conditions but to get a success.

Using of the considered and improved models and attitudes will help to raise a relevant management decisions anyway, but hardly make the process of decision making easier.

Abstract

Colloquially, the term "value" is understood as something particularly valuable, meeting high requirements; it is something we want, desire and which is the goal of human aspiration. The values can be classified differently. One of these classifications takes into account economic values. In order to learn about the preferred values and their hierarchical arrangement, the authors of the articles decided to study the impact of the coronavirus pandemic on the volatility of economic values among students. This social group, shaping its economic values at this stage of life, will in the future influence the processes of economic socialization of the next generations. Therefore, the article verifies the research hypothesis: The Covid pandemic determines a change in the approach to economic values among the young generation. The aim of the research will be to examine a group of young people through the use of focus group interviews in terms of changes or lack thereof resulting from the pandemic in their economic values. And the conclusion for the research was the answer to the following research question: In the opinion of the respondents, did economic values change under the influence of the conditions arising in the covid pandemic among young people? The verification of the research assumptions allowed to indicate that the change in economic values among the studied group under the influence of the coronavirus pandemic is rather invisible according to the surveyed students.

Keywords: value, economic value, covid, pandemic.

Introduction

COVID-19 is the disease caused by a new coronavirus called SARS-CoV-2. World Health Organisation (WHO) first learned of this new virus on 31 December 2019, following a report of a cluster of cases of 'viral pneumonia' in Wuhan, People's Republic of China (www.who.int). The SARS-CoV-2 epidemic was recognized as a pandemic (a worldwide spread of a new disease) by the WHO on March 11, 2020 (Gandjour, 2020).

Economic values are especially important for the development of an economic culture in society. They are shaped from the beginning of birth. Their first source is the family, where the social unit acquires value through economic socialization at this stage. Successive stages of life either strengthen the values in a person or change. The Covid-19 pandemic period is a special time that may result in social changes also in the aspect of economic values among young people, whose views are still being shaped and their implications of the changes may be significant. Hence, in order to show a certain area of science and analyze it, the article distinguishes two currents. The first one, of a cognitive nature, focuses on the analysis of the literature on the subject. These studies included foreign and Polish literature, which allowed for a critical analysis and shaped the research framework. They concerned concepts related to economic values and values. The second trend, the study one, focuses on research conducted in the form of focus group interviews on the impact of the coronavirus pandemic on the change or lack thereof in the perception of economic values. The research was conducted on a group of young people. Students from the first-year of management were participated in the interviews. The opinions obtained in this way made it possible to verify the assumed hypothesis and research goal. The conclusion for the conducted research will be the answer to the following research question: In the opinion of the respondents, have the economic values changed as a result of the

conditions emerging in the covid-19 pandemic among young people? In connection with the above, the following hypothesis was posed: The Covid pandemic determines a change in the approach to economic values among the young generation.

Value in the literature

Economic value, as well as the notion value per se, raise on the philosophical, moral, ethical, social ground. Value is a broad term and multidimensional. It is discussed in many disciplines.

In psychology, value is treated as an individualized, subjective concept, depending on the preferences of the evaluator. Value in this approach is a trait of things or people desirable for individuals (Nadolna, 2011, p. 170). The notion of value depends on the context in which it is considered. Values are internalized cognitive structures that guide choices by evoking a sense of basic principles of right and wrong, a sense of priorities, and a willingness to make meaning and see patterns (Oyserman, 2015, p. 1).

One of the fresh, actual theory in psychology is Schwartz's theory. Professor J. Cieciuch analysed publication of Schwartz and synthesized the term value, referred to the previous theories. According to J. Cieciuch Schwartz's theoretical proposition is a far-reaching modification, extension and improvement of Rokeach's theory, along with its synthesis with Allport's approach (Cieciuch, 2013, pp. 39, 43). According to the value theory there are six main features of values (Schwartz, 2012, pp. 3-4.):

1. Values are beliefs linked inextricably to affect.
2. Values refer to desirable goals that motivate action.
3. Values transcend specific actions and situations.
4. Values serve as standards or criteria.
5. Values are ordered by importance relative to one another.
6. The relative importance of multiple values guides action. Any attitude or behaviour typically has implications for more than one value.

In classic model Schwartz distinguished 10 values (Schwartz, 2012, pp. 5-7):

- *self-direction* – independent thought and action - choosing, creating, exploring;
- *stimulation* – excitement, novelty, and challenge in life;
- *hedonism* – pleasure or sensuous gratification for oneself;
- *achievement* – personal success through demonstrating competence according to social standards;
- *power* – social status and prestige, control or dominance over people and resources;
- *security* – safety, harmony, and stability of society, of relationships, and of self;
- *conformity* – restraint of actions, inclinations, and impulses likely to upset or harm others and violate social expectations or norms;
- *tradition* – respect, commitment, and acceptance of the customs and ideas that one's culture or religion, or family provides, respect for tradition, humility;
- *benevolence* – preserving and enhancing the welfare of those with whom one is in frequent personal contact (the 'in-group', family member, friends).
- *universalism* – understanding, appreciation, tolerance, and protection for the welfare of all people and for nature.

These 10 values are grouped in four *higher order values:*

1. *self-transcendance* consisting of *universalism and benevolence* ;
2. *self-enhancement* consisting of power and *achievement*;
3. *openness to change* consisting of *self-direction* and *stimulation*
4. *conservation* consisting of conformity, tradition and *security*.

Hedonism it is a border value that is part of two neighbouring groups of values - self- enhancement and openness to changes.

After study in 10 countries in 2010 Schwartz et al. (2012, pp. 7-8) proposed refined version of basic human values. Refined theory divides the circular continuum of values into 19 motivationally distinct values. After deeper analysis some values were divided and one, face, has been added (Cieciuch, Schwartz, Vecchione, 2013, pp. 26-28). Refined values theory provides greater precision of prediction and explanation for a diverse set of attitudes and beliefs than the original theory (Schwartz et al, 2013, p. 23).

In a research study of value preferences among students, to the most preferred values this group includes: benevolence - dependability, benevolence - caring and self-direction—action. Then appear successively: self-direction—thought, universalism-societal concern, security-personal and universalism-tolerance. The least preferred are: conformity-rules, universalism—nature, power-dominance and power-resources (Cieciuch 2013, p. 284). Schwartz S. (2012, p. 3) explained in the simplest way definition of value, "it is what we think is important to us in life". The complexity comes then each person has their own numerous values, which may be unimportant for another person.

From sociological point of view, values are given a social dimension. Values are arise, develop and evolve with changes taking place in the world (Nadolna, 2011, p. 170). A research study concerning clinical practice (Calman, 2004, p. 366) shows that values can and do change. Nevertheless, there are certain core values (as an example Calman quoted articles from Universal Declaration of Human Rights) that may be unchanged over a long period of time. The reason why value may change is due to either new knowledge or new area of work, changes in social and cultural values and norms, and changes arising through an individual's personal experience of life.

Collins and Porras 2003 (cited in Walecka-Jankowska, Zimmer, Gągała-Sokołowska, 2020, p. 2) highlighted that core values do not undergo any fashion or trends, they are independent from the market situation and stress the authenticity of convictions.

The sociological and psychological approach to the value is reflected in the economy. From the economic theory point of view, a value is considered a feature (or set of features) of a thing, often expressible in money, which is perceived as more or less desired, useful and respected. In the theory of economy there are three main schools, which referred to the term value (Nadolna, 2011, p. 172):

- classical economics (*Adam Smith, David Ricardo, Karl Marx*)
- neoclassical economics (*S.M. Longfield, A. Marshall, J.B. Clark)* began in Europe around the 1870s.
- Austrian School (marginalism) (*C. Menger, W.S. Jevons, F. Wieser, L. Walras)*

Classical school is objective Theory of Value. Focus on the conditions of production (King, McLure, 2015, p. 1). Values, meaning things or phenomena useful to a certain system, that is, supporting the existence or development of it system. Such a system can be an individual, a social group or an organization value (Nadolna, 2011, p. 172). Adam Smith distinguished two concepts of value: value-in-use and value-in-exchange. First one expressed the "utility" of commodity, the second, means "the power of purchasing other goods" that the commodity carries (Gupta, A. 1960). Smith made work a measure of value. However, Smith treated work not as a normal manifestation of human life, but as a kind of "sacrifice", an alternative cost to freedom, peace and happiness (Drenda, 2016, p. 43). Subjective approach focus on the preferences of consumers. This approach is closer to neoclassical economics and especially Austrian school. Value in this approach refers to marginal utility. The utility that an individual derives from the consumption of a quantity of a particular good is determined by his or her subjective assessment of the pleasure, or satisfaction, derived from consumption. 'Marginal utility' refers to the satisfaction that an individual gains from the consumption of an additional unit of a particular good in a given context King, McLure, 2015, p. 6). King and McLure conclude that in modern, digital world, world of twitter, we are prone in direction of subjective theory of value.

Due to the multidimensionality of the value concept, defining economic value in an unequivocally way may result in difficulties. In the literature to define and measure value the notion of economic value is used. Especially when it comes to economic choices, involving trade-offs in allocating resources. Measures of economic value are based on what people want – their preferences. Those choices, preferences are limited by the time, income. Economic value is measured by the most someone is willing to give up in other goods and services in order to obtain a good, service (King, Mazzotta, 2000).

Economic value is characteristically in what is useful. Based originally upon the satisfaction or bodily needs, the interest in utilities develops to embrace the practical affairs of business world - the production, marketing and consumption of goods, the elaboration of credit and accumulation of tangible wealth. Economic value is measured subjectively in market places in terms of labour and commodities (Gupta, Sharma, Thakur, 2011, p. 71).

From the other hand, in the literature there is accounting approach which need objectivism in economic value. According to Nadolna (2011, p. 178-179) considerations, economic value is a category that provides a wide range of information to managers and investors. It is a conceptual category focusing on monitoring the economic effectiveness of decisions regarding the use of a given resource from the point of view of the benefits generated for all stakeholders of the enterprise. As a basic drawback she considers the subjectivism of the estimates, which may lead to the loss of credibility of the information generated by it. A generalized definition of economic value is presented by A. Karmańska (2009, p. 143), *who defines it as a judgment of a given person based on market*

analysis, carried out in relation to each component of resources involved in the economic activity managed by him, i.e. things, systems, laws, financial means and instruments, concepts various business solutions, knowledge, ways of organizing operational activities, various management concepts, methodological solutions, customer relations and many other broadly understood economic resources as to the possibility of recognizing a recognized component as a source of generating economic benefits (cited in Nadolna, 2011, p. 178).

According to Leibniz approach, some material goods produced are so useful that society expresses an urgent need to increase their quantity. The measure of work is not the quantity of material goods produced, but the achieved saving in the work done. Work saving is the microeconomic, empirical equivalent of the concept of economic value (LaRouche, 1995, p. 63). According to L. Drenda (2016, p. 41) economic values are characterized by the creative dimension of humanity. The overarching goal of economic values is to serve life. The threat that appears in the analysis of economic values is reducing them only to the criterion of utility. Mainly due to utilitarization, some of the higher values are available only to a very narrow group of recipients. Only utilitarian disinterestedness guarantees that value is universally useful, and access to it is not rationed. She quotes after Zuziak (2012, cited in Drenda, 2016, p. 42) that work is one of the factors that combines economic values with ethical values. Human work, which is the commitment of activity and freedom, becomes a contribution to self-realization and satisfaction. It becomes a medium of social communication and gives opportunities for the realization of humanity. In similar approach Profesor J. Hausner (2019) seeks the new economic value theory, other than utilitarian. According to his considerations, the meaning of goods, that is, the existential value, is given by cooperating people. Economic value cannot be reduced to profit, any more than good cannot be reduced to goods and utility.

When discussing economic value, the choice function is important. Subjectivism comes in here. Individual preferences, desires, making a choice based on your own needs. Economics as a science teaches about managing unlimited needs and the scarcity of goods. During the pandemic period, we were limited, of course for the higher good of life. Nobody would have imagined that the economic value of a good such as toilet paper would increase so dramatically at the beginning of March 2020 in Poland, and in other countries a little earlier. Basic goods found in nature, which seem immeasurable, have acquired high economic value.

The impact of the coronavirus pandemic on economic values among young people

Material and method

The article presents the scope of the issues of own research. The research area of the presented subject matter includes getting to know the discussed issues on both the theoretical (literature studies) and empirical levels (focused group interviews). Based on the application of appropriate scientific methods and procedures, the concept of economic values and values and their variability under the influence of the covid-19 pandemic were defined. This means that the following methods will be used in the research: analysis, synthesis, induction and deduction. The conclusion for the conducted research will be the answer to the following research question: In the opinion of the respondents, have the economic values changed as a result of the conditions emerging in the covid-19 pandemic among young people? In connection with the above, the following hypothesis was posed: The Covid-19 pandemic determines a change in the approach to economic values among the young generation.

In qualitative research, focus group interviews (FGI) were conducted. The interviews were focused on 4 areas: general recognition of economic values and the impact of the coronavirus pandemic on their change (as an introductory area). Completing an appropriate group of respondents caused many difficulties in obtaining research material. However, the authors hope that the results that were gathered during the research process made it possible to systematize the above-mentioned ones. The essence of the study is: conducting a group interview in the presence of a moderator who supervises the appropriate course of the study, establishing a research scenario using previously selected tools. Research conducted in this way allows solving the problem of the respondents through observation and conclusions that result from this process. Focus group interviews were conducted in a group of students using the online method (MS Teams) in October 2020. The group consists of 12 first year management students, aged 19 to 23.

Findings and Discussion

Therefore, at the beginning of the discussion, participants were asked about the definition of value. One participant defined "personal beliefs that are most important to a person, principles that are important to a person." Another participant, supplementing a colleague's statement, said that in her opinion "values can be divided into material and spiritual". After receiving the response, the respondents were familiarized with the definition of value from the literature on the subject. M. Łobocki defines "values as everything that is considered important and valuable for the

individual and society and is desirable, which is associated with positive experiences and is at the same time the goal of human aspirations" and According to S. Kowalczyk, value is a desired object, what is desired by man, what is the goal of his endeavors". It turned out that without an introductory introduction to the subject, students understand this concept very well. Students were asked what values they know and to arrange them in the order appropriate for themselves? According to the respondents, the general values are happiness, love, friendship, sense of security, health, being resourceful and hardworking. Students indicated important values in human life that determine proper social development. In connection with the above, the students were asked to answer the question whether the concept of value is changing nowadays and whether greater material or spiritual values are important? The respondents decided that the values as such have not changed recently, perhaps for some people health, family and the possibility of keeping a job became a more valuable value. Therefore, students were asked what the concept of economic values meant for them. Initially, it turned out that, unfortunately, students already have a problem with defining this issue. The basic definition of economic values was also presented to the respondents so that the rest of the analysis could be carried out correctly.

Then the respondents were asked what economic values they particularly appreciate. The respondents mentioned as value primarily work and the way it is performed (respect for it, reliability of approach to work, resourcefulness) and education. They were then asked to clarify how the coronavirus pandemic since March 2020 has changed their approach to these economic values. To a large extent, the respondents stated that the pandemic did not change their approach to these economic values. In addition, it turned out that two people got a job thanks to the coronavirus pandemic and considered it valuable as young people and not at risk of severe infection. For them, finding a job before the pandemic was difficult. In addition, their attitude to work, reliability and resourcefulness at work increased. They were therefore asked what can be considered a value in connection with work and its performance. The respondents decided that thanks to diligence, which they considered a value, one can achieve a lot in life. This was stated by the majority of the surveyed students. Conscientiousness and respect that you have a job came second. On the other hand, other people indicated that the pandemic enabled them to take a different approach to new skills in the form of using programs that help in distance learning. One of the respondents stated that thanks to distance learning she could have taken up additional extramural studies. If there was a normal time, she would not be able to study on the weekend in an additional field of her choice due to the considerable distance. Selected people appreciated the possibility of distance learning and the chances of getting another profession and the possibility of getting a better job in the future.

Summary

Summing up the research carried out, it should be noted that it turns out that the respondents are able to freely define the issue of value without any problems, it was difficult for them to define the concept of economic value. The change in economic values under the influence of the coronavirus pandemic is rather invisible, according to the surveyed students. What students lack in remote study are real contacts, meetings. On-line communicators definitely facilitate the existence in the period of isolation, but they are not a substitute for traditional face to face conversation. Values such as closeness, kindness, relationships with others have been noticed in the sanitary regime. However, it is noteworthy that a small number of respondents indicated positive aspects for their perception of values resulting from the Covid-19 pandemic. It is very interesting that young people appreciated the possibilities of getting a job and noticed that work itself is a value, but also its reliable performance, resourcefulness and additional education resulting from distance learning. Referring to the posed hypothesis, it is worth noting that the pandemic affects the views of young people regarding economic values, but the impact is small. This may be due to its too short duration. This may be due to the situation of the respondents, as the vast majority are still dependent on their parents. Certainly repeating the research in some time and looking at the emerging volatility may show a completely different aspect of this issue. Perhaps the research conducted by the authors will become the basis for further analyzes, which will be deepened and will allow the emergence of new threads enriching this research aspect.

Acknowledgment

Abstract

Financial statements provide information that could explain the return on equity. The DuPont extended model identifies five key ratios/indicators that might explain the performance of a company – tax effect, interest burden, earnings before interest and taxes (EBIT) margin, assets turnover and financial leverage. This study aims to analyse the relevance of the tax effect on the "return on equity" (ROE). For the purpose of the study we selected a sample based on listed companies from the stock markets of France, Germany, Portugal and Spain. The number of companies of the sample is 516. The Ordinary Least Square (OLS) method was used to determine the individual impact of each factor on the "return on equity". According to our findings, the tax effect and the interest burden play the most important role in order to explain the return on equity.

Keywords: tax effect, return on equity, DuPont model, stock markets.

Introduction

The evaluation of a company's performance is always a relevant issue in the management field. The tax burden (or tax effect) is a variable that significantly affects any company's financial performance. Consequently, all companies do tax planning, tax avoidance or even tax evasion, to reduce the tax burden. Therefore, the tax burden analysis in return on equity (ROE) is necessary if the managers intend to present better results to shareholders. An evaluation of performance could be performed using accounting or markets data. The financial statements provide the raw material to do the financial analysis. The DuPont model is a well-known model that uses financial accounting to analyse the company's performance. The most intuitive way to compute the return on equity is by dividing net income by equity. For detailed information about the factors which influence the ROE, the DuPont model claim that ROE depends on three factors: "net income margin", "assets turnover" and "leverage". A modified version suggested by Hawawini and Viallet (1999) extend the model to five factors: "tax burden", "interest burden", "EBIT margin", "assets turnover" and "financial leverage". Thus, in this study, considering that we are focused in tax burden relevance, using a sample with 516 companies listed in stock markets in France, Germany, Portugal and Spain, we calculate all the DuPont's components which affect the ROE in the 2017 year (which consists in on cross-section analysis). Then, we used the OLS method to find evidence about each variable' relevance, particularly the tax burden, to explain the ROE, according to the main objective. This study is structured as follows: firstly, we present a brief background about the topic; secondly, we expose the data, sample, variables and method; thirdly, we present and discuss the results. Finally, we disclose the main conclusions.

Brief Literature Review

For shareholders, the companies' taxation is an essential factor that influences the performance of any company. Therefore, managers try to reduce the tax burden. Thus, how mentioned previously, tax planning is a strategic followed to improve the shareholders' net income.

The ratios' use in research has been one way to find evidence about the taxation impact on the companies' performance. The ratios could be used to measure several kinds of performance, at know, the financial performance. Therefore, in many studies, the company' performance is measure as a financial ratio (Lazar, 2016). For example, the ratios analysis can be defined as the use of ratios to interpret the financial statements to analyse the historical performance and current financial position (Sahu & Charan, 2013).

One of the most know and use ratio (in the profitability ratios category) is the ROE. As ROE, profitability ratios are like the confirmation that one company is efficiently capable of using their available resources to grow sales and/or the net income (Ciurariu, 2015). This ratio use net income as a reference in profitability measure (Kijeeska, 2016). However, can be get information more deep reformulating this formula. The main objective of DuPont model is learning how the other factors/ratios could be affecting ROE. DuPont model was first introduced by F. Donaldson Brown, an electrical engineer who integrated the financial department of a chemistry company in 1914 (Kharatyan, Lopes, Nunes & Aghababyan, 2016). The three facts formula is:

$$ROE = \frac{net\ income}{EBIT} \times \frac{sales}{total\ assets} \times \frac{total\ assets}{equity} \quad (1)$$

A change was introduced by Hawawini and Viallet (1999). Two more factors were added, constituting a total of five ratios combined to form ROE. The equation suggested by previous authors claimed as:

$$ROE = \frac{net\ income}{EBIT} \times \frac{EBT}{EBIT} \times \frac{EBIT}{income} \times \frac{income}{total\ assets} \times \frac{total\ assets}{equity} \quad (2)$$

Where EBIT is income before interest and taxes, EBT is income before interest and ROE is given by the following formula:

$$ROE = tax\ burden \times interest\ burden \times EBIT\ margin\ \times assets\ turnover \times leverage \quad (3)$$

In this ROE' formula, tax burden measure tax effect in ROE, interest burden measure effect that interest burden as tax has in ROE, EBIT margin measure ROE's operational profitability, assets turnover measure how efficiently company use its resources to generate income and financial leverage measures the relation between equity and asset turnover.

The DuPont method analysis requires a few simple calculi, as emphasised by Liesz and Maranville (2011) and offers managers the possibility to realise strategic financial planning. In literature, we can find several studies that use the DuPont model to explain profitability. However, some authors (e.g. Kharatyan, Lopes, Nunes & Aghababyan, 2016) claim that, individually, financial ratios indicate incomplete information of a company. Therefore, in many investigations, other ratios were also considered (e.g. current ratio or price/price). For example, Batchimeg (2017) examined which ratios can determine the financial performance of Mongolian companies. He used sales growth, income growth, assets growth, earnings per share, gross profit margin, cost/revenue ratio and return on profit, costs, short-term debt-to-assets ratio, current assets-to-total assets ratio, long-term debt to total assets, fast ratio, current ratio and cash ratio as explanatory variables. Return on assets (ROA), return on equity (ROE) and return on sales (ROS) were choose as the performance indicators.

The DuPont model has no regard the relation between return and risk, as capital asset pricing model and modified versions. However, it is always an essential tool for analysing a company's profitability and understanding the factors contributing to better performance.

We can find in literature many studies on performance issues. Lazar (2016) analysed specific determinants of Romanian companies' profitability during the period 2000-2011. He found that tangibles, leverage, size, and work intensity negatively affected a company's performance.

In addition to the previous factors, we believe that the "tax burden" will always be an important factor in improving profits shareholders. Sometimes, "tax burden", "interest burden" and, consequently, "capital structure" are linked to explain profitability. In 1963, Mogliani and Miller, based on two different companies, one financed by external

sources and other funded by intern sources, they find that the use the external sources seems to have an advantage due to deductions from interest costs. However, considering the taxation of corporate profitability, the weighted average cost of capital is influenced not only by the tax rate but also by the capital structure (Modigliani & Miller, 1963).

In terms of leverage, according to Ribeiro (2015, p.8) "hopes that companies more leveraged show effective taxes lower", mentioned that Richardson and Lanis (2007) and Kraft (2014) find a negative significative relation between leverage, using as a proxy the capital structure and effective taxes rates (ETR). Therefore, if the debt cost is less than the investment of profitability, due to a tax deduction of interest, the return on equity will increase.

Using a sample of 20 companies listed in the stock market of Bucharest and the net income and return on assets as a performance measure, effective tax rate, companies' size, capital structure, long term debt and financial leverage, Pitulice et al. (2016) analysed a possible influence of corporate tax on a company' financial performance. They found that the effective tax rate negatively influences the dependent variable (ROA); lower net profit 5,63% compared to 0,32% in ROA.

Constantin (2012), concerning the correlations between financial indicators and effective tax rate (ETR), found a negative relation between the asset ratio and the ETR: an increase of 1% in the ratio between fixed assets and total assets, the effective tax rate at company level decreases 0,3251%; the relation between effective tax rate and ROE is negative; sales margin and ETR show an indirect relation.

Xianyu (2011) finds that the tax burden on macro and micro operational performance has a significant negative impact on companies' performance listed in China.

The relation between the effective tax rate and leverage, calculated as the ratio debt to capital, occurs in some studies as negative (Md Noor et al., 2010; Richardson & Lanis, 2007; Gupta & Newberry, 1997). The authors found a significant negative relation between corporate tax and financial performance using an asset's profitability as a variable measure.

One study realised by Rotimi and Henry (2016) confirms a significant relationship between corporate tax and manufacturing companies' performance in Nigeria. The results show a negative relation between the corporate profitability tax and earnings per share, "indicating that a unit increase in tax cost reduces earnings per share in approximately 38,3%, during analysing' period".

Concerning component "assets turnover", Soliman (2008) study the decomposition of profits: assets turnover, profit margin and market association with DuPont components, either in long windows tests as in short windows. He found that assets turnover has an explicative power to future variations in "return on operating net assets".

Methodology

Objectives

The tax burden is always an essential factor that reduces the available profit to shareholders. The impact could be bigger or smaller considering tax rates, tax benefits, tax incentives and tax adjustments to "profit before tax" to calculate the "tax profit". Therefore, it depends on tax law and, consequently, is dependent on the country in analyse. Thus, this study's main objective is to calculate the impact of tax effect in return on equity, considering the DuPont model's variables as a whole.

Data and sample

The data was selected from financial statements in companies listed in stock markets in Germany, France, Portugal and Spain available in database Amadeus (http://amadeus.bvdinfo.com). The accounting information needed to the study is the data about results before tax, net profit, EBIT, sales, total assets turnover and equity. After getting the database information (march, 2019), the data was analysed and defined to avoid biased results. Data were obtained from 2017 financial statements, so the analysis is a cross-section. In the data preparation process, several companies were excluded according to the following guidelines:

(a) Financial institutions were removed from the database because they use a different accounting system with specifics accounting standards. Therefore, financial information isn't comparable with the purpose of this study;

(b) Companies with values considered outliers, which could bias the results (e.g. ROE values above 100% and negative);

(c) Companies with missing variable values, not allowing the calculation of ratios;

(d) Companies with no activity in 2017;

(e) Companies that didn't pay corporate taxes in 2017;

(f) Companies without financial charges ("positive" financial costs, i.e., tax profits higher than expenses).

As a result of our approach, the database includes 516 companies listed in the following values: Germany (199), France (233), Portugal (18) and Spain (66). Then, after identifying the extended DuPont model variables, values for these variables were calculated according to their formulas (see Table 1).

Variables

The variables used are the following: ROE, tax effect, interest burden, EBIT margin, asset turnover and financial leverage. Table 1 identifies the variables, descriptions and formulas, and the expected association between each variable and ROE.

Table 1: Identification and description of the variables included in the extended model.

Abbreviation	Variable	Description	Formula	Expected Association
ROE	Return on equity	Amount of income returned as a percentage of shareholders' equity	$\frac{net\ income}{total\ equity}$	n/a
tax_effect	Tax effect / tax burden	The proportion of the company's profits retained after paying income taxes%	$\frac{net\ income}{pré - tax\ income}$	+
interest_burden	Interest burden	Measures the effect on interest on ROE	$\frac{pré - tax\ income}{EBIT}$	+
EBIT_margin	EBIT margin	Measures how much is left of revenue considering the cost of goods sold and operating expenses	$\frac{EBIT}{sales}$	+
asset_turnover	Assets turnover	Measures the efficiency of a company's use of its assets in generating sales revenue	$\frac{sales}{total\ assets}$	+
leverage	Financial leverage	Is the use of borrowed capital to increase the potential return of an investment	$\frac{total\ assets}{equity}$	+/-

Source: Author's elaboration

ROE is the dependent variable (the one we intend to explain). All the others are the independent variables (the ones that we expect to have some association/effect on the ROE). Regarding the type of association with ROE, all independent variables are expected to present a positive association. For example, the higher the tax effect ratio value, the lower the tax to be paid. In other words, if the ratio increases, the tax burden decreases. The same happens with the interest burden. Regarding the EBIT margin, the higher the ratio, the better. Concerning the financial leverage, the higher the ratio value, the greater the leverage level.

Method

About the model, the traditional OLS regression method was used in this study to identify the most relevant indicators in explaining variations in ROE and quantify the relationship between each variable and the return on equity. Therefore, the OLS regression method is applied to determinate which variables are more explanatory/have better power of association in the ROE's variables.

The complete linear regression is present in equation (4). The OLS method application in equation (2) requires the use of logarithms. The equation estimate is the next:

$$ROE_i = \alpha + \beta_1 effect_tax_burden_i + \beta_2 effect_interest_burden_i + \beta_3 effect_EBIT_margin_i + \beta_4 effect_assets_turnover_i + \beta_5 effect_financial_leverage_i + e_i \quad (4)$$

Results and Discuss

First of all, it is important to remember the coefficients found in estimating the OLS model that relates the independent variables with the return on equity. Thus, the values found are shown in Table 2.

Table 2: Analysis of ROE by factors.

	Tax effect	Effect of the interest burden	Effect of EBIT margin	Effect of assets turnover	Effect of financial leverage
Estimated coefficient	1.20	1.64	0.33	0.10	0.27
R^2	0.29	0.35	0.13	0.01	0.02

Source: Author's elaboration

Note that the variation of 1% in the variables in the study, induces an increase between 0,10% and 1,64% in return on equity. The variables that encourage a higher increase in ROE by an increase of one unit in these same variables are the "interest burden effect" and the "tax effect", respectively. The variables have significant explanatory power, except for the variables "effect of financial leverage" and "effect of asset turnover" which have a determination coefficient of only 2% and 1%, respectively.

The main objective of this work is to evaluate the tax effect on the profitability of listed companies. Therefore, models were analysed with more than one explanatory variable, intending to conclude how the tax effect was manifested according to the analysed variables. Firstly, it isn't possible to perform the analyses with all the explanatory variables. Since the ROE is the product of the multiplication of all five explanatory variables, the model presents itself with perfect multicollinearity, which doesn't allow the estimation of that same model. Thus, the solution found is to remove each of the variables, in turn, and estimate the model.

Table 3 shows the models constants and the value of the variables in each model and the value of the adjusted coefficient of determination of the model. Model 1 corresponds to the estimation of ROE without considering interest burden, model 2 to the estimation of ROE without considering EBIT margin, model 3 to the estimation of ROE without considering assets turnover and model 4 without considering the financial leverage.

Table 3: Estimation of ROE for studied models

Explanatory variables		Model 1	Model 2	Model 3	Model 4
Constant		0.46	-2.23	-1.77	0.47
L_tax_effect		1.11	1.04	0.94	0.97
L_effect_interest_burden		-	1.68	1.64	0.71
L_effect_EBIT_margin		1.19	-	0.27	0.86
L_effect_asstes_turnover		1.24	0.05	-	0.91
L_effect_financial_leverage		0.85	0.75	0.88	-
Model adjustment accuracy indicators	**R^2 adjusted**	0.75	0.66	0.74	0.81
	F(4.511)	559.46	179.75	218.60	476.93
	P value(F)	0.00	0.00	0.00	0.00
Model information criteria	**Schwarz**	189.75	834.86	700.10	534.06
	Akaike	168.52	813.63	678.87	512.83
	Hannan-Quinn	176.84	821.95	687.19	521.15

Source: Author's elaboration

Model 1 shows that, with a 99% confidence level, it is possible to affirm that the 1% increase in any of the explanatory variables that are part of the model increases return on equity between 0.852% and 1.238%. The variable "effect of

asset turnover" is the one that most contributes to the variations in the variable ROE and the variable "effect of financial leverage" that least causes variations in the variable ROE. The adjusted determination coefficient indicates that the variations that occur in the explanatory variables with the "interest burden effect" as a variable omitted explain 90.3% of the variations that occur in ROE. This value is very high, so this model has high explanatory power. The F test assesses the joint significance of the variables and in this model, this parameter is statistically significant, which means that the variables together form a good model.

By analysing model 2. at a 99% confidence level. it is possible to state that the 1% increase in the variables "tax effect". "effect of interest burden" and "effect of financial leverage" increases the return on capital 1.041%. 1.675% and 0.752%. respectively. Although the variable "effect of assets turnover" indicates that if it undergoes an increase of 1%, the variable ROE increases by 0.050%. There is insufficient statistical evidence to affirm that this variable has significance in this model. The variable "effect of interest burden" is the variable that most changes the variable ROE and the variable "effect of financial leverage" is the one that causes the lower changes in the dependent variable. The variations in the explained variable are justified in 65.6% by the variations of the independent variables when the variable "effect of EBIT margin" is omitted, as shown in the adjusted determination coefficient parameter. This value is reasonable, so this model has some explanatory power that is in line with what is indicated in the F test result. This test indicates statistical significance, so these variables form a good set that allows building a model.

Model 3 shows that. with a 99% confidence level, it is possible to affirm that the 1% increase in any explanatory variables increases the ROE between 0.268% and 1.640%. It is the variable "effect of interest burden" that causes the bigger change in the dependent variable and the variable "effect of EBIT margin" is the one that least induces changes. By the adjusted coefficient of determination, it is possible to identify that 73.5% of the variations in the return on equity are explained by the variations in the independent variables when the variable "effect of assets turnover" is missing. The F teste shows that the variables together make a good model. The result is significant for a 1% significance level.

Model 4 shows that, with a 99% confidence level, it is possible to state that the 1% increase in any of the explanatory variables increases the ROE variable from 0.712% to 0.973%. The variable that causes the most changes in the dependent variable is "tax effect". The variable that has the least influence on the return on equity in this model is the "effect of interest burden". Observing the adjusted determination coefficient is possible to verify that 80.8% of the variations in the return on equity are justified by variations in independent variables. This value is high. So this model has an explanatory value. The F test proves that the use of this set of variables forms a good model with significance for a level of statistical significance of 1%.

Comparative analysis and discussion between models

Model 1 had an adjusted coefficient of determination of 90.3%, indicating that 90.3% of the variations that the return on equity suffers are justified by the variations in the explanatory variables that the model includes. It is a high value, so the model has good explanatory power. The F test confirms the explanatory power since it indicates that the set of variables form a good model. at a significance level of 1%.

In the observation of the adjustment accuracy of Model 2. it is noted that the model has an adjusted coefficient of determination of 65.6%. The variations in the profitability of equity are explained only 65.6% by the variations of the explanatory variables that integrate the model. Although it is not a high value, it is considered reasonable and allows us to conclude that the model has some explanatory power. The joint significance test indicates that the variables used form a good model at a significance level of 1%.

Model 3 has an adjusted coefficient of determination of 73.5%. The variations that occur in the profitability of equity are 73.5% explained by the variations of the independent variables that constitute this model. It is a high value and indicates that the model has explanatory power. With this, by observing the F test result, it can be affirmed that the variables together form a good model for a significance level of 1%.

Concerning Model 4, the adjusted coefficient of determination shows that 80.8% of the variations that occur in return on equity are explained by the variations of the model variables. This value is high and, therefore, the model has explanatory power. The F test proves this fact as it indicates that the set of variables forms a good model at a significance level of 1%.

As for specifying model information, three criteria - Schwarz. Anaike and Hanna-Quinn - were analysed. They allowed choosing the best model among the five models studied. According to the criteria selection rules, the model

with the lowest values is chosen. Thus. one can conclude whether the best model is Model 1 (see Table 3). as it has lower values. Accordingly, the adjustment coefficient also indicates, which is the best model that has the highest value (90.3%).

As for the worst model, it can be concluded that it is Model 2. The model has the lowest value in the parameter of the adjusted determination coefficient, indicating that the variations in the explanatory variables justify it in a lower percentage (compared to other models) changes in return on equity. In the three information criteria understudy, it is the model with the highest values.

The impact of the tax effect – global simple

The "tax effect" variable plays an important role in determining the return on equity. The impact measured in percentage terms, for each unit, varies between 0.944% and 1.112%. That is. if the tax effect varies by approximately 1%. the return on equity will vary between 0.944% (Model 3) and 1.112% (Model 1). Concerning the other variables, the "effect of financial charges" under Models 2 and 3 and the "effect of asset rotation" under Model 1 stand out.

In general, concerning the "fiscal effect". the results are in line with the studies carried out by Xianyu (2011). Constantin (2012). Pitulice et al. (2016) and Rotimi and Henry (2017). which show an effect positive effect of the "tax effect" on the return on equity. Concerning the other variables, the direction of the influence on the return on equity is also in line with other studies already carried out. In particular. with the evidence of Batchimeg (2017) who observed a positive influence of the "EBIT margin effect". Also, Gupta and Newberry (1997), Richardson and Lanis (2007), Soliman (2008) and Md Noor et al. (2010) obtain the same results. They are stating that the "effect of asset rotation" is positive. When this variable is negative, the results are in accordance with the results of Janssen and Buijink (2000) and Adhikiri et al. (2006). Regarding the "financial leverage effect". the results are in line with those of the investigation by Delen et al. (2013). who concluded that it had a positive impact.

Conclusion

Using data from companies listed on the German. French. Spanish and Portuguese stock markets we analysed the DuPont models' factors where the tax effect is included. The evidence shows that taxation plays an essential role in explaining ROE. The tax effect alone explains about 29% of ROE. In terms of the impact on ROE, if the tax effect increases by 1% (that is. the tax paid decreases. according to the model), ROE increases by 1.20% which shows the importance of this factor in the decision-making process about investment decisions. The interest burden is the factor that has the most significant impact on ROE and explains approximately 35%.

The analysis was carried out with companies from all countries (global sample). It is important in future research to extend the analysis to each country, taking into account the differences in ETR. The conclusions of this study must be considered taking into account the context of the DuPont model. From the initial sample, we had to eliminate several companies due to the deferred tax accounting procedure. When we think about the DuPont model, we can have the following premises: taxes will decrease profit before taxes and the interest burden will also decrease profit before interest paid. Currently, due to the general adoption of IASB international accounting standards (IAS. IFRS), the accounting context for deferred taxes may not be well understood when using the DuPont model; we expect taxes to decrease profit after tax. not the other way around. Therefore, although we have removed from the sample, the companies that present profits after taxes higher than profits before taxes, the results can be influenced by deferred taxes.

Motivation is what gets you started.
Habit is what keeps you going.
Jim Ryun

Abstract

The article attempts to approximate the topic related to the use of e - learning as a form of education and related opportunities to motivate participants to learn. Modern education must meet the demands of today's world. The CODIV-19 pandemic became the perpetrator that made remote learning no longer an experiment zone but a fact. This situation also allowed us to look at the nature of man and his motivation to learn in conditions other than traditional teaching. At the outset, the motivation that stimulates the body to act is characterized and the desire to achieve the goal. In turn, remote teaching is described as a support in the didactic process, taking into account its advantages and disadvantages.
The study focuses on the role of lecturers - teachers as external motivators that stimulate and trigger the motivation of students - pupils to learn and thus to achieve their goals. As a summary of the considerations, the author presented examples of recommendations for lecturers conducting remote education.

Keywords: Motivation, E-Learning, Teacher, Process.

Introduction

E - learning is becoming not only an integral part of academic education, but also of learning at its lower levels. It continues to cause controversy and it is certainly not possible to speak of a full acceptance of this teaching method in a not only research and teaching environment but also among participants of distance learning. This form has long been used in universities or enterprises to improve the knowledge of employees, but it has never included such a large group of participants. The CODIV-19 pandemic has accelerated the development of distance learning. All its participants had to adapt to the new reality.

The subject of the article is important due to the psychological and emotional aspects, the impact on the motivating process, how to get motivated and how to stay motivated. Classes prepared for its participants on the e-learning platform should consist of several components. On the one hand, they should allow for the consolidation of messages, on the other hand, they should allow for better assimilation of knowledge and another for building social bonds that are so important.

The main purpose of the article is to provide recommendations for lecturers who should be a kind of mentor for listeners, students and the driving force behind their motivation to learn. It also shows the motivation that is needed by the teachers themselves. The analysis of the presented issues required taking into account many aspects, such as: psychological, pedagogical or social, as well as technical conditions for remote education. The Author interchangeably uses the words lecturer - teacher or student – pupil.

For the purposes of this study, the Author has formulated research questions in order to better analyse the topic undertaken.

Research Questions

Q1: Motivation and social bonds, or how does working in a group make us "want"?
Q2: How important is the teacher himself in the teaching process?
Q3: How does the teacher influence the student's level of motivation?
Q4: How is the teacher motivated, what drives him to act?
Q5: What will make us motivated at a later time?

The answers to these questions are included in the content of the study.
The article has a theoretical character and was created as a result of literature studies, analysis of the surrounding reality and own experience. In the future, the Author intends to conduct extensive research on the problems faced by students in distance learning and what makes it most difficult for them to motivate to learn and what are the learning outcomes.

Motivation as a source to achieve the goal

Motivation arises when we feel an unmet need, it can become consciously or unconsciously. It is this need that set us a goal and makes us take specific actions, as a result of which - we expect to achieve our goal. If the action taken does not bring the expected results, it is certain that in the future we will no longer take the same action to achieve it. However, if we have chosen the right course of action and the objective has been achieved, we will probably use it again when the need arises. In research on the essence of motivation, the definition of Oleksyn stands out, who used the phrase: motivation aims at making people want to want (Nieżurawska - Zając J., 2020, p. 22). It is the "desire" that encourages us to take further steps or to begin them.

An unmet need motivates people. In literature, there are numerous classifications of needs, they can be summarized as follows: biological, social, achievements, recognition, development, the need for power. Motivation arises from needs, as well as goals and expectations, the motivation is stronger the more people care, how much they believe that their efforts will be crowned with a reward worth the effort, that the need will be met (see Armstrong M., 2007, p. 34-35).

Motivation consists of three phases. In the first, there is a factor called "Motive", it triggers readiness to act, that is, triggers certain behaviours. The choice is then made of a certain behaviour which is intended to have an effect - result (phase II). In the last third phase, there is satisfaction or lack of it. This is, of course, a very simplified scheme of motivation, but it illustrates it in a very clear way.

Motivation can be divided into external and internal. The former consists of the factors that are aimed to trigger certain behaviours, undertake tasks to get the desired effect. Generally speaking, external motivation describes what others are doing to motivate us - in the topic described, it will be primarily a lecturer who will try to liberate the desires and motives to learn by the student - pupil. On the other hand, the internal motivation arises from the work itself, it has not been provided by anyone from outside. "External motivation has a quick and effective effect, but it doesn't last long. Internal motivation related to the "value of work" gives deeper long-term effects "(Armstrong M., 2007, p. 36). Internal motivation is like gold, it is the energy for action that is within every person. They're kind of mechanisms that come into the right mode to propel you even more. There is a situation when we want something very much, something we particularly care about, which causes our thoughts to revolve only around a given goal. At such moments, the very mechanism that is inside us is released.

There are huge deposits of motives in man, located in his consciousness. According to Professor S. Szuman, the ease or difficulty of learning motivation is based on a four-factor theory of development and depends on (Szuman S., 1959, pp. 145-158):

1. our capabilities and properties - they have a genetic basis;
2. our activity change with age;
3. the environment in which we live in, which affects us and to which we adapt;
4. how we are brought up and how and what we learn.

Our motives for action depend on the interaction of the above-mentioned factors and the learning process.

It is worth citing the definition of motivation according to Griffin (Griffin R., 2006, pp. 518-519), which defines it as a system of forces that encourage people to behave in a certain way. In contrast, Lindsley (Lindsley D.B, 1957, 44-105) recognizes that motivation is a collection or a result of forces that initiate, direct and sustain goal-oriented

behaviour. Mitchell (Mitchel T.R., 1982, pp. 80-88) described motivation as a psychological process that initiates direction of actions, and then prompts them to undertake voluntary activities aimed at achieving goals (Nieżurawska - Zając J., 2020, p. 20). All these definitions combine need and purpose, a goal that is an indispensable driving force for action. According to Dweck, goal-oriented students strive to develop their abilities. They confront tasks, striving for their perfect execution. They regard the difficulties associated with this as a natural element of the learning process (Mietzel G., 2008, p. 303). The development of students is a very important element of teachers' motivation, because the most important motivating factor is the learning progress in their learning (Tin L. G., et al., 1996, p. 28).

When determining what motivates other people, care should be taken on the assumption that the source is their constant personality trait. In the first stage, it is important to observe what incentives or risks flow from the outside. Then, to take into account social motivation, Alfred Adler believed that problematic behaviours often have their sources in a sense of personal mismatch and perceived social threats. A healthy personality compensates for this with the purpose or need for cooperation and a desire for acceptance from others, Adler called it a social interest (Zimbardo P., et al., 2017, p. 22). Currently, psychologists try to combine social motivation with external incentives and threats, calling it a "power of the situation."

Motivation is very important in everyone's life. It helps in the proper functioning of our mental and physical sphere. It is needed for, among other things, work or study. The current situation related to the coronavirus may affect this motivation to a varying degree. Unfortunately, space constraints and the introduced general restrictions can have a negative impact on the level of effectiveness of our operation. The emotional state of students turned out to be a serious problem, caused by both epidemic as well as social distance, feelings of loneliness, fatigue and exhaustion. That is why the motivation that lecturers should “infect” with an impulse to make an effort is so important.

E - learning - support in the didactic process

Remote learning, or so called e - learning takes advantage of the opportunities offered by the Internet through which we can disseminate knowledge. At this point, it is necessary to reflect on one of the aspects of its social role. "A social bond comes down to the feeling of" identifying "an individual with a group, i.e. identifying one's aspirations and aspirations of other group members ”(Woźniak - Zapór M., 2017, pp. 18-19). In the process of remote learning, it is very difficult to "ensure the implementation of social functions performed by a group of learners: stimulating interest through social pressure, mobilizing to effort by fighting for the recognition of the group (...),the social effects of grouping people in a similar social situation" (Woźniak J., 2009, p. 56).

The Internet has emerged in many areas of life, from various forms of education, through entertainment, interpersonal communication, to remote work, as we already know and use. The Internet is no longer just a technical domain. It is necessary to focus on its social activity for many groups, it has become an indispensable part of social functioning that allows to satisfy the majority of social needs and motivations (Zając J.M., Krejtz K., 2008, p. 191).

E - learning covers six areas such as technology, content, people, context, behavior and communication, they are interrelated and influence each other. In order for a given course, training to be successful, regardless of the unit in which it is implemented, it cannot take place without taking any of them into account. A well-prepared e-learning training should meet the relevant requirements in terms of: content, learning process, personalization of e-learning, learning culture and technology (Plebańska M., 2011, pp. 13-15). Today, technology plays a key role in the teaching process. Modern forms of communication have become a catalyst for the progressive integration and globalization, these processes have a direct impact on the operation and functioning of the educational sector (Olearnik J., 2011, p. 13).

In 1996, the concept of a knowledge-based economy was defined by the Organization for Economic Cooperation and Development, it was recognized as "an economy based directly on the creation, distribution and use of knowledge and information" (The Knowledge - Based Economy, Paris, 1996, p. 7). The knowledge-based economy of its kind is based on a constant increase in quality and productivity, and the demand for knowledge itself and for qualified employees is growing, which is the result of didactic work (Olearnik J., 2011, p. 11). However, it should also be noted that in 2010 the European Council adopted the Europe 2020 strategy, which has one of the priorities being "smart growth: development of an economy based on knowledge and innovation" (Europe 2020, p. 6).

The forms of distance learning have been used for many years and are an effective tool to support education not only adults but also children. Remote learning enables a wide range of education levels in society. One of the priorities of the European Union is to support the electronic form of teaching, building open, attractive and accessible learning environments for everyone.

Selected advantages and disadvantages of the distance learning system (Lorens R., 2011, Warszawa – Bielsko – Biała, p.10.).

Advantages:

- freedom to choose the time and place of learning
- the independence of the student's and learner's location,
- reduced participation costs (e.g. travel, accommodation, meals, loss of working day),
- quick access to teaching materials,
- the possibility of repeated acquaintance with the teaching material,
- modern, interactive educational materials,
- greater opportunities to individualise work with a student who is capable or has learning difficulties,
- more contact possibilities with the teacher outside of school hours,
- improving the use of information and communication technology in practice,
- shaping the ability to take responsibility for development and education,
- acquiring the skills of systematic work, opportunity to improve IT skills.

Disadvantages:

- the need to have both adequate computer equipment and high-speed Internet connection,
- the need to know how to use your computer and efficient typing,
- limited personal contact between learners and teacher,
- greater possibility of dependent work on the part of students,
- limited possibilities to motivate the student,
- difficulties with the systematic work of the student,
- poor ability to control the student's work, decrease in motivation in case of technical problems with the platform.

Only selected advantages and disadvantages are listed above, of course it is impossible to list them all. E-learning will surely always have its supporters and opponents. However, one thing is certain, technological progress meant that, despite the adversity brought about by the pandemic, we are able to meet the requirements for the transfer of knowledge to teachers, lecturers and trainers.

Summing up, special attention should be paid to the important fact that humans play a decisive role in both traditional and online teaching. Based on the most modern techniques of knowledge transfer, it is people who are a key part of this system, both the learner and the taught person.

Motivating learners on e-learning courses - the role of the teacher and the learner as a joint process for achieving the goal

In time with the development of information technology, there are changes in the roles of students and lecturers. A teacher - lecturer who has the competence to conduct classes in his discipline, has numerous scientific achievements, should also expand his skills in the organization and implementation of the didactic process. As it turned out, during the coronavirus epidemic, many teachers were surprised by the lack of even basic knowledge about creating and operating courses in distance learning. Lecturers were confronted with the fact "overnight", for many it was a completely foreign tool especially for teachers in primary or secondary schools.

According to the research conducted during the coronavirus epidemic, which was carried out by Centrum Cyfrowe in cooperation with the Centre for Civic Education and the School with Class Foundation, as many as 85% of the teachers surveyed had no previous experience with remote learning (Centrum Cyfrowe, 2020, p. 5). However, it is hardly surprising that the basic model of traditional education was the classroom form.

Teachers were put to a great test and had to develop a new teaching methodology, which entailed some limitations. You cannot forget about an additional psychological factor not only for teachers but also for students for whom, as a result of a pandemic, the learning process has become a highly traumatic and stressful experience. In such situations, the motivation to work and study is, unfortunately, strongly weakened. Despite various obstacles encountered by the lecturers, whether they were problems with the equipment, Internet access or prosaically lack of space for peaceful learning, they were up to the task. Most teachers have even decided to use more than one e-learning method despite being aware of their extra time. Their motivation to take such actions is primarily the desire to facilitate and improve the learning process. Meeting students and not, in rare cases, parents.

The role of a teacher, lecturer, trainer, any person conducting classes or various types of online courses should be to motivate students and to be interested in what is happening at any given moment, as well as to further independent learning, in this way "students learn independence in organizing their time and the place of study, thus also in the future they should not have problems in acquiring knowledge, skills or expanding their competences ”(Woźniak - Zapór M., 2017, p. 57).

In view of the above, sample guidelines have been developed - recommendations for lecturers conducting remote learning:

1. Easy to provide up to date information on the teacher-student line.
2. Additional feedback provided to individual participants.
3. Carefully prepared educational content rich in multimedia forms.
4. Creating tests, questionnaires that will not only be motivating by focusing on success, but will provide an opportunity to enrich and deepen the mastered content.
5. Create short and short-term training modules. Short modules will contribute to a greater motivation of the student and will also result in the completion of the course to a significant extent. However, in this case, the strongest factor is the individual need resulting from the need to absorb the content learned during the classes.
6. Presented multimedia educational content, created in such a way as to create the possibility of additional interest of the student.
7. Maintaining adequate flexibility in on-line teaching.
8. During remote classes, the teacher should give a sense of security and be fully committed.
9. The process of motivating to learn will be facilitated by the on-call aspect - consultations appointed by the teacher for students, they will be able to address questions and problems during this time – an individual approach. Involvement and listening will make the participant feel special and thus will be more motivated to continue working.
10. The lecturer should organize work in groups during the classes - such a procedure will have a positive effect on getting to know the participants and making closer relationships, secondly, it can trigger a competitive factor, which will additionally be a motivating factor for further learning.
11. React to the participants' signals, you should "read between the lines" - that is, to try to capture the suggestions of the listeners during the course.
12. Apply rewards and punishments (assessments), in the education process it is important to shape behaviours, norms and values and it is important to check that they are respected. In this way, we teach the hierarchy of norms. However, experience and research indicate that positive reinforcements are more effective. The award provides positive emotions and thus motivates the repetition of behaviours that led to success.
13. The lecturer as a "leader" should not dominate, but skilfully convince students to achieve a common goal (transfer of knowledge and encourage further study - the lecturer and the student's goal will be, for example, to pass an exam or to work in a dream position in connection with obtaining the appropriate qualifications).
14. The last point, but how important it is to be not only a teacher, but also in a certain way, a psychologist, the ability to pick up and react to emotions.

This thread is especially important during the coronavirus pandemic. Isolation from social life, lack of contact in the real world makes students lost and they do not know how to control their emotions – to find themselves in a new situation for all of us, which also affects their poor motivation to learn. In the United States, the concept of "learning social and emotional skills", in short SEL (Social and emotional learning) has started to appear in curricula since 1995. It has been proven that SEL is an active component of programs that improve learning ability. “Helping children to develop self-awareness and gain self-confidence, control emotions and impulses and the development of empathy leads not only to better behaviour, but also to a measurable improvement in academic performance” (Goleman D., 2005, p. 15). Such preparation gives invaluable results in facing problems in further professional and personal life.

The motivation of lecturers is extremely important, substantive preparation, positive attitude and their commitment strongly influence the motivation of students. It is the external motivation that the lecturer is able to offer that can lead the student to fulfil his / her needs and, consequently, to satisfaction. The student will remain motivated in the long term through memories, he will be able to return to the moments that gave him a positive motive to act.

Summary

Modern education must meet the demands of today's world, keep up with the need for a growing knowledge society. These needs arise from the need to solve problems not only with those we have to face now during the CODIV-19 pandemic, but in the broader perspective, because the growing technological capabilities give us a wide range of activities, especially opportunities to use it in education. Participation in distance education has become a fact, it required of teachers, or at least from the majority of them, as the research shows, quick acquisition of skills and a methodological workshop based on information and communication technologies. The article is devoted to remote education, but it is a tool for motivation for both lecturers and students. Motivation works in two ways. Motivated to work teacher will be happy to pass on substantive knowledge, which he will be able to pass on in an interesting way to his students, who, encouraged to learn, will be motivated to make an effort to also draw satisfaction from the lessons acquired. To sum up, in such a closed circuit, lecturer – student – lecturer will all drive themselves to action, they will motivate themselves and with such an attitude they will remain motivated - perhaps for a long time to continue to act, recalling the positive aspects of motivation.

Selected Initiatives of CSR Practices Towards Employees as An Expression of Concern for Human Capital in The Light of Findings of Primary Studies

Agnieszka KWARCIŃSKA

Department of Human Capital Management, Institute of Management, University of Szczecin, Szczecin, Poland

agnieszka.kwarcinska@usz.edu.pl

Abstract

The significance of the condition and advancement of human capital currently comprises a determinant of the dynamics and progress of both economies as a whole, as well as different actors functioning on markets. It is therefore important that we pay attention to the need for caring for human capital in various dimensions and that we continuously look for alternatives to improve its condition and create growth opportunities. This is where the concept of corporate social responsibility, or CSR is helpful. With its principles, CSR is fully consistent with the sphere of responsibility of entities (organizations) for, among others, employees. Because of that, in the dimension of performance, the delivery of activities in this field can effectively determine the quality and development of human capital. The aim of the article is essentially to present the results of primary research conducted in 2019 on a group of 301 enterprises from the Zachodniopomorskie Voivodeship in Poland, regarding the implementation by these entities of selected activities addressed towards employees in the field of corporate social responsibility. The results of these studies provided the basis for the formulation of key proposals regarding, inter alia, the degree of involvement of these entities in the implementation of CSR-related activities towards employees, as well as shaping human capital. The studies allowed to indicate a peculiar insufficiency of taking responsibility in this area of CSR and the need to raise awareness about the importance of caring for the human factor in the organization.

Introduction

Human capital as a function of abilities, knowledge, skills, education, specific characteristics of particular individuals, their experience, attitudes, health, willingness to work, motivation and commitment represents the most important factor of development in the macro and microeconomic dimension. The levels of interest in the quality of human capital include both individuals, who in a somewhat direct way care primarily for personal development, as well as organizations, enterprises that engage and use the human factor in an economic sense and derive specific benefits, in a scope more than merely material, and finally countries aware of the importance of this determinant as the major driver of long-term socioeconomic development. This article focuses on the level of enterprises in an entity-based approach; this point of view was used to exemplify two groups of entities representing the service sector. On the other hand, in a subject-based approach, an attempt was made to analyze the degree of undertaking practical steps towards employees by the surveyed companies as part of implementation of the concept starting points of corporate social responsibility (CSR), assuming their favorable influence on the condition and development of human capital. Examples of corporate involvement cover the two main factors of staff management, namely occupational health and safety and health protection.

