When choosing the division related to the movement of goods across the customs border, import, export and transit duties are distinguished (they no longer apply). “Import duties are of the utmost importance and their purpose is to protect domestic production and the level of domestic prices, or to improve the trade and payment balance. Like other types of duties, they can also serve fiscal purposes, ie increasing state revenues ”(Rymarczyk J., 2012, p. 268). Revenues to the state budget are presented in Table 1.1, which collects statistical data for 12 years.

Customs duties are transferred to the budget of the European Union in the amount of 80% for imports with third countries. The remaining 20% remains in the country collecting the customs duty and is intended to cover the running costs of the customs administration. The amount of customs duties on goods imported to the EU is regulated by the Community Customs Tariff.

“The return to economic liberalism, which we have been observing for over a dozen years, indicates rather a general retreat from protectionist policies - organizations of countries are emerging that remove tariff barriers. An example is the countries of the European Union; countries that in 1947 they concluded the General Agreement on Tariffs and Trade (GATT) to liberalize world trade. With time, as a result of negotiations (eighth round of GATT), the process of lifting customs barriers progressed. In 1995, the GATT was incorporated into the World Trade Organization (WTO). Another example of lifting customs restrictions is the Central Europen Free Trade Agreement (CEFTA), functioning until the accession of Central and Eastern European countries to the EU ”(Owsiak S., 2005, p.187).

Currently, Donald Trump's policy shows a return to economic protectionism.

VAT in trade with countries outside the European Union

Activities subject to VAT (which is based on the EU Council's VAT Directive (Directive 2006/112 / EC of the EU Council on November 28, 2006) are specified in the Act of March 11, 2004.

"In order to assess the degree of protection of the domestic market by means of indirect measures, one should take into account - apart from customs duties - also taxes" (Dudziński J., 2010, p. 191).

The concept of tax and tax entity can be defined as follows: "A tax is a cash benefit for a public-law association, obligatory, determined unilaterally, free of charge, non-returnable and general.

Tax is a benefit defined, measured and paid in monetary units in a given country. (...) Tax revenues go to public-law unions at various levels. Most often it is their budget income. Taxes are the main source of revenues for the budgets of individual countries (in Poland, taxes account for over 85% of the state budget revenues) ”(Nykiek W., et al., 2011, p.11).

Table 1.1: Budgetary receipts in Poland in particular years - in the period from January to December of a given year

No.	Description	Budget revenues*)											
1	Year	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015

"The subjects of tax and legal relations are: a public law association which is a tax creditor, represented by a relevant authority, and a taxpayer who is the entity liable to pay the tax, ie a tax debtor" (Ibidem, p. 31).

Taxation with tax[2] on goods and services in Poland is regulated by the Act of March 11, 2004 on tax on goods and services (Journal of Laws of 2004, No. 54, item 535, as amended) - hereinafter referred to as the VAT Act. Taxable goods tax and services (VAT) are subject to (Ibidem, p. 370):

1) delivery of goods against payment and provision of services against payment in the territory of Poland;
2) export of goods;
3) import of goods;
4) intra-Community acquisition of goods for remuneration within the territory of the country,
5) intra-Community supply of goods.

"Within the meaning of the VAT Act, the export of goods is the export of goods from the territory of the country to a third country after the sale has been confirmed by the customs office. Due to the determination of the person affected by this mechanism, exports are divided into:

a) direct - the export is made by the supplier;
b) indirect - the export is made to a buyer established in another country ”(Stępień B., 2012, p. 399). The trade in goods in the act on tax on goods and services was defined as import and export of goods. The import of goods is the import of goods from the territory of a third country to the territory of the country. We have to note here that the area of impact of Directive 2006/112 / EU, i.e. defining the limit of intra-Community supplies and purchases, does not coincide with the customs territory. Due to this situation, trade in goods with third countries has a different territorial scope in the customs regulations and in indirect taxes.

From the date of Poland's accession to the EU structures, that is from May 1, 2004, customs borders between Poland and its other members were eliminated. The concepts of export and import of goods within the EU have disappeared and have been replaced by the term intra-community transactions: intra-community acquisitions of goods and intra-community supplies of goods. We continue to use the terms export and import of goods in dealing with non-EU countries. "Intra-Community acquisition of goods (CTS) takes place if the conditions for registration as a VAT-EU taxpayer are met, both on the part of the buyer and the supplier. This means the buyer and the supplier should be VAT - EU registered taxpayers in the respective Member State” (Ibidem, p. 375).
Of course, there are some exceptions, but that applies to other tax considerations.

Customs Tariff

Customs authorities are an indispensable element of almost every country and for the most ancient years they have been supervising the proper trade exchange. Customs duties were collected in Poland during the times of King Bolesław the Bold, as described above.

The literature covers customs tariffs from the turn of the 12th / 13th centuries, in particular the tariffs in Kołobrzeg from 1159, Płock from 1203, and Szczecin from 1257 (cf. Samsonowicz H., p. 705). -707).

By referring to historical materials from slightly less distant times, because of the end of World War I, you can find valuable information related to the establishment of the civil customs administration at the beginning of 1919. On August 1, 1919, the Government granted the ministers of the treasury, industry and trade the right to develop a customs tariff. The first customs tariff of the Second Polish Republic was issued on November 4, 1919, together with the ordinance and executive regulations. This event can be considered the beginning of modern customs administration in Poland (cf. http://www.sprawynauki.edu.pl/index.php?option=com_content&view=article&id=2953:co-a-ochrona-granic-ii-rp&catid= 317 & Itemid = 30, 11/19/2015).

The customs tariff in Poland was constantly changing, which was a consequence of changes taking place in the economy. The years 1998–2000 are significant for these changes. On January 1, 1998, at the same time as the customs tariff (Journal of Laws No. 158, item 1047), the Customs Code (Journal of Laws, No. 23, item 117) entered into force, and in 1999 and 2000 the customs rates were changed. The last version of the Polish customs tariff is dated January 1, 2003 and was valid until April 30, 2004.

Poland, becoming a member of the European Community, also adopted the Community Customs Tariff (Common Customs Tariff - WTC) (http://ksiegowosc.infor.pl/obrot-gospodarczy/clo/739164,Wspolna-Taryfa-Celna-i-klociągacja-towarow.html ; http: // www.psz.pl/index.php/slownik/W, access: 20/05/2016), which is valid in all Member States.

The basic legal instrument regulating trade with third countries is the Common Customs Tariff (CCT), adopted for the first time in 1968.

According to the definition, the customs tariff "is an ordered list of goods (nomenclature) containing a list of duties collected on goods crossing the customs border of a given country" (Budzowski K., 2003, p. 137).

"Customs tariff (t.c., English) - a systematic statement (classification) of goods and customs rates when goods pass through the customs border. The statement contains code numbers that allow for the assignment of individual goods to specific types, items and subheadings, a detailed description of the names of the goods to be dutiable, usually according to the degree of processing, and columns in which the amount of duty rates for individual goods is given. The columns are distinguished:

- autonomous, with the highest rates;
- conventional, most-favored-nation clause, or participation in an organization whose members benefit from reduced tariffs, such as the World Trade Organization or the European Free Trade Association;
- preferential, where the lowest duty rates are set (Universal System of Preferences). In countries belonging to the European Union, an external t.c. is used.

Integrated Tariff of the European Union (Intergrated Tariff of the European Community) including all the above-mentioned components (customs nomenclature) (Białecki K.P., 2007, p. 272).

When discussing the customs tariff, one should of course describe its most important element, which is the Combined Nomenclature (CN).

“The duty classification (n.c.) is the grouping of goods in customs tariffs based on certain criteria. Three categories of n.c. are used:

1) in alphabetical order;
2) according to the amount of customs duties;
3) according to the properties (characteristics) of the goods listed in the customs tariff (e.g. the production phase or the degree of finishing of the goods according to the content of specific ingredients).

The third criterion is now commonly used. According to the classification adopted therein, goods are divided into chapters, sections and items. There are 10 sections numbered from 0 to 9 (…). Only the US classification is different, which consists of 8 divisions divided into parts, groups and items.

Since January 1, 1988, the countries of the European Union have used the Harmonized Commodity Description and Coding System. The benefits of using this nomenclature consist in adopting a unified coding system, using an electronic data transmission system, using unambiguous statistical registration ”(Ibidem, pp. 186–187.).

The Community customs tariff of the European Union includes the resulting regulations from the obligations of the European Union towards the World Trade Organization.

Council Regulation (EEC) No 2658/87 of 23 July 1987 on the tariff and statistical nomenclature and on the Common Customs Tariff OJ L256 / 1987

(https://ec.europa.eu/neighbourhoodenlargement/sites/near/files/20161109_strategy_paper_en.pf, 2015) introduced:

1) The tariff nomenclature known as the Combined Nomenclature (CN), it includes:
  - **a)** the Harmonized System (HS) Nomenclature;
  - **b)** Community divisions to the HS nomenclature - the so-called CN subheadings where the duty rate is specified;
  - **c)** introductory provisions, additional notes to sections or chapters and footnotes relating to CN subheadings.

2) Common Customs Tariff;
3) TARIC Integrated Tariff of the European Communities;
4) the Customs Code Committee.

Integrated Customs Tariff of the European Community - TARIC (Union Customs Code, 28.07.2016) is a document adopted annually by the European Commissionand published in the Official Journal of the European Community, Series L TARIC, meets the requirements of:

1) the Community Customs Tariff;
2) external trade statistics;
3) trade policy;
4) agricultural policy;
5) other Community policies relating to the import or export of goods.

The TARIC database is open to everyone, both private economic operators and third country administrations. This database is updated daily. An electronic version is available on the website of the European Commission.

TARIC also publishes data on export and import bans, export restrictions and returns, as well as data supplementing the trade mechanism and export refunds.

On May 1, 2016, changes were made to the EU Customs Code, but the rules of the Common Customs Tariff did not change. The basis of import duties and exports is the Common Customs Tariff. Other measures, laid down in EU regulations governing specific areas of trade in goods, are applied in accordance with the tariff classification of the goods concerned (http://www.odprawacelna.pl/system-taric.html,.19.11.2015).

Summary

After Poland joined the structures of the European Union, the role of the customs duty was significantly weakened. The first chapter describes the elements of the theory of customs and the effects of introducing and canceling them. First of all, by introducing duties, the state may pursue various goals of economic policy, the theory of state interventionism should be mentioned here. Secondly, the greatest possibilities for the state to influence the market situation exist in the field of international exchange.

International trade - commodity exchange is constantly changing its shape, structure and directions. As for the theories of international trade, it can be said that they all agree that it brings additional income. As should be noted of the presented theories, there is no single theory that fully describes it. Of course, you can define some determinants - factors influencing trade - but there is never likely to be a theory of international trade that fully describes the phenomenon as international trade becomes increasingly complex.

The article also discusses the customs union, the introduction of which results in:

- trade shift - replacing imports from third countries with goods from the grouping;
- trade creation - the emergence of new trade flows.

When Poland became a member of the European Union, it had to adapt to the regulations that resulted from joining its structures, e.g. VAT in trade with non-EU countries or adopt the Community Customs Tariff, which includes regulations resulting from the EU's obligations to the World Trade Organization.

References

- [1] Currently, terms of trade can be distinguished: - price - as the ratio of the prices of exported goods to imported goods; - quantitative, i.e. the quantity of goods that must be exported in order to be able to import a certain amount of other goods; - profitable, being the product of the terms of trade indexand an export volume index; - factorial, which can be univariate when price terms of trade are weighted with the productivity index of exported goods, or two-factorial when the price terms of trade are weighted by both the index of performance in the production of goods for export and in the production of goods that the country imports.
- [2] Taxes - Value Added Tax: The Union does not set taxes in the Member States. Each country determines for itself what taxes and in what amount its citizens must pay. The only exception to this rule is the adoption of the principle that the standard rate of VAT in the Member States may not be lower than 15% (currently it is 23% in Poland). The so-called the reduced rate of this tax may not be lower than 5% (currently 8% in Poland). Cf.: W. Brzeziński, A. Górczyński, *Encyklopedia Unii Europejskiej,*p. 128.
- [3] J.M.'s theory Keynes was founded in the 1930s. It tried to explain the causes of the Great Depression (1929–1933) and mass unemployment. The classical system was rejected because it was supposed to subordinate the state of economic activity and employment to the automatic mechanism of restoring the balance of payments. The main goal of his theory was to explain the causes of internal imbalance and to provide methods of its restoration. See: *Międzynarodowe stosunki gospodarcze*, (ed.) A. Budnikowski, E. Pandemic Challenges for Bodies of Local Self-Government in Europe

Denis KRASIVSKY

Abstract

The coronavirus pandemic in Europe has shown that moderately centralized unitary states, as well as small countries, have been able to deal with it most effectively, enabling the center to carry out its orders quickly on the ground. In addition, the need for large-scale state assistance to overcome the economic consequences of quarantine reinforces paternalistic sentiments among citizens and threatens to weaken decentralization trends. At the same time, regional differences in quarantine policies within one country have highlighted the importance of good local governance, which will make citizens more responsible in the selection of members of representative bodies at the local level.

Keywords: local self-government, public administration, decentralization, crisis management, epidemic.

Introduction

The catastrophic situation with the spread of COVID 19 coronavirus in the world and in Europe, in particular, showed the necessity for a single centralized approach to the concentration of resources and their adequate allocation, created the preconditions for strengthening paternalistic tendencies in society, and on the other clearly demonstrated save lives: through self-organization on the ground, without waiting for instructions from higher authorities, a number of municipalities in the most affected countries by the pandemic have demonstrated their ability to use available resources and powers effectively to minimize the negative consequences. In other words, the pandemic has become a challenge for local self-government: on the one hand, there are preconditions for curtailing decentralization processes, and on the other hand, it forces citizens to be more responsible in the choice of representative bodies on the ground.

Quite a lot of attention is paid by researchers to the problems of crisis management (Turpin, Neal (2016)) (for example, in floods (Steen, Riana and Morsut, Claudia (2019)), the peculiarities of the organizational structure (Christensen Tom, Lægreid Per, and Rykkja Lise H. (2016)), training of officials (Sinclair Helen, Doyle Emma E.H., Johnston David M., and Paton Douglas, (2012)), the role of leadership (Boin, A. and Hart, P. (2003)), the political consequences of crises (Albrecht Frederike, (2017)) and disaster management (Sanneke, Kuipers (2019)). Also in the literature the participation of bodies of local self-government in the prevention (Smith, S. (2013) 'Emergency preparedness: a challenge for rapidly urbanizing regions of the world', 141st American Public Health Association Annual Meeting, 2–6 November, 2013, Boston, MA), control and elimination of the consequences of emergencies, primarily natural or man-made (earthquakes, floods, accidents at work)(Sinclair, H., Doyle, E.E., Johnston, D.M. and Paton, D. (2013) 'The use of emergency operations centres in local government emergency management', International Journal of Emergency Management, Vol. 9, No. 3, pp.205–228.) is covered in detail. However, the role and importance of municipalities in preventing and counteracting epidemiological phenomena were not considered in the literature until recently. The COVID 19 coronavirus epidemic showed that despite the significant number of

factors that contributed to the rate of disease spread and the effectiveness of pandemic response in each country, it revealed the importance of good governance not only nationally but also locally and regionally. This article is dedicated to the research of this aspect in the context of the experience of European countries and Ukraine.

Presenting Main Material

Significant differences between the rates of morbidity and the number of deaths are observed not only on the European continent, but also within the countries themselves. This suggests that not only the level of development of the health care system (medical infrastructure and its readiness for peak loads, the number of medical staff and their provision of personal protective equipment) but also a timely and balanced response to this played a significant role in the effectiveness of anti-epidemic policy. a threat from local and regional authorities, which has made it possible to slow down the rate of infection and prevent a sharp rise in mortality among the population.

Since the number of deaths per 1 million population indicates the quality of medical services, the age of the population, from a managerial point of view is more informative the number of infected per 1 million population, which primarily indicates the effectiveness of quarantine and public authorities at all levels.

Table 1: The number of cases of coronavirus COVID 19 infection per 1 million population as of 15.04.2020

Country	Number of cases of infection	Country	Number of cases of infection
Spain	3799	Sweden	1181
Switzerland	3043	Denmark	1153
Belgium	2897	Estonia	1055
Italy	2732	Slovenia	600
Ireland	2325	Finland	584
France	2195	Czech Republic	580
Portugal	1774	Lithuania	401
The Netherlands	1643	Romania	375
Austria	1591	Latvia	353
Germany	1584	Greece	210
Great Britain	1451	Poland	200
Norway	1243	Ukraine	86
Reference: https://www.worldometers.info/coronavirus/			

Thus, in Europe, the leaders in the number of infected are countries with a high degree of independence of territorial units (highly decentralized unitary countries with autonomous regions (Spain, Italy, and Great Britain), federations (Belgium, Germany), and confederations (Switzerland)). Small unitary countries with a high rate of centralization (Ukraine, Poland, Greece, Latvia, Romania, Lithuania, and the Czech Republic) best dealt with the pandemic.

A number of factors can explain differences in the course of the pandemic: the intensity of passenger traffic, especially international, cultural and climatic features of a particular country, quality and availability of medical services, readiness of medical infrastructure for peak loads and more. However, not the least role in this was played by the quality of public administration, in particular the degree of centralization, which affected the efficiency of response.

The peculiarity of the epidemic is the necessity for rapid detection and isolation of the first patient, checking all his contacts to curb the exponential growth of the disease. Accordingly, the sooner public authorities take measures to reduce contacts between citizens (closure of kindergartens, schools, entertainment venues, shops, etc.), the better the chances of patients receiving adequate medical care, as no health care system in the world is designed for large-scale peak loads at the hospital.

Political scientist T. Pappas identified three key factors in successfully counteracting the pandemic: 1) it is the determination and effectiveness of state leadership; 2) it is the capacity of states and their health care systems in times of crisis; 3) the willingness of society to comply with the rules established in an emergency (Papas T., (2020)). Comparing countries similar to Greece in mentality and climate, he concluded that the success of Athens in countering the pandemic is due to the quality of government. He notes that, unlike the European countries most affected by the

coronavirus, Spain and Italy, Greece is a unitary, centralized state, making government decisions quickly implemented at the regional and local levels.

The coronavirus in Italy was officially confirmed on January 31, and on February 22, it became known about the first death from the coronavirus. On March 5, when the death toll exceeded 100 (and the death toll reached 3,000), the government closed all schools. Since March 8, when confirmed cases approached 6,000, the prime minister has quarantined all of Lombardy and other northern provinces, which at the time was the most radical step in the fight against the virus anywhere outside China. On March 10, the quarantine was extended to the whole of Italy. As a result, 38 days (and 16 days from the first death) passed from the first confirmed case of the disease before a strict quarantine regime was imposed, and on March 19, Italy became the country with the highest number of confirmed deaths in the world.

The opposite situation occurred in Greece, where the first patient with coronavirus was recorded on February 26. On the same day, the country's health minister canceled all planned mass events across the country, and the government banned all study trips abroad. Thirteen days later, on March 10, when there were only 89 confirmed patients in the country and no deaths from COVID-19 were recorded, the government closed all kindergartens, schools and universities. On March 12, the first death from coronavirus was recorded in Greece. Over the next few days, the government closed theaters, cinemas, restaurants, bars, shopping malls, playgrounds, museums, cottages, parks, recreation areas, marinas, organized beaches and ski resorts; the only exceptions were supermarkets, pharmacies and food outlets. The rapid action of the Greek government has resulted in some of the lowest rates in Europe of the number of infected and dead per 1 million population.

In Ukraine, the first case of COVID-19 infection was confirmed on March 3, 2020, and on March 12 quarantine was introduced in educational institutions, on March 16 - entry of foreigners was banned and international traffic was closed, on March 18 transportation within Ukraine was stopped and traffic was restricted, public transport, only grocery stores and pharmacies are allowed to operate. On March 25, a state of emergency was declared throughout the country, and on April 6, a strict quarantine was introduced: a mandatory mask regime was introduced, no more than two people were allowed to walk on the street together, and no public places were allowed, and so on.

However, a number of local authorities without waiting for instructions has introduced most of these restrictions from public authorities. Part of the problem of countering the pandemic fell on the shoulders of mayors and bodies of local self-government, who had to resist the outbreak of the virus and at the same time ensure the functioning of cities in crisis.

It should be noted that according to the current legislation, the powers of local governments in the field of civil protection include (Article 19 of the Civil Protection Code of Ukraine): providing civil protection in the relevant territory and performing tasks created by them links of territorial subsystems; development and implementation of programs and action plans in the field of civil protection, in particular, aimed at protecting the population and territories from emergencies and preventing their occurrence, ensuring man-made and fire safety; organization and management of restoration works to eliminate the consequences of emergencies; organization and implementation of evacuation of the population, property to safe areas; development and implementation of measures aimed at ensuring the sustainable functioning of economic entities in a special period; creation and use of material reserves to prevent and eliminate the consequences of emergencies; providing social protection for victims of emergencies, including the payment of material assistance; creation of commissions on techno genic and ecological safety and emergency situations in cities, and in case of emergencies - special commissions for their liquidation (if necessary), ensuring their functioning. For coordination of activities of central and local executive bodies related to techno genic and environmental safety, protection of the population and territories, prevention and response to emergencies, regional and city state administrations establish regional commissions on techno genic and environmental safety and emergencies; and district state administrations, executive bodies of city councils, district in cities and settlement councils - local commissions on techno genic and ecological safety and emergencies (Article 6 of the Civil Protection Code of Ukraine).

In order to coordinate work for the elimination of a specific emergency and its consequences at the state, regional and local levels, special commissions for the elimination of an emergency are formed. Links of territorial subsystems of the unified state system of civil protection are created by district state administrations - in districts, and local governments - in regional centers, in cities of regional and district significance (Article 10 of the Civil Protection Code of Ukraine).

Aware of the potential threats, local authorities were forced to undertake measures that were unpopular with residents, either on their own initiative, before the relevant orders of the central government were issued, or after a relevant resolution of the Cabinet of Ministers of Ukraine. Thus, Kyiv was one of the first to impose strict restrictions, in

particular on the operation of public transport and wearing masks in public places. In Lviv, one of the first in the country to impose restrictions on the activities of trade establishments, and in early March, a headquarters was set up to combat the epidemic. In Odessa, an emergency commission and an expert council consisting of infectious disease specialists and anesthesiologists have been set up to develop recommendations and engage in strategic planning taking into account the specifics of the region. At the same time, Kharkiv tried to postpone the closure of kindergartens and schools, and the mayor insisted that local authorities were better aware of the epidemiological situation and, given true decentralization, such a situation could not happen in principle (Statement by Mr. Gennady Kernes on the situation with quarantine in schools, 2019).

Many cities have had to revise their budgets to allocate additional funds to tackle the epidemic. In particular - for the purchase of ventilators, tests and equipment for laboratories. In addition, as many medical facilities in the country lack medical equipment and personal protective equipment, cities have competed to purchase the necessary goods. In addition, in Kyiv, Lviv and Odesa, the authorities are going to pay monthly from their own budgets to doctors who are fighting coronavirus. However, later the Cabinet of Ministers of Ukraine allocated additional funds from the state budget for the payment of increased salaries to physicians. Also in these cities, it was decided to exempt from payment all enterprises that rent communal premises, but were forced to close for quarantine.

It can also be argued that it was thanks to the activities of mayors and heads of territorial communities that the outbreak of the epidemic was contained, as the country was quarantined without a third of the heads of district state administrations (DSAs). As of mid-April 2020, only 314 of the 490 required DSA heads had been appointed, and mainly deputies appointed under former President Poroshenko headed the rest of the districts. The largest staff shortages were experienced by Luhansk region (only 4 DSA heads appointed), Chernihiv region (3 DSA heads appointed out of 22), Ternopil region (5 out of 17), Kyiv region (10 out of 25), Volyn region (7 out of 16), Vinnytsia region (14 out 27) and Sumy region (0 out of 18). At the same time, only Ternopil region was among the top three in terms of the number of cases, and the fewest were recorded in Luhansk, Chernihiv, Donetsk and Sumy regions.

Bodies of local self-government have also shown a willingness to join forces to defend their rights. One example is the joint statement of 23 mayors - members of the Association of Ukrainian Cities (AUC) were against the adoption by parliament of an "anti-coronavirus" law (On Amendments to the Tax Code of Ukraine and Other Laws of Ukraine on Support of Taxpayers for the Period of Measures Aimed at Preventing the Occurrence and Spread of Coronavirus Disease (COVID-19)), which provided for the exemption of businesses from a number of taxes, including land fees and real estate tax, which go to local budgets without prior consultation with bodies of local self-government. Such tax benefits and other restrictions can cost local budgets about 12 billion UAH, which go to salaries for doctors, teachers, social workers and utilities, and so on. Subsequently, the Cabinet of Ministers allocated funds to compensate for the increased salaries of medical workers involved in the fight against coronavirus, but the proceeds from a number of abolished taxes will have a negative impact on the activities of local governments.

In addition, regular local elections are scheduled for October this year, forcing mayors and local deputies not only to think about fighting COVID-19, but also to consider the necessity to fight for re-election in the wake of growing dissatisfaction with the inevitable deterioration of the socio-economic situation after the epidemic. Therefore, in early May some regions began to weaken gradually the quarantine regime, not waiting for the appropriate order of the central government, not least for reasons of political expediency.

Conclusions

Thus, the negative consequences of the pandemic in European countries were minimized due to the prompt response to the threat, the compact size of the countries and the centralization of public administration, which facilitated the immediate implementation of central government orders. However, in addition to these obvious conclusions, it can make a number of less obvious, more fundamental ones.

This crisis has shown that the effective operation of local governments is not only the proper operation of public transport and utilities, a high level of socio-economic well-being of residents, but also saved lives. Accordingly, residents will pay less attention to the party affiliation of local politicians, focusing primarily on their managerial qualities; will more closely monitor their activities, because it depends on their survival. At the same time, this increase in public confidence in the local authorities that have effectively dealt with the pandemic is combined with another, contradictory trend - the growth of centralization and paternalistic expectations, as it turns out that only a strong state can implement and monitor strict quarantine measures of the epicenter of the crisis. Moreover, only the state can provide large-scale assistance to small and medium-sized businesses create temporary jobs until the economic crisis caused by quarantine.

The state is threatened no less by the outcome of the pandemic: against the background of serious economic problems, some territories may take advantage of the inefficiency of the central government in combating the coronavirus and insist on greater independence. Thus, one of Spain's most separatist regions, Catalonia, which was severely affected by the coronavirus and was ready to accept military aid from Madrid during its rapid spread, now says the center has taken anti-epidemic measures too late and the region could do much better on its own which he needs even more power.

The pandemic also pointed to the necessity to change management approaches to prevent and minimize the effects of pandemics. An outbreak of coronavirus in Europe has shown that the ability of local governments to respond and recover from a disaster depends largely on the actions taken in the run-up to the disaster. They must develop plans to respond to, rebuild and minimize the consequences of the disaster. They should define the role of the various organizations in the event of a disaster, the mechanisms for coordinating their activities to avoid duplication and inconsistencies. The community's ability to respond to an emergency begins with the development of a local emergency plan. Such a plan should include a list of available resources in case of various situations: floods, fires, earthquakes, etc. (for example, means and places for evacuation of the population).

Conclusion

If the city does not reach an agreement in advance on possible resources with private companies to provide transport, technical equipment, etc., it loses precious time trying to negotiate access to the resources already needed. In addition to agreeing with the private sector, the municipality may also negotiate with neighbors to join forces or provide assistance. At the same time, plans at all levels of government - local, district, and regional – have to be agreed in order to ensure effective action to combat natural disasters.

In addition to the contingency plan, special attention should be paid to emergency recovery and response projects, which should include the powers and responsibilities of public authorities, mechanisms and procedures that they will use at all levels of government in the short and long term periods of crisis recovery.

It is also worth paying special attention to the exchange of crisis and post-crisis experience between local governments, to create conditions for the dissemination of the most effective disaster management practices in the future.

siti.nuryanah@ui.ac.id

Abstract

The objective of this research is to analyze the impact of the Omnibus Law Job Creation Taxation Cluster enacted in 2020 on the management of Hajj pilgrimage fund in Indonesia by the Hajj Financial Management Agency (Badan Pengelolaan Keuangan Haji-BPKH). This research was conducted by studying the literature, especially the laws and regulations regarding hajj financial management and taxation. The results show that the tax exemptions in the Omnibus Law of the Taxation Cluster Job Creation Act can provide an increase in the allocation of benefit values to waiting hajj pilgrims. In addition, the tax exemption also potentially increases the economy of Indonesia through increasing the amount of Hajj Fund that can be invested.

Keywords: Omnibus law, Pilgrimage, Tax, Public Finance, Finance.

Introduction

In Indonesia, to be able to perform the hajj pilgrimage, prospective pilgrims must pay a certain amount of money to a bank appointed by the government and register for a portion number. This payment is commonly referred to as an initial deposit. The amount of initial deposits that must be paid by the pilgrim candidate from 1999 to 2019 has continued to increase (Sasongko 2015); as seen in the graphic below:

Figure 1: Initial Deposit by The Pilgrim Candidate
Source: Data processed by author based on Sasongko (2015)

Then after receiving notification to make Hajj repayment from the Ministry of Religion, the pilgrim candidate must pay another amount of money to the designated bank. This payment is known as a paid deposit. The amount of the deposit in full varies depending on each departure area. The amount of initial deposit and deposit paid in full by the pilgrim candidate is the hajj cost that is borne by the pilgrim candidate. The amount of Hajj costs borne by the pilgrim candidate has also continued to increase from 1999 to 2019 as shown in the graph below:

Figure 2. Hajj Cost Borne by the pilgrim candidate

Source: Data processed by author based on Gilas (2019)

Meanwhile, the real cost to carry out the hajj pilgrimage from Indonesia to Saudi Arabia and return to Indonesia per person is USD 4,558 in 2018 and USD 5.179 in 2019. This shows that there is a difference between the costs of Hajj borne by the pilgrims (initial deposit plus paid deposit) with real costs to carry out the pilgrimage.