Both the entity-based and subject-based approach were of interest mainly for two reasons. First, because of the importance of the service sector today. Secondly, in view of the fact that modern enterprises undertake the implementation of the broadly understood concept of corporate social responsibility. It should be added that the second premise is the leading issue of this article, which comprised the base for preparation and analysis of the research material. The primary focus was specific activities in the field of CSR concepts undertaken by enterprises in relation to their employees, and the legitimacy of their implementation was compared to a specific support for the care of human capital. It can be noted that the research efforts are extremely important, which can be demonstrated

by the ever-growing number of publications covering similar issues (Kwarcińska, 2018; Zieliński, 2014; Furmańska-Maruszak, Sudolska, 2017; Badura-Mojza, 2016; Kaźmierczak, 2018). These publications refer to the theoretical aspects of CSR concepts concerning the relations with staff in the organization, as well as the human resource management process (Herrera, Heras-Rosas, 2020; Voegtlin, Greenwood, 2016), and often have an application dimension (Nowak-Lewandowska, 2009; Gadomska-Lila, 2012). Dissatisfaction could be caused by the lack of comprehensive and clear approaches to this topic, probably also due to the variety (Kwarcińska, 2019) of possibilities for individual organizations to become involved in the implementation of the CSR concept.

The functioning of enterprises on the basis of the principles of corporate social responsibility

Assuming the evolutionary nature of the development of enterprises, taking into account the increasing number of determinants of their functioning and the increasing competitiveness, it can be observed that today's organizations are increasingly turning towards the awareness of responsibility. What follows is that they take into account the impact of their activities on various groups of stakeholders and the consequences associated with it, and at the same time recognize the meaning behind analyzing this impact and creating mutual relations. Such assumptions of responsibility form grounds for the concept of corporate social responsibility known as CSR (Kwarcińska, 2015). It is worthy to mention that the source of social responsibility is probably the idea of sustainable development, and its application dimension represents a set of activities undertaken, among others, by enterprises in relation to their broadly understood environment. In this sense, two dimensions of considering corporate social responsibility are most often indicated: external and internal. In this approach, the external dimension includes:

- "impact on local communities,
- relations with business partners, shareholders, suppliers, customers, public institutions,
- respect for human rights,
- care for the natural environment" (Bartkowiak, 2011).

On the other hand, the internal dimension takes into account:

- "safety at the workplace,
- human resources management,
- management of raw materials consumed by the enterprise and
- environmental impact" (Bartkowiak, 2011).

This means that when running their primary business activity, enterprises, i.e. de facto representatives who manage them, are aware of the subject-based links functioning on the market and take into account the importance of the values at their disposal and those which they direct to all colleagues. At the same time, they know the importance of the impact of mutual relations on a number of decision-making processes and the future of the company, and therefore on a practical level of their activities they undertake a number of heterogeneous activities in various areas of responsibility. The intensity of involvement in individual dimensions is driven by a number of factors, and a comprehensive approach often becomes a long-term development challenge.

The importance and adaptation possibilities of CSR for various organizations have been repeatedly indicated and emphasized by various types of international organizations in the form of peculiar normative guidelines (Kwarcińska, 2016) while keeping their application and the freedom to select a set of specific activities on a voluntary basis. By way of example, it is worth quoting the proposed OECD provisions of the Guidelines for Multinational Enterprises, dealing primarily with the aspects of disclosure of information, human rights, employment and labor relations, environmental protection, combating corruption, protecting consumer interests, science and technology, competition protection. One could also mention the principles of the Caux Round Table relating to conducting business, as well as the Global Compact principles covering the main areas of business operation, such as: human rights, labor standards, environmental protection, anti-corruption strategy. Finally, also worthy of special notice is the "Green Paper: Promoting framework for Corporate Social Responsibility" prepared by the European Commission, in which, given the division of responsibility into the internal and external dimensions, the following aspects are emphasized: investing in human capital, health and safety, change management, interaction with the local community, business partners and suppliers, customers and finally public authorities, and responsibility for the natural environment.

The normative basis that allows various organizations to engage in shouldering of responsibility in the most active and holistic manner seems to be the ISO 26000 – Guidance on social responsibility (Norma ISO26000). It serves as a kind of a practical guide to systematized aspects covering seven main areas of the organization's functioning, among which various issues are taken into account. The first aspect relates to organizational order and, in its assumption, concerns the functioning of the entire organization and thus all areas of social responsibility. Then, the sphere of human rights is indicated, in which there are issues such as: due diligence, threats to human rights, avoidance of complicity, treatment of complaints, discrimination and particularly sensitive groups, civil, personal and political

rights, economic rights, fundamental principles and rights at work. Another area known as the best practices at work covers employment and industrial relations, working conditions and social protection, social dialogue, occupational health and safety, as well as human development and on the job training. The next important area according to ISO 26000 is the environment, and this is where prevention of pollution, sustainable resource use, mitigation and adaptation to climate change, environmental protection, biodiversity and the restoration of natural habitats come into play. Aspects of fair market practices are also stressed, including: anti-corruption strategy, responsible involvement in political activities, fair competition, promoting social responsibility in the value chain, and respecting property rights. The penultimate area relates to consumer concerns, and the following are considered important: fair marketing, truthful and objective information and fair contractual practices, consumer health and safety, sustainable consumption, consumer service, support and complaints and dispute resolution, data protection and consumer privacy, access to basic services, education and awareness. The final area is social engagement and the development of the local community, which emphasizes social commitment, education and culture, creating jobs and developing skills, technological development and access, creation of wealth and income, health, social investment. The CSR areas presented on the basis of the ISO 26000 standard are, on the one hand, a synthetic and structured approach, and on the other, a broad spectrum of subjective interactions and subject-based dependencies of each organization. This may be the reason why applying this standard to the guidelines allows not only to take fragmentary actions as part of implementation of CSR, but also to notice the significance and exact scope of each area and to find a way to take this otherwise moral obligation of responsibility in a comprehensive manner.

Based on the cited basic normative provisions concerning the principles and specific problem areas of corporate social responsibility, it can be noted that the essential framework of its scope has been outlined. Therefore, it is the responsibility of entrepreneurs, as an expression of voluntary commitment to the implementation of CSR, to initiate concrete actions towards their stakeholders, among whom employees are repeatedly considered the most important group.

Employees as the basic stakeholders of enterprises

For good reason, the staff of organizations are assigned a particular rank as the most important stakeholders. The dynamism of the contemporary world means that only people are able to meet the requirements of the ongoing need to adapt to change with their knowledge and commitment. This seems possible mainly through the application of analytical skills and reacting flexibly. Such are the abilities of employees in organizations, and they are those who have a direct impact on the functioning of each market entity, generate its competitive position and enable it to maintain it in the long term. The force of their impact is often essential for shaping all dependencies and processes in the enterprise, both internal and external. After all, the commitment and determination of the staff determine the effectiveness in achieving the objectives of economic entities. It is also a kind of showcase of the organization and creates its brand. The recognition of these interdependencies and of the value of employees by employers is therefore the basis for building the organization's sustainable development and often represents the first step in the direction of taking responsibility towards employees in accordance with the concept of CSR. A practical embodiment of the implementation in enterprises of such assumptions is each time, regardless of the type of stakeholders, a set of specific initiatives undertaken towards employees, subject to general normative guidelines. The main subject of this article are primarily measures taken towards staff. These measures take different forms depending on a range of determining variables. Selected examples of employee engagement activities of Polish enterprises, arranged according to the aspects of human resource management, are presented in Table 1.

Table 1: CSR initiatives of employers towards employees with a view to selected aspects of human resource management

Area of involvement	Examples of initiatives
Personnel planning	programs for pupils and students, patronage agreements with schools, internship programs, apprenticeships, scholarships, field trips for students, programs for talented students, participation in job fairs, presence in social media and specialized websites, cooperation with career offices, employee referral programs
Induction,	initial training, foreign training campuses, onboarding programs, support from experienced employees
Staff appraisal	evaluation system taking into account the achievement of objectives, assessment of competences and skills
Renumeration and rewarding	uniform remuneration rules, open remuneration system, bonus remuneration system, holiday subsidies, gift cards, housing loans, non-returnable random allowances, co-financing of theater tickets,

	concerts, packages for children of the employees, transport for employees, co-financing of integrative events
Education and development	organizing stationary trainings, e-training, on-line training for various positions, foreign language courses, postgraduate studies, career reviews, managerial programs, projects promoting women's development
Motivating	implementing ideas of employees that improve efficiency, introducing individual goals, regular work quality assessments, internal recruitment
Balance between work and private life	shortening the working hours for pregnant women while maintaining full-time remuneration, shortening the working hours for all employees, e.g. by 2 hours, family day, visiting the workplace by the family, workshops, advice, exercises on the subject of professional burnout, building family bonds, coping with stress, supporting the passion of employees through participation and rewarding, one-time financial support on the occasion of the birth of a child, flexible working hours, home-office
Communication	face-to-face meetings, intranet, videoconferences, posters, e-mail, platforms - employee forum, travel meetings, newsletters, corporate magazines, message boards, support in communicating changes
Employee satisfaction	staff satisfaction surveys, competitions for employees, company picnics for employees and their families
Corporate volunteering	aid schemes, engagement in charity, donating blood, collection of batteries and waste electrical and electronic equipment, collection of Christmas presents for the poorest families

Source: Compiled on the basis of selected social reports submitted in the 12th edition of the "Raporty Społeczne" ("Social Reports") competition, [http://raportyspoleczne.pl], quoted after: (Kwarcińska, 2019).

The set of initiatives undertaken by employers presented in Table 1 is not exhaustive and does not mean that each of the cited examples was present in every organization. In this respect, one can notice significant variations in the surveyed enterprises both in terms of the type of involvement, i.e. the choice of a specific activity, and its intensity in individual aspects of staff management. It is striking that Polish employers are even taking up the challenge of accepting responsibility towards their employees. This allows to draw a constructive conclusion about the growing degree of companies' awareness about the importance of employees. The reaction in the form of generating interest in the staff, their plans, degree of job satisfaction, motivation, future, development, and even their private life is moving in the direction of recognizing the value of involved human capital. Therefore, there are visible initiatives that include in their scope care for individual elements of human capital, and thus for its condition and development.

Implementation of selected CSR activities towards employees in the light of the results of primary research

Focused empirical analyses presented in the further part of the article concern primarily a verification of the level of commitment of the surveyed enterprises in CSR activities towards employees in terms of ensuring occupational health and safety and health protection. It was assumed that the efforts made by employers, inter alia, in these two aspects are also determinants of care for human capital.

Research Methodology

The basis for conducting research, whose partial results are presented in this article, was the analysis of social reports of Polish enterprises published at http://raportyspoleczne.pl. This analysis represented a primary source of information on non-financial CSR activities towards employees of these organizations. The selected initiatives were contractually assigned to certain aspects of staff management and addressed in the form of survey questions regarding their implementation to a group of 301 enterprises from the Zachodniopomorskie Voivodeship in Poland conducting business activity in the service sector. The structure of the questioned respondents, with respect to the scope of their business, included 150 entities conducting accounting and bookkeeping activities, as well as tax consultancy (PKD 69.2 section) and 151 entities operating in the field of cleaning services (PKD 81.2 section). On the other hand, considering the number of employees, it comprised almost 86% of establishments employing from 1 to 9 people, 13% of organizations with 10 to 49 employees and 1% of companies employing 50 to 249 people. The aim of the study was to determine the extent of involvement of the questioned respondents in the implementation of selected CSR activities towards employees. The rationale for formulating questions about concrete initiatives is the observation that companies often undertake various types of actions towards their employees, but are not aware that those actions

could be classified as CSR activities. That is why the set of initiatives selected from social reports was treated as a reference point for the application of good practices with the possibility of supplementing with other activities undertaken by the questioned respondents in each of the proposed aspects of human resource management.

Research Results

Table 2 shows the percentage of replies confirming the implementation of selected activities in the aspect of occupational health and safety in both groups of enterprises, broken down into their current implementation, their presence in the past, i.e. during the last three years of the enterprise's activity, and planning for their implementation in the coming year.

Table 2: Percentage of replies confirming the implementation of selected measures in the field of occupational safety and health

Type of action / PKD section	The action is being implemented		The action has been implemented		The action will be implemented	
	69.2	**81.2**	**69.2**	**81.2**	**69.2**	**81.2**
measurement and monitoring of activities in the field of health and safety	54,67	49,67	15,33	9,27	7,33	8,61
adopting additional goals, e.g. "zero accidents"	10,00	11,92	0,67	3,97	0,67	5,96
additional security plans	18,00	27,15	5,33	3,97	0,67	3,97
short but frequent lectures on health and safety issues	19,33	40,40	4,67	18,54	0,67	15,89
organizing a health and safety week	2,67	4,64	0	0	0	0,66
applying additional protective measures	8,00	17,22	2,00	4,64	0	5,96
health and safety knowledge competitions	3,33	1,99	0	0,66	0	0,66
instructional videos	11,33	4,64	4,00	1,99	0	0,66
security fairs	8,00	3,97	0,67	0	0,67	0
anonymous helpdesk	1,33	0	0	0	0	0

Source: Compiled on the basis of primary research.

The analysis of the structure of responses in the field of occupational health and safety allows, first of all, to observe that activities in this aspect in both groups of enterprises focused on measuring and monitoring occupational health and safety activities. Such action was indicated by over 54% of companies conducting accounting and bookkeeping, as well as tax consultancy operations, and nearly 50% of companies providing cleaning services. On the one hand, such a scale of responses seems relatively high considering the percentage of replies confirming a different type of activity, but on the other hand, one could stress dissatisfaction and fears that half of the surveyed enterprises do not implement such major activities from the point of view of protecting employees during the performance by staff of official duties. Another conclusion shaped on the basis of the presented results is the synthetic constatation that, by far, a relatively higher percentage of companies cleaning facilities compared to accounting and tax advisory companies:

- adopts additional health and safety objectives, e.g. "zero accidents" - approx. 12% compared to 10%,
- applies additional health and safety security plans - approx. 27% compared to 18%,
- organizes brief, but frequent lectures on health and safety - approx. 40% compared to approx. 19%; at the same time, almost 19% of the surveyed cleaning companies declared that such activities had been implemented and almost 16% that they would appear in the future,

- organizes a health and safety week - approx. 4.6% compared to 2.7%,
- applies additional protective measures - approx. 17% compared to 8%.

The main justification for such results is probably the unique quality of activities of both groups of enterprises. The risk of various types of hazards, dangers, harmful and burdensome factors in the workplace in cleaning companies is much greater. In this case, it is therefore more justified to apply additional security plans and supporting protective measures.

Another observation following the analysis of results presented in Table 2 concerns the relatively more frequent involvement of accounting and tax consultancy firms compared to facility cleaning companies in occupational health and safety competitions, safety fairs, presenting instructional films and launching an anonymous helpdesk. Nevertheless, it has to be underlined that in each of these exemplary activities, the participation of both groups of enterprises is still minor, simultaneously with the prevailing indications that such initiatives have not been implemented and will not be undertaken. It therefore seems that these measures are definitely not used readily. This leads to the question about justification of the lack of such interest, which could probably form the basis for the implementation of further, in-depth research in this area.

On the other hand, Table 3 demonstrates the percentage of replies confirming the implementation of selected healthcare measures in both groups of enterprises, taking into account also their division into the current implementation, their occurrence in the past, i.e. during the last three years of the company's activity and planning their implementation in the coming year.

Table 3: Percentage of replies confirming the implementation of selected measures from the aspect of health protection

Type of action/PKD section	The action is being implemented		The action has been implemented		The action will be implemented	
	69.2	81.2	69.2	81.2	69.2	81.2
medical care packages for employees and their families	33,33	23,18	7,33	5,30	9,33	3,97
sports cards for employees and their families	12,00	9,27	0,67	0,66	4,00	1,32
life insurance packages	42,00	33,77	8,67	3,31	6,67	5,96
amenities for cyclists	0	1,32	0,67	0	0,67	1,32
organizing meetings with experts in health, healthy nutrition and lifestyle	0,67	0	0,67	0	0	0
psychological support	2,67	0	0,67	0	0	0
swimming co-financing	0	0	0,67	0	0	0
instruction in preventive exercises for those working with monitors	4,00	0	0	0	0	0
cooperation with suppliers of healthy food for employees	0,67	0	0	0	0	0

Source: Compiled on the basis of primary research.

The basic conclusion that can be drawn after analyzing the structure of replies confirming the implementation of selected activities by both groups of enterprises concerns the relatively most common indications with regard to offering life insurance packages to their employees. Exactly 42% of accounting and tax advisory companies as well as nearly 34% of cleaning companies declared to offer life insurance packages. Concurrently, a relatively large

number of indications also concerned the use of medical care packages for employees and their families, with indications of approximately 33% in the case of accounting and tax advisory companies and approximately 23% in the case of cleaning companies. It seems that activity in this area is perfectly justified and could probably be promoted among companies that have not declared their position in this respect.

A characteristic effect revealed on the basis of the results presented in Table 3 is the relatively prominent involvement of employers in the area of sports activities, and to a slightly greater extent in accounting and tax advisory companies - 12% declared offering sports cards for employees and their families, compared to 9% of cleaning companies. Such a result confirms that practicing sports is probably perceived by the surveyed entrepreneurs as a crucial element of health care, and the differences in the degree of involvement of individual groups of enterprises are justified, for example, due to the type of professional activities, which, for the most part, are more physically demanding in cleaning companies.

The last conclusion following the analysis of data in Table 3 actually concerns answers confirming the involvement of enterprises in the implementation of all other activities and boils down to the conclusion that both groups of enterprises are not favorable to their implementation, with a relatively minor exception being the use of preventive exercises for people working at monitors and psychological support by accounting and tax consultancy companies.

Conclusion

Certainly, the formulation of overall conclusions on the basis of fragmentary research does not constitute a comprehensive, clear and unambiguous picture of the situation. That said, it allows to recognize the basic positives and indicate the existing imperfections in the scope of the undertaken research area. The thematic scope presented in this article is related to two extremely important issues. Firstly, it takes into account one of the most important areas for modern business entities to engage in the implementation of the CSR concept involving employees. Secondly, it explores the significance of the application dimension of specific activities from this aspect for the care of human capital. Taken as a whole, both issues allowed to indicate the overall undertaking of activities in the field the surveyed enterprises' involvement in the implementation of the basic assumptions of corporate social responsibility in the employee aspect, however, with a view to a shortfall, if only in these two aspects of human resource management selected for analysis. Concurrently, although to a moderate extent due to the narrow research dimension, they have contributed to formulating the constatation covering the statement that today's employer is not yet fully aware of the range of activities that he could pursue to take care of the human capital in every employee. It is therefore appropriate to conduct further research in this field, expanding, for example, the degree of involvement of enterprises, also from other sectors and specific scopes of activity, in taking CSR activities towards employees in further aspects of human resource management. It also makes sense to call attention to the necessity to undertake educational and training activities covering both the application dimension of the concept of corporate social responsibility and the area of shaping awareness of the importance of human capital for the organization.

Acknowledgment

The project is financed within the framework of the program of the Minister of Science and Higher Education under the name "Regional Excellence Initiative" in the years 2019 - 2022; project number 001/RID/2018/19; the amount of financing PLN 10,684,000.00.

Abstract

One can only trust the numbers, like any other information, after its scrutiny. Data on our actions matters much more than data on our words and intentions. Big data is a series of approaches, tools and methods for processing structured and unstructured data of a large volume and its diversity to obtain human-perceived results. It is effective in conditions of continuous growth, distribution over numerous computer network nodes, formed in the late 2000s, as an alternative to traditional systems and solutions for managing database information in the Business Intelligence class. Big data is a proven, albeit relatively young field of technology that has spread to many areas of business and plays an important role in a business development. Big data technologies have marked the moment when the concept of "information society" has acquired a full meaning. Information has become the status of a valuable asset, a kind of new oil that drives the information society, just as traditional oil was the main resource in the era of industrial society. Big data technologies are vital for modern banking. Asset management, risk assessment, retention and expansion of the customer base – these are options unavailable to perform without training in Big data.

Keywords: Big data, data mining, data science, cost management, banking, predictive analysis.

Introduction

There are three illusions about digital infallibility:

Firstly, the numbers are accurate. When some doubt occurs, the first desire is to add digits after the decimal point to make them look more accurate. In fact, numbers are only as accurate as the process that generates them.

Secondly, the numbers are objective. In reality numbers can be as biased as words, but in numbers it is much easier to hide the bias. For example, while forming a set of data on the rates at which foreign companies pay taxes, three indicators of tax rates are presented: from a simple average value of rates for all enterprises in the sector, which gives the lowest value, to weighted average rates calculations exclusively for profitable enterprises, which gives more value. If we want to show that foreign companies pay little taxes, then we will show only the first figure and will be silent about the rest, and if we want to convince people otherwise, we will take the last figure.

Thirdly, the numbers give us control. A person strives for control, and numbers help him. It seems to us that attaching a number to an unstable or uncontrolled indicator allows us to control it.

One can only trust the numbers, like any other information, after its scrutiny [7].

Data is not equal to information. The data is different. Data on our actions matters much more than data on our words and intentions, for example, an upbeat social media post on Apple is not as useful as data on buying Apple stock. It should be taken into account that there is a general trend towards combining social media data with financial data to create "super" databases. The main task of data analysis should remain not to create distracting graphs and statistics, but to transform data into information.

If everyone has data, then in fact no one has it. Data has its real added value in case we have exclusive access to it or a unique method of processing this data. That is one reason why investors cannot turn broader access to financial data into a source of profit.

Not all data can be used. For example, if a company offers a specific set of products and services, it must be prepared to modify existing products and services or introduce new ones based on the information received [1].

Characteristics of the concept of "Big Data"

The term "Big data" is relatively recent. Since 2011 Google Trends has seen an active growth in the use of this phrase, and these days the term has already been used quite often.

But what exactly does the term "Big data" mean?

According to the common definition, "Big data is a field that treats ways to analyze, systematically extract information from, or otherwise deal with data sets that are too large or complex to be dealt with by traditional data-processing application software. Data with many cases (rows) offer greater statistical power, while data with higher complexity (more attributes or columns) may lead to a higher false discovery rate. Big data challenges include capturing data, data storage, data analysis, search, sharing, transfer, visualization, querying, updating, information privacy and data source. Big data was originally associated with three key concepts: volume, variety, and velocity. When we handle big data, we may not sample but simply observe and track what happens. Therefore, big data often includes data with sizes that exceed the capacity of traditional software to process within an acceptable time and value" [4].

Using Big data mechanisms, we do not operate with a specific set of data but rather with methods of processing the entire set of data which is allowed for distributed information processing. The mentioned processing methods can be used both for processing a truly large amount of data – the content of all web pages on the vastness of the World Wide Web, and for processing relatively small amounts of data – the content of this article.

Here are some examples of data sources that may require Big data technology to process:

1. logs of user actions on the Internet;

2. indicators of the game players' online activities;

3. data collected from the Large Hadron Collider;

4. digitized medical records of patients;

5. data on all bank clients' transactions;

6. a log of data on purchases of a particular store chain.

As the number of data sources grows steadily, interest in big data technology is also in demand [8].

Based on the definition of Big data, we can formulate the basic principles of data maintenance:

1. Horizontal scalability shows the amount of unlimited data; in this regard any system that assumes the processing of big data must be scalable.

2. Fault tolerance emerges in horizontal scalability; it implies that there can be several machines in a cluster, so methods of working with big data must take into account the possibility of large-scale failures and their ability to survive without significant consequences.

3. Locality of data is in large distributed systems, data is distributed over a large number of machines.

All modern tools for working with Big data somehow follow these three principles. To follow them, one needs to invent some methods, techniques and paradigms for developing data mining tools.

The Big data field is characterized by the following features:

Volume is the amount of accumulated data.

Velocity is the speed of data accumulation.

Variety is data diversity, the presence of structured and unstructured multi-format information that can be processed.

Veracity is driven by the concept that “only reliable data matters”.

Value is data significance.

If the above 5 conditions are met, the accumulated data volume can be classified as large.

The scope of Big data technology is extensive, it can be used to clarify customer preferences, study the effectiveness of marketing campaigns, or conduct risk analysis. As a result of a survey by the IBM Institute on the use of Big data technology in business, the following data was obtained: most of the companies use Big data technologies in the field of customer service, the second most popular areas are operational efficiency and risk management, but the use of Big data at this stage is the least widespread.

It should also be noted that Big data is one of the fastest growing areas of information technology; in accordance with statistics, the total amount of received and stored data doubles every 1.2 years.

Thus, Big data is a well-established, albeit relatively young, field of technology that has spread to many areas of business and plays an important role in business development.

Data Analytics Models

It is customary to distinguish four types of data analytics which differ in the level of information complexity and the degree of human participation:

1. Descriptive (descriptive) answers the question “What happened?” by creating a summary of historical data for later analysis.

2. Diagnostic analyzes information to answer the question “Why did it happen?” In this case, statistical methods of data analysis are used to classify, drill down and identify correlations in order to determine the key factors affecting the results.

3. Predictive (prediction, forecasting) predicts unknown events in the future, answering the question “What can happen?” based on the analysis of accumulated information using the following methods: mathematical statistics, modeling, machine learning and other areas of Data Science, as well as data mining.

4. Prescribing (prescriptive) answers the main management question “What to do?”, using the methods of intelligent data processing. All accumulated and processed data is analyzed to find the optimal solution for each specific situation.

Application of predictive analytics (data mining) as part of Big data technologies in the banking sector.

The bank, like any commercial organization is undoubtedly interested in increasing profits.

Let us consider the options for using Big data technology in the banking sector.

Get a complete view of your customers with their profiling.

Customer segmentation has long been common in the financial services industry, as it allows banks and lending institutions to categorize their customers into clear demographic categories, but basic segmentation is not detailed enough for banking institutions to understand the true wants and needs of their customers [11]. The use of Big data technology in the banking sector helps to bring segmentation to a new level by building detailed customer profiles. These profiles must take many factors into account:

1. Demographic composition of clients.

2. Number of customer accounts.

3. Products and services that customers currently use.

4. Offers that customers have turned down in the past.

5. A set of products and services that customers are likely to purchase in the future.

6. Major events in the life of clients.

7. Their relationships with other clients.

8. The attitude of clients towards the bank and the financial services industry in general.

9. Behavioral models

10. Service preferences, etc.

Individual approach to each client.

Almost a third of customers expect the companies they do business with to take into account the personal characteristics of customers. Based on the analysis of data over the past year, it was found that almost 33% of potential customers abandoned the services because of the insufficient personalization of the offers. And if the bank strives to increase the number of reliable customers, increase profits and prosperity, then the introduction of data mining technologies, including predictive analytics is a strategic necessity.

Analysis of buying activity.

Almost all of the data in banking is generated either through customer interactions with sales and service representatives, or through transactions. While both forms of customer data are of immense value, the data generated through transactions gives banks a clearer understanding of customers' purchasing habits and over time broadens understanding of behavioral patterns [2].

Credit risk analysis.

Based on the analysis of information on the credit history of existing customers, profiles of reliable and unreliable customers are formed; the bank can divide borrowers by risk groups, set individual conditions for the amount of borrowed funds, interest, and loan term.

Identifying opportunities for increased sales and cross-selling.

Statistically, the probability of selling something to an existing customer is 60% -70% higher than the probability of selling something to prospective customers, which gives banks a great opportunity to increase profits through cross-selling. Usage of data mining tools allows one to easily get all the necessary data to increase sales.

Reducing the risk of fraud.

Reducing the risk of fraud is one of the fastest growing forms: in 2019 fraudsters carried out RUB 5.7 billion in transactions with retail accounts, a record high from the previous record high in 2018. Monitoring the structure of customers' expenses and identifying unusual behavior is one of the ways to use Big data technologies. Banks can prevent fraud and increase the level of customer security.

Evaluation of the business projects profitability.

With the help of Big data technology it is possible to analyze a significant amount of data on investment projects, their profitability, possible risks, excluding the possibility of a subjective human assessment of the facts.

Assessment of competitiveness.

There is an information analysis about banking organizations that have the most similar characteristics, further segmentation into groups based on similar parameters to represent the hierarchical structure of the banking industry.

The potential value of the information available is surprising: within recent years, the amount of data has increased significantly, while the cost of processing it has decreased. Distinguishing truly meaningful data from other – irrelevant information contributes to more effective problem solving and strategic decision making [5]. Real-time analytics help you understand the problem holding your business back, while intelligent analytics helps you choose the right method to solve it. Perceptibly better results can be achieved by integrating analysis into the banks workflow to avoid potential problems in advance.

No method is universal, each method has its pros and cons, and the right choice depends on the goals and circumstances.

Data Science makes this process more automated, accurate, productive, and less costly for employees.

Below you can consider different ways of using Big data technologies to solve micro and macro tasks.

The Central Bank of the Russian Federation is using artificial intelligence and Big data in order to accurately adjust monetary policy and quickly understand the problems of financial markets.

The Central Bank of the Russian Federation is working on a number of projects – from analyzing cash data for assessing inflation to machine learning in bank reporting and collecting macro data. These projects are aimed at improving the quality of forecasting and the soundness of decisions in the field of monetary policy.

The relevance of such data for politicians and investors has increased in the context of the coronavirus outbreak, when immediate solutions are required, and official statistics reflect the situation with a significant delay and often distorted.
Macro data collection is a baseline that will show how indicators adjust over time as new information arrives, which will serve to improve forecasting accuracy for decision-making on monetary policy [10]. In the longer term, it is planned to build news indices that will be used in short-term forecasting of macroeconomic indicators.

Online inflation – data processing from online cash registers – is an algorithm being prepared for the automatic classification of an expanded range of products.

Banking control. The Central Bank of the Russian Federation is also acquiring competence in working with big data and artificial intelligence in the field of banking supervision, and official banking statistics are analyzed using machine learning to predict an imminent violation of the rules by the bank. At the next stage it is planned to conduct

automatic analysis of news about the bank and companies that it accredits. Negative news will indicate an increase in risk and warrant oversight to pay attention to.

Sberbank is introducing a system called "Labyrinth", which initially finds mass founders. This system allows one to identify interesting financial schemes – a kind of fraud when several companies, seemingly completely independent from each other, take loans and then at some point disappear, or through interaction with each other, "scroll" credit funds, withdraw them and then disappear. At the same time, the connection between these companies is not visible on the surface, but if additional external data is available, the risk that the company is a conglomerate of suspicious organizations may be detected. The "Labyrinth" also makes it possible to identify the so-called "hidden holdings".

It is known that Sberbank has quite a lot of clients both individuals and legal entities. Certain production chains can be tracked in transactions. For example, when enterprises pay each other regularly for services, and in fact form a de facto holding, although they have not yet been formalized. And if the algorithm detects such production chains, then this group of companies can be offered special corporate products suitable for holdings, which will allow companies to be faster, more convenient, at lower costs, etc. This allows companies to use banking services more conveniently. This information is a graphic image: a certain company is depicted and around it there is a cloud of interconnected customers. To solve the problem the client's counterparties are considered; it turns out which companies the client provides with services, which companies provide services to the counterparty. Graphically, it looks like a client and around him there are diverging rays-counterparties. The analysis begins, as a rule, with large clients, and then all chains are expanded further.

A project for tracking the status of a customer and a client based on historical information "News Monitoring" is under development. New sources are processed as text where you can find important events concerning the bank's customers. For example, if a large amount of information appears in the news about legal cases with some organization, then for the relevant client manager this is a reason to inquire in more detail, for example, their financial status.

Thus, the main directions for the usage development of Big data technologies in the banking sector are:

Improved algorithms for detecting fraudulent transactions. Using the analysis of stereotypes of fraudulent and legal transactions, the self-learning system issues a warning which allows banks to promptly prevent suspicious transactions and not eliminate the consequences of fraudulent actions.

High risk assessment. Big data connected to business intelligence tools with automated analysis and predictive capabilities can signal customer profiles with higher levels of risk than others [14].

Increased customer retention. In-depth customer profiles make it easier to build stronger and more lasting customer relationships.

Product personalization. Demonstration of a desire to understand each individual customer who is expressed in the development of products, services, etc.

Customer feedback. Staying on top of current customer issues, comments and concerns, using big data to sort feedback and respond in a timely manner.

Workplace improvements. Creating an environment where employees of a financial institution are motivated to carry out effective work, using Big data technologies to monitor performance indicators, assess employee feedback and corporate culture, and assess overall employee satisfaction.

Modern problems of implementing Big Data analytics. The implementation of Big data tools for analyzing banking information meets the interests of any financial institution. There are several things that banks and financial institutions should be aware of before embarking on implementing Big data technologies.

Outdated computing systems have lack of a modern infrastructure to analyze large amounts of data, which creates a significant load on outdated systems. Therefore, banks are advised to upgrade their existing computing systems before implementing a strategy for dealing with large amounts of data.

Data quality management should be one of the top priorities when using Big data technologies. Even if a bank upgrades its system, "dirty" data – inaccurate, inconsistent, incomplete, duplicate or outdated – can skew the results

[13]. Before the digital era much data was entered manually, which created a risk of human error; banks should carefully analyze and consolidate existing data before entering it into a new system in order to identify and eliminate cases of entering "dirty" data and identify data entry sources to reduce the number of new cases of "dirty" data entry.

Conclusion

Big data technologies have marked the moment when the concept of "information society" has acquired a full meaning. Information has gained the status of a valuable asset, a kind of new oil that drives the information society, just as traditional oil was the main resource in the era of industrial society. Big data technologies promise great benefits in several areas: the emergence of new business models based on an individual approach to the client; improving the health care system; improving the crime situation in big cities; combating fraud, etc.

Big data technologies are vital for modern banking. Asset management, risk assessment, retention and expansion of the customer base – these are options unavailable to perform without training in Big data.

According to the consulting company Alacer, the largest US banks have already accumulated more than 1 exabyte (1,018 bytes) of information. This amount of data is contained, for example, in 275 billion audio recordings of songs in mp3 format.

The Impact of the COVID-19 On Eurozone and the United States Banking Sectors. Contribution to The Post Pandemic Scenarios

Abstract

The article discusses the role of banking sectors in Eurozone countries and the United States in times of the COVID-19 pandemic. The presented analysis is related to the commercial banks' sector and central banking during the pandemic. It shows that commercial banks were affected by the consequences of the pandemic situation in terms of capital market indices, lending activity and profitability of banking sector. Both central banks, the European Central Bank and Federal Reserve, implemented new phases of the quantitative easing (QE) policy as the reaction to the economic situation triggered by the pandemic. In consequence the value of balance sheets of both of central banks almost doubled during the last twelve months. In the short-term, such policy is beneficial for both economies. The long-time outcome is unknown. Another challenge is the scenarios of economic recovery. There are some positive, negative, and neutral scenarios possible to happen. The positive expectations assume that the economic activity will be restarted. The pessimistic one indicates some acute problems and asymmetrical recoveries (especially in some Eurozone countries) which might trigger political tensions among countries. There is still a significant role of a banking sector for further support of economies in the post-pandemic time.

Keywords: COVID-19 pandemic, Eurozone banking sector, US banking sector

Introduction

Banking sectors play crucial role in the economy of every country. Banks are responsible for money circulation and credit intermediation, and a well-functioning banking system is necessary for every country. It is especially important in the bank-oriented model of financial markets (so called 'continental model'). The COVID-19 pandemic has had a large impact on the banking system in almost every country. The pandemic outbreak and its economic consequences were sudden and long-range. In such situation banks, in many countries around the world, were expected to provide and important role in absorbing the shock and providing credits to households and corporate sector. The efforts of commercial banks were facilitated by central banks and governments. In such context it is important to pose the research questions:

1) How the pandemic of COVID-19 impacted on the banking sectors in the United States and Eurozone countries?
2) What is the potential impact of the applied countercyclical lending policies, provided by the selected central banks, on banking sectors and economies?
3) What is the role of banking sectors during pandemic and when the pandemic is over?
4) What are the post-pandemic scenarios in the analyzed countries (the United States and Eurozone countries)?

The main role of the research is to provide the overview of banking sectors in the United States and Eurozone during the first phase of the COVOD-19 pandemic. It is still too early for an insightful analysis, as the presented data and accessible information are related to the first two quarters of the 2020. It is, however, very important to recognize the main mechanisms of the banking activity at the outset of the specific time of pandemic. The processes are very different, compared with the nature of the pre-crisis banking functioning. Such a short term and initial analysis might contribute to the further research of these problems.

Contribution to The Post Pandemic Scenarios" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

The Impact of COVID-19 Pandemic on Banking Sectors

Commercial banks are the oldest financial institutions and play important role in every economy. They are situated in the center of every financial system and they link financial systems with real economies. The main banking activities is the intermediation between depositors and creditors. The activity embraces accepting deposits and making loans. Banking systems are also responsible for organizing the money circulation in the whole economy and participating in payment systems. Moreover, they also provide many other services, like running accounts, advising their customers, organizing securities purchases, providing foreign exchange services, offering insurance services, and many others (Valdez, Molyneux, 2013). These are only the basic banking functions and in fact the banking activities are much more sophisticated. These institutions provide services in almost every aspect of the economy and they are critical for stimulating economic growth, especially by increasing the funds for investment and improving the quality of investments.

The very important feature accompanying the role of banks is that these institutions are susceptible to unwarranted withdrawals of deposits during panics, spread of contagious micro and macroeconomic shocks, and many other mechanisms which lead bank failures or even banking crises (Calomiris, 2015). On the other hand, they play important role in stabilizing the real economies in times of turbulence.

The condition of the American and Europe's largest banks before the pandemic was good. These banks are very well capitalized but after the financial crisis of 2007-2009 they had less complex business models and limited risk appetite than several years ago, during the financial crisis of 2007-2009. Moreover, their supervisors have become more supportive (The Corner, 2020). Such situation resulted in the possibility of banking sectors to play very crucial role during pandemic time. All of the countries affected by the pandemic implemented unprecedented initiatives and measures at important challenges: dealing with health emergency needs, supporting economic activity and employment, preserving monetary and financial stability, and preparing the ground for recovery (Gortsos, 2020).

The development of the pandemic exerted, however, a great impact on the institutions and impaired their financial efficiency. Banks, that are especially endangered, are those which focus on lending to small business and consumers. These two groups of bank customers are suffering the most. As a consequence of lockdowns in many countries, millions of companies have fallen into bankruptcy since the outbreak of the pandemic (Morris et al., 2020). It exerts a big pressure on banks and their financial situation. Even those, which are not exposed to the riskiest investment assets and were not engaged into financing the endangered entities, are in a bad situation. It will be difficult to make profits in environment with interest rates fluctuating near zero and when the future of global economy is gloomy.

The biggest challenge for the banking sectors during the COVID-19 pandemic might be losses caused by bad debts. Some of the difficulties were created by governments and other authorities. Banks were obliged to provide payment holidays on credit cards, mortgages and other assets, which created stress on banks' loan books (Buehler et al., 2020). The governments offer some help for banks and participate in various recovery programs, so there is a chance that finally the situation in credit losses will not be the worst effect of the pandemic crisis. Another concern is related to investments. The low interest rate environment creates pressure on investors. The banks' dividends and share buybacks create pressure on stock market and banking indices (Figure 1, Figure 2).

The COVID-19 pandemic crisis has a global dimension, and it exerts an impact on every person, every aspect of society, economy, and industry. The banking industry can act as a source of stability, providing help for real economies. It means that banks are participating in many countries in the process of exiting from the COVID-19 pandemic crisis. Their main role is to provide the needed funds which are necessary in these abnormal circumstances. Among the main actions which have been undertaken are: liquidity supports for endangered firms and support the flow of credits, investments in government bonds. Banks struggle to keep their distribution channels open, and to manage the revenues and customers' expectations in the environment of low interest rates and growing pressure from their balance sheet challenges.

The situation observed on the stock exchanges is very pessimistic, compared with the activity of respective banking sectors. The Figures 3-4 present the situation in consumer credit activity in the United States and Eurozone. Comparing to the pre-COVOD-19 pandemic, the situation in both of the credit markets worsened.

Fig. Consumer loans at commercial banks – US (in billion USD)

Source: Trading Economics

Fig. Consumer credit – Euro Area (in million EUR)

Source: Trading Economics

The main determinants of the decline of the credit activity during the pandemic were the consequences of the lockdown, the near-zero interest rates (as result of the monetary policy), which affected bank's profitability, and the growth of credit risk (Ferrando, 2020; Acharya, Steffen, 2020). It is assessed that the aggregate spending was at the level of several dozen percent (depending on the severity of the government restrictions on mobility and economic activity in particular country) (Andersen et al, 2020). However, it must be highlighted that the decline in credit activity

in both markets, the US and the Eurozone, was confined by the monetary policy and prudential measures. Without such actions, the situation might be much more severe (Altavilla et al, 2020).

Commercial Banks' Profitability

Apart from the credit activity, very important determinant of the banking activity is the profitability, usually best expressed by the return of equity ratios. In the Eurozone banks the ratio achieved 0% return on equity in the second quarter of 2020. It is the worst result for the last years (Figure 5). The same situation is in the United States (Figure 6). The low interest rate is reducing the commercial banking sector profitability. The return of equity for the period of Q1.2016 – Q2.2020 is the lowest since the beginning of 2020.

Fig. 5: Return on equity and composition on net profit and loss by reference period in banking sector in Eurozone countries (EUR billions, percentages)

Source: ECB.

Fig 6. Return on equity for all US banks (percentages)

Source: FRED Economic data.

The profitability of Eurozone and the US banking sectors, presented in Figures: 5 and 6 is related to the situation after the first wave of the pandemic. It should be expected that the situation after the second wave will be much more severe. The growth of the NPL will have a great impact on banks' ROE indicators. The pending question is how the low interest rate environment and the fiscal stimulus from the governments are able to mitigate the situation in short- and long-term (Carletti et al, 2020).

Quantitative easing policy as central banks' reactions

The reactions from central banks for the COVID-19 pandemic resulted in the implementation of quantitative easing policy (QE). Both central banks, the FED and ECB applied such solutions as their reaction to economic downturn caused by the pandemic. These actions are assessed as the necessary approach in times of an extraordinary circumstances. Their impact is not only direct, but also indirect, and it assessed that the policy would have persistent effect on the economies via different channels (Dedola et al., 2020; Hartley, Rebucci, 2020; Jinjarak et al., 2020;

Cortes et al., 2020). Among them is the improvement of liquidity in short-term markets, but also the stimulus for the public plans for the economic recovery.

The COVID-19 pandemic had a strong impact on the economy in the United States. It triggered not only the severe health threat, but also disrupted lives and created severe economic slowdown. It led to decrease of the retail sales, national industrial production, and high unemployment rate. Some assessments highlight that putting together the health and economic problems creates the scale of the crisis which is unprecedented in the history of the United States (Bauer et al., 2020). In such situation there was the reason for the Federal Reserve to support the economy. Among the FED actions might be enumerated (Cheng et al., 2020):

- low interest rates (the federal funds rate is below 0,1 percent since April 2020),
- the "forward guidance policy" which says that the interest rates will remain low,
- securities purchase (QE) – the FED balance in 2020 almost doubled (from 4,15 trillion USD to 7,18 trillion USD) (https://www.federalreserve.gov/monetarypolicy/bst_recenttrends.htm),
- supporting financial markets in many ways (e.g., lending to securities firms, repo operations, direct lending to banks and corporate employers, relaxing regulatory requirements, supporting loans to SMEs, households, and municipal borrowers).

The American central bank takes all the necessary steps to provide maximum employment, stability of prices and of financial system. Many of these actions were aimed at supporting the flow of credit in the economy. The consequence of the reaction is the unprecedented growth of the central bank's assets, which exceeded the 30% of GDP of the country (Figure 7). It is also worth noting that doubled during the last year.

The situation in Europe is severe as well. Similarly like in the United States, in the Eurozone numerous actions were undertaken dedicated to economic and social welfare such as to aid companies affected by the crisis in Germany, France, Spain, Italy, and some other countries (Nicola et al., 2020). The unprecedented reaction was also implemented by the European Central Bank. It has a name *Pandemic emergency purchase program* (PEPP) and was initiated in March 2020 (Grund, 2020). Originally the ECB launched EUR 750 billion, but the assumption is that it will last until the pandemic is over. Its main goal is a temporary asset purchase of private and public sector securities (https://www.ecb.europa.eu/mopo/implement/pepp/html/index.en.html). The ECB has a big dilemma, with implementing QE policy, compared with the FED, as its only goal is to ensure price stability in the euro area. The explanation of undertaken actions is that there are also secondary objectives for the ECB, and they can be pursued as long as they are not implemented at the expense of price stability (Claeys, 2020). The second dilemma is that prior to the pandemic, the ECB already implemented QE actions, like purchasing about EUR 20 billion each month in government and regional authorities' bonds, corporate bonds, asset-backed securities, and other securities under the existing Asset Purchase Program (APP). It led to enormous engagement of ECB into the operations. The bank's balance sheet growth is even greater than the FED, exceeding 45% of GDP (Figure 7).

Fig. 7: The ECB and FED balance sheets (central bank assets as a percent of GDP)
https://www.ceps.eu/whats-the-ecb-doing-in-response-to-the-covid-19-crisis/ (Retrieved: 15.11.2020).

It should be highlighted that the short-term impact of the QE policy, both, in the United States and in Eurozone is positive. The significant question is how it will impact in the long run on the world economy and, especially on these economies where the policy was implemented.

The situation in the post COVID-19 economy

The recovery from the pandemic is crucial for every country and it will exert big pressure on different parts of economies. The process of exiting from the pandemic will vary in speed and intensity across industries, countries, and regions. There is no doubt, that safety and soundness of the financial systems and economies will depend on bank's financial resilience (McKinsey & Company, 2020). And vice versa, the situation of the banking industry will depend on the economic recovery of real economies in the post-pandemic future. Regarding the possible scenarios of recovery, they will depend on the standing of the crisis situation. The length of the pandemic and the accompanying lock down will exert a great pressure on economies and on banking sectors. The longer the pandemic lasts, the worse impact it has on economies.

There are forecasts of some possible scenarios of the post-COVID economic situation, namely positive, negative and neutral. In the positive one, the economic activity after the pandemic will be restarted, and a process of stable recovery can be expected. Such scenario is optimistic, and beneficial for the US and Eurozone economies. In Europe many countries were struggling with the unbalanced growth before the COVID-19 pandemic. It means that during the post-pandemic time the problems will still continue in these countries. The situation also has impact on banks. The tentative calculations suggest that in the case of the Eurozone banks, the bank's market-implied losses as a consequence of COVID-19 pandemic range from 7% to 43% of banks capital and reserves (Renders et al., 2020). It is estimated that in the next three years European banks will face losses of more than EUR 400 billions of credit losses (Wyman, 2020; Morris, Walker, 2020). In worse scenario, it is predicted that the value of the losses may even double. Banks will experience bad loans and revenue decline. Moreover, recovery from the pandemic may be very slow. When linked with the new level of public debt, it might lead to the stagflation in Eurozone (Bonatti et al., 2020). The neutral scenario means that the economy will need a permanent public stimulus, because in new normality, the private sector will not be able to play such role, as it played before the pandemic. There is, however, still possible to have even worse scenario, when the problems faced by the governments, central banks and economies, will lead to deep structural problems, and finally asymmetrical recoveries might trigger tensions and lead to some negative political decisions, undertaken by some of the weakest Eurozone countries. In such scenario the economic situation might trigger a political problem for the whole process of economic integration.

Regardless of which scenario is more accurate, similarly, like during the pandemic, also in time of recovery, the banking sector will play a crucial role. It is especially prevailing in the Eurozone, where the whole financial sector is banking oriented. The important feature of the EU banking sector is that the structures of banking vary in different Eurozone countries. Some of them face lower credit losses due to better condition of the economy (Germany), while in other countries the situation is more serious (Italy or Greece), where the levels of NPLs are higher and the pandemic exerts stronger influence. The situation before and after the pandemic in selected countries is presented in Table 1.

Table 1: The situation on the banking sectors in pre-COVID-19 and post-COVID-19 in selected Eurozone countries

Country	2019 Pre COVID-19		2022 Outlook		Concentration
	ROE	NPL ratio	ROE	NPL ratio	Market consolidation
France	7,2	3,4	6,0	8,1	Low
Germany	1	2,2	3,7	4,2	High
Spain	9,1	4	7,4	8,4	Medium
Netherlands	6,7	2,6	5,6	6,5	Low
Italy	5	8,9	5,5	13,2	High
Greece	3,3	40,1	4,2	47,1	Low
Portugal	2,8	8,3	4,1	11,7	Low

Source: own elaboration on the basis of Oliver Wyman, Aim for revival. Not just survival. European Banking 2020, www.oliverwyman.com (accessed: 17.11.2020).

The situation of banking sector in the United States is similar to the situation of banks in the Eurozone. The US economy experienced a dramatic collapse as a consequence of the pandemic, and it exerted the pressure on the banking sector. The economic shock caused by the COVID-19 pandemic triggered a sharp increase in demand for cash and short-dated investments. Similarly like in Europe, banks in the United States are working in tandem with the governments to provide assistance and prevent businesses from collapsing, thereby affecting the whole economy. The situation on the market resulted in significantly constrained liquidity, higher cost of capital, increased margin requirements and other negative processes (Kothari, 2020). However, it is a fact that banking system in the US will recover faster than many banking systems in Europe. They are more profitable than their European peers and they will be able to retain a greater share of their earnings to rebuild their cushions. It is estimated that while European

banks' ROE stays well below cost of capital until 2025 the US banks return to precrisis levels of ROE by 2023 (McKinsey & Co, 2020).

It becomes obvious that the COVID-19 accelerated some of the trends which already existed in banking sectors. The pandemic will deepen and lengthen the period with very low interest rates. It also accelerates the process of digitalization of banking services. Almost all aspects of the banking industry are becoming digital – the services offered for bank customers, internal processes (remote work), and the transformation of bank operating and business models (Carletti et al., 2020). It will create the new environment for the further development of banking sectors. Together with such changes, there will be a need for banks to return to lending policy in new economic circumstances. As lockdown is lifted, the economies will come back to normal functioning. There will be many difficult situations in business, and banking sector should provide necessary financing. The bad debts must be restructured if unsustainable, and other measures must be undertaken to support the recovery of economy. There is also a need for banking sector to be prepared for the post-COVID-19 recovery actions (Blanchard at al., 2020). It means that the governments must prepare necessary programs for past-pandemic time. Among the crucial areas should be selected: helping workers to adjust to new normal, helping firms in their short-term problems, restructuring the unsustainable debts, and providing new investment loans. It means that new, post-pandemic strategy for banking sector is needed.

Conclusions

The economic deterioration in the Eurozone and United States, together with the engagement of banks in the countercyclical lending during the COVID-19 pandemic exposed banking systems to additional stress. It is, however, different in respective banking sectors, depending on the pre-crisis characteristics of the banking sector in particular country (Demirguc-Kunt et al., 2020). In general, it cannot be concluded that the situation is better in the United States than in Eurozone countries, and vice versa. The potential long-term impact of the policies provided by the selected central banks is still unpredictable and all of the scenarios, positive, negative and neutral are equally possible. The role of banking sectors during the pandemic and after is crucial for fostering real economies.

Abstract

Eyetracking metrics can be calculate and analyze in user experience web sites evaluation. This paper presents the results from the experiment where 11 commercial websites where tested with first click A/B tests. Used methodology are user observation and eyetracking data recording. Aim of the study is to verify the legitimacy of the use and interpretation of a specific set of eye-tracking metrics for the purpose of their universal application in user experience research on websites.

Keywords: eye tracking, user experience, eyetracking metrics, A/B tests

Introduction

Nowadays the designing user-oriented interfaces are of great importance. More and more money are spent on not only web-page usability assurance but also User Experience improvement. Researchers are using different devices to monitor web user's behavior. Researches carried out by Schall, A. et al. (2014), Horsley et al. (2014) and Bojko (2006) present useful methodologies for application of eye tracking in usability testing of web pages. These methodologies are also applied in comparison of web page designs at different stage of design process (Poole, A and Ball, Linden, 2006). Most of them are based on the assumptions that fixation point determines user interface elements that attract attention and that are invisible or incomprehensible during the completion of the task on the tested web page (Pashler and Homan, 1998; Rogos-Turek, B. 2015).

In this paper we present the experiment that verifies usability of the common commercial websites of hotel, e-shops, restaurant, fitness club, energy provider, social networking, and insurance company have been presented to the respondents. The experiment was built as a standard A/B test, version A – more friendly user interface, version B – less friendly user interface. User interface elements of group A has increased visibility and/or readability with modified size, contrast or added graphics (Goldberg, Joseph and Kotval, Xerxes, 1999), (Kotval, Xerxes and Goldberg, Joseph, 1998). In the research nine examples of the pairs of design versions of the same websites have been presented to the separate groups of users. For each sample we measure gaze points and calculate seven eye tracking metrics to confirm whether the difference of measures for these two versions of design are significant (Bojko, 2013; Nielsen and Pierce, 2009).

The paper is constructed as follows. First, we present the experiment stimuli, then we give the description of the experiment methodology followed by the experiment setup. Then we present the experiment results. At the end we give some conclusions.

Experiment stimuli

Different versions have been prepared by adding or changing visually one of the elements, or group of elements on the website' design. A task was prepared for each pair of design versions, which correct solution was to click on the modified / tested element. Eleven web-page designs in two versions have been prepared for the study, however only nine of them have been analyzed, as in the case of two prepared scenarios have not been understandable for all respondents, as they reported in the interview after the study.

The off-line versions of the pages listed in the table 1 have been the basis for preparation of the research stimuli used in the experiment. Modifications were made on specific elements to create user interface more (A) or less user friendly (B). Clicking on the specific part of each element have been led to the tasks solutions. These elements have been also the source on the eye tracking metrics.

Experiment Methodology

In the experiment with users two methods have been applied: observation and one-on-one interviewing. With information about the study, the user was asked to sit in front of the laptop and interact with websites selected for testing. Each respondent was asked to complete eleven tasks, eight of which were analyzed later and presented in the table 1. We have used eye tracking system to record the user activity. Using this system, the fixation paths has been recorded together with screen and mouse activity. After finishing all tasks, the users have participated in a one-on-one sound recorded interview that aim was to verify understanding of the task as well as confirmation of seeing the web-pages for the first time. In the study 22 participants have been engaged, what made 11 participants for each web-page in less or more user-friendly variant. The web-pages have been presented using laptop with 15" LCD screen. The sessions have been recorded using Tobii Eye Tracker X60 (60 Hz) and Tobii Studio software.

The experiment has been conducted at the University of Technology Sydney, Australia (UTS) from 27.11.2019 to 6.12.2019. The methodology of the study has been approved by the local Ethical Committee (UTS HREC ETH19-3452). In the study participated 22 respondents (9 - UTS' PhD students and 13 - staff members), out of which 12 - women and 10 - man.

Experiment Results

In this section the experiment result will be presented. The statistical significance will be verified by two-tailed t-tests (Cho 2013; Ruxton 2010). The results will be presented in tables. In bold-face results that are statistically significant will be given (with p=0.05). The more user-friendly version results are given in row A and the less user-friendly version in row marked as B.

In table 2 the number of errors in task accomplishment? for each version (A and B) will be given.

Table 2: Number of errors for each version.

	C21	**GE**	**LS**	**PP**	**POPO**	**SS**	**RM**	**FB**	**HL**
A	3	5	3	0	2	0	2	3	1
B	6	6	4	0	2	0	4	2	3

For two web sites designs : C21 and RM there were half less incorrect task realizations on more user friendly versions, then on worse. For other 3 web sites designs (PP,POPO,SS) there were no differences. In other cases there were usually one error less on more friendly version.

In table 3 time to first fixation for two versions of 9 designs is presented. Time to first fixation is defined as the time from the start of the stimulus display until the test participant fixates on the AOI (Bojko, 2013).

Table 3: Mean time to first fixation on the A and B version of designs

	C21	FB	GE	**HL**	LS	POPO	PP	RM	SS
A	4,51	6,75	14,37	**9,18**	5,96	6,43	5,83	6,08	2,27
B	8,63	7,51	11,55	**18,93**	3,86	7,71	7,47	8,1	2,7

In 7 out of 9 designs average time to first fixation was longer for design B then design A, however there was only one significant difference in the scores for HL website (input filed modified). Version A (M= 8,515, SD=3,71) and Version B (M=14,93, SD=11,61), t(13)=-2.64, p=.020.

Table 4 presents the results for the mean value of a measure fixation before, which equals the number of fixations prior to first fixation on an AOI (Bojko, 2013), for the A and B versions of designs.

Table 4: Mean fixations before on the A and B version of designs

	C21	FB	GE	**HL**	LS	**POPO**	PP	RM	SS
A	10	12,5	43,29	**19,38**	9,57	**9,5**	13,83	16,29	3,3
B	16,38	18,43	22,75	**45,88**	9,29	**17,29**	20,12	16,8	1,75

There were two significant difference in the scores for: HL website version A (M= 19, SD=6,72) and version B (M=42, SD=27,68), t(14)= -2.63156, p= .019726 and POPO website version A (M=10,5, SD=6,20) and version B (M=19, SD=3,99), t(14)= -2.55, p=. 023

Table 5 presents the results for the mean value of a measure of total fixation duration on AOI, for the A and B versions of designs.

Table 5: Mean total fixation duration on the A and B version of designs

	C21	FB	GE	HL	LS	POPO	PP	RM	SS
A	**3,16**	1,98	1,27	0,77	0,9	0,53	1,56	1,06	1,22
B	**1,35**	1,43	1,06	0,72	0,78	1,02	1	1,16	0,81

There was only one significant difference in the scores for C21 website version A (M= 2,92, SD=1,10) and version B (M=0,72, SD=1,45), t(12)=2.53, p=.026.

Table 6 presents average values of fixation count over AOI, for the A and B versions of designs.

Table 6: Mean fixation count on the A and B version of designs

	C21	FB	GE	HL	LS	POPO	PP	RM	**SS**
A	11,67	8,88	4,29	3,25	4,14	3,6	4,83	2,71	4,5
B	5	6	5,5	2,75	2,86	4,86	3,38	2,8	3

There were no significant results for this measure.

Table 7 presents the results for the mean value of visit count over AOI, for the A and B versions of designs.

Table7: Mean visit count on the A and B version of designs

	C21	FB	GE	HL	LS	**POPO**	PP	RM	SS
A	**5**	2,25	2,14	2,38	3,43	**1,6**	4	2,14	2,6
B	**2,38**	2,86	2	2	2,29	**3**	2,38	2	1,75

There were two significant difference in the scores for: C21 website version A (M= 5, SD=0,89) and version B (M=2, SD=1,6), t(12)= 3.6, p= .0036 and POPO website version A (M=1,5, SD=0,7) and version B (M=3, SD=3,99), t(15)=-2.56, p=. 021.

Table 8 presents the results for the mean value of time from the first fixation on AOI to the mouse click within this area, for the A and B versions of designs.

Table 8: Mean time from first fixation to mouse click on the A and B version of designs

	C21	FB	GE	HL	LS	POPO	PP	RM	**SS**
A	10,74	5,17	2,25	2,28	17,76	4,02	4,15	3,6	**2,02**
B	4,58	2,65	5,86	2,11	26,24	5,29	2,5	2,68	**1,15**

There was only one significant difference in the scores for SS website version A (M= 1,65, SD=0,79) and Version B (M=1,2, SD=0,47), t(16)=2.29, p=.035.

Table 9 presents the results for the mean value of fixation duration on AOI for the A and B versions of designs.

Table 9: Mean Fixation duration on the A and B version of designs

	C21	FB	GE	HL	LS	POPO	PP	RM	SS
A	0,27	0,22	0,3	0,24	0,22	0,15	0,32	0,39	0,27
B	0,27	0,24	0,19	0,26	0,27	0,21	0,3	0,41	0,27

There were no significant results for this measure.

Summary

The experimental results and statistic verification shows that in most cases of designs and corresponding measures there is no significant differences in average values. In the case of designs FB, GE, LS, PP and RM, for no measure reaches significant difference between designs A and B. We may notice however that in most cases the average values of the proposed measures, the values (higher or lower) indicate that the improved design A is better than B, but mainly these differences are not statistically significant. However we must note that the low frequency (60Hz) of eye tracking data registration resulted in the lack of precise fixations on small interface elements and numerous shifts. This in turn resulted in fewer samples than registrations and had an impact on the significance calculations.

There could be several reasons for the obtained results, however it seems that the difference between proposed samples of designs have no significant influence on the users interaction. Most of the participants were very experienced web users, so they often used web pages with better and worse designs as they have to get used to that. We are going to repeat that kind of experiments with some changes in web page designs and also we will recruit both experienced and less web experienced users. We are also planning to change the eye tracking system from Tobii X60 to Tobii TX-300, which registers eye tracking data with much higher frequency (300Hz) and is using workstation with 17"LCD screen.

Abstract

A thorough and systematic reform of local self-government has been launched since 2014 in Ukraine. The experience of Central and Eastern European countries in combination with international standards and recommendations for the positioning of the institution of municipalities is entrusted to the development of relevant legislation and mechanisms for the practical implementation of change. The updated legal framework has significantly contributed to the municipal consolidation in the country and created the appropriate legal conditions for the implementation of the developed reform and the effective functioning of local authorities and economies.
The study analyzes and evaluates a new phenomenon for Ukraine - political and economic decentralization of power and it's impact on economic development. The reform is carried out in favor of the formation of the basic level of government through the formation of new primary structures - united territorial communities. The influence of the principle of subsidiarity on the formation of local self-government structures on the economic development of communities is studied. The first stage of decentralization reform is generalized taking into account the projected changes, real results and expected risks.

Keywords: decentralization, united territorial community, economic development, investment.

Introduction

The purpose of the study is to analyze the features of the economic impact of decentralization processes in the context of local government reform in Ukraine. The complexity of the subject of research determines the use of a set of methods for analysis and identification of features on the issue. The application of the historical method makes it possible to trace the retrospective of decentralization processes in world practice. Systematic approach used in the study of the decentralization process in Ukraine as the complex legal, political, administrative and economic measures designed to strengthen local communities. The empirical research was carried out by analyzing international recommendation documents concerning the powers of local self-government, as well as legislative projects and acts of the Ukrainian state authorities.

Main Research

The formation of the basic principles of local self-government is associated with the formation of industrial capitalist relations in the nineteenth century. The French historian and public figure A. de Tocqueville (2000) developed a "theory of free communities", guided by the idea of the historical primacy of the community and secondary - of the state. A. de Tocqueville noted the direct leadership of the people as a source of power in the community and the delegation of some powers to the state. According to this concept, we can define the community as an independent basic administrative unit in its competences, which is empowered to independently conduct business and carry out local government taking into account the local interests.

The main provisions of the state theory of local self-government were developed by professor of the University of Vienna Lorenz von Stein and professor of the University of Berlin Rudolf Von Gneist (1869) in the nineteenth century. They came to the conclusion that there are no special public affairs because they are all essentially belong to state. The transfer of some powers of governance to local communities is necessary in order to ensure more effective decision-making. This theory of local self-government is now used in many countries around the world, including the Anglo-Saxon legal system.

The dualistic theory of local self-government reveals its dual essence. It considers local government as a synthesis of autonomy in local affairs and delegated government functions at the local level. According to this theory, local governments, performing functions delegated by the state, go beyond local interests and act as a tool of public administration. This mechanism is based on the manifestation of a counter-initiative: on the part of the population, which entrusts local governments with a number of important functions, and on the part of the state, which instructs local authorities to address a number of issues important not only for a particular municipality but also for the state.
In scientific research, the term "decentralization" can be used in a broad and narrow sense. We can talk in general about the mechanism of redistribution of power and the delegation of some functions from the central to the local level. At the same time, this concept can be considered as a certain system of relations between the state and administrative-territorial units of the lower level. The process of transferring powers to local authorities, increasing the capacity of local self-government and expanding its powers, which are transferred from the center to local communities on a subsidiary basis, is an objective basis for decentralization. The processes of decentralization and centralization should be considered as processes of concentration or distribution of powers, and not only in the sense of the level of approximation or delimitation of decision-making processes to the national level.

Decentralization involves the transfer to the local, regional level of as many powers as the local government can actually perform in order to fulfill its responsibilities. Local authorities need to focus on providing public services and improving the well-being of people living in a particular area. Decentralization should involve citizens in solving current problems of local development, increase citizens' self-awareness as "owners" of the territory, as well as find internal resources and introduce effective incentives and levers aimed at stimulating economic growth of communities. We can affirm that decentralization covers a huge range of activities: from the development of political consciousness of citizens, the formation of civil society and to improve the economic development of the territory and the specific territorial community.

Decentralization processes, which entered an active phase in Europe at the end of the twentieth century, are aimed at a radical reorientation of policy to the level of municipalities, where the possibility of forming horizontal interactions is much higher. The most interesting for the study is the economic aspect of decentralization, namely how decentralization can affect the stimulation of economic growth of territorial communities in Ukraine.

The experience of European countries in reforming the institutions of local self-government in individual territories and in general is extremely valuable for Ukraine in terms of developing the legal framework and practical mechanisms for implementing the new principles of governance. The determining factor of such changes can be considered the unification and standardization of international principles of self-government through the development and adoption of agreements and treaties between countries with the assistance of intergovernmental organizations.

Based on the reforms carried out in Central and Eastern Europe, five basic factors of the decentralization process are identified by Pigul N.G., Lyuta O.V. (2016). The first and most important is the development of local and regional autonomies as a way to achieve the democratization of society. Solving local problems and freedom as a result of local and regional autonomy are also important factors. This also includes guarantees of ensuring and supporting cultural, linguistic and ethnic diversity and stimulating economic competition between authorities at various levels.

Decentralization in the European Union has become an integral feature of governance. It covers both the issue of decentralization within individual member states and the specifics of the division of responsibilities between countries and European institutions throughout the association. EU countries are constantly looking for an effective model of public administration. This search provides several options that have a higher or lower level of decentralization. One of the most effective examples of decentralization in recent years is the experience of Poland. After 1989, democratization processes took place in Poland aimed at forming a democratic system characterized by the protection of individual rights and civil liberties. This process was accompanied by the reform of the economic system, namely the formation of a market economy based on private property. At the same time, the system of public financial management was reformed. Decentralization has become not only a mechanism for solving the problems of the regions and the state budget, but, most importantly, a condition for ensuring the economic development of the country as a whole, although this conclusion is not supported by all scholars. The experience of the Republic of Poland is very useful for Ukraine because of the common historical past, the closeness of mentalities and the similarity of the

management system before the beginning of the decentralization reform. Theorists of decentralization reform in Ukraine have widely used the experience of Poland and implemented some of its provisions.

Prior to the implementation of the decentralization reform in Ukraine, the Law on Local Self-Government was the main legal document that defined the status and powers of local government structures, principles and the system of self-government. Article 5 of the law defines the structure of the local government system, which includes the territorial community, village, settlement or city council, village, settlement or city mayor and relevant executive bodies.

Decentralization reform in Ukraine began in 2014 with the adoption of basic legislative documents. This should include the Concept of local self-governance and territorial power reforming (2014), Law of Ukraine 'On voluntary unification of united territorial communities' (2015) and Law of Ukraine "On cooperation of territorial communities" (2014). Also important in terms of financial decentralization are changes to the Budget and Tax Codes.

First of all, analyzing the the Concept of local self-governance and territorial power reforming, it is necessary to highlight a number of important problems, which, in fact, this reform is designed to solve. In particular, the decline in the quality and accessibility of public services as a result of the lack of sufficient resources of a significant number of local governments and their inability to perform their own and delegated powers. Also the problems of icommunal services, namely the critical condition and lack of repair of heating, sewerage, water supply networks, as well as emergency housing, and the risks of man-made disasters due to lack of sufficient funding and small local budgets. A large number of territorial communities, especially those where there are no numerous cities, face the problems of nation aging, urbanization and the decline of rural areas. Another area of problems is the lack of coherence of local socio-economic development policy with the public interests and enhanced centralization of powers and financial resources by the executive branch.

To solve these problems, the Concept of local self-governance and territorial power reforming provides local governments with basic powers in accordance with their human, financial, infrastructural potential and resources on a new territorial basis. The purpose of the Concept is aimed at identifying mechanisms, areas and deadlines for creating an effective system of local self-government and optimal territorial organization of government to provide citizens with quality administrative services.

The basis for the redistribution of powers and the strengthening of local self-government was the European Charter of Local Self-Government, ratified by the Verkhovna Rada of Ukraine on July 15, 1997. The decentralization reform in Ukraine is planned in 2 stages, the first of which was preparatory and lasted in 2013-2015, providing organizational, analytical and research processes in studying the real state of local government, choosing the best ways to implement reform. The second stage includes the period 2015-2020 and is aimed at implementing the reform, with the task of completely renewing the administrative-territorial organization, completing the process of forming united territorial communities.

It is important, in our view, that decentralization transfers basic powers directly to the local level, thus speeding up the resolution of local problems. The ability to act independently motivates the population and the leadership of the local community to develop and improve conditions. Through the reform, the united territorial communities are empowered in such areas as local economic development, local infrastructure development, improvement and development of the territory of the united territorial communities (UTC), provision of housing and communal services, management of secondary, preschool and out-of-school education institutions, provision of health care services, development of culture and physical education, provision of social assistance and administrative services.
The Law of Ukraine 'On voluntary unification of united territorial communities' (2015) defines a single mechanism for the formation of a new administrative-territorial unit, and emphasizes the voluntary nature of such association and the initiative of residents of the village, town or city, deputies and relevant councils, local self-organization bodies. The united territorial community is the legal successor of the property, rights and obligations of the united territorial communities from the date of official receipt of certain powers by the elected community. It follows that the united territorial community receives in its activities a significant number of powers from the preceding local governments. Markovych, H. (2019) emphasizes that the financial side of the reform is provided by the amendments to the Tax and Budget Codes, which from January 1, 2015 increased the economic capacity of the united territorial communities by obtaining more finances. The budget of the united territorial communities (UTC) is 60% of the personal income tax, 5% of the excise tax on the sale of excisable goods, 100% of the single tax, 100% of the property tax (land, real estate, etc.). In addition, local budgets remain at the disposal of 100% of the income tax of enterprises and financial institutions of communal property, 100% of payments for the provision of administrative services and 25% of the environmental tax.

Amendments to the Budget Code fix funding from district budgets in the field of secondary health services and activities at the district level, regional funding of educational institutions, at the level of state subventions. Local budgets of municipalities will be supplemented by revenues from state duties, administrative services, collection of administrative fines, collection of tourist income, payment of licensed economic activities, rent for the use of communal property, subsoil and water resources.

The fact of establishing direct inter-budgetary relations with the state budget remains important, because before the reform such relations were available only to the budgets of oblasts, rayons and cities of oblast significance. It is also possible to approve the local budgets of the united territorial communities (UTC) regardless of the date of adoption of the Law "On the State Budget".

For the successful implementation of the reform, the budgets of the united territorial communities (UTC) receive support from the state authorities in the form of subventions. Exercising the powers delegated by the state, local governments receive appropriate transfers in the form of grants, educational and medical subventions, subventions for community infrastructure development, socio-economic development of territories, etc.

The councils of the united territorial communities (UTCs) also have the right to make local borrowings to the budgets of the UTCs, both local and domestic, including by obtaining loans from international financial institutions. Borrowings are made to the development budget and funds are directed to the implementation of investment programs (projects), the purpose of which is the development of communal infrastructure, introduction of resource-saving technologies, renewal of long-term strategic facilities.

	2014	2015	2016	2017	2018	2019
The share of local budget revenues in GDP	5,06%	5,11%	6,15%	6,46%	6,57%	6,92%
GDP, UAH million	1 586 915	1 988 544	2 385 367	2 983 882	3 560 596	3 974 564
Revenues of the general fund of local budgets (excluding transfers), UAH million	80 230,00	101 574,00	192671	234105	275169	291745

The main macroeconomic indicators (2020)

Since the beginning of the decentralization reform and the formation of united territorial communities, the share of revenues of the general fund of local budgets (excluding transfers from the state budget) in GDP has gradually increased - from 6.15% in 2016 to 6.92% in 2019. This indicator shows the positive dynamics of decentralization reform as local budget revenues are growing rapidly. Such results are possible due to the expansion of powers and increasing the interest of local governments in increasing revenues to local budgets, attracting reserves to fill them and increase the efficiency of administration of taxes and fees.

During decentralization reform the Government of Ukraine has approved 24 long-term plans for the formation of the UTCs with 100% coverage of the country's territory. From 2015 till September, 10, 2020, 983 united territorial communities were created out of 1466 provided by the new system of administrative-territorial organization. New prospects for economic development of communities are envisaged after the liquidation of districts in accordance with the Resolution of the Verkhovna Rada of Ukraine "On the formation and liquidation of districts" of July 17, 2020. This normative act liquidates the existing 490 districts and forms 136 new districts in Ukraine. The village,

township, and city budgets will no longer depend on the district. All 1,469 territorial communities, the territories of which have already been approved by the Government, will switch to direct inter-budgetary relations with the state budget which opens new prospects for UTCs.

Conclusions

The launch of decentralization reform in 2014 has become both a tool for improving the development of local democracy and an effective tool for increasing the financial capacity of local communities. The adoption in April 2014 of Concept of local self-governance and territorial power reforming in Ukraine launched a complex procedure for updating local government. The priority of the reform was the formation of about 1,500 united territorial communities with the possibility of independent local development and the provision of affordable administrative services. The same task was due to the elimination of the "duality" of administrative powers of state and municipal authorities.

Based on the analysis, we can identify the positive aspects of decentralization reform in relation to the economic development of territories. One of the benefits of the reform is the increased efficiency of resource allocation through establishing direct inter-budgetary relations with the state budget. Another advantage is the increase in the level of targeting in the allocation of state resources. Attracting most of the taxes to the local budget was encouragement for local businesses get involved in territorial development. At the same time, we can single out the risks of decentralization, which require the development of new management mechanisms. These include a reduction in the government's control over public finances, the problem of efficient use of resources in newly created communities and the need to control municipalities in attracting and repaying loans.

Abstract

The aim of the research was to identify problems concerning workplace stress during the COVID-19 pandemic, including those related to the applied stress management strategies. The research conducted in the article was based on quantitative secondary data and analysis of available source literature. Research methods adopted in the article include: critical analysis of source literature and an analysis of secondary data. The aim of the article is to discuss the phenomenon of stress in the workplace during the pandemic, to indicate the methods of dealing with stress in an organisation during the pandemic and to identify the symptoms of work-related stress.
The following research question was formed in the paper: do employees experience additional stress in the workplace during the COVID-19 pandemic and do they have an opportunity to cope with stressful situations caused by the COVID-19 pandemic in their organisation?
The analysis and assessment carried out in the article indicated that the COVID-19 pandemic and its consequences causes social trauma and extreme stress related to a work situation which is not handled well by many employees. Taking appropriate precautions to protect and maintain physical health in the workplace can help to relieve the stress and anxiety which may be associated with COVID-19.
The results obtained may be used to develop programmes to effekt stress at work to counter the effects of the crisis in organisations.

Keywords: Stress, Stress at Work, Management Strategies, Covid-19, Pandemic, Organisation.

Introduction

The reason for changes in working conditions and the workplace is constant social and civilisational development. Work-related stress poses one of the main challenges in respect of health and safety. It is present in the life of every person and, despite concerns about its effects, it is often impossible to prevent it. Occupational stress is a significant type of stress, as it leads to irreversible consequences which pose a threat to the mental and physical health of different professionals. It results from the human body's internal reaction to external environmental stimuli. Stress at work stems from situations which cause mental discomfort. Most people link stress with difficult conditions and requirements at work. They tend to associate this phenomenon with a sense of failure, helplessness or anxiety. Stress may also be motivating, it allows a person to concentrate better on a task or increases an energy level. Many people seek to counter adverse effects of stress so that they do not feel discomfort outside of their professional lives. Is it possible during the COVID-19 pandemic?

The changes brought about by the COVID-19 pandemic did not spare the labour market either. Increasingly often work occupies human life and therefore plays a significant role in our existence. As a result, more and more people are experiencing situations harmful to health, which are reflected, inter alia, in their work and affect their surroundings. Employees are constantly thinking about the workplace and the work itself, and for many, the end of the weekend is a cause for concern, as every week brings a great deal of new responsibilities and problems they must face (Ryder, 2020). Work-related tension accompanies employees every day, regardless of the type of work they perform or position they hold (Harnois, Gabriel, 2000). Stress is therefore a natural response to everyday challenges and changes in life, not only negative but also positive. Any activity can be stressful: air travel, an important exam, the first day at work or losing one's job. There are numerous sources of stress, including personal difficulties (e.g. conflicts with relatives, loneliness, lack of income, fear for the future), problems at work (e.g. conflicts with co-workers, extremely demanding or insecure job) or serious social threats (e.g. the COVID-19 pandemic, violence, illness, economic crisis or lack of economic opportunities) (Ahorsu, Lin, Imani, Saffari, Griffiths, Pakpou, 2020; Brooks, Webster, Smith, Woodland, Wessely, Greenberg, Rubin, 2020; Hossain, Tasnim,

Sultana, Faizah, Mazumder, Zou, Ma, 2020). It is stress that is considered to be one of the main threats in the workplace and, compounded by the COVID-19 pandemic, it has an even greater impact (Pappa, Ntella, Giannakas, Giannakoulis, Papoutsi, Katsaounou, 2020; Pakpour, Griffiths, 2020).

The aim of the research was to identify problems concerning workplace stress during the COVID-19 pandemic, including those related to the applied stress management strategies. The research conducted in the article was based on quantitative secondary data and analysis of available source literature. Research methods adopted in the article include: critical analysis of source literature and an analysis of secondary data. The aim of the article is to discuss the phenomenon of stress in the workplace during the pandemic, to indicate the methods of dealing with stress in an organisation during the pandemic and to identify the symptoms of work-related stress. The following research question was formed in the paper: do employees experience additional stress in the workplace during the COVID-19 pandemic and do they have an opportunity to cope with stressful situations caused by the COVID-19 pandemic in their organisation?

Literature Review

Many researchers have been trying for years to define the concept of stress in scientific terms, which means that this problem has been addressed in a variety of ways. It is traditionally defined as a set of responses of a human body to actions which disturb its balance, mobilise it or, on the contrary, disturb the balance of an individual. According to the contemporary view on stress, it may be classified subjectively, which means that it is a process located in the subject, or systemically, defining stress in the category of subject-environment relations. Given the multitude of the related terms, the ambiguity and the number of different criteria for classifying stress, the nature of stress may be considered as non-specific – it is a “broad response to difficulties”. This concept of stress was formulated by Selye (1950; 1974) and it is advocated by most authors. When defining stress, the relationship between stress and negative affects, such as fear, anger or sadness, must be considered.

Change is an inevitable part of human life, for example: illness, death, choosing a new school, taking a new job, promotion or dismissal, but also everyday frustrations: exams, late-coming, noisy flatmates, car crashes and the like (Holmes, Rahé, 1967). All these factors provide stress that affects the functioning of a human body (Holmes, Rahé, 1964).

Often stress occurs only in work-related situations, however other factors, such as personal matters, financial situation or environment in which a person lives and surroundings in which they function, play an important role as well. These aspects are also closely linked to work. People devote a significant part of their life to professional work, even if, due to the development of technology, it may be carried out at home – it actually consumes more and more time (Lazarus, Folkman's, 1984).

In the first half of the 20th century, in the era of industrialisation, the man was treated as an addition to a machine and this approach was widespread in the industry. It was only the hands, eyes and simple skills that mattered most, and the man as a whole, with his psychological, spiritual and social needs, was not a matter of entrepreneurs’ interest. Such approach to an employee often proved to be economically inefficient, as the person treated in this way was uncommitted to work, alienated, tired and made many mistakes. This adversely affected the quality of the manufactured product.

In Japan, the term “karoshi”, which refers to death from overwork, is still valid today. For cultural reasons, Japanese workers were not uncommitted to work, yet their physiological response was no different than in other countries, hence the costs of maintaining health had to be borne as well. In order to maintain quality, the control stations had to be multiplied, and this increased the costs even more. As a result, where the market position of a company's product depended on the highest quality, the production managers abandoned the dehumanising “assembly belts” and introduced the so-called teamwork.

The following years of industrialisation saw the development of trade unions, which enforced increasingly “humane” treatment of workers. In the post-war years, the Human Relations paradigm of promoting managers' interest in the psychological and social needs of employees began to spread in management, and as a result of its evolution, an even greater theory emerged, Organisation Development, which combined the humanist orientation “towards employees” with the perspective of the organisational and management corporate system (Caplan, 1994).

At the end of the 1970s, one of the promoters of management theory and practice based on the Organisation Development theory was Adams (1987), who at that time proposed a novel approach to diagnosing and improving the company’s management system. He suggested that the functioning of the company's management system should be viewed through the prism of stress experienced by employees and managers. The identification of processes and

places which are the sources of unnecessary stress of organisation's employees and managers was aimed at identification of those organisational areas which (in the name of increasing effectiveness) were to become an area of improvement and more reasonable solutions. Adams' analyses demonstrated that the constant, stressful working conditions included above all: continuously raised standards of productivity, insufficient time to complete tasks, only negative feedback from a superior, unclear standards of evaluation and conflicts between organisational units. Those are accompanied by daily problems, such as changes in instructions, the requirement to work overtime, sudden increase of work rate and any restructuring.

Today, we are witnessing a remarkable technological development and the related modern and humanistic forms of management organisation in knowledge-based areas, i.e. those whose growth depends on the mental efficiency of employees. However, it appears that in various areas of economy – industry, large-scale trade, financial services – the "traditional" practices of exploiting workers and managers are reintroduced. The "more efficiency, less expenditure" principle is applied. The globalising economy is contributing to over-exploitation of resources, including human resources. Companies not only reduce social benefits and privileges, but also reduce job security, which is a stress-inducing factor. At the same time, more and more funds are being spent on health care. This is not only due to the high cost of the latest medical technologies, but mainly due to the increasing number of people suffering from health problems caused by work-related stress (Buddeberg-Fischer, Klaghofer, Stamm, Siegrist, Buddeberg, 2008).

The working environment is constantly evolving under the influence of new technologies, changes in work organisation as well as economic, social and demographic transformations (Cooper, Rout, Faragher, 1989). Health and safety policy and practice must therefore be adapted to changes in the labour market, and the changes in the European labour market concern, inter alia, the workforce which:

- is ageing;
- consists of a growing proportion of working women;
- is composed of an increasing number of migrant workers, both legal and unregistered;
- is more frequently engaged for temporary and part-time work;
- increases the use of new technologies.

Changes in the working environment have strained the traditional coping mechanism. There is a growing pressure for greater productivity and longer working hours. There is a need to absorb and use more and more information. The sense of job security is poor (threat of dismissal). Demographic changes and the need for both men and women to reconcile work and family life are additional aggravating factors (Ruotsalainen, Verbeek, Mariné, Serra, 2014).

Stress has an economic dimension. The effects of stress affect the employee turnover and absenteeism rates. The higher the above rates, the heavier losses a company incurs. Stress additionally has other consequences which include the lack of motivation, low productivity, burn-out and poor performance of individuals and teams (Fontana, 1990).
Stressed employees tend to:

- make unintentional errors and mistakes;
- have accidents at work;
- suffer from chronic and severe diseases requiring expensive treatment;
- lose interest in their job (burn-out);
- come into conflict with their superiors;
- fail to comply with safety rules;
- be reluctant to change or innovative solutions;
- take frequent sick leaves;
- quit their jobs (frequent staff rotation).

These behaviours may cause losses to companies, for example as a result of accident costs, changes in work efficiency, lost equipment, lost profits, the need to train new employees or spend additional funds on replacements (Cooper, Payne, 1978).

Work-related stress symptoms during the COVID-19 pandemic

As the situation with regard to the spread of the pandemic and the resulting increase in workplace stress is constantly changing, it is essential that employees recognise the signs and symptoms of work-related stress as they emerge and refrain from ignoring or suppressing them. Recognition of signs and symptoms of stress is the first step

to develop plans to build up immunity, deal with symptoms and seek help when needed (Singh, 2020). During the COVID-19 pandemic, work-related stress may affect employees and cause the following symptoms (Maintaining Positive…, 2020):

- physical symptoms: increased heart rate, fatigue or burn-out, loss of or change in appetite, difficulty sleeping, muscle tension, frequent headaches, persistent nausea, dizziness;
- emotional or psychological symptoms: anger, irritation, denial, sense of insecurity, nervousness, constant worrying, lack of motivation, loss of self-confidence, low self-esteem, racing thoughts, sadness, depression, hypersensitivity, guilt or lack of commitment to work;
- behavioural symptoms: difficulty concentrating or inability to concentrate, poor judgement, limited decision-making, neglecting work and/or family responsibilities, procrastination, reduced productivity.

The COVID-19 pandemic has exacerbated the existing problems related to stress and anxiety in the workplace. For certain people, the reality of public work during the global pandemic raises serious health and safety concerns. For others, working from home involves its own challenges. Others are still unemployed and experience serious financial difficulties, which also contributes significantly to stress and anxiety (Time to Change…, 2020).

For those working at home (online), the stress of social isolation may easily lead to burn-out, which is a common syndrome suffered in the workplace and recognised by the World Health Organisation (2020). The requirements for adaptation to COVID-19 and social distancing measures can significantly impede creativity and efficiency of the workflow of blue-collar workers (organisations). Moreover, many employers may not provide adequate personal protective equipment or, for fear of employees' health, grand them paid leave (Labrague, De los Santos, 2020).

The situation resulting from the spread of COVID-19 and reactions to the pandemic have affected a vast majority of employees. According to the research conducted in the US, almost 70% of American employees consider COVID-19 pandemic as the most stressful period in their career and 88% of employees experienced moderate to extreme stress in the first months of the pandemic (America's State…, 2020).

The main factors which increased employees' stress and anxiety during the pandemic included:

- concern for personal health or the health of family and friends;
- fear of a difficult financial situation or concern about losing one’s job;
- change in sleep or eating patterns;
- difficulty sleeping or maintaining concentration;
- deterioration of pre-existing chronic conditions;
- deterioration of mental health;
- higher consumption of caffeine, nicotine, alcohol or other substances.

It should be noted that these stressors also affected significantly the employees' productivity. Among employees reporting increased levels of stress during the pandemic, 62% claimed they their productivity dropped at least by one hour a day, and 32% reported a loss of as many as two hours a day. This resulted in the loss of nearly $ 23 billion in the short period from the beginning of the pandemic to April 2020 (America's State…, 2020). The protracted COVID-19 pandemic is leading to a loss of productivity, increased health costs and is threatening employees’ well-being.

Furthermore, as a result of the coronavirus, the number of prescriptions for anti-anxiety drugs and the accompanying risks have increased. During the pandemic antidepressants and anti-anxiety drugs, many of which have a number of negative side effects, such as cognitive disorders and high risk of physical dependence, are prescribed more frequently (Labrague, De los Santos, 2020).

To conclude, people nowadays experience chronic stress, and in the COVID-19 era its level is even higher, which contributes to the development of mental problems in healthy people and exacerbation of the existing conditions (Gavidia, 2020). People who have never received psychiatric treatment begin to suffer from sleep disorders, anxiety disorders and depression. Initially patients experience adaptive disorders, however later some of them may develop symptoms of a depressive episode. The instability, uncertainty of the current situation causes fear fuelled by rapid changes in forecasts and further spread of the epidemic. People are experiencing fear of becoming infected, fear for themselves and their loved ones, which lasts many weeks. It is very difficult for some people to witness others in crisis situations. There is a sense of social risk. Stress may be additionally caused by limitations resulting from sanitary and epidemiological regulations, e.g. staying at home, telecommuting. In the era of COVID-19 pandemic, mental health may be also adversely affected by the professional and economic instability, limited opportunities to earn a living and support a family, as well as by the fear of stigmatisation of a person infected with the coronavirus

(Ahorsu, Lin, Imani, Saffari, Griffiths, Pakpour, 2020). Chronic stress generates losses, as the reality is distorted by anxiety. In times of stress and epidemic, the ability to think creatively is diminished. More mistakes are made which cause new fears and increase frustration (Singh, 2020). The somatic symptoms of anxiety – chest tightness, irregular heartbeat or abdominal pain – make it necessary to visit a doctor to discover their medical causes, yet not a psychiatrist, but a cardiologist or an internist. However, after the diagnosis which excludes a disease, some patients are unable to accept the thought that they suffer from a stress-based, psychological problem. The quarantine forces a significant change in functioning in terms of habits, routine and daily contacts with household members. Suddenly it turns out that the whole family have to stay together in one place, that remote work is not easy, as the time allocated thereto needs to be shared with children and other household members. Apart from that, isolation is always a source of additional anxiety.

The problem of coping with stressful situations caused by the COVID-19 pandemic in the organisation – discussion

There are many actions that may be taken, also by an organisation, to deal with stress and promote positive mental health and well-being among employees during the COVID-19 pandemic. To adequately address the growing problem of stress and anxiety in the workplace, both during and after the COVID-19 pandemic, and the associated consequences for physical and mental health, a multifaceted approach is needed. This approach should include the provision of additional mental and emotional health support from employers in the form of employee care programmes, as well as innovative approaches to psychotherapy and the use of pharmacology. Such a programme should be sponsored by employers who should ensure that employees have access to advisory services and other resources. It is also recommended that those programmes address challenges in every day life of an employee which contribute to stress and anxiety, such as childcare services, financial assistance, legal advice, etc. (Marsh, 2020). They should also include telephone and online counselling, online chat and face-to-face sessions. The resources provided by employers will play a key role in the maintenance of mental health and well-being of employees, as well as in efficiency, productivity and reduced employee turnover (Mayer, 2020).

It turns out that employers are not able to cope with stress of their employees (Biskupski, 2020). According to a survey by HRK (2020), recruitment company, more than half of employees are concerned about losing their jobs and income. Unfortunately, the actions taken by employers which should alleviate stress are considered unsuccessful. Currently, as many as 52% of employees are concerned about sudden loss of employment and a source of income. Among other concerns, employees indicate the fear of making a mistake (28%) which will have serious consequences, as well as the fear of the boss (15%) – their unjustified criticism, lack of appreciation, recognition of accomplishments and unclear communication in the daily delegation of tasks. For 43% of the respondents, clear and two-way communication is the basis for all activities, as it allows mutual exchange of experience, information and resolution of doubts. Straightforward communication creates less ambiguity and thus fewer stressful situations, and this is lacking in Polish companies during the COVID-19 pandemic.

It should be emphasised that one of the important action strategies at the organisational level, reducing the stress level of employees during the epidemic, involves a systematic provision of reliable and up-to-date information. It should relate to the epidemiological situation in the workplace, as well as any ongoing activities carried out by an employer to reduce the risk of infection as well as the procedure to be followed during this period. The information in question may come not only from superiors but also from occupational medicine physicians and occupational health and safety specialists. Where possible, helplines, instructional videos and training webinars should be made available. It is the practice of some wealthier companies to invite experts (e.g. virologists) to provide employees with more specialised knowledge.

Moreover, it is necessary to support employees in carrying out tasks in new conditions, different from the standard ones, as well as to ensure an opportunity to maintain an individual approach to working hours or productivity. To provide information support, additional trainings for employees present in the workplace regarding the tasks of those who, for various reasons, will not be able to return to work, may be considered.

It may also be good practice to provide support to the members of middle management who should communicate with their teams, yet may not have the necessary tools which are available to top managers. This may be accomplished by organising online or other trainings on team management methods.

Another very important organisational strategy to be implemented in this difficult period to prepare employees for return to work is the development of rules of conduct towards employees who have recovered from the infection. They may feel deeper anxiety due to their situation, which is more difficult than that of others; they may feel isolated from the rest of the team and ignored in the life of a corporate community. This poses a genuine dilemma

for an employer: how to respect the employee's privacy, how to keep their health status confidential (to which they are fully entitled), yet at the same time take care of the health and safety of other employees (OECD, 2020).

To allay the fear of stigmatisation of those who recovered from the infection, it seems crucial to advise them of anti-mobbing procedures and a policy of "zero tolerance for psychological abuse" applicable in the company. Such a policy fosters a culture of mutual respect and fulfils its purpose of ensuring the well-being of employees in any situation, and especially in crisis situations such as an epidemic. Pursuing the policy of "mutual respect", it is also important that the employer remains sensitive to the needs of a person who has recovered, to their particular condition, physical weakness, as well as to possible problems with concentration and severe stress and concern about their health (OECD, 2020).

It would therefore be advisable to hold a brief and regular forum to provide the employees with an opportunity to express their concerns and ask questions as well as to encourage them to support each other. In the Anglo-Saxon tradition, for example, such forms of mutual support which involve sharing opinions, concerns and advice are extremely popular and strongly encouraged by employers.

Remote employees who are less burdened by the presence of other family members, should try to follow a fixed daily routine based on their daily work routine. This is particularly important for telecommuters who are more vulnerable to changes and disorganisation of routine procedures, which may cause them strong anxiety, lack of concentration and worse performance at work.

All employees, including telecommuters and those returning to work, should be encouraged to use different forms of physical recovery that support individual resistance to stress, including regular physical exercises such as jogging, stretching, etc. As indicated above, they significantly improve mood by reducing the level of anxiety.
Mental rest, including a break from work, for example, to indulge in one's hobbies, relaxing books or to take a walk, also reduces the level of anxiety.

Conclusions

For many people work is the major source of problems and stress in life. Occupational stress may affect employees regardless of their position and age. Considering that stress is a widespread social phenomenon, it would be advisable to implement measures to reduce or completely eliminate it from companies. Solutions which involve monitoring and immediate response at an early stage of problem identification in an organisation, would allow for a quick reaction and reduction of psychic costs and economic losses.

Methods of managing workplace and occupational stress and developing resistance may help to overcome the adversities faced by employees who adapt to different work environments, such as those working in normal places of work/offices or those returning to the workplace after the company had been reopened. It would therefore be advisable to inform employees of the rules and procedures applicable in the workplace in order to reduce the risk of the spread of coronavirus and protect their health. To prevent the infection from spreading, the rules and procedures established in the workplace as well as public health recommendations should be followed (e.g. frequent hand-washing, respiratory etiquette, physical distance, cleaning and disinfection of the workplace). Taking appropriate precautions to protect and maintain physical health in the workplace can help to relieve the stress and anxiety which may be associated with COVID-19.

The ongoing epidemic causes social trauma and extreme stress related to a work situation which is not handled well by many employees. In order to alleviate this stress, we generally use intuitive forms of self-help and help others in an intuitive, spontaneous manner. Fortunately, despite isolation and social distance, thanks to technology we are not alone in this situation.

People differ in their ability to adapt to this new reality and many struggle with it. This is a cause for concern, especially since the threat of coronavirus is still beyond human control. The vaccine has not been developed yet and the health system is overloaded, which makes it more difficult to receive assistance immediately.

Whenever we experience chronic stress, the risk of developing or exacerbating symptoms of mental disorders, including mood and anxiety disorders, but also other conditions, increases significantly. As a source of a long-term stress, the pandemic already has a major impact on the mental health of employees and will probably continue to affect them for a long time after it finally dies down.

Abstract

The paper presents the analysis of quantitative research conducted during second wave of the economic crisis caused by Covid-19 pandemic among the sample (N=795) of Polish employees representing three economic sectors: services, production and public sector. Two variables**:** the type of the sector and the level of the subjective sense of safety and their elements were statistically controlled via two-way analysis followed. Obtained results show employees differ in their experiencing prolonged stress caused by the COVID-19 pandemic and most of them (employed in service and in production sector) perceive disturbances in their subjective sense of safety. Employees of all economic sectors connect their sense of safety with the degree of satisfaction of their basic needs, the safety of their relatives, and their appreciation of the corporate order currently existing in their organizations. The employees' assessment of the corporate safety is more critical in case of enterprises, both in service and in production, in compare to the evaluation of public sector organizations. The found results can be used as recommendations for introducing more intense and accurate anti-crises interventions addressed to the sector of enterprises.

Keywords: corporate safety, sense of safety, employees, COVID-19 crisis

Introduction

In the situation of the COVID-19 crisis the foundation of the socio-economic order is threatened by an objective and serious stressor of biological nature, which has many socio-economic repercussions. Government and regional administrations, organizations and individuals are trying to face this stressor since the first quarter of 2020. Social distancing, self-isolation and economic restrictions are causing reduced turnovers across all economic sectors and thus - the risk many jobs can be lost (Tucker 2020, Nicola et al 2020, Ritter and Pedersen 2020). The second wave of the crisis situation (from early autumn 2020) is visible both in the intensity of the daily sickness and death rates as well as in various economic indicators (e.g. rising unemployment, number of corporate bankruptcies, etc.).These indicators mirror also the effectiveness of already implemented anti-crisis interventions at the government or regional level, which are evaluated not only by experts, but first by citizens, employees and employers (Carnevale and Hatak 2020, McKinsey & Company 2020).

The main theory underlying the article is the concept of the safety broadly defined as an objective state of non-threat that is subjectively felt by individuals or groups (Korzeniowski 2000, Czajkowski 2014). This approach includes two perspectives of understanding phenomenon of safety: an objective, related to the external factors that are important for a safe life, and subjective, concerning individual, subjective assessment of the state of possession or availability essential goods and relating to the individual's experience. The stressfulness of the COVID-19 crisis is revealed at the level of subjective perception of different threats which can be assumed as the measure of the subjective sense of safety. The sense of safety, in literature (exchangeable called as sense of security), is variably understood, but one of the leading meaning is that it represents the subjective state of belief of individual in having sufficient resources to take own action or development activity (Bar-Tal 2000, Klamut 2012, Piwowarski 2014). The general sense of safety can be defined as a state of internal balance resulting from having acceptable level (from the point of view of individual) of own goal-oriented activity. Three internal variables of the sense of safety reflecting its emotional

Cite this Article as: Wojciech PIESTRZYNSKI and Ewa MATUSKA " Assessment of Corporate Safety Across Economic Sectors DuringThe Second Wave of SARS COV2 Crisis - The Employees' Perspective" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

dimension (Klamut 2019) include: the degree of satisfaction of the basic life needs, the level of perceived safety of relatives, and the assessment of the possibilities of continuing own social or economic participation.

Authors of the article used above specification to plan own research. The paper content is conceptualized based on the literature review and on the basis of the execution of own quantitative research. The on- line questionaries regarding the sense of safety was disseminated in Oct. 2020 among employees of the three economic sectors in Poland, namely: services, production, and public institutions, and obtained results were followed with ANOVA and correlation analysis.

Research Concept and Design

The research main assumption was that emotional context of ongoing stressful COVID-19 situation is a risk factor both for employees economic well-being as well as for their corporate participation. The subjectively experienced sense of safety of employees reflects not only the trust to their organizations (corporations or institutions), but also to the relevant administrative bodies (governmental/regional) responsible for undertaking adequate anti-crisis interventions. As COVID -19 especially hit the service sector, employees of that sector are probably more vulnerable with weakening their own sense of safety in compare to employees of other sectors.

The sample of 795 women and men, working in organizations located in north regions of Poland (Pomerania, West Pomerania, Masuria and Warmia) was randomly selected and checked for the level of their perceived sense of safety. Respondents were representing three economic sectors: services, production, and public institutions. The study was conducted in first half of Oct. 2020 when COVID-19 pandemic restrictions were minimized after summer when the speed and range of the disease spread was lighter. In that time the governmental anti-crisis tools were already implemented as the aid for organizations. Information about the research sample is presented in a Table 1.

Table 1: Descriptive statistics of respondent sub-grups

Employment sector	Number /N	Median/M	Standard Deviation /SD
Services	216	17.722	4.49
Production	238	18, 336	3.17518,336
Public sector	341	18,563	2.768

Source: own elaboration

The following problems and hypotheses were formulated:

1. *Does the sense of security experiencing during second wave of COVID-19 pandemics differ in case of employees of three economic sectors?*
   H1 – it is supposed that there are significant differences for the three sectors, especially between employed in services versus other subgroups.
2. *Does exist the correlation between the employees' sense of safety and their level of satisfaction referred to filling basic life needs during the second wave of COVID-19?*
   H2 – it is supposed significant correlation exists between employees' sense of safety and their level of satisfaction referred to filling basic life needs.
3. *How does the sense of safety of employees correlate with the assessment of the safety of their relatives during the second wave of COVID-19?*
   H3 – it is supposed correlation exists between the employees' sense of safety and their assessment of the safety of their relatives.
4. *What are the correlations between employees' sense of safety and their assessment of the corporate safety during the second wave of COVID-19?*
   H4 – it is supposed correlation exists between the employees' sense of safety and their and their assessment of the corporate safety.

The research have used the Safety Experience Questionnaire (SEQ) standardized for Polish population by Klamut (2019) and adopted to the on-line version. Three internal variables of the sense of security were examined: the degree of satisfaction of the basic life needs, the level of perceived safety of relatives, the assessment own possibility to act as an appreciation of perceived corporate order . The norms for raw scores of global sense of safety in SEQ were following: raw scores (min 5 – max 25); from 5 to 15 - low sense of safety; 16 - 20 - moderate sense of safety; 21 - 25 high and very high sense of safety. For data statistical elaboration the analysis of variance (ANOVA) and the Pearson correlation coefficient (r) were used.

Results and Discussion

Tables 2a and 2b summarize descriptive statistics of the sense of safety for examined employees of the three investigated economic sectors.

Table 2a: ANOVA for sense of safety of employees of (S), (P), (PB) sectors*

Source of variance	SS	df	MS	Test F
Between subgroups	95.129	2	47.564	5.262
Inside of subgroups	7 158.337	792	9.038	
Sum	7 253.466	794		
p = .005				

** (S) - services, (N = 216; M = 17.722; SD = 3.172), (P) - production (N = 238; M = 18.336; SD = 3.175), (PS) – public sector , (N = 341; M = 18,563; SD = 2,768); SS - sum of squares; df - degrees of freedom; MS - mean of squares*
Source: own elaboration

Table 2b: Post hoc Tukey's test for sense of safety of employees of (S), (P), (PB) sectors*

Pair	Tukey's statistics HSD Q	p values of Tukey's HSD Q	p
S versus P	3.073	.076	Nonvalid
S versus PS	4.548	.003	** p<.01
P versus PS	1.263	.632	Nonvalid

Source: own elaboration

ANOVA have showed statistical differences in the level of the sense of safety between studied subgroups (F = 5.262; p = .005). When looking for answers to what pairs' treatments contributed to the above overall result, the post hoc Tukey test was used, thanks to which significant differences in the sense of safety were established only between those employed in services (M = 17,722) versus those employed in the public sector (M = 18,563), where the value of p = .003. The results confirm assumptions of the first hypothesis (h1) – employees of the three investigated sectors significantly differ in the level of their sense of safety, and a special differences were found in case of employees of service sector (low raw score of sense of safety) compared with those from public sector (high raw score of sense of safety). Employees of production estimated their sense of safety on a moderate level. It could suggest that employees of the service sector doesn't perceive sufficient corporate aid.

Summarizing, employees differ in their experiencing prolonged stress caused by the COVID-19 pandemic but most of them (employed in service and in production sector) perceive disturbances in their subjective sense of safety in time of COVID -19 crisis.

In order to verify the next hypothesis (h2) using the Pearson correlation coefficient, it was established that, regardless of employment in a specific branch of the economy, the sense of safety of employees correlates with the degree of satisfaction of their basic life needs (Tab.3).

Table 3: Correlations of the sense of security of employees in subgroups with the degree of satisfaction of their basic needs

Employees in subgroups	Variable 1	Variable 2	Pearson's r	p < 0,05
Services	Sense of safety	The degree of satisfaction of basic needs	682	.001
Production	Sense of safety	The degree of satisfaction of basic needs	694	.001
Public sector	Sense of safety	The degree of satisfaction of basic needs	.621	.001

Source: own elaboration

The research also attempted to establish a relationship between the sense of safety of employees and the safety of their relatives (see hypothesis no. 3). A moderate (significant) correlation was established for all subjects (Tab. 4).

Table 4: Correlations of the sense of safety of employees in subgroups with the safety of their relatives

Employees in subgroups	Variable 1	Variable 2	Pearson's r	p < 0,05
Services	Sense of safety	The safety of loved ones	.452	.001
Production	Sense of safety	The safety of loved ones	.443	.001
Public sector	Sense of safety	The safety of loved ones	.567	.001

Source: own elaboration

The verification of the last hypothesis (h4) concerned the correlation between the employees' sense of security and their appreciation of the corporate safety perceived by order in the organization to which they belong in the professional dimension. The corporate order was estimated by employees as the level of the various aid instruments offered within organizations which were benefited also from side of governmental/regional institutions as anti-crisis interventions. Statistical analysis of correlation coefficients (Tab. 5) shows that in the case of employees employed in services and production, there is a moderate relationship between the above variables. On the other hand, a weak correlation was noted in case of budgetary sector employees, what suggest they not connect so much those two variables in compare to other ones.

Table 5: Correlations of the sense of security of employees in subgroups with their appreciation of the corporate order

Employees in subgroups	Variable 1	Variable 2	Pearson's r	p < 0,05
Services	Sense of safety	The degree of appreciation of corporate order	.546	.001
Production	Sense of safety	The degree of appreciation of corporate order	.557	.001
Public sector	Sense of safety	The degree of appreciation of corporate order	.325	.001

Source: own elaboration

Summing up all hypotheses were confirmed. The employees of investigated economic branches in Poland generally estimate their subjective sense of safety during second wave of COVID-19 pandemics from low to high level and differ in their experiences. Especially vulnerable seem to be people employed in service sector which was most hit by crisis restrictions even during summer of 2020. Not significantly more safe feel employees of production, and relatively most safe are those employed in a public sector. Examination of particular components of the phenomenon of the sense of safety revealed that employees of all branches connect their sense of safety with the degree of satisfaction of their basic needs, with the safety of their relatives, and with their appreciation of the corporate order currently existing in their organizations.

Conclusions and Implications

The corporate order in the research was estimated by employees on the base of their satisfaction with aid instruments offered within their organizations in connection with COVID-19 crisis problems. It is necessary to note that the level of organizational aid is mostly depended on time and accuracy of anti-crisis interventions offered by governmental or regional institutions. In case of employees of services and production the corporate aid was perceived as moderately correlated with their subjective sense of safety, compared with weak correlation noted by budgetary sector employees. Obtained data suggest that from the employees' perspective, their assessments of the corporate safety across various economic sectors during second wave of Sars Cov 2 crisis differ. They are more critical in case of enterprises, both in service and in production, in compare to the evaluation of public sector organizations. The results show employees of budgetary sector feel subjectively more safe in compare to those employed in service and production sectors. All it suggests the need of implementation of more intense and adequate anti-crisis interventions addressed to the sector of enterprises in Poland.

Labour Migration as One of The Factors Influencing Economic Security

Izabela Szkurlat

Pomeranian University in Slupsk, Poland

E mail: izabela.szkurlat@apsl.edu.pl

Abstract

Maintaining economic security is one of the foundations of the functioning of the state. It also relates to the security of the national economy and the threats associated with it. We assume that the economy must generate profits and function smoothly. The problem of an ageing population and shortages of human resources may affect its disruption. Labour migration may be the solution. One of the aims of this article is a statistical analysis which shows the scale of economic migration of Poles to other countries, including Europe. This affects the Polish labour market and the need to fill it with economic migrants from other countries.

Keywords: Economic Security, Labour Migration, Emigration, Immigration

Introduction

Economic security according to E. Haliżak is: "The notion of economic security of a state refers to the notion of threat to the security of the national economy, i.e. a situation in which the economy cannot <<develop, generate profits and savings for investment, or where external threats will lead to disruptions in its functioning, which will put citizens and businesses at risk, and possibly threaten the physical survival of the state>>" (M. Plecka, A. Rychły-Lipińska, 2013).

By identifying threats to economic security, we can include, among other things, the inadequacy of the directions of financial and economic policy in the country and, above all, human resources. In developing the concept of human resources, we mean, firstly, an ageing society, secondly, a lack of highly qualified workers and, thirdly, deficits in the regions which offer jobs. In other words, there is a shortage of workers who are ready to work for the wages offered (A. Bralewski, 2018).

The phenomenon of migration is an important problem that has been under consideration for centuries. It affects many aspects of life, including political, cultural, social and economic aspects. Definitions, divisions of migration, models and new trends occupy a considerable amount of contemporary literature. We consider migration to be a phenomenon: "the constant movement of individuals and groups from place to place. Migration is one of the basic processes in human history. (...) Immigrants usually provoke hostility among the local population, which accuses them of taking jobs and weakening local culture (...)" (Slownik politologii, 2008).

Focusing on the needs of articles on labour migration, we are dealing with a change of residence or place of stay for economic reasons. The pushing factor is the impossibility of earning or earning too little in relation to expectations and costs of living. The push factor is also often the lack of any possibility of earning money at the place of residence due to the high unemployment rate. The attraction factor for a given place is an alternative that will allow you to meet your own expectations in financial terms and the possibility of finding a job.

Analysis

Analysing the situation of Poland and the economic migration of Poles, we find that Poland's accession to the EU in 2004 has opened up opportunities for work in other countries of the Community. Despite the opportunity to introduce transitional periods for citizens of other countries, which would consist in restricting the labour market, countries such as the United Kingdom, Ireland and Sweden, among others, have not made use of this right. This made it possible to take up work outside Poland's borders and caused many Poles to leave the country for work. According to the Central Statistical Office, it is estimated that they emigrated from Poland for temporary residence to European Union countries in 2004 – 770,000 people, and in the following years this number has been increasing significantly, assuming values: 2005 – 1200,000 ; 2010 – 1.685,000 ; 2011. – 1.670,000; 2012 – 1.720,000; 2013 – 1.789,000; 2014 – 1.901,000; 2015 – 1.983, 000; 2016 – 2.096,000. In 2018, there were an estimated 2,455 Poles abroad, including

Cite this Article as: Izabela Szkurlat " Labour Migration as One of The Factors Influencing Economic Security" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

about 2,155 in Europe. For example, there were 706,000 Poles in Germany, 695,000 in the UK, 123,000 in the Netherlands and 113,000 in Ireland (Informacja, 2019).
In 2018, more than 90% of migrants chose European countries. There were 4.4k people migrating to Germany and 2.7k to the United Kingdom. Migrants were mostly people of working age 25-44 years (Human capital, 2019). Migration of Poles, above all to other European Union countries, resulted in changes on the labour market in Poland. According to a report prepared by Work Service in November 2018, 8.6% of Poles who are professionally active or who will be potential persons on the Polish labour market consider emigration within 12 months. This is estimated at 1.6 million people. Currently, the direction of paid work is mainly Germany - 23%, Norway - 16%, Sweden - 15%. The profile of a Polish immigrant is as follows: 45% - 18-34 years old; 68% - inhabitants of villages or smaller towns up to 100 thousand, 31% - inhabitants of central Poland; 69% - people with lower education, 82% - people with employment in Poland. Preferred economic trips of Poles are mainly for 3 months 37.1%. Only 4.4% prefer to leave for six months, 9% for a year, 22.9% for several years, 19.2% for permanent residence, and 7.4% are not determined (Migracje zarobkowe, 2018).

It is estimated that already in 2006 there were shortages of workers on the labour market in Poland in quantities: 20% construction companies, 21% automotive industry, 25% furniture industry, 34% woodworking, 24% paper industry (Pujer, 2017). Due to the continued economic emigration of Poles and the lack of willingness to work for the remuneration offered, it was necessary to admit citizens from other countries to the labour market.

Thus, migrants as less skilled workers are usually employed in the agriculture, hotel and catering sector. In the years 2015-2019, Poland has seen a systematic increase in the issuance of work permits for foreigners. Analysing statistical data, 6,578 permits were issued in 2015 and 127,394 permits in 2016, 235,626 permits in 2017, 328,768 permits in 2018. In 2019, however, 444.7k permits were issued, of which 74.3% were work permits for Ukrainian citizens (Zezwolenie, 2020).

According to statistics from the second quarter of 2014, carried out on a population of 54,000 people aged 15 to 64, approximately 70% of immigrants are active in the labour market, of which 45% are employed. They most often work in sectors such as industrial processing, trade and vehicle mechanics. In 33% of the professions they have been specialists. As many as 23% of immigrants declared to have higher qualifications than their current occupation. For comparison, the percentage of indigenous citizens was lower at 19.9% (Informacja, 2015).

Tabel 1. Total fertility rate

	FR	SE	UK	CZ	UE	ES	PL	NL	DE
2004	1,92	1,75	1,75	1,23	1,50	1,31	1,23	1,72	1,36
2017	1,90	1,78	1,74	1,69	1,59	1,31	1,48	1,62	1,57

Source: own elaboration based on Poland in the European Union A statistical portrait, p. 22.

Another factor that has affected the labour market in Poland is, as in other European countries, the ageing population. This means that the number of indigenous citizens is significantly decreasing, which leads to a situation where the demand for workers from other countries is increasing. It is estimated that the population in Poland, according to the economic age groups defined as the mobile group, will decrease from 14 million in 2020 to 11 million in 2035, decreasing to 9 million in 2050. The forecast of the immobile group, on the other hand, assumes a significant increase from 7 million in 2020 to over 8 million in 2035, with an upward trend to 10 million in 2050 (Population, 2014).

The fertility rate, as in other European countries, is far from what is expected. Births are the most important factor influencing the structure and size of the population. Comparing the figures since 2000, it has remained at a level in subsequent years: 2000 - 1.37; 2005 – 1.24; 2010 – 1.38; 2015 – 1.29; 2016 – 1.36 and 2017 – 1.45. In comparison with 1955, the fertility rate in Poland was 3.61 (Urodzenia, 2018).

The Sussmith Commission report of 2001 states that, among other things, Germany is a country that benefits and will continue to benefit from migrants when it comes to staffing. The same is true of the United Kingdom. Following analysis by the Home Office over a period of 30 years, it has been recognised that there are potential benefits in using migrants to fill vacancies. The first factor that determines this is the economic factor. Firstly, developed countries are unable to move all jobs for the low-skilled and low-paid out of their territory. In some sectors of the economy, industries must operate where their customers live (e.g. construction services, restaurants, hotels). The second factor is the demographic factor. Developed countries considered rich have a marked decline in fertility rates. Of course, it is not possible to change the fertility rate with the help of migrants in order to halt the ageing of societies. It is assumed that the benefits of migration in relation to the fertility process are usually short-lived (S. Castles, M.J. Miller, 2011).