Table 1. Difference Hajj Real Cost and The Cost of Hajj Borne by The Pilgrim

No	Description	2018	2019
1	Hajj real cost per person	USD 4,558	USD 5,179
2	The amount of initial deposits and deposits in full for the Hajj Candidates per person	USD 2,417	USD 2,518
3	Difference per person (1-2)	USD 2,141	USD 2,662
4	Number of pilgrims leaving	204,000 pilgrims	204,000 pilgrims
5	Total difference (3x4)	USD 436,710,172	USD 542,982,129

Source: Data processed by author based on Rachman (2019)

Table 1. shows the difference of USD 436,710,172 in 2018 and USD 542,982,129 in 2019. The very large difference between the real costs of Hajj and the costs of Hajj that is borne by the pilgrims (initial deposit plus payment in full) turns out to be covered by funds originating from yields or the so-called benefit value generated by the Hajj Financial Management Agency (BPKH) on investment management and placement of hajj funds.

BPKH is a public legal entity established under Law No. 34/2014 through Presidential Regulation No. 110/2017 on Hajj Financial Management Bodies. This institution has the task of carrying out corporate and non-profit hajj financial management with the aim of increasing the value of benefits or returns obtained from investing and placing pilgrimage funds that have accumulated due to the minimum haj quota per year of 221,000 prospective pilgrims compared to pilgrims whose waiting list reaches 4.2 million prospective pilgrims.

Quoted from bpkh.go.id in 2018 and 2019, according to a member of the BPKH Supervisory Board, almost all of the returns or value of benefits generated by BPKH are actually used to cover the difference between the real costs of haj and the haj costs borne by pilgrims (initial deposit plus full deposit). In other words, almost all of the returns or benefits generated by BPKH are given to the departing congregation. In fact, BPKH is also expected to provide returns to prospective pilgrims waiting (waiting list) according to the mandate of Law No. 34 of 2014.

From the explanation above, it can be concluded how important the role of BPKH is for the departing pilgrims and the waiting pilgrims. However, the fact is that currently the yield or benefit value generated by BPKH is only enough to be distributed to the departing pilgrims. Meanwhile, the waiting hajj pilgrims did not get the returns they deserved.

One of the things that causes the reduction in the value of benefits generated by BPKH is the income tax imposed on returns from investments and placement of Hajj funds. As a public legal entity in Indonesia, BPKH has the obligation to comply with the provisions in Indonesia. One of the provisions that must be obeyed by BPKH is regarding taxation. Based on Article 4 paragraph (1) of Law Number 36 Year 2008 Concerning the Fourth Amendment to Law Number 7 Year 1983 Concerning Income Tax, the object of the tax is income, which is any

additional economic capability received or obtained by the Taxpayer, whether originating from Indonesia and from outside Indonesia, which can be used for consumption or to increase the wealth of the Taxpayer concerned, under whatever name and form.

In 2018 the taxes paid by BPKH to the state reached USD 86,324,663 (Witjaksono,2019). The amount of tax is derived from income tax on investment returns on securities subject to income tax at a rate of 15% and returns from placement of hajj funds in Islamic banking products such as current accounts, savings, deposits subject to income tax at a rate of 20%.

Quoted from cnnindonesia.com, that according to BPKH Executive Board Member, the tax imposed on BPKH investment returns on Hajj funds creates problems because it contradicts the purpose of establishing BPKH to obtain optimal returns for prospective pilgrims.

On Monday, October 5, 2020, the House of Representatives (DPR) approved the Omnibus Law Job Creation Draft. One of the topics regulated in this bill is taxation. In article 111 of this bill, there is an amendment to Article 4 paragraph 3 of the Income Tax Law regarding the exemption of certain tax objects.

In relation to BPKH, the amendment is in the form of the addition of letter o, namely the tax exemption clause on funds deposited for Hajj Implementation Costs (BPIH) and/or a special BPIH, and income from the development of Hajj finance in certain financial fields or instruments, received by the Hajj Financial Management Agency (BPKH) whose provisions are regulated by or based on a Regulation of the Minister of Finance.

This clause provides the basis that the returns or benefits generated by BPKH from investments and financial placements for hajj are exempt from the imposition of income tax. However, what kind of income tax exemption model will be applied to BPKH is still not explained in detail in the bill. The mandate of the bill states that a derivative regulation is required in the form of a minister of finance regulation.

Institutionally BPKH is a unique institution because it is the only institution that manages hajj fund in Indonesia. In addition, based on Law Number 34 of 2014 concerning Hajj Financial Management, BPKH's hajj financial management is carried out in a corporate and non-profit manner. Therefor the objective of this study is to thoroughly analyze how the impact of tax exemptions in the omnibus law job creation act on the hajj fund management in Indonesia.

Having discussed the background and objective of the study, the literature review and research methodology are then presented, followed by acknowledgement and discussions. The conclusions and suggestions for future research are presented at the end of the paper.

Literature Review

Some of the regulations governing Hajj financial management, namely:

a. Law Number 34 of 2014 concerning Hajj Financial Management
   In article 24 letter a of the law, it is explained that BPKH has the authority to place and invest hajj finance in accordance with the principles of sharia, prudence, security, and value of benefits. The principle of benefit value means choosing an investment that provides the most optimal benefit value.

b. Law number 36 of 2008 concerning income tax
   The subject of Corporate Tax is an entity that is established or domiciled in Indonesia. BPKH as a public legal entity is the subject of corporate tax. Based on the explanation of article 2 paragraph 2 of the Income Tax Law, the subject of domestic corporate tax becomes a taxpayer from the time it is established or domiciled in Indonesia.

c. The Omnibus Law on Job Creation
   BPIH deposit funds (Initial deposit and paid deposit by pilgrim candidate) and income from the development of Hajj finance in certain fields or financial instruments, received by the Hajj Financial Management Agency (BPKH), the provisions of which are regulated by or based on a Regulation of the Minister of Finance.

d. Government Regulation Number 5 of 2018 concerning Hajj Financial Management
   In article 7 paragraph (2) of the government regulation, it is stated that BPKH is required to administer the financial management of Hajj and BPKH assets in accordance with the provisions of the laws and regulations.

One of the laws that BPKH must comply with is the Taxation Law. This means that the value of benefits generated by BPKH must be subject to income tax in accordance with existing taxation provisions. In addition, Article 26 paragraph (3) of the government regulation explains that the investment made by BPKH is carried out in accordance with the principle of benefit value. The principle of benefit value means choosing an investment that provides the most optimal benefit value. This regulation confirms the articles in Law No. 34/2014.

e. Presidential Regulation Number 110 of 2017 concerning Hajj Financial Management Agency
This regulation explains in more detail about the organs of the BPKH, namely the Implementing Body and the Supervisory Board which have the responsibility to carry out the management of Hajj finance which can provide optimal benefit value for BPKH.

Some of the previous studies used as a comparison and reference in this study are "Management of Hajj Funds In Indonesia" by Jumali (2018) which stated that BPKH is expected to be able to apply justice to the sharing of the benefit value (profit sharing) of hajj financial management to each pilgrim according to the waiting period.

Currently, the sharing of return given by BPKH to the departing and waiting pilgrims have not shown justice because almost all the return is given to the departing pilgrims. Meanwhile, the allocation of the waiting pilgrims is still very small. This happens partly because the return generated is still insufficient. One of the things that reduce the value of the benefits is taxes.

With the Omnibus Law Job Creation Act which has a tax exemption clause on the value of benefits generated by BPKH, it is hoped that the distribution of the value of benefits to the departing and waiting congregations will be much fairer. However, it must first be analyzed how the tax exemption model is right for BPKH.

The second research, namely the Optimization of Investment Portfolios at BPJS by Rahman (2016) states that the selection of BPJS investment instruments in addition to considering returns and risks as well as limits on applicable investment fund allocations, must also consider tax regulations. This research contradicts the Government Regulation Number 73 of 2016 concerning Income Tax on the Social Security Program by BPJS. In that regulation, tax facilities have been given on the returns received by BPJS so that BPJS should not have to consider tax regulations.

Meanwhile, for BPKH, the tax exemption clause has just been provided in the Omnibus Law Job Creation Act. This clause also does not yet regulate the technical details of the said exemption. Therefore, further analysis is needed as to what kind of tax exemption is right for BPKH.

Finally, a study entitled Optimization of BPIH Fund Investment in 2016 by the Directorate General of Hajj and Umrah Implementation of the Ministry of Religion of the Republic of Indonesia by Rahman (2017) states that the BPIH investment management system is divided into three instruments, namely SBSN (government bonds), SUN (government bonds), and time deposits. For information, the tax rate on deposits is currently at 20%, while for securities the tax rate is 15%. The rate is quite high, although the tax will flow to the state treasury, but of course it will reduce the amount of yield that should be given to pilgrims and prospective pilgrims.

With the Omnibus Law Job Creation Act, which has a tax exemption clause on the value of benefits generated by BPKH, it is hoped that the distribution of the value of benefits to the departing and waiting congregations will be fairer. However, it must first be analyzed what tax exemption model is right for BPKH.

Research Methodology

This section will describe the research methods used in this study. The method used in this research is case study and literature study. Based on Ellet (2007), a case study must have at least one of the benefits in the form of analysis, evaluation, problem solving, decision making and rule determination. The author hopes that the results of this study will be of direct use to BPKH as the only agency that manages haj funds in Indonesia.

Literature studies are carried out by collecting all relevant provisions and documents governing haj financial management, especially Hajj fund investment, such as Laws, Government Regulations, Presidential Regulations, Minister of Finance Regulations, Bank Indonesia Regulations, Financial Services Authority Regulations. The data and information obtained are used to answer questions on problem formulation

Analysis

In accordance with article 4 of Law Number 34 of 2014 concerning Hajj Financial Management, Hajj finance includes revenue, expenditure, and wealth. Furthermore, BPKH also has tax obligations in accordance with the Hajj financial business process which includes revenue, expenditure and wealth for. In summary, the BPKH's tax obligations for hajj financial revenue before the Omnibus Law on Job Creation can be seen in the Table 2 as follows:

Table 2. BPKH's Tax Obligations for Hajj Financial Revenue Before the Omnibus Law on Job Creation

No	Description		Corporate Income Tax Obligation	Witholding Tax Obligation
A	Revenues			
	1	Initial deposit and paid deposit by pilgrim candidate	Not Object through fiscal reconciliation	No Implication
	2	Yield/hajj financial development returns	Corporate income tax object/ final income tax object	Article 4 paragraph 2 Income Tax deducted (for the final income tax object)
	3	Hajj Efficiency Fund	Not Object via fiscal reconciliation	No Implication
	4	The endowment fund of the muslims	Corporate income tax object/ final income tax object	Article 4 paragraph 2 Income Tax deducted (for the final income tax object)

Source: Law number 34 of 2014, Law number 36 of 2008, self-managed

Table 3 shows the BPKH's tax obligations for hajj financial expenditures before the Omnibus Law on Job Creation In summary, as follows:

Table 3. BPKH's Tax Obligations for Hajj Financial ExpenditureBefore the Omnibus Law on Job Creation

No	**Description**		**Corporate Income Tax Obligation**	**Witholding Tax Obligation**
A	Expenditure			
	1	Costs for hajj (BPIH)	Non Deductible Expense	No Implication
	2	BPKH operational cost	Deductible Expense (if they meet the requirements)	Must deduct income tax 21/23/26 / 4a2 according to the type of transaction
	3	Placement / Financial Investment for Hajj	Non Deductible Expense	No Implication
	4	Refund of initial deposit and paid deposit	Non Deductible Expense	No Implication
	5	Special BPIH deposit balance payments to PIHK	Non Deductible Expense	No Implication
	6	Payment for Virtual Account	Non Deductible Expense	No Implication
	7	Activities for the benefit of Muslims	Non Deductible Expense	No Implication
	8	Returns the difference between BPIH and / or	Non Deductible Expense	No Implication

		BPIH deposits specifically from the determination of BPIH and / or Special BPIH for the current year		

Source: Law number 34 of 2014, Law number 36 of 2008, self-managed

Based on article 18 of Law Number 34 Year 2014, Hajj Financial Wealth includes money and goods that can be valued in cash which are managed by BPKH. In terms of taxation, hajj financial wealth is categorized as an asset that is reported in the Annual Corporate Income Tax Return. Meanwhile, from the point of view of withholding tax, there are no tax obligations that arise.

Furthermore, Article 111 of the Omnibus Law on Job Creation amends the clauses that are exempted as tax objects in article 4 paragraph 3 of the Income Tax Law. One of the amendments is the addition of letter o, namely the deposit fund for Hajj Administration Costs (BPIH) and / or a special BPIH, and income from the development of Hajj finance in certain financial fields or instruments, received by the Hajj Financial Management Agency (BPKH), the provisions of which are regulated by or based on Minister of Finance Regulation.

Finally, the tax exemption clause also has an influence on the hajj financial business process which includes revenue, expenditure and financial wealth for hajj. In summary, the BPKH's tax obligations for hajj financial revenue after the Omnibus Law on Job Creation can be seen in the table 4 as follows:

Table 4. Implications of the Omnibus Law on Job Creation on Taxation Obligations of Hajj Financial Revenue

No	Description		Before the Omnibus Law on Job Creation	After the Omnibus Law on Job Creation
A	Revenues			
	1	Initial deposit and paid deposit by pilgrim candidate	- Not Object through fiscal reconciliation - No Implication on withholding tax	- Not Object directly without fiscal reconciliation - No Implication on withholding tax
	2	Yield/hajj financial development returns	- Corporate income tax object/ final income tax object - Article 4 paragraph 2 Income Tax deducted (for the final income tax object)	- Not object on corporate income tax - Not object on final income tax - No Implication on withholding tax
	3	Hajj Efficiency Fund	- Not Object via fiscal reconciliation - No Implication on withholding tax	- Not Object directly without fiscal reconciliation - No Implication on withholding tax - Needs confirmation in the derivative regulations
	4	The endowment fund of the muslims	- Corporate income tax object/ final income tax object - Article 4 paragraph 2 Income Tax deducted (for the final income tax object)	- Not object on corporate income tax - Not object on final income tax - No Implication on withholding tax

Source: Law number 34 of 2014, Law number 36 of 2008, Omnibus Law on Job Creation, self-managed

Table 5 shows the BPKH's tax obligations for hajj financial expenditures after the Omnibus Law on Job Creation In summary, as follows:

No	Description		Before the Omnibus Law on Job Creation	After the Omnibus Law on Job Creation
A	Expenditures			
	1	Costs for hajj (BPIH)	- *Non Deductible Expense* - No Implication on withholding tax	- *Non Deductible Expense* - No Implication on withholding tax
	2	BPKH operational cost	- Deductible Expense (if they meet the requirements) - Must deduct income tax 21/23/26 / 4a2 according to the type of transaction	- Deductible Expense (if they meet the requirements) - Must deduct income tax 21/23/26 / 4a2 according to the type of transaction - Needs confirmation in the derivative regulations
	3	Placement / Financial Investment for Hajj	- *Non Deductible Expense* - No Implication on withholding tax	- *Non Deductible Expense* - No Implication on withholding tax
	4	Refund of initial deposit and paid deposit	- *Non Deductible Expense* - No Implication on withholding tax	- *Non Deductible Expense* - No Implication on withholding tax
	5	Special BPIH deposit balance payments to PIHK	- *Non Deductible Expense* - No Implication on withholding tax	- *Non Deductible Expense* - No Implication on withholding tax
	6	Payment for Virtual Account	- *Non Deductible Expense* - No Implication on withholding tax	- *Non Deductible Expense* - No Implication on withholding tax - Needs confirmation in the derivative regulations
	7	Kegiatan untuk kemaslahatan umat Islam	- *Non Deductible Expense* - No Implication on withholding tax	- *Non Deductible Expense* - No Implication on withholding tax - Needs confirmation in the derivative regulations
	8	pengembalian selisih saldo setoran BPIH dan/atau BPIH Khusus dari penetapan BPIH dan/atau BPIH Khusus tahun berjalan	- *Non Deductible Expense* - No Implication on withholding tax	- *Non Deductible Expense* - No Implication on withholding tax

Source: Law number 34 of 2014, Law number 36 of 2008, Omnibus Law on Job Creation, self-managed

Previously, hajj financial assets were categorized as assets reported in the Annual Corporate Income Tax Return. Meanwhile, from the point of view of withholding tax, there are no tax obligations that arise.

This clause is not regulated in the Omnibus Law on Job Creation. Substantially, there is no change in the process or tax implications of this expenditure so that the hajj financial assets are still categorized as assets reported in the Annual Corporate Income Tax Return. Meanwhile, from the point of view of withholding tax, there are no tax obligations that arise.

Discussions

The Omnibus Law on Taxation Cluster Job Creation Article 111 changes the clause that is exempted as a tax object in article 4 paragraph 3 of the Income Tax Law. One of the amendments is the addition of letter o, namely the deposit fund for Hajj Administration Costs (BPIH) and / or a special BPIH, and income from the development of Hajj finance in certain fields or financial instruments, received by the Hajj Financial Management Agency (BPKH), the provisions of which are regulated by or based on Minister of Finance Regulation.

In that tax exemption clause, there are several things that need further discussions, namely:

1. Regular and / or special BPIH deposits are exempted from tax objects
2. Income from hajj finance development in certain fields received by BPKH is exempted from the tax object
3. Income from hajj finance development in certain financial instruments received by BPKH is exempted from the tax object
4. Such tax exemptions are further regulated by or based on a Regulation of the Minister of Finance

Furthermore, the tax exemption clause also has an influence on the hajj financial business process which includes revenue, expenditure and hajj financial wealth as previously explained.

Conclusion and Suggestion for Future Studies

This research was conducted to analyze impact of the Omnibus Law Job Creation Taxation Cluster on the management of Hajj fund in Indonesia by the Hajj Financial Management Agency (BPKH). The tax exemption on then Omnibus Law Job Creation Taxation Cluster clause has an influence on the hajj financial business process which includes revenue, expenditure and financial wealth for hajj.

The results of this study indicate that the Omnibus Law Job Creation has several impacts on the management of Hajj finance, including income, expenditure and wealth, which have been previously mentioned, including:

a. Increasing the economy of Indonesia through increasing the amount of Hajj Fund that can be invested and/or placed

   The increase in managed funds comes from funds previously used to pay taxes on the results of financial development for hajj through tax exemption. After the enactment of the Omnibus Law on Job Creation, the results of hajj financial development are exempted from the income tax object so that BPKH will receive a higher return than before, namely the gross amount. This difference can Increasing the economy of Indonesia through increasing the amount of Hajj Fund that can be invested and/or placed.

b. Addition of benefit value allocation to the waiting hajj pilgrim

   The increase in the allocation of this benefit value comes from the funds previously used to pay taxes on the results of the financial development of the Hajj through tax cuts. After the enactment of the Omnibus Law on Employment Creation, the results of hajj financial development are exempted from the income tax object so that BPKH will receive a higher yield / value than before, namely the gross amount. BPKH can use this increase in returns to increase the allocation of benefit value sharing / virtual accounts to pilgrims.

c. Potential to reduce hajj costs paid by the pilgrims

   The amount of pilgrimage cost paid by pilgrims is discussed jointly by the government and the DPR. After the enactment of the Omnibus Law on Job Creation, the results of hajj financial development are exempted from the income tax object so that BPKH will receive a higher return than before, namely the gross amount. The increase in yields can be used as a consideration for the government and the DPR to reduce the amount of pilgrimage cost paid by pilgrims.

Further research, BPKH has several options for using additional funds under management as a result of the Omnibus Law on Job Creation. BPKH needs to conduct a more comprehensive study to determine how to use the additional managed funds.

Analysis of Tax Court Appeal Verdict for Corporate Income Tax: Indonesian Case

Ahmad Deza PERDANA
Universitas Indonesia, Indonesia, ahmad.deza.p@gmail.com

Siti NURYANAH[1]
Universitas Indonesia, Indonesia, siti.nuryanah@ui.ac.id

Abstract

There are a huge percentage of Indonesia tax court appeal decisions that were won by taxpayers. This study aims to determine from the tax court appeal decision about the characteristics of taxpayers who file an appeal of their dispute with Directorate General of Tax to the Tax Court, the causes of the dispute, the methods and techniques used for auditing corporate income tax on the dispute, and how the relationship between these factors and the verdict of the tax court appeal decision especially in corporate income tax dispute. This research was conducted using content analysis and binomial logistic regression.. The results of the logistic regression test found two variables that had a significant direct effect on the outcome of the verdict, two of them are cause of the dispute due to legislation or regulations and the annulment of dispute plead due to the tax audit method used.

Keywords: Tax compliance, principles of tax, tax dispute, tax court, appeal.

Introduction

In Indonesia, Tax Court is a judicial body to exercise judicial power for taxpayers or tax bearers who seek justice for tax disputes. The tax court has special authority to exercise the judicial power over tax disputes and to issue legal decisions within the state administrative courts. Based on data obtained on the Tax Court website, the total disputes decided by the Tax Court during the period 2012 to 2017 can be determined as 55,519. Of this amount, as much as 56% was won by the taxpayer by "entirely granted" and "partially granted" verdict.

Figure 1: Change of Percentage of Every Types of Verdict Every Year from 2008 - 2017

Based on the Central Government Financial Statements, during 2013 to 2017, Corporate Income Tax is type tax with the largest amount of revenue of all Non-Oil and Gas Income Taxes. In Table 1, it can be seen that the proportion and nominal value of the realization of corporate income tax revenue fluctuates every year. This phenomenon shows that there is a potential to increase the value of Corporate Income Tax revenue that is not yet realized. Therefore, the tax audit of Corporate Taxpayers is one form of exploring this potential. However, as described earlier, there is a phenomenon where the results of the tax audit submitted for appeal to the Tax Court tend to be won by the Taxpayer. With the quality of the human resources of the Directorate General of Taxes who are capable and standardized tax audits procedure, it is an interesting phenomenon why the results of the tax court verdicts are dominated by the decisions in favor of the Taxpayers.

This study aims to determine the causes of disputes, methods and tax audit techniques used for auditing corporate income tax on the tax court decision, as well as how the relationship between these factors and the results of the tax court appeal dispute on corporate income tax.

Literature Review

Tax Law Enforcement Theory

According to Braithwaite & Braithwaite (2001), along with the emergence of e-commerce and other technological developments, the increasing of large multinational companies ability to engage in financial engineering is an increasing threat for tax revenue from companies. In the book “Punish or Persuade”, Braithwaite (1985) states that regulatory compliance is more likely if government agencies denote and implement the rule enforcement pyramid, as shown in Figure 2.1 below.

Figure 2: Rule Enforcement Pyramid

Source: Braithwaite& Braithwaite (2001)

Further explained by Ayres and Braithwaite (1992), at the base of the pyramid, the initial attempt by government agencies was to persuade subjects with persuasion to impose compliance. The next enforcement escalation phase is a warning letter; if doing so fails to ensure compliance, the imposition of penalties in the form of fines or monetary sanctions; if that fails, criminal prosecution; if it fails, the closure or temporary suspension of the license to operate; if that fails, permanent license revocation. Braithwaite & Braithwaite (2001) explain that one way to frame responsive regulatory aspirations is to make most taxpayers believe that tax officials believe the taxpayer's desire to comply, but are also ready to implement stricter enforcement of regulations when that trust is not appreciated.

Tax Dispute

According to Purwito and Komariah (2010), a tax dispute is an event that originates from differences in perceptions, understanding, application of tax laws, and calculation of tax payables, or which actually must be paid between taxpayers and as the results of authorized tax administration audit or written decision that is not admitted by the taxpayer, causing uncertainty. The definition of tax disputes is explained in the provisions of Article 1 point 5 of Law No. 14 of 2002 concerning the Tax Court (UU PP) which reads as follows: "A tax dispute is a dispute arising

in the field of taxation between a taxpayer or a tax bearer and a competent official as a result of the issuance of a decision that can be filed for an appeal or lawsuit to the tax court based on statutory taxation legislation, including litigation for the implementation of tax collection based on the Law on Tax Collection with Distress Warrant."

The basic reason that cause disputes between taxpayers and tax authorities according to Barata (2003, p. 4) are:

a. Differences in perceptions in understanding provisions and legislation.
b. Limited time for tax officers in interpreting the taxpayers' business patterns and accounting systems.
c. The limitation of officers in understanding terms of business activities and naming accounts in bookkeeping is because taxpayers do not communicate correctly.
d. Taxpayers' ignorance and inability to understand the prevailing laws and regulations.
e. Disagreements in recognition of supporting evidence / transaction documents.

Then Purnomo (2005), adds another two cause for the disputes as described by Barata. The two cause are:
a. Taxpayers' Ignorance and inability to distinguish commercial financial reports from fiscal financial reports.
b. The limit of tax provisions and regulations.

Tax Audit

Gunadi (1999) defines tax audit as an effort to assess the level of compliance with tax obligations, both the fulfillment of formal obligations and material obligations. Tax audit are carried out to test the correctness of taxation aspects, both juridical and material aspects. According to Mardiasmo (2009), the target of the tax audit is to look for incorrect interpretations of the Law, miscalculations, specific embezzlement of income, unreal deductions and deductions that are carried out by taxpayers in carrying out their tax obligations.

The tax audit in the general tax provisions flow is a continuation of the self-assessment process carried out by the taxpayer because it is in the form of an official assessment. After the taxpayer reports the annual tax form to the tax office, if the Account Representative or other authorized official finds a reason that is compatible with the purpose of the audit, the taxpayer will be proposed for audit.

Audit methods are techniques and procedures for examining books, records and documents as well as data, information and other information, consisting of direct methods and indirect methods. Both the Direct and Indirect Methods are used to obtain audit findings based on sufficient competent evidence and the provisions of tax laws and regulations. The Indirect Method is used where the Direct Method cannot be applied and is used to support the use of the Direct Method or to identify problems. The indirect method used by the Tax Auditor consists of the cash and bank transaction approach, the source and use of funds approach, the ratio calculation approach, the unit and/or volume approach, the net worth addition approach, and the cost of living approach.

Audit techniques are methods of collecting evidence, testing, and / or proving that are developed by the Tax Auditor to ensure the accuracy of the items being examined. Audit techniques that can be used by the Tax Auditor, include the use of internal and / or external information, document validity testing, evaluation, assessment of documents, activities, systems, and the likes based on certain criteria, analysis of numbers, tracing for numbers, tracing for evidence, examining evidence in support of a transaction that has been recorded or that should be recorded (vouching), linkage testing, equalization or reconciliation, written request of information or evidence from third parties who have a relationship with the Taxpayer, confirmation of activities to obtain affirmation of the correctness and completeness of data and / or information that has been owned by other parties related to a transaction carried out by the Taxpayer, inspection, physical examination, testing for the correctness of mathematical calculations, interviews, sampling tests, Computer Assisted Audit Techniques (CAAT), and/or other inspection techniques

Research Methodology

This study uses a combined method of qualitative and quantitative approach (mixed methods). Content analysis is conducted to determine the audit methods and techniques based on Circular Letter of General Director of Tax number SE-65/PJ/2014 concerning Guidelines for the Use of Audit Methods and Techniques, as well as the characteristics of taxpayers, the causes of disputes and the main reason for the panel of judge's refusal to the results of the audits. All decisions are then grouped based on the type of dispute, the method and technique of examination performed, and the reasons for refusal by the panel of judges to statistically determine the distribution. The results of the relationship analysis of the three criteria are explained in narrative form to answer the formulated problem.

Analysis of the factors, methods and techniques that influence the verdict "completely granted" and "partially granted" were carried out using the Logistic Regression Model. The purpose of using logistic regression research tools is to see the characteristics. This is done by discussing the value of the odds ratio in each independent variable (the value of the odds ratio is (*exp (coefficient)*) of each variable). The odds ratio describes the probability that the event will be worth 0 or 1 (according to the definition of the value of the dependent variable). The explanation of the odds ratio is different from the regression coefficient in general. The exp value (coefficient) in the logistic regression or known as the odds ratio describes the odds, and does not explain how much is "higher" than the variable X. The influencing factor can be seen from the high odds ratio value, which means that the independent variable has a high influence on the results / value of the dependent variable.

To see the relationship of the factors studied to the results of the Tax Court's decision, the proposed equation model is as follows:

$$\boldsymbol{PUTUSAN = \alpha_0 + \beta_1 JENIS\ USAHA_1 + \beta_2 POKOK\ SENGKETA_2 + \beta_3 PENYEBAB\ SENGKETA_3 + \beta_4 METODE\ PEMERIKSAAN_4 + + \beta_5 DASAR\ PEMBATALAN_5 + \beta_6 TRANSFER\ PRICING_6 + \varepsilon_0} \quad \textbf{(1.1)}$$

Where:

PUTUSAN	= Verdict of the Tax Court Decision
β_0	= Constant
β_i	= Model parameters
ε	= Error
$JENIS\ USAHA_1$	= Appellant fields of business
$POKOK\ SENGKETA_2$	= Subject of dispute
$PENYEBAB\ SENGKETA_3$	= Cause of dispute
$METODE\ PEMERIKSAAN_4$	= Audit method used during tax audit
$DASAR\ PEMBATALAN_5$	= Basis of cancellation of dispute arguments by the Panel of Judges
$TRANSFER\ PRICING_6$	= Transfer pricing dispute indicator

Hereinafter, the model parameter significance test is carried out, namely the constant and coefficient (βi where i = 0,1,2,3,4). This test is conducted to determine whether the estimated parameter obtained has a significant effect on the model or not, and how much influence each of these parameters has on the model. The significance test consists of two stages, namely the test of the significance of the model parameters together and the significance test of the model parameters separately. The significance test of the model parameters is carried out by using the likelihood ratio test. The model fit test (goodness-of-fit) is used to evaluate the suitability of the model with the data, the observed value obtained is the same or close to that expected in the model. The level of confidence established in this study was 95% (α = 5%).