There are different positions that are being considered by economists assessing the impact of migration on the economies of the host countries. These are both negative and positive assessments. Focusing on the positive analyses made by the Home Office, it appears that labour migration has an impact on economic growth, which consequently increases the welfare of indigenous citizens and migrants. Similarly, the analysis carried out by the Home Office assumes that migration does not have negative effects on indigenous workers. The analysis concludes that migrants make the labour market complete, which increases productivity and reduces the pressure of inflation (S. Castles, M.J. Miller, 2011).

Abstract

In recent years, various occupational fraud cases involving Malaysian Small and Medium Enterprises (SMEs) have bankrupted the SMEs. Occupational fraud among the SMEs' employees includes asset misappropriation, corruption, and financial statement fraud. This study aims to model an effective fraud prevention technique for SMEs in Malaysia. Data for this research was collected through a qualitative approach using an interpretive multiple case study. This study used a purposeful sampling technique to select three SMEs in the manufacturing industry as the case studies. The data was analyzed using content analysis in terms of within-case analysis and cross-case analysis. Based on the key findings from this study and the organizational fraud triangle model by Free, Macintosh, and Stein (2007), several items were identified as crucial for the leadership, management control, and culture elements in an effective occupational fraud preventive technique. The items in the proposed model include, among others, ethical leadership, realistic performance target, code of ethics, sound internal control system, and compliance with policies and procedures. The proposed model would serve as a benchmark to provide guidelines for the SMEs on preventing fraud in their organizations.

Keywords: SMEs, Occupational Fraud, Fraud Prevention.

Introduction

Small and medium enterprises (SMEs) are the drivers for economic developments and innovations in Malaysia. The SMEs represent 98.5% of the total business community, with its Gross Domestic Product's (GDP's) expansion rate of 6.2% higher than the overall Malaysian economy (SME Annual Report 2018/2019). In a developing economy, SMEs' sustainability has become a concern in the business community amidst the rising occurrence of corruption, fraud, and other criminal activities. KPMG's Fraud, Bribery, and Corruption Survey of 2013 revealed that fraud was a problem for business organizations in Malaysia. According to the Association of Certified Fraud Examiners (ACFE), small businesses face an increasing number of frauds with a range of different types of crimes, in which occupational fraud represents a significant threat (ACFE, 2014). The losses that the small businesses suffer carry more severe consequences (Johnson & Rudesill, 2001) as they usually do not have sufficient funds to absorb the

Cite this Article as: Nor Hafizah ABDUL RAHMAN, Noradiva HAMZAH, Razana Juhaida JOHARI and Yusarina MAT ISA "Modelling an Effective Occupational Fraud Prevention Technique in Malaysian SMES" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

loss (Nawawi & Puteh Salin, 2018). The ACFE reports for 2014, 2016, and 2018 disclosed that the greatest financial impact of fraud occurs in the small business environment with an average organization loss of 5% of their revenue every year. Thus, fraud is very costly to small businesses. Small businesses are also at far greater risk and are more vulnerable to fraud than large corporations because they do not have the resources that larger companies have. The few fraud controls that they do have may be less-effective (ACFE, 2012; Laufer, 2011). Generally, small businesses do not have an anonymous fraud reporting system, do not have a code of conduct, do not perform fraud awareness training, and have weak internal control (Sow, Basiruddin, Mohammad & Abdul Rasid, 2018). Bressler and Bressler (2007) argued that the most cost-effective way to deal with financial loss through fraud is prevention. However, to date, there are limited studies conducted to identify the effective means to prevent fraud, particularly for SMEs. Despite the significant contribution of small businesses to the country's economic growth, previous research has overlooked the fraud issues that are threatening the sustainability of those businesses and, instead, focuses mainly on large and public limited companies (Sow et al, 2018). Therefore, this study's primary objective is to identify the fraud prevention techniques used in the Malaysian SMEs. This study used the interpretive multiple case study method to identify the current fraud techniques adopted in the SMEs. Its results would serve as a benchmark to provide the SMEs with guidelines on preventing fraud in their organizations. Furthermore, with this benchmark, the SMEs can adapt and establish an appropriate anti-fraud approach that will be more suited to their specific business needs and organizational requirements.

Literature Review

This section discusses the review of previous literature that is important to this study.

Occupational fraud

ACFE (2018, pp. 6) defined occupational fraud as "the use of one's occupation for personal enrichment through the deliberate misuse or misapplication of the organization's resources or assets." Hrncir and Metts (2012) highlighted that employees utilize many methods to conduct their fraud. The methods used depend on several factors, including assets that the employees have been entrusted with and the level of access to the company's funds. The ACFE (2018) classified occupational fraud into three primary categories: asset misappropriation, corruption, and financial statement fraud. Assets misappropriation presents the greatest risk. It can be broken down into cash and non-cash misappropriations. Cash is the most commonly stolen asset. Cash misappropriations include cash skimming, cash larceny, and fraudulent disbursement. Some specific examples are paying fraudulent bills and fictitious vendors, embellishing an expense account, and check tampering (Omar, Nawawi & Puteh Salin, 2016; Parker & Kresse, 2012; Laufer, 2011). Non-cash misappropriations include stealing assets either through misuse of physical assets (such as inventory or equipment), false sales and purchases, or misuse of proprietary information (Omar et al., 2016). Employee fraud in terms of cash and merchandise is the most frequent fraud and the most costly. Therefore, these types of fraud are most concerning to the owners (Krambia-Kapardis & Zopiatis, 2010; Kuratko, Hornsby, Naffziger, & Hodgetts, 2000).

On the other hand, corruption involves employees misusing their influence in a business transaction in a way that violates their duties to the employer in order to gain a direct or indirect benefit. Corruption represents a high risk in every department of business, particularly purchasing (ACFE, 2018). Next, financial statement fraud is a scheme in which an employee intentionally causes a misstatement or omission of material information in the organization's financial report. Examples of this fraud are recording fictitious revenue, understating reported expenses, or artificially inflating reported assets. Hence, Parker and Kresse (2012) revealed that, in the rise of the recession, occupational fraud now occurs more frequently and includes a new wave of crimes, such as customer identity theft, intellectual property theft, and sabotage. They also uncovered that employees' fraud is a causal factor for small businesses' bankruptcies. Prevention is the most cost-effective way to deal with fraud (Bressler & Bressler, 2007). Fraud prevention reduces the opportunities of fraud from occurring. Moreover, prevention measures are less costly than the time and expenses required for fraud detection and investigation (IIA, AICPA, ACFE, n.d.). The lack and non-existence of anti-fraud controls, such as lack of internal control and inadequate segregation of duties, would result in employee theft (Said, Alam, Ramli, & Rafidi, 2017; Parker & Kresse, 2012). Laufer (2011) emphasized that the amount of opportunity an employee has to commit fraud is usually a function of their position of authority and level of trust. Cressey (1950) theorized that for fraud to occur, each of these three criteria must be present: perceived pressure, perceived opportunity, and rationalization.

Organizational Fraud Triangle

The criminologist Donald Cressey (1953) initially developed the Fraud Triangle Theory, where three different factors contribute to a person deciding to commit an act of fraud. These factors are pressure, opportunity, and

rationalization. The pressure is the motivation of the person to commit fraud when they are having financial problems, for example. Opportunity, on the other hand, is the method by which the crime could be committed given, for example, loose control procedure in an organization. Rationalization is how the person justifies, in their mind, committing the fraud. Added to this theory was the capability of an individual to commit fraudulent acts (Wolfe & Hermanson, 2004). Capability is a trait of the individual committing the fraud that drives them to seek and exploit an opportunity. In other words, the potential perpetrator must have the skills and ability to commit fraud. The fraudster recognizes the particular fraud opportunity and is able to turn it into reality. Position, intelligence, ego, coercion, deceit, and stress are the supporting elements of capability. The fraud triangle was further expanded by adding competence and arrogance (Howarth, 2011). The component of competence is an approach to an individual's ability to override internal controls and control situations. All these elements, focused on the individual-level, explain how fraud occurs within organizations. At the organizational level, leadership, management control systems (MCS), and organizational culture form the three points of the organizational fraud triangle shown below.

Figure 1: Organizational fraud triangle (Free, Macintosh, & Stein, 2007)

The organizational fraud triangle was initially developed by Free, Macintosh, and Stein in 2007. The elements used for the organizational fraud triangle are leadership, management control systems (MCS), and organizational culture developed through research on case studies involved in Enron's collapse. Leadership, systems, and culture are the main branches that influence people's actions in an organization. The fraud triangle illustrates that the most important lessons from Enron lie in how a corporate culture championed by CEO Skilling overcame a sophisticated and widely lauded set of management controls and the importance of carefully balancing the core concepts of leadership, organizational culture, and control within the organization. Through each of these components, fraud can and will occur throughout the organization when such opportunities emerge. Free et al. (2007) proposed the concept of the organizational fraud triangle, underpinned by (1) charismatic leadership, (2) subverted management control, and (3) a permissive culture.

Fraud Prevention

Fraud prevention is especially crucial for small business organizations since they have limited resources to establish an internal audit department and install sophisticated detection and security systems. Fraud prevention measures include practices attempting to stop irregularities from occurring. Meanwhile, fraud detection measures include procedures designed to identify anomalies in the business. The strongest defense against potential fraud is a well-designed and effective operating system of internal control, where controls are focused on effectively mitigating identified risks (European Commission, 2013). Indeed, the designing and operating of an internal control system in the form of an anti-fraud program is the management's responsibility and can result in reductions in opportunities for employees to commit fraud. Holtfreter (2004) argued that fraud prevention and detection methods could be of two different techniques. Firstly, strategies that are implemented at the pre-employment stage to screen the applicant's historical status. Secondly, measures that take place during employment to prevent fraud from occurring. Organizations should pay particular attention to recruitment decisions especially when engaging people with a history of fraudulent behaviour (Kalovya, 2020). Jolly (2003) stated that organizations must create a sense of responsibility among employees, which is possible by creating a positive environment in the organization. While creating trust and responsibility, the organizations also have to ensure that they implement adequate precautionary measures to protect the employees from resorting to fraudulent opportunities. Therefore, the extent of the organizational level of fraud should be given utmost attention to prevent and deter such actions.

Research Objectives and Design

This paper aimed to propose a model for an effective occupational fraud prevention technique for SMEs in Malaysia. It also aimed to identify the current fraud prevention techniques adopted in the SMEs. The sub-objectives of this study are: 1) to illustrate the elements of fraud prevention techniques adopted in the SMEs; and 2) to identify factors that hinder effectiveness of the current fraud prevention techniques in the SMEs. To achieve these research objectives, the following questions were developed:

RQ1: What are the fraud prevention techniques currently adopted by the SMEs?
RQ2: What are the factors that inhibit fraud prevention in the SMEs?

Sample

SMEs are defined based on two criteria, namely annual sales turnover and the number of full-time employees of a business. For the manufacturing and manufacturing-related services, SMEs refer to enterprises with a turnover of less than RM25 million or full-time employees of less than 150 workers, while for services and other sectors, SMEs are those with a turnover of less than RM5 million or have less than 50 workers. A business that meets either one of the criteria will be deemed as an SME. SME businesses can be legally structured as entities registered either under the Registration of Businesses Act 1956 (Act 197) or the Companies Act 1965 (Act 125). This study selected three SMEs that reported incidences of fraud in Malaysia. For confidentiality reasons, they are named as SME A, SME B, and SME C. In general, these SMEs encountered employee fraud in terms of stolen inventory, corruption, and collusion among employees, which happened mostly in the warehouse and the procurement department. To ensure that the findings were unbiased, these three manufacturing SMEs have similar characteristics:

1. Fall under the manufacturing industry. This industry was chosen because the 2013/2014 Kroll Global Fraud Report highlighted that the manufacturing sector shows an increase in the prevalence of fraud. The report stated that the manufacturing sector has the highest overall fraud incidences and the second-highest rate of financial losses.
2. Won awards as winners of 50 Enterprises organized by the SME Corporation Malaysia to celebrate and highlight the achievements of small and medium-sized enterprises that are well-positioned for the future.
3. Have audited financial records for three consecutive years.

Research Method

This study used an interpretive multiple case study and survey design. Yin (2003) described the multiple case study method as an empirical inquiry that investigates a contemporary phenomenon within its real-life context, especially when the boundaries between phenomenon and context are not evident. In other words, the method enables the researcher to cover contextual conditions that are highly pertinent to the phenomenon of interest. Most multiple case designs are likely to be stronger than single-case designs (Yin, 2003). This study used a multiple case study approach for two reasons. Firstly, this approach enables comparative or cross-case analysis to be conducted between the units of analysis. Secondly, findings obtained in one case could be used as guidance in the analysis of another case. Besides, selecting multiple cases can add to the distinct advantages of multiple sources of evidence and replication of findings.

Instrument

This study used semi-structured, open-ended interviews that consisted of predetermined questions to obtain data. The interview questions were guided by an interview protocol designed to reassure consistency. The design of the protocol was based on previous studies on occupational fraud and fraud prevention. An interview protocol is necessary to assist the researcher in collecting the data. It is more than a list of interview questions; it also extends to the procedural level of interviewing and includes a script of what the researcher will say before and after the interview, prompts for the interviewer to collect informed consent, and remind the interviewer of the information that he is interested in collecting (Jacob & Furgerson, 2012).

Data Collection and Analysis

The data was collected through in-depth interviews with the owner of these manufacturing SMEs. The real names of these manufacturing SMEs are not disclosed to maintain anonymity and confidentiality. The interviews focused on occupational fraud prevention. They were guided by an interview protocol, and each interview lasted around one hour. The interviews were recorded with permission to ensure that every statement was documented. Interview

transcripts provide raw data that needs to be analyzed systematically. This study used the content analysis operationalized via Nvivo12 Plus to analyze the semi-structured interviews with a word-based and code-based approach together with several analytical strategies adopted for the interviews (Stake, 2006). According to Krippendorff (2004), content analysis can range from the simplest form of word count to thematic analysis or conceptual analysis. Huberman and Miles (1994) also suggested the preliminary 'counts' of data and determine how frequently codes appear in the database. This kind of analysis can be useful for discovering patterns of ideas in the body of the text. The conceptual content analysis begins with identifying research questions and choosing a sample or samples. Once chosen, the text must be coded into manageable content categories, sometimes called themes. The process of coding is one of the selective reduction methods. By reducing the text to categories consisting of a word, set of words, or phrases, the researcher can focus on, and code for, specific words or patterns that are indicative of the research question.

Findings and Discussions

This study highlights the elements of fraud prevention techniques adopted in the SMEs and identified factors that hinder the effectiveness of their current fraud prevention techniques. A proposed model of an effective fraud prevention technique in SMEs is provided at the end of the discussion.

Profile of the SMEs

SME A
SME A is known for its premium ice-blended coffee and beverage solution in Asia since its establishment in 2001. SME A currently holds the Halal, HACCP, and ISO22000 certifications. It has also received notable awards and recognition throughout the years from the SME Corporation Malaysia. SME A initially started with its flagship product, the 'Ice-Crushed Cappuccino', and currently has sixty gourmet flavors ranging from coffee and non-coffee products in their product line. SME A believes in being an ethical company and delivers customer satisfaction through its expanding developments in the beverage industry.

SME B
SME B initially focused on recycled glass bottles in 1991 and has now ventured into manufacturing, selling, and distributing bottled beverages for soft drinks, isotonic energy drinks, and clarified sparkling fruit juices. Over the years, SME B has received various awards and recognition, most prominently the 'Prime Minister Award' in the agriculture and agro-based industry sector. SME B envisions to expand further in the local and export beverage industry through continuous innovation.

SME C
Since 1983, SME C has been producing a variety of dairy-based products, such as fresh yogurt fruit, Greek yogurt, and yogurt beverages. With more than 30 years in the industry, SME C has received numerous accreditations, particularly from the SME Corporation Malaysia. It is certified as a Malaysian brand by SIRIM QAS International. SME C aims to create more products in the market, with their motto 'belongs in every fridge'.

This study illustrates the elements of fraud prevention techniques adopted in these SMEs from the perspective of the organizational fraud theory to answer the following research question:

RQ1: What are the fraud prevention techniques currently adopted by the SMEs?

Leadership

Leadership is critical to the creation and maintenance of culture; there is a constant interplay between culture and leadership (Moris, 2009). It is possible that an organization's ethical culture and leadership can affect the management's perceived ability to rationalize and commit fraud (Trompeter, Carpenter, Desai, Jones, & Rriley, 2013). Within organizations, cultural norms arise and change due to what leaders tend to focus their attention on, their reactions to crises, their role modeling, and their recruitment strategies. Based on the interviews conducted, the following responses represent their leadership commitment to culture:

…From day one of company establishment until today, what we believe in… what is our value system, what is our philosophy… we introduce ourselves to our employees, even to our suppliers, customers, agents, and distributors…we do not practice corruption, so we are corruption-free company…

…From my point of view, I will show my commitment in terms of employee welfare. I put aside some money to help my employees if any one of their family is sick, in financial difficulty, and so on. Once a month, I will do a spot check on them to show that I really mean that unethical behavior is not permitted in my company…

Role modeling, in terms of ethical organizational behavior, is derived from ethical conduct and ethical leadership. The senior management must lead by example by adopting an ethical tone and being transparent in all their communications and actions. Violations of ethics, trust, and responsibility are at the core of fraudulent activities (Dorminey, Flrming, Kranacher, & Riley, 2012). Serving as role models, leaders can influence lower-level employees to act ethically or unethically (Trevino & Brown, 2005). Therefore, it is important to set a good tone at the top, which in turn relates to the leaders' moral character and values. Based on the interviews conducted, it can be said that the top management of the SMEs is committed to the showing of ethical behavior. This conclusion is based on the following responses that reflect those commitments:

…When a fraud case is impacted, I think our staff will see how we respond. It is not about the loss it makes but about how management sees this, how we respond to it. They are watching us and see what management will do, and what action we take. If we take it lightly, then they will say... "oh my company actually don't care much about that" …

…We incorporate zero tolerance for fraud and dishonestly and basically, as a leader, we show commitment by leading management practices by example…

In terms of the allocation of rewards and status, there should be fair compensation and realistic individual performance goals. In the same essence of relieving undue pressure to reach performance targets, an organization should work towards the adoption and timely revision of realistic individual performance goals for their managers and executives. Revising bonus plans and performance benchmarks allow organizations to remove potential fraud pressures.

Management Control

Management controls refer to the tools that seek to elicit behavior that achieves the strategic objectives of an organization. The organization should maintain an effective system of internal controls and financial checks to prevent employee fraud. Proper segregation of organizational duties is the key to defeating most fraud schemes (Peltier-Rivest, 2018). This is based on the following responses:

… We have different people with authorization approval role. One person prepares the quotation, then another person will authorize and approve. The same procedure in the factory, there is always one person who prepares the document, one approves, one check or approve, there will be at least two persons or three people will get them to sign on certain thing…

…When we make cash sales, for example, there will be one person who received the cash, he/she will issue receipts. After that, another person at a different department will receive the cash, verify, and bank in. After that, the accounting department will reconcile with invoices…

Maintaining good accounting procedures or systems designed to promote efficiency by imposing surprise audits or random verifications by the internal auditor are also effective in preventing and detecting employee fraud. Surprise audits would make the fraudster's fear getting caught (Wells, 2011). The following responses describe the situation:

…For accounts and sales, we have a good system…proper stock checking systems in terms of physical check and verification with computer recording system…

…We also implement monitoring methods and external financial audits to ensure that the systems are working properly…

Assuring compliance with policies and preventing fraud should reflect organizational objectives as well as regulatory and legal obligations. The likelihood of employee fraud and its potential impact should be analyzed and evaluated in the context of an organization, its industry, and its overall operating environment (Dorminey et al, 2012).

…Every year we have a surveillance audit from HSCCP and ISO to do the evaluation and assessment, especially on our documentation. Then, we have an internal audit and management review every year…

Organizational culture

Organizational culture is the shared principle of beliefs and assumptions that influence how individuals or groups of people behave in an organization (Schein, 1985). Several earlier studies has identified that organizational culture plays a crucial role in shaping the employees' attitudes toward fraud (Holton, 2009; Pfister, 2009; Davis & Pesch, 2013). Organizational culture encompasses values, beliefs, and principles that come from employees, management, as well as the vision and mission of the organizations (Needle, 2010). This is how the organizational culture, which later shapes the individual's course of action within an organization, is built. The SMEs in this study have their own organizational culture based on the following response:

…What we believe, and practice is understanding and application. We can talk about a lot of things, which is written. But if those written things do not create meaning or are not relate to them, so it is just a statement. We need to be practical. We need to explain, and employees need to understand why we practice this and how does this affect them…

Accepted 'rules of the game' are inclined towards the climate of group interaction, shared meanings, and shared knowledge for socialization. These rules can be further elaborated in terms of publicly announced espoused values, and visible cultural artifacts, such as corporate mission statements, corporate metaphors, and important symbols, with the aim of making sense of the relationship between the company's culture and its management control system. This finding is based on the following response:

…during the weekly meetings, we align our employees' belief with the company's mission, the company's direction. Our company stands for ICQ, which I stand for Innovation, C for Commitment, and Q for Quality. Now and then, this ICQ is not only a slogan but what we believe in and we need to respond in our work performance…

Organizations should develop comprehensive compliance risk management programs. Norms relating to risk-taking and acceptable competitive behavior are usually reflected in the business activities, for example, an open bidding policy, and regular monitoring of current and potential vendors. Also, to detect and transform a culture of fraud, organizations should take advantage of the monitoring abilities of their employees and external stakeholders (Bishara & Schipani, 2009). This suggestion is based on the following response:

…We practice internal monitoring methods even though there were no formal risk assessment procedures in place. The information must be available in a timely manner when needed, emphasize on check and balance work procedures as well as effective monitoring…

Prevailing rationalizations of action by the SMEs is in terms of their code of ethics. The Code, which is signed and reaffirmed annually by every employee, underpins their formal control system that lays out the accepted behaviors. This discovery is based on the following response:

…First thing when people join our company, we provide them with training where they have to go through all the company regulations. The employee will sign the "Aku Janji" declaration, with someone as a witness, that the employees will follow the rules and regulations, and acknowledge the action taken when the rules have been broken…

Within the organizations, the impact of culture and leadership on even the most sophisticated management control system must not be overlooked or minimized. It is often too easy to consider cultural and management control systems separately, with culture being a soft issue and management controls a hard one.

Identifying factors that hinder the effectiveness of the SMEs' current fraud prevention techniques is to answer the following research question.

RQ2: What are the factors that inhibit fraud prevention in SMEs?

Weak internal control and the ease with which the existing controls can be overridden enable employees to commit fraud without being caught (Girgenti & Hedley, 2011). KPMG Malaysia (2013) found that weak or inexistent internal control is the leading factor that fosters fraud in business, especially in small businesses. In this case, implementing strong internal control within the SMEs contributes to their success. This finding is based on the following response:

…Our offices are all open (in one big room with a partition)… everybody can see each other than they have been seeing each other what they do, that means there is no restriction area…

However, an open space office may lead to fraudulent activities when staff is left alone or unattended. Furthermore, there is no proper control for confidential processes of data, which could expose the company to fraud relating to information security.

Limitation of the resources to strengthen anti-fraud control includes the internal audit function. According to Hernandez and Groot (2007), a study on auditor experiences, observations, and perceptions to determine the most important mitigating control concluded that an important fraud prevention mechanism is mitigating controls over management attitudes. Based on the interviews conducted, most SMEs have the same problems of limited resources. One of the SMEs stated that:

…We do but not in a proper way. We do not have enough manpower. Besides, it is time-consuming… Honestly saying that… we may not be able to go in-depth or go into very detailed cost and measurement. We do not have specialties or consultation of doing such process…

The SMEs also suffer from lack of fraud awareness by employees, where all their employees are unfamiliar with the business conduct policies. Hence, statements of operating procedures and copies of the aforementioned policies should be issued to all employees to enhance their awareness and understanding of such procedures and policies (Sow, Basiruddin, Abdul Rashid, & Md Husin, 2018). The lack of awareness was identified based on the following response:

…There was no formal documentation of fraud prevention and no formal communication with employees on this matter…

The lack of commitment to the management in promoting high values of honesty is likely to lead employees to commit fraud (Murphy & Dacin, 2011). According to Sengur (2012), by setting up a culture of honesty, top management identifies acceptable ethical behaviors and communicates them to the employees.

Proposed model of effective fraud prevention technique in SMEs

Based on the findings above, this study proposed a model of effective occupational fraud prevention techniques in SMEs as shown in Figure 2.

Figure 2: Propose model of effective occupational fraud prevention technique [Adapted from 'Organisational fraud triangle' by Free, Macintosh, and Stein (2007)]

Conclusion

It is frequently observed that fraud has a greater economic impact on society than any other category of crimes. No other issue has had as strong an impact on the business economy that make SMEs bankrupt as fraud. In light of this impact, SMEs should proactively design anti-fraud control measures that help them to prevent employee fraud. The prevention model in this paper proposed that, at the organizational level, SMEs should have good and strong

leadership, tight management control systems, and a positive environment of organizational culture. These are the main branches of fraud deterrence techniques for the people in the organization. Understanding the organizational vulnerabilities to occupational fraud may assist in streamlining the prevention, detection, and resolution of occupational fraud cases (Kalovya, 2020). However, the findings of this study cannot be generalized to the whole population of SMEs in Malaysia since the study focused only on SMEs in one specific industry.

Abstract

The concept of talent management (TM) has grown into one of the first priorities of businesses in the last decade and subject to theoretical models for many scholars. The people having the competences as defined by their roles are driving the competitive advantage of the organisations, however, practices did not yet reach the expected level to overcome an unexpected crisis as the 2020 COVID-19 pandemic created. The present study is highlighting the evolution of the TM concept and has a closer look at seven of the most debated and applied TM frameworks in the last two decades, by identifying the common and new approaches. Aiming to have a base for TM concept research, we acknowledged two potential solutions for its further development and applicability.

Keywords: Talent management, people development, talent concept, human resources management, behaviour change

Introduction

Talent Management (TM) was explored through original concepts and implemented since decades. Achieving high performance was always a target of any business. There is no general model or framework that can be applied for a consistent talent approach, as many people's development areas remained unexplored. The initial thinking assumed that organizations should have stable activities, repetitive processes, and a plan to correspond to annual budgeting. Nowadays, the business environments are transforming, and the old approach no longer fit for purpose. The capacity to adapt and the flexibility to respond immediately to market requirements are the new norm for the companies. Things are developing fast; crisis can come unexpectedly and there is no plan that can be set up and followed through the end. The global business context was challenged in 2020 by the COVID-19 pandemic, and companies realized they need to be prepared for a range of business continuity scenarios. We will propose two solutions for supporting future developments of the talent concept and create a base for further research.

Research Methodology

In the context of the presented research, we have conducted research on the existing literature related to TM and people's development of the last seventy years. Our target was to find those theoretical and practical models and

frameworks that had the biggest impact in the academic literature and influenced the business practices. We have learned that the concept of TM was developed more over the last 22 years and identified seven such frameworks that we will present in the current paper:

- Four steps to win the war for talent published in 1998 by McKinsey;
- Develop-Deploy-Connect model published in 2006 by Deloitte;
- The Talent Trifecta published in 2007 by Ulrich;
- The talent-on-demand framework published in 2008 by Cappelli;
- A theoretical model of strategic TM published in 2009 by Collings & Mellahi;
- A theoretical framework for how GTM links to MNEs' performance published in 2018 by by Collings et al.;
- A conceptual model for integrating employee's proactive behaviour into TM published in in 2020 by Meyers.

A Historical Perspective of People Development Approaches

Looking back to the last seventy years, when the people development followed the needs of the businesses, we can identify few prominent trends. In the 1950s and 1960s, the internal talent development was the most common practice, focusing on executive coaching, 360-degree feedback, job rotation and high-potential programs. In the 1970s, the marketplaces became unpredictable due to increased complexity of the economic environment and the old type of practice could not support the organizations in the same manner anymore (Cappelli, 2008).

A research done for over 20 years on management, careers evolution, employees learning and development at MIT Sloan School of Management was published in 1976 to support the idea of organizations becoming more dependent on employees. The primary reason was the vulnerability to human error when working with complex technologies emerging. To decrease the level of human error, it was identified the need of having well-trained line or people managers, and individual contributors (Schein, 1977).

The severe recession in the early 1980s led to the end of the lifetime employment, many restructuring and reorganization initiatives were conducted worldwide, cutting layers of hierarchy, and boosting the rethinking of how the talent should be developed and maintained. Many people were let go, especially the white-collar workers (office and management employees). The 1990s were the start of a new era for talent recruitment and management. The business environment was trying to recover and implement new practices.

Companies were focusing on hiring from the laid-off talent pool, but also from the competitors, and rethinking their retention policies. Expertise could have been easily lost, as the head-hunting practices gained more popularity and outside hiring became expensive. As a side effect, the new employees were a blocking factor for internal promotions and retention. During this decade, hiring and keeping the right talent in-house became one of the major concerns of the organizations (Cappelli, 2008). How this was addressed over the following period until today was subject to several theories and practices.

After the great recession of 2009, the term "new normal" emerged when thinking of adjusting business and talent strategies to face economic crisis. Globalization and aging workforce, including the Baby Boomers entering retirement period, were creating additional pressure for the companies to adapt novel approaches. Deloitte issued in 2011 the "Talent Edge 2020" blueprint to highlight the potential trends for the following decade, based on the answers of 334 senior executives and talent managers at big organizations across the globe. They could notice that the "war for talent" was still in place and it was taking place worldwide. The top three derived concerns were related to the global talent competition (41% of the respondents), developing leaders and succession planning (38% of the respondents) and people's retention as per 37% of the respondents (Kwan, Schartz and Liakopoulos, 2011).

The efforts of identifying the best practices for talent development were continuing year over year, moving towards better employee experience approach, supported by the new emerging HR technology. Ten years later after the last recession, when the 2020 global COVID-19 pandemic disrupted all the business environments and people's lifestyles, and the term "new normal" got a new meaning.

The Talent Frameworks

TM steps to win the war for talent

McKinsey consultants conducted an extensive research on 77 companies in different industries to understand how the talent is managed. The "war for talent" concept was mentioned for the first time. The results of their investigation were published in a 1998 report with the main conclusion that TM should be a top priority for any company that aims to be successful and have a competitive advantage in the market. One surprising finding was that many people managers were not accountable for their teams' talents. The job mobility was increasing worldwide, the average executive professionals have worked in five companies so far but was estimated to be seven in the next ten years.

It seemed that executive talent was not managed in the right way in the last twenty years. The people were not a priority for many organizations, as their other assets. Only 23% of 6000 executives confirmed their companies attract high-performers and only 10% that they manage to retain them. The talent-building mindset was missing, as well as the link with the business strategy.

A recommendation was to have senior executives hired from outside the company, to better support the refresh of the talent pool and accelerate growth by coming in with the fresh views.

Fig. 1: Talent Management Steps (adapted from Chambers et al., 1998)

The research concluded that there are four steps, as presented in Figure 1, to follow to have a good and consistent talent program:

- Step 1: to use the learn by doing approach and move people cross-functional. However, only 10% of the 200 executives directly interviewed for the research confirmed they are using job assignments for developing their employees.

- Step 2: to implement a powerful system for collecting also informal feedback and using coaching to support the people development. 73% of executives agreed to this, but only 30% were confirming they have it in place at a good level.
- Step 3: to understand the company's retention problem by documenting why top performers are leaving.
- Step 4: to address the low performers' issue and avoiding their stay in same positions for years, negatively influencing others and damaging the company's employee value proposition. The research showed this is the most difficult action and usually left behind by organizations (Chambers *et al.*, 1998).

Three years later, McKinsey consultants ran another research at 56 large and midsize US companies. Both studies showed a discrepancy between the talent issue and the actions taken on that. Only 14% of the managers confirmed that their companies attract top performers, comparing with 23% in previous study. Only 3% of the respondents to both surveys strongly agreed that their organizations have an effective talent development program (Axelrod, Handfield-Jones and Welsh, 2001). They could not notice progress in this direction in the last period, although the competition for talent increased.

The Develop-Deploy-Connect model

Another well-known consulting company, Deloitte, launched an analysis to understand the talent crisis within the energy sector (oil and gas, utilities, and mining organizations) and what initiatives are ongoing to overcome it. They surveyed 1396 employees from 60 countries. One of the fundamental things noticed was the strong link between TM and organizational performance. Some critical issues appeared to be attracting the required competence (67% of respondents confirmed), attracting new talent (60% of respondents confirmed), and retirement of the Baby Boom generation (49% of respondents confirmed). Hiring and retention were the focal points when speaking about TM. However, the development, deployment, and connecting employees were not enough appreciated, and that would have generated long-term talent shortage.

The consultants proposed the Develop-Deploy-Connect model, considering the people's needs for growth opportunities and communication. This framework illustrated in Figure 2 was one of the first to address the importance of the employee experience.

Fig. 2: Develop-Deploy-Connect Deloitte model (adapted from Serrat, 2017)

As seen in Figure 2, the "Develop" dimension can include the stretched assignments, peer-to-peer learning programs, mentoring, and coaching. "Deploy" can incorporate the actions taken by the companies to understand what motivates the employees and facilitate challenging assignments for them. "Connect" can refer to bringing people together according to the similarities of their interests and purposes, creating a sense of belonging through communities, coaching, mentoring and social networks. Productivity is the first to be impacted when a crisis occurs. The model is built to increase that, additionally to attract and keep top performers of many workers (Serrat, 2017).

The Talent Trifecta

A simplified formula was introduced in 2007 by Dave Ulrich and contained three items: competence, commitment, and contribution as shown in Figure 3. Talent equals competence times commitment times contribution. If one item was missing, it was considered unreplaceable and equation would have collapsed. Competence was referring to the knowledge, skills and values needed mostly for future jobs, according to customers' expectations. Commitment is the factor that creates value for the competence. These two items were forming the main framework for talent so far. In order to keep the people's motivation and interest at high level, the contribution element was introduced. The time and effort translated to success and real meaning of the work same time, can create value for both company and employee. HR professionals can partner with the managers and engage them in actions for improving those three elements for their team members. The talented individuals should have the skills, wills and purposes (Ulrich, 2008).

Fig. 3: The Talent Trifecta (adapted from Ulrich, 2008)

The talent-on-demand framework

One of the most innovative approaches for talent management released in the 2000s was using four principles similar with the ones used in the supply chain management, considering the demand and the supply, as illustrated in Figure 4. The starting point should be the forecast of a product demand, comparable with the one for talent need. Both are eventually referred to cost and time and could be categorized into three items:

- The least expensive and the fastest process to create a product or to develop a talent; • The outsource of the internal production processes or hiring from outside;
- Delivery in due time is strongly related to succession planning.

The two principles addressing the demand side are tackling the balance between make and buy decisions and how to manage the uncertainty of the demand for talent. On the supply part, the principles are considering the importance of the return on investment in development programs and how to protect this investment by balancing employee-employer interests. TM is an investment that must support the companies' growth. The talent-on-demand framework is operating based on the business needs and able to address the potential challenges and unpredictability of the markets (Cappelli, 2008).

Fig. 4: The talent-on-demand framework (adapted from Cappelli, 2008)

A theoretical model of strategic TM

At the end of 2000s, although the TM as a concept was already discussed and debated also on academic level, it remained a poor developed area. Some scholars viewed the strategy of TM based on identification of the company's key positions (not only executive positions), the development of a talent pool to fill in those positions and a differentiated human resource architecture to facilitate placing the right people in the right jobs (Figure 5).

Fig. 5: A theoretical model of strategic TM (adapted from Collings & Mellahi, 2009)

Strategical or pivotal positions should get top performers to increase the competitive advantage of the company. The proposed HR architecture has a crucial role for making sure the high performers are committed to their goals. The whole framework is concentrating around the employees that have pivotal positions or will be developed to get such roles.

The focus should be on individual performance to obtain the organizational one. The employees' behaviour related to work is sustained by their motivation for that and represents the link between the HR practices and company's performance. Furthermore, the link between TM and organizational performance is the organizational commitment. At the individual level, the stronger the link between the personal values and the company's values, the higher the level of organisational commitment. The extra-role behaviour or performance come as an effect of the in-role performance and can be translated into additional voluntary efforts to support the organisational effectiveness.

The key positions are requiring proactivity and flexibility to better contribute to firm performance. The key elements represented by motivation, organisational commitment, and extra-role performance are directly influencing the link between strategic TM systems and company's performance as shown in Figure 5 (Collings and Mellahi, 2009).

A theoretical framework for how GTM links to MNEs' performance

We can notice a simplification of the theoretical approaches for TM, and a focus on the role of HR professionals for facilitating the frameworks. Nine years later since the strategic TM model was released, same authors propose a global framework having the human capital at its core. The model is developed for the multinational enterprises (MNEs) and outlines the link between global talent management (GTM) and the performance at the headquarters (HQ), subsidiaries, and employee levels as illustrated in Figure 6.

Fig 6: A theoretical framework for how GTM links to MNEs' performance

(adapted from Collings et al., 2018)

The new framework is based on three repetitive and recognisable actions named "routines": identification of pivotal positions, development of global talent pools, and development of a differentiated HR architecture. Identification of the key roles of organization should be the first step. Such a recurrent action will respond to the business needs on long term. A global organization will need both global and local expertise for sustaining a successful transnational strategy. Therefore, developing a global talent pool to feed those pivotal positions should be the second routine. The third one is focused on having a differentiated HR architecture to support the development of the human capital to get a high level of performance in any dynamic business environment. All these routines are very well connected one with the other and depend on each other. The authors state that "no universal approach to GTM exists; rather, the appropriateness of GTM systems depends on the overall degree of congruence with the MNE's competitive strategy" (Collings, Mellahi and Cascio, 2018).

A global strategy will be coordinated from HQ, so are the GTM routines, giving less local autonomy for its subsidiaries. On the opposite side is the multi-domestic strategy, oriented on local needs and independent of HQ in developing their human resources and routines. Transnational approach is sharing the practices of the first two strategies mentioned, recognizing the importance of balancing both global and local context for managing the talent pool and providing more of the cultural diversity. Following this theoretical model, four propositions about achieving high performance were defined. The adopted strategies influence the routines, which will further impact the organizational performance, with bigger impact on a global level for routines managed by HQ, with major local impact for those managed by subsidiaries. The development of human capital is strongly influenced by what kind of approach is chosen for GTM, therefore having strong impact on organizational performance (Collings, Mellahi and Cascio, 2018).

A conceptual model for integrating employee's proactive behaviour into TM

The people's proactive behaviour at the workplace and the TM were brought together into a new model highlighted in Figure 7, that explores three potential relationships between these two dimensions. In the past, all the TM frameworks were considering the employees as passive players who will comply with the company's already created processes. The proposed relationships take the people as active participants who influence the practices due to their proactive behaviour. Furthermore, this proactive behaviour can have three roles: predictor, mediator, and moderator, and they can be converted into three propositions.

- Proposition 1 (P1): "Talent proactive behaviour has a positive effect on individual access to TM (practices)" derived from the idea that proactive behaviour can be a predictor of this access to TM practices such as

development programs, project assignments, job rotation and shadowing, coaching, and mentoring, feedback and assessments, promotions and others.

- Proposition 2 (P2): "Talent proactive behaviour mediates the relationship between individual (access to) talent management (practices) and employee reactions to talent management". The reactions could be affective like satisfaction, engagement, motivation, cognitive such as belief in their knowledge and skills, and behavioural as performance and effort.
- Proposition 3 (P3): "Talent proactive behaviour moderates the relationship between individual (access to) talent management (practices) and employee reactions to talent management" This proactive behaviour can be related to work, career and strategic behaviour (Meyers, 2020).

Fig. 7: A conceptual model integrating employee's proactive behaviour into TM
(adapted from Meyers, 2020)

The previously released models show TM as influencer of people's affective, cognitive, and behavioural reactions that produce the positive outcomes for the organization, including a high performance. The partnership between the company and its employees in sharing the responsibility for building a strong TM system is the prerequisite for keeping a competitive advantage within the market.

Debates on the Research Results

Following the research and analysis done, we have identified two solutions that can support future developments of the talent concept and create a base for further research:

- Internal mobility as a source for professional development opportunities
- Significant experience throughout employee lifecycle facilitated by the HR technology

The organizational culture that sustains internal mobility

The change of any organizational culture starts with a shift of mindsets. Incorporating the internal mobility in the culture of a company can begin from outlining the benefits of retaining the employees as much as possible due to costs and loss of productivity and knowledge reasons. When employees' turnover is increasing, mainly on top performers, can have a negative impact on company's brand and talent cycle. If the organization will not offer enough development opportunities, the needed competences for promotions or career changes will not be available, therefore no career planning will be possible and internal mobility will not take place. Mainly the employees part of the talent pool will search for assignments outside their organization and increase the turnover (Erickson, Moulton and Cleary, 2018).

A solution to get out of this cycle is to facilitate an internal talent marketplace. The 2019 Deloitte Human Capital Trends research showed that 35% of companies now have a network of teams, with shared resources across companies. More organizations think of finding solutions for supporting their people to develop through learning on the job by getting new roles, being part of different projects, or having a mentor. Employees can advertise their skills within a dedicated internal platform, and they can apply or be found for different assignments. The same Deloitte report stated that 65% of respondents confirmed it is easier to find a job outside their companies than inside. The

companies can change that by offering internal opportunities and the benefits will be seen on both employer and employees side (Bersin, 2020a).

The HR technology that facilitates employee experience

In the 1970s, all the information about employees' development was collected within the HR department and was based on the managers' assessment for the strengths and weaknesses, as well as for the future development needs. The link to the organizational needs was missing, and the feedback was not done through a well-designed system. As an interesting aspect back then, some believed that the development systems will not be effective if they are not driven by the direct managers of employees. (Schein, 1977) Yet, no real action was taken. Today, the main role of the line managers is seen as critical for people's development.

HR technology changed dramatically from the system of record to automate documents handling in the 1970s and 1980s, to system of talent in the 1990s and 2000s that had new tools for introducing mainly the self-service and applicant tracking and to a cloud-based system of engagement in the 2010s, that integrates everything and supports companies to move towards digital transformation. Currently and moving forward, the system of intelligence will take over due to increasing use of artificial intelligence (AI) that can support easier tracking and identification of talent and its performance, as well as can suggest learning opportunities and how to become more effective (Bersin, 2020a).

All these converge to the idea of employee experience. If by end of 2019, "the team and work management" was the central focus when talking about the future, after the COVID-19 pandemic emerged beginning of 2020, there was a rapid shift to "integrating work and life". The "HR technology" became the "work technology", where communication, collaboration, project management and safety were part of the new concept. TM platforms will become talent experience platforms and will include career planning, job markets, records tracking and productivity tools. The new tools using AI will focus mainly on employees' behaviour change to improve engagement and productivity (Bersin, 2020b).

Conclusions

The theories around a consistent TM developed more after the McKinsey consultants published twentytwo years ago a considerable analysis on how to build a successful system by following four steps inspired from the actual business practices. Another consulting firm, Deloitte, released the DevelopDeploy-Connect model in 2006 and offered a solution to increase the employee experience, a new concept that gained more and more popularity.

One year later, the HR influencer Dave Ulrich brought to the world's attention his simple talent equation with three dimensions: competence, commitment, and contribution. An innovative approach using the supply chain management principles (demand versus supply) was introduced in the 2000s and talent-on-demand framework was created.

Some theoretical models continued to be explored over the next years. Strategic TM model released by scholars in 2009 outlined the importance of having pivotal positions identified within organization, and a strong differentiated HR architecture to support the development and placement of human capital in such roles. While we have approached the end of 2010s, with globalization taking over most of the industries, a GTM approach was needed.

In the presented research, we have identified a framework that recognizes global, multi-domestic and transnational strategies, bringing to the next level the previous strategic TM model of same authors. One of the newest elements to be included in the future investigations of the scholars is the human behaviour, seeing the employees as active players within the HR architecture and TM strategies. An innovative theory released this year was highlighting the three potential roles of the proactive behaviour: predictor, mediator and moderator, for influencing TM practices. The critical talent seems to suffer a scarcity in the last years due to the skills gap, retirement of the Baby Boomers (people born between 1946–1955) and social integration mainly characterized by fast information flow and mobility. Companies moved away from focusing only on replacement and succession of executives to create talent pools across their businesses, to be ready to face the upcoming challenges (Serrat, 2017).

Those talent pools will need to be developed and have opportunities to grow and accomplish their personal and business targets within their organization. We can think of two potential solutions to achieve that: facilitating internal mobility and a great employee experience throughout the work life. The employees' experience can be supported by all-in-one HR platform, AI driven, accessible from any device, anytime, and currently is becoming one of the most desired HR investments.

Since 1977, the role of the line managers was highly important when discussing people development. Nowadays, this role is critical, as well as having a strong HR architecture that makes sure the people with the right competence are placed in the key roles that are well developed and remained committed to their goals. The next focus will be the employees' behaviour change through the new HR technology and with the support of the line managers, to improve engagement and performance.

Models and frameworks continue to be created and discussed, now having the employee experience as focal point, by integrating both life and work. People need to prepare for the unexpected and to learn how to live in an uncertain environment. The partnership between the company and its employees in sharing the responsibility for building a strong TM system is key.

Corporate Responsibility Towards A Silent Stakeholder – The Natural Environment from The CSR Perspective[1]

Ewa MAZUR-WIERZBICKA

Institute of Management, University of Szczecin, Szczecin, Poland,
E-mail address: ewa.mazur-wierzbicka@usz.edu.pl

Abstract

The increasing manifestations of a global ecological crisis observed in contemporary world require relevant efforts to limit this detrimental phenomenon. For organizations, one of such efforts includes taking up pro-environmental actions i.e. to minimise companies' negative impact on the natural environment, which at the same time fall under one of the dimensions of the concept of corporate social responsibility (CSR) which is becoming increasingly popular. The aim of this paper is to identify the actions taken by socially responsible companies towards a silent stakeholder - the natural environment. The paper is composed of three parts. In the first part the place of the natural environment in the operation of the company is identified. In the second part focus is given to the core subject/dimension concerning the natural environment as one of fundamental aspects of the CSR concept. In part three manifestations of companies' environmental awareness under the CSR concept are identified and presented. The paper is based on a critical literature review and available non-financial reports and existing data.

Keywords: corporate social responsibility, natural environment, companies

Introduction

In the age of globalization, threats or social changes, the approach to the role of business in society has changed noticeably. It is no longer solely a product or service supplier, but it is required to take various social actions and efforts orientated towards the protection of the natural environment. As a result, the concept of corporate social responsibility has gained significance in recent years, whose basis is considered to involve the company taking responsibility for their actions in the economic, social and ecological dimension and the company's observance of ethical principles.

Throughout the last few decades the need to verify the current approach taken by companies (and not only them) to the issues of environmental protection has been increasingly signalled. It seems that a response to such a state of affairs involves i.a. pro-environmental involvement of companies, which is manifested i.a. in their taking responsibility for the natural environment as part of e.g. actions in line with the CSR concept.

Given the above, the aim of the paper is to identify the actions taken by socially responsible companies towards a silent stakeholder - the natural environment. Individual parts of the study have been assigned to the implementation of this purpose. Those said parts shed light on the place of the natural environment in the operation of the company, they identify and describe the environment dimension of CSR from the ISO 26000 perspective, and they discuss manifestations of environmental responsibility of companies under the CSR concept. The paper is based on a critical literature review and available non-financial reports and existing data.

[1] The project is financed within the framework of the program of the Minister of Science and Higher Education under the name "Regional Excellence Initiative" in the years 2019 – 2022; project number 001/RID/2018/19; the amount of financing PLN 10,684,000.00

The place of the natural environment in the operation of the company

Companies, wanting to maintain their position in the market or increase their participation in it, focused on long-term operation, must appropriately address the issues of environmental protection, which currently is gaining significance due to even ongoing climatic changes or noticeable pollution of the natural environment (both by producers and consumers - excessive consumption). Pro-environmental (green) behaviours of companies are largely dictated by the operation of two forces. These are the ecological push and the ecological pull (Figure 1). These actions undertaken by companies are greatly determined by the sector, field of operation, competition and level of society's environmental awareness.

Fig. 1. Forces impacting a company in the environmental protection area

Source: author's own compilation on the basis of (Hallay 1996; Pohl 2001).

Next to traditional attributes such as price or quality, the market has started to take into account factors associated with the natural environment, i.e. impact of the manufactured product/provided service on the natural environment or the production process of the manufactured product. At the same time these factors have started determining companies' success and they have also become determinants of their credibility and social trust.

At the moment the existence of a belief (legislation, strategies adopted by individual countries, international organizations) that companies are entering the so-called ecological phase is increasingly noticeable. It may be seen in their strategies which focus on the protection of the natural environment, the so-called environmental strategies. They are a binder of various areas of a company's operation and guide companies in what they should do to reduce their impact on the natural environment. The constructed and introduced environmental strategies should be feasible and implementable (which means that an organization should have resources to carry them out), as well as proactive, that is future-oriented (cf. Ferri, Pini, 2019).

There are many various classifications of environmental strategies. One most often used is the classification of environmental protection strategies in the market approach (Figure 2).

Fig. 2. Classification of environmental protection strategies in the market approach

Source: (Kulas, Kusztal, 2000).

The most desirable strategies in companies are those which ensure their development in the following areas: economic, social and environmental. An environmental strategy should be part of a company's general strategy.

CSR core subject – environment

The very concept of corporate social responsibility is widely described and discussed in the literature (mainly due to its multidimensional and interdisciplinary nature) (Dahlsrud 2008; Mazur-Wierzbicka, 2012; Wolak-Tuzimek, 2019; El Akremi, 2018). There is no single universal definition of the notion of "corporate social responsibility".

It can be assumed that corporate social responsibility means a long-term approach to operating a business activity which contributes to the achievement of the company's economic goals, at the same time taking care of the natural environment (limiting negative impact on the environment), taking into account social interests and consistently building lasting and positive relations with stakeholders, which involves observance of norms and requirements that are more restrictive than imposed regulations of the law and principles of ethics, and also taking full, conscious responsibility for all its actions.

The substance of CSR was also expressed in ISO 2600 where it reads that " that the essence of social responsibility is the organization's taking the responsibility for the impacts of its decisions and activities on society and the environment as well as ethical behaviour that contributes to sustainable development, the health and welfare of society, takes into account the expectations of stakeholders, is in compliance with applicable law and consistent with international norms of behavior, and is integrated throughout the organization (ISO, 2010).

ISO 2600 also clearly identifies sore subjects of corporate responsibility (Figure 3).

Fig. 3. Social responsibility: 7 core subjects

Source: (ISO, 2018).

One of the 7 sore subjects of CSR regulated in the norm is "The environment". As the norm reads "An organization should respect and promote the following environmental principles: environmental responsibility, the precautionary approach, environmental risk management, polluter pays" (ISO, 2010). The organization has a responsibility to reduce and eliminate unsustainable volumes and patterns of production and consumption and to ensure that resource consumption per person becomes sustainable.

The Environment core subject was assigned 4 basic issues: Prevention of pollution (6.5.3), Sustainable resource use (6.5.4), Climate change mitigation and adaptation (6.5.5), Protection of the environment, biodiversity, and restoration of natural habitats (6.5.6). Each of the issues was assigned specific actions (Table 1).

Table 1: Description of actions assigned to issues in the "Environment" core subject

Issue	Examples of actions
Prevention of pollution	Preventing pollution, including: emissions to air, discharges to water, waste management, use and disposal of toxic and hazardous chemicals other identifiable forms of pollution such as noise, odour, visual impressions, light pollution, vibration, electromagnetic emissions, radiation, infectious agents.
Sustainable resource use	Four key areas for improvement are: energy efficiency, water conservation, use and access to water, efficiency in the use of materials, minimized resource requirements of a product.
Climate change mitigation and adaptation	Each company to identify its negative impact on climate change. Striving to minimise the company's negative impact on climate change.
Protection of the environment, biodiversity, and restoration of natural habitats	Key aspects of this issue include: valuing and protecting biodiversity (including aspects related to animal welfare), valuing, protecting and restoring ecosystem services, using land and natural resource sustainably, advancing environmentally sound urban and rural development.

Source: (ISO, 2019).

Identification of a (silent) stakeholder, i.e. the natural environment, in the norm seems natural given that identification of CSR's core subjects, that is the economic area, the social area and the area relating to the natural environment (also defined as the environmental or ecological core subject) is a common practice. What is more, when one accepts such a classification, CSR is somehow directly associated with the concept of sustainable development where the said three dimensions are also identified. When it comes to sustainable development we are

considering the following: economic growth and equitable sharing of the benefits (economic dimension), protection of natural resources and the environment (environmental dimension) and social development (social dimension). Therefore, it is not surprising that corporate social responsibility is considered a tool for implementing sustainable development at the level of an organization. When approaching CSR in this way, the concept of sustainable development becomes understood and its principles are translated into a business practice.

Actions taken up by organizations which fall under the "environment" dimension should be adequately monitored and then reported on. This is done by various systems of indicators among which GRI standards are one of the most popular. For many organizations they are a model of sustainability reporting. The structure of GRI standards is presented in Figure 4.

Fig. 4. Overview of the set of GRI Standards

Source: author's own compilation on the basis of (GRI, 2020).

As presented in Figure 3, indicators falling under Topic-specific standards were grouped into three groups, that is economic, social and environmental disclosures. Environmental standards are described in Table 2.

Table 2: Environmental standards

Aspekt	Disclosure	Description	
GRI 301: Materials	301-1	Materials used by weight or volume	
	301-2	Recycled input materials used	
	301-3	Reclaimed products and their packaging materials	
GRI 302: Energy	302-1	Energy consumption within the organization	
	302-2	Energy consumption outside of the organization	
	302-3	Energy intensity	
	302-4	Reduction of energy consumption	
	302-5	Reduction in energy requirements of products and services	
GRI 303: Water and effluents	Management approach disclosures		
		303-1	Interactions with water as a shared resource
		303-2	Management of water discharge-related impacts
	Topic-specific disclosures	303-3	Water withdrawal
		303-4	Water discharge
		303-5	Water consumption
GRI 304: Biodiversity	304-1	Operational sites owned, leased, managed in, or adjacent to, protected areas and areas of high biodiversity value outside protected areas	
	304-2	Significant impacts of activities, products, and services on biodiversity	
	304-3	Habitats protected or restored	
	304-4	IUCN Red List species and national conservation list species with habitats in	

		areas affected by operations	
GRI 305: Emissions	305-1	Direct (Scope 1) GHG emissions	
	305-2	Energy indirect (Scope 2) GHG emissions	
	305-3	Other indirect (Scope 3) GHG emissions	
	305-4	GHG emissions intensity	
	305-5	Reduction of GHG emissions	
	305-6	Emissions of ozone-depleting substances (ODS)	
	305-7	Nitrogen oxides (NOX), sulfur oxides (SOX), and other significant air emissions	
GRI 306: Waste	Management approach disclosures	306-1	Waste generation and significant waste-related impacts
		306-2	Management of significant waste-related impacts
	Topic-specific disclosures	306-3	Waste generated
		306-4	Waste diverted from disposal
		306-5	Waste directed to disposal
GRI 307: Environmental compliance	307-1	Non-compliance with environmental laws and regulations	
GRI 308: Supplier environmental assessment	308-1	New suppliers that were screened using environmental criteria	
	308-2	Negative environmental impacts in the supply chain and actions taken	

Source: author's own compilation on the basis of (GRI, 2020).

Due to the increasing obligation to report socially responsible actions by organizations, more and more of them use ready-made standards e.g. GRI or supplement them with their own indicators, relevant to the specific nature of their activity.

Manifestations of ecological responsibility of companies as part of CSR

Socially responsible companies undertake an array of initiatives falling under the natural environment dimension, which involve, i.a.:

- designing environmentally friendly products and production processes
- effective use of resources,
- reduced production of waste and pollution,
- "green evaluation" of suppliers in the context of their environmental standards,
- informing business partners, consumers and society about environmental protection issues.

Each of the organizations have, relevant to the portfolio of their activity, the possibility to expand their environmental profile, i.e. establish a set of actions it will undertake in the framework of protection of the natural environment. It may refer to one division or more. Examples of pro-environmental operation are presented in Table 3.

Table 3: Examples of pro-environmental actions undertaken by companies

Divisions	**Raw materials/waste**			
	Energy	**Water**	**Waste**	**Paper**
Marketing, communication	maximum use of daylight at work		reuse of raw materials	reduction of use of paper, use of eco-paper, publications/promotional materials issued in an electronic version
Logistics,	limited use of	using eco-car	recovering goods	introduction of

fleet	air-conditioning	washes (which consume less water)	damaged in transport, reuse of transport packaging	electronic waybills
HR, health and safety at work	promoting tele- and video-conferences, e-learning		implementation of electronic document circulation	use of e-documentation, double-sided printing, preparation of conference/training materials in an electronic form
Production, product, packaging	optimisation of energy use, replacing equipment for newer, more energy-efficient devices	optimisation of water use in the production process (e.g. washing bottles or jars not under running water)	waste segregation reuse of raw materials	limiting the use of paper in packaging production, reducing product packaging
Purchases, deliveries	use of renewable energy or energy produced in cogeneration	use of water-saving taps, using tap filters (instead of buying water)	manufacturing products without packaging/in returnable or recyclable packaging, choosing products made from recycled/biodegradable materials or processed/long-life products	use of eco-paper (certified, recycled, etc.), issuing e-invoices
IT	implementing global solutions optimising energy use by systems, communica-tion to employees and clients		obliging suppliers to collect packaging from their products	setting printers to double-sided printing as default and setting ppt presentations to the 2-slides-per page mode

Source: (Kowalska-Ocneanu, et al., 2009).

Implementation of the above initiatives is possible thanks to companies using various tools, norms and methods. Companies may implement e.g. standardized systems of environmental management compliant with ISO 14001 or the EMAS regulation. Due to mainly their documented, official character, they gain greater credibility among stakeholders. Organizations may also undertake other forms of operation that serve to protect the environment (e.g. implementation of the Cleaner Production programme or, in the case of chemical companies, the "Responsible Care" programme dedicated to them). Additionally, they may make use of other tools such as Ecomapping, introduce pro-environmental actions in their companies such as: appointing an "eco-team", undertaking actions to reduce their negative impact on the natural environment, reduction of use of raw materials (water, energy, paper, etc.), waste, shaping pro-environmental (green) awareness, laying down environmental requirements/transport recommendations for business partners.

The so-called good practices, shared by socially responsible organizations, are an important element of CSR. Some of them are included in reports titled "Responsible business in Poland. Good Practices" issued since 2003 by the Responsible Business Forum, an organization which has been shaping, analysing and promoting corporate social responsibility in Poland since 2000. The reports include examples of socially responsible practices form various areas (since 2011 classification of CSR areas has been based on the one adopted in ISO 26000) submitted by the organization. As seen in Figure 5, the greatest number of initiatives undertaken by companies under CSR was directed at the "Community involvement and development" area, initiatives concerning employee matters came second, while those concerning the natural environment came third.

Fig. 5: CSR practices according to the core subjects adopted in ISO 26000 included in reports "Responsible business in Poland. Good practices" in 2011- 2019

Source: author's own compilation on the basis of (FOB, 2012, 2013, 2014, 2015, 2016, 2017, 2018, 2019).

Table 4 presents examples of actions - good practices undertaken by companies in the "environment" dimension.

Table 4: Examples of actions undertaken by companies in the environment dimension

Issue	Description of actions
Prevention of pollution	**wonga.pl -** a number of actions implemented as part of the zero waste practice: using filtered tap water instead of buying bottled water, plastic disposable dishes replaced by biodegradable products, certified Xerox paper with a low basis weight, i.e. 80G/m2, the company uses electronic documents (in the framework of e-invoice) wherever possible. **Lyreco Polska** – as part of the "Energy-efficient warehouse" practice lighting rails were lowered (down from 7.6 m to 4.5 m), number of light bulbs was limited and lighting of selected parts of the warehouse was made possible. These actions allowed a saving of more than 206,000 Kwh a year. **Kuehne + Nagel** (Święcice warehouse) **-** processes were standardized which resulted in reducing the level of waste to zero. Waste containers for foil, paper, wood, mixed waste and aluminium were places around the facility. Plastic water bottles were eliminated from all company locations. **MAKRO Polska** - dropping the use of Freon by 2030, striving to reduce carbon dioxide emission, innovations that aid reduced use of energy, heat recovery processes used to heat up premises and utility water.
Sustainable resource use	**Grupa Raben –** "E-invoice = higher culture" project - the company encourages clients to replace paper invoices with their electronic versions. Each consent for an e-invoice means one tree planted on behalf of the client. **Volkswagen Motor Polska -** zero CO_2 emission assumption implemented in summer months. Thanks to purchasing energy from hydroelectric power plants the company does not use natural gas or technical heat from an external power plant.

	PGE Polska Grupa Energetyczna – building an installation for thermal treatment with energy recovery, serves to dispose of municipal waste and allows recovery of energy from waste in its thermal treatment process.
Climate change mitigation and adaptation	**Kuehne + Nagel** – the Net Zero Carbon program: by combining efforts reducing and compensating CO_2 emissions, the company strives to achieve carbon neutrality by 2020. The company gets actively involved in the development of technical possibilities of eliminating greenhouse gases from the atmosphere. **Lyreco Polska -** aims to reduce its carbon footprint per 1 kg of delivery. The company is undertaking efforts that reduce emissions from main sources, i.e., freight, employee travels, fixed assets, energy sources, consumables and direct waste. Pharmaceutical Company **Polpharma** in Starogard Gdański - an analysis of carbon footprint has been carried out. Scope one was analysed - combustion and other activities in the production facility and Scope two - electricity and heat produced externally and purchased by the production facility. The first calculations and analyses covered 2016 and 2017.
Protection of the environment, biodiversity, and restoration of natural habitats	**SEGRO Poland** warehouse developer - beehives and insect hotels installed in logistics parks. More than half a million bees have moved in already. These insects can produce about 200 kg of honey per year. **Bank Pekao -** since 2004 has been supporting institutions that deal with protection of the Polish bison by allocating funds to the protection and improvement of the standard of living of this endangered species and to diversification and development of the population and also to financing educational and scientific projects. **CEETRUS Polska** - ensures biodiversity of areas around their commercial facilities. Implements tree, bush and grass planting programmes in collaboration with ecologists and gardeners in shopping centres which have or are applying for the Breeam-In-Use CEETRUS certificate. In areas surrounding its shopping centres - sets bird routes and hotels for insect pollinators.

Source: author's own compilation on the basis of (FOB, 2019).

The companies' undertaking socially responsible actions in the "environment" dimension may bring a number of benefits to them, e.g. savings resulting from a more efficient use of resources, lesser water use, lower waste disposal expenses, savings resulting from more efficient use and recovery of raw materials (lower material consumption and energy consumption), improved image (building a green image) in the eyes of local communities, increased trust in the company, better relations with the local community, customer retention and acquiring new recipients. In the longer perspective, organizations may arrive at a strategic increase of availability of raw materials and contribute to reducing negative impacts of climate change (reduction of CO_2 emission).

Conclusion

The issues of environmental protection increasingly determine the operation of a business activity. When planning long-term actions, companies more and more frequently take into account, next to economic circumstances, the circumstances relating to environmental protection. Some of them decide to implement the concept of corporate social responsibility. These actors, when taking up socially responsible efforts inscribed in the CSR concept, also undertake actions that carry responsibility towards another stakeholder - the natural environment. They take the form of activities included in the natural functioning of the organization (e.g. operating as an eco-office) or highly-formalised activities, e.g. by implementing ISO 14000 or EMAS norms. Taking into account environmental protection actions in companies, clean and eco-friendly technologies in particular, or implementing environmental management systems allows them to obtain a broad array of benefits, both economic and those examined in the social and ecological aspects.

As research shows, CSR is gaining popularity in Polish companies. 80% of managers, both male and female, notices the integration of the value of social responsibility and sustainable development with the company's business operation. 59% of them believe that CSR contributes to solving environmental problems (FOB, 2020). Therefore, a trend to give increasing focus to socially responsible functioning of companies is noticeable - also functioning that is responsible towards a silent stakeholder - the natural environment.

Impact of COVID-19 on International Retail Company on Spanish Market: Case of "Carrefour"

Elena V. KOLGANOVA
PhD, Peoples' Friendship University of Russia (RUDN University), Moscow, Russia

Dmitry I. BABIY
MBA University of Valencia, Valencia, Spain

Alexander I. BABIY
MBA Hochschule Bremen City University of Applied Sciences, Germany

Abstract

The aim of the article is to analyze the impact of the COVID-19 on the operations of the retail company on Spanish market. The international retailer Carrefour was chosen as an object as it has a considerable effect on the Spanish retail market. This is one of the companies that managed to rebuild its activities and adapt in the shortest time to the situation. Despite the fact that in some countries the company had to temporarily close its non-food departments, it faced significant increase in the sphere of e-commerce and food sales as it could partnerships with transportation companies and meet the changing needs of the customers in the period of Pandemic. In the article authors pay special attention to the analysis of the company's environment (3C's analysis and SWOT-analysis) and to its distribution and logistics operations on the Spanish market.

Keywords: Pandemic COVID-19, Retail Company, Spanish Retail Market.

Introduction

Pandemic of COVID-19 is the force majeur that could hardly be forecasted. The countries all over the world suffered from this virus. It affected significantly social sphere of each country, but moreover the pandemic itself and the governmental actions like lockdown in many countries, designed to decrease growth rate of pandemic, led to economic difficulties as the national borders were closed, people had to stay at home and therefore the international trade and international production slowed down in many industries. The impact of COVID-19 crisis on the retail sphere is not unambiguous. On one hand, companies faced a slowdown in non-food sales and the amount of customers in stores decreased considerably. On the other hand, those companies that were ready to e-commerce and managed to adapt to new conditions showed enormous rase of food and essential goods sales.

During our research, the authors conducted several analyses that helped to look at the company from different points of view. The most systematic and successful analysis for any service company in general and a multichannel retailer in specific is Three C's analysis (Company, Competitor, Customers) in reference to the service company. By utilizing this structural analysis as well as others such as SWOT, we were able to apply these for better analysis and understanding of Carrefour. In order to implement these analyses, we have gathered data over the company and its competitors through the means of combining several sources of information.

The chosen company Carrefour also known and translated into 'crossroads', is a multinational French retailer that was founded in 1958 and opened their first physical location in 1960. Since then they have expanded the business to over 12,300 physical locations and accumulated to this day, net revenue of roughly 78 billion euros and an operating income of 760 million euros. Carrefour operates locations over 30 countries throughout Europe, the Americas, Asia, and Africa. Carrefour is a publicly traded company that can be found on 'Euro Stoxx 50'.

3C's framework was created by a Japanese management guru Kenichi Ohmae. According to Ohmae (2009), this framework considers three key elements which are the fundamentals of any competitive business structure. The three elements are as follows:

Cite this Article as: Elena V. KOLGANOVA, Dmitry I. BABIY and Alexander I. BABIY "Impact of COVID-19 on International Retail Company on Spanish Market: Case of "Carrefour"" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

- The customers: describes who the customers are and their needs;
- The company, more specifically: the current position and the internal situation;
- The competitors: describes who the competitors are;

The three elements produced what is now known as The Strategic Triangle, with a C in each corner of the triangle.

Carrefour activity in Spain analysis

We applied the 3C's model in order to research the business structure of Carrefour, the results are as follows:

C1: The Company "Carrefour"

The full name is "Carrefour S.A.". Carrefour is a French multinational retailer with headquarters in Boulogne Billancourt, France. It was Founded in 1959. Carrefour's core business is the provision of supermarkets and retail stores. Its activities include operation and management of hypermarkets; supermarkets; convenience stores; cash and carry stores; and both food and non-food e-commerce websites. According to Carrefour reports, right now, the company is Europe's largest retailer, the second largest retailer all over the world, and it is China's biggest foreign retailer, with nearly 80 stores. Carrefour manages over 12,300 stores and e-commerce sites in more than 30 countries. The number of employees is 316,631.

Products of Carrefour are Cash & Carry, warehouse club, discount store, hypermarket, supercenter, superstore, supermarket. We did not consider any further analysis of the C1-The Company- because our aim was to analyze the logistics strategies of Carrefour and the given data is sufficient. However, we analyzed the background information for Carrefour Spain (Current statistical, financial data and evolution in the last years.).

Carrefour considers Spain as the second most important country of the Carrefour group. And has the following different store location in Spain:

- The first store in Spain in 1973.
- 204 Carrefour hypermarkets.
- 131 supermarkets Carrefour Market.
- More than 680 Carrefour Express supermarkets.
- 114 Cash & Carry.
- 593 Convenience Stores.
- 123 Service stations.
- 426 Travel agencies.

Through reviewing Carrefour annual report 2019, we can summarize the following financial data:

- Carrefour Revenue as on December 31, 2019, was €74.366 billion.
- Operating income: €2,08 billion (2019).
- Net income, Group share growing to €1,31 billion.
- Total assets: €50.8 billion (2019).
- Total equity: €11.67 billion (2019).

Despite the fact that our research is devoted to the analysis of the international distribution and logistics of the company for 2019 it is worth mentioning how Carrefour manages the COVID-19 crisis. The company faced almost the same consumption behaviors in the process of the pandemic spread and later when the government implemented the lockdown. Before the lockdown Carrefour sales of dry groceries and products with long shelf lives increased significantly due to precautionary purchases of consumers. This increase was observed as in stores of all formats as in e-commerce. After the lockdown, the consumers as anticipated chose the closest supermarkets. They started to visit stores more rarely, while the amount of products bought increased significantly. Food e-commerce continued to show an increase. At the same time non-food categories of products sales dropped as for consumers they became not the first priority. In several countries the non-food departments were closed for the time being.

C2: The Customer

Due to a huge variety of different products and services, from food to garments, which are proposed by Carrefour by affordable prices, it is possible to conclude that its target group is 'Middle and low-income households', and the

Segment 'Price sensitive and middle class working population who wish to obtain maximum value at affordable prices'.

On the territory of Spain, customers of Carrefour are able to get a different customer experience, since Carrefour operates through four locations: hypermarkets, supermarkets, convenience stores, e-service. Hypermarkets are normally located outside the cities, the product lines include food, electronic devices, garments, chemical products, etc., in terms of variety of products, Carrefour hypermarkets propose more products, than supermarkets or the convenience stores. Supermarkets are normally located in the central streets inside the cities, the proposed product lines include fewer products than in hypermarkets, however, it is easier for customers to access supermarkets. As for the convenience stores, they have the least product lines, however, they are accessible almost everywhere inside the cities. On the official Carrefour website, customers are able to order products they need, moreover, only on the official website, Carrefour proposes such unique services as ticket order, which are not available in Hypermarkets or supermarkets.

C3: The Competitors

In order to identify the main competitors of Carrefour, online research was conducted. As it is possible to observe in Figure 1, which describes the retail market of Spain in 2019, the main competitors of Carrefour are: Mercadona, Carrefour, Grupo Dia, Grupo Eroski, Lidl and Grupo Auschan.

Figure 1 - The Market Share of Total Grocers in Spain

There is also a huge retailer called SuperCor with a similar business category as Carrefour. We also included to the list the online retailers operating in Spain, such as Amazon, eBay, and Aliexpress. El Corte Ingles was also added to the list. The positioning of Carrefour, in terms of price and quality, compared to the main competitors in food retail could be observed in Figure 2 - Carrefour positioning in Spain.

Figure 2 - Carrefour Positioning in Spain

The results are mentioned as follows and are broken down into the two segments online and department store.

Online Retailer competitors:

- Amazon, (https://www.amazon.es).
- eBay, (https://www.ebay.es).
- Aliexpress, (https://www.aliexpress.com).

Retailer competitors:

- Mercadona, (https://www.mercadona.es/).
- Lidl, (https://www.lidl.es/es/index.htm).
- Grupo Dia (https://www.dia.es/).
- Grupe Auschan (www.alcampo.es /).
- Aldi, (https://www.aldi.es/).
- Eroski, (Website: www.eroski.es).

Online Shopping:

- (www.compraonline.grupoeroski.com).
- SuperCor, (www.supercor.es).
- El Corte Inglés. (https://www.elcorteingles.es/).

During our research we also conducted the SWOT analysis of Carrefour, among main results of which the following can be mentioned:

- The fast-growing e-commerce & online shopping sector is a big area of opportunity for Carrefour and the situation with COVID-19 showed that this opportunity became vital for the company. Carrefour managed to overcome the previously poor e-commerce performance and reached great results.
- The analysis showed that there are not any threats for Carrefour that cannot be overcome with the current strengths.

International Distribution and Logistics Analysis

The conducted analyses showed that Carrefour is a strong company with great experience and stable financial and market position. Now we could move to the analysis of the logistics and international distribution, as its experience can be useful for different retail companies as in Spain as in other countries.

Within the entire Spanish territory Carrefour normally transports the goods on trucks through road transportation, the train or plane freight transportation is only used for perishable commodities or urgent deliveries. The sea freight transportation is combined with road transportation and is used to transport goods to such directions as the Canary Islands and Baleares. According to the Carrefour's report, on the territory of Spain, Carrefour accomplishes 70% of transportation by trucks, 20% by railway and 10% by maritime. Across the territory of Spain, Carrefour manages 17 logistics platforms (Table 1). Also, for high rotation products, some local warehouses are very common.

Table 1 - Carrefour Logistics platforms in Spain

No. of platforms	Description
1	Insular platform;
3	Three platforms are national which includes bazaar, apparel, electronics, and frozen products;
6	Six platforms are regional: consumer products and bazaar with high rotation;

5	Five platforms of fresh products. These logistics platforms belong to the Carrefour's subsidiary "Seidasa";
2	Two platforms are for frozen products;

The warehouses are managed differently since they are located in different regions and work only within specific areas. Some of the logistic processes are outsourced to one of the largest companies that operate in logistics, Kuehne+Nagel.

According to Kristi Rawlinson (2003), in order to deliver goods in time and in good condition, Carrefour developed a special network which is controlled by a computer system with a database that connects all agents related to Carrefour globally in order to make decisions related to the supply chain. The network is called ICAN - Integrated Composite Application Network.

Figure 3 - Logistics Activities in Spain

The transportation process of Carrefour is accomplished in four legs (Cambra-Fierro, 2011). Firstly, Carrefour orders goods directly from the manufacturers, in about 90% of cases, Carrefour acquires goods from the local producers, this helps to maintain low prices by shortening the supply chain and decreasing costs for logistics (Figure 3).

The suppliers prepare the order and deliver it to the consolidation center, up to this point the suppliers are responsible for transportation. Then under the supervision of Carrefour, workers unload the products, put them to stock and start to build the order to distribute them to different Carrefour warehouses later. During the process, the responsible party for goods is the consolidation center.

Then, Carrefour trucks come, remove the ordered products, load them to the car and transport them to the Carrefour warehouses, starting from the loading process, the responsible party for the goods is Carrefour. Lastly, from the Carrefour warehouses, goods would be transported to three different directions, because Carrefour operates three core businesses on the territory of Spain, they are: Hypermarkets, supermarkets, and convenience stores. According to Carrefour web site, they generate around 51% of sales through the Hypermarkets so one half of the goods from the warehouses would be distributed between Carrefour hypermarkets. The other half would be distributed between the supermarkets and convenience stores, all transportation from the warehouses is accomplished on trucks and cars.

Carrefour also proposes to the customers the E-service, customers are able to make an order and collect it in the nearest Carrefour spot. Normally Carrefour proposes delivery only in case of an extra-large assortment. Before the COVID-19 sales through the e-platform used to account for only 1% of total sales. But during the COVID-19

Carrefour has mobilized all its resources and implemented several strategic moves in order to keep running the supply chain smoothly. Besides the creation of general norms for the staff, customers as well as measures for priority products, one of the primary things Carrefour did was the establishment of a special crisis unit that maintains the supply chain and communicates with suppliers in order to increase the direct flows. As it is stated in Carrefour report (2020), Carrefour's supply system is also supported by the partnership in the area of delivery with such companies as Uber Eats and Glovo.

In terms of e-commerce, during the epidemic situation, Carrefour reached a significant success. The following improvements were accomplished:

- Virtual queues
- Several order preparation points were created
- Automatisation of processes in warehouses
- Significant increase in speed of work
- Carrefour drive points are available
- Carrefour apps for essential food purchase were developed
- The staff increased in speed on the workplace

As a result of all these actions Carrefour has a stable balance sheet despite the pandemic. The company continues to show growth and even get the rewards for sanitizing operations.

Conclusion

The case of Carrefour allowed the authors to come to a conclusion that in the current situation the businesses should be ready for different unexpected situations. It is not really the news, that the world business environment is not stable for several decades, but the COVID-19 pandemic showed that it can hardly be forecasted at all. The best way for the companies to survive in any situation is to keep up with the newest business tendencies and to be flexible. The modern era of economic development is characterized by globalization, momental information transfer and deep country-into-country economic integration. That is why the crisis of one country almost instantly becomes the one in the others. To use any crisis for the benefit of the business is becoming the main goal in the modern economy.

Social and Environmental Sustainability a Prerequisite for Company Profitability and Creation of Economic Value Added

Valentina VINSALEK STIPIC

Polytechnic "Nikola Tesla" in Gospić, Croatia
valentinavinsalek@gmail.com

Abstract

This research work conducted a study that sought to prove the connection between the implementation of social and environmental sustainability with the profitability of enterprises and the creation of economic added value. Expressing social and environmental sustainability as numerical indicators is quite undefined, because companies in Croatia do not have a legal obligation to state them in their business reports and notes. It is just a measure to improve and raise business and market ratings. Therefore, for this research, data on social and environmental sustainability as measurable variables were obtained after a survey conducted among employees and company management on a sample of 126 Croatian companies. The obtained measurable variables for environmental and social sustainability were ultimately put into comparative analysis with the company's profitability indicators and the created economic added value. This research obtained data that there is a connection between environmental and social sustainability with the profitability of the company and the creation of economic added value, but it is extremely small, social sustainability 0.212 and environmental sustainability 0.243.

Keywords: Ecological sustainability, social responsibility, economic added value

Introduction

Effective identification, pricing and risk management, more recently sustainable business, are essential features of efficient economic operators. By not implementing environmental care measures, not caring for the environment leads to a number of negative results and financial risks, which has major consequences for the global future. The activity of economic operators for environmental risk assessment has been ongoing for decades, but these have been sporadic cases, limited to certain sub-sectors, far from the main practice. Today, we distinguish between tools and methodologies that enable economic operators to integrate environmental data into the decision-making process from the perspective of risk management and resource allocation for long-term profit-making.

Environmental factors are increasingly recognized as one of the most important risk factors for the global economy. Examples from practice in world economies show that air pollution, water scarcity and degradation of natural capital can also serve as sources of credit, market and legal risks for economic operators.

Efforts by institutions to assess financial impacts affected by environmental risks have begun to increase given their analytical scope and sophistication. Including a wider range of environmental factors, as well as political and technological factors, considering the impact of events on the environment. In addition, a growing number of public institutions, including governments, regulators, supervisors and others, are recognizing that environmental factors can have an impact on the resilience and efficiency of economic operators, and potentially on the economic system. Finally, an analysis of environmental factors begins to reveal that potential financial effects can be nonlinear and disrupted, posing challenges for risk management.

For this paper, a study was conducted to try to prove the connection between the implementation of social and environmental sustainability with the creation of corporate profits and economic value added. The expression of social and environmental sustainability as numerical indicators is rather undefined, because companies in Croatia do not have a legal obligation to state them in their business reports and notes. It is just a measure to improve and raise business and market ratings. Therefore, for this research, social and environmental sustainability data as measurable variables were obtained after conducting a survey among employees and company management from the sample.

The obtained measurable variables for environmental and social sustainability were ultimately put into a comparative analysis with profitability indicators and the created economic value added of the enterprise.

Development of social and environmental sustainability of enterprises

Corporate social and environmental responsibility has been discussed for decades, but clear guidelines on measuring and monitoring social and environmental sustainability benchmarks have never been adopted. The corporate social responsibility strategy started as a new way of doing business in large multinational companies, which were exposed to attacks due to their environmental policy and employees (Vrdoljak and Hazdovac, 2014). For many years, companies have been primarily focused on making a profit without paying much attention to the needs of society and the environment. However, the growing awareness of the harmful effects on the environment in which we live has caused a great deal of critical attitude towards companies that do not implement a strategy of social and environmental sustainability.

The research conducted so far on social and environmental sustainability is aimed at strengthening the long-term strategy of sustainable development. Therefore, social responsibility is beginning to be viewed as a separate management system in which companies develop a specific business policy aimed at the wider community (Orlitzky, 2014). Thus, the business strategy of sustainable development is viewed through three segments: environmental, social and economic sustainability. Through the current practice, the fact is observed that companies that implement a strategy of social sustainability have a better business and investment reputation (Cheng et al., 2011). In the business world, there is a strengthening of corporate reputation and improvement of managerial efficiency in companies that implement a sustainable development strategy (Orlitzky et al., 2003).

A review of previous research has shown that there are no clear guidelines for measuring and recording in business reports the implementation of the strategy of social and environmental sustainability of enterprises in the national economy. The research on Croatian companies shows descriptive reports on the implementation of the sustainable development strategy, mainly in larger national companies, while a high positive connection between creating added value of companies and socially responsible business was observed (Vinsalek Stipic, 2017). Therefore, a key question arises as to what extent the implementation of social and environmental sustainability contributes to profitability and the creation of economic value added of enterprises.

Social and environmental sustainability as a business model

In terms of environmental risk management, business organizations may react differently to the results of risk analysis and in different ways. It is possible to approach medium or long-term risk for the environment and the community, and to act proactively, which has consequences in relation to the strategy of preventive action in reducing the risk to the environment. Some companies engage in strategic macro-environmental actions and adjust their investment preferences to support orderly market operations, applying a low-impact economy, which could reduce risk and ensure profitability.

The scope of activities that can be applied to establish a green economy strategy in order to promote social and environmental sustainability are:

- analysis of short-term financial impacts at the company level through sophisticated techniques of environmental impact analysis
- incorporation of environmental impact analysis requiring active monitoring of environmental impact in all activities
- revision of risk management, ie change of business policies by introducing limits of action in accordance with the harmful impact on the environment and the social community
- establishing governance at the level of the environmental committee to achieve change at the top of the management chain downwards, thus reducing the risk to the environment at the enterprise level
- taking measures to implement the framework through risk functions, such as product innovation, including the development of green products and services
- reviewing and reallocating capital, giving up high-risk investments for the environment and looking for new green investment opportunities
- engaging all actors, including clients, investors, market intermediaries and policy makers, who often form partnerships for common interests, in this case social and environmental sustainability

In recent years, efforts to implement a sustainable development strategy have accelerated significantly given their analytical scope and sophistication, there is a greater impact on financial decision and market behavior. Looking across the financial sector, there is a growing interest in understanding how environmental factors can pose physical

and transitional risks to assets, economic operators and the economy as a whole, which in turn can pose risks to financial assets, institutions and sectors. An increasing number of public institutions in developed countries including governments, regulators, supervisors other public institutions recognize that environmental factors can affect the resilience and efficiency of economic institutions and systems as a whole.

Tools for assessing business risk and environmental impact

It is definitely the case that sustainability applies to present and future generations and requires that the needs of all humanity be met. When we talk about social and environmental needs, we mean eco-justice and eco-efficiency, and the assessment of the risk of environmental impact. Environmental risks can be effectively integrated into the company's decision-making process, using proven financial instruments that can be adjusted to take into account environmental factors. Companies should combine two types of approaches to environmental risk assessment (Gray and Bebbington, 2000):

1. Looking for environmental factors that may pose risks to the company's operations
2. Translating environmental risk factors into quantitative measures for comparison with the company's operations

However, it is necessary to point out time as an important variable for study for the purpose of planning the occurrence of risks and assessing the harmful effects of risks on the environment. It is necessary to observe how risks are evaluated over time. Then the risk of risk must not be neglected. For example, incorrect determination of liability for pollution or insurance against a natural disaster may pose a risk of liability, especially when the probability of an event is underestimated.

Environmental risk analysis tools

When market actors analyze the financial impacts of climate change and other environmental risks on a company's financial performance, it is necessary to combine two types of approaches, ie two elements for environmental risk analysis (GFSG, 2017):

- environmental factors and
- financial risk assessment tools

Environmental factors - the first step is trying to understand how environmental factors can pose risks to financial assets and how such risks can evolve over time. Such factors may include direct risks such as the physical impacts of climate change on the assets of the real economy or indirect risks arising from policies and market reactions to environmental factors. In this sense, we observe economic entities with a high level of risk to the environment, and therefore it is necessary to assess their impact on different sectors and the economic system. If companies are not ready for physical performance or for a transition with a low level of environmental impact, they may face credit, market, business and legal risks.

Financial risk analysis tools - environmental factors must be translated into quantitative financial risk measures that can inform about risk. For example, it may not be very helpful for an investor just to know that the area where the property is located is likely to suffer from drought. However, when this is expressed as a potential impact on the assessments of agricultural producers and water supply plants in that region, the investor may take it into account in their capital allocation decisions.
Therefore, it is difficult to define the types of tools and metrics for financial risks due to adverse environmental impacts.

The adequacy of risk analysis tools depends on the asset class and the types of risks to which firms are exposed in the course of their business, while the choice of approach depends on the type of direct and / or indirect exposure to the environmental risk factor. Different levels of analysis are likely to be conducted in a particular organization, such as at (GFSG, 2017):

- the level of individual valuation of assets
- portfolio level
- macroeconomic (systemic) level

Due to different views on business risk and environmental impact risk, we also notice differences in the study and application of different variables and tools for assessing business risk.

Use of financial tools for environmental impact analysis

The type of financial assets used to assess environmental risk depends on the needs and constraints of different economic operators, and may vary depending on the types of financial shares, the situation towards capital markets and the position of risk analysts in the capital distribution chain. Financial institutions and regulators may also seek to assess how the observed risks could affect the safety and stability of the observed and analyzed companies, as well as to explore the potential for environmental factors to pose systemic risks.

The risk instrument primarily depends on the different types of assets through which companies can be exposed to direct and indirect environmental risk factors. Different levels of analysis are likely to be conducted in a particular organization. Some analysts assess individual assets, while others perform risk analysis at the portfolio level or analyze it at the macroeconomic or systemic level.

Individual assessment of assets

Analysts who focus on market risk assessment use valuation tools, such as discounted cash flow (DCF) models, that take into account asset risk. Environmental factors may be taken into account by adjusting the expected future cash flow or adjusting the risk premium, taking into account future cash flows that affect the valuation of capital. Market risk assessment analysts could use assumption models to assess how earnings or risk premiums are affected by environmental risks.

Analysts considering bond credit risk focus on the issuer’s ability to repay borrowed funds and thus focus more on short-term finance than medium-term cash flows. These are key factors influencing the bond valuation decision. However, for long-term securities, the effects of environmental factors and the effects on future cash flow analyzes attract more attention, including valuation decisions.

Coverage risk when observing loans from banks, credit risk analysts use tools such as expected loss (based on timely coverage of overdue liabilities and possible loss realization). By studying other risks, insurers have the longest track record in developing and applying models for assessing financial losses arising from environmental hazards, primarily for the purpose of making insurance decisions. Disaster risk models are embedded in environmental information.

Portfolio Level Risk Analysis

In addition to assessing the risk of individual assets, environmental risk analysts, for financial risk analysis, perform assessment at the aggregate level of the portfolio. This can be based on an assessment of individual assets that is then aggregated or the assessment is initiated by some aggregate market risk factor affecting the industry, and their total exposure is measured. Also, the difference between the market and the loan is applied here, depending on the assets in the portfolio. And the interpretation of the metrics will depend on the approach used to obtain it. On the credit risk side, ratings for an entire industry or property in a particular country may be affected by environmental factors.

Observed from the point of view of coverage risk, the risk may be much higher than it seems at first glance. For example, on the side of the insurer's liability (insurance risk), physical risks can be applied to groups of policyholders who are in the same area of physical risk, so a higher level of coverage risk is observed.

Risk Analysis at The Systematic Level

Private sector actors and regulators have a common interest in environmental risk assessment, whether it is physical environmental risk and / or transition risk for better environmental protection, as they may affect the stability of the system as a whole. Systemic risk analysis involves assessing the company's financial system, including an assessment of the company's overall risk exposure, size and concentration in the industry, but also an analysis of whether there are deficiencies in the financial system in which social and environmental risks are concentrated.

Behind the direct financial impact on stability, system-level risk analysis can bring risk to the economy as a whole. Such an analysis of risk exposure goes beyond looking at exposure and assessing potential impacts on GDP, consumption and financial conditions under the assumption of risk realization. An analysis of environmental risks across the economy will require some kind of macroeconomic model that assesses the effects of feedback between sectors of the economy. Both approaches aim to quantify the social and environmental risks of the environment at a systematic level.

Method of the research

The company's focus on earning and profitability are considered key elements of a company's successful long-term business. Many business owners and managers analyze the business of the company by measuring the realization of profits and profitability, and based on the results obtained strategic plans of the company, of course in accordance with available resources. Profit maximization as the sole goal came into conflict with the strategy of responsible management. The globalization of the economy, which creates an unstable competitive environment, in the face of growing social expectations for the proper functioning of the corporation, has placed new demands, social and environmental sustainability on the management of the company. No matter to these environmental risk measurement tools the experience of financial institutions in environmental risk analysis, as currency variables, is still limited (GFSG, 2017). In the practical application of such methods to individual economic entities or national economies, there are ambiguities and inadequate application of defined tools.

Therefore, every day in practice, new opportunities appear that open the door to new approaches, but all for the purpose of achieving the ultimate goal, which is to operate according to the principles of social and environmental sustainability. First of all, social and environmental responsibility of companies contributes to the public reputation in the economic market, while on the other hand they prevent the occurrence of environmental disasters that can have major financial consequences for the company's operations.

In today's business world, all actors in the economic system are interested in achieving profitability and long-term value creation of companies, while new models of corporate governance based on the application of sustainable development strategy, and more recently management based on social and environmental sustainability. The subject of the research includes determining the importance of social and environmental sustainability of companies for long-term profitability and the creation of economic value added. The research starts from the assumption that corporate social and environmental responsibility is extremely important and necessary for successful long-term business.

The research described in this paper is based on empirical testing on a sample of 126 Croatian companies based on the financial statements as of December 31, 2019, from which profitability and EVA indicators were obtained. As most of the companies covered by the survey do not compile sustainability reports, which according to the GRI guidelines should cover economic, social and environmental aspects, an anonymous survey was conducted among employees and company management, covering only social and environmental aspects. The survey sought to obtain the maximum objectivity of the respondents by assigning a general score of 1 to 5 for each company and separately for both groups of questions individually social sustainability (DO) and environmental sustainability (EKO). The aim of the research is to obtain results on the relationship between the implementation of social and environmental sustainability with the profitability of enterprises using the indicators Return On Sales (ROS), Return On Equity (ROE), Fundamental earning power (FEP) and the creation of economic value added (EVA). Therefore, an analysis was performed using correlation and regression in the statistical program SPSS Statistics 17.0., and the obtained results are shown in the table below.

Hypotheses of the research

This paper seeks to explore the extent to which the social and environmental sustainability of enterprises contributes to the creation of profitability and economic value added. In accordance with the above, the scientific hypothesis was set:

H1: The social sustainability of companies is positively and significantly statistically related to the creation of the economic value added
H1-1: The social sustainability of companies is positively and significantly statistically related to the realization of return on sales indicator
H1-2: The social sustainability of companies is positively and significantly statistically related to the return on equity indicator
H1-3: The social sustainability of companies is positively and significantly statistically related to the indicator of the fundamental earning power
H2: The ecological sustainability of companies is positively and significantly statistically related to the creation of the economic value added
H2-1: The ecological sustainability of companies is positively and significantly statistically related to the realization of return on sales indicator
H2-2: The ecological sustainability of companies is positively and significantly statistically related to the return on equity indicator

H2-3: The ecological sustainability of companies is positively and significantly statistically related to the indicator of the fundamental earning power

The following variables have been defined in this research which we obtained from a survey on the implementation of social and environmental sustainability:

a) Predictors (Constant):
   - VAR X1 – social sustainability (DO)
   - VAR X2 – environmental sustainability (EKO)
b) Dependent Variable which we calculated from the financial statements of the company as of December 31, 2019.:
   - VAR Y1 – economic value added (EVA)
   - VAR Y2 – return on sales (ROS)
   - VAR Y3 – return on equity (ROE)
   - VAR Y4 – fundamental earning power (FEP)

Results of the research

The obtained research results are presented below. The observed companies from the sample according to the number of employees are classified into three groups: the first group, 57 of them, consists of companies from 1 to 10 employees, then 42 companies with 11 to 50 employees, and companies with more than 51 employees, 27 of them. In the observed sample of analyzed companies according to the activity they are engaged in, most of them belong to the retail and wholesale activities, followed by companies whose main activity is financial operations (bookkeeping services and financial consulting), then companies whose main activity is transport, and information technology and communications , in the last places are construction and other activities. Table I. and table II. presents the results of the statistical significance of the coefficient of correlation and regression of the VAR X1 – social sustainability (DO) and VAR X2 – environmental sustainability (EKO) with business performance indicators (VAR Y).

Table 1: Statistical presentation of correlation and regression coefficients VAR X1 and EVA, ROS, ROA, FEP

Model Summary[b]										
					Change Statistics					
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	R Square Change	F Change	df1	df2	Sig. F Change	Durbin-Watson
1	,212[a]	,045	,013	,38924	,045	1,417	4	121	,232	2,101
a. Predictors: (Constant), DO										
b. Dependent Variable: EVA, ROS, ROA, FER										

Source: Author's work

From the presentation in Table 1 we see from the correlation coefficient R that the correlation between the variables exists but is very small. The coefficient of determination R2 is closer to zero than to one, so we cannot speak of a good linear correlation of the model. Regarding the F ratio, we can see that the empirical F ratio (1,417) is higher than the theoretical value (0,232), based on this with a given level of significance 0.05 and with the number of degrees of freedom (4,121) we notice greater variability, ie variation resulting from the influence treatment, suggests that the orientation of the company towards social sustainability does not affect the profitability of the company and the creation of economic value added, but there is little correlation (0.212). Durbin-Watson has a value of about 2 which indicates the absence of autocorrelation of relation errors.

Table 2: Statistical presentation of correlation and regression coefficients VAR X2 and EVA, ROS, ROA, FER

Model Summary[b]										
					Change Statistics					
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	R Square Change	F Change	df1	df2	Sig. F Change	Durbin-Watson
1	,243[a]	,059	,028	,58767	,059	1,897	4	121	,115	2,074
a. Predictors: (Constant), EKO										
b. Dependent Variable: EVA, ROS, ROA, FER										

Source: Author's work

As shown in Table 2 by analyzing the correlation coefficient R we can see that the correlation between the variables exists, but the correlation is small (0.243). The coefficient of determination R2 is closer to zero than one, so we cannot talk about a good linear correlation of the model, which can be seen in Graph 1. When we look at the F ratio, we can see that the empirical F ratio (1,897) is greater than the theoretical value (0,115). Moreover, with a given level of significance of 0.05 and the number of degrees of freedom (4,121), we come to the conclusion that the company's business is oriented towards environmental sustainability to a small extent, ie partially related to the company's profitability and economic value added. The Durbin-Watson has a value of about 2 which indicates that there is no autocorrelation of relation errors.

Conclusion

The strategy of environmental and social sustainability is not sufficiently implemented in Croatian companies. This study found that 21.87% of the observed companies (with an average score of about 4.5) satisfactorily implement the strategy of environmental and social sustainability. Whether this is due to the inability to adapt to environmental and social requirements but also to the inadequate implementation of environmental control systems and the protection of social and social rights, should be determined by additional research. Most companies do not systematically implement the strategy of social and environmental sustainability, and this research provides data that there is a link between environmental and social sustainability with company profitability and the creation of economic value added, but it is extremely small (DO 0.212 and EKO 0.243). Consistency of all participants in the economic system in the implementation of social and environmental sustainability for the benefit of the entire community and future generations is necessary.

Monetary Integration - Currency in The Euro Area And Economic Club Theory

Piotr WALĄG
University of Agriculture in Krakow, Mickiewicza Av. 21, 31-120 Krakow, Poland,
e-mail: piotr.walag@urk.edu.pl

Abstract

The article is an attempt by the authors to fit in with the discussion on the benefits and costs of joining the euro area, which focuses primarily on the differences between countries in real structures.
The thesis of the article is that full economic and monetary integration will increase costs among those countries whose broadly understood socio-economic structure differs from that of the most developed countries. Differences in GDP or asset structure (especially in periods of falling global demand) inevitably lead to the fact that the rising costs of competition (efforts) will be transferred to societies that generate their income from **internationally immobile resources**. The theory of clubs will be applied to verify the thesis. Countries integrated in the euro area are identified as members of a club that offers the club good - the common currency. The existence of differences that make the club heterogeneous through costs and benefits will determine the optimal size of the club.

Keywords: club theory, monetary-currency integration, eurozone, asymmetric demand shocks, nominal convergence, real divergence, not internationally mobile assets.

Introduction

The inclusion of more countries in the euro area makes this grouping more heterogeneous, which entails forcing the policies of the supervisory institution (European Central Bank - ECB) to develop mechanisms to deal with the growing conflicts between the economic objectives of individual countries, which, despite meeting the nominal convergence criteria, have different GDP structures, trade structures, potential, financial market barriers and social preferences (J. Ahrens, W.H. Herman, R. Ohr 2005). Failure to meet the criteria of real convergence imposes on the policy of the supervising institution the need to develop a consensus between the economic objectives of individual countries. The ECB is faced with a conflict of goals, as the share of individual countries in particular costs is not proportional.

This article is a key contribution to the discussion on the benefits and costs of joining the euro area.

Countries integrated in the euro area are identified as members of a club where the club's common currency is offered. The thesis of the article is that full economic and monetary integration will increase costs among those countries whose broadly understood socio-economic structure differs from that of the most developed countries. Differences in the structure of GDP or assets (especially in periods of falling global demand) inevitably lead to the fact that the rising costs of competition (efforts) will be transferred to societies that generate their income from **internationally non-mobile resources**. The theory of clubs will be applied to verify the thesis.

The first chapter will show the basics of the economic analysis of club theory in relation to monetary integration. In the following section the costs and benefits of membership (participation) in the monetary union will be outlined on the basis of the economic analysis of club theory. It will then show the conditions for full participation in the benefits of the single currency and the costs and scale of such participation.

Theoretical Basis, Methods, Results and Discussion

Integration in the euro area as club membership

The monetary union in the euro area is a grouping of countries - members of the European Union - which benefit from clubbing - monetary integration, which is inaccessible to non-attached countries. The good that is monetary integration (the common currency) is a non-rivalry good (the use of it by one member does not diminish the possibility of using it by other members, and countries that are not members of the euro area are excluded from using it.

The grouping of euro area countries can be seen as a club that has emerged within the established institutional framework, regulations and guidelines for participation.

The actual formation of the euro club from the EU Member States since 1999, as well as the pursuit of instruments of closer institutional cooperation from 1979 (the European Monetary System became operational) (L. Oręziak 2003) to 1999, indicates the economic theory of clubs as an appropriate application tool for the analysis of economic and institutional and political mechanisms and conditions for both deepening and further expansion of the monetary union. The analysis conducted on the basis of club theory shows the benefits and costs resulting from monetary integration in relation to differences in real structures between the economies of the Member States. This is a theoretical approach, the foundations of which were developed by Samuelson P. A (conceptual distinction between purely private and purely public goods) (P.A. Samuelson 1954; 1955), Buchanan J. M. (development of economic club theory) (J.M. Buchanan 1965), Tiebout C. M. (introduction of an element of competition between countries through tax and public service packages) (C.M.A Tiebout 1956) It also sheds light on the political capacity to deal with current and future problems arising from the enlargement of the monetary union and the possibilities for institutional neutralization.

It is not the rivalry of the club good, which is monetary integration, that increases the usefulness of the club good as the number of members increases. The growing size of the club usually implies higher integration costs, which increase more than proportionally as the collection (club) becomes more and more heterogeneous and the implementation of the common monetary policy becomes more and more difficult.

Increasing the size of the club has positive marginal benefits for incumbent club members, but for countries that are still looking for closer cooperation and club membership, this marginal utility may decrease as the number of club members increases. or those that also reflect relatively similar interests in certain policy areas and show significant interdependencies, but are characterised by differences due to different production structures (countries have different patterns of change in the structure of the economy (G. Dosi, F. Riccio M.E. Virgillito 2020)) and assets.

The marginal utility of accession is low, with a tendency to weaken for countries that show great differences in economic structures and preferences compared to the incumbent Member States and which have only entered into loose economic ties with the incumbent countries (J. Ahrens, W.H. Herman, R. Ohr 2005).

Using the framework of the clubs' analysis, an attempt was made to simultaneously determine the optimal widening and deepening of the good that is monetary integration. Otherwise, in the first stage there will be a simultaneous determination of the optimal number of club members (club size, expansion scale) and the optimal level of supplied club goods (degree of intensity / depth of integration [common fixed exchange rate system with a wide band - system of fixed exchange rates - monetary union with a common currency]).

Assuming that all members have identical utility functions, all consume the club's goods to the same extent, there is no competition in consumption,

A representative member of the club (the government of a euro area member) seeks to maximise its utility functions, with a given budgetary constraint.

(1)Ui = Ui (Gi, X, n), where Ui - usefulness of a representative member of the club *i*, Gi - real public expenditure of the member *and* as an approximation of the provision of the public good in the country, X - degree of integration with regard to the club's good, n - number of members in the club
An increased number of members can produce economies of scale - increases in G^1 , X and n have a positive effect on U.

(2) pGi + (C(X, n))/n = Ti, where C - costs, Ti - taxes
Exogenous tax revenues 'i' must be equal to nominal government spending plus the ith share of the cost of providing club goods. The assumption is a positive relationship between the cost and the degree of integration of the club and the number of members (this assumption suggests that we adopt Krugman P.'s view based on Mundell's theory, contrary to the European Commission's proposals) (P. De Grauwe 2003).

It is possible that costs increase more than proportionally with enlargement, especially when the club becomes more heterogeneous (the cost burden on individual members increases with the number of members) - on the one hand, the cost of production of the club's goods increases with enlargement, on the other hand, this cost is shared by a larger number of members, but as the cost increases more than proportionally - increasing marginal costs - the individual cost burden will increase with increasing membership.

(3)Ux / UG = Cx / (P x n) > 0, where G - quasi-private state good

the traditional Samuelson's condition for providing an optimal amount of public goods
(4) $_{Un}$ / UG = (Cn - [(C(X, n)]/n) / (P x n) > 0, membership condition when it is advantageous to have further members

Figure 1

Source: Ahrens J., Herman W. H., Ohr R., Deepening Integration in an Enlarged EU: A Club-theoretical Perspective, European Integration, Vol. 27, No. 4, December 2005, s. 428

Figure 1 shows the simultaneous solution for X and n. In the first and second quarter, utility and cost functions are presented for levels X and n respectively.

The cost per club member increases in proportion to the degree of integration and depends positively on the size of the club (increasing marginal costs of an additional member).

Individual usefulness also increases with a higher degree of integration and is dependent on the size of membership, but in both cases with decreasing marginal usefulness.

Rising marginal costs and the decreasing marginal utility of the additional members are particularly credible / convincing if the new members differ strongly from the 'old' members in structural terms, hence the diversity of economic data and the divergence of political objectives, constraints and the need for adjustments is becoming increasingly clear.

Optimal sizes X and n are achieved when the difference between the costs and benefits of a representative member is maximised. Thus, an optimal degree of integration X* in the first quarter is achieved if the membership size is n*.
If the number of members is greater than n* (e.g. n2) the optimal degree of integration will be X1.

The second quarter shows that the optimum size of membership is n* for a given degree of integration X*. If the integration did not occur so deeply (e.g. up to X1), the optimal size of membership is n1.

In Quarter IV we construct Xopt charts and notes which correspond to equations (3) and (4).

The Xopt curve illustrates the maximisation of net usability from the degree of integration X for alternative membership sizes

The nopt curve illustrates the maximisation of net utility from the size of membership for alternative degrees of integration intensity.

The slope of both curves reflects the interchangeability between the degree of integration and enlargement (increasing the number of members). P is at the same time the optimal solution for X and n.

As the utility and cost functions will differ for different club goods (different levels of integration intensity: fixed exchange rates .... currency union), so the received functions for nopt and Xopt will also differ. It follows from the herds that the optimal size of a club will also vary for different club goods (different levels of integration) and that a single club that provides more than one club good for its members will be suboptimal from a theoretical point of view. If we assume that n* is equal to the number of the current euro group, then the enlargement of the union (n1> n*) would lead to a suboptimal size of the club (P25). This constellation will only meet the optimality criteria if the Xopt and nopt curves move down or to the right, respectively, and intersect at the X* and n1 coordinates. Such a shift would be the result of a decrease in the cost of delivering the club good, independent of the size of the membership and the degree of integration (J. Ahrens, W.H. Herman, R. Ohr 2005).

Benefits and costs of 'euro club' membership.

The benefits of monetary integration increase with the intensification of trade and financial relations between the countries of the zone, and this is broadened and deepened with stronger economic and monetary integration. Although for new members who are economically weakly linked to the Member States, participation in *the club* may mean less than proportional increases in benefits.

The most tangible and credible benefits of economic and monetary integration emerging from economists' analyses include lower transaction costs, reduced exchange rate risk and increased price transparency (S. Lis 2008).

Deeper monetary integration is expected to lead to positive changes in the welfare of the population as a result of the functioning of a single currency instead of a few, by intensifying the flow of goods, services, capital, labour through the elimination of transaction or exchange costs (gathering information on future exchange rate developments, savings on hedging costs' related to exchange rate risk). Additionally, the elimination of exchange rates will reduce the element related to exchange rate risk in direct investment decisions as an investment stimulator. Elimination of the risk premium will reduce currency speculation, often leading to distortions in the real economy.

More reliable and transparent prices mean better decisions on production, investment and consumption.

The benefits of participating in a common monetary area may be all the greater the more countries that are part of it. The elimination of transaction costs, including the reduction of price discrimination between markets in different countries, and the reduction of uncertainty in economic decisions, especially as regards the formation of a company's income, significantly stimulate multi-level cooperation between Member States (P. De Grauwe 2003).

The countries, i.e. Poland, should benefit most from stable monetary policy and stable prices, as well as low interest rates. They will also benefit from lower transaction and information costs (R.A. Mundell 2000).

Costs related to joining another country (marginal), resulting from institutional regulations, law, competition rules, etc. will be positive and will increase with the number of club members. Consensus building by club members becomes more difficult as the number of members and their heterogeneity increases, mainly due to the complexity of the club management process (e.g. voting procedures, monitoring/supervising activities etc.) (J. Ahrens, W.H. Herman, R. Ohr 2005).

The main cost of joining the euro club is the loss of opportunity to influence the business cycle by revaluing or devaluing the national currency (loss of national currency independence). Each successive country joining the euro area increases the difficulty of managing business cycles in individual member economies, and this difficulty increases with the diversity (heterogeneity) of countries joining the euro area.

Furthermore, the loss of ability to influence the interest rate and exchange rate exposes the economy to asymmetric shocks as a result of falling global demand.

However, in addition to the costs of adopting the euro, there are a number of costs of staying outside the euro area, i.e. an increase in permanent adverse exchange rate movements as a result of the collapse of global financial markets or an increase in central banks' vulnerability to the increasing mobility of capital flows (mainly in the property markets) (A. Sławiński 2008).

The optimal size of the club will be determined by equating marginal benefits with costs generated by joining another country's club (P.C. Padoan 1997; J. Ahrens, W.H. Herman, R. Ohr 2005).

Conditions for a beneficial monetary union - structural adjustments.

If the (politically preferred) enlargement illustrated in Figure 1 is to become economically optimal as well, economic policy measures must influence cost determinants. The application of club theory to monetary integration clearly shows that the main determinant of rising costs is a heterogeneous set of club members. It stems from the lack of real convergence (cohesion of the real structure).

Chart 2

Source: Own study

The cost per club member increases in proportion to the degree of integration, and once it has been achieved, the introduction of the single currency will only depend on the size of the club (increasing marginal costs of the additional member). Individual utility also increases with a higher degree of integration and is dependent on the size of the membership, but in both cases marginal utility will depend on the degree of convergence of structures. The convergence of economies in structural terms may result in the elimination of rising marginal costs and lead to increased marginal utility. This will result, as shown in Figure 2, moving to its Quarter IV, in the optimal size of the club increasing with the degree of integration. On the other hand, the optimal size of a good club is full monetary integration, i.e. adoption of the common currency.

Summary

In presenting the prospects and proposals for economic and monetary integration, the Delors Report warned against the resulting significant trade imbalances. At the same time, it points to the need to increase the flexibility of prices and wages and the mobility of capital and workers as ways to eliminate these adverse effects of integration.

The key task in the further process of shaping the monetary union is therefore, alongside the development of the institutional framework or the political and economic method of operation, the structural adjustment of Member States' economic areas that is real convergence.

[1] real budgetary expenditure - bringing closer the provision of public goods and, in the theory of clubs, a quasi-private good that can only be used by the citizens of a country

Theoretical Aspects of Deindustrialisation in Developed World Economies

Piotr WALĄG
University of Agriculture in Krakow, Mickiewicza Av. 21, 31-120 Krakow, Poland,
e-mail: piotr.walag@urk.edu.pl

Abstract

The effects of deindustrialisation, which became apparent most strongly in the 1970s and 1980s in the United Kingdom and the United States, set strategic trends for the next decades of the world economy.
The content of this article deals with selected issues relating to the deindustrialisation process, particularly in the United Kingdom and the United States.
This article states that the emergence of deindustrialisation in such economic phenomena as investment, the collapse of old industries, the declining strength of trade unions, the relocation of industries and wage differentials are evidence of painful but desirable adjustments for further economic growth.
After presenting a theoretical view of changes in the structure of employment in the economy, the concept of deindustrialisation and its most important determinants, within the framework of selected issues, the problem of the decrease in the share of industry in total employment in the economies of the United States and the United Kingdom is presented, as well as its structural sources, i.e. the centralisation of wage negotiations in the United Kingdom, the British minimum wage policy, the effects of strong trade union traditions in the United Kingdom, the relocation of American companies to foreign economic areas, investment in the United States, the positive dimension of the strong wage differential in the United States.

Keywords: deindustrialisation, employment structure, collapse of industries, change in demand structure, increase in productivity, wage differentiation, relocation of enterprises.

Introduction

The effect of industrialisation first became apparent at the end of the 1960s in the UK and was triggered by an increase in the relative prices of raw materials, which caused supply shocks in the industrial product markets. As a result, the British economy of the 1970s began to show declines in the share of the industrial sector in employment and production and declines in the share of exports in world trade growth - the share of industrial production in total net production, measured in constant 1963 prices, has been falling since 1970, in current prices it fell by nearly 8% between 1950 and 1975, the share of industrial goods in world trade fell by almost 10% between 1955 and 1973, import penetration in industrial goods markets was increasing, the rate of investment was relatively low. In the 1970s, there was an absolute decline in the number of industrial businesses in the UK industrial sector, and, as a result, an absolute decline in production and employment in the sector (C.J.F. Brown, T.D. Sheriff 1979).

Between 1970 and 1980, the Northeastern Industrial *Belt (Manufacturing Belt*) in the United States recorded large, absolute declines in employment. The region recorded a loss of around 1 million jobs in the 1970s. (R.D. Norton 1996). The United States was the original manufacturing area, where the phenomenon of the relocation of mature industries to competitive foreign areas was observed (R. Vernon 1996). The economic decline of the industrial north was seen in a rapid repetition of the history of Great Britain in the last century (1870s-1970s), sometimes referred to as the 'climacterium' of Britain (the collapse of old and failed attempts at the successful operation of new industries, the decline of TFP, the decline of production) (R.D. Norton 1996).

Deindustrialisation has appeared in the light of such phenomena as: the declining share of employment in industrial companies in developed economies, the stagnation of average real wages and the increase in wage inequalities in the United States since 1973, the massive increase in unemployment in most developed European economies since the early 1970s (R.D. Norton 1996). These effects are intertwined with the phenomenon of rapid growth in trade cooperation and capital mobility between developed and developing countries. As a result, resources of production factors have been shifted in highly developed countries from industry to the service sector, and from highly developed countries to developing countries.

Cite this Article as: Piotr WALĄG " Theoretical Aspects of Deindustrialisation in Developed World Economies" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

It would seem unreasonable to pretend to understand the above phenomena and related problems in the economies of advanced countries without first realising the fundamental evolution of their structure (J. Fourastie 1972).

After presenting the basic elements of the evolution of the employment structure, the concept of deindustrialisation will be presented, and then the determinants of this phenomenon in developed economies will be identified. In the next part, a short description of the economies which were subject to the deindustrialisation process will be presented. The work will be completed with the emergence of implications resulting from deindustrialisation.

Theoretical Basis, Methods, Results and Discussion

Basic elements of the evolution of economies in the context of structural change.

The first industrial revolution caused economic conditions to evolve much faster, in a very surprising way from 1900 onwards, and then from 1930 onwards. Economic reality began to evolve so quickly that it becomes impossible to grasp its rights. Only economists will be able to grasp an important phenomenon when it is immediately replaced by another previously insignificant one (J. Fourastie 1972). This shows the profound structural changes that have caused rapidly changing economic conditions. Structural changes and the collapse of long-term economic trends were the subject of research long before the industrialisation processes in world economies actually came to light.

On the basis of his concept of the tri-sectoral division of the economy (agriculture - industry - services), Allan Fisher has identified the regularities of structural changes in economies that are based on economic progress (J. Fourastie 1972). He has identified the structure of the economy and structural changes in the economy as a share of individual sectors in the total stock of labour and capital. The regularities of changes in the economic structure that he observed can be reduced to the claim that the share of the agricultural sector in the labour and capital stock is decreasing in favour of the service sector as the economy progresses. In the industrial sector, its share of the factor inputs is initially increasing and then decreasing in favour of the service sector. Such shifts of input stocks between sectors reveal the nature of economic progress. As the role of individual sectors in the economy changes, there is a transfer of inputs from the first sector to the second and then to the third sector.