Results

The number of legal business entity forms of appellants from the sample studied shows that limited liability companies are the most dominant form of business entity as the basis for corporate income tax revenue. The taxpayer's business sector that filed the most appeal disputes in the sample of decisions studied was Manufacturing, with a total of 262 disputes or 49% of the total sample. In Table 1, based from the verdicts, the manufacturing business sector has almost the same number, 129 disputes for "partially granted" verdicts and 133 disputes for "grant all" decisions. This figure shows that the Directorate General of Tax gives the manufacturing industry is a fairly high level of tax compliance inspection.

Table 1: Number of Appellant Legal Entity Form Grouped According Fields of Business in the Sample Studied

Legal Entity Form	Business Field				
	Agrarian-Mining	Service	Manufacture	Commerce	Total
Partially Granted					
Permanent Establishment	0	0	1	0	1
Limited Partnership	1	0	2	1	4
Government Owned Companies	0	1	0	0	1
Limited Liability Companies	48	54	126	28	256
Foundation	0	1	0	1	2
Completely Granted					
Permanent Establishment	2	1	0	0	3
Limited Partnership	0	0	0	4	4
Non-Profit Institution	0	1	0	0	1
Government Owned Companies	0	1	0	0	1
Limited Liability Companies	39	59	133	29	260
Foundation	0	1	0	0	1
Total	90	119	262	63	534
Percentage	16,9%	22,3%	49,0%	11,8	100%

For the causes of disputes, as explained by Purnomo (2005) whom adopting from Barata (2004), there are 7 causes of disputes over tax audit results, but only 6 causes of disputes can be examined from the Tax Court Decision data obtained. Of the six causes of disputes, the causes of disputes due to disagreements in recognition of supporting evidence/transaction documents were the causes of most disputes. In addition, it can be seen in Table 2 that the number of decisions with the words of "partially granted" and "completely granted" for each type of decision tend not to be much different. Even so, the decision "completely granted" has more total causes of the dispute than the “partially granted" verdict.

Table 2: Number of Cause of Dispute Grouped According The Verdicts in the Sample Studied

Cause of Dispute	Verdict		
	Partially Granted	Entirely Granted	Total
Differences in perception in understanding the provisions and legislation	149	129	**278**
The limitation of officers in understanding terms of business activities and naming accounts in bookkeeping is because taxpayers do not communicate correctly.	203	189	**392**
Taxpayers' ignorance and inability to understand the prevailing laws and regulations.	14	7	**21**
Taxpayers' ignorance and inability to distinguish commercial financial reports from fiscal financial reports.	79	71	**150**
Disagreements in the recognition of supporting evidence / transaction documents.	217	208	**425**
The limit of tax provisions and regulations	17	23	**40**
Total	600	627	**1227**

In the data of subjects of disputes, the two subjects of disputes with the largest number are corrections of operating costs and corrections of revenue. Partially granted verdict have higher correctons of operationg cost as subject of

dispute compared to completely granted verdict. Table 4 shows that completely granted verdict tend to have fewer subjects of dispute.

Table 3: Number of Subject of Disputes in the Sample Studied

Dispute Subject by Type of Verdict	Number of Dispute Subjects	Percentage
Partially Granted		
Correction of Operating Cost	204	30.96%
Correction of Book-Tax Gap	102	15.48%
Correction of COGS	119	18.06%
Correction of Non-Operating Activity	113	17.15%
Correction of Revenue	121	18.36%
Entirely Granted		
Correction of Operating Cost	102	23.89%
Correction of Book-Tax Gap	53	12.41%
Correction of COGS	76	17.80%
Correction of Non-Operating Activity	80	18.74%
Correction of Revenue	116	27.17%
Total	**1086**	

Tables 4 and 5 show the number of audit methods and techniques used in the studied sample. Table 5 shows that there is no distinct difference in the number of indirect methods used in audit for disputes with "completely granted" and "partially granted" verdict, thought the former tend to have lower number. As with the audit, there is no distinct difference in the number of audit techniques from studied sample, but there were several techniques that had quite striking differences in numbers, namely tracing and evidence tracking techniques.

Table 4: Number of Use Of Indirect Methods in the Studied Sample

Types of Indirect Methods	Verdict		
	Partially Granted	Completely Granted	Total
Cash and Bank Transactions	87	80	167
Sources of Used Fund	72	61	133
Ratio Calculation	76	75	151
Units and/or Volume Calculation	78	78	156

It can be seen in Table 5, that tracing for numbers and tracing for evidence are more widely used in "partially granted" decisions. The two tracing techniques are interrelated techniques, and could be linked to the accounts of revenue and operating cost that are often the subject of the dispute. Accounts for operating cost and revenue are accounts that relate to daily activities, therefore recognition and documentation of both accounts could involve a large amount of documents. Then there is also manufacturing as the field business with the most number of appellant. It can be argued that the frequent use of numbers and evidence tracking techniques could be related to the number of daily transactions that are carried out by companies in manufacturing.

Table 5: Number of Audit Techniques in the Studied Sample

Tax Audit Technique	Verdict		
	Partially Granted	Entirely Granted	Total
Use of information	264	270	534
Document validity testing	57	61	118
Evaluation	256	260	516
Analyze the numbers	216	189	405
Tracing for numbers	193	147	340
Tracing for evidence	180	122	302
Vouching	111	92	203
Linkage testing	39	43	82
Equalization or reconciliation	76	58	134
Confirmation from third parties	54	29	83
Inspection	13	12	25
Physical examination	15	15	30

Simultaneous Significance Test

To test whether independent variables have significant simultant influence toward dependent variables or not, it could be done through Simultaneous Significance Test.

H0 : There is no significant simultant influence of independent varibles toward dependent variables
H1 : There is significant simultant influence of independent varibles toward dependent variables
α : 0,05
Criterion : Reject H0 if *p-value* < α, unable to reject H0 if *p-value* > α

Table 6. Simultaneous Significance Test Results

Omnibus Tests of Model Coefficients			
	Chi-square	Df	Sig.
Step	80,165	12	0,000
Block	80,165	12	0,000
Model	80,165	12	0,000

From Table 6, obtained *p-value* are 0,000, which mean reject H0, independen variables have significant simultaneous influence to dependent variable.

Partial Significance Test

To test whether whether independent variables have significant partial influence toward dependent variables or not, it could be done through Simultaneous Significance Test.

H0 : There is no significant partial influence of independent varibles toward dependent variables

H1 : There is significant partial influence of independent varibles toward dependent variables
α : 0,05
Criterion : Reject H0 if *p-value* < α, unable to reject H0 if *p-value* > α

Table 7: Partial Significance Test Results

Variable	B	S.E.	df	Sig.	Exp(B)
PROSES			3	0,992	
PROSES 1	-0,059	0,358	1	0,870	0,943
PROSES 2	0,017	0,341	1	0,960	1,017

Kel_Pokok 1	-1,809	0,291	1	0,000	0,164
Kel_Pokok 2	-1,460	0,340	1	0,000	0,232
Kel_Pokok 3	-1,544	0,272	1	0,000	0,213
Kel_Pokok 4	-1,312	0,286	1	0,000	0,269
Kel_Pokok 5	0,738	1,111	1	0,506	2,092
Penyebab_1_OPR	-0,180	0,195	1	0,356	0,836
MetodeTidakLangsung	-0,239	0,215	1	0,266	0,788
Metode	0,000	0,250	1	0,999	1,000
Transfer Pricing	0,345	0,274	1	0,207	1,412
Constant	1,035	0,330	1	0,002	2,814

Partial significance test results in Table 7 show the subject of dispute variable is a variable that partially has a significant effect on the model.

Conclusion and Suggestion

From the analysis and examination of 534 samples of studied verdicts, it can be concluded that the characteristics of the Taxpayers who file an appeal dispute over the Tax Court on the results of the Corporate Income Tax audit with the ruling "partially granted" and "completely granted" based on the legal entity form of the appellant are limited liability companies, non-profit institutions, foundations, government-owned companies, permanent establishment, and limited partnership. Meanwhile, the characteristics of the taxpayers who file an appeal to the tax court based on the fields of business of the appellant are services, manufacturing, trading and agrarian-mining. The form of legal entity with the highest number of appellants is a limited liability company, while manufacture is the field of business with the highest number of appellants.

The cause of the dispute in Tax Court appeal on the results of the Corporate Income Tax audit with the "partially granted" and "completely granted" verdict are the difference in perceptions in understanding provisions and legislation, limited time for tax officers in interpreting the taxpayer's business patterns and accounting system, the limitations of officers in understanding the terms of business activities and naming accounts in bookkeeping because taxpayers do not communicate correctly, taxpayers' ignorance and inability to understand the prevailing laws and regulations, taxpayers' ignorance and inability to distinguish commercial financial reports from fiscal financial reports, disagreements in the recognition of supporting evidence / transaction documents, and the limit of tax provisions and regulations.

The audit methods and techniques used for tax audits are regulated in the Directorate General of Taxes Circular Letter No. SE-65/PJ/2013 concerning Guidelines for the Use of Inspection Methods and Techniques. The Direct Examination Method is the use of examination techniques. There are 4 methods of indirect examination that can be examined, namely the Cash and Bank Transaction Approach, the Source of Used Fund Approach, the Ratio

Calculation Approach, the Unit and/or Volume Approach, with the cash and bank transaction approach methods are the most used for audit. The audit techniques used are the utilization of internal and/or external information, document validity testing, evaluation, analysis of numbers, tracing for numbers, tracing for evidence, vouching, linkage testing, equalization or reconciliation, confirmation of activities from third party, inspection, physical examination, testing for the correctness of mathematical calculations, interviews, sampling tests, Computer Assisted Audit Techniques (CAAT), and/or other inspection techniques.

The results of the research show the relationship between the characteristics of the Taxpayer of the Appellant, the subject and causes of tax disputes, the methods and techniques of audit with the Tax Court verdict of appeal on Corporate Income Tax with "partially granted" and "completely granted" verdict. The relationship the subject of the dispute has a partial effect on the outcome of the decision. Meanwhile, the field of business, audit methods and techniques used in tax audit did not affect the outcome of the verdict.

It is recommended that the Directorate General of Taxes establish a standard communication pattern during the audit process so that taxpayers can easily understand the intentions desired by the DGT and DGT can reduce the number of disputes that could have been avoided. This is in accordance with what has been explained by Wahyudi, Ludigdo, and Djamhuri (2017) that tax disputes from the perspective of a tax auditor, one of which is a form of communication failure which is also in line with the results of this study where the two most common causes of disputes are due to communication failures, namely the limitation of officers in understanding terms of business activities and naming accounts in bookkeeping is because taxpayers do not communicate correctly and disagreements in the recognition of supporting evidence / transaction documents.

The Directorate General of Taxes are also advised to make standards or regulations regarding the evidence that can be recognized at the level of tax audit, audit objection, and appeal. As well as establishing an understanding with the Tax Court regarding the standards and regulations of the evidence in question so that it can be applied while maintaining the independence and power of judges in determining decisions. In addition, it's advised to accelerate the digital transformation of tax documents so that tax evidence could easily be stored and searched for and to increase the awareness of taxpayers in tax administration orderliness, especially for taxpayers who are involved in certain business fields that have a large number of daily transactions.

Abstract

This research aims to determine the influence of community expectation and corporate governance on Corporate Community Involvement Disclosure (CCID). The study examines companies listed in Indonesian Kompas100 index for August 2016-January 2017 period. The data used in this research is secondary data with a sample of 45 companies with years of observation from 2011-2016. The results of this study found that community expectations, meeting frequency of board of commissioners, and the existence of GCG committees significantly positive effect on the CCID volume.

Keyword: Corporate Community Involvement Disclosures, Community Expectation, Corporate Governance

Introduction

Corporate Social Responsibility (CSR) is one of the company's efforts to foster good relations with the community. It is a form of social responsibility undertaken by companies to provide attention and concern for the environment and society, both those that are directly related to company activities or those that are not directly related to company activities. This CSR concept departs from the expectations of the community regarding the company's role in overcoming environmental and social problems.

Previous studies discussed the level of honesty and integrity, the means and methods used to conduct environmental disclosure. However, aspects of CSR classifications which are still lacking in terms of both essence and disclosure are Corporate Community Involvement (CCI) activities. Rehbein and Schuler (2015) stated that CCI is a Corporate Community Program which is a business participation of a company that involves the community in an effort to meet the needs of the communities where the company operates (Moon dan Muthuri, 2006; Yekini et al., 2015).

Yekini et al. (2016) found that there is a significant positive effect between public expectations and CCI disclosure. This research was conducted to respond to the research of Yekini et al. (2016), by providing evidence of data from Indonesia. This study extends Yekini et al. (2016) by taking Indonesian case study. This study uses the Kompas100 Index for the period August 2016-January 2017 as the population of the research sample because the stocks included in the Kompas100 Index are estimated to represent around 70-80% of the total market capitalization value of all shares listed on the Indonesia Stock Exchange.

Literature Review and Hypothesis Development

CSR Activities and Tax Aggressiveness Behaviors

CSR activities are considered to have little to do with the companies' operations, so activities outside of the context are considered less important because they cannot maximize corporate profits (Friedman, 1962 in Lanis and Richardson, 2012). However, according to Williams (2007), CSR activities should be presented in the companies' main strategies and activities, as the fulfillment of its responsibilities to the community. Avi-Yonah (2006, in Lanis

Cite this Article as: Steven JOY and Siti NURYANAH "The Influence of Community Expectation and Corporate Governance on Corporate Community Involvement Disclosure (CCID)" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

and Richardson, 2012) explains that companies are "real word" entities that must endure the rigors of competition in business environment, so that CSR disclosures can succeed the companies' business through its acceptance in community. In addition, companies also has an indirect contribution to the community through the tax payments fulfillment. Based on this situation, CSR activities and tax payments fulfillment must run simultaneously as a strategy of corporate legitimacy to be accepted by various parties, especially the community.

Based on above explanation, legitimacy theory is considered as the most appropriate theory in explaining the relationship between CSR activities and tax aggressiveness. This theory views the importance of reputation as a legitimacy strategy (Lindblom, 1993 in Bebbington et al., 2008). Thus, companies are expected to provide information on CSR activities, as voluntary disclosure, to stakeholders to enhance legitimacy through the maintenance of its reputation (van der Laan, 2009). Thus, companies are expected to be more careful not to take tax aggressiveness (Lanis and Richardson, 2012). This is conducted to make companies have a good reputation according to the views of all related parties.

In fact, CSR activities and the tax payments fulfillment are still considered as a big expense for the companies, so many are carrying out CSR activities to take tax aggressive measures in order to minimize their tax payments (Rusydi and Siregar, 2014). This is considered socially irresponsible and unacceptable actions (Lanis and Richardson, 2012), so it should be noted the factors underlying the existence of CSR activities in companies. One of the main factors that should became the motivation of companies in carrying out CSR activities is its role in generating a positive reaction because it is seen as a form of corporate compliance with its obligations, including tax payments fulfillment.

Companies need a positive reaction to be considered as companies have ethics and responsibilities (Shafer and Simmons, 2008), so it can be seen as having a good reputation. Zeng (2012) explains further that the CSR activities undertaken by companies consistently can reduce tax aggressiveness level. This is in accordance with Hoi et al., (2013) which explains that companies with irresponsible CSR activities will be more aggressive over their tax obligations. Pradipta and Supriyadi (2015) and Tiarawati (2015) also asserted that CSR activities are considered to represent the level of companies' awareness, so that responsible CSR activities will make companies more compliance with the rules by not engaging in tax aggressiveness. Based on the discussion above, a hypothesis can be developed as follows.

H1. CSR activities have a negative effect on tax aggressiveness behaviors.

Risk Management System, CSR Activities, and Tax Aggressiveness Behaviors

Implementation of CSR activities and tax payments fulfillment are two burdens for companies. Consequently, an oversight mechanism on both is indispensable. Board of Commissioners (BoC) may represent this role in order that the implementation of CSR activities and the tax payments fulfillment may work as well and benefit the communities or key stakeholders of companies (Lanis and Richardson, 2016), whether directly or indirectly. Thus, the concept of stakeholder theory can illustrate the responsibility of board of commissioners regarding CSR activities and tax aggressiveness. Stakeholder theory basically emphasizes the importance of ethics (Phillips, 2003), so that CSR activities and tax payments fulfillment can be viewed as embodiments of corporate ethical actions that are expected to work for all stakeholders, especially key corporate stakeholders.

In carrying out its duties and authorities, BoC holds the ultimate control in establishing policies within companies. Implementation of a risk management systems is a main oversight mechanism that BoC can do best, since risk management systems is one way to assess the fairness of a methodology and assumptions in preparing accounting and taxation-related information (Richardson et al., 2013). Based on that, BoC have an important role to engage in risk management related to CSR and/or taxation, as an integral implementation of a comprehensive risk management system. Thus, the reporting of CSR activities and tax payments fulfillment is a benchmark for the qualify risk management systems successful implementation (Bebbington et al., 2008; Hoi et al., 2013).

Godfrey et al. (2009), Minor and Morgan (2011) specifically explains that good CSR activities can enhance the companies' reputation and maintain the possibility of various risks, one of which risks are viewed negatively by key corporate stakeholders. This opinion is also supported by Hoi et al. (2013), which explains that the implementation of a good risk management systems will avoid the possibility of possible negative outlook, so that it will increase responsible CSR activities implementation. In addition, Richardson et al. (2013) also explains that companies that implement effective risk management systems tend to be less involved in tax aggressiveness.

Companies with more effective risk management systems should tend not to engage in fraud and fraud in financial reporting, one of which for management not to be opportunistic by choosing CSR activities only on the basis of income tax deduction. In Indonesia, the terms related to CSR activities as an aspect of income tax deduction have

been specifically regulated in Government Regulation no. 93 of 2010 on the Reduced Contributions of Gross Income. Therefore, the influence of CSR activities in reducing tax aggressiveness can be strengthened by the implementation of an effective risk management system. Based on above discussion, the second hypothesis proposed in this study is:

H2. Effective risk management systems strengthen the effect of CSR activities on tax aggressiveness behaviors.

Research Methodology

Population and Sample

This study was conducted by taking sample from a developing country namely Indonesia due to its specific characteristics related to tax reform programs as for example tax amnesty programs in 1964, 1984 and currently in 2016, besides sunset policies and changing in tax rate. The sample of this study is all listed companies in Indonesia Stock Exchange (IDX) during 2013 – 2015 except companies in industries of mining, property, real estate and building construction, and finance. This study excludes the exception companies due to the presence of special setting mechanisms and the imposition of a final income tax. Data were obtained by hand-collected, completed with Thomson Reuters DataStream. Table 1 shows the selection of companies sampled in this study which is based on purposive sampling method

Table 1: Sample Description

Sampling Selection Criteria	Total
The number of listed companies on the Indonesia Stock Exchange	537
Less:	
– Companies that are in sector: Mining (43); Property, Real Estate and Building Construction (60); Finance (89)	(192)
– Companies that do not have data completeness for 2013 - 2015	(93)
– Companies that use reporting by currencies other than rupiah	(55)
– Companies that do not use financial report for period ended Dec, 31	(2)
– Companies that meet pre-tax loss	(92)
The number of companies that can be used as samples	103
The number of observations	**309**

Research Model and Variable Operationalization

This study uses panel data analysis, which is estimated using fixed effect (FE) model using Estimated Generalized Least Square (EGLS) method through Cross-section Weighted procedure to overcome the violation of classical assumption. To test the hypotheses, this study estimates the following regression model:

$$TAGG = \beta_0 + \beta_1 CSR + \beta_2 CSR^* RMS + \beta_3 RMS + \beta_4 SIZE + \beta_5 LEV + \beta_6 CINT + \beta_7 INVINT + \beta_8 MKTBK + \beta_9 ROA + e$$

Where:

TAGG: Corporate Tax Aggressiveness is measured by DTAX measurement, which is residuals of total regression result of permanent differences in variables which are nondiscretionary items are possible not as tax aggressiveness but are known to be reasonably capable of causing permanent differences (Frank et al., 2009), which is calculated based on model:

$$PERMDIFF = \beta_0 + \beta_1 INTANG + \beta_2 UNCON + \beta_3 MI + \beta_4 CTE + \beta_5 \Delta NOL + \beta_6 LAGPERM + e$$

CSR: Corporate Social Responsibilities index in reference to Clarkson et al. (2008) and Sutantoputra (2009), which break down to hard disclosure (verifiable) and soft disclosure (unverifiable), which is calculated by formula:

$$CSR = \frac{\sum \text{Hard Disclosure Items} + \sum \text{Soft Disclosure Items}}{\text{Maximum Score}}$$

RMS: Risk Managements Systems index modified based on Risk Oversight category in ASEAN CG Scorecard, which is calculated by formula:

$$RMS = \frac{\text{Total Disclosure Items}}{\text{Maximum Score}}$$

SIZE: Firms Size is measured by calculating natural logarithm of total asset;
LEV: Leverage is measured by dividing total liabilities to total assets;
CINT: Capital Intensity is measured by dividing total fixed assets to total assets;
INVINT: Inventory Intensity is measured by dividing inventory to total assets;
MKTBK: Market to Book Ratio is measured by dividing market value to book value;
ROA: Pre-Tax Return on Asset is measured by dividing income before taxes to total asset;
e: error term.

Results

Table 2 shows that there are 48.57% of samples who have reported CSR activities. This has not reached 50%, so it can be said that the level of CSR activities reporting in Indonesia is still not good enough, this is in accordance with some previous research in Indonesia (Vidia, 2014; Rusydi and Siregar, 2014; Pradipta and Supriyadi, 2015; Tiarawati, 2015; Wahyudi, 2015; and Wijayanti et al., 2016). However, when viewed by its character, soft disclosure items have a higher value than soft disclosure items, 44% vs 56%. So that, Indonesian companies, in general, have enough awareness of their responsibilities along with the rules which required all companies to address social and environmental issues, but apparently companies still emphasize their image related to their responsibilities to build good corporate image. Then, risk management systems implementation is excellent as a high mean value shown at 73.14%.

where,
TAGG: Tax Aggressiveness Measurement (DTAX); CSR: CSR Index Scoring; RMS: Risk Management Systems Index Scoring; SIZE: Firms Size (*Ln. Total Asset*); LEV: *Leverage* (*Debt to Asset Ratio*); CINT: Capital Intensity (*Fixed Asset to Total Asset*); INVINT: Inventory Intensity (*Inventory to Total Asset*); MKTBK: *Market to Book Ratio*; ROA: *Pre-Tax Return on Asset*.

Tax aggressiveness value illustrates the value that is in the range -0.22699 to 0.33552. A positive value indicates companies commit tax aggressiveness behaviors by taxable income decreasing, and vice versa. The average rate of 0.00175 suggests that Indonesian companies generally decrease its taxable income to carry tax aggressiveness behaviors, this is in accordance with some previous research in Indonesia (Sari, 2010; Vidia, 2014; Zulma, 2015).

The results of hypothesis testing can be seen in Table 3 which presents the level of simultaneous significance (F-test) and the level of partial significance (t-test). Equation (1) is conducted to test hypothesis 1, which is the effect of CSR activities on tax aggressiveness, equation (2) is conducted to test hypothesis 2, that is the role of risk management systems in moderating the influence of CSR activities on tax aggressiveness, and equation (3) is conducted to test the character of the moderation variable, ie as a pure moderator or quasi moderator. Based on test results, intercept indicates that tax aggressiveness (TAGG) will have -0.21275 (1), -0.05313 (2), and -0.17908 (3) (in ratio) when other variables are zero.

Hypothesis 1 proposed in this study explains that CSR activities (CSR) have negative impact on tax aggressiveness behaviors (TAGG). H1 test results can be seen in equations (1) and (2) which show the regression coefficient for CSR is negative and significantly associated to tax aggressiveness behaviors (Prob <0.01), providing support for H1. In equation (1), CSR activities have a coefficient of -0.20202 indicating that any CSR activities increase of 1 point will reduce tax aggressiveness behaviors values to 0.20202. Then in equation (2), CSR activities have a coefficient of -0.59288 indicating that any CSR activities increase of 1 point will reduce tax aggressiveness behaviors values to 0.59288. These results are consistent with previous studies (e.g. Shafer and Simmons, 2008; Zeng, 2012; Hoi et al., 2013; Lanis and Richardson, 2012; Pradipta and Supriyadi, 2015; Tiarawati, 2015), whereby companies are socially responsible will become less aggressive towards taxes.

Hypothesis 2 proposed in this study explains that the effect of CSR activities on tax aggressiveness becomes higher by existence of effective risk management systems (RMS), which is interacted with CSR activities (CSR), so it becomes moderating variable (CSR*RMS). This study is the first to formally test the importance of an effective risk management systems to maintain conformity of CSR activities and fulfillment of tax payments. H2 test results can be seen in equation (2) which shows the regression coefficient for CSR*RMS is positive and significantly associated to tax aggressiveness (Prob <0.01), with values of 0.59500, indicating H2 is rejected. Positive coefficient indicates that moderating effect of risk management systems can weaken the effect of CSR activities on tax aggressiveness, as implied by Hoi et al. (2013).

Besides hypotheses testing, regression results also show the role of risk management systems (RMS) on tax aggressiveness behaviors, either as moderating or independent variable. Based on regression results in in equations (2) and (3), it was found that RMS was negative and significantly associated to tax aggressiveness behaviors (Prob <0.01), with -0.28507 (2) and -0.05031 (3). This result is consistent with Richardson et al. (2013) who described that companies with stronger or more effective risk management systems are less likely to misstate or incorrectly report financial or taxable income, have reduced opportunities to engage in activities that are directed at benefiting executive management, and are less likely to engage in complex tax aggressiveness behaviors. Thus, it can be concluded that RMS is a quasi-moderator variable, which can be used as independent variable and moderator variable. Related to control variables, the regression results indicate that overall has been in accordance to the predicted sign as described by Lanis and Richardson (2012).

Discussions and Implications

The Effect of CSR Activities on Tax Aggressiveness Behaviors

H1 test results explain that the more socially responsible companies are expected to become less aggressive towards taxes. In other words, CSR activities is able to increase the companies' compliance in fulfilling its tax payments. Several previous studies (eg, Shafer and Simmons, 2008: Zeng, 2012, Hoi et al., 2013; Lanis and Richardson, 2012; Pradipta and Supriyadi, 2015; Tiarawati, 2015) also support H1 test results. This is due to the assumption that companies with little CSR activities will be considered socially irresponsible, thus becoming more aggressive in avoiding taxes. In addition, CSR activities and tax aggressiveness also affect the long-term companies' sustainability.

CSR activities and tax payments fulfillment are one form of corporate strategy in build legitimacy, as an effort to maintain its sustainability. In accordance with discussion in the previous section, companies still continue to promote reputation through CSR activities reporting. This fits perfectly to the legitimacy theory which views the importance of disclosure of CSR activities as legitimicy strategy (van der Laan, 2009). On the other hand, the tax payments fulfillment will also generate a positive reaction for companies, thus strengthening the companies' legitimacy strategy. As both are accomplished, companies are enabled to execute legitimacy strategy in two ways (Lindblom, 1993 in Bebbington et al., 2008). First, company changes its output, method, or objectives to conform to public expectations, and then informs the public of these changes. Second, companies do not change its output, method, or purpose, but demonstrates the suitability of its outputs, methods, or objectives through education/training and information.

Basically, tax aggressiveness behavior is considered unethical and irresponsible in public perception, so it is inconsistent with the meaning contained in CSR. Thus, even though CSR activities are included in the cost that can be deducted from taxable income and done to build a good corporate image (Rusydi and Siregar, 2014), it does not mean companies do CSR activities solely to reduce its income tax. The reduction of the tax burden can be seen as common in companies, as cost reduction is seen as application of efficiency that will enhance growth and performance of companies (Pradipta and Supriyadi, 2015). Based on this view, the reduction of tax burden is more emphasized through utilization of other gaps in accordance with the rules and carried out with full responsibility. Thus, the amount of reduction of tax burden is still within reasonable limits.

The Role of Risk Management Systems in Moderating the Effect of CSR Activities on Tax Aggressiveness Behaviors

H2 test results explain that risk management systems can weaken the negative impact of CSR activities on tax aggressiveness. In other words, oversight mechanism through effective implementation of risk management systems will encourage companies to further increase CSR activities, when indicated to tax aggressiveness. Conversely, when companies are more compliant with tax payments, CSR activities become less important. This is done by companies for maximizing its earnings in such a way. This study is the first to examine the importance of an effective risk management systems to maintain corporate reputation on CSR activities and tax payments, but the results have been implicitly supported by Hoi et al. (2013).

Based on descriptive statistics in Table 2, implementation of risk management systems in Indonesia have been effective. Basically, however, risk management systems effectiveness are determined from its achievement in reducing the likelihood of various risks. Risk management systems are important element in identifying risk, one of the companies' key risks related to reputation. Reputation-related risks can occur when companies do business by ignore its responsibilities, which can be realized from CSR activities and/or tax payments fulfillment.

The test results show that risk management systems are implemented through CSR activities reporting to maintain reputation, as the embodiment of legitimacy strategy. When companies are indicted for tax aggressiveness, companies will report CSR activities to maintain its legitimacy. So it can be concluded that CSR activities are carried out irresponsibly (Hoi et al., 2013). This situation can be explained through legitimacy theory that emphasizes the importance of information to related parties, although indicated as imaging.

The test results also show the possibility of how companies executes its legitimacy strategy (Lindblom, 1993 in Bebbington et al., 2008). First, companies tries to change public perception by associating itself with symbols that have high legal status. Second, companies tries to change people's expectations by aligning them with the outputs, goals, or methods that companies has adopted. In addition, Indonesia, which is research location, as a developing country also clarify companies motivation in engaging and reporting CSR activities (Omran, 2015), that is to show that companies have responsibility and good performance solely to maintain sustainability and improve its value (Godfrey et al., 2009; Minor and Morgan, 2011).