Around 1800, 80 to 90% of the world's population were farmers, and already around 1950, in developed countries, the agricultural population represented only 20% of the total population (J. Fourastie 1972).This phenomenon was introduced to the economic sciences by Colin Clark, showing the correlation between the high standard of living achieved by a country and the small percentage of people employed on the land (J. Fourastie 1972).In his research he focused on the amount of national income per capita and the relative importance of the three sectors of the economy, except that, unlike Fisher, he only captured the importance of individual sectors on the basis of their share in the labour force. On the basis of his research, he concluded that, as income per capita increases, the ratio of agricultural workers to industrial employment decreases and the ratio of service workers to industrial workers increases.

Based on the change in the relative importance of the three sectors, Clark specifies two phases of development. In the first phase, there is a decline in the relative importance of the agricultural sector and an increase in the importance of the industrial sector, and in the second phase, where, with adequate *per capita* income, the development of the industrial sector is slowed down, there is a relative decline in employment in the industrial sector in favour of the service sector (C. Clark 1957).

Jean Fourastie, like Fisher and Clark, has used the concept of a three-divisional structure of the economy to identify the regularities of structural transformation in the economy. In Fourastie's view, as the economy develops, the share of the agricultural sector in total employment is becoming smaller. The industrial sector shows an increase in its share of employment at a certain stage of development, followed by stabilisation and decline. As far as the services sector is concerned, it continues to show an increasing trend in its share of total employment, first at the expense of the agricultural sector and then the industrial sector. To illustrate the process of economic development, Fourastie distinguishes three phases of economic development - the primary civilisation, the transition period and the tertiary civilisation. With the first industrial revolution, there was an increase in productivity and living standards, which ended the period of primary civilisation and began the transition period. The transition period, due to the importance of technical progress and related changes in consumption structure, is divided by Fourastie into three stages - start, expansion and completion. In the start-up phase, there is a rapid increase in employment in the industrial sector and the industrialisation of the economy begins. This stage continued in the US and UK economies from 1800 to 1920. During the expansion stage, when labour productivity growth is accelerated by the strong acceleration of technological progress, employment in the industrial sector begins to stabilise. As technological progress has the greatest impact on productivity growth in the industrial sector, and at this stage its relative importance in the economy is greatest, economic growth is relatively high. The economies of the United States and the United Kingdom were at this level of development in the 1960s. In the last phase of the transition period - the complementing phase -

employment in the industrial sector started to fall and grow dynamically in the service sector. The share of employment in the services sector is increasing throughout the transition phase, but in its final phase, when labour productivity growth is much faster than the increase in demand for industrial goods, the share of employment in the services sector starts to increase significantly. In addition, the decline in employment in the industrial sector in the complement stage means that the service sector is absorbing all the labour released from both the agricultural and industrial sectors (J. Fourastie 1972).

The end of the transition period will start an era of servicing (the Fourastie stage of tertiary civilisation), in which the service sector will achieve its greatest relative importance in the economy and its share of employment will be close to the level of employment achieved in the primary civilisation stage by the agricultural sector.

The concept of deindustrialisation

Deindustrialisation is a feature of the economic development process that is inevitable. It occurs both before the emergence of wage inequalities and unemployment, with which it is very closely associated in debates on economic development in developed countries.

Deindustrialisation does not mean the collapse of the industrial sector, but the natural effect of economic development, resulting from the process of creative destruction inherent in the capitalist system (J.A. Schumpeter 1942). However, we cannot reject the claim that deindustrialisation can sometimes be combined with difficulties in the industrial sector or in the economy as a whole. A country may lose jobs as a result of a negative shock (i.e. a high appreciation of the real exchange rate), and the service sector may not be able to absorb the released labour force completely. Here, deindustrialisation may involve rising unemployment or slow growth or even a decline in living standards.

De-industrialisation can be classified in two categories - measured by the relative decline in industry's share of total production or measured by the relative decline in industry's share of total employment.

Deindustrialisation, understood as a long-term (secular) decline in the share of employment in industry, is analysed not as a negative phenomenon, but as a natural consequence of industrial dynamism in developed economies (R. Rowthorn, R. Ramaswamy 1997).

Using the gross job losses indicator, Bluestone and Harrison defined deindustrialisation as the destructive side of creative destruction (B. Bluestone, B. Harrison 1982).

Thurow deindustrialisation is described as the destruction of the industrial economy, which, in contrast to the destruction of the agricultural economy itself, is caused by identifiable human activities that can be controlled (L. Thurow 1980).

Controversy over the determinants of deindustrialisation

The key factors explaining the growing employment in industry during the period of industrialisation, which is largely a shift in employment from agriculture to industry, can be reduced to two factors. The first is the action of the Engel law (the proportion of income spent on food decreases with economic growth, leading to changes in the structure of demand - from agricultural products to manufactures and services), which is related to the profitable elasticity of demand (as a result of the increase in income, the structure of demand changes). It was also the basic criterion for dividing the economy into three sectors in Fisher's theory (A.G.B. Fisher 1952). The second determinant is the rapid productivity growth in agriculture caused by the introduction of automation. Rapid productivity growth is a measure of technical progress, which in his concept of the evolution of economies Fourastie considered to be the prevailing factor, and at the same time a criterion for distinguishing three sectors in the economy (J. Fourastie 1972). These combined effects, occurring on the demand and supply side, are the result of large-scale shifts in employment from agriculture to industry and services. These phenomena were responsible for the increasing share of employment in industry in the industrialisation phase.

The rapid changes in the rate of productivity, which are driven by changes in production technologies, take place much more in the industrial sector than in the service sector, which would mean that the impact of new technologies on productivity growth is much greater in industry than in services, which, in turn, is the prevailing factor in explaining the deindustrialisation processes, which are seen as changes in the structure of employment between the industrial and service sectors. The value of industrial products in the advanced countries at constant prices over the period 1970-1994 has more or less remained unchanged, calculated in current prices, but has decreased significantly. It follows that the share of the value added in GDP of manufacturing companies has decreased, not because of a fall in industrial production (its value in constant prices does not change significantly), but because of a fall in the prices

of industrial goods, as shown by the fall in the value of industrial output at current prices. Further, it can be concluded that shifts in the structure of domestic expenditure have not been the main cause of changes in the share of industry in value added (value added at constant prices has not changed significantly). The persistence in the analysis of long-term trends in services sector production at the level of manufacturing output, although productivity in industry is increasing much more than in services, indicates the indispensability of increasing the share of the services sector in the employment structure, as a result of labour force absorption pushed out of industry (R. Rowthorn, R. Ramaswamy 1997).

In the hypothesis of the '*industrial growth lag',* Kuznetz argued that the industrial revolution had initiated a seemingly unrestricted process of economic growth: individual nations and industries were growing and then collapsing. When asked about the reasons for the collapse of the so-called 'old industries', he answered that the opportunities for the use of new technologies, cost reduction and further growth in sales were diminishing in these industries. Kuznetz stresses that sustainable economic growth requires the creation of new industries which, by achieving high growth rates, will 'compensate' for the inevitable slowdown in the spread of inventions and innovations in the old industries. Therefore, the high growth rate of the entire economy is accompanied by significant shifts in relative importance between industries as old ones collapse and new ones emerge (S. Kuznetz 1959).

The law of industrial growth indicates that industries mature when the main benefits of technology end, slowing down cost reduction, market expansion and sales growth, and making ageing industries vulnerable to the competition of younger rivals with faster productivity growth (E.B. Alderfer, H.E. Michl 1942).

Schumpeter's vision of development is achieved through painful structural changes. Schumpeter rejects all economic reasons for the expiration of investment opportunities. He points to the capitalist growth system as the one that could be threatened by three factors. Firstly, the growth of large industries, which could result in the paralysis of capitalism. Secondly, excessive wealth growth, which could undermine the values and institutions legitimising capitalism. Thirdly, a possible decline in investment opportunities, which could result from the saturation of human needs, a reduction in the size of economic resources, the disappearance of technological innovation or a shift in investment projects towards public goods. Both Schumpeter and most economists at the end of the 20th century rejected each of these factors as a source of fading economic growth in industrialised countries. For Schumpeter, the real threshold for investment opportunities was Kondratiev's 50-55-year cycle or 'long wave'. With brutal optimism, Schumpeter saw the economic depressions as an essential element in clearing the economy of outdated practices and restoring efficiency. As a result, such a creative destruction would have conditioned the growth of new industries. New industries would initiate the next long wave, ensuring the achievement of capitalism's objective of a significant increase in living standards every 50 years. Schumpeter does not see economic restrictions on growth, but envisages political and cultural restrictions (a break with the main values of capitalism, a strongly regulated and inflexible mature economy, which in the long run, politically, means the end of the growth system).

Hansen shared Schumpeter's idea of long waves, although he strongly opposed his laissez-faire approach. Hansen introduced a kind of *natural law of industrial ageing*. This can be explained as the disappearance of industries after they have undergone a phase of strong growth in investment activity, maturity and decline, which causes deep stagnation in the economy and it can take a long time before a similarly strong economic force acting in the opposite direction appears (E.M. Hoover 1948).

Burns wrote in the *Growth Law* that the growth rates of individual industries tend to fall as the age of the industries increases. Unlike Hansen, Burns did not see the ageing of industries as a problem, but saw it as a natural part of the growth process (R.D. Norton 1996).

Wolf assumed the existence of four *growth retardation laws*, one of which specifically indicated that any technical modernisation by reducing costs and improving the use of raw materials and energy hinders further development. As a result, there is less and less room for improvement, and thus a narrowing of opportunities slows down or completely interrupts technical development (R.D. Norton 1996).

The ripening phase of the industry and its main production centres, when the growth rate of the market is slowing down, when fundamental issues related to product design have been solved and when the necessary machinery has been constructed, is transformed into a dispersion phase. The key to explaining this process is work. Over time, when technological progress makes work largely routine, when a concentrated and highly qualified workforce is no longer necessary to carry out the production process, industries move to areas where wages are relatively lower and production conditions are more flexible than in the home production areas. This does not mean, however, that the maturity of the industry, which is commonly combined with decentralisation, will or should cause the gradual spread of production. Indeed, at the same time, a permanent process of new industries is under way(E.M. Hoover 1948).

Baumol, Blackman and Wolf (W.J. Baumol, E.N. Blackman, E.N. Wolff, 1989) formulated and proved that productivity growth is higher in some (technologically progressive) activities than in others (technologically stagnant) (W.J. Baumol, E.N. Blackman, E.N. Wolff, 1989). Manufacturing is, in general, technologically progressive (which is the basis of deindustrialisation). Such characteristics of manufactures are connected with their internal attributes, i.e. ease of standardisation, possibility of formalizing information necessary for production into easily repeatable information packages. The services, on the other hand, are significantly different from manufactures in this respect. For example, *non-personal* (*impersonal)* services, such as telecommunications, have characteristics similar to manufactures and can be qualified as 'technologically progressive'. Personal services, however, such as medical care, for example, cannot easily be standardised, cannot be subject to mass production methods and are therefore called 'technologically stagnant' [1]. The general approach to ageing is the *maturity hypothesis* developed by Kindleberger and independently by Olson. Kindleberger's maturity hypothesis was aggregate, referring neither to the life cycle nor to the "S-shaped" growth of industry (*per capita* production tends to grow in the early stages of growth, then slow down as the economy reaches the economic maturity stage). Olson mainly points to the political side of economic maturity, highlighting the role of interest groups. He stresses that the older the roots of industrial development are, the more time is needed to work out the efforts of the various interest groups in order to develop a climate conducive to business growth (R.D. Norton 1996).

Characteristics of industrialising economies

The UK economy suffered a decline in exports and increased import penetration in increasing world trade between the 1970s and 1980s. This showed a decline in the competitiveness of British industrial goods in international markets. Improving international competitiveness depends on achieving higher domestic productivity growth than overseas. The decentralised structure of trade union negotiations in the United Kingdom has held back long-term planning and decision-making capabilities and acted against flexible responses to changes in the organisation of work and has generally held back productivity growth. Negotiations on working conditions delayed the adaptation and diffusion of new technologies and did not lead to high levels of labour utilisation. Negotiation disagreements resulted in production disruptions, unfulfilled orders, reduced product availability, and the resulting poor productivity usually meant poor quality and questionable product reliability (A. Kilpatrick, T. Lawson 1980).

The implementation of a new technological process in industry requires wage differentiation. This is because maintaining the operability of new technologies requires the employment of highly qualified workers, which requires higher wages. The trade union system of procedures and standards, on the other hand, ensures that workers with different qualifications receive equal status in terms of qualifications and pay (J.M. McLean 1978). The inability to change the organisation of work and the adaptation and diffusion of new technologies caused by resistance from workers has forced managers to close down, as a result of the loss of competitiveness, a large number of businesses, resulting in an absolute decline in the number of industrial businesses in the UK economy.

Without limiting the supply-side factors of the economy - mainly in the form of minimum wages and a relatively unskilled labour force with strong trade union traditions - industry is able to generate competitively priced industrial products, as has been the case in developing countries to which industrial production from the UK has been relocated. This has been made possible by the maturity of the industry, which has made production highly susceptible to migration to areas with low labour costs or to areas at home and abroad where there is a favourable location for production (E.M. Hoover 1948; R. Vernon 1996). This has resulted in an additional absolute decline in industry's share of employment. British domestic companies were more likely to seek profit through foreign investment and exports to partially protected regions than to restructure and modernise domestic businesses, where they had to confront workers at every attempt at large-scale modernisation or integration of domestic industry.

The loss of gross jobs in American industry was linked to the phenomenon of the relocation of mature industries to competitive foreign areas. This phenomenon was analysed by Vernon, who attributed different locations in the world to each of the three stylised stages of product development. In the first stage, a typical new product is developed and produced in large American cities, close to the necessary skilled workforce and market - customers. Such initial production centres will supply the product to domestic and foreign markets. At the second stage, the acceleration of production is observed, partly due to fear of taking over the domestic market by foreign (European) competition. This pushes American companies to establish their branches in Europe, which is helped by the gradual reduction of uncertainty as low-cost production technologies are invented and standardized. This stage is therefore marked by a decline in US exports. The third stage, the maturity stage, is characterised by the possibility of production everywhere and with the great benefits of low labour costs in the low developed countries (this is mainly marked in the production of textiles, small electronics, etc.). In this stage, the United States becomes a net importer (R. Vernon 1966).

So-called 'private investment' in US companies, known as 'corporate flight' (*corporate flight*) was considered to be the reason for the destruction of higher-paid, working places and activities through factory and factory closures. In

addition to the corporate flight phenomenon, B. Bluestone and B. Harisson also saw other sources of structural change taking place in the United States (B. Bluestone, B. Harrison 1982; R. Norton 1996). Lawrence lists at least five alternative sources of these changes. The first, in his opinion, is related to post-industrial effects, i.e. a fall in consumer spending, which is seen as the Americans' income increases. The second, also linked to the post-industrial effect, concerns the decline in the share of industry in total employment as a result of faster aggregate productivity growth in industry than in other sectors. The third, identified as cyclical effects, highlighted the stronger impact of slow demand growth on goods than on services. The fourth, which is identified as trade effects, indicates that the competitiveness of the United States may be reduced in the short term due to differences between the United States and other countries as regards the passage of particular phases of the business cycle and differences in the practice of monetary policy. As a fifth source and another trade effect, Lawrence mentions the possibility of comparative advantages shifting in the long term, as the production of mature products is transferred to underdeveloped countries. Lawrence combines the relocation of US production from the 1970s with the weak growth in global demand resulting from the supply shock and the fight against inflation. He attributes the net loss of jobs since 1979 to short-term effects with macro-economic roots. The loss of jobs in the manufactures since 1979, just like the United States' trade deficit, does not deserve, according to Lawrence, to be called industrialisation effects. This is because they do not reflect the long-term decline in the competitiveness of the United States and can be eliminated by appropriate fiscal and monetary policy measures (R.Z. Lawrence 1984; R.D. Norton 1996). Other empirical findings show that the increase in *North-South trade* has probably only had a small impact on the deindustrialisation process (R. Rowthorn, R. Ramaswamy 1997).
The greater effectiveness of the adaptation of the United States to the conditions of the new global economy than that of Europe was seen in the beneficial effect of the regional differentiation that took place in the United States. The strong interregional differences in the United States have forced the painful but helpful adaptations that were lacking in Europe (R. D. Norton 1996). The interregional disparities have largely prevented the centralisation of wage negotiations in the United States, which has made wage differentiation possible. Appropriate wage differentials are needed to compensate for the differences in skills and the intensity of work that this diversity attracts. In general, deciding on appropriate wage differentials in a rapidly changing environment is difficult with centralised trade unions. Wage differentials in US industrial companies have allowed the rapid adaptation and diffusion of new technologies, which has increased productivity throughout the sector (R. Rowthorn, R. Ramaswamy 1997).

The deindustrialisation processes in the EU-15 have been plagued by high levels of unemployment caused by a fall in the absolute number of people employed in industry, with a relatively small increase in total employment between 1970 and 1994. By contrast, in the United States, where the rise in unemployment as a result of a fall in industrial employment was cushioned by an increase in total employment, the negative features of deindustrialisation have been revealed in widening income inequalities and stagnating earnings.

Implications of deindustrialisation in developed economies.

According to the theory of sectoral employment structure A. Fisher and C. Clark's positive changes in the employment structure of the economy occur when the share of agriculture in labour demand is decreasing and the share of the service sector is increasing. By contrast, the share of industry and construction should increase at the expense of agriculture or decrease in favour of the service sector. The balance of changes in the share of these two sectors should be negative for highly developed regions and positive for developing regions (E. Kwiatkowski, L. Kucharski, T. Tokarski, 2003).

Changes in the relative weights of the three types of national production show strong links to the increase in economic prosperity: increasing levels of national income are always linked to a decreasing share of employment in the first economic sector (the agricultural sector). The relative weight of the second sector (the industrial sector) first increases as national income increases and then reaches its maximum and falls. Employment in the third sector (services sector) has not yet reached its maximum. Further increases in national income are seen in the reallocation of production factors from the first to the second, and especially to the third sector (C. Clark 19570).

On the basis of [2] Baumol, Blackman and Wolff's theory of 'asymptotic stagnation', which says that, in the long term, the average growth rate will be determined by the activities for which productivity growth is slowest, services can be identified as those for which productivity growth will be determined largely by average economic growth (R. Rowthorn, R. Ramaswamy 1997).

The theory of 'asymptotic stagnation' has important implications for understanding the relationship between competitiveness, productivity and living standards / welfare (P. Krugman 1994) and the existence of bottlenecks. Industrial productivity growth is likely to be less important than before for increasing overall productivity and living standards in advanced economies. As the process of deindustrialisation continues, productivity growth in the economy will increasingly depend not so much on industrial productivity growth as on productivity growth in the service sector.

In contrast, the evolution of productivity in the service sector will depend on the future development of areas such as information technologies and changes in the competitive structures of the sector. Technological development means that certain types of services will develop much faster than others, and therefore there will be significant structural changes in this sector over time. However, it should be noted that product innovation in industry will continue to play an important role because of *the spillovers to productivity growth in services* (R. Rowthorn, R. Ramaswamy 1997).

The dispersion effect of Kaldor's approach shows the importance of individual sectors of the economy for economic growth in a slightly different light. In Kaldor's opinion, the rate of productivity growth in the whole economy depends on the expansion of the industrial sector, which not only leads to faster productivity growth in industry (operation of Verdoorn's law[3]), but has a dispersal effect on the whole economy. The increase in productivity growth in the economy as a whole also depends on the disappearance of declining economies of scale, inefficient economic activities, i.e. agriculture or other non-industrial sectors. Freeing labour and other resources from inefficient activities (characterised by declining economies of scale) and shifting them to a dynamic industrial sector has a double benefit for productivity growth in the economy as a whole: it increases productivity by freeing up excess labour from non-dynamic sectors and by the expansion of dynamic sectors (S. Dasgupta, A. Singh 2006).

Deindustrialisation will most likely have important implications for industrial relations in advanced economies. Unification is less common, as it is usually more difficult to organise in the service sector (with the possible exception of public services) because of the wide and deep diversity in the nature of work and size of enterprises in service activities. The nature of work in services varies greatly depending on service activities (financial services, where relatively high qualifications are required, and retail services, where low qualifications are sufficient).

A centralised system of wage bargaining, where the main focus is on reducing wage differentials, will expose economies operating in such conditions to serious challenges as consequences of deindustrialisation.

Employment relationships will require the formation of strong incentive relationships, where incentive schemes are to induce proxies to work as if they were working in the company they own.

Industry remains important as a source of employment and structural change, at least in low and middle-income countries. Although the decline in industry's share of total employment is at a much lower level of national income *per capita* than in the currently economically advanced countries, this does not necessarily mean that a pathological phenomenon exists (S. Dasgupta, A. Singh 2006).

Summary

Deindustrialisation is a natural process of transfer of production factors, in particular the labour factor, at a certain stage of economic development from industry to services[4], dictated by the correctness of changes in economic structure if society is to benefit from the effects of economic progress.

The emergence of deindustrialisation in economic phenomena such as investment, the collapse of old industries, the declining strength of trade unions, the relocation of mature industries to developing countries, and wage differentials are evidence of painful but desirable adjustments for further economic growth.

However, deindustrialisation can be bought, as a result of slow adjustments, by socially undesirable phenomena such as unemployment, income inequalities, a slowdown in the growth of living standards and a reduction in the level of social security. The most important result of deindustrialisation, however, is the need to move away from workers' social security, which stiffens the labour market, towards greater flexibility with regard to employment, working time, wages and labour supply.

However, the symptoms of deindustrialisation, although their positive and negative effects could be balanced in theory, should be carefully analysed in relation to the various economic conditions.

The flexibility of the response to economic change at an increasingly rapid pace brought about by deindustrialisation made it a necessary process in a sequence of unavoidable changes in economies with high levels of economic development. Research carried out by Blackman, Baumol and Wolff has provided ample evidence that industry can no longer be a reliable engine for growth as it was in the past (W.J. Baumol, E.N. Blackman, E.N. Wolff, 1989).

[1] the concept of 'asymptotic stagnation' is not prescriptive, it does not mean that the rate of productivity growth will have to be low in absolute terms in the long term; Rowthorn R., Ramaswamy R., Deindustrialization: causes and implications, IMF Working Paper, No 42, 1997, p. 22

[2] the concept of 'asymptotic stagnation' is not prescriptive, it does not mean that the rate of productivity growth will have to be low in absolute terms in the long term

[3] faster production growth increases productivity due to increasing economies of scale

[4] capital as a production factor is relatively less important in the service sector than in the industrial sector - Fisher A. G. B., Capital and the growth of knowledge, The Economic Journal, 1933, p. 384, after Kwiatkowski E., Teoria trzech sektorów, PWN, Warsaw 1980, p. 93

Abstract

Sustainable development has become a concept commonly used in terms of global spatial development, national and regional planning. In view of the fact that deposits of non-renewable energy resources are inevitably running out, it is particularly important to take a new look at the problems associated with energy-efficient and ecological construction. The definition of sustainable construction determines both the specific parameters to be met by a given building and a comprehensive approach to the problem, starting from the design stage of the building, through its construction and operation, to the demolition or other form of the final stage of its life cycle. Such buildings are characterised, on the one hand, by the use of modern technologies and materials and, on the other, by a return to rational architectural design. The concept of "green building" refers to the ecological, social and economic aspects of the whole life cycle of a building. The methodology for determining the environmental impact of a building is still under consideration. There are currently several methods for the assessment and certification of green and energy-efficient buildings. The most popular system for such assessment and certification of buildings is the BREEAM (Building Reaserch Estabilishment Environmental Assesment Method) system, which became popular in the UK in 1990. The purpose of this article is to carry out an LCA (Life Cycle Assessment) for a single-family building, at the design stage, and to identify the building materials used in terms of environmental loads during the entire building life cycle.

Keywords: BREEAM building certification system, building life cycle, sustainable "green building", LCA analysis in construction.

Introduction

Green building and BREEAM building certification system

The interest in ecology in the context of construction and functional operation of s emerged in the 1980s. However, the energy-saving and ecological solutions used at that time still existed to a small extent, mainly as partially experimental buildings. In 1992-2003, in Western Europe, energy-efficient construction started to develop on a larger scale, with ecological and passive houses gaining popularity (Przemycka, 2011). The BREEAM certification system includes building studies in various aspects, depending on the solutions adopted, using a point scale. A code is used to determine the degree of a building's environmental impact and its 'sustainability', which assigns a certain number of points for pro-energy and pro-ecological solutions. BREEAM environmental certification is a voluntary issue for informed investors who can demonstrate their concern for the environment, user comfort and health. The quality of project execution is confirmed by a proper certificate, which through its recognition has a direct impact on increasing the demand for space among tenants. In Western European countries, the interest of entrepreneurs and developers in having the appropriate certificate for an investment is constantly growing and a certified building translates into its material value. In 2011, a new certification system "BRE Global international Code for a Sustainable Built Environment" was introduced, containing guidelines, assumptions, objectives and requirements, the implementation of which will determine the approach to design, development, management and certification of the economic, environmental and social impact of an investment. The objectives of this document include: mitigating the environmental impact of the investment's life cycle, identifying and classifying buildings in relation to their environmental benefits, ensuring a credible level of environmental/environmental labelling for the investment, developing demand for sustainable construction. The BREEAM certification method is constantly being modified by

BRE in order to adapt it to the assessment in a specific country or area. It can be used by both individual clients and project teams wishing to provide investors with data that certify the real environmental impact of an investment.

BREEAM certification enables the team of experts, designers involved in the project and supervision of construction works to have fuller and more conscious control over the proper implementation of the investment. Certificates are excellent assessment tools, but they are not design tools, it should be remembered that they are strongly linked to them but only indicate the right course of action. The need for integrated design is based on a close, multi-faceted relationship between all members of the investment process, starting from the programming phase (Juchimiuk, 2011). Poland is dominated by the model of a traditional design process, which omits the opinion of experts, specialists from various industries, in the conceptual design. In the integrated design process, a BREEAM assessor should be obligatorily involved in particular phases. Figure 1 shows the difference between an integrated and traditional design process.

Certification of green buildings in Poland. In 2016 and early 2017, Poland saw a dynamic growth in sustainable construction. Green buildings are filling the map of our country with increasing intensity. The construction industry has an increasingly accurate knowledge of the characteristics of sustainable buildings, and the circle of professionals who are able to design and erect such buildings is rapidly expanding, reaching a high global level (Kuczera, 2017). As reported in the PLGBC (Polish Green Building Association) report of 2017, we have 409 certified buildings in Poland and their total area exceeds 10 million ^{m2}. One of the four international multi-criteria certification systems is applied: BREEAM, LEED, DGNB and HQE. BREEAM is the leader in this list (Figure 2). 74.3% of facilities in Poland are certified in this system.

In the sector breakdown by function, the office sector dominates in Poland, a worldwide trend. The residential and hotel sector is only at the beginning of the certification process in our country. In 2017, a new category has appeared, which is schools, with one building so far. In the CEE region, Poland is an unquestionable leader in building certification. On the territory of 14 countries, out of 850 certified buildings, as much as 48% are located in Poland.

Essence and principles of sustainable construction . In May 2001, at its meeting in Gothenburg, the European Commission presented to the Council of Europe the concept of a 'European Union strategy for sustainable development'. It emphasised the need to introduce environmental issues into all sectoral policies and formulated the most important sentences concerning the implementation of sustainable development: reduction of progressing climate change and increase in the consumption of renewable energy, appropriate handling of public health risks, wise use of natural resources, improvement of communication systems and action to optimise space use. Therefore, construction which is to meet the requirements of sustainable development should, in all phases of its life cycle, aim to minimise the consumption of energy and natural resources, thus reducing its negative impact on the environment. The basis for this task is the identification of the main factors and their components which determine the relations with the building's environment both at the investment stage and during its operation (Adamczyk, 2005). The principles of sustainable building development concern mainly such aspects as: sustainability of the production and consumption system in relation to local (national, regional and sub-regional) environmental conditions, adaptation of legal regulations to the implementation of the sustainable development strategy in particular areas of economic and social life, development and broadening of knowledge on the relationship between the factors of sustainable development and demographic development, planning and management of land as a natural resource, by promoting sustainable use of land, promotion of an integrated system of securing environmental infrastructure, by adequate management of water, sewage and solid waste treatment, promotion of a sustainable energy management system and transport system in housing estates, encouraging the location of settlements in areas that are devastated and endangered from the point of view of biodiversity, promoting activities aimed at sustainable construction, making efficient use of market, economic and other instruments to promote sustainable development, developing systems to enable environmental and economic settlement, protecting the atmosphere through the appropriate management of energy sources and their use in transport, construction and industry, classifying and labelling chemical products and determining the degree of risk of their use, minimising waste and pollution, promoting 'clean production' systems, developing education in the field of improving knowledge relating to sustainable development.

The most important entities operating in the construction industry for sustainable development are manufacturers of building materials and products, designers, construction contractors and users of buildings. Manufacturers of building materials should pay particular attention to the rational management of raw materials, energy and obtaining environmental declarations for their products which confirm their high quality and 'environmental safety'. Designers, on the other hand, should know that it is their responsibility to choose the right choice of construction materials, with particular emphasis on the possibility of using recycled or recycled materials. Construction contractors, on the other hand, are responsible for the organisation of work on construction sites, the sustainable use of land and the application of modern technologies which make it possible to reduce energy consumption and minimise the negative impact on

the environment during the construction phase. Finally, the users of the buildings themselves influence the creation of sustainable development through conscious and ecological patterns of behaviour, as well as the implementation of a pro-environmental system of water, energy and waste management and care for maintaining the good technical condition of the buildings.

The construction industry is a sector of the economy that has a significant impact on the environment, alongside such industries as the energy, mining, chemical and steel industries. The environmental aspects of construction activities are linked, in particular, to the use of raw material resources, including energy carriers and space. Assuming that a single construction object does not have a large negative impact on the environment, the fact that the impact is emitted simultaneously and in the long term through a mass number of objects causes the accumulation of negative effects in the environment on a large scale and at different levels of construction activity and concerns (after Adamczyk, 2005): extraction of raw materials and production of construction materials, the course of construction, exploitation of the building, the process of demolition and recycling of construction materials.

Building materials are produced from raw materials extracted from the environment and then processed in production processes into final products with specific performance parameters that determine the quality of the building. During the production process of materials, energy carriers, water and many other raw materials and materials are used, and at the same time solid waste, technological sewage and harmful gaseous substances are released into the environment. The construction phase is burdening the environment through work on site preparation, the construction of access roads and temporary buildings, as well as the storage of products and materials, often hazardous, on site. In addition, during the construction phase there are nuisances such as vibrations, noise, disturbance of the groundwater table, distortion of the landscape, displacement of earth masses, etc. The construction work is also linked to the consumption of energy carriers.

The exploitation phase of a building has the greatest impact on the environmental load, for European conditions it can be as high as approx. It can be as long as 100 years. The energy consumption necessary to ensure adequate thermal comfort in our climate zone is much higher in the building's use phase than in the other phases, which is influenced by the long time horizon of the building's operation. The demolition phase of the building also has an environmental impact. During this phase energy is also consumed and in the environment, demolition materials that cannot be recycled are collected in landfills (Adamczyk, 2005).

LCA (Life Cycle Assessment) is a method of assessing environmental aspects. The advantage of this technique is that it seeks to take into account all factors that may potentially affect the environment and are related to a particular activity or product. The final definition of the LCA was adopted by the American Society for Environmental Toxicology (SETAC) in 1995. It defines an LCA as a technique to evaluate the environmental hazards of a product system or activity, both by identifying and quantifying the materials used, energy and waste introduced into the environment and evaluating the environmental impact of these materials, energy and waste. The assessment covers the entire life cycle of the product as presented in Figure 5, starting from the extraction and processing of mineral resources, through the production of the product, distribution, transport, exploitation, reuse, to recycling and final waste management.

Research Methodology

This stage is particularly important because it determines how the research is carried out and how detailed it is. The aim of the research is to assess the environmental impact of a residential building, a two-storey single-family building with a garage with a usable area of 153.76 ^{m2} (gross cubic capacity of 870 ^{m3}), as well as to identify the building materials used in terms of environmental nuisance at each stage of building use.

Setting an objective gives rise to the identification and definition of such relevant issues. Product system and its limits - defining all operations related to the building, i.e. the collection of material and energy-related processes. The system boundaries describe which processes should be included in the life cycle assessment and which can be omitted when drawing up a worksite balance sheet. The building system in this article covers: the manufacturing phase of construction materials and products, the construction phase, the use phase, the demolition phase. A 99-year building lifecycle is also adopted. Functional units - should correspond to the purpose and scope of research, must be clearly defined and measurable. When the LCA analysis is carried out for the overall environmental impact of a specific building, the area of the entire building (153.76 ^{m2}) with a specific function (single-family building) is taken as the main functional unit. The additional functional units for a building's LCA are mass (kg) and volume (^{m3}). Reference flux - the quantity of product needed to perform a function determined after the definition of the functional units. When carrying out the LCA analysis, the scope of the tests may be modified as the data is collected. It is also possible to extend the predefined limits of the system if it is found necessary at the data set analysis stage.

Research Results

Scope of life cycle analysis.

The assessment of the building's life cycle included the following stages:

- A1 - A3 - Construction materials. Production stage from cradle to grave. Determines the impact of a material or product ready to be sent to the construction site, including extraction of raw material, transport and emissions from production. If recycled or reused materials are used at this stage, their emissions can be accounted for as zero.
- A4 - Transport to the construction site. Includes the impact of transporting the product from the factory to the construction site. The transport chain may include intermediate stages, through a warehouse or warehouse.
- A5 - Construction process. It covers the entire construction process, including wasted materials (including production of the wasted part of materials), waste transfer and the necessary transport.
- B4 - B5 - Replacement and renewal of materials, maintenance and use.
- B6 - Energy consumption. Includes all energy imports from the building (including electricity, district heating, cooling and fuels). Any energy from renewable sources on site is excluded (excluding fuels or imported electricity needed for its use). Exported energy is not deducted.
- C1 - C4 Demolition. Includes the impact of materials after demolition of the site (reuse, recycling, disposal, landfill).

The life cycle assessment was carried out using the OneClickLCA programme. Table 1 shows the total impact of the life cycle of the building under investigation during its 99-year lifetime. As shown in the report generated by the OneClickLCA programme, a building will emit one and a half million kg $_{CO2e}$ and almost 8,000 kg $_{CO2e}$ bio during its entire life cycle. According to the Carbon Heroes benchmarking programme, the building under examination is classified as E on a seven-stage $_{CO2}$ emission (A-G) scale. In order for the building to be able to apply for the eco-certification of the project under examination, significant changes must be made, among other things by eliminating or reducing the "hot spots" that generate the most $_{CO2}$ to the environment.

Table 1: Complete building life cycle

Sector		**Global warming [kg $_{CO2e}$]**	**Storage of biogenic carbon [kg $_{CO2e}$ bio].**

B4-B5	Exchange of materials and renewal	200 644,98	
B6	Energy consumption	1 146 106,53	
C1-C4	Deconstruction	6 630,02	
TOTAL		**1 490 000**	**7 600**

Own elaboration

The most carbon dioxide emitted to the environment (77%) occurs during the exploitation phase of the building, then (13%) during the replacement, renewal and maintenance of materials and during the production of construction materials (9%).

Storage of biogenic coal, occurs only at the stage of production of construction materials.

The greatest impact of a building on global warming occurs during its operation phase, then in the phase of replacement, renovation and maintenance and in the phase of production of construction materials. Biogenic carbon is stored only in the materials manufacturing phase.

Tables 2÷5 show the impact of the analysed building materials in particular phases of the building life cycle assessment. Minor fixings (screws, nails) were omitted from the calculations. The impact of materials at the stage of their transport, construction site operations and deconstruction was estimated in database scenarios for specific materials.

Carbon dioxide emissions and storage of biogenic carbon at the production stage of construction materials. Figure 1 shows the building elements and building materials that generate the most carbon dioxide to the environment during their production phase, thus contributing to global warming. In the project under analysis, the elements most burdening the environment are vertical structures and the building's facade (internal walls and non-load-bearing structures) (70%) and foundations and substructures (27%).

In terms of materials, these are: gypsum materials, plaster and cement (51%), concrete (22%), bricks and ceramic materials (15%), building insulation installation (7%) and steel and other materials (2%).

Summary

The use of the LCA method to assess the environmental impact of the facility under investigation has helped to determine which elements and stages of the facility generate the most CO_2 to the environment, thus contributing to the deterioration of our climate. The calculations of the carbon footprint are a useful tool for design offices, in order to optimise it and thus obtain appropriate certificates.

When assessing a building for BREEAM certification, particular emphasis is placed on the lowest possible CO_2 emissions to the environment, both during the operation of the building and during the production of construction materials, their transport and disposal, promoting the 3R principle (recycling, reuse, restoration). According to the LCA analysis, the examined building is classified as E on a seven-stage CO_2 emission (A-G) such a result makes it impossible for the facility to obtain a BREEAM certificate without making significant changes in its design.

During its 99-year service life, the object under analysis will emit a charge equal to 1.49 -106 kg CO_{2e}, which is 52 kg $CO_{2e/m2/year}$ respectively. These values are much higher than those given in the literature, Lasvaux et al. (2017), which analyses 40 individual energy-efficient single-family houses, the average CO_{2e} emission over the entire life cycle of the buildings is 8.4 $CO_{2e/m2/year}$. The difference in the results of the analysis is mainly due to the lifetime of the buildings in France (50 years) and the energy consumption necessary for their proper functioning (most of the buildings below 50 kWh/m2/year). In terms of building materials, which have the most negative impact on the environment, in both cases it is concrete.

The following conclusions can be drawn from the analysis of the research results contained in this Article:

- The highest CO_2 emissions to the environment occur during the use of the building. It can be minimised by e.g. replacing a gas boiler with a biomass boiler, using RES in the building (solar collectors, photovoltaic panels, heat pump), better thermal insulation, etc.
- Structural materials contribute to significant CO_2 emissions. Thanks to LCA analysis, the design team can identify the most harmful materials and modify them. In the case of the object under study, such materials include cement, concrete and brick. Their environmental impact can be reduced by substituting ecological materials.

- Cement production is a very environmentally harmful technological process, but the construction market already has eco-cement to offer, which contains fly-ash from waste management plants. By choosing eco-cement and the concrete that contains it, we can significantly reduce the CO_2 emissions of construction materials. The bricks used in construction can also be eco-friendly - they come from demolition of other buildings.
- The market for building materials is constantly evolving, offering more and more environmentally friendly products, new technologies are also being implemented to reduce CO_2 emissions during their production, this should be borne in mind and, when selecting materials, suppliers offering building products containing recycled materials should be sought.

Abstract

Economists generally agree that the best way to achieve optimal control of carbon gasses is by globally uniform emission charges equal to the best available estimates of the global marginal social costs of emissions. Prices equal to global marginal social costs motivate efficient economizing, and global marginal social costs of emissions are globally uniform. Less attention has been paid to the question of how the proceeds of carbon gas taxes should be allocated. The simple answer would be that there is never any shortage of ways to use tax revenue. One can always reduce other taxes or pay for the most urgent unmet public needs. But it may be worth thinking about a system of global sharing of the revenue from carbon gasses. There are three reasons for this. 1) Some nations, such as low-lying island nations, are particularly hard-hit by global warming. They deserve compensation for the harm they experience from global warming. 2) It has been notably difficult to persuade less developed nations to participate to the extent that would be efficient in the global effort to slow global warming. It is possible that a system of sharing revenue, after compensation for special harms, would make full participation in the interest of less developed nations. 3) It may be possible to achieve a global resonance with the idea that all persons have equal rights to the atmosphere, so that if some persons wish to use it in ways that must be limited, we deserve to share equally in the revenue that results, after compensation for special harms. This paper traces the relationships across countries among population, carbon gas emissions, and per capita income, so that the consequences of global sharing of the proceeds of carbon gasses can be estimated and the prospect of achieving something close to global agreement can be assessed.

Keywords: Globally Uniform Tax, Carbon Tax.

Introduction

The effort to move of the concept of a carbon tax from the realm of theory to economic reality encounters a myriad of tough questions and too few actions that the theory calls for. This paper develops a path for more effective actions. The paper focuses not on the design of a carbon tax, but rather on how to make it valuable for countries at all levels of economic development.

A Globally Uniform Carbon Tax—Literature Review

Starting with the effect of greenhouse gas emissions on global warming and the economic costs of global warming and other changes in climate, Nordhaus (1991) paves the way for calculating the marginal social cost of greenhouse gases reductions and the potential benefits of various policy measures.

Climate control is a global public good, which mean that international cooperation is very important for achieving it. But international cooperation is difficult to achieve. To succeed, it is important to have some type of symmetry of effort as well as reliable monitoring (Bereby-Meyer, 2012; Ostrom, 1990). However, the review processes of COP (Conference of the Parties) do not provide a satisfactory level of comparability to effectively monitor, report and verify climate control actions. The chief obstacle in the contemporary emission reduction negotiations is the self-interests of countries. They all have incentives to be free riders. The key need is reliable cooperation. Therefore, reciprocity and uniform carbon pricing are the solution/*sine qua non* for international cooperation(Cooper et al, 2016).

A carbon tax is a fee for emitting into the atmosphere a unit of carbon (or other greenhouse gas measured in carbon equivalents). Its purpose in to efficiently disincentivize emissions (Rose et al, 2020). The preponderance of economists agree that a carbon tax is the best mechanism for doing this.

The Framework Convention on Climate Change (signed in Rio de Janeiro, 1992), extended by the Kyoto Protocol (adopted in Kyoto, 1997 and entered into force in 2005) has been building consensus that global warming is a fact and that human-induced carbon dioxide emissions have made a substantial contribution to it. In these agreements, the signatories commit to reduce greenhouse gas concentration in the atmosphere to "a level that would prevent dangerous anthropogenic interference with the climate system" (Article 2). Arguing that the allocation of greenhouse gas emissions rights among nations is impractical (especially for developing economies), R. N. Cooper highlights taxes on the offending activities as a much better solution than approaches focusing on control of quantities. His vision is for a uniform carbon emission tax specified by an international obligation (Cooper, 1998).

The scale of mitigation costs and their allocation to particular stakeholders is the core of the disagreement over how to achieve emission reductions (Mahapatra, Ratha 2017). Efforts to achieve voluntary agreement are challenged by the existence of a "tragedy of commons" (Clarke, Waschik 2012). Efforts to moderate emissions through artificial markets for carbon emissions, such as the European Trading Scheme (ETS, Richstein, Chappin, de Vries 2015) have yielded unsatisfactory results (Perdana, Tyers, 2020).

The fact that taxing is more effective than direct regulation in lowering carbon emission is confirmed by Nordhaus. A carbon tax is both a disincentive to use products that are intensive in carbon emissions and an inducement to search for alternatives to carbon-based products and technologies, thereby promoting lower carbon emissions. The more carbon taxes add to the prices of fossil fuels, the more protection there will be for the global climate. Since there is an incentive for free-riding by individual nations with respect to carbon emissions, enjoying the benefits of burning fossil fuels while relying on others to reduce emissions, the world needs a global incentive to reduce emissions, built into the price of emissions globally (Nordhaus, 2007). There remain issues of design and implementation, including the proper tax rate and the procedures for collecting the tax, which will not be developed herein.

Nordhaus proposes the combination of "target carbon pricing and trade sanctions" as the instruments for reducing the carbon emissions. He has also modeled 50 USD per ton at current income and emission levels as a viable price for making a stable coalition (Nordhaus, 2015). Complementing Nordhaus's (2015) research is the model by Saelen (2016) that includes population, GDP, emissions, and vulnerability to climate change in a stylized binary decision model. Saelen concludes that side payments could stabilize the coalition of countries to abate their greenhouse gas emission. Hovi et al. (2017) explore a regionally disaggregated version of Saelen's approach, pointing to a possible leading role for the USA and the EU.

Aldy and Stavins confirm the greater efficiency of market-based instruments, compared to the introduction of uniform performance standards and technology. They consider different forms of carbon pricing tools, such as carbon taxes, cap-and-trade, emission reduction credits, clean energy standards, and fossil fuel subsidy reduction, for making private firms take into account the external cost of greenhouse gas emissions. Carbon pricing not only incentivizes reductions in greenhouse gases emissions, it also promotes innovation and mitigates fiscal difficulties.

An efficient carbon tax would be globally uniform. This means that the level of carbon tax would be the same in all countries and (presumedly) that each country would retain revenue from the tax that it collected (Aldy, Stavins, 2012). Aldy and Stavins entertain the possibility that countries would agree to "fixed lump-sum payments from developed to developing countries". The proposal for the harmonized tax system, however, does not calculate the amounts to be transferred and offers a vague proposition for a commitment by developed countries to use the tax revenues in a globally beneficial way (for example, research and development programs). Developing countries would use the tax revenues in whatever ways suited them – for example, subsidizing petrol while developed countries taxed it (Aldy, Stavins, 2012).

Uniform carbon taxation is advocated for its transparency and its contribution to minimization of "carbon leakage" (Barrett, 2002; Cramton et al., 2015), as well as for dominating trading systems in terms of coordination simplicity (Avi-Yonah, Uhlmann 2009). It is also praised for providing new financial possibilities (Shiller1981; LeRoy 2005). Therefore a uniform carbon tax is seen to have a high potential for reducing emissions, despite having a high risk (McKibbin, Morris, Wilcoxen 2008).

Perdana, Tyers (2020) praise the simplicity and transparency of the negotiation target for a uniform carbon taxation, as well as its capacity to serve as an efficient policy measure for them to model. Similarly, Wietzman (2014, 2016a, 2016b) see carbon taxes as easier to administer transparently than a cap-and-trade system.

S. Dissanayake et al. (2020) acknowledge the simplicity and practicality of a carbon tax compared to ETS, in the short term and medium term. They make the case mainly for developing countries, with institutional constraints in energy and transport industries. They conclude that a carbon tax is an attractive and cost-effective market-based instrument in terms of revenue generation and its potential to provide revenue for compensating for losses (declines in wages and employment loss). Weitzman (1974), Pizer (1999), and Hoel and Karp (2002) all endorse a carbon taxes for yielding better results than tradable permits, in terms of transparency and administration.
Carbon taxation has also been explored as an instrument for stimulating renewable energy. When emission costs are built into market prices under a carbon tax, climate change is reduced as other energy sources are substituted for carbon-intensive fuels. Moreover, considerable revenue is created, which can be used for a broad range of purposes, including investing in less-carbon-intensive products and technologies. Nordhaus (2007) identified the tax approach (in contrast to quantitative approaches) as providing less opportunity for corruption and financial abuse, since no artificial scarcities emerge that would induce rent-seeking behaviors.

M. L. Weitzman suggests that a carbon tax (a uniform price on carbon[1]) obscured some favorable arguments because it is modeled in an abstract way. Quantity-based and price-based controls both have inherent uncertainties (between times of periodic review), as cap and trade result in the knowledge on total emission, but uncertainty about the price. Contrarily, a carbon tax provides certainty about the price of carbon emission, while there is uncertainty about the total emissions. It is assumed that citizens find quantity uncertainty much more acceptable than price uncertainty, which would imply fluctuations in the process of the energy products they buy.

The revenues from a uniform carbon tax is presumed to be retained within the country that collects the tax and can therefore offset other taxes in that country. But this retention is not necessary to achieve the benefits of a uniform carbon tax. What economic theory shows is that an appropriate uniform (negotiated) minimum tax/price for carbon ("*internationally harmonized but nationally retained*") internalizes the global warming externality. The price that nations agree to is important for efficiency, not the use of the revenue or the impacts on other prices. Furthermore, negotiating one binding price instead of multiple binding quantities has the virtue of simplicity from a political perspective ("the natural salience and relatively low transaction costs of negotiating one price against negotiating n quantities").

The Redistributive Aspect of a Carbon Tax

Implementing a carbon tax induces higher costs of energy consumption. In the case of energy-intensive manufacturing industries, their competitiveness can become endangered, and consequently, in the absence of a globally uniform carbon tax, the overall economic and environmental performance can deteriorate with the relocation of the companies to the jurisdictions without restrictive climate protection regulations, increasing the pollution in the less restrictive locations and causing "emission leakage" (Aldy, Pizer, 2009).

Additionally, a carbon tax can have a particularly adverse effect on lower income households, which spend more of their income on energy and other goods that are hit hard by a carbon tax. For this reason, some carbon tax proposals return some of the revenues back to the lowest income households.

Morris and Mather (2017) also highlight the fiscal benefits of a carbon tax. As the tax can be a considerable source of revenue, it can contribute to the reduction of budget deficits and public debt, together with targeting some lower-income households through subsidies or tax reduction.

Advocates of *Emissions Egalitarianism* (EE)[2] claim/demand that emission permits be allocated according to "an equal per capita share of the atmospheric absorptive capacity," as no person has greater right to emit greenhouse gas than any other person (the *per capita approach*). Therefore, EE requires that countries be allocates emission shares corresponding to their shares of population.

Methodology

To make a quantitative contribution to the scholarship on uniform carbon taxation, the authors assume that the tax levied by all countries on carbon emissions will be at the level of 50 USD per ton. That level is found in some of the literature that seeks to model a tax equal to the marginal social cost of carbon emissions. An adequate model must have a worldwide scope, since the harm is the same wherever emissions occur.

[1] The difference between carbon price and carbon tax is not clear
[2] Also called Equal per Capita View; principle saying that "every person should have the same right as everyone else to emit greenhouse gases; see more: E. A. Posner, D. Weisbach, 2010, Climate Change Justice, Princeton University Press; S. Caney, Just Emissions, Philosophy and Public Affairs 2012, vol. 40, issue 4.

This paper does not discuss the way that the tax is collected or the particular use of the revenue.
The empirical part of the paper is analysis of each country's share of the greenhouse gases emissions. We compare actual emissions with the levels emission that would be assigned by the (*per capita approach*). The calculated difference is priced at 50 USD per ton of CO2 equivalent. Finally, the numbers obtained are related to per capita income in the countries.

Results

The first graph presents Gross Domestic Product per capita (GDP pc) and the amounts of outflows/inflows stemming from carbon tax of 50 USD per ton.

Graph 1.

The trend line indicates that the higher the GDP, the greater the amount of money that a country pays as a result of the carbon emissions. This implies the carbon emissions per head are greater in richer, more industrialized countries. The lower the GDP per capita, the greater is the amount of money received as a results of uniform carbon tax payment. Correspondingly, the countries that are poorer and less industrialized, have lower emissions per capita.

Countries were divided ones that pay and ones that receive. There are 106 that received and 73 that paid. For those that received, the amount of the money received was generally significant as a share of GDP. Whereas the countries that paid transferred relatively tiny parts of their GDP to those that emitted less per capita.

Graph 2.

For receiving countries, the lower the GDP per capita, the higher the ratio of inflow to GDP per capita. This means that in low GDP per capita countries, the inflow of money assigned by a uniform carbon tax is a relatively large share of GDP per capita—a significant injection of money into the economy.

Graph 3.

For the paying countries, the higher the level of GDP per capita, the lower the ratio of the outflow from a global uniform carbon tax to their GDP per capita. This means that as GDP per capita grows, the outflow from uniform tax as a share of GDP per capita generally falls.

Summary

For the majority of paying countries under a globally shared, globally uniform carbon tax, the share of the tax outflow in GDP per capita (typically about 1% and almost never more than 5%) is at levels significantly lower than the share of inflows in GDP per capita for the receiving countries (often as much as 18%).

Even though the amounts of money paid by the countries with higher GDP per capita can be quite significant, as shares of GDP per capita they are generally small. That means that the globally shared, globally uniform carbon would not be particularly onerous for an average-income country.

For the majority of receiving countries, the monetary inflows from the globally shared, globally uniform carbon tax are significant shares of their GDPs per capita. Contrarily, for the paying countries, the ratios of outflow per capita to GDP per capita are generally quite small.

Abstract

The pandemic COVID-19 has a great impact on different spheres of life in countries all over the world. In the current article the authors presented the results of the research devoted to the analysis of the fast-food company activity in Spain. KFC was chosen as an object of the research. This theme is very interesting and actual as the out-of-home dining culture is highly developed in Spain. At the same time, fast-food is not preferred by the Spaniards. They choose more healthy food and in case of fast-food they would prefer Spanish cafeteria instead of world-famous brand. That is why the authors suggested that the KFC company can suffer much more from the COVID-19 pandemic and lockdown and made various analyses to define the real situation.

Keywords: Pandemic COVID-19, Spain, Food Industry, Fast-Food Company, KFC

Introduction

The fast-food industry is one of most demanded of the restaurant business in a majority of countries. Nevertheless, Spain is out of the list. Despite the fact that every Spanish spends around 10% of the budget in cafeterias and restaurants (Bolsamia, 2018), according to Euro Weekly News Media (2016), each person in Spain eats in fast-food restaurants only several times a year and annually spends an average of €42.60 on fast-food. These challenges the managers in a fast-food industry, they permanently have to analyze the market, implement new strategies and think about how to attract new customers in order to compete with the other restaurants.

COVID-19 had a significant impact on the Spanish economy and especially on the restaurant business. The government monitors the situation daily and if needed introduces new norms that help to fight against the spread of the virus. However, these norms often complicate the business operations and the restaurant industry suffers significant losses.

Current conditions on the restaurant market require the restaurants to adapt and implement new strategies in order to survive during the pandemic and this in turn requires a proper analysis of the macro and micro environment.

Main Part

Profile of the company. "KFC Corporation: also known as Kentucky Fried Chicken" headquartered in Louisville, Kentucky, USA. It is the leading brand of fried chicken products, which owns the original recipe of Colonel Sanders. There are over 21,000 KFC restaurants in more than 130 countries and territories around the world.

KFC is recognized worldwide not only for its Chicken Original Recipe but also for its crunchy recipe, brazier, and burgers.

For the aim of macroenvironment analysis we decided to use *PEST analysis* and find out how the environment changed in the current situation with pandemic.

BABIY " Fast-Food Industry Company in the context of pandemic COVID-19: Case of KFC on Spanish Market " Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

Political factors. Food quality regulations - are controlled on different levels. The general food law and European Food Safety Authority introduce the norms and regulations for the food industry on the EU level. These norms cover feed production, primary production, food processing, storage, transport, and retail sale. Also, there is such an organization as Food and Agriculture organization which introduces norms that cover the territory of Spain: the conditions for the marketing, use, importation and exportation. Also, the food quality is controlled on the national level by Spanish Agency for Consumer Affairs, Food Safety and Nutrition. Basically, these organizations are interdependent and any change on the EU level can lead to the changes on the national level. That is why all players in the food industry should check the regulations and act according to them. The government checks this issue very strictly.

Packaging regulations - all restaurants in the fast-food industry should also follow these regulations. They include, which raw materials should be used in the packages, which materials are prohibited. These regulations are essential for fast-food since every meal has a package even if a customer eats inside the restaurant.

Nowadays, according to Instituto para la Calidad Turística Española (2020), (due to COVID-19, the restaurant business has several limitations: Restaurants must guarantee the distance between visitors, staff and tables. Every visitor and staff member has to be checked by means of a thermometer. All zones involved in the work processes must be disinfected regularly. On par with these rules, there are also several regulations that concern ventilation, changing rooms, disinfectors, uniform, face protection masks-on policy and team management.

Economic factors. As per statistical information (Trading Economics, 2020), about Spanish economy the following figures can be presented:

- Unemployment rate: 16.26%
- Minimum wage: €1050.00
- Average salary: €1804.00
- Each person in Spain spends an average of €42.60 a year on fast food

The unemployment rate, minimum levels of wages and average salary indicators would help to assess the overall economic and labour situation with workers. The other important indicator is the average amount spent by a person on fast-food every year. The amount of €42.60 is minimal. That means that the average person in Spain goes to a fast-food restaurant only 4-5 times a year.

The pandemic stroke Spain harder than the other European countries, since Spain is highly dependent on tourism, the measures applied in order to fight COVID-19 almost destroyed the touristic sector, this in turn, according to Dombey (2020), will increase the unemployment rate till 22.1% and already in 2022, the total debt will reach 128.7% as a percentage of GDP. This information indicates that the overall economic recovery will take a long time.

Social factors. Spanish people prefer Healthy Mediterranean diet rather than consumption of fast-food. The highest consumption of fast-food is in tourist destinations such as Mallorca due to a high flow of tourists.

COVID-19 pandemic led to the drop in the amount of tourists and consequently the demand for fast-food decreased. The customers' behavior and preferences changed. Previously many Spaniards used to eat at the restaurants and cafeterias permanently. Now to save the healthy lifestyle they move toward home cooking.

Technological factors. The level of technologies used by fast-food restaurants is almost the same as around the world. The only two recent inventions are:

- The usage of touch screens, which makes the order process very convenient for a customer.
- The possibility to order in applications and online, combined with delivery services

The latter can be considered as one of the major success factors in the fast-food industry within the pandemic and requires a certain amount of resources in order to maintain the whole system: organize relations with the distributors and delivery companies, maintain personal web pages and applications, build and manage personal delivery systems.