Discussions on Control Variables

This study used several control variables related to determinants of tax aggressiveness behaviors in accordance with Lanis and Richardson (2012), which were replicated in this study. Thus, all predictive signs for control variables are also similar with Lanis and Richardson (2012). Based on main regression results presented in Table 3, overall control variables have similar signs to the prediction.

SIZE has a positive sign, which means the larger its size, companies are estimated to have a tendency to become more aggressive towards taxes, and vice versa. This is due to the assumption that the size of companies is directly proportional to its experience which will improve its ability and knowledge in many ways, so that large companies will have more knowledge and ability to manage tax payments, than small companies.

LEV and CINT have a positive sign. LEV is related to corporate loans, so when companies debt ratio is high, companies try to minimize its tax payments to make it easier to settle its debts. Then, CINT explained that the higher capital intensity, which is manifested from fixed asset turnover, will indicate the higher tax aggressiveness, because tax regulations have slightly different regulation in calculation of depreciation that it can be a gap to engage tax aggressiveness. In addition, LEV and CINT also show its interest expense and depreciation expense which are classified as deductible expense on the calculation of taxable income.

This study also uses INVINT, where firms with high inventory turnover also tend to be non-aggressive, which is shown to have a negative sign. This reinforces the role of INVINT in substituting CINT. In addition, inventory turnover can be represented through inventory calculations, which already have the same regulation between accounting and taxation, making it increasingly difficult for companies to exploit loopholes to engage in tax aggressiveness. Thus, companies are expected to become compelled to be more compliant.

The growth control variable, as measured by the MKTBK calculation, and performance-related control variables, as measured by profitability through the calculation of pre-tax ROA, show a positive sign in relation to tax aggressiveness. This is in accordance with previously mentioned, that tax aggressiveness is exist and can be regarded as usual thing. In addition, it should be emphasized that tax aggressiveness is not a tax evasion. Thus, tax aggressiveness can be seen as a form of efficiency to maintain sustainability and increase companies value. So that, the higher MKTBK and ROA, tax aggressiveness also increases, but within reasonable limits in accordance with the meaning of tax aggressiveness itself.

Sensitivity Testing

Sensitivity testing is used to determine the consistency (robustness) of the model used in the study. Sensitivity test results can be seen in Table 4 above, with details according to the changes made. This study applies sensitivity testing by making some changes to some variables, based on previous research. Some changes include changing the measurement of tax aggressiveness by proxy Permanent Difference (PERMDIFF), changing the measurement of tax aggressiveness measures by proxy Total BTD (BTD), and changing the measurement of risk management systems into the use of dummy variables (DRMS).

Sensitivity test in this study generate seven regression equations. Equation (1) looks at the sensitivity test results when using DRMS with the dependent variable DTAX. Then, equations (2) and (3) look at the sensitivity test results when the PERMDIFF dependent variable usage, equation (4) looks at the sensitivity test results when using DRMS with PERMDIFF dependent variable. Finally, equations (5) and (6) look at the sensitivity test results when the use of the BTD dependent variable, equation (7) looks at the sensitivity test results when using DRMS with the BTD dependent variable. Overall equations have been tested for model specifications and classical assumption testing.

Based on sensitivity testing results, overall equation is consistent to the main model test results, except the sensitivity equation (7), so that it can be concluded that the research model has been consistent (robust). These results also confirm that the level of corporate awareness is in line to the existence of CSR activities and tax payments fulfillment. Furthermore, risk management systems also shows its role in maintaining companies'

reputation through CSR activities or tax payments fulfillment. Thus, risk management systems will encourage CSR activities increase to form a positive image, while engaging in tax aggressiveness.

Implications of the study

The results bring an implication on the importance of companies' reputation to be legitimate. Therefore, the role of regulators is very important. This study contributes to the literature by taking the risk management systems into account in the relationship between CSR activities and tax aggressiveness behaviors. The risk management systems are assessed based on CSR index improvement that reflects the current GRI G4 and risk management systems index improvement that relate to CSR and/or taxation based on Risk Oversight category in ASEAN CG Scorecard.

Conclusion and Suggestion for Future Studies

The purpose of this study is to analyze empirically the effect of CSR activities reporting on tax aggressiveness behaviors and evaluate the role of risk management systems in influencing the effect of CSR activities reporting on tax aggressiveness behaviors. Based on the test results, it can be concluded that CSR activities applied by companies have an influence in minimizing tax aggressiveness behaviors. This can happen because CSR activities are a manifestation of ethical and responsible behaviors (Shafer and Simmons, 2008), so that more companies engage in CSR activities, companies are seen to be more ethical and responsible, thus becoming more aware of its tax payments, then become non-aggressive against its tax payments (Lanis and Richardson, 2012). In addition, the implementation of risk management systems can weaken the influence. This weakening can occur because risk management is more emphasized to maintain companies' reputation (Minor and Morgan, 2011). By engaging risk management through the implementation and reporting of CSR activities, companies are expected to be more sustainable even though it is indicated to have committed violations, particularly related to the fulfillment of its tax payments (Hoi et al., 2013).

This research has some suggestions for future research. First, measurement of tax aggressiveness can be completed with Abnormal BTD, while still using better sensitivity testing. Second, enrichment of literature so that subjectivity in content analysis can be minimized. In addition, measurement of CSR activities will be better if done by survey directly to the field area in order to obtain the primary data, which can minimize the emergence of biases that occur when the use of secondary data. Third, the development of a risk management systems index needs to be based on prior research, theory, policy, and circumstances in order to be better, objective, and reliable in explaining its effective implementation.

Abstract

This study primarily aims to investigate the determinant of company's compliance with audit committee rules. This study also examines the association of effectiveness components of audit committee, which are composition, authority, resources, and diligence with earnings management. Using 562 listed companies in Indonesia Stock Exchange (IDX) as a sample, the result shows that board of commissioner characteristics, company's size and listing age are found to be significant factors for company's compliance with audit committee rules. Additionally, the authority is positively associated, and the size of audit committee is negatively associated with earnings management. However, this study fails to find the association between audit committees' expertise and meeting frequencies with earnings management.

Keywords: audit committee effectiveness, expertise, authority, size, diligence, discretionary accruals, and company's compliance.

Introduction

The growth of Indonesian capital market is quite impressive. Based on Financial Services Authority's (OJK) data, Indonesian market succeed to rise the number of public companies up to 20% from 2007 until 2012. On the contrary, ASEAN Capital Market Forum (ACMF) issues a publication about poor rating of Indonesian public companies' governance scores compare to other public companies in South East Asia's countries in 2013. Indonesian companies only got 5th ranked out of 6th countries (http://www.investasi.kontan.co.id, 2015). At the same time, Organization for Economic Cooperation and Development's (OECD) research result states that the rating of company compliance for Indonesian companies is still low. The average scores of Indonesian company compliance are 54.55 in scale of 100 in 2013 (http://www.neraca.co.id, 2014). From both scores, it can be concluded that the implementation of good corporate governance in Indonesia is still low.

To ensure the compliances, therefore company needs an organ that can run supervision function, which is audit committee. On brief history, audit committee was designed to minimize the doubt of the independency of independent auditor's work. The presence of the committee was to recommend to management the appointment of independent auditor, therefor the result of audit work will be independent (Birkett, 1986). Nowadays, the role of audit committee has developed. Tasks and responsibilities of the committee currently have grown in supervising corporate activity. The widening of this role is to ensure the quality of financial report.

Indonesian Country's Act no. 40 (2007) about company states that one of the boards of commissioner task is in company's supervising. Concerning about this vital task, therefor the boards needs supporting structures. According to National Committee for Governance Policy (KNKG), one of structure that can support the board and needs to be established is audit committee. Moreover, Indonesian Capital Market Supervisory Body's (Bapepam dan LK) rules no. IX.I.5 (2012) poin 1.b. states that public company obliged to have an audit committee.

Based on those issues, the presence of audit committee is very critical especially for public company. Blue Ribbon Committee (1999) issued several recommendations for capital market, and its regulatory body. The concerns of the recommendations are: (a) audit committee independency, (b) the composition of audit committee, (c) audit committee charter, (d) audit result communication, (e) audit committee report, and (f) review of annual report. In accordance with BRC's recommendation, DeZoort et al. (2002) states the same concerns. DeZoort et al. concludes that an

effective audit committee covering these aspects, which are: (a) composition, (b) authority, (c) resources, and (d) diligence.

Previous research discussed about the effectiveness of audit committee were more concentrated on general characteristics of audit committee. Those characteristics include member's independency, expertise presences, size of committee, and meeting frequency. These characteristics were used in previous studies because it can be easily quantified. Meanwhile in other characteristics, there are no standard measurements yet (DeZoort et al., 2002). However, those unmeasured characteristics play an important role to achieve an effective audit committee. A few literatures that discussed about the authority and diligence of audit committee was Carcello et al. (2002). Carcello et al. using IIA's guidance and SEC's disclosure rule to measure the authority and the diligence of audit committee proxies.

This study obejctives are to identify the factors that related to public companies' compliance with audit committee rules and to identify the effect of audit committee effectiveness in earnings management. The main concern to identify the determinant factors of company compliance was referring to the issues discussed above. It can be said that the poor rating issues in governance of Indonesian public companies related to low supervision of audit committee and the potensial issue in earnings management. By using four components of audit committee effectiveness proposed by DeZoort el al. (2002) which are independency, authority, and diligence, this study try to fill the research gap, whereas no research that combine all those aspects.

Literature Review and Hypothesis Development

Company's Compliance Studies

There were few studies that particularly discussed company's compliance specifically in their compliance with audit committee related rules. Turpin and DeZoort (1998) did a study of determinant factors that influence companies to comply with applied rules. Turpin and DeZoort (1998) uses company's characteristics such as stock ownership, leverage, boards of director composition, company's size, and listing status. Their research result shows that larger companies have more sources to comply.

Nuryanah (2004) studies the determintant factors that influence public companies to comply with board governance rules. She includes company size, age of listing, and type of industry as determinant factors. The result shows that type of industry was more comply with board governance related rules. No surprisingly the result shows that financial industry was more comply compare with other type of industry concerning the financial industry have more restricted rules.

Other studies related with public company compliance were Kelton and Yang (2008), Ettredge et al. (2011), Gao and Kling (2012), Puspitaningrum and Atmini (2012), Bazrafshan et al. (2015), Liu (2015). Those studies using the same proxies as determinant factors of company compliance such as: boards of commissioner's characteristics, management ownership, and company's characteristics.

Liu (2015) did a study on governance and disclosure on low information level business environment. His study reveals that the existence of independent commissioner on boards can raise the level of corporate disclosures. Other factor which is insider trading was also related with corporate's disclosure policy.

Audit Committee's Effectiveness and Earnings Management Studies

Previous studies that discussed on audit committee effectivity and earnings management were tend focused on earnings quality and issues related tofinancial reporting and audit committee characteristics. McMullen et al. (1996) states that audit committee with at least one member with CPA's background will make the committee more aware in financial reporting, accounting, and audit issues.

The frequency of committee meeting is also related to corporate issue. Abbott et al. (2004) explore the effect of Blue-Ribbon Committee (BRC) recommendations in mitigating financial misstatement. By using 83 companies with misstated financial report as sample in 1991-1999 period, it was found that the frequency of meeting and the independency of committee related to financial misstatement. Krishnamoorthy et al. (2002) on his survey study about the association of audit committee's effectiveness to financial reporting quality shows that the presence of expertise and strong commitment of committee were important attribute to audit committee effectiveness. Bedard's (2004) study reveals the association of audit committee's expertise, independency, and acitivity with earnings management aggressiveness.

Klein (2006) studies using sample from NYSE and NASDAQ to test on board of commissioner and audit committee's characteristics and its association with earnings management. His study shows that the independency of audit committee was associated with earnings manipulation. Meanwhile, Habbash's (2012) study shows different result. Habbash reveals that there is no association between audit committee characteristics and earnings management. He and Yang (2014) states that audit committee effectiveness in minimizing earnings management is affected by certain industry rules.

Hypothesis

In two tier board country, the supervision function is run by boards of commissioner. The function of boards of commissioner is to supervise the company's operation runs by management. Most of Indonesian companies' commissioner positions are engaged by the owner itself. Therefor there will be potensial agency issue if the board is not independent. The presence of independent commissioner was to minimize this agency issue. Bazrafshan et al. (2015) states that the presence of independent supervisory board will compliment the supervision function.

In Indonesian Financial Services Authority (OJK) rules no. 33 (2014) states that there is goodwill from boards of commissioner to fully responsible and due professional care over the company's management policy supervision. In other rule, Company Act no. 40 (2007) article 114 states the responsibilities of boards of commissioner and the possibilities of lawsuit if fail to notice issue that can caused company losses. The sentence of being not comply with certain rules is also become a company loss. Consequently, the boards especially independent board member will be more aware in supervising by complying with rules. Based on this analysis, the proposed hypothesis will be as follows:

H1a: Public company with independent commissioner served as a commissioner president tends to comply with audit committee related rules.

H1b: Public company with higher portion of independent commissioner on board tends to comply with audit committee related rules.

H1c: Size of board commissioner related with compliance of audit committee related rules.

The compliance of public company to enclose audit committee report in their annual report is one of good governance practices. Nuryanah (2004) states that company's size, company's age, and type of industry are the factors that affects company's governance structur. Applicable rules required public companies to have more sources. Bigger companies have more possibility to comply with rules because they have more sources. Therefor developed hypothesis is as follow:

H1d: Size of company is positively related with company compliance with audit committee related rules.

Public company that has been listed in capital market earlier, gained an experience about the situation and reaction of capital market and its effect for the company by following certain rules (Nuryanah, 2004). Therefor the obstacles of experienced public company to implement certain rules are smaller and the possibilities are bigger. The developed hypothesis is as follow:

H1e: Listing age of public company is positively related with company compliance with audit committee related rules.

This study defines the audit committee effectiveness as a board that consist of qualified members supported with authority and resources to protect stakeholders' interests by ensuring the reliability financial reporting, internal control, and risk manajemen through diligent monitoring effort (DeZoort et al., 2002). Based on this definition, therefor the component of audit committee wiil be used in this study are composition, authority, resources, and diligence.

Members with finance and or accounting expertise were expected makes the review of financial reporting became more effective because their ability to understand the reporting process and the content of the report. McMullen et al. (1996) on his survey report states that the committee which has at least one with public accountant certification will raise the awareness in financial reporting, accounting, and auditing issues. Krishnamoorthy et al. (2002) on his survey involves auditor as participant to test the effectiveness of audit committee in financial reporting quality. The result of the survey shows that financial and or accounting's expertise, independency, and strong commitment were important attributes in effective audit committee.

Kang et al. (2011) and Sun et al. (2014) states that the association between financial and or accounting expertise with accruals discretioner is negative. Meanwhile Nelson and Devi (2013) and Garven's (2015) studies shows insignificant result. In Indonesian capital market's rule states that audit committee members should understands the financial report and one of the members should have the expertise in accounting and or financial.

Earnings management is one of many issues in accounting and financial reporting. Although accrual discretioner is not forbidden in accounting policy, however it may mislead the reader of financial report on understanding the numbers. The presence of financial and or accounting expertise can assist the board of commissioner in supervising by understanding the motive of management using the opportunities in making discretion.

Based on statements above it can be concluded that there is association between the presences of accounting and or financial expertise with earnings management practice. Therefor the developed hypothesis is as follow:

H2: Audit committee expertise is negatively associated with earnings management.

Audit committee that aware of their roles and responsibilities can maximize their function. Effectiveness in supervising can be achieved if the legitimation of the existence and the function of audit committee were acknowledged by the company. Not so many previous studies focused on audit committee's roles and responsibilities (Kalbers and Fogarty, 1993; Rittenberg and Nair, 1993; Lin et al., 2008).

Kalbers and Fogarty (1993) assert that audit committee will become more effective if supported by given strength. The strength here was the authority of the audit committee. Rittenberg and Nair (1993) view that audit committee members' needs to understand their responsibilities more specifically in order to capture issue in the financial information. Lin et al. (2008) states that the positive effect of the elevation of the quality of the financial report could only be accomplished if there is a depth understanding of the audit committee's roles and responsibilities.

On one of Indonesian capital market's and stock exchange's rules, it mentioned that audit committee was responsible for issued financial information. One of many forms of financial information review was to understand the process of financial reporting and accounting policies that management taken. With the given roles and responsibilities, audit committee supposed to taken care the review of financial information very carefully, especially in detecting financial report's issues such as earnings management. If the financial report's users misinterpret the financial report content caused by earnings management practice, consequently it becomes the responsibles of the committee. Based on those arguments stated above, therefor the developed hyphotesis is as follow:

H3: Audit committee authority is negatively associated with earnings management.

In many studies, an audit committee resource was associated with the size or numbers of audit committee member. Several studies discuss the association of the audit committee's size with earnings management (Bedard *etal*, 2004; Kang et al., 2011; Nelson and Devi, 2013; Sun et al., 2014; Ramachandran et al., 2015; Garven, 2015). Bedard et al. (2004) study the association of expertise, independency, and activity of audit committee with earnings management. The activity on their study was proxy of audit committee size. Their judgment states that the committee size should not be excessive in order to maintain the effectiveness supervisory function. However, their study shows positive association but statistically insignificant.

In contrast, Garven (2015) and Sun et al. (2014) shows a negative association between audit committee's size and discretionary accrual. It means that the more member of audit committee, the lower the number of discretionary accruals. Sun et al. (2014) investigate the association of audit committee's characteristics with real earnings management in United States. One of tested variable was audit committee's size. Their judgment was by adding more members in committee, the knowledge of the committee will be becoming much better and minimizing the opportunities of management in influencing the committee. One of BRC (1999) recommendation was the audit committee consist of at least three persons. Indonesian capital market rules also follow it by obligate the public company to have an audit committee headed by independent commissioner and two independent others as a member. Based on disparities arguments and results as above, the development of the hypothesis is as follow:

H4: Audit committee size is associated with earnings management.

Previous studies use meeting frequency as audit committee's diligence proxy (McMullen, 1996; Kang et al., 2011; Garven, 2015). McMullen (1996) states that the companies with less frequent meeting have potential issue with financial reporting. Same studies conducted by Garven (2015) states that companies with less frequent audit committee meeting tend to ineffective in supervising management, especially on earnings management issue. Based on Kang et al. (2015) studies show that audit committee meeting frequency have negative association with earnings management. Companies with more frequent audit committee meeting will reduce the level of management aggresiveness in doing earnings management.

Earnings management practice is still the concerns in financial reporting issue. Considering the urgent of this issue, therefor the companies needs to discuss it among the supervisory board, independent auditor and the management

continuosly. These meetings are to ensure that the published financial report was free from management discretion. Based on those explanations above, the developed hypothesis is as follow:

H5: Audit committee diligence is negatively associated with earnings management.

Research Method

Population, Samples, and Data

The population of this study is public companies listed in Indonesian Stock Exchange. Purposive non-probability samplings were used to obtain the sample. The criteria sets are as follow: (1) the companies listed from 2012 until 2014; (2) financial sector is excluded because it's specific regulation and the different treatment to measure the discretionary accruals (Siregar & Utama, 2008); (3) the financial data for 2012, 2013, and 2014 are available in Eikon Thompson Reuters database; (4) the companies has audit committee since 2013; and (5) consist of 6 companies of each industry sector in each year in order to get an efficient model of estimated discretionary accrual (Subramanyam, 1996).

This study use published annual and financial report as source of the data. Financial data were taken from Eikon Thompson Reuters and annual reports were taken from Indonesian Capital Market Directory (ICMD), Indonesian Stock Exchange, and companies official worldwideweb sites. For statistical testing, this study use balance panel because to observe dynamic changes, it is more proper to use repeated numbers of cross section observation (Gujarati & Porter, 2009).

Research Model

This study develops two models to be tested on hypothesis testing. Model 1 was used to test determinant factors that associated with public company's compliance with audit committee related rules. Model 2 was used to test the association of audit committee effectiveness with earnings management.

$$ACCOMPit= \beta0+\beta1dBCCHAIRit+\beta2BCPROPit+\beta3BCSIZEit+\beta4LnASSTit+ \beta5\ AGEit+\beta6dINDUSTit+\varepsilon \quad \textbf{(Model 1)}$$

Where ACCOMP is the numbers of information that company's comply to compare to all information needs to be comply (ratio), dBCCHAIR is the independent commissioner whose also chief commissioner (dummy), BCPROP is the numbers of independent commissioner compare to numbers boards of commissioner (ratio), BCSIZE is the numbers of boards of commissioner (number), LnASST is natural logarithm of company's total asset (Ln), AGE is the numbers of years since company listed in stock exchange (number), dINDUST is the type of industry (dummy).

$$DACCit= \alpha0+\alpha1ACEXPit+\alpha2ACRESPit+\alpha3ACSIZEit+\alpha4ACMEETit+ \alpha5LnASSTit+\alpha6ROAit+\alpha7DERit+\alpha8dBIGit+\varepsilon it \quad \textbf{(Model 2)}$$

Where DACC is the absolut number of discretionary accruals, ACEXP is the numbers of accounting and or financial expertise on committee, ACRESP is the numbers of committee's responsibilities information that company's mention in committee's charter compare to all committee's responsibilities information according to rules, ACSIZE is the numbers of committee member (number) ACMEET is the numbers of committee meeting per year (number), LnASST is natural logarithm of company's total asset (Ln), ROA is return on asset (ratio), DER is company's leverage (rasio), dBIG is the category of accounting firm (dummy).

Variables

Variables used in this study are describes and measures as follows (Table 1).

Table 1 Variables

Code	Description	Measurement
DACC	Earnings Management	The absolut value of total residual of discretionary accrual
ACCOMP	Company's compliance with audit committee related rules	Scoring and ratio
ACEXP	The presence of audit committees' financial and or accounting expertise	Number
ACRESP	Number and percentage of audit committee responsibilities' items stated on company's annual report.	Scoring and ratio
ACSIZE	Number of committee's member	Number
ACMEET	Number of committee's meeting per year	Number
dBCCHAIR	Indepent commissioner as a chief of board of commissioner	*Dummy* (1; 0)
BCPROP	Percentage of independent commissioner on board	Ratio
BCSIZE	Number of board of committees' member	Number
LnASST	Company's size	Natural Logarithm
ROA	Profitability	Ratio
DER	Leverage	Ratio
AGE	Listing age (since IPO)	Number
dINDTYP	Industry Sectors (Manufactures or others)	*Dummy* (1; 0)
dBIG	Public Accounting Firm (Big 4 or non-Big 4)	*Dummy* (1; 0)

Results and Discussions

Based on available data in Eikon Thompson Reuters, there were 1.036 observation companies in 2013 and 2014. With the criteria given in part three, this study obtains 562 observation companies for samples. The samples were obtained described in Table 2.

Table 2 Samples

Sampel's Criteria	n
Numbers of listed companies in IDX in 2013 and 2014	1.036
Excluded: companies in financial sector	(194)
Excluded: missing data	(180)
Excluded: companies without audit committee	(2)
Excluded: industry sectors with less than two observation companies	(98)
Numbers of observation companies' samples	562

Statistics Descriptive

Table 3 shows that the Skewness number of DACC, BCPROP, ACSIZE, ACMEET, BCPROP, and DER are more than three. Therefor those variables will be treated with winsorizing method. The statistics descriptive of all variables that are used in this study are as follows:

Table 3 Descriptive Statistics

Variable	Mean	Minimum	Maximum	Skewness
ACCOMP	0,6500	0,1250	1,0000	-0,1856
DACC	**0,0000**	**-3,3937**	**5,7808**	**3,1048**
dBCCHAIR	0,1441	0,0000	1,0000	2,0319
BCPROP	**0,4053**	0,1667	**1,0000**	**3,7216**
BCSIZE	4,4021	2,0000	9,0000	0,7254
ACEXP	1,8968	1,0000	4,0000	0,2220
ACRESP	0,7329	0,1111	1,0000	-0,2405

ACSIZE	**3,0445**	**2,0000**	**6,0000**	**5,7540**
ACMEET	**5,7722**	**1,0000**	**79,0000**	**5,4453**
LnASST	28,8152	23,8666	33,0950	-0,1747
ROA	6,3665	-27,3875	86,8796	2,5314
DER	**0,8679**	-6,0802	**20,6289**	**5,8807**
dBIG	0,3665	0,0000	1,0000	0,5554
AGE	13,6461	0,4889	35,3528	0,1789
dINDUST	0,3487	0,0000	1,0000	0,6364

ACCOMP= compliance with audit committee related rules, DACC= discresionary accruals (Kazsnik's model), dBCCHAIR= independent commissioner as commissioner president (*dummy*), BCPROP= independent commissioner's proportion, BCSIZE= board of commissioner's size, ACEXP= audit committee member with accounting and or financial expertise, ACRESP= audit committee responsibilities, ACSIZE= audit committee's size, ACMEET= audit committee's meeting frequency, LnASST=natural logarithm of total asset, ROA= return on asset, DER= debt to equity ratio dBIG= public accounting firm (*dummy*), AGE= company's age of listing, dINDUST= type of industry (*dummy*)

Regression Results

Company's Compliance and Audit Committee Related Rules

Table 4 presents the panel data regression Model 1 results that test factors'that affect company's compliance with audit committee related rules. The table shows that five out of six hypotheses tested shows significant effects. Hypothesis H1a, H1b, H1c, H1d H1e are failed to be rejected. Only hypthesis H1f was rejected. The variable dINDUST is not a factor that affects the company's compliance with audit committee related rules.

Variables dBCCHAIR and AGE shows negative influence against compliance audit committee related rules. Commissioner who is not an independent commissioner of the company and its age of listing more obedient towards audit committee related rules. In contrast, BCPROP, BCSIZE, and LnASST shows positive association with audit committee related rules'compliance. These results in accordance with the prediction of the direction, which means companies with larger proportions of independent commissioners and larger number of Board members, and companies with larger total assets, has higher level of allegiance against the audit committee related rules.

Table 4 Regression Result Model 1

Variable	Hypothesis (Sign)	Coefisien	Prob. (t-Stat)	
C	(?)	4,2878	0,0000	
dBCCHAIR	H1a (+)	-0,2711	0,0000	*
BCPROP	H1b (+)	0,4347	0,0000	*
BCSIZE	H1c (+)	0,0362	0,0000	*
LnASST	H1d (+)	0,0430	0,0252	*
AGE	H1e (+/-)	-0,0058	0,0012	*
dINDUST	(+/-)	-0,0250	0,3682	
Adj. R2	0,1002			
Prob. (F-Stat)	0,0000			

*5% significant level

ACCOMP= company's compliance with audit committee-related rules, dBCCHAIR= the independent Commissioner who is the Chairman or the President Commissioner of the company (dummy), BCPROP = proportion of independent Commissioner in Council, BCSIZE = the number of members of the Board of Commissioners, LnASST = the natural logarithm of total assets, AGE = age of listing company, dINDUST = type of industrial companies (dummy)

The results of the factors that influence compliance rules related with audit committee shows that the position and the proportion of independent commissioners, the size of the board of commissioners, the company's size and the company's listing age (Hypothesis H5a, H5b, H5c, H5d, and H5e) are all factors that influence the company to abide by related audit committee. While only the kind of industrial companies (H5f Hypothesis) the only variables tested are not significant as a determinant factor for compliance related rules against issuers of the audit committee.

In contrast to Nuryanah (2004) that the industry type associates with compliance while the size and age of the listing has no effect. This could be due to the companies that were used as samples of her research include banking and finance. While in this research, companies specializing in the field of banking and finance were not included. As a note, that the oversight on the financial industry and banking in Indonesia are quite strict, so it is worth a thought to the type of banking and finance industry will affect compliance when included in the research.

Earnings Management and Audit Committee's Effectiveness

Table 5 presents the results of the regression of data panel Model 2 which test the influence of components of the audit committee's effectiveness against the earnings management. From the four hypotheses tested on the Model 2, Hypotheses H3 and H4 are failed to be rejected. Based on their significance value indicates that the information of the audit committee responsibility and the number of audit committee members are associated with earnings management but with a different direction. Audit committee's responsibilities show a positive effect towards the earnings management. This implies that companies with more audit committee responsibilities, the greater the occurrence of earnings management. While the number of audit committee members influential negatively with earnings management. This shows that the more the number of audit committee members in a company, the lesser practice of earnings management. Hypotheses H2 and H5 are rejected, although the predicition sign is in accordance with the results, but not significant enough. Hypotheses H2 and H4 indicates that there are no association between the presence of expertise in the audit committee members as well as the number of audit committee meetings with earnings management.

From the four control variables are used, only profitability (ROA) and leverage (DER) that associated with earnings management. These results are supported by the direction of predictions that show a positive result, which means that the greater the level of profits generated through investment of company assets, and the greater the level of debt compared to its capital, then the greater the earnings management. According to the result, the company's size and company's public accountant has no effect against the earnings management.

Table 5 Regression Result Model 2

Variable	Hypothesis (Sign)	Coef.	Prob. (t-Stat)	
C	(?)	0,0811	0,4917	
ACEXP	H2(-)	-0,0168	0,3738	
ACRESP	H3(-)	0,0214	0,0021	*
ACSIZE	H4(+/-)	-0,0171	0,0000	*
ACMEET	H5(-)	0,0052	0,1395	
LnASST	(+)	-0,0011	0,8046

DER	(+)	0,0053	0,0506	*
dBIG	(-)	0,0090	0,4867	
Adj. R2	0,0138			
Prob. (F-Stat)	0,0468			

* 5%
DACC= discretionary accrual's model, ACEXP= audit committee member with finance and or accounting expertise, ACRESP= audit committee responsibilities, ACSIZE= size of audit committte, ACMEET= audit committee's meeting frequency, LnASST= natural logarithm of total asset, ROA= return of asset, DER= debt to equity ratio, dBIG= public accountant firm (*dummy*)

Hypothesis H1 results shows that existence of expertise in audit committee is not significant. This is finding quite interesting because logically member with expertise in accounting and or in finance should be able detects accrual discretioner made by manager, but in fact the result had not significant. These results corroborate the results of Bedard et al. (2004), Sun et al. (2014) and Garven (2015) whose states that there is no influence of the existence of the audit committee members with expertise or accounting and finance. In this study, the criteria used to define the expertise in accounting and or finance were not very specific. To be able to understand about accrual discretioner that have been made by the manager, it may need special qualification such as certified financial analys (CFA) or certified internal auditor (CIA), and so on, that can support the expertise of the members of the audit committee in analyzing financial statements. With more specific expertise of the audit committee may be able to minimise the accrual discretioner made by the Manager.

The result of hypothesis H3 testing indicates that the audit committee's responsibilities associated significantly positive with accrual discretioner who carried out by the management. But this result is contrast with the predictions sign. The test results indicate that higher compliance of the statement of the audit committee's responsibilities with the rules, higher the discretion made by the managers. The reasons that may explain this condition is that the roles of the audit committee to detect any discretion who conducted by the management are less specific. The number of the tasks set by the regulators will open the opportunities for management to distract the focus of the audit committee in detecting discretion. Therefor it will be more focus for audit committee to supervise if the specified task was clear.

The result of Hypotheses H4 shows association between the numbers of the audit committee member with accrual discretion. The number of members of the audit committee of has a negative impact on accrual discretioner made by manager. This result suggests that the more numbers of members of the audit committee, the less discretion made by the management. These results corroborate the results of the research of Sun et al. (2014) and Garven (2015). A logical opinion related with this result is when a greater numbers of audit committee members, the scope to oversee management activities will become wider. Many individu who supervise management, the chance to maximize the opportunistic behavior will be decrease. By adding more members in the audit committee will create a lot of thought and knowledge, therefor it became less likely the monitoring function influenced by the management.

The result of hypothesis H5 indicates that the frequency of meetings of the audit committee has no effect against the accrual discretioner made by management. The results of this research strengthen Bedard et al. (2004) and Habbash *et al*. (2013). They state that there is no association between audit committee's meeting frequencies with the aggressiveness of management discretion. These result shows that this is still inconclusive to determine wether audit committee's metting frequencies with earnings management caused by vary results among related studies.

The reason that may explain this result is, in Indonesia, dualism the Office a lot happening on this position. Many members of the audit committee from public listring company occupy similar positions or other position such as in board of commissioner, director, and other managerial position in another public listing company. Dualism position potentially might make the audit committee will be unfocused in doing the monitoring function. This condition becomes an opportunity that can be exploited by managers to conduct their opportunistic behavior.

Four control variables are used in this model, i.e., the company's size, the profitability level, the leverage level, and the external audit's quality. The profitability and the leverage level show significant association. While in contrast, the size of the company and the audit quality has no association. These results are in line with the concept of earnings management, which the accrual discretioner made to affect the reported earnings. This pupose of course affects the profitability (ROA) and leverage (DER) ratio.

Differ results show no significance of the company's size and public accountant's quality. In Indonesia the practice of earnings management is not influenced by the size of the company's total assets. The manager that made discretion came from companies with small to big total assets. They have the same rationality to maximize their opportunistic behavior. Earnings management is also not affected by the company's public accountant. The result shows no different between the big-4 or non-big 4 accounting firm. This is possible because the client is exposed to the uniformity of public accountant. In Indonesia large companies generally will be audited by big-4 audit firm, while small and medium sized companies audited by the non-big-4. It can be interpreted that the risk faced by the respective public accountant will follow its clients so that the quality of the audit provided could be no different.

The regression results show that the ability of independent variables in explaining the appropriate model for measuring the dependent variable is quite low. The value of Adjusted R^2 shows 0.0138, which means there are still 98.62% of other explanatory variables that are not included in the research model.

Simultaneously, the independent variables used in model are significantly associated with earnings management. The characteristics of board of commissioners, company's size, age and type of industry significant (95% level of confidence) indicated by the value of the Prob (LR = 0.0000 statistics ").

Table 6. Sensitivity Test of Model 2

Variable	Hypothesis (sign)	Kazsnik's Model			Jones's Model			Dechow's Model			Kothari's Model		
		Coef.	Prob (t-Stat)		Coef.	Prob (t-Stat)		Coef.	Prob (t-Stat)		Coef.	Prob (t-Stat)	
C	(?)	0,0811	0,4917		0,1971	0		0,2131	0		0,2233	0

Prob (F-Stat)			0,0521			0,0078			0,0658			0,029	

*, ** 5%, 10%

DACC= discretionary accrual's model, ACEXP= audit committee member with finance and or accounting expertise, ACRESP= audit committee responsibilities, ACSIZE= size of audit committte, ACMEET= audit committee's meeting frequency, LnASST= natural logarithm of total asset, ROA= return of asset, DER= debt to equity ratio, dBIG= public accountant firm (dummy)

Robustness Test

Robustness test was conducted to see the robust of association of audit committee effectiveness component with earnings management (Model 2). In this test, the estimation number of discretionary accruals from model Kasznik was replaced with other estimation models, which are Jones (1991), modified Jones (Dechow et al., 1995), and Kothari et al. (2005).

According to the test result in Table 6, it shows that ACRESP is relatively significantly consistent (three out of four model are significant) and ACEXP and ACMEET are relatively insignificantly consistent (four out of four). Meanwhile ACSIZE is inconclusive because two out of four models show significant but insignificant on the other two models.

Company's size is significant in Jones and Kothari Models. For ROA, consistent on three models which are Kazsnik, Jones, and Dechow. dBIG becomes the only variable which is consistently insignificant in all accrual discretioner models.

Conclussion and Future Studies

By using 562 samples of listed public companies from 2013 and 2014, regression results shows that five variables used in model one and four components of audit committee effectiveness that: (a) independent commissioner as a chairman, independent commissioner proportion on board, size of board of commissioner, company's size, and length of listing affecting company to comply with audit committee related rules; (b) there is no association between audit committee expertise and audit committee diligence as audit committee effectiveness components with earnings management; (c) Audit committee roles and responsibilities and audit committee size as audit committee effectiveness components associated with earnings management.

These research results theoretically imply that the presence of audit committee was to minimize the asymmetry information between owners and agents. In organizational structure, the founding of audit committee must consider its' proper component such as composition, authority, and resources. Therefor the effectiveness of audit committee will be achieved. The regulatory board must consider the lack of compliance and the low of governance score of the public companies as serious issues in order to make the Indonesian capital market can be competing globally.

Improvements in some cases are still needed for upcoming research. The sample and the periods used were limited to only certain public companies and two years of observation. Future research needs try to look an alternative measurement of accrual discretion for a better indication of earnings management. It is also needing to be more

specific in measuring audit committee expertise's criteria and try to find literatures that can be quantifying audit committee's role and responsibilities. The regression result shows that both models used in this research were not good enough. Therefor future research needs to include variables that were not used in models nor exclude it if it were not fit in the model. Speaking of quality, future research also needs to consider exploring qualitative method, because quality needs to be measured in both methods, quantitative and qualitative.

Abstract

The paper presents an original agent-oriented methodology suitable for development process of management information systems for virtual organizations. It starts with description of emerging business structures and a semantic gap problem, which is quite common for software development projects supporting operations of modern enterprises. To eliminate this problem we have decided that system architecture source code will be generated directly from business models describing virtual organization strategy, structure, business processes, business rules and assets. The business models will be created with specific modeling methods and visual language created with UML extensions we have developed for our methodology. Using software agent and its basic characteristics as main implementation construct enabled us to provide close semantic proximity between business models and system's architecture components. Therefore it was possible to create the transformation templates that can be run in a CASE Tool environment (Enterprise Architect) with MDG Technology to generate, directly from visual models, runnable source code of the software solution that possesses high level of business value. In our opinion it is significant contribution because we have reduced the Business–IT Wall which is predominant in management information systems development projects. All modeling methods included in our approach have been based on international standards published by Object Management Group – Business Motivation Model (BMM), Business Process Model and Notation (BPMN), Unified Modeling Language (UML) and Software Process Engineering Metamodel (SPEM). This should shorten the adoption timeframe of our methodology when used by teams that are familiar with state-of-the-art business computing standards. For implementation discipline in our methodology we have adopted Belief-Desire-Intension architecture for Multi-Agent Systems that is widely used framework and its implementation – Jason environment with Agent Speak language. Before we have decided to develop brand new methodology, comparative analysis of several currently used approaches aimed at inter-organizational information systems modeling has been conducted. The analysis results, which summary is presented in the paper, have enabled us to formulate the motivations and assumptions for the approach taken. The paper also discusses the static and dynamic structure of the methodology and the example of its possible use case.

Keywords: business modeling, agent-oriented development methodology, agent-oriented-software engineering, virtual organization, semantic gap, agent-oriented management information systems.

Introduction

Nowadays business organizations are becoming increasingly complex systems. This complexity is well visible during the development process of information systems supporting modern organizations' activities. Companies are no longer monolithic structures with clear boundaries and areas of operations, well defined according to functional hierarchies. Modern business structures can take different forms. As Franke (2002) mentioned they can consist of distributed independent organizations with physical presence, that share resources to achieve common goals, or can be fully virtual and operate primarily via electronic means e.g. various forms of business webs what is described by Tapscott et al (2000). Therefore the structural and behavioral characteristics of business firms have profoundly changed. All these changes have to be taken into consideration during the process of management information systems development.

Cite this Article as: Jacek B. JAKIELA, Marcin L. OLECH and Malgorzata A. RATAJ "Crossing the Chasm – from Business Models to Software Architecture" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

Apart from the complexity of business domain there is also the problem of complexity of software, which is its essential property, not an accidental one. This inherent complexity derives – as Booch at al. (2007) and Brooks (1995) stated – from such elements as: the difficulty of managing the development process, the flexibility possible through software, and the problems of characterizing the behavior of discrete systems.

The third problem is that contemporary methodologies for software development are not equipped with modeling methods for preparing system specification including all characteristics of new business structures that have emerged. As a result a semantic gap arises between business models and software models used for implementation of management information system. This gap is the source of many problems during the process of transforming business requirements into the software architecture. The main problem is that many aspects of organization operations that should be supported by system under development are not taken into account during development process and therefore software does not support properly business goals of the enterprise. As there will be shown in the paper, the solution of this problem is to use appropriately selected modeling concepts for all of the stages of software development.

The concepts defined for every stage have to have high semantic proximity, and thanks to this, the process of transforming business model into software model is an intuitive and unambiguous mapping of specifications' artifacts.

The paper presents the original management information system development methodology that has two main goals. Firstly it improves the process of business and software complexity management. Secondly it helps to reduce the semantic gap between business requirements and system specifications prepared during software solution development process. The proposed methodology is based on the concept of software agent and its characteristics which are used as modeling constructs. The methodology enables to model and analyze the management information system with the use of CASE (Computer Aided Software Engineering) tool and finally generate source code of solution based on visual business models developed.

Emerging business models – virtual organizations

Business organizations often take a form of virtual organizations that are temporary, value-added partnerships of independent, autonomous actors, such as individuals, companies or research institutes that have established the relationships in order to work together for achieving common goals. As has been shown in Jakiela (2006) there is very close semantic proximity between basic characteristics of modern organizations and multi-agent system – it was the most important premise to use agent-oriented approach for our methodology development.

Virtual organization can be viewed as a hub of partner firms that are selected according to an actual need in order to carry out a given task on a temporary basis. They can be partnerships of independent firms with physical presence. In such case every partner delegates specific unit of organization which constitutes the part of the virtual organization structure. It can also be the whole organization that takes part in such alliance with all departments and resources it possesses. Organizations may also take fully virtual forms. With the development of the Internet and modern ICT, new ways of conducting business have evolved. Many firms without physical presence are conducting business on electronic marketplaces. Franke (2002) in his book has stated, that in such case, virtual organization is a business web platform which provides the environmental condition, such as trust, coordination mechanisms and tools, necessary for the dynamic configuration of market and customer-driven value chain constellations. Therefore the task of designing organization boils down to developing the software (in the form of business web) that will support all operations of e-business partners related to extended enterprise.

The challenge of business modeling

In order to better explain our original approach we would like to clarify the business model concept. It may be defined differently depending on the domain where it is used. Osterwalder and Pigneur (2010) define business model as "the rationale by which organization crates and delivers value to its customers and captures the value in return in a systematic, repeatable and sustainable way". They provide the modeling technique called Business Model Canvas, that supports the process of creating business models in informal way. The business model concept used in this paper is related to systems development methodologies (e.g. RUP – Rational Unified Process), where business modeling discipline is considered as a crucial part of engineering process what has been mentioned in Olech (2017). The main rationale of using business models in RUP methodology, the same as we have assumed in our approach, is to understand where systems are being deployed, who uses them, how they need to integrate with existing systems, and what specific business tasks they automate. This is a key to deploying a successful system. The business model in RUP methodology consists of several visual models that represent problem domain business processes as well as business entities/objects processed by enterprise. The modeling language used in RUP is Business Modeling Profile,

UML extensions for business models development. The main aim of Business Modeling discipline in RUP is to create the models that take into consideration all important characteristics of business domain and use them in the process of software architecture development. We have assumed that the set of business models recommended by RUP is not sufficient when developing management information systems for virtual organizations. Therefore we have focused on identification of inherent characteristics of modern business structures and then we have extended the set of business models defined in RUP with new ones, that are important for modeling virtual organizations.

Previous section presented possible forms of virtual organizations. In both cases it is possible to abstract the common characteristics of such business structures. The most important are the following:

- process oriented organization structure rather than functional hierarchy,
- dynamic nature of organization structure that can change during its lifecycle,
- high autonomy of business partners that constitute virtual organization,
- every business partner is self-contained what means that it has all needed competences and resources for conducting specific category of tasks,
- goal orientation, what means that all the tasks are organized toward achievement of common goals,
- physical distribution of partners.

All of the characteristics presented above have to be taken into account when developing the software supporting operations of virtual organizations. This is the responsibility of properly done business modeling stage. Therefore the challenge of business modeling is to find the proper modeling concepts that describe all important aspects of problem domain and then develop modeling language as well as modeling methods. What is more the business models developed should be easily transformed into software architecture that will support business organization.
If the modeling language constructs for business models does not fit the modeling language constructs for software models then semantic gap will arise that will result in software architecture that is not aligned with business requirements and the software solution will have very low level of business value or no business value at all.

Reducing semantic gap between business and software models

The semantic gap characterizes the difference between two descriptions of an object by different linguistic representations. In computer science, the concept is relevant whenever human activities, observations, and tasks are transferred into a computational representation. More precisely the gap means the difference between ambiguous formulation of knowledge related to the business domain and its computational representation in a formal language – at first system requirements specification (SRS) and then programming language used for solution implementation.
It is a fundamental task of software engineering to close the gap between application specific knowledge and technically doable formalization. For this purpose domain specific (high-level) knowledge must be transferred into algorithms and their parameters (low-level) as stated Dorai and Venkatesh(2003). When developing management information system there are two main analysis and design perspectives: business system perspective and software system perspective. In order to describe business domain, analyst with stakeholders prepare business model that formalizes all important aspects of organization's operations and structure. It typically includes organization chart, strategy related documents (vision, mission and goals statements), business processes models and data models. This constitutes the foundation for application domain analysis and requirements elicitation as well as specification. In the next stage the system specification is derived from business specification. It includes the software architecture and software features description. The main question here is "How to express business artifacts in terms of implementation constructs?" At this point the semantic gap problem usually arises because every perspective uses its own set of concepts – different for business and software modeling, and therefore there is no intuitive and unambiguous mapping between business and software mindsets. In the following sections there will be shown how to tackle this problem with original methodology developed by authors of this paper. The cornerstone of proposed solution is to base development methodology on an agent concept. Justification of such approach has widely been described in Jakiela (2006) and Olech (2017).

New methodology for new challenges

One can ask, if the new approach is needed when there are many methodologies for inter-organizational information systems development available? The answer is yes, because in most cases they do not fully meet the requirements for modeling virtual organizations. To prove this claim, the comparative analysis of available methodologies has been conducted. Detailed description and all the results of the analysis conducted may be found in Olech (2017). Next section presents only the summary of results.

Methodologies for Inter-Organizational Information Systems development – comparative analysis

The analysis takes into consideration only methodologies developed after year 2000. The approaches selected for analysis are: UN/CEFACT Modeling Methodology (UMM) designed by United Nations Economic Commission for Europe (2006), Commitment-based business modelling methodology (COMMA) proposed by Telang and Singh (2012), Tropos described by Giorgini et al. (2004) and Information-Decision Model of the Management Systems (MIDSZ) proposed by Zaborowski (2016). In the analysis conducted, the following criteria have been used:

- does the methodology fully support the business modeling discipline; as a reference model the Business Motivation Model (BMM) created by Object Management Group has been selected; in our opinion it is a best choice as BMM is an international standard for business modeling, its description can be found at Object Management Group (2015) website,
- what is the visual language of specific methodology; does the methodology use custom or standardized notation like Unified Modeling Language; the key point here is that, the approach that uses standardized visual language (e.g. UML) or its extensions can be easily adopted and used by development teams; the UML specification can be found at Object Management Group(2017) website,
- does the methodology support such disciplines as: business modeling, analysis and design as well as implementation.

The most important results of the analysis are presented in the table 1.

Table 1. Summary of methodologies comparative analysis

Methodology	Analysis results
UMM	only partial scope of reference business model (BMM) is addressed, no guidelines for implementation,
COMMA	only partial scope of reference business model (BMM) is addressed, no support for analysis & design and implementation, uses custom visual notation not standardized,
TROPOS	only partial scope of reference business model (BMM) is addressed, uses custom visual notation not standardized, uses agent oriented modeling approach (Belief-Desire-Intention Architecture) in business modeling discipline,
MIDSZ	only partial scope of reference business model (BMM) is addressed, all business models are stored in one perspective, what results in lack of clarity and problems with understanding what has been modeled, implementation of business model is in the form of simulation experiment not management information system, uses Enterprise Process Modeling Language (EPML) as a visual modeling language, which is based on UML.

Apart from the weak points listed in the table 1. one of the key problems in many available methodologies is that, they often do not offer any software support for system development activities (by software support we do understand the CASE Tool environment that can be used for developing visual models and generating the system source code according to software engineering best practices). It has significant influence on methodology adoption and its real applications. Without such support the methodology may be used in academic environment but not in real applications and management information systems development projects. Even if the software environment for specific methodology is available, it usually takes a form of modeling tool (drawing visual models – diagrams) without real support for the implementation discipline (e.g. code generation from models developed).

The methodology assumptions

The methodology has been developed according to the following assumptions:

- it is focused on business modeling discipline, what should lead to management information system with high level of business value,
- the methodology has been developed with software support for CASE tool environment what helps the users to create business models with visual modelling language based on UML extensions,
- business models may be automatically incorporated into the architecture of management information system under development, what ensures that all important business characteristics will be embedded in software solution;

- software support developed for the methodology helps the users to transform business models into agent-oriented programming language and finally generate runnable source code of the system; this has been done with the use of Model Driven Generation (MDG) Technology,
- the methodology comply with international standards like BMM, Business Process Modeling Notation (BPMN) which is presented on Object Management Group (2013) website and UML,
- the methodology process is defined with Software Process Engineering Meta-model (SPEM); its specification can be found on Object Management Group (2008) website.

The software support for the methodology in the form of CASE Tool extensions (UML Profiles) has been developed for the following reasons:

- creating visual models is relatively easy – user has to select modeling perspective and develop the specific diagram,
- all notation elements have been developed as the extensions to UML language,
- most CASE tools have built-in code generation mechanisms that transform visual models into source code of specific programming language (for example Enterprise Architect environment supports MDG Technology, what allows to write custom Code Generation Templates (CGT) that can be used to generate runnable source code directly from visual models).

Methodology structure

The methodology structure has two dimensions: static and dynamic. Static structure of the methodology describes software development process according to activities, input and output activities artifacts, roles and defined workflows. Dynamic structure presents software development process with regard to a time frame: cycles, milestones, phases and iterations.

Static structure

In the static structure of the methodology we have defined the following disciplines:

- business modeling which goals are to provide deep understanding of the business domain the management information system is being developed for and allow to build a set of models describing business requirements and domain characteristics,
- analysis and design that defines the way of business models are transformed into programing structures available in target implementation platform,
- implementation that is responsible for transforming the visual language structures into source code of selected implementation platform; in case of our methodology it is Agent Speak language with Jason Runtime Environment.

Completed visual models, which are the output of the business modeling discipline constitute input artifacts for analysis and design, as well as implementation disciplines. Business models are developed according to layered structure. Every layer defines its own perspective where specific characteristics of modeled organization are defined. The following layers have been designed:

- strategy layer – which is divided into two sections: ends – where vision, goals and objectives are modeled; means – where missions, strategies and tactics are described; this layer is based on BMM standard,
- business process layer – where business processes, sub-processes and activities are modeled as well as control flow between activities; this is based on BPMN standard,
- assets layer – it is responsible for storing information according to resources and fixed assets,
- business rules layer – where business policies, business rules and directives are defined,
- organization structure layer – which describes the division of the modeled enterprise (virtual organization) into business units.

Analysis and design discipline of our methodology includes transformation tables that specify how every element stored in business model will be converted into programming language constructs. All transformations are related to Belief-Desire-Intention (BDI) architecture of agent-oriented system (detailed description of BDI architecture can be found in Rao and Georgeff (1992)). However this is not obligatory and, in fact the transformations can be written to generate programming constructs for other programming languages, and then business models elements can be finally converted into other languages source code like: JAVA, C#, Python, etc. In the implementation discipline programming constructs generated during analysis and design, are finally transformed into source code of BDI agents what provide required functionality of management information system for specific organization.

The CASE tool environment (Enterprise Architect) we have used has built-in support for MDG Technology and therefore analysis and design as well as implementation disciplines activities could be integrated. This is significant advantage of our approach as it is possible to generate software source code directly from visual business models. In other methodologies activities in analysis and design discipline are used to develop additional models, which enable to reduce the semantic gap between business and system models. In our approach object diagrams allow for direct transformation of business models into runnable source code of management information system.

Dynamic structure

Dynamic structure of the methodology is based on Rational Unified Process developed by Rational Software Corporation (2002). The software development process has been divided into the following phases:

- inception – its goal is to ensure understanding of business domain and to formulate basic assumptions and business requirements of planned management information system,
- elaboration – main goal of that phase is to define stable architecture of solution, that can be used in construction phase,
- construction – main activities in that phase are connected to detailed design, implementation and testing of the software to develop final solution,
- transition – its goal is to deploy final software solution that meets the business requirements.

In every phase at least one iteration is needed and the number of iterations depends on complexity of the problem domain. Every iteration consists of set of activities which belong to specific discipline defined in the static structure of methodology. In every phase specific milestone has to be reached to move to the next phase of the software development process. Detailed description of methodology dynamic structure can be found in Olech (2017).

Application of Methodology

This section presents typical workflow of methodology usage which is supported by CASE Tool environment (Enterprise Architect). In the first step the business analyst has to select the type of diagram which is related to the specific modeling perspective of the organization – fig. 1.

Figure 1. Choose business model perspective

Toolbox connected to selected perspective (figure 2.) allows the business analyst to create specific business model of the organization – sample results are presented in the figure 3 which shows defined visions, goals and objectives, as well as relations between them.

Figure 2. Toolbox connected to chosen perspective

Every element of visual notation enclosed in the diagram has its own characteristics defined with the use of tagged-value fields. In the figure 4. specification of "Objective1" has been shown.

Figure 3. Part of the business model

Figure 4. Description of elements using tagged values

After the business models selected for the specific iteration are fully developed, the transformation templates can be run using MDG Technology to generate runnable source code of the software solution. Sample transformation template is presented on the Figure 5. This template instructs the code generation engine to build the source code in Agent Speak language based on visual model elements, relations between them and additional characteristics defined in the tagged values.

Figure 5. Custom Code Generation Template

Generated source code can be executed in the runtime environment - Jason platform. The ready to use solution should be extended with graphical user interface, because the CASE tool generates from the visual models only specific data and the business logic. Figure 6. presents the screenshot from Jason platform which includes the characteristics of strategy layer with ends section details represented as software agent's beliefs.

Figure 6. Sample source code generated directly from the visual business model

Conclusions

High complexity and newly emerged characteristics of contemporary business structures require new approach to management information systems development. This approach should address two main problems: enable to reduce sematic gap between business model of application domain and design model of the system under development as well as improve the process of complexity management. Paper presents the solution in the form of original agent-oriented development methodology for systems supporting virtual organizations' operations. Agent orientation is an effective way to capture and incorporate into the system architecture the structural and behavioral aspects of modern enterprises. It is possible because of very high semantic proximity of agent paradigm modeling constructs and contemporary organizations characteristics. Our methodology is generic what means that it can be used for development of systems for organizations of any specificity and industry sector. Thanks to modeling methods we have created on the basis of international standards our methodology can be fast adopted to business and engineering domains. What is more, because of very detailed business modeling discipline it is possible to model all important aspects of every organization and finally elicit the system features that will fully support virtual enterprises' business goals and objectives. As a next step in methodology development we have planned its adaptation to management

information systems supporting operations of enterprises that are under transformation towards Industry 4.0 model. From our perspective its application looks very promising.

Analysis of The Impact of Mobile Applications for The Monitoring of Hospitalized Patients: A Review of The Scientific Literature From 2015-2020

Edson De la Cruz-Peña
Universidad Autónoma del Perú, Lima, Perú, edelalalacd@autonoma.edu.pe

Michael Cabanillas-Carbonell
Universidad Autónoma del Perú, Lima, Perú, mcabanillas@ieee.org

Abstract

The document uses a review of the scientific literature from 2015-2020 to know the criteria, tools, architecture and definitions that this technology provides in this health sector, summarizes an architectural framework and methodology, and provides conclusions. The most popular journals included IEEE Xplore, Science Direct, SCIELO, ACM Digital Library. 75 related articles were produced from the search, then reviewed. The study concluded that there were four most used tools for the development of mobile tracking applications, three types of most used architectures. The analysis of mobile applications in the health sector is being promoted in a promising domain to provide information on the internment process.

Keywords: Mobile application, Patients monitoring, Systematic review of the literature.

Introduction

During the last 3 years according (C. Sales, 2020) se 50% of the time of cell phone use, is intended to use mobile applications since there are approximately 9 million of them, where usability has changed, the designs are now minimalist, functions, that bring value, easy navigation and added value, there are uses in different companies and entities where hospitals also benefit from this technology in the difficulties when providing the information of patients with diseases that urge isolation for indeterminate times, according to (PAHO) argue that: "The hospitalization service welcomes the hospitalized patients for long periods, who receive little social or family assistance, and those with obligation legal treatment in the hospital environment." The objective of the tracking, from where the data is taken and entered into the application installed on the patient's Smartphone, whose data will be transmitted to a web server, where they are processed and sent over the wireless network to the mobile device of the health specialist, which also has an application on Android, which will give relevant recommendations to the patient. (P.C. Orlando, D. R. Evert, and B. Gisella, 2015) Therefore, according to WHO (J. Alonso-arévalo and J. A. Mirón-canelo, 2017) it mentions that "health developments mainly include apps aimed directly or indirectly at maintaining or improving healthy behaviors, quality of life and the well-being of people. Some of these new mobile apps are specifically aimed at helping people in their own health and wellness management. Other mobile apps target health care providers as tools to improve and facilitate patient care delivery. In this article we review research on the use of mobile applications to have greater monitoring of patients in front of specialists and family members. This document is organized as follows. Section II details the methodology for reviewing study documents. Section III presents the results of the review. Finally, Section IV presents the conclusions.

Methodology

A. Research Questions

The review process was conducted on the basis of the following research question:

RQ1: What kind of most outstanding studies are given for the development of mobile applications, in hospitalized patients?

RQ2: What tools are most com only used for the development of mobile applications of patient follow-up?

RQ3: Which mobile application development architecture are most efficient? ?
RQ4: Which technologies are most commonly used in the development of mobile applications?

These aspects of the research question guided the review process by correctly identifying thematic areas, relevant studies, material sources, and inclusion and exclusion criteria. The review aimed to provide pragmatic solutions to the research question by capturing concrete and significant aspects with the support of empirical evidence.

(J. A. Arevalo, 2016). There vised articles show that the use of mobile applications is effective to improve health monitoring, encouraging self-management of patient care, and allowing the permanent training of professionals,

favoring multidisciplinary integration. (V. Donayre and E. Esmeralda, 2016)

B. Databases on selection paper

Our search was conducted in four databases: IEEE Xplore, ScienceDirect, SCIELO, ACM Digital Library.

C. Choosing research terms

The study carried out the search of the database combining the main keywords: "Mobile Applications", "Patient Tracking", identified and presented a total of 28 search chains of different sequences within Mobile Apps: "Mobile Applications", "App Types", "Features", "Versions", "Most Used Apps", "Usability", "Framework", "Development Tools", "Design of a Mobile App", "BD", "Development Layers" and “design of a mobile application”, "Encoding", "Tracking", "Telehealth".

D. Applying detection criteria

Articles that are not directly linked to research processes interests, such as processes, BD, Satisfaction, have been excluded. Research on Patient Tracking Apps has a search has within 20 to 2015 to 2020 where it was considered representative to opt for a decision in the conclusions.

E. Doing the review

Searches were limited to the abstract field. A total of 124 documents were downloaded and reviewed. Since the study focused on capturing the maximum number of views on Apps in patient follow-ups, a quality assessment was established regarding the clarity of the documents "contributions to research questions. At this stage, 75 documents were identified. To proceed with the analysis of the revision of the literature.

F. Synthesize the results

The general distribution of the literature was analyzed, discussed and summarized according to the areas of research: methods, techniques and applications.