As per information above the fast-food industry in Spain is highly regulated by EU authorities and special independent organizations as well as by Spanish government. The Economic situation in the country and wages are significant factors for the fast-food market development. Spanish people have a passion to eat healthy food more than fast-food. Technologically Spanish fast-food industry is on the average level among European or Western countries.

For the analysis of the competition on the Spanish market we used the 5 Forces of Competition Analysis (Schermerhorn, 2020).

Rivalry on the Spanish market: All KFC's competitors can be divided into two groups (restaurants in both would have similar prices):

- The first group would consider KFC as a fast-food chain. This group would consist of such world-famous fast-food chains i.e., McDonald's, Burger King, Subway, Domino's, Five guys, etc.
- The second group would consider KFC's chicken-oriented feature. There are not that many restaurants that focus mostly on chicken meals.

However, many local restaurants propose meals with chicken. That is why, taking into consideration the price issue, this group would consist of: local Spanish restaurants that propose tapas, Burritos, Turkish Doners, and Asian woks.

The threat of new entrants: The cost of opening a new restaurant is relatively cheap. Any working adult can invest in a small cafeteria or a restaurant; that is why KFC has a large amount of competitors.

Bargaining power of suppliers: KFC is a franchise fast-food chain; all KFC restaurants have the same suppliers. The overall number of chicken suppliers is high that is why in case of any problem with suppliers, switching costs would be low. Therefore, the bargaining power of suppliers could be defined as low.

Bargaining power of buyers: Customers can influence the creation of new menus and changes in quality. However, they cannot influence such big issues as a significant change in prices or for instance creation of burgers with beef which would cross the KFC concept. Consequently, the bargaining power of buyers would be medium.

Threat of substitutes:

- Products offered by such competitors as McDonald's, Burger King (with no chicken).
- Products offered by local cafeterias and restaurants.

Spanish customers prefer local cafeterias and spend more money in these than in fast-food restaurants. Moreover, during the pandemic, people prefer to order online and eat at home, that is why the presence of local cafeterias on the online platforms increases the number of potential substitutes. This in sum causes the threat of substitutes to be high.

During the COVID-19 the competitive environment intensified due to the change in dining habits - people nowadays prefer to eat at home rather than in restaurants. That is why the online sales in both fast-food and restaurant industries soared. In terms of online platforms, Burger King and McDonald's are far ahead of KFC, around 49% of customers used at least once the Burger king application and delivery service during the last 12 months, whereas McDonalds used 10% of respondents (Diaz, 2020). However, it seems like the customers prefer such online platforms as Uber Eats and Glovo with a rich choice of restaurants and dishes. The competitive environment on the online platforms such as Uber Eats or Glovo is fierce since the potential customers are able to see all possible options to order. KFC in Spain does not have a personal delivery service and operates only via such online platforms as Uber Eats and Glovo, the absence of the KFC personal delivery system in Spain results in loss of customers.

Due to COVID-19 pandemic situation and quarantine, the global demand for restaurant-produced products reduced significantly, whereas the retail demand is up, since the government launched several limitations as a countermeasure against COVID-19. As a result, some of the restaurants were closed, some of them had two-weeks lockdown, others had limitations in terms of working hours and working area. All these factors influenced the suppliers significantly, it is hard to sell all products considering the reducing demand. Therefore, the bargaining power of suppliers during the COVID-19 is low.

We chose *SWOT-analysis* as a complex method for comparison of internal and external factors of the environment. Among the main outcomes from this analysis, we chose the following as most significant:

- KFC in comparison with its competitors did not manage to use the opportunity of using the online platform for e-commerce. Pandemic showed that this opportunity was vital for companies in the fast-food market to survive. Due to this fact this became one of the current main weaknesses of the company in Spain.
- The above-mentioned weakness led to demand decrease as lots of customers cannot visit restaurants in person and do not have a possibility to order online properly. Demand decrease consequently resulted in suppliers' problems as they had overproduction and had to switch to other restaurants and cafeterias or go bankrupt.

- The strong brand name and brand awareness will obviously help the company to overcome the difficulties of the pandemic period, but the market share of KFC will decrease due to the customers switching to the companies which were able to use the opportunities of e-commerce more efficiently.

Previously the process of choosing the place to eat in Spain included the following steps. The first thing the customers did before choosing KFC as a place where they could eat, they felt hunger or they made a plan for the nearest future, for instance where they would eat during the lunch time.

The next step was the information search, normally customers used Google or such applications as Yelp in order to find a restaurant, some customers just recalled the nearest places and went there. Normally in the case of KFC, it is not the place which the customers would reach on purpose from afar. That is why customers normally find the KFC places via Google or they already know where the nearest location is. The locals already know the restaurants around that is why when they compare the places, in order to choose KFC, they should feel that they want chicken or fast-food. Those who don't know the surroundings, use the applications, which make the comparison even easier.

After the customers walk in the restaurant, they are able to see the menu on the touch screen or on the screens above the counter. The prices are included to the menu, also the employees are able to answer all questions about the meals and give advice. So, the purchase decision process is not complicated.

Then, the customers have to pay for an order, using credit cards or cash. After that they receive the meals.

Lastly, in case the customer is not satisfied or has complaints, they can talk to the manager. In case everything is good, customers would leave, in some cases they would give a good evaluation.

During the COVID-19 pandemic the process of choosing the place to eat changed considerably. Currently fast-food - customers have only two options to get their favorite meal as follows: drive through or order the food online through delivery services. The drive through option is much safer rather than getting the food on a takeout desk as it is only necessary to drive by several takeout windows and pay in the end, usually by card. Irrespective of how safe the drive through process is, the majority of people stay at home and very few people could visit the restaurant on their way to work or anywhere else.

The main changes touched the place where the customers eat meals. After the lockdown, it became possible to do only at home and during the whole pandemic period the amount of clients that can be present in the restaurants decreased at least twice due to governmental measures. The market of e-commerce in the sphere of food and essential goods skyrocketed. So, the customers choose the meal they want and order using the most convenient online platform offering the loyalty program. One more factor for choosing that or this food supplier is the speed and quality of delivery.

Conclusion

KFC is one of the leading restaurants in a global fast-food arena competing for market share with other fast-food giants such as McDonald's, Burger King, Subway, Domino's. However, in Spain the significant market share is occupied by local cafeterias with much healthier food.

The fast-food industry in Spain is highly regulated by EU and Spanish authorities. Despite the average salary of €1804.00 (Trading Economics, 2020), annual expenditures on fast-food are on average €42.60 (Euro Weekly News Media, 2016). Spanish citizens have a passion to eat healthier food in local places and maximally avoid any fast-food restaurants even if those have any advantages and conveniences of service.

The above stated analyses revealed that KFC in Spain was not prepared for the sudden change of conditions on the market, caused by COVID-19 pandemic. Moreover, considering McDonald's and Burger King performance in the same conditions, KFC in Spain is one step behind its main competitors. As it was already stated above, the lack of personal online platform and delivery services resulted in the loss of customers.

Corollary Impact of Corona on The Medical Tourism Industry: With Special Focus on India

Jyothsna P. KUNAPAREDDY

Krishna University, Machilipatnam, India

sathijyothsna@gmail.com

Abstract

Medical Tourism is a glamorous industry witnessing a tremendous growth. The global medical tourism market was valued at USD 16,761 million in 2018, USD 44.8 billion in 2019 and it is expected to reach USD 27,247.6 million by 2024. The Indian medical tourism market is expected to touch the $9 billion by 2020, according to Federation of Indian Chambers of Commerce and Industry (FICCI) and Ernst & Young. Since Feb 2020, the whole world is tumbled down by the Pandemic-Covid 19, Corona catastrophe. The Paper aims at assessing the impact of Corona pandemic on Indian Medical Tourism market, evaluates the impact of Corona pandemic on the industries directly or indirectly related to medical tourism industry. The manuscript is developed based on extensive literature review. The paper unravels the future scenario of the industries which are directly or indirectly related to Indian medical tourism industry. The paper alerts Indian business entrepreneurs and prepares them for the upcoming scenario, thereby helps them to make better strategies for the recoup.

Keywords: Medical Tourism, Corona, Pandemic.

Introduction

"Atithi Devo Bhava", (Guest is God) a verse of ancient Indian scriptures mirrors how India welcomes and values guests. India, a blend of ancient and modern heritage, basket of varied cultures, besmeared with glamorous destinations has been an attraction to international travellers. As per WTTC, the Indian tourism industry generated ₹16.91 lakh crore (US$240 billion) or 9.2% of India's GDP in 2018 generated 42.673 million jobs, 8.1% of total employment.

Tourism is a pleasure activity of travelling, but illness is a displeasure. Combining these two phenomena, Medical tourism (Also called as health tourism, medical travel, cross border healthcare), a niche sector evolved from healthcare and tourism. Indian Medical tourism industry has come a long way. According to the numbers of Indian Ministry of tourism, the Indian medical tourism industry could grow by 200% by 2020, touching $9 billion. The ease of Visa procedure for the tourists who come on medical grounds, launch of medical tourism website www.indiahealthcaretourism.com in three languages – Arabic, Russian, French etc. makes us believe that Indian government is taking steps promoting India as a preferred medical tourism destination. 10.5 million foreign tourists, more than five million visiting NRIs, 1.8 billion domestic tourists and over 26 million outbound travellers came to India during 2018-19 (money control 2020).

India, having the strengths of advanced medical facilities, highly skilled doctors, low-cost treatment, unique traditional practices such as yoga and Ayurveda will not let the efforts go in vain. India has a legacy as historic medical tourist destination. It was constantly visited by travellers for healing through Ayurveda. India occupies 5th position in MTI 2016 overall ranking. The tourism friendliness and the patient centric attitude of the Indian Medical tourism service providers is making the country more competitive. According to Health care, IBEF Jan 2019 Indian medical tourism market is growing at the rate of 22-25 per cent and is expected to reach US$ 6.0 billion by 2018 from US$ 3.0 billion in 2017. Medical tourism is slowly transforming into Medical Value Travel (MVT) as patients are looking for destinations which offer best quality healthcare services for lower price.

Cite this Article as: Jyothsna P. KUNAPAREDDY "Corollary Impact of Corona on The Medical Tourism Industry: With Special Focus on India" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

Medical tourism aims at bringing patients from other countries. The aim of medical tourists is to get elective surgeries like Dental treatments, Spine surgery, Non-emergency By-pass surgery etc done in host countries. But due to pandemic / epidemic they might become a prey to the new disease in addition to the health problems they have or they might become vectors for spreading the disease in the host country. These epidemics / pandemics, so called travel related diseases cease people to cross borders. If the medical tourists move from their place, there is every chance to get caught up to the epidemic / pandemic. This leaves a big challenge for the medical tourism marketers to make moves for the survival. Pandemics / Epidemics show significant impact on tourism industry as travel restrictions are imposed by the governments as a part of disease control measures. The travel related diseases like Ebola, Zika virus, MERS, SARS have been showing great impact on tourism industry, and all tourism related industries. In 2003, during SARS chaos there was a drop of 68 % in Hongkong tourism industry, more than 70 % in Singapore etc. More than all the epidemics, COVID 19 pandemic is going to show dramatic impact on the global tourism industry.

Methodology

The paper was an outcome of the Secondary data analysis research method. An exhaustive study was conducted on vast range of data banks comprising of books, research articles, conference papers, newspaper articles, Indian government publications, websites of various stakeholders of medical tourism service players etc. An extensive literature review was conducted on the relevant articles retrieved from different journals available on Elsevier, Researchgate, ScienceDirect, PubMed, Biomedcentral, haworthpress etc. Bulletins released by World Tourism Organisation, World Health Organisation, World Bank, Reports released by the Government of India-Ministry Of Tourism, FICCI, Indian government website http://www.indiahealthcaretourism.com, Indian newspapers like The Economic times, The Business standard, The Hindu, Financial express, Deccan herald, Indian government policies, statistics of Immigration department. Doctoral thesis retrieved from Shodhganga is studied thoroughly. The websites of the hospitals offering healthcare services to the international patients, medical tour operators are studied thoroughly.

Objectives of The Paper

The Indian medical tourism industry is at a blossoming stage. Medical value travel is identified as one of the major growth drivers and a major source of Indian forex earning. During such a prosperous era, like all other countries India is also facing Corona pandemic. In this present scenario the paper unravels the impact of corona pandemic on the Indian medical tourism market, throws light on the corollary impact of Corona pandemic on the industries directly or indirectly related to medical tourism industry.

Significance of The Topic

At this outset of global terrifying unpredicted CORONA pandemic, the paper gives a glimpse of impact of the corona on the Medical tourism destination, India. Max Healthcare, a tycoon in Indian healthcare estimates that it is going to lose an income of US$5 million per month. Global Care, Indian medical travel agency said that they used to serve 500 international patients every month and it is completely dried up with corona pandemic. It also shared that it is chasing over US$1 million of outstanding payments from struggling Indian hospital providers. During this alarming situation, the paper is quite contemporary alerting the stakeholders for the overnight changes brought in the medical tourism industry, which occupies 18 % of the global medical tourism industry market share.

Review of Literature

What is Medical Tourism?

Medical tourism is a blend of two distinct top-notch service sectors ‘healthcare’ and ‘tourism’ with niche service features (Anu Rai et al 2014). Medical tourism refers to people travelling to other countries to obtain medical treatment (Horowitz, 2007). It is a provision of ‘Cost-effective’ high end medical care in amalgamation with the tourism industry for patients, in requirement of surgical or other forms of treatment. (Suresh. L. B 2013). OECD defines it as a significant new element of a growing trade in healthcare has involved the movement of patients across borders in the pursuit of medical treatment and health. Earlier people travelled from less-developed countries to highly developed countries for better medical treatments. Contrary to the older phenomena, now

people from highly developed countries are travelling to less developed countries owing to different advantages in the destination (Neil et al, OECD 2012).

The Robust Indian Medical tourism industry: -
The global medical tourism market is estimated to be $53,768 million in 2017 (Allied market research Jan 2019), USD 44.8 billion in 2019 (Grand view research March 2020). It is speculated to reach $143,461 million by 2025 (Allied Market research report Jan 2019), $162 billion by 2026 (Acumen research and consulting). The number of foreign medical tourists' arrival to India has been growing steadily by 233,918 in 2015, 427,014 in 2016, 4,95056 in 2017 (IMTJ 2018). During 2017, India engulfed around 18% of the global medical tourism market (IMTJ 2017). During 2019, foreign tourist arrivals (FTAs) in India stood at 10.89 million, achieving a growth rate of 3.2 per cent year-on-year. During January-February 2020, Foreign Tourist Arrivals (FTAs) were 21,33,782 (India brand equity foundation).

According to Global Medical Tourism Index (2016-17) given by Medical Tourism Association, the top 5 medical tourism destinations include Canada, UK, Israel, Singapore, India. India occupies 5th position in global ranking, 3rd position in terms of quality of facilities and services and 1st position in terms of medical tourism industry. India has robust demand as a medical tourist destination. Due to quality of adaptability with the changing world demand for healthcare and its greater competitiveness (Sultana 2014), India is able to gain leadership in medical tourism industry.

Medical Tourism is not a new idea to India (Sultana 2014). India has a long history of 5000 years with Yoga and Ayurvedic medicine. During the past times, spiritual students and medical travellers used to flock to India for pursuing the benefits of alternative-healing method (Tomislav 2018). For example: - Kerala, a state in India is a bizarre destination for its Ayurveda packages and natural scenic beauty. Having such a glory history, still India stands as one of the most preferred medical tourist destinations (Essays, UK. November 2018).
Factors favouring India as a top medical tourist destination:

- Internationally accredited (JCI) and NABH healthcare centres / hospitals
- Easy Visa processing (Tour my India 2019)
- Latest medical technology (FICCI 2019)
- Highly qualified medical professionals and para medical staff (Anand 2012)
- Extraordinary cost savings on medical treatment (60 – 80 % less than North America and UK prices)
- Availability of unique alternative medicine, AYUSH-Ayurvedic, Yoga, Unani, Siddha and Homeopathy (Tanmay 2018)
- Zero waiting time
- Fluent English-speaking staff (Naik 2013)
- Customised services in the hospitals like private room, translator, private chef, dedicated personal assistant during the stay
- India, a perfect destination for pleasure, spiritual tourism- worth watching after the medical treatment (TMI 2019).

Speed breakers for Tourism Industry

Albeit Medical tourism industry of India is growing, factors like War, Terrorism, Crime, disasters -Natural disasters (Tsunami/ earthquake/ Floods) man-made disasters (Terrorist attack / Pandemic / political unrest etc) become speed-breakers of the industry. Decline in FTA implies slump in foreign medical tourists. After 26/11 terror attacks, the FTA to India in 2009 fell by 3.3 % when compared to 2008.

Tourism has long been negatively affected by unpredictable events (Statista 2018). Unexpected events like epidemic diseases, natural disasters (Tsunamis / earthquakes / landslides / volcanic eruptions), political unrest and economic downturn show negative impact on international tourism (Maria 2020).

The Global air traffic declined by 5% in the wake of Gulf war in 1991. The terrorist attacks on tourists in Luxor in 1997 caused a drop in international tourist arrivals from 3.7 million in 1997 to 3.2 million in 1998 (WTO 2001). The tourism industry of Taiwan faced severe losses for 11 months due to earthquake devastation in September 1999 (Huang & Min, 2002).

The FTA to 2000 Fiji coup, the 1998–2000 Solomon Islands civil conflict, and the 2000 Papua New Guinea decreased by 28.3%, 67.0% and 13.4% respectively during civil turbulence (SPTO, 2003). The number of international tourists to USA declined from about 6.8 million in 2000 to about 5.7 million in 2001 as an aftermath effects of 9/11 attacks (The New York times, 3rd Nov 2017). The US travel agents' revenue in 2001 declined by $9.9 billion, down from $13.4 billion in 2000 (The American Society of Travel Agents estimate). 7.3%–13.8% decline in FTA was seen during 2001–2002, a cyclone caused in Vanuatu. After the 2002 Bali bombings, approximately 75% of hotels dropped their prices by approximately 37%. In 2017, there is decline in tourists to Caribbean due to series of hurricanes (Harvey, Irma and Maria). Mexico experienced severe losses due to earthquake in 2018.

According to the tourism ministry, in 2017, FTA to Kerala is around 1.09 million. But the Kerala Ayurvedic medical tourism, India dropped in 2nd quarter of 2018 due to severe floods in Kerala state, India (Financial Express, 2018).

Figure 1: Fluctuation in the total number of tourists arriving at Indonesia's international airports in 1997-2016. Source : Statistics Indonesia, 2018

The tourism industry of Indonesia was badly affected by Tsunami. The below figure shows how the Indonesia tourism industry is affected by different speed breakers.

The Paradox

Contrary to this, there are instances when tourism industry kept growing even after mishaps. 2008, the year of Indian Mumbai terrorists attack (26/11/2008) experienced 5.28 million foreign tourists to India whereas 5.08 million in 2007 (Ministry of tourism, India). Even the number of FTA in India in December 2008 (522,000) slightly more than November 2008 (521,000). Despite the global meltdown and terrorist activities on famous Indian tourist spot like Delhi, Varanasi, Mumbai, Pune etc, during 2006 - 2012 there was continuous growth in share of India International Tourist Receipt (Mukhesh, Priyanka, 2014). According to UNWTO there is a growth of 5.6 % in Indian tourism industry during 2006- 2012. One year after Luxor attack ie in 1999, international tourism increased by 40 % and Egypt reached a total of 4.5 million tourists (WTO 2001).

Unnaturally, the natural disasters became a boon in tourism development of some places. For eg, Cornish village of Boscastle, was totally destroyed by heavy downpour of 200 mm rainfall. As a relief measure, the government dedicated millions of dollars and renovated the village beautifully. The natural disaster became a boon and tourism developed tremendously.
In lieu of the calamities, relief measures are established by the respective governmental authorities, federations, associations or stakeholders to revive the industry. Budget allocation for restructuring the dismantled infrastructure due to earthquakes/ tsunamis/ floods etc, redefined marketing programs to gain the confidence of tourists and care for health of tourists, steps to curb epidemics renovate the tumbling tourism industry. Varying from case to case, it takes months to years to regain the glory of tourism industry.

Impact of Travel Related Diseases on Tourism Industry:

"Pandemics have always had significant social and economic effect to humanity over centuries and hospitality, travel and tourism sector is worst hit in terms of severity as well as longer recovery period which will also have an impact on medical tourism to a large extent," said Piyush Tiwari, director (Commercial & Marketing), India Tourism Development Corporation (ITDC), under Indian Ministry of Tourism.

Travel is categorically central to epidemiology and disease surveillance (Hon, 2013; Khan et al., 2009). Travel and tourism is a contributor for disease blowout and its economic pay-out, but it is vividly affected by it because of NPIs (Nicolaides et al., 2019). Pandemics blast due to global transport system (shipping and railways) (Killingray, 2003 Taubenberger & Morens, 2006).

Even though pandemics show colossal impact, few research studies have been conducted on the worldwide economic effects of pandemics (Fan et al., 2018) and a few at national level (Keogh-Brown et al., 2010a, 2010b) Prager et al., 2017). The economic impact of influenza on high income OECD countries (Peasah et al., 2013) has been taken up researchers. The influenza pandemic resulted in 7,20,000 deaths and a cost of 0.6 % of global income (Fan et al. 2018)

A comparative analysis of the economic downturn created by three different pandemic catastrophes – Hong kong flu, Asian flu and Spanish flu (Burns et al., 2006; McKibbin & Sidorenko, 2006), is shown in this table.

Table 1: Pandemic scenarios and their human and economic consequences

	Hong Kong Flu	**Asian Flu**	**Spanish flu**	**Spanish flu**
	1968-69	**1957**	**1918-19**	**1918-19**
Global deaths in millions	1.4	14.2	71.1	142.2, 180-260
% change in GDP, 1st year				
World	-0.7	-2	-4.8 to - 6.7	-10.7
High-income	-0.7	-2	-4.7 to -8.4	-10.6
Developing	-0.6	-2.1	-5.3	-12.2
East Asia	-0.8	-3.5	-8.7	-21.7
Europe & central Asia	-2.1	-4.8	-9.9	
Middle East & North Africa	-0.7	-2.8	-7	-13.6
South Asia	-0.6	-2.1	-4.9	-9.3

Source: Stefan Gössling, Daniel Scott & C. Michael Hall (2020): Pandemics, tourism and global change: a rapid assessment of COVID-19, Journal of Sustainable Tourism, DOI: 10.1080/09669582.2020.1758708

Hong Kong Flu pandemic reduced global GDP by around US$2.4 trillion (McKibbin and Fernando (2020). 3 pandemics occurred during the 20th century. The 'Spanish' flu or influenza during 1918-19: the 'Asian' flu (H2N2) (1957), the 'Hong Kong' flu of 1968. 4 pandemics occurred during 21st century. The SARS (2002), the Bird flu (2009), MERS (2012) and Ebola (2013-14) etc.

SARS (2003), declared as epidemic by WHO, showed immense impact on the tourism industry of China, Hong Kong, Vietnam, Singapore, which is four or five times the impact of 9/11 in the USA (Rick Miller, WTTC). According to World Economic Forum, during SARS outbreak in 2003, the FTA to China dropped to 9.4 million and incurred losses between $30 billion and $50 billion. During 1st to 21st April 2003, tourist arrivals in east Asia fell by 41% that of 2002. The FTA to Malaysia fell by 1/5th (20.5%) in 2003 to 10.57 million compared to 13.31 million the year before (Tourism Malaysia). In 2003, Malaysia tourism receipts accounted for RM21.29 bil, 17.4% less compared to the RM 25.78 bil in 2002. Nevertheless, the tourism receipts again picked its pace in 2004 to RM29.65 bil. SARS had an approximate total global economic cost of US$100 billion, and US$48 billion in China alone (McKercher & Chon, 2004; Siu & Wong, 2004).

H1N1 influenza (Swine flu) pandemic in 2009 was relatively a less disastrous event. In the manuscript, Russy and Smith (2013) mentioning the effects of the pandemic on tourism in Mexico, stated that it lost approximately 1 million overseas visitors over a five-month period i.e approximately losses of around US$2.8 billion. It took 5 months to recover and take its original shape (Dunia 2013) Keogh-Brown et al. (2010a, p.453), opined that the current pandemic has not removed the threat of a more virulent avian flu pandemic in the near future.

During the birth of COVID -19, two other pandemics were existing in the world – MERS & Ebola. MERS was studied by many tourism researchers because it affected large number of tourists who were on Haj pilgrimage (Al-Tawfiqef et al., 2014). MERS 2015, outbreak the tourism industry of Republic Of Korea witnessed a loss of 37.4% between June and September 2015. (2.1 million tourists out of 5.7 million projected) (Heesoo 2019).

The relationships between pandemics and travel are the crux of understanding health security and global change (Burkle, 2006). Travel related diseases impose international, regional and local travel restrictions immediately. This affects international, national economies comprising tourism structures vis a vis international travel, domestic travel and the industrial components - air transport, cruises, public transport, accommodation, cafés and restaurants, conventions, festivals, meetings, sports events, tour guides, tour operators etc.

Table 2: Impact of Pandemics on the world in terms of economic, social and political angles.

STARTING YEAR	EVENT	GEOGRAPHIC EXTENT	ESTIMATED DIRECT MORBIDITY OR MORTALITY	ESTIMATED ECONOMIC, SOCIAL OR POLITICAL IMPACT
1347	Bubonic plague (Black death)	Eurasia	30-50 % mortality of the European population	Likely hastened end of the feudal system in Europe
Early 1500 s	Introduction of small pox	Americas	More than 50 % mortality in some communities	Destroyed native societies, facilitating the hegemony of European countries
1881	Fifth Cholera pandemic	Global	More than 1.5 million deaths (9.7 per 10000 persons)	Sparked attacks on Russian tsarist government and medical officials
1918	Spanish flu influenza pandemic	Global	20 million - 100 million deaths (111-555 deaths per 10,000 persons)	GDP loss of 3 % in Australia, 15 % in Canada, 17% in the United kingdom
1957	Asian flu influenza pandemic	Global	0.7 million - 1.5 million deaths (2.4 -5.1 deaths per 10,000 persons)	GDP loss of 3 % in Canada, Japan, the United kingdom and the USA
1968	Hong kong flu influenza pandemic	Global	1 million deaths, 2.8 deaths per 10,000 persons	$ 23 billion - $ 26 billion direct and indirect costs in the USA
1981	HIV / AIDS pandemic	Global	More than 70 million infections, 36.7 million deaths	2- 4 % annual loss of GDP growth in Africa
2003	SARS Pandemic	4 continents, 37 countries	8098 possible cases, 744 deaths	GDP loss of $ 4 billion in Hongkong, China, $ 3 billion - $ 6 billion in Canada and $ 5 billion in Singapore
2009	Swine flu influenza pandemic	Global	151700 - 575500 deaths, (0.2 - 0.8 per 10,000 persons)	GDP loss of $ 1 billion in the Republic of Korea
2012	MERS epidemic	22 countries	1879 symptomatic cases, 659 deaths	$ 2 billion loss in the Republic of Korea, triggering $ 14 billion in government stimulus in spending
2013	West Africa Ebola virus epidemic	10 countries	28646 cases, 659 deaths	$ 2 billion loss in Guinea, Liberia and Seria, Leone
2015	Zika virus pandemic	76 countries	2656 reported cases of microcephaly or CNS malformation	$ 7 billion - $ 18 billion loss in Latin America and the Carribbean

Adapted from: Patel, V, D. Chisholm, T Dua, R Laxminarayan, and ME Medina-Mora, editors. 2015. Mental, Neurological, and Substance Use Disorders. Disease Control Priorities, third edition, volume 4. Washington, DC: World Bank

The above table portrays how the pandemics affect the world in terms of economic, social and political angles. Non-OECD countries were economically affected by Spanish Flu. The global economic cost of Spanish flu pandemic was nearly 12.6 % of GDP (McKibbin and Sidorenko 2006). In 2001, Foot and Mouth Disease (FMD) epidemic outbreak (in farming industry) took UK tourism industry and its alliance industries into crisis in terms of financial losses (Elizabeth and David 2004). In UK, the loss of revenue was estimated to lose £125 million a week (The Economist, 2001b) i.e. 13% of normal weekly tourism expenditures (Blake et al., 2002). The same FMD outbreak occurred during 1967-68. The domestic holidays taken by the Great Britain declined slightly and effected the number of visitors (Elizabeth and David 2004).

Travellers are vectors of certain diseases (Annelies 2005). The spread of pandemics / epidemics is invariably associated to travel (Marion 2020). Over the past 15 years, the world has come face to face with a number of pandemics, ranging from SARS, MERS, Swine Flu, Ebola and the recent COVID 19. The disease originated in one part of the world is carried to the other end of the world through travellers. Coming to the aspect of Medical tourism, patient crosses borders with the hope of cure for his ailments. Nevertheless, they become carriers of certain epidemic diseases, make themselves sicker and put other country citizens into trouble. With the travel restrictions imposed, the medical tourism industries gets affected and finally land up in losses.

Brown et al.,(2016) opined that air travel plays an important role in catalysing propaganda of influenza and corona viruses. During the millennium, tourism industry has been affected by diseases outbreaks. Many research studies including tourism studies (Gössling, 2002; Hall, 2006, 2020; Page & Yeoman, 2007; Scott & Gössling, 2015), health researchers (Bloom & Cadarette, 2019; Fauci & Morens, 2012), government agencies (National Academies of Sciences, Engineering, and Medicine, 2017, 2018) and institutions (Jonas, 2014; World Bank, 2012) presaged that pandemics pose a major threat to society and tourism industry. Noted by Pongsiri et al., (2009) and Labonte et al., (2011) Due to a swiftly mounting population growth, mobile global citizens, urbanization trends, increased density in population, industrialized food production in global value chains, increased consumption of higher-order foods including meat, pork, beef; and finally the development of global transportation networks became vectors in the spread of pathogens. SARS, Ebola, Marburg, hantavirus, Zika and avian influenza are all upshots of anthropogenic impacts on ecosystems and biodiversity (Petersen et al., 2016; Schmidt, 2016; World Bank, 2012). Owing to changes across the globe, the rate at which major epidemics and pandemics occur has been increasing.

Figure 2: Impact of 3 previous crises on world arrivals

(Source: https://www.unwto.org/international-tourism-and-covid-19

Global tourism industry has been experiencing varieties of crises during 2000-15. The major catastrophes include the 9/11 terrorist attacks (2001), the SARS (2003), the global economic crisis (2008/2009), MERS (2015) outbreak. They showed short term decline and none of them showed longer-term decline in the global development of tourism. Some of them have not even shown significant impact. SARS showed (-0.4%) and the global economic crisis (-4.0%) decline in international arrivals (World Bank 2020a, 2020b). It is inferred that tourism system has been resistant to external shocks. But the impact and recovery from the COVID-19 pandemic is unpredictable.

Table 3: Estimates by the World Travel and Tourism Council show the average recovery time in months by type of crisis

Estimates by the World Travel and Tourism Council show the average recovery time in months by type of crisis	
Crisis category	**Average recovery time (Months)**
Political turmoil	26.7
Terrorism	13
Pandemic	21.3
Environmental Disaster	23.8

Covid 19 And World Tourism Industry

Pandemics and Economics are closely related. To condemn the spread of pandemic, all the international doors are closed. The air travel is blocked. The international tourist arrivals across the world touched 1, 00, 00 in Jan 2020, but with a steep decline it touched 0 by April 2020 because of Pandemic COVID 19. According to UNWTO, during the pandemic COVID 19 by 5th July 2020, the losses are estimated to be 850 million to 1.1 billon international tourists, US$ 910 billion to US$ 1.2 trillion in export revenues from tourism, 100 to 120 million jobs are at risk. According to the International Air Transport Association the airlines' passenger revenue is speculated to drop by $314 billion in total — or 55% — from 2019 levels,

INTERNATIONAL TOURIST ARRIVALS ACROSS THE WORLD

Figure 3: International tourist arrivals across the world

In the eve of Corona pandemic, the world-wide occupancy rate of hotel accommodation drastically slashed. By 21st March 2020, the hotels started experiencing negative sales. The below graphic representation shows world-wide decline in accommodation occupancy rate.

Accommodation occupancy rate change for the week of 21 March (year over year). *Data source:* STR (2020a)

Figure 4: Change in accommodation occupancy rate for the week of 21st March (year over year)

World Medical Tourism Industry: Post COVID Plight

The world medical tourism industry is hit worst by COVID 19 pandemic. The countries which are tourism dependant are upset by the COVID 19 border restrictions. For example: - Medical tourism is one of the main sectors driving the Thai economy. In 2018, Thailand received 302270 medical tourists from various parts of the world - Middle East including countries like UAE, Bahrain, Qatar, Oman, Iran, Jordan and Turkey (58%), Bangladesh, Myanmar, Cambodia, Vietnam and also contribute a huge amount of medical tourist i.e. 3%, 6%, 3% and 4% respectively. Bumrungrad International Hospital gets large proportion of their income from the more than 50% of patients who are overseas medical tourists. Such countries are tumbled down by the pandemic COVID 19.

Table 3: Challenges and opportunities of tourism industry during COVID 19 pandemic

CHALLENGES AND OPPORTUNITIES OF TOURISM INDUSTRY DURING COVID -19 PANDEMIC		
STRENGTHS	**WEAKNESSES**	
Proven resilience of tourism in past crises	Segments potentially affected are also high spenders: international, long haul, business travel and events	
Domestic tourism can be a buffer	Major disruption in airline failures and concentration	
Adaptation capacity: Safety and hygiene protocols, trips closer to home, value for money, responsible consumer behaviour	Lack of references in previous downturns	
Government support to the sector	Perception of travel as a risk	
	Low levels of demand when restarting tourism due to social distancing	**INTERNAL FACTORS**

OPPORTUNITIES	THREATS	
Re- think business model	Economic environment: World recession, rising unemployment and jobs at risk, closure of business mainly SMEs, disposable income, uncertainty weighing on consumer and business confidence	
Innovation and digitisation	Uncertain length of pandemic (including resurgence) and vaccine unavailability	
Sustainability and sustainable oriented segments (rural, nature, health)	Extent of lockdowns and travel restrictions	
De-escalation phases initiated by several countries toward the 'new normal'	Unknown form of the 'new normal'	
Progress in adaptation plans in destinations and companies		**EXTERNAL FACTORS**
POSITIVE	**NEGATIVE**	
Source: UNWTO World Tourism Barometer May 2020Special focus on the Impact of COVID-19		

Corollary Impact of Corona on Indian Medical Tourism:

Corona, indeed the calamity shaking the whole world is going to show a massive impact on the Indian medical tourism industry. The medical tourists from different parts of the world come to India in search of better health. They don't like to become ill-healthy while searching for healthy place.

Due to Corona (2019), The Indian tourism industry is estimated to incur a revenue loss of Rs 1.25 trillion in 2020, 40 % decline in revenue over 2019, 50 % during Jan, Feb 2020, 70 % in March 2020 (CARE rating 2020). During April-June, the Indian tourism industry is speculated to incur a financial loss of Rs 69,400 crore, indicating a year-on-year (y-o-y) loss of 30 per cent (Business standard April 28,2020). The Indian hotel, aviation and travel sector together may incur a loss of about 85 billion (IATO) in 2020. The Federation of Associations in Indian Tourism & Hospitality (FAITH) opined that more than 95% MSMEs of 53,000 travel agents, 115,000 tour operators, 15,000 adventure, 911,000 tourist transporters, 53,000 hospitality and five lakh restaurants are facing severe survival problems due to Corona 19 calamity (money control, 2020). The influx of tourists, including medical tourists will remain slow at least for a good part of this year (Anu 2020).

Fall in commercial flights hinder the movement of medical tourists from the home country to the destination countries. During COVID 19, Medical value travel industry of India (including modern medicines and AYUSH), a $3 bn market for India (Express healthcare, April 2020) came to standstill for the next few months in 2020. The fiscal damage could be $2.5 billion (Amit Sharma, Founder and CEO, eExpedise Healthcare 2020). Dr Anvar AM, chief physician, Raha Ayurveda Hospital said that they lost Rs. 1 crore during the 1st week of March 2020 with respect to the cancellations of the ayurvedic treatments booked by the foreigners (Times of India 12th March 2020). During the 1st week of March 2020, foreign medical tourists dropped by 75 % of the routine number due to Corona chaos. 25-30 % of the earnings in Kerala Ayurvedic hospitals is from Foreign Medical tourists. With the closure of doors of the airports, the foreign medical tourists' arrival to Kerala are clean swept.

With the decline in Medical tourism industry, the bed occupancy in the hospitals which are targeting the foreign medical tourists will decline, thereby total revenue. The Max healthcare, a big boy specialised in offering healthcare services to foreign medical tourists, who gets 10 % of the total revenue from foreign patients, treats 50,000 foreign patients / year hailing from the Middle East, central Asia and Africa. (Manveena, CNN 2018). With the decline in patients, the sales in pharmacies, medical consumables, patients to pathological laboratories, radiological test centres reduce. This results in losses of pharmaceutical industry, medical devices

industry, medical consumables industry. The business of hotel industry, taxi travels, restaurants, service apartments, tour operators – domestic and international, ticketing agents decline. The start-up players – hospitals, medical tour operators, cannot survive facing huge losses and they vanish from the market. If the corona calamity continues for a period of 6 months, the MVT industry would incur a financial loss of approximately $2.5 billion, which is equivalent to the revenue over 8 months, if the unpredicted event don't happen.

Post Corona scenario of Indian Medical Tourism industry: Prophecies

India is a land full of opportunities for players in the medical devices industry (IBEF). The industries dealing with personal protection equipment, face masks, cap masks, gloves, santisers started gaining demand and will result in profits during post-corona era. Demand for medical devices (ventilators, infrared thermometers) started growing swiftly.

India is the birthplace of Yoga, Ayurveda, Sidda, naturopathy etc. Yoga is a 5,000-year-old spiritual discipline, which is widely popularised in the West. Ayurveda is the Hindu system of medicine which is widely preferred by the west as a solution for many chronic ailments. These honoured ethnicities have become worldwide spectacles due to their efficacy in outbringing physical, mental, spiritual and emotional balance. The Indian government floated National Medical and Wellness Tourism Board to provide a devoted organized agenda to promote Medical and Wellness Tourism covered by Ayurveda, Yoga, Unani, Siddha and Homeopathy (AYUSH). These arenas have attracted many foreign tourists. 60 % of the medical tourists come to India on these purposes only. This will catalyse the revival of Medical tourism industry in this post pandemic era.

The Tele-medicine concept is going to take a novel shape in the industry. The Indian medical professionals are keen on developing tele-consultation phenomena. Countries other than India do not provide over-the-counter medication. So, the success of tele-medicine remains as a question mark.

In pre-corona, the Indian medical travel industry is included among "12 champion sectors" by NITI Aayog and Ministry of Commerce which is targeted for promoting under the services promotion council (The Economic times, 4th April 2020). So, the catastrophe will be accepted as a challenge for uplifting Indian medical value travel industry.

Seeing the job cuts, revenue slashes, huge losses, difficulty in survival, Foundation of Healthcare & Wellness Promotion, urged the Indian Government to take necessary steps to streamline the industry by recognising MVT as an independent industry, financial stimulus and support, involve COVID impact council along with FICCI to support the MVT industry, reduce restrictions on international patients coming to India as soon as possible not comprising at the epidemic rules and regulations. On 13th May 2020, The Prime minister of India Mr. Narendra Modi, said that he is keen in developing "Post-Corona tourism" which would attract the foreign tourists and there by the tourism industry regains its normalcy.

Once the vaccine is launched, the tourism resumes by modifying Visa policies. The new policies ask for vaccination certificate of the medical tourists. The trend of flying doctors to other countries and performing surgeries will pick-up. The international patients can meet these doctors in their home countries itself. In 2021, the patients with complex disorders travel to other countries for treatment.

The impact of COVID-19 in the Indian medical tourism sector appears to be catastrophic. In spite of it, Indian medical tourism industry tycoons are optimistic about the post pandemic recovery. Mr. Mihir, Vora, Founder and CEO of Mumbai-based Magnus Medi, says that there is a silver lining, and the future holds big. "India was at the forefront and has supplied hydroxychloroquine to other countries, and we have sent our medical teams to the Gulf countries. Thus, once the situation normalises, India will emerge as a bigger brand and patients from developed countries will be more willing to get their treatment done here". These two achievements of Indian healthcare industry boost up confidence among the foreign medical tourists and that will attract them more.

Harish Pillai, Chair-Federation of Indian Chambers of Commerce and Industry- Medical Value Travel (FICCI-MVT) Committee opined that "As soon as the international air travel restrictions are lifted, medical value travellers, after following due protocols including RT-PCR testing, will flock to India simply for its value proposition of outstanding value for money and excellent clinical outcomes,".

Shanay Shah, member, Confederation of Indian Industry (CII) and Director, Shalby Hospitals, Ahmedabad, said, the way India has handled the pandemic, keeping mortality rates low for a highly communicable disease like covid-19, despite the population density, has proven India's medical ingenuity once again. Industry experts also

said alternative medicines and telemedicine facilities will add value to the sector. “There is also a visible opportunity for the Indian healthcare industry in context to medical tourism. Post covid-19 Indian wellness system, Yoga and Naturopathy are likely to gain more popularity world over," said said Piyush Tiwari, director (commercial and marketing), India Tourism Development Corp. (ITDC), under the tourism ministry.

Conclusion

During and after every calamity the tourism industry slashes down, so as the Medical tourism industry. After gestation period, either slowly / quickly the tourism industry revives. So as Medical tourism sector. The Indian Medical tourism industry might slash by 40 % for the next 1 year of Corona. By witnessing the way India encountering Corona, the source countries for foreign medical tourists develop confidence in the Indian healthcare, Indian Pharmaceuticals, Indian medical professionals and likely to get attracted more than pre-corona era. Might take a longer time, but the industry is going to recover as it recovered in post swine-flu, SARS, MERS times. Shaken by the pandemic, people realised the importance of health and surely people don’t mind travelling to any long distances for the betterment of health.

Abstract

Welfare among population in country are important for achieve sustainable economic growth. Fundamental theory from welfare economics are efficiency and equality. Welfare economics described by allocation of resources are equal and how the distribution of resources affects economic condition as a whole. Redistribution of income and wealth in economy enables the resources more accessible and furthermore preserve the income sustainability. Waqf effectively as tools for income redistribution because of large potential among Muslim majority in Indonesia. This research conduct simulation of waqf in financing small and micro industry in Indonesia. Sample used in this paper are obtained from Small and Micro Industry Survey 2014 (VIMK 2014). Method for this study used OLS regression to analyse association between capital and profit, while used arithmetic from coefficient OLS regression for microsimulation. The results of the study show that increased capital as increased factor of production can increases the profit. Furthermore, welfare among society increases because of increases income in small and micro industries.

Type of Paper: Empirical

JEL:

Keywords: Waqf Productive; Small And Micro Industry; Welfare; Equality.

Introduction

The contribution of the non-oil and gas manufacturing industry to GDP reaches 17-18% and become the highest contribution among another economic sector in Indonesia (BPS, 2018). The agricultural and trade sectors only earn 13% each. Small and Medium Enterprises (SMEs) in Indonesia are very large (BPS, 2016), large industries only consist of 0.77% from total enterprises. Those large industries only have employment rate of 9.63%, while medium, small and micro industries with a very high percentage respectively with total enterprises of 2.90%, 63.07% and 33.26% and employment rate of 6.17%, 21.45% and 62.76% respectively. The large number of SMEs has great opportunities and challenges, opportunities for what is called one of the conditions of economic development in the long run. However, revenues for small and micro industries are still dominated by Java Island as it has a high population compared to other islands. This creates income inequality between Java and Outer Islands.

Small and micro industries have not maximized their role due to various challenges, especially capital challenges. Small and micro industries have limited access to financial institutions that inhibit productivity. This has resulted in delays in the purchase of additional raw materials for production and investment of the latest technology to develop the business. More than 50% of poor households running micro businesses in Indonesia avoid risk and refuse to seek credit (Vos, Yeh, Carter, and Tagg, 2007). According to a survey of small and micro industries in 2014, 83.3% of micro businesses and 59.9% of small businesses rely on self-financing. While the proportion that borrows to banks is only 6.5% for micro businesses and 25.6% for small businesses.

In 2007, government introduced Kredit Usaha Rakyat (KUR) with a partial guarantee scheme by the credit guarantee institution. Until 2013, the largest sector receiving KUR loan is the trade sector, it is caused by lower risk compared to other economic sectors (TNP2K, 2013). Geographically, KUR is concentrated in Java Island which is the richest island in Indonesia. As of November 2014, 52.9% of the total KUR issued was allocated to six provinces in Java. A total of 12.3 million KUR borrowers reside in Java (Adam and Lestari, 2017). The government policy supports the policy of food security and downstream industry in Micro, Small and Medium Enterprises sector by increasing the distribution of KUR in the production sector, one of which is the manufacturing industry (Permenko 11, 2017). However, the realization of KUR by economic sector, the manufacturing industry only with 4.32% different from the trade sector which reached 56.15%.

In the contribution of economic growth, equitable access to land can improve the effects of poverty reduction by ensuring the benefits gained can be shared more widely. However, if access to land is concentrated it will cause an uneven profit distribution as the profits are controlled by those who have high income in income distribution that have access to land (Deininger and Squire, 1998). In rural populations, land and labor are the main factors in production with land as the main asset in increasing wealth (Vendryes, 2014). For this reason, African villages have a strong relationship between land access and household income (Jayne et al., 2003; Krishna et al., 2006), so land distribution is the main focus of efforts to reduce poverty (Wineman and Liverpool -Tasie, 2017). Johnston & Kilby (1975); Mellor (1976), Quan and Koo (1985) and Deininger and Squire (1998) suggest that egalitarian land distribution yields higher economic growth than concentrated land. For example, Ravallion and Datt (2002) found that the percentage of households without land significantly affects poverty elasticity of non-agricultural expenditure in India.

Indonesia with a percentage of Muslim population of 80% has the potential to contribute funding in the third sector such as through waqf land (BPS, 2018). Islam has various alternatives in reducing inequality such as zakat, infaq and sadaqa. Waqf itself is a part of infaq and sadaqa and is highly recommended in Islamic teachings so that the wealth of resources is not focused on just a few people. Waqf land can be used in the productive sector for the welfare of society. Waqf is a voluntary gift that is expected to provide a better economic impact for the needy. Chief Excecutive of Badan Wakaf Indonesia (BWI) Slamet Riyanto (2016) conveyed the potential of waqf land in Indonesia is very large, with total amount if capitalized reach Rp 2.000 trillion. Currently, there are recorded waqf land area of 430 million hectares throughout Indonesia. However, the use of waqf land in Indonesia is still largely aimed at non-productive sectors such as use for mosques or musola (75%), education (14%) and funerals (5%) (Wakaf Indonesia, 2018).

Productive waqf research in Indonesia previously referred to the independent institution of management waqf as the third sector in the economy. Waqf investment case study in Dompet Dhuafa Republika done through interview session by Candra and Rahman (2010). The commercial use of waqf land in Indonesia from the perspective of Islamic law and Indonesia's land law has been investigated by Sihombing and Sugiantoro (2016). Qualitative research on the use of waqf in financing social and development projects as a third sector other than the government and private sector by Shaikh, Ismail, and Shafiai (2017). Contribution of waqf in economic development is spelled out by Budiman (2014). The use of waqf in financing small projects through cash waqf schemes to reduce unemployment through literature studies and experiments from several countries by Alani, Algodah and Alshwaiyat (2016).

Previous research on the use of waqf land in the production sector is qualitative so in this case the researcher uses quantitative method with microsimulation. In this research, the researcher hopes that the specific target of the problem can increase the productivity of waqf land use so as to improve the welfare of the community. The use of waqf land rents is expected to increase capital for small and micro industries to further increase business profits. The objective of the research is to conduct a microsimulation of the utilization of unproductive land for financing small and micro industries as an alternative in the management of waqf asset.

Literature Review

Theory of Factor Production

The theory of the factors production undergoing development begins from only consisting of two factors, namely land and labor by Sir William Petty (Aspromourgos, 1996). Then in 1803, Jean-Baptise Say issued a book entitled A Treatise on Political Economy, in which he proved that the value of production relates to the function and the combination of labor, land and capital. In the theory of the three factors, Say mentions that labor generates wages, capital generates interest and land generates rent. Other economists like John Stuart Mill and Wilhelm Roscher share the same view. In addition, Wilhelm Roscher argues that natural factors such as land are a dominant factor in

the low cultural phase, labor becomes the dominant factor in the intermediate culture phase while capital becomes the dominant factor in the advanced cultural phase.

Pecking Order Theory

Empirical evidence supports the application of pecking order theory in financing small and micro enterprises (Chittenden et al., 1996; Michaelas et al., 1999; Berggren et al., 2000; Aybar-Arias and Lopez-Gracia, 2000; Sogorb-Mira 2005 ; Ou and Haynes, 2006). In the study, small and micro businesses use internal resources to finance and borrow from external parties to finance operations and increase growth, and only a small portion of capital use from investors through equity. Some studies also suggest that small and micro businesses operate on a limited scale and do not consider getting financing from investors (Holmes and Kent, 1991; Howorth, 2001). This causes a constant growth of business without any capital injection from investors. Small and micro businesses have high asset volatility (Barclay and Smith Jr, 1995) with a high proportion of short-term assets (Stohs and Mauer, 1996) and have more short-term loans.

Waqf

Waqf etymologically derived from the word waqafa synonym of the word habasa which means stop, silence (al-tamakkust), or hold (al-imsak) (Anshori, 2005: 7; Baalbaki, 1995: 1220). Ibnu Mandzur (1954: 276) adds al-hubus wa wuqifa (something to be given), such as habasa al-faras fi sabīlillah (he awards the horse in the way of Allah), or habasa al-dār fi sabllahahi (he dedicates his house in the way of Allah). Yusuf bin Hasan (1990: 548) explains that the word al-waqfu is a form of masdar (gerund) from the expression waqfu al-syai 'which means to hold something.

In general, there is no Qur'anic verse that explains the concept of waqf clearly. Because waqf includes infaq fi sabilillah, the basis used by scholars in explaining the concept of waqf is based on the promulgation of verses of the Quran that explain about infaq fi sabilillah. Among the verses include:

"O ye who believe! Spend (in the way of Allah) a part of the fruit of your good works, and a portion of what We expelled from the earth for you. "(Q.S. al-Baqarah (2): 267)

"You are not at all good (perfect) before you spend some of what you love." (Q.S. Ali Imran (3): 92)

In history, waqf provides public needs (roads, water and sewage), educational institutions and hospitals. Kuran (2001) asserts that waqf institutions provide public goods in the Muslim economy for long periods. Waqf institutions help build capacity and wealth creation through human, physical and financial capital development. By the end of the 18th century, revenues from 20,000 waqf in Ottoman operated equal to one-third of total revenues, including agricultural taxes from the Balkans, Turkey and Arabia (Yediyildlz 1984: 26). In the Ottoman period, Yediylldlz (1990: 5) writes:

“Thanks to the waqf institutions, human beings can be born in homes owned by waqf, sleep and eat from the management of waqf, receive instructions from books from waqf, become teachers in waqf schools, earn a salary from waqf income, and for their detah in a waqf cemetery.”

In the context of Indonesia, the practice of waqf has been implemented by Indonesian Muslim community since before independence. Therefore the government has stipulated a special law regulating waqf in Indonesia, namely Law number 41 of 2004 on Waqf. According to Law No. 41 of 2004, waqf is a wakif legal act to separate and / or hand over some of his property to be exploited forever or for a certain period in accordance with his or her interest for the purposes of worship and / or general welfare according to sharia. The purpose of waqf property according to Article 22 in achieving the purpose and function of waqf is for religious activities; education and health facilities; assistance to the poor, neglected children, orphans, scholarships; progress and improvement of the people's economy; and / or other general welfare progress that is not contrary to sharia and the laws and regulations.

Akta Ikrar Wakaf, abbreviated as AIW, is a proof of Wakif's intention to donate his property to be managed by Nazhir in accordance with the designation of waqf property which is poured in the form of deed. According to PP. 42 of 2006 Article 28, the creation of AIW of immovable property shall comply with the requirements by submitting the land title certificate or certificate of the respective flat unit or other proof of land ownership. After obtaining AIW, according to the Joint Decree of the Minister of Religious Affairs and Head of BPN No. 422 and

No. 3 / SKB / 2004, concerning Land Certificate of Waqf, nadzir or appointed person register wakaf land to the local BPN office to obtain a waqf land certificate in accordance with existing requirements.

Waqf land allocation according to the data of Directorate of Waqf Empowerment under the Ministry of Religious Affairs of the Republic of Indonesia is used for musola, mosques, schools, other social purposes, tombs and pesantren. In contrast to utilization of other waqf land such as musola, mosques, schools, tombs and pesantren, the allocation of waqf land as other social purposes in the amount of 8.37% can be used to improve the welfare of the community. The allocation of waqf land to the productive sector can improve the welfare of the community in the long term. Waqf land is divided between already certified and not yet certified. Waqf land already certified and not yet certified by 8.37% used for other social activities can be allocated in small and micro industries as capital injection.

Hypothesis

Empirical evidence supports the application of pecking order theory in financing small and Financing assistance can improve business performance and in the long term help small and medium enterprises get financing apart from government due to reduction of asymmetric information (Xiang and Worthington, 2017). This financing assistance can increase production factors such as raw materials so that it will increase business profits. The hypothesis formula used is:

H1: There is a positive association between capital injection and profit
H2: There is a negative association between tangibility and profit
H3: There is a positive association between productivity and profit
H4: There is a positive association between the age of the company and the profit
H5: There is a positive association between company size and profit

Research Methodology

Descriptive Analysis (OLS)

This descriptive analysis is used to describe variable data through mean value, standard deviation, maximum value, and minimum value of related variables. Regression model is used to analyze the relationship between log profit and log cost of raw material. In the regression model used ordinary least square regression (OLS). OLS is run by minimizing the sum of squares from the difference in predicted values and data values. The regression model will be done by following the following equation:

$$\text{logProfit} = \text{x0} + \text{x1 logRawMaterial} + \text{x2 Tang} + \text{x3 Prod} + \text{x4 Age} + \text{x5 Size} + \varepsilon \quad (1)$$

logProfit = Revenue minus cost
logRawMaterial = Cost of raw material

Microsimulation Analysis

Company is an economic decision-making unit and has many dimensions such as location selection, demand factor, production process, supply of goods in certain price, portfolio investment and financing. The microsimulation model used should be able to explain the phenomenon so that if there is a change it can explain the variable changes that occur (Buslei, Bach, and Simmler, 2014). Development of a model of microsimulation for firms in analyzing the impact of government fiscal policy, specifically estimating for tax revenues and analyzing the impact of corporate earnings and the consequences of tax reform (Ahmed 2006) or corporate demography (Van Wissen, 2000). For Germany, Fossen & Bach (2007) built and applied a model of corporate tax microsimulation. In Italy, the model of microsimulation was established by the Office of Statistics and academia based on surveys of large companies and published financial statements, the model called DIECOFIS (Buslei, Bach, and Simmler, 2014).

The method of microsimulation consists of several steps (Ballas et al, 2005):

1. Making a set of microdata from the samples owned by the selection of variables that can describe the business in reality with the consideration of the theory of business financing. Models of data availability see the level of profitability as an independent variable. The level of profitability in this study is a variable that will be affected by the addition of capital. With this policy, it is expected that small and micro industries can increase profitability so that the business can absorb more resources with the use of additional profit as capital. Small and micro businesses therefore are able to absorb the workforce with the efficient use of resources so that the resulting production increases without reducing the scale of the economy. Independent variable is determinant that influence profitability in small and micro business that is cost of raw material, tangibility, productivity, company age and company size.

2. Creating micro-level populations for individuals that match existing data using OLS models. With the OLS regression, the associations of both variables are proved so that the model can be used as a what-if microsimulation model.

3. Do a static what-if simulation, where the impact of alternative policy scenarios in the population can be estimated. The additional capital from the waqf land rent is included in the microsimulation. The return of capital may be accompanied by a profit share in accordance with the agreement of both parties at the beginning of the agreement. Waqf land in the form of hectares is converted to nominal (Rupiah) in the average land rent price of each province. Those nominal is an additional capital that can be used by small and micro businesses. The addition of capital according to the model previously will increase the profitability of small and micro enterprises in Indonesia.

Results

Regression Results

Regression results of the determinants of profit in 2014 are presented in table 1. The overall independent variables significantly affect at the 5% level.

Cost of Raw Material

The regression model shows that positive associations occur between cost of raw material and profit. With the increase of factor production in raw and auxiliary materials by 1% it will increase the highest profit by West Sulawesi Province by 0.68%, Maluku Province by 0.67% and Riau Islands Province by 0.66%. Efficient use of production factors in raw and auxiliary materials proves to increase profits. According to Myers (1984) in pecking-order theory explain the importance of profit in operational financing. If the profit rate increase, then the business owner will increase the capital by way of loan. This capital will be used in the cost of raw and auxiliary materials. However, Riau Province has a negative association between raw materials with a profit of -0.02%. Negative associations suggest the use of loans requires higher costs such as large collateral availability and high borrowing costs due to the high risk that small and micro industries have (Gill & Biger, 2011).