Table 1 Data based log

N°	Database journal	Number of items
1	IEEE Xplore,	26
2	ScienceDirect,	33
3	Scielo	14
4	ACM Digital Library	11
		84

Results

The results of our systematic literature study were categorized in terms of concepts. Categorization of SLR results is highly recommended because it provides a valuable overview of the revised articles

A. Distribution of Publications by Year

Figure 2 shows the number of documents published during the period 2015 to 2020. Clearly, it is clear from the figure that the number of publications on applications for mobile applications in patient follow-up factor is in 2015, after which publications had a significant increase in the last 4 years. This growth denotes that technology is present in various areas of health and in the last year has been forced to conduct research due to the current context.

Figure1 Distribution of publications by year

B. Distribution of Publications by Language

In order to understand the distribution of mobile application roles according to the thematic area. Figure 3 reveals that warehouse operations are extensively examined by 83% of published items. They were in Spanish, 16% in English and also 1% in Portuguese.

Figure2 Distribution of Publications by Language

C. Classification of selected documents based on publications by country.

It offers an overview of the publications of the various countries as such which stands out the most: Spain with 27% followed with 25% Colombia and Peru with the third place with 13% publications in the use of mobile applications for a patient follow-up.

Figure3 Publications by Country

D. Models

This section describes different study models where it aims to classify the main ones: analysis models, where they were found as a descriptive model with 63%, qualitative with a range equal to 22%, then with 11% the quantitative model, the descriptive analysis models of descriptive analysis which aims to prepare and analyze historical data, as well as identify sample patterns to inform trends. While qualitative analysis relies on observation to collect non-numerical data, using tools such as interviews, survey discussion groups. And quantitative analysis predicts population behavior focuses on a cause and effect.

Figure4 Posts by Model

E. Methodology

In order to complement the analysis of obtaining that the most commonly used study methods are experimental consisting of 49% of all DBs found, with 17% the non-experimental study does not indicate that the researcher cannot control, manipulate the subjects but relies on interpretation or observations to reach a conclusion and with 11% the conceptual method is present in the BD of the research performed.

Figure5 Publications by method

F. Technology

This section shows different most commonly used technologies, where se mobile technology is presented with 59% usability in the study generated with the presence of mobile devices developed with a set of tools such as android, Patterns, frameworks,, similarly shown the most used M-Health technology with 19%, is a mobile technology clearly to manage the health and well-being of people, is commonly used under the support of mobile devices such as PDA, mobile phones, tablets or patient monitoring devices among others, also the most prominent was web technology with 10% in the general BD.

Figure6 Most Used Technology

G. Tool

This section shows different tools more used by programmers of studies conducted within the BD, where it can be shown that the use of virtual reality, biometric system, CDA is present with 2% usability, also appear tools such as Weka, Ionic, Raspberry Pi, Laravel, Arduino. The one that stands out with its modernity is the Raspberry Pi tool as it is a series of small board computers, unique and low cost, which has a favorable result when linked to a mobile application.

Figure7 Most Used Tool

H. Architecture

It shows the system designs or architectures most commonly used in the encoding of mobile applications in the studies found, where it is reflected with 40% the MVC architecture (Model-View -Controller) a pattern of software architecture that separates the data and mainly what is the business logic of an application of its representation and module responsible for managing events and communications. Then we have client-server with 37%, this architecture is a software design model in which tasks are divided between resource providers, called servers, and plaintiffs, called clients.

Figure8 Most Used Architecture

I. Techniques

In Table 1 you can find an overview of the techniques of analysis of mobile applications used in the literature studied.

Table 2 techniques

Technical	Amount papers	Reference

Real-time	2	(S. Enrique et al., 2017), (F.B. Domingues et al., 2015)

Discussion

In the last 5 years mobile applications have been a tool that supports different business areas and society in facilitating the processes of the daily routine. So to better understand we ask each other questions as follows:

RQ1: What kind of most outstanding studies are given for the development of mobile applications, in hospitalized patients? According to Figure 5 it shows that the most commonly used study types are as the descriptive, qualitative, quantitative model, since these types of studies make a more detailed analysis with historical data.

RQ2: Which tools are most commonly used for the development of mobile applications of patient follow-up?

As Figure 8 shows the tools such as the use of virtual reality, biometric system, CDA, makes mobile applications have an added value and achieve the objectives of facilitating in communication, therefore it also shows the tools of use clearly of the coding environment such as Weka, Ionic, Raspberry Pi, Laravel, Arduino that give greater complexity with optimal results in the solutions mentioned in the different articles.

RQ3: Which mobile application development architecture are most efficient?

According to Figure 9 shows us that MVC architecture (Model-View -Controller) is a software architecture pattern that separates data and mainly what is the business logic of an application from its representation and module responsible for managing events and communications, it was the most used in the articles found as this makes it easier to create more reliable and more reliable mobile applications, as also with less margin a client-server architecture was used as this is a software design model in which tasks are divided among resource providers, giving the ease of programming in the developments of mobile applications.

RQ4: Which technologies are most commonly used in the development of mobile applications?

According to Figure 7 it represents the most used technologies according to the studies seen in the last 5 years coming to show that mobile technology has a greater utility since it comes with greater usability worldwide, then web technology became present in 2015, 2016 having not so favorable results since this technology was not efficient in daily tasks or activities in the environment that was useful.

Conclusion

In this article on patient monitoring applications, we have reviewed and analyzed the literature based on mobile applications, during the period of 5 years (2015 -202020): What type of studies are most prominent for the development of mobile applications, in hospitalized patients? We found that the quantitative model is descriptive with 63%, qualitative with a range equal to 22%, followed by 11% of the quantitative model, which reflects that the studies went mostly through 5 phases of analysis. What tools are most commonly used for the development of mobile patient monitoring applications? Figure 8 presents the virtual reality with 2% usability, as well as tools such as Weka, Ionic, Raspberry Pi, Laravel, Arduino. Which mobile application development architecture is more efficient? Figure 9 shows with 40% the MVC architecture (Model-View -Controller) and also the client-server architecture with 37%, where it can be concluded that they are the most used to date. Which technologies are the most used in development?, the most used technologies are mobile with 59% of the total, M-Health with 19% and web with 10% where this indicates that mobile applications are being of greater consideration in the health sector.

Abstract

This research aims to analyze the effect of corporate ownership, earnings management, and corporate governance on tax avoidance. This study also examines moderating effects of corporate governance on the impact of corporate ownership, and earnings management on tax avoidance. Sample used are 68 manufacturing companies listed in Indonesia Stock Exchange with total observation of 204 firms. The results of this research are: first, corporate ownership has no effect on tax avoidance. Second, earnings management have a positive effect on tax avoidance. Third, good corporate governance practice have a negative effect on tax avoidance. Fourth, there is a moderating effect of good corporate governance on the positive effect of earnings management on tax avoidance. And last, there is no moderating effect of good corporate governance on the positive effect of corporate ownership on tax avoidance.

Keywords: Corporate Ownership, Earning Management, Corporate Governance, Tax Avoidance

Introduction

Taxes paid by companies are a process of transferring wealth from the company to the state so that tax payments are a significant cost for both the company and the owner (Fatharani, 2012). Thus, the company will take various actions as an effort to save taxes so that the taxes paid are not too large. Aggressive tax action can lead to a reduction in the tax burden, both legally and illegally (Frank, Lynch, and Rego, 2009). Tax avoidance is a process to reduce the amount of tax owed by legally manipulating company income that is still in the corridor of tax laws. Meanwhile, tax evasion is a process to reduce the amount of tax owed by illegally manipulating company income (Gunadi, 2007).

Tax avoidance actions can provide marginal benefits and marginal costs (Fatharani, 2012). The possible marginal benefit is the existence of significant tax savings for the company and the marginal cost that may arise is the cost of possible tax fines or sanctions if found to violate tax regulations. Tax avoidance actions can be influenced by the nature and level of agency problems, because some of the costs incurred as a result of tax avoidance are not for tax-related matters, but costs arising from covert actions of managers (Fatharani, 2012). Family firms indicate a greater likelihood of agency conflicts between majority and minority shareholders. On the other hand, family firms indicate a lesser likelihood of agency conflicts between owners and managers (Chen et al., 2010). The factor that distinguishes the level of tax aggressiveness carried out by family firms and non-family firms is the extent of the impact of the marginal benefit or marginal cost that may arise from tax avoidance actions taken to the owners of the family owners. Or, how big is the impact of tax avoidance measures a manager might receive on non-family companies (Sari, 2010).

Chen et al. (2010) found that the level of tax aggressiveness in family firms is lower than non-family firms. The results of this study are different from the results of Martani and Sari (2010) that family companies in Indonesia had a higher level of tax aggressiveness than non-family companies. However, Fatharani (2012) using a sample of companies listed on the IDX for the period 2007 to 2010, shows that ownership structure is not proven to influence tax aggressive actions.

Researchers also examined how the company's profit management affects tax avoidance. Not many studies have been found that directly link earnings management with tax avoidance. The company's net income is usually used by stakeholders as the main indicator of the company's performance. Mulyadi and Anwar (2014) assume that company managers will carry out earnings management to minimize corporate tax obligations. One of the actions is by taking tax avoidance measures that allow legally reducing tax payments in accordance with applicable tax regulations.

Earnings management can be done by controlling accrual transactions, where accrual transactions have an effect on revenues and expenses but do not appear on cash flows. There are two accrual concepts, namely: discretionary accrual and non-discretionary accrual (Scott, 2012). It is still a matter of debate among researchers in the world to determine whether earnings management affects tax avoidance, or tax avoidance that affects earnings management. Frank, Lynch, and Rego (2009) found that there is a significant but causal effect between earnings management and tax avoidance. In contrast to company management who want to pay the lowest possible tax, the government wants to collect taxes from companies as high as possible because taxes are one of the primary sources of income for the state. This is a conflicting situation exists in a company. This potential conflict of interest can be minimized by corporate governance mechanisms. Corporate governance is a mechanism that controls the company so that it can run effectively in meeting the interests of stakeholders, both external and internal (Fatharani, 2012).

The interaction between tax avoidance and corporate governance has been widely studied by several researchers. Desai and Dharmapala (2006) state that companies that have good governance tend to have internal control mechanisms that can prevent managerial fraud, and state that there is a negative influence between managers' equity incentives and tax avoidance. Conversely, they argue that companies with poor governance cannot use equity incentives to encourage tax avoidance because they do not have internal control mechanisms to prevent managerial fraud.

Based on the description above, this study combines several literatures regarding tax avoidance measures, company ownership structure, earnings management, and corporate governance. The sample of this research is public companies in Indonesia. This is because Indonesia's tax rate can be said to be high (25%) when compared to Indonesia's neighboring countries. This allows Indonesian companies to evade tax by choosing a head office in a country that has a lower tax rate than Indonesia. The neighboring countries that have the same tax rate as Indonesia are only Malaysia 25%, while other neighboring countries have lower tax rates, such as Vietnam 22%, Thailand 20%, and Singapore 17%. In addition, there are also countries that are often referred to as Tax Haven Countries which have a 0% tax rate, such as Cayman Island, Bahamas, or Bermuda.

With the comprehensiveness of the literature as a reference, this study aims to 1) test the effect between corporate ownership structure and tax avoidance measures, 2) test the influence between earnings management and tax avoidance measures, 3) test the effect of corporate governance and tax avoidance measures, and 4) test the moderating effect of corporate governance on the effect of corporate ownership structure, and earnings management on tax avoidance.

Theoretical Framework

Company Ownership Structure

Chen et al. (2010) found that family firms are less aggressive in tax avoidance than non-family companies. The research also states the importance of non-tax costs as a result of tax avoidance. Family companies are considered less aggressive in tax avoidance than non-family companies because family companies consider the possibility of non-tax costs such as sanctions and penalties from tax officers, price discounts from non-family shareholders, and a decline in the company's reputation. Martani and Sari (2010) examining the influence between corporate ownership structure, corporate governance, and tax aggressive actions found that family firms in Indonesia are higher in the level of tax aggressiveness than non-family firms. Based Chen et al. (2010), and Martani and Sari (2010), it can be concluded that there is an effect of family ownership on tax avoidance.

Therefore, the authors attempt to examine the effect of family ownership on tax avoidance by proposing the first hypothesis as follows:

H1: Family ownership has a positive effect on tax avoidance.

Earnings Management

Management tends to intend to pay lower tax liabilities because taxes will significantly reduce the company's net income. The company's net income is usually used by stakeholders as the main indicator of the company's performance. Frank, Lynch, and Rego (2009) examined tax avoidance actions and corporate financial reporting found that there was a significant and causal effect between tax avoidance measures and earnings management. Frank, Lynch, and Rego (2009) found significant evidence of the effect of tax avoidance measures and earnings management. However, this study cannot draw conclusions about the direction of the significant influence, whether earnings management has a significant effect on avoidance actions or whether tax avoidance measures have a significant effect

on earnings management. Mulyadi and Anwar (2014) examined the effect of corporate governance, earnings management and tax management, assuming that company managers will carry out earnings management to minimize corporate tax liabilities found that consistent earnings management (both in GAAP ETR and Current ETR) shows a positive effect on tax avoidance. Martani, Anwar, and Fitriasari (2011) found that earnings management was the company has a positive effect on the company's book-tax gap, and shows that companies in Indonesia have a tendency to carry out earnings management by decreasing income.

Based on the description above, the authors formulate and propose a second hypothesis as follows:
H2: Earnings management carried out by the company has a positive effect on tax avoidance.

Good Corporate Governance

There are many ways to minimize the tax burden that the company must pay. Tax planning aims to reduce the tax burden to a minimum by manipulating the company's business and transactions while it is still in the corridor of tax regulations (Suandy, 2008). In regard to tax avoidance, the government has developed a tool that can reduce tax avoidance efforts by companies in the form of corporate governance regulations (Schön, 2008). Some of these corporate governance regulations are mandatory and some are voluntary. An example of taxation regulations in Indonesia that can affect corporate governance is the regulation for the using of book value for the transfer of assets in the context of mergers, consolidations, or business expansion. There are also examples of corporate governance regulations that can influence tax decisions such as principles of good corporate governance regarding to openness and transparency.

Friese, Link, and Mayer (2008) found that companies with good corporate governance can reduce tax avoidance by fulfilling the requirements of tax law. These results are similar to research conducted by Sartori (2009) which found that there is a positive influence between corporate governance and the level of corporate tax compliance, so that companies will try to avoid aggressive tax actions. Martani and Sari (2010) found that good corporate governance has a negative effect on tax aggressive actions.

In accordance with the description above, this study proposes a third hypothesis as follows:
H3: Good corporate governance has a negative effect on tax avoidance.

Moderating Effect of Good Governance on the Effect of Earnings Management on Tax Avoidance

According to classical agency theory, the main objective of a company operated by management (agents) is to maximize shareholder wealth (principal). However, because of their respective self-interests, management often does not align their interests with those of shareholders. This difference causes agency problems. Therefore, the role of corporate governance is very important, namely to reduce agency problems and reduce agency costs to create value for shareholders (Rezaee, 2009; Shleifer and Vishny, 1997). Shen and Chih (2007) examined the effect of corporate governance on earnings management in companies in developing countries in Asia. Larcker et al. (2007) found that companies with a company with a higher governance rating (index) would likely have better corporate performance than firms with a lower governance ranking (index). This is because companies with higher governance ratings (indexes) have been properly monitored, so that the likelihood of management taking actions that only benefit management, such as performing earnings management, is lower. In addition, many other studies have found companies with good corporate governance mechanisms have shown reduced earnings management (Garcia Osma, 2008; Sarkar et al., 2008; Duh et al., 2009). Martani, Anwar, and Fitriasari (2011) found that earnings management by companies has a positive effect on the company's book-tax gap, researchers argue that good corporate governance weakens the positive influence of earnings management on tax avoidance.

In accordance with the description above, the researchers propose the fourth hypothesis as follows:
H4: Good corporate governance weakens the positive influence of earnings management on tax avoidance**.**

Moderating Effect of Good Governance on the Effect of Family Ownership on Tax Avoidance
The tax policy of a company will be influenced by how big or small the concentration of the company's shareholders is (Khurana and Moser, 2009). Shareholder concentration is divided into two, namely short-term shareholder concentration and long-term shareholder concentration. Aggressive tax policies will increase when the concentration of short-term shareholders increases. However, an aggressive tax policy will decrease the greater the concentration of long-term shareholder ownership. This is because short-term shareholders will demand an increase in their welfare for a short period. So that management also justifies various ways, for example tax avoidance, to be able to improve

the short-term welfare of shareholders in a short time. This is different from long-term shareholders who think that tax avoidance will harm the company in the future, so that management will avoid tax avoidance.

Desai and Dharmapala (2006) found that management compensation/ incentives have different effects on corporate tax avoidance actions between companies that have good corporate governance practices and those with bad corporate governance practices. The study found that the positive influence between management compensation/ incentives and tax avoidance was found in companies that had good corporate governance. Conversely, the negative influence between management compensation/ incentives and tax avoidance measures is found in companies that have bad corporate governance. This negative effect may occur because in poor company management there is an opportunistic nature of managers who are thought to be the dominant factor in determining company policy. Martani and Sari (2010) found that corporate governance was not proven to have a moderating effect between family ownership and corporate tax aggressive actions.

Based ont the discussion above, this study argues that corporate governance weakens the positive effect of family ownership on tax avoidance. This is due to the fact that good governance can reduce agency problems between majority shareholders and minority shareholders because companies with good governance can suppress the domination of influence of majority shareholders in the company.

In accordance with the description above, the researchers propose the fifth hypothesis in an alternative form as follows:
H5: Good corporate governance weakens the positive influence of family ownership on tax avoidance.

Research Methodology

Data and Samples

The sample selection method used in this study was purposive sampling, with the following sample criteria: 1) Companies in the manufacturing industry listed on the IDX during 2011-2013 consecutively, 2) Companies that have published a complete annual report and have audited during the period 2011-2013, and 3) Companies that have all the data needed in this study.

Research Model

This study modifies Martani and Sari's (2010) research model, by adding an independent variable, namely earnings management proxied by discretionary accruals in accordance with the model developed in the study of Kothari et al. (2005). This is because the Performance Matched Model developed by Kothari et al. (2005) can provide information about earnings management better than other earnings management measurement models, such as the Jones Model or the Modified-Jones Model. In addition, this study also excludes the control variables for NOL and ΔNOL because the data is less and less varied. Thus, the following research model is obtained:

$$BTG_{it} = \alpha_i + \beta_1 Ownership_{it} + \beta_2 DACCS_{it} + \beta_3 CGIndex_{it} + \beta_4 Ownership_{it} * CGIndex_{it} + \beta_5 CGIndex_{it} * DACCS_{it} + \beta_6 SIZE_{it} + \beta_7 ROA_{it} + \beta_8 LEV_{it} + \beta_9 PPE_{it} + \beta_{10} MKTB_{it} + \varepsilon$$

where:

Book-Tax Gap$_{it}$	= Tax Avoidance Action of company *i* in year *t*.
Ownership$_{it}$	= Family ownership structure of company *i* in year *t*.
DACCS$_{it}$	= *Discretionary Accruals* of company *i* in year *t*.
CGIndex$_{it}$	= *Corporate Governanve Index* of company *i* in year *t*.
SIZE$_{it}$	= Size of company *i* in year *t*.
ROA$_{it}$	= *Return On Asset* of company *i* in year *t*.
LEV$_{it}$	= *Leverage Ratio* of company *i* in year *t*.
PPE$_{it}$	= *Properties, Plant, and Equipment Ratio* of company *i* in year *t*.
MKTB$_{it}$	= *Market-to-Book Ratio* of company *i* in year *t*.
ε	= *Error term*.

Results and Discussion

Descriptive Statistics

Table 1. Descriptive Statistics before *Winsorize*

Variable	Mean	Std. Dev.	Skewness	Min	Max
BTG	-0.097	0.122	-1.532	-0.524	0.199
Ownership	0.515	0.501	-0.059	0	1
CGIndex	0.343	0.476	0.666	0	1
DACCS	$2.28e^{-10}$	$4,6e^{-10}$	4.109	$4,0056e^{-13}$	$3,68e^{-9}$
SIZE	21.164	1.624	0.492	18.044	26.077
ROA	0.122	0.141	1.691	-0.190	0.719
LEV	0.067	0.101	1.701	0	0.393
PPE	0.728	0.742	3.047	0.023	2.981

Table 2. Frequency of *Dummy* Variable

Variable	Value= 0	Value=1
Ownership	99	108
CGIndex	135	73

Table 1 shows that the BTG average value is -0.097. This value means that, on average, Indonesian manufacturing companies have a higher fiscal profit (according to tax) than commercial profit (according to accounting). The smallest BTG value is owned by PT Unilever Indonesia with a value of -0.524. Meanwhile, the largest BTG value is owned by PT Primarindo Asia with a value of 0.199. Based on Table 1, it can be seen that the average value of ownership is 0.514, and based on Table 2 it can be seen that the value of 1 (family ownership) is more than the value of 0 (non-family ownership). Based on Table 1 it can be seen that the average CGIndex is 0.343, and based on Table 2 it can be seen that the value of 0 (bad governance) is more than the value of 1 (good governance). Based on Table 1, the average value of the DACCS variable is 2.28e-10. The minimum value of the DACCS variable is 4.01e-13. While the maximum value of the DACCS variable is 3.68e-9. The value of the DACCS variable cannot be explained because there are differences in policies regarding the income of each company, which causes the discretionary accrual value of each company to be different. Then, an outlier test is carried out so that there is no data on a variable that has unique characteristics compared to data on other variables. If there is outlier data, it will be Winsorize.

Table 3. Regression Results

$$CTA_{it} = \alpha_i + \beta_1 Ownership_{it} + \beta_2 DACCS_{it} + \beta_3 CGIndex_{it} + \beta_4 Ownership_{it} * CGIndex_{it} + \beta_5 CGIndex_{it} * DACCS_{it} + \beta_6 SIZE_{it} + \beta_7 ROA_{it} + \beta_8 LEV_{it} + \beta_{10} PPE_{it} + \beta_{10} MKTB_{it} + \varepsilon$$

Variable	Hypothesis	Coefficient	p-*value*	Description
Ownership	+	-0,0020	0,901	Not significant
DACCS	+	5,0676	0,058	Significant at α = 10%
CGIndex	-	-0,0420	0,029	Significant at α = 5%
Ownership*CGIndex	-	-0,0295	0,380	Not significant
CGIndex*DACCS	-	1,2588	0,000	Significant at α = 1%
SIZE	+	0,0076	0,084	Significant at α = 10%
ROA	-	-0,6375	0,000	Significant at α = 1%
LEV	-	-0,0595	0,308	Not significant
PPE	-	-0,0202	0,034	Significant at α = 5%
MKTB	-	-0,0055	0,002	Significant at α = 1%
N = 204				
R2 = 0,8222				
Prob F = 0,0000				

BTG = Book-Tax Gap (Manzon and Plesko, 2002); Ownership = Company Ownership Structure; DACCS = Discretionary Accrual (Kothari et al., 2005); CGIndex = Corporate Governance Index based on the Indonesian Institute for Corporate Directorship (IICD); Ownership * CGIndex = The interaction of the Ownership variable with the CGIndex variable; CGIndex * DACCS = Interaction of CGIndex variable with DACCS variable; SIZE = Company Size; ROA = Return on Asset; LEV = Funding Rate; PPE = Properties, Plant, and Equipment; MKTB = Market-to Book Ratio.

Based on the regression results of the research model (see Table 3), the F-stat value is less than 1%. This shows that the research model used in this study is good with a confidence level of 99%. R^2 value is 0.8222 meaning that the variables used in the model are able to explain 82.22% of the dependent variable, and the remaining 17.78% are explained by other factors not included in the research model.

The Effect of Company Ownership Structure on Tax Avoidance

Table 3 shows that ownership, which is a proxy for the company's ownership structure, has a negative effect on tax avoidance because the regression results show an ownership coefficient of -0.0020. However, the regression results showed a p-value of 0.901. This means that the negative influence has no significant evidence. Based on the regression results, it can be concluded that Hypothesis 1 in this study is rejected.

The Effect of Earnings Management on Tax Avoidance

Table 3 shows that DACCS, which is a proxy for earnings management, has a positive effect on tax avoidance because the regression results show a DACCS coefficient value of 5.0676. In addition, the regression results also show a p-value of 0.058. This shows that the positive effect is significant at the 10% level. Based on the results of the regression, it can be concluded that Hypothesis 2 in this study is accepted, namely earnings management by the company has a positive effect on tax avoidance.

The Effect of Good Corporate Governance on Tax Avoidance

Table 3 shows that CGIndex which is a proxy for corporate governance has a negative effect on tax avoidance as seen from the regression results which show a coefficient value of -0.0420. CGIndex also has a p-value of 0.029 which means that the negative effect is significant at the 5% level. Based on the results of the regression, it can be concluded that Hypothesis 3 in this study is accepted, namely good corporate governance has a negative effect on tax avoidance.

The Effect of the Role of Good Corporate Governance on the Relationship between Earnings Management and Tax Avoidance

Table 3 shows that there is a negative influence seen from the coefficient of -1.2520. Also obtained is the p-value of the CGIndex_DACCS interaction variable of 0,000. This value means that the role of good corporate governance in weakening the positive influence of earnings management on tax avoidance is significant at the 1% level. Based on the regression results, it can be concluded that Hypothesis 4 in this study is accepted, that is, good corporate governance weakens the positive effect of earnings management on tax avoidance.

The Effect of the Role of Good Corporate Governance on the Relationship between Ownership Structure and Tax Avoidance

Table 3 shows that there is a negative effect as seen from the coefficient of -0.0295. However, the p-value shows a value of 0.380 which means that there is no significant effect. Based on the regression results, it can be concluded that Hypothesis 5 in this study is rejected.

Conclusion

From the test results and analysis of the results, it can be concluded that there is no strong evidence that the company's ownership structure have a significant effect on tax avoidance. This is possible because the owners of family companies in Indonesia do not fully and maximally use the influence of their power in carrying out corporate tax planning. Earnings management is consistently proven to have a positive and significant effect on tax avoidance. This shows that companies that carry out earnings management will have the opportunity to take higher tax avoidance measures. Good corporate governance is proven to have a negative and significant effect on tax avoidance. This suggests further that the implementation of good corporate governance will prevent tax avoidance. Similarly, the moderate interaction of good corporate governance with earnings management on tax avoidance has been shown to have a positive and significant effect. This is because companies that implement good governance allow reduction of agency problems and reduce agency costs so that they have effective control and supervision. With effective control and supervision, the likelihood of management taking actions that only benefit management, such as performing earnings management or tax evasion, is lowered. However, in this study, the moderating interaction of good corporate governance with corporate ownership structure on tax avoidance is not proven to have a significant effect. This is probably due to the practice of good corporate governance in Indonesia which is still unable to reduce the influence of dominating family ownership. Companies with family ownership tend to ask management to satisfy the majority shareholder (family), so that it will harm the minority shareholders.

Abstract

This study aims to examine the effect of tax avoidance towards firm value with politic connection as moderating variable. The sample consists of firms that are listed in Indonesia Stock Exchange for periods 2012-2014. The results show that, first, tax avoidance increases firm value. Second, tax avoidance decreases the agency cost. These results contrast to previous studies. The results indicate that in Indonesia tax avoidance is considered as an activity approved by the principal, so it will not cause the agency problem and agency cost. This research also shows a different result with previous studies, where political connection can weaken the effect of tax avoidance against firm value. This result indicates further that political connections will causing a lack of innovation and decrease the company's performance.

Keywords*:* Tax avoidance, politic connection, firm value and agency cost.

Introduction

Taxes are an obligation that must be carried out by taxpayers, because the revenue from taxes is used by the government to run the country's economy and development. However, there are different objectives in the implementation of taxation between the government and taxpayers (companies). Companies often carry out tax management with the aim of carrying out their tax obligations properly and minimizing tax payment burdens to maximize company profits without violating applicable laws. The question is whether tax avoidance can affect firm value? The available empirical evidence regarding the reactions of investors to tax avoidance is very mixed. Desai and Dharmapala (2009) state that the overall effect of tax avoidance activities carried out by companies on firm value has almost no effect. The effect will only be positive for companies with high levels of institutional ownership. Desai and Dharmapala also argue that there are two effects in the application of tax avoidance on firm value. Tax avoidance is the transfer of wealth from the government to shareholders, conflict within the agency between management and shareholders can increase the possibility of a managerial transfer minus the value of the company.

Tax avoidance can have a direct and indirect impact on a company's cash flow, both current and future cash flows. The impact of changes that is felt immediately is that tax avoidance can increase the company's cash flow through tax savings, which will lead to high agency costs. On the other hand, aggressive tax avoidance can complicate business transactions, which will lead to lower information transparency and indirectly lower company value. Chen et al. (2014) found that tax avoidance was negative and significant towards firm value. In addition, tax avoidance will also result in high agency costs, which can be measured using the selling expense ratio. Research by Chen et al. (2014) also found that tax avoidance would only increase the value of a more transparent firm. However, research conducted by Wang (2010) shows that tax avoidance can have a positive effect on firm value, especially in companies that have good transparency. Chasbiandani and Martani (2012) found that tax avoidance in the long term will have a positive effect on the value of the company, while tax avoidance in the short term does not significantly affect firm value.

The operation of a company is closely related to politics. This is due to the success or failure of a company, one of which is influenced by the political conditions in which the business operates. Political economy literature shows that political relations are a valuable resource for individual companies, either in developing countries or in developed countries and are very important in influencing agreements that will impact the choice of corporate strategy. Chansog and Liandong (2014) argue that companies that have political relations are more tax aggressive because these companies have a lower detection risk, can get better information about changes in tax regulations or law enforcement in the future, lower pressure to carry out transparency , and lower political costs associated with aggressive taxes.

Nugroho (2011) found that companies with political connections would not have a significant effect on the effective tax rate. However, in the research of Mulyani et al. (2013) found that the political connection variable had a significant negative effect between the political connection variable on tax avoidance. The difference in the results of the study makes it interesting to re-examine to see whether the relationship between the two variables is negative or positive.

There are differences in this study with research conducted by Chen (2014) and Nugroho (2011). Chen (2014) examines tax avoidance with firm value and transparency as moderating variables. Meanwhile, research conducted by Nugroho (2010) looked at the influence of political relations and tax reform on the effective tax rate of companies listed on the Indonesia Stock Exchange in 2008-2009. This study examines the effect of tax avoidance on firm value and political connections as moderating variables.

Theoritical Framework

Tax avoidance, political connections, and corporate value

Lestari et al. (2014) found a positive relationship between firm value and tax planning activities. The better the company is in carrying out tax planning activities, the more it will increase company value. These results support the traditional theory which states that tax planning measures to transfer wealth from the state to shareholders Desai and Dharmapala (2006) in Lestari et al. (2014). Structured tax planning activities can reduce taxes by taking advantage of applicable tax regulations. Thus this will have an impact on increasing firm value, assuming that the benefits to be received are higher than the costs incurred by the company in tax planning activities.

Chasbiandani and Martani (2012) found that long run tax avoidance has a positive effect on firm value, while short run tax avoidance does not significantly affect firm value. This indicates that the lower the long-term ETR paid by the company, the higher the firm's value. However, Ilmiani and Sutrisno (2014) mentioned that tax avoidance has a significant and negative effect on firm value. Chen et al. (2014) stated that tax avoidance can lead to direct and indirect changes to current cash flows. An example of an immediate change could occur if tax avoidance could increase cash flow through tax storage which would also lead to increased agency costs. Kusumawati (2015) stated that political connections has an effect on company value. This positive impact reflects that directors who have political connections create value through knowledge and influence on legal development. In addition, companies with connections to the winner of the gubernatorial election will invest more than he previously did, improve operating performance, have more cash, and perform better long-term stock performance. Thus, the value of the company increases. Brogaard et al. (2015) stated that political connections increase the likelihood of winning contracts with the government, their findings give rise to the notion that political connections increase firm value by increasing firms' access to government contracts. However, they also found undesirable effects of political connections in the long run. They say that political connections weaken the incentives for innovation and reduce performance in the long run. Li and Xia (2013) stated that political connections have positive and negative effects on firm value. The net assets per share of politically connected companies have a positive impact on their value. However, the growth of companies with political connections does not have a significant impact on company value. After conducting an empirical study, they found that political connections were not significant in influencing the long-term growth of companies. After the crisis, political connections have a significant relationship and a positive impact on company value.

Hypotheses Development

There are still many discrepancies among the research results regarding the relationship between political connections and tax avoidance. Lestari et al. (2014) found a positive relationship between tax planning actions and firm value. Companies that do tax planning well, further increase the value of the company. This supports argument that tax planning measures to transfer wealth from the state to shareholders (Desai and Dharmapala (2006) in Lestari et al. (2014)). Structured tax planning activities can reduce taxes by taking advantage of applicable tax regulations. Thus this will have an impact on increasing firm value, assuming that the benefits to be received are higher than the costs incurred by the company in tax planning activities.

However, theoretically, tax avoidance behavior provides companies with more cash flow in both the short and long term, which directly increases firm value, and tax avoidance itself will shift cash flows indirectly with the influence of management decisions. Practically speaking, the complexity and ambiguity of tax avoidance makes managers choose to increase their own self-interest, which can reduce current and future cash flows. In addition, based on classical agency theory cash flow from tax evasion leads to the consumption of company payments and the building of a "personal empire", which will shrink future cash flows and reduce firm value. What's more, aggressive tax avoidance is associated with administrative penalties and loss of reputation, which can reduce future cash flows and corporate value (Chen et al, 2014).

Thus, companies that do tax avoidance will tend to reduce firm value. This is because there are risks that the company will face in the future that will cause the company's value to decrease, including the detection of corporate tax avoidance by the tax directorate general, payment of fines / penalties due to tax avoidance and loss of company reputation. Thus, the hypotheses formulated based on the above arguments are:

H1: Tax avoidance has a negative effect on firm value

Tax avoidance is the cause of agency conflicts between companies and shareholders. Company managers tend to take opportunistic actions in fulfilling the interests that must be achieved by the company, where this behavior can harm the company's investors. This agency conflict will result in agency costs incurred to be used to supervise shareholders on the performance and activities of managers (Jensen and Meckling, 1976 in Anggoro, 2015).

With companies that do tax avoidance, it will increase the company's agency costs. This is because based on Chen et al. (2012) with tax avoidance, companies must monitor management behavior that tries to build a "personal empire". So that the provision of appropriate compensation is needed so that managers continue to act in accordance with the interests of shareholders (Kusumawati, 2015).

H2: Tax avoidance behavior has a positive effect on agency costs.

Companies that do tax avoidance will have a lower corporate value in the future, this is because there will be risks that will reduce the company's current cash flow and future cash flows. However, Kusumawati (2015) states that directors who have political connections create value through knowledge and influence on legal development. His opinion is also supported by Brogaard et al. (2015) who say that political connections increase the likelihood of winning contracts with the government, their findings give rise to the notion that political connections increase firm value by increasing firms' access to government contracts.

In addition, companies connected to the winner of the gubernatorial election will invest more, improve their operational performance, have more cash, and enjoy better long-term stock performance. Thus, the value of the company increases (Kusumawati, 2015). Faccio (2006) also found that the largest officers or shareholders enter politics, or politicians join corporate boards. The study found that a significant increase occurred in firm value. Faccio (2007) found companies with political connections have high leverage (use preferential proxies to access credit), pay lower taxes (which use tax discount proxies) and have high market power (use proxies for monopolies, contract with government, and protection in general), but weak in accounting performance when compared to companies that have no connections.

H3: Political connections strengthen the effect of tax avoidance on firm value.

Research Methodology

<u>Regression Model</u>

The regression model that will be used to test the effect of tax avoidance on firm value (H1) is as follows:

$$\boldsymbol{q_{i,t} = \alpha_0 + \alpha_1 TaxAgg\alpha_{i,t} + \alpha_2 PPE_{i,t} + \alpha_3 DEBT_{i,t} + \alpha_4 ROA_{i,t} + \alpha_5 NOL_{i,t} + \alpha_6 GROWTH_{i,t} + \alpha_7 SIZE_{i,t} + \varepsilon_{i,t}}$$

The regression model that will be used to test the effect of tax avoidance on agency costs (H2) is used a regression model as follows:

$$\boldsymbol{Agencycost = \alpha_0 + \alpha_1 TaxAgg\alpha_{i,t} + \alpha_2 PPE_{i,t} + \alpha_3 DEBT_{i,t} + \alpha_4 ROA_{i,t} + \alpha_5 GROWTH_{i,t} + \alpha_6 SIZE_{i,t} + \varepsilon_{i,t}}$$

The regression model that will be used to examine the effect of tax avoidance on firm value with political connections as a moderating variable (H3) is as follows:

$$\boldsymbol{Q_{it} = \alpha_0 + \alpha_1 TaxAgg\alpha_{i,t} + \alpha_2 Polcon_{i,t} + \alpha_3 (TaxAgg_{i,t} * Polcon_{i,t}) + \alpha_4 PPE_{i,t} + \alpha_5 DEBT_{i,t} + \alpha_6 ROA_{i,t} + \alpha_7 GROWTH_{i,t} + \alpha_8 NOL_{i,t} + \alpha_9 SIZE_{i,t}\, \varepsilon_{i,t}}$$

Operationalization of Variables

Table 1. Operasionalisasi Variabel

No.	Variables		Description
1	Dependent variables H1 and H3	Adjusted Tobin's Q	Firm value: $Adjusted\ Tobin's\ Q = \frac{MVE + D}{BME + D}$
2	Dependent variables H3	Agency Costs (STA)	$Sales\ to\ Total\ Assets\ (\text{STA}) = \frac{Sales}{Total\ Assets}$
3	Independent variables (H1, H2 and H3)	Penghindaran Pajak	Tax avoidance is measured using the level of corporate tax aggressiveness, namely the Book Tax Difference (BTD), Residual Book Tax Difference (TS), and Effective Tax Rate (ETR) $BTD = \frac{Pre\ Tax\ Income - Taxable\ Income}{Average\ Total\ Assets}$ $BTD_{i,t} = \beta_1 TA_{i,t} + \mu_i + \varepsilon_{i,t}$ $TS_{i,t} = \mu_i + \varepsilon_{i,t}$ $ETR = \frac{Income\ tax\ expense}{Pre\ tax\ income}$

Results and Discussion

The sample used in this study consisted of 507 samples from all industries, except the financial industry and the property, real estate and building construction industries from 2012 to 2014. Table 2 presents descriptive statistics of the data in this study. Adjusted Tobin's Q is a proxy of firm value. The Tobin's Q proxy used in this study follows the model of Rezaei et al (2014). Adjusted Tobin's Q has a mean value of 2.02385, which shows that the company average

has a high enough value compared to its book value. The highest value of Adjusted Tobin's Q is 17.93549 and the lowest value is 0.3328539.
BTD, TS and ETR are proxies of tax avoidance. BTD has an average value of -2.970418, the lowest value is -315.0494 and the highest value is 0.9555033. TS has an average value of -2.601729, the lowest value is -2.972474 and the highest value is 7.264747. ETR has an average value of 0.2750628, the lowest value is 0.0273665 and the highest value is 0.9476172.

STA is a proxy for agency costs which has an average value of 1.143939, the lowest value is 0.0318636 and the highest value is 7.264747. This shows that the company has a high sales to total asset ratio, which reflects the high productivity of the company. Polcon is a moderating variable for political connections. Political connections have an average of 0.3668639 where this shows that the political connections within the company that are observed are high, namely 36.69% of the total 507 observations.

Table 2: Descriptive Statistics

Tables 3-5 show results of H1 testing Models 1, 2 and 3. H1 states that the company value will be lower for companies that do tax avoidance than companies that do not do tax avoidance. Results show BTD tax avoidance is negative, this is in accordance with initial expectations with a coefficient level of -0.0112039, indicating that the higher the company avoids tax, the lower the firm value. While TS is positive with a coefficient of 0.376876 indicating that the higher the company takes tax avoidance measures, the higher the firm value. This is also consistent with hypothesis testing on tax avoidance using the ETR proxy, the results show that using the ETR the relationship between tax avoidance and firm value is negative, in contrast to initial expectations with a negative coefficient of -0.3181138, this indicates that the more companies do tax avoidance, the more the value of the company will increase.

Results show that BTD had a significance level of 0.0505 and the regression results using the ETR for tax avoidance had a significance level of 0.06. However, the regression results using the TS for tax avoidance has a significance level at the 0.0925 level. So that the conclusion of hypothesis 1 is rejected because what is in accordance with the prediction is only the BTD, but the TS and ETR show that firm value will increase firm value.

Firm value is considered as one of the responses from investors to the activities carried out by the company (Anggoro et al., 2015). The results found that tax avoidance through tax planning would increase firm value. This is in line with Lestari et al. (2014) which found that there was a positive effect of tax planning activities on firm value. With the better the company in carrying out tax planning activities will further increase company value. These results support the traditional theoretical perspective which states that tax planning activities are used to transfer welfare from the state to shareholders (Desai and Dharmapala, 2006). By going through tax planning activities, namely taking structured actions so that the tax burden is as low as possible by utilizing existing regulations to obtain an increase in

profit after tax which will have an impact on increasing company value. With the assumption that the benefits obtained are higher than the costs incurred from the tax planning activities.

Results of testing of H2 Models 1, 2 and 3 are presented in Tables 6-8. H2 states that tax avoidance behavior will increase agency costs. Results show that BTD is positive, in contrast to initial expectations with a coefficient of 0.0035649, indicating that the higher the level of tax avoidance, the lower the company's agency costs. TS is positive with a coefficient level of 0.0307709. This is in line with the test using the BTD that companies with a high level of tax avoidance will reduce the company's agency costs. Meanwhile, the ETR test results with agency costs with a coefficient of -0.0327418 indicate that the higher the level of tax avoidance in a company, the lower the agency costs incurred by the company. Based these results H2 is rejected because the three proxies indicate that tax avoidance will reduce firm value. This indicates that the activities of tax avoidance carried out by management are actions that have been approved by the principal, so that there are no agency problems and do not cause agency costs.

Agency costs are costs incurred by the principal to oversee the behavior of the agent (manager behavior) in order to act in the interests of the principal. The ideal is according to Zeng and Zhang (2010) in Chen et al, (2014) stated that areas that have strong tax enforcement will have low agency costs, tunneling activity and transactions with related parties will be less for the majority shareholder, so it is argued that tax enforcement can function as an external corporate governance mechanism. However, this study argues that tax enforcement in Indonesia is still not strong, this is reinforced in the publication of the World Bank (2012) that the realization of tax revenues in Indonesia is around 12% (Amir, 2014). This figure is relatively low compared to other ASEAN countries such as Malaysia, Thailand and Singapore which have reached 16.1%, 16.5% and 14.5%.

Results and Discussion for H3

Table 9: Results on Hypothesis 3 (Proxy BTD)

Results of testing of H3 Models 1, 2 and 3 are presented in Tables 9-11. H3 in this study states that political connections strengthen the relationship between tax avoidance and firm value. BTD is negative with a coefficient of 0.4262169 shows that the higher the company's aggressiveness in tax avoidance, the higher the company's value. Meanwhile political connections have a positive relationship with adjusted Tobin's Q with a coefficient 0.043498, indicating that having political connections within the company will increase the value of the company. The BTD*Polcon coefficient has a negative relationship of -0.4375412, indicating that political connections weaken the relationship between BTD and adjusted Tobin's Q from -0.0112039 to -0.4375412.

It can be concluded that in companies that have political connections, weaken the relationship between corporate tax aggressiveness and firm value. According to Brogaard et al. (2015) this can be caused by political connections in the long-term causing weak innovation and reducing company performance in the long term so as to reduce firm value.

Table 10: Results on Hypothesis 3 (Proxy TS)

$$q_{i,t} = \alpha_0 + \alpha_1 TS_{i,t} + \alpha_2 Polcon_{i,t} + \alpha_3 Polcon * TS_{i,t} + \alpha_4 PPE_{i,t} + \alpha_5 DEBT_{i,t} + \alpha_6 ROA_{i,t} + \alpha_7 NOL_{i,t} + \alpha_8 GROWTH_{i,t} + \alpha_9 SIZE_{i,t} + + \varepsilon_{i,t}$$

Source: Stata 13 output, processed by authors (2016)

TS has a coefficient of 0.2898118, indicating that the higher the company's aggressiveness in tax avoidance, the company value will increase. Meanwhile, politics has a positive relationship with adjusted Tobin's Q, which is 0.4378579, indicating that companies with political connections will increase firm value. The TS*Polcon coefficient is 0.1525817, indicating that political connections weaken the relationship between TS and firm value, from a coefficient of 0.3294607 to 0.1525817.

Table 11: Results on Hypothesis 3 (Proxy ETR)

$$q_{i,t} = \alpha_0 + \alpha_1 ETR_{i,t} + \alpha_2 Polcon_{i,t} + \alpha_3 Polcon * ETR_{i,t} + \alpha_4 PPE_{i,t} + \alpha_5 DEBT_{i,t} + \alpha_6 ROA_{i,t} + \alpha_7 NOL_{i,t} + \alpha_8 GROWTH_{i,t} + \alpha_9 SIZE_{i,t} + + \varepsilon_{i,t}$$

Source: Stata 13 output, processed by authors (2016)

ETR has a positive coefficient 0.0526434 and this is in accordance with the initial hypothesis, but the significance level is 0.441, indicating that the higher the company's aggressiveness in tax avoidance, the company's value will

decrease. Meanwhile, politics has a positive relationship with adjusted Tobin's Q, which is 0.1819982, indicating that companies with political connections will increase firm value. Polcon*ETR is -0.6694413 indicating that political connections weaken the relationship between ETR and firm value, from the coefficient of - 0.3181138 to -0.6694413. It can be concluded that tax avoidance will increase firm value. However, political connections weaken these relationships.

Conclusions and Suggestions

This study aims to determine the relationship between tax avoidance and firm value, agency costs and tax avoidance and the role of political connections on the effect of tax avoidance on firm value. Tax avoidance is measured by three proxies namely BTD, TS and ETR. Meanwhile, agency costs are measured using the STA proxy. Based on the results of hypothesis testing that has been done, it can be concluded that:

1. The results show that tax avoidance has a positive relationship with firm value, meaning that tax avoidance increases firm value. Hence, tax avoidance affects firm value. This is indicated through tax planning activities so that the tax burden is as low as possible by utilizing existing regulations, then an increase in profit after tax will have an impact on increasing company value.

2. This study found that agency costs have a negative effect on tax avoidance, this indicates that tax avoidance reduces agency costs. Hence, tax avoidance affects agency costs. This indicates that the activities of tax avoidance carried out by management are actions that have been approved by the principal, so that there are no agency problems and do not cause agency costs.

3. This study found that there is a moderating effect of political connections which weakens the marginal effect of tax avoidance on firm value. It is indicated that political connections in the long run cause weak innovation and reduce company performance in the long run so that it can reduce firm value.

Open Innovation in Small and Medium Enterprises: A Review of The Literature

Ph.D Student Daniel RUSU

Bucharest University of Economic Studies, Bucharest, Romania, rusumdaniel@gmail.com

Ph.D Student Maria FRANGIEH

Bucharest University of Economic Studies, Bucharest, Romania, frangieh.m@gmail.com

Abstract

In recent years, studies on open innovation in small and medium-sized enterprises (SMEs) have seen a spectacular increase. However, even in this context, there is still no comprehensive analysis for this area of research. Through this study we will examine the current state of research in terms of open innovation in SMEs because we want to structure the empirical results and at the same time draw a future research agenda. To a large extent these studies are conducted in a European context, along with a number of studies in Korea and China, while in the North American context studies are rare. The overall innovation performance of SMEs is largely enhanced by open innovation (OI). Even in this context, the relevant models and theories of managers are not well established in the literature. As a matter of fact, it is essential to recognize the competitive advantage sources of the enterprise. When these resources are recognized, it becomes easier to draw a plan regarding goal attainment and competitive advantage realization. The company's leader plays a major role in deciding whether to venture into an open innovation strategy or to play it safe by adhering to a traditional closed innovation strategy. Consequently, it is up to the leader to outline the elements that profoundly impact the firm's innovation activity.

Keywords: Literature Review, Strategy, SMEs, Open Innovation (OI), Leadership

Introduction

Ever since the concept of open innovation was introduced by Chesbrough (2003), studies on open innovation have grown significantly. It defines open innovation as "the use of intentional knowledge flows and outflows to accelerate internal innovation and expand markets for external use of innovation" (Chesbrough et al. 2006, p.1). In many cases, and most recently, most of the studies conducted in terms of open innovation have been conducted on large firms (Van de Vrande et al. 2009; Bianchi et al. 2010; Ceptureanu EG et al., 2019a). They use open innovation in their strategies, successfully, a number of large companies such as Procter & Gamble, Philips, IBM (Chesbrough 2003). Regarding small and medium enterprises (SMEs) a series of studies regarding open innovation are carried out only in the initial phase, they are based in general on managerial, conceptual or secondary data.

SMEs lack, in most cases, both technical and managerial skills for their effectiveness (Rahman and Ramos 2010; Ceptureanu EG et al, 2017). In open innovation, compared to large companies, SMEs are much less active due to their specific characteristics, such as strategy, culture, organization. It uses the open innovation approach, actively, only a percentage of SMEs between 5-20%, according to an OECD study. Many studies on open innovation in SMEs are lacking in continuity, fragmented (Bianchi et al. 2010; Colombo et al. 2014). SMEs are able to obtain much more consistent benefits from open innovation (IB) than large firms due primarily to the faster ability of SMEs to react to changing environments, their increased desire to assume risks and a much lower bureaucracy, are the opinion of some researchers (Parida et al. 2012). Moreover, for SMEs, open innovation is an ambitious and promising means to increase their profitability and overcome their challenges (Gassmann et al., 2010). For SMEs to succeed in overcoming their limits but also the barriers that appear in the direction of successful implementation of open innovation, procedures and methods are needed that can certainly help. Given all these aspects, the need to integrate this fragmented state of literature is essential. The examination of current research on open innovation in SMEs in order to integrate empirical results and highlight a future research agenda is the objective of this study.

Research Methodology

First, for this study, the selected articles were collected from the ISI Web of Science database because quality articles are included in this database. Researchers have widely regarded the ISI Web of Science recently as a rich source of significant research articles (Dahlander and Gann 2010). In peer-reviewed journal articles that were written in English, the search was limited for the period 2003–2019 in business discipline. Search results in the ISI Web of Science database retrieved 52 articles using the keywords "SMEs" and "open innovation". Given these issues, the number of articles on open innovation in SMEs, published in journals listed in the ISI Web of Science is low. In conclusion, to include as many articles as possible in this research, using the same search criteria, a second attempt was made using the Scopus database. In total, 64 articles were retrieved from the Scopus database. Double article entries were subsequently removed. Subsequently, the irrelevant articles were removed, after carefully estimating the results, both from the Scopus databases and from the ISI. In conclusion, only 74 articles were considered relevant. Finally, one last attempt is made to find more articles, the search being performed in Google Scholar, where six more articles were found. After carefully reading the main text of each article, 16 articles were excluded, given that these articles were outside the scope of this study.

To compare the summary of each article with others, the NVivo program was used to generate broad study topics (Macpherson and Holt 2007). From each article, the necessary information, based on the thematic categories, is tabulated in a spreadsheet. At the end, a thematic analysis is performed in order to identify the empirical evidence from the studies.

In order to pursue open innovation, the use of an efficient and appropriate search strategy is a particularly important step for SMEs. For this search strategy, exploitation and acquisition are crucial. The absorption of external technologies is included in the acquisition process and the exploitation refers to the technology marketing process. Brunswicker and Vanhaverbeke (2014) identified five strategies that SMEs adopt for search: (1) minimal search, (2) supply chain search, (3) technology-oriented search, (4) application-oriented search and (5) fully -field researchers. In relation to external sources of innovation, such as network partners, IPR experts, research organizations / universities, suppliers and customers, each strategy involves a mixture of interactions. Collaborations between open innovation partners and SMEs allow the latter to make strategic moves that cannot be feasible for closed innovation SMEs (Colombo et al. 2014). Comacchio et al. (2012) suggest that the endowment of social capital at organizational and individual level but also of human capital at individual level are the determining factors for SMEs in terms of coordinating the tasks involved in a limiting role. Through a partial disclosure of their internal development in the external environment, SMEs can identify an extremely valuable development from external sources (Henkel 2006). Together with external barriers to innovation, national and regional approaches are the main factors for SMEs to open up innovative activities (Idrissia et al. 2012).

Even under these conditions, in a certain industry, the open systems strategy initiates a phenomenon of induction of entry and in this way the adoption of open systems by new entrants is easier than incumbent operators. In terms of partner selection and practices, it is essential that SMEs focus significantly (Theyel 2013). For different activities, such as potential market, partners, innovative ideas, new knowledge, SMEs develop search strategies (Ceptureanu SI et al., 2015). Unfortunately, compared to large companies, these search strategies offer fewer advantages and benefits for SMEs.

The challenges of innovation management

In order to achieve innovation, SMEs face unique challenges. These challenges include, among others, access to up-to-date scientific excellence, coordination of the company's operational functions, the complexity of the scientific field but also the lack of resources (Abouzeedan et al., 2013). According to Andries and Faems (2013), even if it is beneficial for external parties to provide knowledge about SMEs, for short-term benefits it is not beneficial. According to Christensen et al. (2005), there is a complex interaction between the titular agents and the technological entrepreneurs. They point out that open innovation often involves high transaction costs. SMEs have weak connections with senior officials but also with other organizations. (Dodourova and Bevis, 2014). According to Pullen et al. (2012), despite the fact that they actually face a number of barriers while trying to apply open innovation, SMEs actively practice such open innovation activities.

To cope with increased external contacts, most SMEs face challenges related to cultural and organizational issues (Van de Vrande et al., 2009). Within these challenges we can list external participations, outsourcing research and development (R&D) activities, external networks, customer involvement, adventure. Moreover, SMEs in developed countries face different challenges compared to SMEs in developing countries. A government agency in a developing country that uses innovation hubs could help SMEs collaborate, communicate and connect with independent inventors and other parties to implement innovation practices (Vrgovic et al., 2012). In terms of international competitiveness, SMEs largely depend on two very important internal components - managerial skills and managerial structure but also on research and development capacity and two external factors, namely - the company's ability to

attract government subsidies for technological development but also for research and development and open innovation practices (Wynarczyk, 2013).

SME policy for open innovation

Following the provision to SMEs, as an alternative method, of outsourced development and research services, this concept of open innovation emerged, representing a strategically focused approach and conception (Albors-Garrigós et al. 2011). These companies are quite different from the influence of factors of nature and political involvement and from this point of view they are not supported by a series of public policies (Brown and Mason 2014), according to a UK study on SMEs that are technology-based (Brown and Mason 2014). If they want growth at an international level, it is essential for SMEs to adopt open innovation and from this point of view, to appreciate, encourage and develop throughout life the desire to study, knowledge and learning, self-motivation, self- discipline, criticism and creativity, cooperation and openness, no doubt need a strong educational system (Csath, 2012). Regarding the importance of different networks for SMEs, it is very possible that there is no awareness and accountability from decision makers (Hemert et al., 2013). According to Kamp and Bevis (2012), in connection with the direction and awareness of SMEs in the direction of developing specific open innovation activities, the necessary schemes and mechanisms for innovation are extremely useful from public factors and decision makers. Encouraging openness to the outside, the perception of uncertainty and also the size of the team are absolutely essential for the success of the open innovation policy (Kim et al., 2014). They argue that in order to obtain public support for collaboration and cooperation, an efficient dimension of the average team is appropriate. Even in the case of SMEs, more and more eco-innovation is becoming an integral part. According to Bocken et al (2014), in order to achieve eco-innovation, it is necessary for SMEs to adopt open, systematic and innovative informal approaches.

In order to encourage the initiation but also the development of such networks, it is necessary for SMEs to be integrated in certain programs to support these networks through public policies (McAdam et al., 2014, Ceptureanu SI et al, 2018). In order to act as a catalyst for open innovation, in many countries public funding is provided directly to the research and development centers of companies and universities, but this public funding is necessary to focus and focus primarily on the needs of SMEs (Roper and Hewitt-Dundas, 2013). In order to facilitate open innovation in service SMEs, public policy initiatives specialized in differentiating network strategy are more effective (Suh and Kim, 2012). In order to be able to effectively accelerate open innovation in SMEs, it is necessary to significantly improve existing public policy (Vega et al., 2012). To better meet all individual needs, a number of group and open innovation policies can encourage innovation, while, given the problems at regional level, society-led innovation needs to be encouraged through a number of programs. reform at national level, taking into account European challenges for innovation (Vigier, 2007). There is no significant impact on innovation performance for SMEs that have links and cooperate with government agencies (Zeng et al., 2010). To become active participants in the process of technological innovation, SMEs can be supported through a set of effective public policies, such as fiscal incentives (Yan and Yu, 2013).

Collaboration of SMEs

The collaboration of SMEs depends on what they intend to achieve. The chances of SMEs to launch new services and products are obviously increased by their collaboration with external agencies (Spithoven et al., 2013). Regarding SMEs, vertical collaboration is relevant for achieving radical innovation and horizontal collaboration is necessary and appropriate for incremental innovation, according to a study by Parida et al. (2012). According to Lecocq and Demil (2006), vertical specialization, achieved within an open system of an industry, can lead to a decrease in the size of SMEs. According to Spithoven et al. (2013) collaboration between SMEs includes value chain partnerships, which bring new knowledge bases that they can easily absorb even beyond technology and science. SMEs that carry out closed innovation tend to develop collaborations in order to implement the incremental changes of their already existing products, and within open innovation SMEs will tend to collaborate for product introduction (Wynarczyk, 2013). In agreement with Van de Vrande et al. (2009), Hemert et al. (2013), compared to the early stages of innovation, in the marketing stage, it is more important the collaboration between SMEs, according to studies reconfirmed many times. Obviously, the degree of collaboration is closely related to the emotional dimension of the company.

Dynamic capacities of SMEs

To a very large extent, SMEs are beneficiaries of knowledge-based, dynamic and labor-intensive industries, but at the same time have limited options in mature, capital-intensive industries (Dodourova and Bevis, 2014). In the innovation process, the critical dynamic capabilities of SMEs were explored by Grimaldi et al. (2013). They found that SMEs with strong configuration, confiscation and detection capabilities are much more likely to develop a range of open innovation approaches. According to Zeng et al. (2010), compared to horizontal cooperation with state agencies, academic institutes but also with research institutions, horizontal and vertical cooperation with suppliers, customers but also with other agencies have a much more distinct role in terms of innovation process of

SMEs. Following studies, Guräu and Lasch (2011) identified a number of factors that accelerate the capacity of SMEs through which they manage and develop open innovation systems. Among these factors we can list the company's ability to implement and manage open innovation systems, its ability to identify partner organizations with complementary resources, its ability to develop partnerships, the organizational stage and the size of the company. According to Heger and Boman (2014), SMEs are helped to approach the approach to dynamic capabilities through a wider knowledge base.