Tangibility

The tangibility variable denotes a negative association with profit. With the increase of tangibility of 1 unit, it will decrease the biggest profit by West Nusa Tenggara Province by -1.66%, East Nusa Tenggara Province by -0.90% and Bengkulu by -0.84%. With investment in fixed assets, expectation of greater returns in the medium and long term, so tangibility has a negative association of profits in the short term (Vatavu, 2014). The negative association explains that high tangibility will lead to lower financial performance, but has a high leverage operation. The operation indicates that the company is able to use the fixed assets efficiently. This negative association describes in the short run, fixed assets reduce business performance because it is used for operations. In the long run, these fixed assets if invested can improve the performance of the company. If a fixed asset investment is used for a collateral loan it can reduce long-term profit if it is used for activities that are not profitable for the company.

The tangibility variables show positive associations with profit. With the increase of tangibility of 1 unit, it will increase the biggest profit by Riau Islands Province by 1.06%, Papua Province by 1.02% and Maluku Province by 0.90%. In accordance with Akintoye (2008) research that firms that have investments in tangible assets will have less financial fiscal costs than those that depend on intangible assets, thus having a positive association with company performance such as profit. In accordance with factor theory of production, the use of fixed assets in production and not to be guaranteed also affect the positive associations.

Tangibility

The productivity variables show positive associations with profits. With a productivity increase of 1 unit it will increase the most profit by Papua Province by 0,018%. Theoretically, a company that has the advantage of using all of its resources efficiently and uses it to maximize profits (Jovanovic, 1982). Profit companies are more productive companies and use cost effective in their operations and management (Demstez, 1973). Productivity also provides a comparative advantage and the potential for greater investment.

However, looking at the provincial tabulation, Papua Province has the second lowest average productivity value after the Bangka Belitung Islands Province. The average productivity value of Papua Province is only 22%. This is supported by the average Papua Province gap reaches 15 million rupiah, but in reality the welfare of the community is still far from the word prosperous. So it can be concluded that there are outliers in the data used so as not to describe the results according to the original condition of the province, especially Papua Province. The high average value of the difference can also be caused by the coal product industry and petroleum refining. For Gorontalo Province and Bangka Belitung Islands Province, with a productivity increase of 1 unit will decrease the profit by -0.0011% and -0.0009%. In this case, the industry in the province has not used the available resources effectively.

Firm Age

Regression results show a positive association between firm age and profit. With the increase of company age by 1 unit, it will increase the biggest profit by Gorontalo Province by 0,017%, West Sumatera Province 0,015% and Maluku Province 0,013%. In accordance with the theory of production factors, the older a company will be easier in meeting the needs of resources. This is because the age of the company has better association with experience, information, reputation and access to the business environment and financial institutions, thereby helping companies solve resource constraints problems and operate more efficiently (Curran et al., 1993).

Regression results show a negative association between firm age and profit. With the increase of company age by 1 unit, it will decrease the biggest profit by Papua Province by -0.020%, Central Kalimantan Province by -0.014%, and West Sulawesi Province by -0.011%. Negative associations supported by Gschwandtner (2005) and Nunes et al. (2009) indicates the age of the company has a negative association with profitability due to the older the company in fact will reduce profits because of the more inefficient in operations so no effort to develop the company because it has been using all existing production factors and do not have innovate.

Firm Size

Regression results show a positive association between firm size and profit, except Bangka Belitung Islands Province. In accordance with production factor theory, there is a positive association between firm size and profitability, as the larger the firm the access to resources and the opportunity to increase profits through product diversification. Gschwandtner (2005), Ito and Fukao (2006), Nunes et al. (2009) and Mac an Bhaird and Lucey (2010) show firm size significantly with positive associations affecting profitability. For the Province of Bangka Belitung Islands, with the increase of company size by 1 unit will decrease the profit by -0.033%. In this case, the industry in the province has not used the available resources effectively in the workforce.

Microsimulation Analysis

Provision of capital in reducing costs in the production of small and micro industries with the scheme of waqf land rental results. Costs in production for small and micro industries are in line with needs and aim to increase profits. The waqf land used in this scheme is 8.37% as waqf land use as another social activity purposes (BWI). The waqf land is not directly used by the industry, but through the scheme of waqf land rent in the empowerment of government-run waqf land. So that afterwards can be used as additional capital for small and micro industries to increase the cost of raw materials and auxiliary as a factor of production so as to increase profits.

A. Estimated Additional Capital Potential

Potential of waqf land with amount 8.37% is then multiplied by the price of land rent per square meter in each province. To facilitate the analysis then the price of land rent per square meter is the same if it is in one island. In the determination of the rental price of course only as a general description without regard to the location of soil and soil fertility such as the theory of land value in the factor of production. An overview of rental prices is obtained from online sites of sale and purchase and land rent, then the overall price is averaged so that the land rent price per square meter. Waqf land units are acres converted to square meters. The potential of waqf land in the form of square meters is then multiplied by the price of land rent per square meter in each province so as to generate potential capital for additional cost of raw materials to be used in the analysis of microsimulation. Microsimulation analysis excludes NTB, NTT, Maluku, North Maluku, Papua and West Papua provinces due to limited information on the general picture of land rent per square meter.

Target of additional capital based on regional province, looking at the condition of asset ownership in each province with different main industries. Besides the asset ownership condition, productivity level, company age and company size also explain the condition of small and micro industries in the province. The simulation of small and micro industries explains the cost and production income in 2014 so that the simulation used is static simulation and see the difference of condition of each province. In the microsimulation used is not compensated with taxes nor fiscal and monetary calculations.

B. What-if simulation

The role of government in empowering waqf land assets so that it can get a return that will be used as additional capital for small and micro industries. Capital increase can increase operational and investment expansion. In this microsimulation, the addition of this capital can be used as an addition factor of production in the form of main raw materials and auxiliary materials. In regression results, the cost of primary raw materials and auxiliary materials has positive associations with profit. The coefficient of raw and auxiliary raw materials is the formation of a population of synthesis enterprises in a microsimulation to be used for what-if simulation with prescribed assumptions. The cost of this raw material can be increased by the addition of capital so that the positive coefficient is multiplied by the addition of raw and auxiliary goods by the additional capital and this value is an advantage of the micro and small industries of each province with the record of other variables considered constant. Riau Province is not included in the microsimulation analysis because it is an anomaly in the data because it has a negative coefficient.

The result of microsimulation is influenced by raw material coefficient and potential value of waqf land used, according to the equation below. The potential value of waqf land is changed in log form so that it corresponds to the regression equation as a LogRawMaterial. The result of microsimulation has the same pattern with raw material coefficient so that the role of raw material coefficient is very big in the analysis.

$$logProfit = x1\ logRawMaterial \quad (2)$$

B. The result of microsimulation

The result of microsimulation analysis is shown in Figure 1. With the addition of capital can increase the biggest profit by West Sulawesi Province by 7.59% (Figure 1). Nevertheless, the raw material coefficient represents a considerable production cost so that if there is additional capital it will greatly assist small and micro industries so as to increase business profits. However, West Sulawesi province has the lowest productivity coefficient compared to other provinces in Sulawesi Island and the company's age has the third highest negative coefficient in Indonesia of -0.020%. In addition, Sulawesi Island only has a contribution of manufacturing industry to 2.7% national GDP

(BPS, 2016). The contribution of the largest manufacturing industry to the national GDP is still dominated by Java Island with a large 70.7% (BPS, 2016).

Furthermore, capital increase was able to increase the second largest profit by Riau Islands Province by 7.02% (Figure 1). Riau Islands Province has a raw material coefficient of 0.66. The positive coefficient of tangibility of Riau Islands is the largest with the value of 1.06. In accordance with Akintoye's (2008) research that firms that have investments in tangible assets will have less financial fiscal costs than those that depend on intangible assets, thus positively associated with firm performance such as profit. In accordance with factor theory of production, the use of fixed assets in production so as not to be guaranteed also affect the positive associations. With additional capital, the use of fixed assets in production can be increased so as to increase profits. Riau Islands Province is an agglomeration of rubber industry, rubber goods, and plastics and made national strategic project and priority program in March 2017 by the President of RI for the development of new industrial centers. The island of Sumatera has a second manufacturing industry contribution of 18.6% to the national GDP (BPS, 2016).

For the capital increase with the smallest percentage to increase profit is Bengkulu Province with a value of 1.4% (Figure 1). Bengkulu province has the third highest negative coefficient of tangibility with a large 0.84. With investment in fixed assets, expectation of greater returns on the medium and long term, so tangibility has a negative association of profits in the short term (Vatavu, 2014). The negative association explains that high tangibility will lead to lower financial performance, but has a high leverage operation. The operation indicates that the company is able to use its fixed assets efficiently for lending purposes. With the addition of capital, the more assets that can be used to meet the lending operations. Bengkulu Province is an agglomeration of pharmaceutical industry, medicinal products from chemicals and traditional medicine outside Java Island.

The potential of large waqf land does not directly increase profits if the business provided by the capital has no efficiency in production such as the use of raw materials, assets, productivity, length of business and the number of workers. While affecting the second smallest profit by South Kalimantan Province of 1.605%. South Kalimantan has the second lowest productivity coefficient on Borneo Island, with additional capital it is expected South Kalimantan can increase productivity in order to increase profit. Kalimantan Island has a third manufacturing industry contribution of 6.5% to the national GDP (BPS, 2016).

Figure 1: Microsimulation Results

Using SI index calculations, the micro agglomerated manufacturing industry in 12 provinces (BPS, 2016), namely Nanggroe Aceh Darussalam, Central Java, DI Yogyakarta, Bali, NTB, NTT, North Sulawesi, Central Sulawesi, Southeast Sulawesi, Gorontalo, West Sulawesi, and Maluku. However, according to the SI index categorization of Balassa, all of these provinces belong to a weak agglomeration group with an index value of one to two. As for the agglomeration of small-scale industries it is found only in six provinces, namely West Java, Central Java, DI Yogyakarta, East Java, West Nusa Tenggara, and Central Sulawesi (BPS, 2016).

Discussion

There are several suggestions for waqf management institutions, practitioners able to further develop waqf land empowerment program as one way to assist the government in improving equality and prosperity of the community. The results of this study can be used as the basis for planning the use of productive waqf land so as to provide additional capital to small and micro industries. While the suggestion for the government is expected to be one of the reference in making government policies related to the use of waqf assets to reduce poverty and improve the welfare of the community and can be an example of planning on the management of waqf assets so as to provide additional capital to small and micro industries. Waqf land management can be done with waqf-linked-sukuk scheme for unproductive waqf asset development with waqf asset scheme as underlying asset (Ismal et al., 2015).

Subsequent research in describing the characteristics of micro-populations in the microsimulation approach can be more specific so that if there is a policy related to capital increase it can better describe the resulting impact. This should be supported by data that further illustrates the business conditions that the policy will impose. Geographic data becomes important considering the location of waqf land is very scattered in various regions.

Conclusion

The use of waqf land rents in the productive sector can increase the profitability of small and micro industries. Waqf land potential can be utilized for productive activities such as for financing the capital of small and micro industries in Indonesia. This can increase business profits, maintain the sustainability of small and micro businesses and the management of waqf. Of course the management planning of waqf land should be well targeted both regionally and industry so that added value can increase people's income. With the increase in income society is expected to reduce the income gap that occurred.

Cite this Article as: Anatolii DANYLENKO, Tetyana ARBUZOVA , Larisa SATYR, Victoria NOVIKOVA, Viktoriia ZUBCHENKO, Olena VASYLENKO and Oksana BANAR " Tools for analyzing cash flows from investing activities in Ukraine" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

Abstract

The article deals with the improvement of tools for analyzing cash flows from investments made by a company, which is topical due to the required productivity and competitiveness of business. The research puts general description and provides improved steps for analyzing cash flows generated through investing activities. By analyzing cash flows from investing activities of a company, one should take into account the full set of indicators of variable industries highly impacting the company and its life cycle. The conducted research systemized tools for analyzing cash flows from investing activities, investigates them and developed improved stages included in the analysis procedure. It can be employed for assessing the efficiency of managing the cash flows from investing activities.

Keywords: Net cash flow, cash flow from investing activities of the enterprise, the efficiency of cash flow management, analysis, cash flow optimization, synchronization cash flow sensitivity of investment of the enterprise.

Introduction

Under current conditions of heavily restricted financial markets, Ukrainian companies suffer from the huge money deficit and no access to the financial resources. Foreign investors do not will to finance local projects through the invasion of the Russian Federation. Thus, the primary objective pursued by the top management of any company is to maintain the relative stability of the cash flow and provide operations based on investment and paying the debts.

There is a topical task of improving the conceptual framework for analyzing cash flows from investing activities, which will allow enhancing the company's competitiveness. There are several reasons for analyzing company's cash flows:

1) results gained through the cash flows analysis are used for assessment of investment projects;
2) company's competitiveness is achieved through reallocating cash to investment and financial activities as well as operations;
3) the investment strategy of a company is developed and changed on the basis of the cash flow analysis;
4) the effective cash flow regulation provides the company with speeding-up turnover of the working capital and release of additional financial resources for further investing activity.

Brief Literature Review

The tools of the cash flow analysis are investigated by many foreign and Ukrainian economists. Among them are J. C. Van Horne, V. Dickinson, Ye. Brihkhem, E. Nikkhbakht, T. Rays, V. V. Bocharov, L. N. Pavlova, H. V.Savyts'ka, I. A. Blank, F. F. Butynets, H. H. Kireytsev, O. Lihnenko, A. M. Podder'ohin, O. O. Tereshchenko, R. B. and other.

Most scientists argue that the cash flow analysis should include the following stages:

1. Analysis of the cash inflow (a pattern of cash inflows, changes in cash inflows, the ratio of the growth of cash inflow to the growth of output and sales);
2. Analysis of the cash outflow (a pattern of cash outflow, changes in cash outflow);
3. Analysis of the net cash flow (the balance between inflows and outflows, the quality of the net cash flow and the level of sufficiency of cash inflows);
4. Analysis of cash flows generated by different activities (historical analysis of the balance sheet with revealing cash flows from operations, investments and financial activity and defining the direct and indirect factors of cash flows changes);
5. Analysis of the gap between the net cash flow and net profit (assessment of available cash and the gap between the net cash flow and net profit);
6. Analysis of cash inflows sufficiency and cash outflows efficiency.

The Ukrainian economic contributions either do not entirely provide tools for the analysis of cash flows generated through investing activities or have a substantial imperfection, as well as foreign research works do, following the main focus on the total amount of cash flows and sometimes on operations cash flows. Thus, tools for the analysis of cash flows from investing activities require improvements towards expanding theoretical concepts and practices.

The purpose

The article aims at considering and improving tools for the analysis of cash flows from investing activities. During the research, we employed such general scientific methods as analysis, synthesis, logic chains and dialectic.

Results

The overviewed scientific works allowed clarifying and generalizing the common tools for the analysis of cash flows generated from investing activities based on financial reports. Main tools being considered more often than others are:

1. Horizontal analysis provides trends in cash flow in terms of the sources of its generation over a period and its growth rate.
2. Vertical analysis shows the pattern of cash inflows and outflows.
3. Benchmarking implies comparing the main indicators of a company with those of competitors within the industry and other close industries.
4. Ratio analysis provides a range of relative indicators showing competitiveness, liquidity etc.

We consider the primary goal of the analysis is the detection of:

1. Reserves for increasing company's efficiency;
2. Facts of managerial failures;
3. Better ways of financial resources allocation and negative factors impacting company's productivity and competitiveness.

For efficient analysis of cash flows generated from investing activities, we should outline the main principles of it. Among them are objectivity and correctness of the data, consistency and integrity of calculations as well as readable and scientific-based results.

By taking into account available tools for analysis of cash flows from investing activities [1, 2, 5, 6] and current political, economic and financial conditions in Ukraine, we consider it necessary to introduce the following stages of the analysis of cash flows from investments (Figure 1).

The first stage of the analysis of cash flows from investing activities of a company provides comparison of the actual cash flow and planned one generated from either a single investment project or the investment portfolio.

Figure 1: Basic Steps for the Analysis of Cash Flows from Investing Activities

So, the first stage of the analysis of cash flows is proposed to compare suggested and actual increase in the cash flow during the period. The analysis of investment cash flows involves the use of such absolute indicators of investment cash flows as:

1. Cash inflows and outflows;
2. Net cash flow from investing activities;
3. Cash outflows for uncompleted investment projects being conducted at the moment;
4. Budgeted cash flows including net cash flow from completed investment projects;
5. Amount of cash reserved on bank accounts and company's cash department [8-12].

The second stage of the analysis of the cash flows from investing activities involves determining the structure and dynamics of changes in investments cash flows as well as comparing these indicators. In the analysis, it is important to consider that the structure of the cash flow varies according to the stage of the life cycle of a company (Figure 2), as the misinterpretation of results gained through the cash flow analysis can negatively impact the further development of the company. Such scientists as Dickinson and Brikhem [3] identify the following stages of the company's life cycle and consistent to them cash flows:

Stage 1 - Startup. This period is characterized by the cash inflow from financing activities and cash outflow from investing and operating activities.

Stage 2 - Rapid Growth. This period faces high rates of profit growth and company's own investments into R&D.

Stage 3 - Maturity. This period is characterized by growing sales and revenues. Total cash inflows slow down despite growing cash flows from investing and operating activities.

Stage 4 - Stability. A company maintains profitability at an optimal level. Cash flows from all activities remain unchanged.

Stage 5 - Decline. Profitability and financial stability of a company are falling down. Cash flows from all activities are slowing down [13-16].

Dependently on the owners' and managers' decision, the last stage of the company's life cycle may bring either rebirth through reengineered business processes and involved investments in innovations or death through liquidation or acquisition.

Investing activities following the company's life cycle is expected to reduce cost of capital and improve financial flexibility. According to the contributions made by Ivashkovs'ka I. V., financial flexibility of a company is a growing financial stability through diversified capital involved from different groups of investors [7, c.163].

Figure 2: A Pattern of Cash Flows through Life Cycle of Company (7)

Analyzing cash flows generated from investing activities requires conditions of external environment to be taken into account and results to be matched to the macroeconomic indicators.

The third stage of analysis of cash flow generated from investing activities implies establishing relationship between investment amounts and current assets for evaluating the elasticity of investing activity of a company.

The importance of investigating the relationship between investing activities and variable cash flows can explained by the fact that investments are vital for business development and competitiveness in the marketplace though cash is a highly restricted resource underlying investment activity [4, 17].

Cash flows generated from operations are very often invested. Thus, it is advisable to match investments to the net operational cash flows. In the case of net operational cash flow exceeding investment amounts, then an investing policy of a company should be considered efficient with growing financial investments.

The fourth stage of the analysis of cash flows from investing activities covers changes in assets of a company resulted from investing activities. The analysis of investments' impact on cash flows allows managers to observe cash through accounts, assess liquidity of activities and conclude whether available cash fits investment goals of a company [18-19].

At the fifth stage of the analysis, financial ratios showing the efficiency of investing activities are calculated. As a

rule, scientists distinguish the following financial ratios for investing activities to be analyzed:

1. Ratio of cash flows from investing activities to net cash flow shows cash flow from investing activities per monetary unit (USD, EUR, UAH etc.) of net cash flow.
2. Coefficient of cash inflows from investing activities shows amounts of cash inflow per monetary unit of cash flows.
3. Ratio of long-term liabilities to net cash flow shows the extent to which short-term and long-term liabilities cover cash outflows from investing activities of a company.
4. Coefficient of cash outflows from investing activities shows cash outflow from investing activities per monetary unit of cash flows.
5. Ratio of cash inflows from investing activities to liabilities shows the amount of investments needed for purchasing a monetary unit of non-current assets.
6. Ratio of cash inflows from investing activities to non-current assets shows the amount of investments needed for purchasing a monetary unit of non-current assets.
7. Coefficient of liquidity of cash flow from investing activities shows cash inflow to cash outflow ratio.
8. Efficiency of cash flows from investing activities shows general net cash flow to cash outflow from investing activities.
9. Ratio of long-term liabilities to cash outflow from investing activities shows the amount of cash outflow from investing activities that can be compensated by long-term liabilities.
10. Ratio of short-term liabilities to cash outflows from investing activities shows the amount of short-term liabilities used for making investments as cash outflow from investing activities.
11. Coefficient of cash inflows from investing activities shows the share of cash inflows from investing activities in total cash inflow of a company.

The offered approach to the analysis of cash flows from investing activities is expected to match to companies (their legal status, industry) and macroeconomic conditions individually [18].

Conclusion and research perspectives

By analyzing cash flows from investing activities of a company, one should take into account the full set of indicators of variable industries highly impacting the company and its life cycle.

Thus, the conducted research systemized tools for analyzing cash flows from investing activities, investigates them and developed improved stages included in the analysis procedure. It can be employed for assessing the efficiency of managing the cash flows from investing activities.

Abstract

For implementing a quality crisis management framework in the enterprise PPRR-model (Prevention Preparedness Recovery Response-model) is proposed. For the early crisis identification and evaluation of the signal intensity of its beginning the main trends of the comprehensive scanning of the enterprise business environment have been determined. In article it is considered approaches to an assessment and the analysis of efficiency of carrying out changes at the enterprise. Recommendations about possible use of tools in activity of the domestic enterprises in modern conditions of managing are created. As a result of research the attention was focused on increasing value of carrying out systematic process of restructuring at the domestic enterprises.

Keywords: crisis, anti-crisis management, PPRR mode, factors, restructuring, tools, process of changes.

Cite this Article as: Victoria NOVIKOVA, Andrii NEPOCHATENKO, Mykola DIACHENKO, Nataliya PETRENKO and Oksana BANAR " Modeling of The Innovative Level of Preventive Anti-Crisis Management of Strategic Changes of Enterprises" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

Introduction

In modern unstable economic, financial and political situation in Ukraine, preventive crisis management is quite topical. A modern period of the domestic economic development is mainly characterized by instability, high dynamics and variability of the economic environment. Under the circumstances, most of the domestic enterprises refer their success mainly to their own activities, but failures to external factors. This approach prevents from developing and implementing effective conduct regulations in the market as well as forming an effective system of anti-crisis management. This attitude of the company management does not let timely identify crisis phenomena, track their progress at different stages of a crisis formation and development and impact their causes, as well as create mechanisms for monitoring risk activities and learn the methods of crisis management and how to exit the crisis (Z. Shershneva, 2004). In this case the enterprise ability to properly generate a range of necessary strategic changes at all stages of its anti-crisis development guarantees its survival and further success. This raises the importance of early diagnosis in providing detection and preventive treatment of the crisis as any crisis has a wide range of signs and shades. At the present stage of economic development of Ukraine, the management of industrial enterprises tries to consider all options for raising competitiveness and counteract negative factors external influences such high risk on the macroeconomic situation in the country, high inflation, reducing demand, problems with credit software and more for financial recovery of the company. Under such conditions it is restructuring is a critical factor in the successful restructuring of the companies, since it can significantly increase economic activity, increase market share and ensure the growth of the market value and more.

Brief Literature Review

The issues of anti-crisis diagnostics of the enterprise are quite widely covered in the scientific publications written by foreign and domestic authors. Thus, methodological approaches to the diagnosis of the crisis of business entities in the crisis management framework are investigated in the works of I. Buleev and N. Bryuhovetskaya, G. Gryaznovaya, A. Chernyavskiy, E. Korotkov, G. Kurashevaya, L. Ligonenko, G. Shvudanenko, Z. Shershneva , A. Yankovskiy and many others. However, the problem of searching innovative approaches to the prevention and timely threat detection of a crisis has not lost its relevance. Yet, no methodical approach has been found so far to meet the demands of practical applications. Most of the available anti-crisis diagnostics, offered by the scientists, focus on certain parameters of financial and economic activities (mainly financial) and are based on using only quantitative indicators. Practical experience of leading domestic and foreign companies confirms that the external instability of the functioning environment of the enterprises and high level of its aggressiveness requires a methodological approach used for assessing the crisis threat in a comprehensive and objective way. This necessitates a reassessment of the existing approaches to anti-crisis enterprise management in times of crisis and a focus on developing innovative models of crisis management. Issues of management process of restructuring of the company attracted the attention of many Ukrainian and foreign experts, as evidenced by a significant number of publications devoted to this topic. Yes, thanks to research M.D. Aistova, O. Vinogradov, V.V. Davydenko, I.I. Mazur, D.M. Lambert, O. Suharov, L.M. Taranyuk, A. Harrison, M. Hammer, J. Ciampi, V.D. Shapiro and others, it is possible to acquire this experience and use it on practice.

The analysis of foreign and domestic experience on the development of restructuring demonstrates the need for further research. Given the importance of this problem, the theoretical and practical questions of the formation of the restructuring will continue to remain relevant.

The purpose

of the article is:

- to study the features of the application of the PPRR model for improvement innovative level of preventive crisis management of strategic changes in the enterprise,
- to clarify the nature of the restructuring of enterprises,
- development of recommendations on the possible use of the useful experience in the current economic conditions.

Result

Modern approaches to enterprise anti-crisis management (L. Ligonenko, 2010) involve overcoming the crisis and detecting its first signs, as well as anticipating the beginning of the crisis. The earlier anti-crisis measures are developed and implemented, the higher their efficiency is and the lower losses of the enterprise are.

In practice, the formation of a crisis situation in the enterprise is effected by a whole range of factors. Therefore, a comprehensive model of enterprise crisis management is required for achieving an objective evaluation of the crisis threat and its prevention. Meanwhile, opportunities for the application of methods for diagnosing crisis management

in the theory and practice have not been exhausted so far. Quite often, crisis management involves only determining and predicting the insolvency based on financial performance analysis and accounting data, despite the fact that the crisis is a multidimensional phenomenon and its causes and first signs can occur in all spheres of functioning of the enterprise.

A theoretical study showed that most of the existing tools and technologies of anti-crisis management provide signal detecting required for the adoption and implementation of preventive anti-crisis measures. They either detect the current pre-crisis processes or take into account only specific aspects of enterprise development. Thus, in the economic literature (V. Dorofeev, 2012; K.Baldin, 2011), depending on the crisis phase there are a priori two types of crisis management: prevention (when the growth of the business entity is steady) and reaction (when the growth of the business entity is unsteady, during the crisis and bankruptcy procedure or in the post-crisis period).

We suppose that in times of cyclical instability in Ukrainian economy and politics, domestic enterprises need to focus on preventive anti-crisis management. For this purpose, it is strongly recommended to apply the PPRR risk management model proposed by the leading Australian emergency management agencies. The PPRR model contains four components (Fig. 1).

Fig.1: The PPRR risk management model

The key components of the PPRR model enable to promptly take and implement management decisions as well as effectively to prevent the possible beginning of the crisis in the enterprise.

The benefit of applying this model in anti-crisis strategy formation is that it helps in anticipating possible direct effects to business.

According to this model, in the first stage, the enterprise should take steps to reduce the risk of a crisis event occurring or minimize its adverse effects. The second phase involves carrying out preventive actions. Preparing for a crisis situation means including the element "preparedness" which identifies and defines the priority measures to eliminate any malfunctions during the crisis.

At the stage of "response" supervision is undertaken. This stage contains the element "answers" and determines direct management response to a specific crisis event with a view to deterring, controlling and minimizing its negative effects.

The last phase of enterprise crisis management is characterized by recovery (depending on the severity of the crisis) which describes a sequence of actions and aims at minimizing the violations of anti-crisis stability of the enterprise and its restoration.

One of the main tasks of anti-crisis management in times of crisis transformations is ensure effective management in the enterprise in crucial moments as well as solve the question of how to avoid negative effects of a crisis situation, to prevent it from occurring and treat it. This is because in the world of business any entity daily faces with different problems, but not every problem becomes a crisis. Anti-crisis actions should aim at creating the conditions for preventing current situations from becoming crises. Preventing the enterprise crisis from occurring requires its earlier identification in order to effectively respond to negative trends when the enterprise is still under

control. In this context, the early detection of the crisis is a case of particular urgency.

One of the approaches for the early detection of crises is a "scanning method" (continuous ordered, feature-based scanning of the environment or object) proposed by G. Kurosheva (G.Kurosheva, 2000). According to this method, a diagnostic object is considered to be a signal of a possible crisis - the initial economic phenomenon. The first signal indicates changes in the enterprise's behavior. The next step includes a quantitative evaluation of the intensity of the signals and enables to measure it on the basis of available information as well as select a real signal out of "background noise".

"Scanning" must be performed in the following way:

- making a list of a company's external and internal environmental parameters;
- quantitative and qualitative evaluation of external signals as to dynamics of economic, technological, environmental as well as demographic and legal situation in the national economy;
- quantitative and qualitative evaluation of internal signals as to dynamics of the strategic potential as well as evaluation of their impact on the competitive status of the company;
- defining the frequency of monitoring a company's external and internal environmental parameters;
- analyzing the possible consequences of the crisis identified during the monitoring process;
- defining "control points" in economic chains;
- conducting a comprehensive diagnosis of anti-crisis management;
- evaluating analysis results with a view to their impact on the ability to perform the initial mission of the enterprise;

The advantage of this technique is that it allows you to detect crises at the earliest stages.

Restructuring is a versatile management tool now, it is done in enterprises of different industries, became one of the most effective ways to improve not only the competitiveness of enterprises, but also of their ability to pay, which is due to a decrease in the amount of operating costs, the introduction of new technologies, equipment modernization and increased productivity labor.

Note that the process of restructuring the company can not be a one-off, because under these conditions will not be a subsoil, for which it is held. Therefore, the process of restructuring of the company should be held regularly and meet the current market conditions.

There are a number of external and internal factors that have an impact on the process of restructuring of the company (Table 1).

Table 1

Factors that stimulate the restructuring of the company

Internal factors	External factors
Organizational	Legislation
Technical	Economic policy
Financial and economic	The level of economic liberalization
Social	The competitive environment
Corporate	Financial and credit policy of the government
Internal corporate groups of interest	Investment policy
External groups of interest	Structural policy states
Politics corporation	Globalization of the economy
Availability of resources	Trends in Foreign Relations
Market activity	Resource policy of the State

In addition to that, the influence of the external factors is more active and dynamic. It is important to note that you must consider the fact that the environment changes every day and requires a different behavior on the market. Moreover the environment requires to use different methods and techniques, and resources in order to achieve positive results.

In addition, each process of restructuring of the company is unique and uses different instruments of restructuring. Figure 2 represents the basic classification of the instruments of restructuring.

So, taking into account all of the above we can make a conclusion that restructuring guarantees an opportune and flexible change of the company structure, its adaptation to the changed internal and external factors.

The research of national experience enables to select the following major disadvantages of restructuring of companies:

- the lack of necessary methodical grounds of effective models of restructuring;
- preferential use of approaches based on the distribution companies into separate parts, without proper consideration of alternative variants of restructuring;
- insufficient justification for the economic consequences of restructuring objects;
- the lack of mechanisms to attract investments in the restructuring process;
- the uncertainty of funding sources of restructuring;
- unresolved social issues in the development of restructuring plans.

Fig 2: Classification of instruments of restructuring of the company

[based on the information 6-12]

One of the reasons of unsuccessful attempts of restructuring is insufficient a scientific approach to the solution of problems in Ukraine. Therefore, to solve this problem is necessary:

- define the features of restructuring in conditions of formation market environment. It is necessary to properly represent the environment of the enterprise in which restructuring process is done. The description of the environment from the standpoint of its interaction with the project must be accurate. Because it help to restructure the enterprise in a right way;
- to identify methodological approaches to assess the effectiveness of the restructuring and administrative actions against its implementation. Restructuring should have a clear goal, the achievement of which should be assessed at various stages and overall;
- to consider the problem which is relative to specific project of restructuring of the company. There is not common way to restructure the enterprise.

Conclusions of this study

The crisis situation is a turning point in the functioning of any business entity. Early diagnostics of the crisis phenomena is the key principle of anti-crisis management. To prevent a crisis situation from occurring in the company you need an efficient innovation system of crisis prevention management. The application of the PPRR model of enterprise crisis management helps you to timely detect a crisis situation and anticipate possible direct impacts to your business. Early diagnostics of the crisis situation of the company helps in avoiding bankruptcy and is important for the effective company operation and preserving competitiveness in the consumer market [13-15].

So domestic industrial enterprises should adopt international experience of restructuring, but they must select the methods and directions that effectively influence on economic recovery of the company and implement in order to adapt to changes in the external and internal environment.

So, we must emphasize that there is no single procedure of restructure for all companies. The experience of the restructuring of domestic and foreign enterprises demonstrates the diversity of areas and types of restructuring in general, proves the efficiency of restructuring measures under different economic conditions and for various businesses in today's environment.

In addition, the sequence of stages of restructuring and choice of instruments vary significantly that depends on the condition of the company, its potential position in the market, conduct of competitors, characteristics of goods and services produced by the company and many other factors.

However, domestic enterprises should consider the risk of incorrect implementation of restructuring of the company and learn from the mistakes of companies, which have experience of ineffective restructuring.

Abstract

The article is devoted to the economic role of customs duties in the national economy of Poland. The study also refers to the basic economic doctrines in the theory of foreign trade, but only from the point of view of customs issues (the role of customs). Issues related to the customs union and basic concepts in the field of customs were also discussed.
Customs duties constitute one of the most important instruments of the state's economic policy, and have a significant impact on the structure of imports and its effectiveness, and constitute a source of budget revenues.

Keywords: customs, foreign trade, economy, European Union.

Introduction

The customs duty is one of the important legal instruments by which the economic and economic policy of the country is shaped. After Poland's accession to the structures of the European Union (EU), foreign trade acquired a new meaning. These conditions were mainly related to the change in the customs lawand tax. The opening of borders and the freedom of movement at the same time increased the interest of entrepreneurs in selling their goods and services to other countries, not only in the EU, but also outside its territory.

The article presents various definitions of the duty, its essence and meaning. The customs tariff that was in force in Poland until 1 May 2004, that is until Poland's accession to the European Union, and the Community Customs Tariff, which is applied after that date, are characterized, making comparisons between them. One of the consequences of Poland's accession to the EU in the field of customs was the disappearance of the concept of exports and imports and replacing them with the term intra-Community supply and acquisition of goods, duty free, of course. The aspect of VAT, which is used in trade with countries outside the European Union, was also dealt with. The article presents the elements of customs, their place in economic doctrines and theories of foreign trade, and the effects of the customs union.

This article tries to answer the following question: what is the role of customs in the modern economy? Does it still constitute one from significant state budget revenues and has it acquired a different meaning? For this purpose, the literature on the subject of the research was analyzed.

The concept of duty, its essence and role

Historically, the tariff is the oldest tool of trade policy. King Bolesław the Bold has already ordered customs duties to be collected on the Bug River. The oldest Polish document that deals with customs matters in Poland is the Bull of Gniezno, issued on July 7, 1136 in Pisa (Ex commisso nobis a Deo, April 8, 2018).

In the 17th century, collecting duties was one of the ways of getting rich in a given city and country. In the 19th century, the duty was additionally used as an instrument to protect domestic production, which could be seen mainly in the United States, Germany and France, which thus wanted to protect their markets against the import of British goods (Jura J., 2008, pp. 25-26).

Cite this Article as: Katarzyna SZMYD " Economic Role of Customs In The National Economy of Poland" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

In economic literature, customs duty (French - dront de douane, German - Zoll) is most often defined as a levy imposed by the state on goods that cross the customs border of a given country (Klawe AJ, et al., 1987, p. 448). After joining the structures of the European Union, customs duties can be described as: “as our own source of income flowing into the EU today. They are no longer levied within the Community, but only towards third countries ”(Brzeziński W., et al., 2003, p. 24).

Customs duty is understood to mean charges levied by the state on goods crossing its frontier. The customs duty is the equivalent of a tax that increases state budget revenues (Broży J., et.al., 2002, p. 309), or as a fee charged by authorized factors on goods for crossing the customs line (Waschko S., 1971, p. 87), or a tax that is imposed on goods that pass through the customs border of a given country ”(Budzowski K., 2003, p. 92).

The duty is also considered to be the most common levy levied by the state on the import, export or transport of goods across the customs borders of a country or a customs union (Kaczurb J., Poland in GATT, 1998, p. 61), or a specific tax or duty on imported or exported goods. goods (Kamerschen DR, et al., 1991, p. 986), relatively the simplest of the instruments of trade policy, denoting the tax burden on the import of products (Krugman PR, et al., 1993, p. 127).

“A duty is a public levy, similar in nature to a tax. Its primary feature is its use in international trade in goods and services. The functions of the duty include: fiscal, socio-economic (protection of sectors sensitive to the economy, improvement of the balance of payments) ”(Felis p., 2010, p. 101).

As a result of Poland's accession to the structures of the European Union, the role of the customs duty was significantly weakened. “Currently, the amount of duty revenues is influenced by: the volume of performed imports, the average euro exchange rate and the effective duty rate” (Ibidem, p. 101).

Elements of the theory of customs. Effects of introducing and abolishing customs duties

According to Springer Gabler Wirtschaftslexikon, "the theory of customs is the theoretical basis for understanding customs policy" (https://wirtschaftslexikon.gabler.de, 8.04.2018). In this short German definition there is the simple observation that the theory of customs duties provides a theoretical explanation of why public authorities act in the field of customs in such a way thatand no other way and the economic effects of such conduct. According to this understanding, the theory of customs is a derivative of economic policy, but it is not a unique approach in economics. By way of example, we can mention the theory of state intervention, which was established after its initiation, not before.

By introducing duties, the state may pursue various economic policy goals. One of the main goals of introducing a duty by the state may be to protect domestic producers or to increase budget revenues. The effects of the duty will be felt by consumers, who will have to pay a higher price for the goods. The negative impact can also be seen in the economy, when the duty raises the prices of semi-finished products used by companies for further production.

The greatest possibilities for the state to influence the market situation existin the field of international exchange. The state's policy may aim not only at shaping the commodity and directional structure of imports and exports, but also at stimulating or inhibiting imports or exports.

“A customs duty is a form of excise duty levied only on the sale of imported goods. In the past, customs duties were an important source of budget revenues due to their easy collection. In the modern world, customs duties are more often aimed at limiting imports and protecting domestic producers competing with imports, than at being an important source of budget revenues ”(Krugman P., et al., 2012, pp. 376 - 378).
The departure from free trade and the introduction of tariffs leads to both transfers and and for pure losses. Money transfers are made in the direction: from consumers to the state budget, and to producers (Begg D., et al., p. 499).

Summarizing the effects of introducing the duty, it can be stated that the imposition of the duty is a kind of "wedge" between the foreign and domestic price, if we increase the domestic price, but by less than the amount of the duty rate. It should be noted here that if we are dealing with a small country that does not significantly affect foreign prices, in this country the duty will fully shift to domestic prices. Considering the costs and benefits from duty, it can be measured using the concepts of consumer surplus and producer surplus. If we take these two concepts into account, we show that domestic producers of a given good gain because the duty will raise the price they receive. In contrast, domestic consumers lose because of the same reasons. The state will also notice the benefitsin the form of revenues.

Taking into account the costs and benefits of introducing a duty, we note that the net effect on social welfare can be divided into two parts. On the one hand, there is a loss of efficiency, and on the other hand, there is an effect in the form of improved terms of trade, which reflects the duty effect of lowering the foreign export price.
In the case of a small country, which does not exert an influence on foreign prices, the second effect does not occur, so we are dealing with a simultaneous loss of prosperity (Grotowska G., 2017).

Without delving too much into the issues of microeconomic analysis in the form of graphical models, it is worth illustrating these observations with a few examples of empirical research, including also other, apart from those mentioned above, microeconomic issues concerning the effects of changes in customs or customs environment.

The first example concerns the estimation of the economic impact of time delays related to customs clearance, i.e. transaction costs. Authors from Inter American Development Bank conducted research on the impact of delays in customs clearance on the volume of Uruguay's foreign trade. They observed, among other things, that the increase in waiting time for customs clearance by an average of 10% reduced the country's exports by 1.8% on average (Volpe C., 2013). This meant an increase in transaction costs for enterprises and a decrease in their exports.
Ernst Verwaal and Bas Donkers from the Erasmus University in Rotterdam dealt with a similar issue. They investigated the relationship between the costs of transactions related to customs clearance with other variables, such as: the number of transactions, the size of the company, the number of customs transports, etc. The study was conducted on a sample of approximately 3,000 companies trading abroad in the Netherlands. They observed that the duty-related transaction costs significantly burden the economics of the surveyed companies, and that the reduction of these costs was influenced by factors such as economies of scale, simplified customs procedures and improved communication between companies and customs authorities (Verwaal E., et al., 2001). This study confirms that reducing the nuisance of the customs procedure has a positive effect on the economy of enterprises, reducing their transaction costs.

One of the most interesting studies devoted to the effects of the introduction of customs duties is the report prepared by the Directorate General of Internal Policy of the European Commission on the economic effects of Brexit. Study, discussing and compiling the results of a series of studies in this area reveals, inter alia, that when Great Britain leaves the Customs Union within the EU and introducing tariffs based on the WTO most-favored-nation rates, EU countries' exports to the UK may fall by 30%, with the overall decline in the volume of EU global exports going to be small, only 2% (Lawless M., et al., 2016) . The comparison of 6 different studies on the effects of leaving the customs union in this variant (MFN WTO) shows that the GDP of the EU27 may drop from 0.11% to 0.52% of GDP (by 2030), and the United Kingdom, in the same period - it may drop from 1.31% to 4.21% (An Assessment ..., 2017). This report also discloses the methodologies for calculating each of the estimates. This report is interesting because each of the estimates predicts higher Brexit costs for the UK than for the EU27.

In 2003, the World Bank Research Group conducted a study on the impact of trade facilitation in the APEC group of Asia-Pacific countries (including improvement of the customs environment in the field of industrial products) on the effect of trade creation in these countries. Specification of the econometric (gravity) model was developed, examining the impact of these factors on trade, and then simulated on the assumption that the weakest members of this group would improve the efficiency of ports, improve the customs environment, administrative procedures and use electronic business to an average level in the group. As a result, the intra-group trade flows were expected to increase by 21% and only on condition that the customs environment and port efficiency are improved (Wilson J.S., et al., 2003).

In summary, apart from the positive budgetary effect and the protection of domestic production, most quantitative studies predict a decline in trade and GDP due to tax increases or withdrawal from the EU. It is worth adding that these studies were based on a neoclassical perspective and do not take into account behavioral determinants and legal.

Customs issues in the theory of foreign trade and economic doctrines

Since customs is an important external regulator of economic processes in foreign trade, it would seem that customs issues should occupy a high place in the theory of foreign trade. This theory consists of a series of theoretical concepts trying to explain, sometimes better and worse, what the flows of trade result from, what benefits are achieved and by whom, where the sources of these benefits lie, and a number of other important issues for international exchange. Unfortunately, the problem of the impact of customs duties on the economy has been reduced in the theory of foreign trade to only a few individual issues (such as e.g. the customs union and optimal currency areas), which makes it necessary to look for justifications for the customs policy in economic doctrines of a political nature.

Mercantilism as a form of customs intervention

Referring to the pragmatic position of the German, according to which the theory of customs is an explanation of the foundations of the pursued customs policy, and thus is a derivative of economic policy, the first more serious references to customs in economic thought can be found in the doctrine of mercantilism, which appeared at the turn of the 16th and 17th centuries. This doctrine saw the sources of wealth in the resources of precious metals. Thomas Mun put it this way in 1664: "The usual means of increasing our wealth and our possession of precious metals results from foreign trade, and we must constantly obey the rules in order to sell abroad more value than we buy from it "(Thomas Mun, Rymarczyk J. 2010, p. 22).

Another follower of this doctrine, Abraham Lincoln, is credited with the statement: "I don't know much about customs. I know that when I buy an English coat I get my coat and England my money, and when I buy an American coat I have the coat and America has money.

Most economists of Lincoln's contemporaries have rejected the idea that raising tariffs to obtain a trade surplus would improve state welfare (Samuelson P.A., et al., 2012, p. 361). However, the firm application of this principle and the accumulation of gold enabled the newly established United States, by purchasing new areas, to expand its territory - Louisiana from France, Florida from Spain, Alaska from Russia, and finally compensating Mexico for the annexation of Texas and California. So the accumulation of assets allowed for the increase of assets and a systematic increase in the prosperity of the state.

According to the mercantilists, "… the basis of wealth is gold and all kinds of valuable resources; directing foreign trade in such a way as to ensure the inflow of gold and silver; promoting industry by encouraging the import of cheap raw materials; protective duties on the import of processed goods; stimulation of exports, especially of finished goods; emphasis on population growth while keeping wages low. The essence of mercantilism is, of course, the doctrine that a favorable trade balance is desirable because it somehow leads to the welfare of the nation" (Blaug M., 2000, pp. 32-33).

The doctrine of economic liberalism. Negation of the role of customs

The economic doctrine opposed to mercantilism was the doctrine of economic liberalism, which after 1815 was gradually implemented by three English treasury secretaries. England, exhausted by wars with France, decided to relieve taxpayers and gradually began to reduce duties and taxes. The theoretical "anchor" of this doctrine were the views of British economists that had been initiated several decades earlier. These new views were expressed in Adam Smith's Research on the Nature and Causes of the Wealth of Nations (cf. Smith A., 2007), published in 1776, which in the science of economics became the foundation of the classical school. They were continued by the classics of political economy, especially David Ricardo and John Stuart Mill "(Misala J., 2009, p. 48). Apart from denying the role of tariffs and promoting free trade, classical economists made little contribution to the theory of tariffs. However, their role in strengthening the political doctrine of economic liberalism was important.

Classical theories of exchange. Optimum duty concept

The late classics dealt with the problem of the influence of customs duties in a broader way and neoclassicals. R. Torrens was the first to see the possibility of a positive impact of the duty on the prosperity of a large country, while the benefits related to the improvement of terms of trade, as a result of the customs barrier, were described in 1906 by Ch. Bickerdike. R. Torrens stated that, unlike a small country, only a large country can gain benefits from the introduction of customs duty. This is due to the fact that a country with a large share of the international market may influence the price level in this market. A small country is, unfortunately, the recipient of the prices prevailing on the world market. A large country having a monopoly position may take advantage of it, e.g. by means of customs duties on exports, and thus limit the export of goods, which ultimately will increase the price of the goods sold, so in this case the large country will act as a monopolist. On the other hand, it will act as a monopolist on import markets, limiting imports and reducing the world price of the commodity.

The optimal duty for a large country will be a rate at which the marginal benefit from improving (terms of trade1) will be equal to the marginal loss of efficiency caused by excessive production growth and reduced consumption under the conditions of applying the duty (Krugman PR, et al., p. 314 -316). These are important economic arguments, but they raise serious reservations. Firstly, the relations of the imposing country with other countries are deteriorating (e.g. loss of trust). Such actions also result in the introduction of retaliatory measures, and this may destroy the benefits originally obtained by the imposition of the duty. Second, the imposition of tariffs by one country disrupts free trade and thus inhibits international specialization, reducing the welfare of the world. One

should also mention the benefits of introducing a duty - for the decisive most of the countries whose supply and demand have a slight impact on the world price, they are not available (Budnikowski A., 1998, pp. 220 - 221).

Resource Abundance Theory. Views on the customs union

One of the other theories that addressed the problem of the importance of customs was the resource abundance theory. The founders of the theory of resource abundance are Eli Heckscher, Bertil Ohlin and Paul A. Samuelson. They assumed that international trade is only a special case of trade between different regions, which could also be customs unions. They argue that the theory of international trade is merely a more general theory of interregional trade. "According to their views, the main elements of the customs union include:

- the effects of indirect equalization of prices of factors of production, e.g. by the development of international trade (theorem of Abby P. Lerner and Paul A. Samuelson);
- links between changes in product prices and changes in prices of inputs (Wolfgang F. Stolper and Paul A. Samuelson theorem);
- The relationship between trade-induced changes in resource equipment and the fields of specialization (theorem of Tadeusz M. Rybczyński) ”(Bożyk P., et al., 2003, p. 137).

The doctrine of educational protectionism (customs protectionism)

Another economic doctrine that began to shape customs policy was the doctrine of educational protectionism (German customs protectionism). It was formulated in the 19th century by the German economist Friedrich List. The letter had completely different views than those presented in the above-mentioned theories, which assumed that the condition of fully realizing the benefits of exchange was the policy of free trade. He believed that "the theory of comparative costs imposes on less developed countries the traditional agro-raw material specialization, realizing the production of processed goods for industrialized countries. (…) Under the conditions of free trade, the less developed countries would not have a chance of industrialization at all, because their production would be eliminated from the market by foreign competition in the seed stage. Therefore, the Letter called for temporary tariff protection for newly emerging industries. (...) It would last until the protected industry gains lasting international competitiveness - hence the name: educational protectionism ”(Rymarczyk J., 2012, p. 413).

“The wave of new protectionism, known as neoprotectionism, has been particularly intense in the last two to three decades. In a qualitative sense, the new forms of protection of economies differ from the previous ones mainly in terms of their selective nature. The instruments used within them are directed against individual countries or groups of countries and refer to specific sectors ”(Rymarzewski T., 2006, p. 355).

"Among the authors whose works played the most important role in formulating the theoretical foundations of new arguments for protectionism, mention should be made of James Brander, Barbara Spencer and Paul R. Krugman (cf., https://en.wikipedia.org/wiki/Brander%E2 % 80% 93Spencer_model, 2016). The result of their work is the initiation of several concepts justifying the application of protectionist measures. The most famous of them are:

- **strategic trade policy** (is a concept explaining under what conditions a country can, at the expense of a partner, obtain benefits by introducing subsidies); and the most commonly used
- **industrial policy** (it is a policy of countries aimed at the development of industries and industries considered modern; in order to achieve this goal, the state uses various measures: subsidies, tax breaks, subsidizing research and development works, cheap loans, loan guarantees and derogations from the application of certain provisions antitrust) ”(cf., Budnikowski A., 2001, p. 223,224,227).

In the literature, one can find numerous arguments for the introduction of protectionist measures by individual countries. There are many criteria for their classification, one of them is the division into economic and non-economic arguments. For the so-called significant economic arguments include:

1) the arguments of the educational duty;
2) arguments for market failures;
3) Optimum duty arguments;
4) arguments for strategic trade policy.

We consider them to be rational, that is, those which, by introducing barriers to international trade, can achieve benefits in the sphere of prosperity. The argument of the educational duty is one of the most famous and oldest. The

rationale behind its introduction is to protect industry in international trade. It was first formulated by A. Hamilton and F. List, and then supplemented by, among others, J.S. Milla.

The argument of the educational duty is also consistent with the theory of comparative advantages and does not question the idea of free trade, but the perception of comparative advantages as a phenomenon that does not change over time. Of course, the argument of the educational duty also has weaknesses, such as the inability to correctly select the industry that should be protected and which will be competitive in the future, because it is best verified by the market itself. Another disadvantage is the time when protection will be needed that is difficult to define. The weakness of this duty is also apparent from the fact that the enterprises that were established and operate thanks to it, or subsidies, will not be inclined to lower costs and maintain high-quality production, which will lead to increased international competitiveness.

The doctrine of state interventionism

The customs issue was also reflected in the doctrine of state interventionism. Interventionism was a reaction to the problem of the global economic crisis. John Maynard Keynes3, who gave this doctrine a finishing touch, saw foreign trade as a need for a full employment policy. “If the source of the crisis was insufficient effective demand on the domestic market, then the improvement of the situation should be brought by faster growth of exports than imports, because then foreign demand for domestic goods grows faster than domestic demand for foreign goods, and multiplier mechanisms are activated. Limiting imports and increasing exports improve the use of domestic resources ”(Rymarczyk J., 2006, p. 35).

For the first time, Keynes introduced a demand model of production and employment in his dissertation The General Theory of Employment, Interest and Money Publisher in 1936. This model explains the causes of high unemployment and low production levels during the Great Depression of the 1930s. He suggested also the idea of close economic cooperation within the institution established to perform such a function. Its task would be to ensure full employment and payment balance. The policy of supporting exports and limiting imports, in accordance with the doctrine of interventionism, resulted in the breaking of trade ties in the second half of the 1930s and serious disruptions in international trade.

The customs union as the basis for the functioning of the common market of the European Union

By definition, a customs union "is that the members of the union break down barriers in the movement of goods and establish a common customs tariff and unify the trade policy towards external partners "(Ibidem, p. 295), and" a free trade zone is defined as a grouping of several countries within which customs duties have been abolished and other quantitative restrictions in international trade, but each country retained the right to national tariffs and to pursue an autonomous trade policy towards third countries (Ibidem).

"The free trade zone and the customs union are sometimes called preferential trade agreements, because the subject of both is international trade" (Budnikowski A., 2001, p. 248).

The effects of introducing the customs union are:

1) trade shift - replacing imports from third countries with goods from the grouping;
2) trade creation - the emergence of new trade flows; is the result of production specialization and the replacement of less efficient domestic production with cheaper products produced in another member state of the customs union.

The above-mentioned effects of the introduction of the customs union are classified as static effects, while the dynamic effects include: economies of scale, development of intra-industry trade, increase in investment, increase in competitive pressure and reduction in price margins. The basic functions will be introduced in the above chapter and tasks of the customs union within the European Union.

According to Art. 3 of the Treaty on European Community of December 1, 2009, the customs union is an exclusive competence of the European Union. 'Title two sets out the rules governing the functioning of the customs union. The provision of art. 28 of the Treaty on the Functioning of the European Union states that the Union includes a customs union that covers all trade in goods "(Laszuk M., 2009, p. 9).

The creation of the customs union can be dated on July 1, 1968, when it was initiated by the then European Economic Community - EEC. There was a complete elimination of customs duties and equivalent charges between the member states, thus the Common Customs Tariff became applicable to third countries.
Export duties in the Community trade were abolished on December 31, 1961, while the last import duties in mutual trade were abolished on July 31, 1969 - they concerned forty agricultural products.

In 2008, a strategy for the customs union was developed by the European Commission, the strategy sets out common goals that should strengthen the role of customs services in ensuring the safe operation of the common market. The goals have been set in the following areas (COM (2008) 169,: //eur-lex.europa.eu/ legal-content / PL / TXT / PDF /? uri = CELEX: 52008DC0169 & from = PL.):

Protection: protecting the public and the financial interests of the Community by:

1) ensuring the correct and efficient collection of customs duties and taxes;
2) applying effective measures to prevent the movement of illegal goods and goods subject to import bans or restrictions;
3) the further development of effective risk assessments that contribute to the fight against terrorism and criminal activities, including drug trafficking, counterfeit goods and pirated goods;
4) preventing, detecting, and investigating and prosecuting fraud and abuses related to customs law at the national level;
5) using mutual administrative assistance to ensure the correct application of the law in customs and agricultural matters.

Competitiveness: contributing to the competitiveness of European enterprises by:

1) modernizing the environment and working methods of customs services (e.g. by taking into account system approaches, greater harmonization of working methods, etc.);
2) elimination of the paper form of customs documents (creation of an electronic customs service system); and
3) taking a proactive approach to standards through endorsement international standards as appropriate, such as those of the World Customs Organization, and by developing new EU standards that could serve as global model standards.

Facilitation: to further facilitate legal trade by:

1) design and improvement of control systems through which the interference the movement of goods and the administrative burden reach the minimum required to meet other policy objectives related to public order and security requirements and by
2) making it easier for legally operating business entities to reduce compliance costs.

Control: controlling and managing supply chains applied to international flows of goods by:

1) improving and strengthening effective controls at the optimal point in the supply chain (at the border or within the EU),
2) correct and consistent application of Community and national legislation in the field of goods control and movement,
3) improving the effective and systematic transfer of information about threats,
4) Consider sharing information with major trading partners to establish a comprehensive supply chain control and management system.

Cooperation: maintaining, developing and improving good cooperation between the customs authorities of the Member States, between customs and other state administration authorities, and between the customs service and the business sector by:

1) deepening the existing cooperation in the field of customs,
2) coordinating activities aimed at protecting the financial interests of the Community,
3) taking the initiative in developing mechanisms for close coordination with other border authorities (one-stop shop),
4) improving the methods of cooperation and consultation with the enterprise sector,
5) strengthening international cooperation or mutual administrative assistance in customs matters through appropriate agreements with third countries and greater participation in international forums responsible for international law and decisions of the international community (such as embargoes, environmental protection agreements,
6) contracts relating to intellectual property rights, etc.) (Ibidem).

When implementing tasks related to the customs union, the European Commission should be guided primarily by its rational development within the European Union, support and development of trade between Member States and third countries, comply with competition rules, provide access to raw materials and semi-finished products and avoid disturbances in the economy (Brodecki Z ., 2002, p. 168).

Customs Classification

Trade policy measures are divided into tariff and non-tariff measures. Non-tariff duties are divided into par-tariff and non-tariff duties - customs duties are tariff. Fees collected in the form of duties are the most important tool of tariff trade policy. “Customs are an instrument of a legal and economic nature. The customs duty is classified as financial law in the broad sense of the term and among economic instruments because it affects the economic zone ”(Jura J., 2008, p. 25).

The customs duty can be divided in various ways, depending on what classification criterion we choose.