According to Teece (2007), we can define dynamic capabilities as the ability of the organization to transform, interact, learn and feel in close accordance with rapidly changing external environments. According to Peng and Lin (2017), so far, research on the link between dynamic capabilities and internationalization has been able to contribute to the robustness of the theory of dynamic capabilities. Through this theory we are able to highlight the importance of having the capacity to change in order to address, in an international business context, rapid environmental change. In order to learn from experience, it is necessary for organizations to be able to develop processes for detecting the international environment. The main factor that determines international success is the possibility and availability of an organization to transform its resources, processes and attitudes. According to Carlos and Pinho (2011), MacLean et al. (2015), Rothaermel and Hess (2007), these dynamic capabilities can be found in several levels, such as network level, company level or individual level and of course, between these levels there is an interaction. The researchers ignore the heterogeneity present at the individual level and highlight specific constructions such as capacities and resources, when analyzing the internationalization of companies. When the analysis of a single level is performed, this implicitly leads to the fact that heterogeneity is at the chosen level and the other levels remain homogeneous. However, according to Felicio et al. (2015), Fernandez-Mesa and Alegre (2015), there is previous research that has managed to verify an indissoluble link between corporate characteristics and individual characteristics.

According to Teece et al. (1997) dynamic capacities consist of two components: 1) dynamics is defined as the ability to remain constant in a process of business exchange in response to innovations; 2) the role of strategic management defines the capability, which intervenes in the process of integrating resources into a new group or reconfiguring or integrating resources. According to Schreyögg & Kliescheberl, (2007), meeting the needs of adaptation to change in a rapidly changing environment requires external and internal skills that consist of the following elements: the duration of the probability of trust, training and the process of solving complex problems. In expansion, the concept of dynamic capabilities plays a particularly important role given the long-term ability of an organization to improve and change its performance much better than their competitors (Schiuma, Lerro and Moustaghfir, 2008). creating new knowledge, we must always focus on the processes present in the organization. The creation and development of new levels of competence for self-development is a particularly important capacity that in any organization must be developed with priority. The increase of dynamic capacities is determined within the organizations by the change of capacities and resources mainly in the moments of market fluctuations (Teece et al., 1997).

The dynamic capacities present at individual level have a primordial predictive role in the development of dynamic capacities at international and organizational level. We also need to ask ourselves what are the capabilities that most closely resemble the dynamic capabilities present at the entrepreneurial level? Long before their rivals, entrepreneurs exploit, discover, define but also create opportunities. Dynamic capabilities are generated by entrepreneurial activities (Zahra et al., 2006). Consequently, the entrepreneurial orientation re-presents a main characteristic of the individual level and is able to measure the degree of entrepreneurial inclination of the founder / owner.

Patenting in SMEs

Of course, SMEs also benefit from patenting, as in the case of large companies. In their effort to license their knowledge to external parties, patenting activities significantly support SMEs (Andries and Faems, 2013). Apart from its main activity, for the technologies of a company, the timely recognition of licensing opportunities is quite difficult. In this context, SMEs present, for innovation activities, limited financial resources, a specialized knowledge base but also a concentrated business portfolio (Ceptureanu EG et al., 2019b). In this context, to demonstrate how SMEs can identify viable licensing opportunities, Bianchi et al. (2010) developed and developed a specific methodology. Also, Jeon et al. (2011), demonstrated a unitary approach to finding external partners through patent information. According to them, companies can find partners by performing three consecutive steps: data collection and preprocessing, transforming patent documents into coincidence vectors and deriving potential technology partners based on similarity indicators. According to Saguy and Sirotinskaya (2014), state organizations and universities, when dealing with the SME sector, are forced to consider adaptable and diverse IP management strategies. While large firms mainly benefit from their search strategies, the turnover of SMEs made from new products is mainly determined by patent protection (Spithoven et al., 2013). Suh and Kim (2012) demonstrate that technology acquisition is positively related to patenting for service SMEs. To fully benefit from their innovation activities, patenting is considered by SMEs as a particularly important strategy (Andries and Faems 2013).

In connection with the reasoning or advantages (reasons) behind the companies to patent, a series of studies have been conducted. Given that for economics patents have several functions, there are a number of reasons to patent. Among these we can list: allowing licenses, improving technological negotiation, rewarding researchers, avoiding disputes, preventing imitation. Recent studies include a number of additional reasons: attracting capital, improving reputation, blocking competitors present in certain technological fields. For companies that patent, another important reason would be related to protecting their freedom to operate. A patented invention makes an important contribution to the prior art. Therefore, the same actors cannot certainly patent the same invention and the one who is the owner of the respective invention cannot be removed from the use of his own invention.

The marketing and acquisition of technologies by companies can be achieved through production and research and internal development but also through internal marketing of services and products. Regarding the commercialization and internal acquisition of the technology, there are several alternatives. The licenses can be sold or bought by the companies or other variants of commercialization on the technological markets of the technologies can be identified, as well as through the patent auction. Within different organizational structures, with different degrees of organizational disintegration, the marketing and / or acquisition of technologies can be achieved through spin-offs, joint ventures or partnerships. In conclusion, in agreement with Enkel et al., (2009); Dahlander and Gann, (2010), all these different external technological strategies can sometimes be categorized as different forms of open innovation or more correctly different forms of open output or input innovation.

Networks

According to Lee et al., (2010), the most effective way to facilitate open innovation among SMEs is through the network. However, according to Heger and Boman (2014) it was found that the network partnership is made and used mainly for activities necessary for data collection and limitedly for fundamental activities such as decision making and strategy. For forecasting opportunities, these authors found that SMEs can benefit substantially from networking approaches. According to Hemert et al., (2013), SMEs considered innovative are more likely to network with institutions but also with other SMEs. The concept of horizontal collaborative networks is supported by social network constructions but also by open knowledge-based innovation (McAdam et al., 2014). According to Padilla-Meléndez et al. (2013), regarding open innovation, it is necessary for SMEs to pay attention to both informal and formal relationships with different actors. Under these conditions, according to Pullen et al. (2012), a relatively consistent, concentrated and closed network has higher innovation performance. According to these authors, in order to have a successful network profile, it must have a high level of trust, complementarity of resources and complementarity of objectives. According to Suh and Kim (2012), regarding service SMEs, the network may not be an efficient activity. According to Török and Tóth (2013) an important role in the success of SMEs is still played by personal networks. A real challenge for SMEs is the management of several networks. In conclusion, it is necessary for SMEs to exchange between large and intensive networks and to be careful about who should build the network (Hughes 2009). SMEs prefer, instead of suppliers, the network with customers in general (Theyel 2013).

The performance of open innovation in SMEs

According to Yun and Mohan (2012), largely in high-tech industries, open innovation is essential for the continued growth of SMEs. In agreement with Colombo et al. (2014), to a large extent SMEs depend, in order to implement their strategies, on the resources of their open innovation partners. Long-term incentives have a greater effect than short-term incentives, but significant positive effects on firms' innovation efficiency have both short-term and long-term incentives (Fu, 2012). It also found that innovative efficiency is present in the open innovation of SMEs achieved through external collaboration. According to Zeng et al., (2010). there is a significant relationship achieved through cooperation with research organizations, cooperation with intermediaries and between companies and the innovation performance of SMEs in Chinese SMEs. However, even in this context, the significant positive impact on the performance of innovation among SMEs is given by the organization between companies. A significant mediating effect on the relationship between business model innovation and organizational inertia but also the relationship between firm performance and organizational inertia has open innovation (Huang et al., 2013). Regarding SMEs in South Korea, development and external research have a significant positive effect on the production of innovation, external knowledge has no impact and external ideas have a negative effect (Kim and Park, 2010). In this way, not all open innovation activities have a positive effect on innovation efficiency.

The characteristics of the tasks and the team can affect the openness, at the project level (Kim et al., 2014). They include the relevance of the task for the main business, the uncertainty and technology of the market, the strategic importance, the learning distance, the size of the team. Technological research shows an incremental innovation performance while technological supply is directly linked to the radical performance of innovation (Parida et al. 2012). Deep and wide-ranging search is curvilinear (taking an inverted U-shape) in terms of performance for UK SMEs (Laursen and Salter, 2006). They claim that SMEs that are much more open to external channels or sources are more likely to achieve higher innovation performance. Creating innovations requires openness in most cases, but marketing innovations requires protection, which is a paradox of openness (Laursen and Salter, 2014). They

identified a concave relationship achieved between formal collaboration for innovation, the strength of firms 'adequacy strategies and the extent of firms' external search. Moreover, they showed that the concave relationship is stronger for the breadth of formal collaboration at the expense of external search. With strict reference to the development and research performance of service SMEs, within the internal development and research, collaboration in development and research but also technology acquisition are positively related to process innovation, patenting activity and service / product innovation Suh and Kim, 2012). Although for SMEs operating in emerging economies, involvement in open innovation can increase business performance, they do not necessarily depend on entrepreneurial behavior for business growth (Chaston and Scott, 2012).

The advantages of open innovation in SMEs

Especially for the initiatives present at the early stage, open innovation is not directly an attractive option because it is very possible that they do not have adequate capacities in terms of capital but also investments in research and development (Lee et al., 2009). Apparently, for SMEs, open innovation has a high potential (Lee et al. 2010). Given these issues, because development and research are most often long-term, always risky and costly, and require the necessary protection of results, Oakey (2013) criticizes Chesbrough for exaggerating the applicability of open innovation systems. He argues that closed innovation is still an effective way to invest in development and research. Even under these conditions, in terms of capitalizing on the external and internal capacities of SMEs, support tools, such as Web 2.0 and the Internet, are becoming increasingly important (Bell and Loane 2010).

In the opinion of many researchers, regarding the use of different open innovation practices in parallel, SMEs are much more efficient compared to large companies (Spithoven et al. 2013). However, most SMEs continue to pursue closed innovation versus open innovation (Lichtenthaler, 2008). It is more innovative products than non-suppliers that offer ideas to external parties (Török and Tóth, 2013). It is the reciprocal relationships that significantly increase the probability and possibility that SMEs will benefit from a substantial benefit from the contribution made to product development projects by other companies, rather than one-way exchange. To find the cost associated with various sources of innovation, Tranekjer and Søndergaard (2013) explored Danish SMEs. They found that collaborating with clients results in lower project costs, collaborating with similar knowledge base providers is related to market performance and science and market sources, and is related to low costs. Even in these conditions, for SMEs that are closely related to suppliers, the degree of novelty of new products is lower. In the opinion of Parida et al., (2012) for high-tech SMEs, technological research is a cost-effective option. As part of their business activities, as a whole, SMEs are increasingly adopting open innovation (Xiaobao et al. 2013; van de Vrande et al. 2009).

Marketing

Mainly, SMEs pursue open innovation for commercial activities, such as keeping pace with competitors and meeting customer demand, according to a study by Van de Vrande et al. (2009). It is especially important for SMEs to interact with innovation sources not only in the final stage of the innovation process for the successful commercialization of a service or product but also in the recognition phase of the innovation process, according to a study by Hemert et al. (2013). In terms of SMEs in South Korea, the degree of government support and the size of the company are factors with a significant impact on the trade activity of SMEs (Kang et al., 2013). In the same context, the investments made in external research and development as well as the innovative capacities generate a particularly strong positive impact on the commercial activities of SMEs. According to Lee et al. (2010), although SMEs do not have the necessary resources for marketing, they still claim that they are good at inventions. As a consequence, SMEs can be helped and supported in order to exceed the marketing limits by collaborating with intermediaries in the commercial stage but also with other partners. According to Van de Vrande et al. (2009), Hemert et al. (2013), Theyel (2013), regarding SMEs, in the commercialization stage, collaboration is much more important than other stages, such as development, research, idea. According to Chaston and Scott (2012), Spithoven et al. (2013), open innovation is less efficient for innovations than for sales, for SMEs. Given these aspects, in order to overcome the challenges faced by SMEs, it is necessary and very important to cooperate with economic agents in the industry.

Conclusions

Several particularly important aspects are reported on the subject of open innovation in SMEs. Unfortunately, in the top journals there are a rather limited number of studies on this subject. Researchers in the European Union have played a particularly important role in the literature. If we talk about Asian countries, such as Taiwan, South Korea or China, a number of articles have appeared in a wide range of magazines about open innovation in SMEs. In many studies, a series of simple statistical analyzes have been used. There is certainty that many highly sophisticated analysis techniques should be used in future studies. Panel data is used in most impact articles. Particularly intuitive results can be obtained with the help of studies based on primary data. In order to obtain in-depth knowledge in the direction of the relevance of open innovation in the field of SMEs, longitudinal studies can be especially useful. Compared to the activities in the early stages, such as development and research, for SMEs open innovation is much

more beneficial and useful in terms of marketing. Given that intellectual property (IP) is able to protect highly selective technologies, it is necessary for SMEs to be particularly careful in this regard, compared to large companies. In a collaboration it is especially important to have a balance between the protection and disclosure of intellectual property. Compared to large companies, SMEs do not have particular inclinations regarding the adoption of search strategies. Compared to incremental innovation, open innovation for new product innovation is more important and relevant for SMEs.

When it comes to adopting open innovation, new entrants are always faster than current ones. Along with many indirect benefits, some measurable effects are brought about by open innovation. The activities that are considered by SMEs are those activities that are closely related to development and research, represented by obtaining the competitive advantage but also by satisfying customer requirements. A long but expensive process is represented by the collaboration of SMEs with external parts (Ceptureanu EG et al, 2018). Consequently, it is always necessary for SMEs to assimilate a new management paradigm. High-tech SMEs are always taken into account when conducting studies on open innovation in SMEs. For future studies, in the field of open innovation in the field of SMEs, it is absolutely necessary to put more emphasis on those SMEs that are not found in high-tech industries.

Regarding studies that refer to very large geographical areas such as South America, Africa but also Asia, they are particularly necessary for the future. There are also very few studies on the effects of policy decisions on open innovation in SMEs. The help provided by state and other agencies to SMEs remains particularly important, compared to large companies. In conclusion, special attention is needed in future explorations regarding the evolutions of policy factors intervening in support of SMEs for the assimilation of open innovation. Regarding the advice of the factors involved in the decision-making process, the link between entrepreneurship and innovation must be developed by researchers. Disputes, trust and culture are some of the most diverse issues facing the innovation process. Given these aspects, these issues remain unexplored in the literature that currently exists. The existing culture within a location is strongly marked by open innovation. The respective cultural issues will have to be analyzed in a more diverse context. Stakeholder confidence directly leads to a number of activities related to open innovation. A number of extremely important legal issues are generated by the sharing of properties such as business models, technologies, ideas. Many networks are not supported by SMEs due to the limited resources present in SMEs. In conclusion, to support open innovation activities within SMEs, their ability to maintain these networks is particularly important. Predominantly for developing countries, the establishment of organizations such as Living Labs and venture capital is particularly necessary to stimulate many open innovation activities within SMEs. In the process of transforming SMEs into an open environment, it may be particularly useful to explore in future studies the role of intermediaries, public organizations and the state. Even if open innovation was mainly used in the commercialization stage, the studies carried out for this stage are still few.

Abstract

This work presents a Scrum maturity practice model for banks. The model allows to assess how mature the current Scrum implementation is. This assessment is done in two dimensions (functional and technical) and on two different levels of organizational structure. The model is based on a yes/no questionnaire.

Keywords: Maturity Model, Project Management, Scrum, Banking Sector.

Introduction

As complexity of projects grows and business requirements are changing fast, the usage of classical project management methods becomes less useful. The implementation of Agile methods is necessary to allow company to be competitive. Being Agile is about being able to cope with change. Scrum is one of the most popular Agile approaches that has been initially designed for software development (Lei et al., 2017). However, choosing Scrum does not guarantee success. It is important that Scrum implementation is done properly. When company has been using old project management methods for years, it is not a matter of days or even weeks to adapt to using the new method. It is a long-lasting process, that needs supervision.

To assess the degree of implementation of a given method or approach, maturity models are used (Brajer-Marczak, 2012). This work proposes a Scrum maturity model for banking sector. This sector has been using classical management for years, but recently more and more banks are transforming its management to be Agile (Kerr et al., 2018). Scrum, as popular Agile approach, is often the first choice.

Maturity models allow to quantitatively express qualitative assessments (Kosierdzka and Smagowicz, 2016). Besides helping to assess the current situation of the organization (descriptive function), the models also allow setting goals connected with achieving the given level of maturity (prescriptive function), because they give a possibility to plan and execute the improvements to existing practices and help to build a roadmap for future organizational changes. Maturity assessment can also be used to compare the methods to the methods used in different organizations (comparative function), e. g. (de Bruin et al., 2005), (Kalinowski, 2011), (Skrzypek, 2012). In relation to Scrum, the higher the level of maturity is, the more productivity is achieved. Mature Scrum organization should have the business processes that are efficient and effective and should use practices that are implemented based on Scrum Guide (Schwaber and Sutherland, 2017), fulfil the four basic principles of Agile Manifesto and the 12 principles of Agile. Attachment to traditional management methods, relying on the decisions of superiors, no taking responsibility for work are key barriers in the adaptation of Scrum approach.

The research methods used in this work are in-depth literature review, analysis of the bank documentation and interviews. The practical aspect of the article is a proposition of Scrum maturity model, that is based on questionnaire. Although interviews designed for the research process were conducted only in one bank, the model is meant to be general and can be applied in any bank that uses similar organizational structure (Figure 1). The structure of this work is as follows: first the existing maturity models for Agile project management approaches are reviewed and compared, then the Interviews are described, and a Scrum maturity model is proposed. Then we outline the validation of the model presented. Finally, conclusions and directions for further research are listed.

Maturity Models in The Literature

As far as literature review is concerned, we constrained our search to Agile maturity models. There already exist some approaches to Agile maturity assessment. The models that were found in the literature are: Agile Maturity Model – AMM (Patel and Ramachandran, 2009) and Scrum Maturity Model – SMM (Skomra and Kuchta, 2017). They both

Cite this Article as: Ewa MARCHWICKA and Roksana WITIAK " Scrum Maturity Model for Banking Sector" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

are based on questionnaires. The main features of the models found in the existing literature are summarized in Table 1.

Table 1: Project risks typology

Scrum Maturity Model	Agile Maturity Model
MAIN OBJECTIVES	
- to assess Scrum maturity in the examined organization, resulting from the way Scrum is used in individual project implemented in a selected period	- to tailor the software process improvements program for the Agile environments - to identify the level of the Agile practices and levels of improvement
FEATURES	
- has a form of a questionnaire - is divided into sections - maturity is determined from a perspective of particular project and the whole organization	- has a form of a questionnaire for each level - consists of 5 levels with certain goals - for each goal certain Agile practices have been either hinted or explicitly suggested - assessment questionnaires are based on the Agile software development practices, principles and values
ADVANTAGES	
- is easy to use - is adapted to the Scrum framework - allows assessment from two perspectives (project and whole organization)	- proposes a generic maturity model for Agile development - suggests Agile practices for each level - identifies the levels of improvements
DISADVANTAGES	
- has a lot of questions, is time-consuming - is not adapted to the needs of bank sector - is not able to check the maturity of specific team	- focuses only on Agile software development practices - is complicated in use - is not dedicated to Scrum only
POSSIBLE APPLICATIONS	
- can be use in all types of enterprises using Scrum framework	- is tailored to suit Agile software development environments

The main gap identified in the methods found in literature is the lack of approaches that are dedicated to the banking sector. The Scrum (SMM) and Agile (AMM) maturity models are suitable for software development companies, which Scrum originates from, but they are not adjusted to the needs of banks. Banking sector has many specifics, which makes it different from IT sector. Banks develop products and services for their clients, which are people and companies, but they don't communicate with their clients directly, as in case of many software development companies, but via digital channels. Direct collaboration with customer is impossible, because of the very large number of customers that are being served by banks (Yuonan and Mamedov, 2020). The most important characteristics of banking sector (Polish Financial Supervision Authority, 2019) in the context of this research are (1) regulations conducted by financial supervision authorities, (2) specific and strict procedures (make changes hard to be applied in this type of institutions), (3) the need to document all changes due to audits (in particular it is difficult to apply the Agile manifesto principle regarding the minimal documentation).

Research

The Scrum maturity model proposed in this article is suitable for banks that have recently started Agile transformation and adjusted their organizational structure based on the Spotify model. The ING was the first bank which introduced this kind of structure to their organization (Mahadevan, 2017). Agile organizational structure includes Squads, Tribes and Chapters. Squad is a cross-functional unit (of maximum 10 people) that can independently supply a product. Tribe is a collection of Squads with an interconnected purpose. Chapter is to develop and maintain expertise within Tribes, responsible for educating, providing workshops, hiring, evaluating, promoting, providing tools and methods (Kerr et al., 2018). The key roles in this model are Agile Coach, Product Owner, Tribe Lead and Chapter Lead. Chapter Lead takes responsibility for personal development, coaching and performance management. Agile Coach advices individuals and teams in the process of improving the performance (e.g. how to manage Product Backlog, how to provide transparency). Product Owner is responsible for the vision of the product and its functionality, servers as a communication channel between the Squad and its surroundings, works together with Agile Coach to improve productivity, manages Product Backlog and ensures that is visible and understandable to all interested parties. Tribe Lead is responsible for developing the right strategies and tactics to deliver desired business outcomes and to determine what work needs to be done and how to prioritize opportunities.

Fig. 1: Agile organization structure of a bank (Mahadevan, 2017).

The research was based on interviews. Interviews were informal, in a form of conversation. What is more, they were uncategorized, which means that the base set of questions may have been reordered, some questions may have been deepened, some omitted, and some new questions may have been added, depending on the course of conversation. The interviews were conducted with Agile Coaches, Product Owners and Tribe Leads. To keep short volume of this publication, we do not list questions that were used in the interviews. We only indicate that the base set of questions was different for different roles, but some common questions were used, like describing the responsibilities in the Agile context and listing the benefits of having a maturity model implemented in the organization. The interviews allowed us to identify the key elements of Scrum that are important from the banking sector point of view. All interviewees admitted that measuring maturity can provide benefits to the organization, because using maturity model will help to improve the work (e.g improving the productivity in introducing new technologies) and help to provide the wider view on the changes that are needed for better Scrum implementation. The researched bank has not applied any Scrum maturity model yet, in particular they haven't applied any maturity model adjusted to the needs of the banking sector.

The Scrum Maturity model described in this work is different from the existing models in the following aspects: (1) it is dedicated to banking sector specifics (in particular none of the models take into account the restrictions imposed on the banking sector by external supervision authorities and the fact that banks needs to be compliant with the regulations) (2) it has no divisions to levels of maturity and the model simply assesses Scrum's maturity in the scale from zero (no maturity) to one (full maturity) (Skomra and Kuchta, 2017), (3) it considers maturity on two different levels and in two dimensions, (4) it is much simpler than most of the maturity models found in the literature (e.g. a questionnaire is based only on yes/no questions), (5) its parameters are adjustable and are systematically updated, according to the voting procedure.

Model Proposal

The proposed Scrum practice maturity model is based on Yes/No questionnaire of 40 questions. Answers like: "partially" or "I don't know" are not possible. This simplifies the questionnaire and reduces to the time to give the answer. Each question assigned to a specific category: *Squad, Events, Artifacts*. The categories are designed in reference to the main Scrum elements. In *squad* category we can find questions regarding the whole squad and roles within it. In *event*, there are questions about Daily meetings, Sprint planning, Sprint realization, Sprint retrospective and Sprint review. In turn in *artifacts* there are questions about product backlog, Sprint backlog, DoD and increment. The vote of each members is equally important. The model considers the importance of the questions and allows to assess the maturity in two dimensions: functional dimension (Squad members and Squads within Tribe) and competence dimension (Tribe chapter members and Organization chapter members) at two levels: Team level (Squad or Tribe Chapter) and Organization level (Tribe and organization Chapter). The maturity of each level is determined as a weighted average. We give the formula used for calculating maturity in case of functional dimension. The formulas for competence dimension are analogous, but at the first level we iterate over Tribe chapter members (instead of Squad members) and at the second level we iterate over organization chapter members (instead of Tribe Squads). The first level functional maturity for Squad members defines the Squad maturity (formula 1).

$$S(t) = \frac{\sum_{j=1}^{N}\sum_{i=1}^{M} I_i(t)A_{ij}(t)}{N\sum_{i=1}^{M} I_i(t)} \cdot 100\% \qquad (1)$$

where importance is denoted as $I_i(t) \in$ R+, the i-th answer of a person j is denoted as $A_{ij}(t) \in \{0,1\}$, number of questions is $M = 40$ and number of Squad members is N. Yes answered question has a value of 1 and No answered question has a value of 0.

The second level functional maturity defines the Tribe maturity (formula 2).

$$T(t) = \frac{\sum_{k=1}^{K} S_k(t)}{K} \quad (2)$$

where $S_k(t), k = 1, \ldots, K$ and K is the total number of Squads within Tribe.

The symbol *t* illustrates that maturity is an iterative process that is calculated for a given time moment. What is more, $I_i(t)$ indicates that the parameters of the model (question's importance) are dynamic and are systematically updated. We describe the update process after presenting questionnaire questions. The questionnaire consists of forty questions and is presented in Table 2.

Table 2: Yes/No questionnaire that is used for assessing Scrum maturity for banking sector

Category	Initial Importance	Question
Squad	1	The goal of my squad is clear to me.
Squad	1	My squad has a dedicated Product Owner.
Squad	1	My Product Owner can make final decisions on the Product Backlog.
Squad	1	My squad has a dedicated Agile Coach.
Squad	1	Agile Coach supported my squad and Product Owner in achieving Sprint's goal.
Squad	1	Agile Coach supported my squad and Product Owner in the application of the Scrum approach.
Squad	1	In my squad I can openly express my opinion.
Squad	2	My squad is interdisciplinary, i.e. it has the competencies and knowledge about the banking policy necessary to perform end to end work with the Sprint Backlog.
Squad	1	My squad is able to execute its deliveries even when one of its members is temporarily absent.
Squad	2	My squad communicates with the client / end user to improve the products.
Squad	1	My squad has fewer than 10 people.
Squad	1	My squad decides who, when and how will do the work during the Sprint.
Squad	1	During the Sprint, my squad creates product value increment.
Squad	2	My squad independently analyses and makes necessary corrections to the Sprint Backlog taking into account the latest bank regulations and procedures.
Events	1	Each Sprint is preceded by the Sprint Planning.
Events	1	The goal of the Sprint is determined on the Sprint Planning meeting and is clear for everybody.
Events	2	The goal is consistent with the bank security policy and legal norms.
Events	1	Product Owner discuss the assumptions and elements selected to the Sprint Backlog.
Events	1	Our Sprint Backlog is available, actual, measured and prioritized.
Events	1	Each of the last two Sprints lasted less than one month.
Events	2	In the case of dependence with other teams, we are able to work effectively in a Sprint with compliance of bank's policy.
Events	1	My squad's speed was measured in the last Sprint.
Events	1	Each Sprint ends with a new increment.
Events	2	The new increment after each Sprint is finished and meets the requirements of banking policy.
Events	1	Sprint Review is held at the end of the Sprint.
Events	2	The result of the Sprint Review is revised Product Backlog including banking regulations.

Events	1	We start every day at work with Daily.
Events	1	Daily ends with a work plan for the next 24 hours.
Events	2	During Planning, my squad creates a Sprint Backlog in accordance with bank regulation containing the planned scope of work.
Events	1	Product Owner took into account the speed of the squad when planning work on Planning.
Events	1	During the Sprint, we improved my team's work process based on the findings from Retrospective.
Events	2	Our improvements are reviewed by a special reviewer for compliance with bank's policy.
Events	1	During Review Product Owner and / or stakeholders inspect the increment made.
Events	1	In Review Product Owner and / or stakeholders discuss further product development with my team.
Artifacts	1	My squad has an actual Product Backlog.
Artifacts	1	Our Product Backlog is prioritized based on business value.
Artifacts	1	Description of Product Backlog elements is prepared in the form of User Story.
Artifacts	1	Product Backlog in my squad contains estimated elements for at least the next 3 Sprints.
Artifacts	1	Each finished user story in the Sprint complies with the Definition of "Done".
Artifacts	2	Definition of "Done" include the request of reviewing the completed task by compliance experts.

There is one element of the model that is not depicted in the table. It is a question purpose. The purpose is given to avoid differences in understanding and interpretation. As part of the method being proposed, we suggest that the importance values assigned to questions are being updated within each Squad and Chapter in the process of voting procedure, each time after the questionnaire is filled in. Squad and/or Chapter members should vote on the model elements that mostly hindered compliance with bank regulations and those that mostly helped being compliant with regulations. The importance of the elements that helped with compliance should be multiplied by two and the importance of the elements that were compliance-problematic should be divided by two. Some of the elements in the initial questionnaire have already their initial importance multiplied by two, as they were designed to help with bank regulations compliance issues. The two main features of the model that distinguish it from standard Scrum maturity models and make it appropriate for bank organization are the updatable importance parameters to track the compliance with regulations as well as the consideration of two different dimensions (functional and competence) of the specific Agile organizational structure, that was primarily applied in the bank of ING and has been then followed by many other banks. Another important feature is that naming maturity levels is not considered in the model. The model offers quantitative assessment of the degree of maturity that ranges from 0% (no maturity) to 100% (full maturity), which makes it simple to be used.

Model validation

The model has been created in a form of questionnaire, so that it is relatively easy to be analyzed and it is easy maintainable. According to the research, introducing maturity model can bring many benefits to the organization. However, the model should be validated. In general, assessing a quality of the proposed model is not an easy task. There is lack of benchmark data that can be used to compare the given model to other models known from the literature. None Scrum maturity models related to banking sector were found in the literature. Comparison with standard Scrum maturity models (like SMM) is also difficult, as it is hard to measure how much the given model helps to improve Scrum productivity. For this reason, we suggest a questionnaire, which does not allow the organization to assess the quality of the model, but it gives the organization a possibility to improve it.

Table 3: Questionnaire used for maturity model improvement

No.	Question
1.	Do you think the choice of questions in the maturity model survey is appropriate? Explain why.
2.	Do you have the needed knowledge to answer all the questions? Which questions are difficult to answer?
3.	What should be the frequency of measuring the level of maturity?
4.	What is the current level of maturity in your squad?
5.	How the results of the assessment are used by squad members?
6.	What benefits give you the introduction of the model?
7.	Do you think the squad has become more mature in terms of Scrum since the introduction of the model? Explain why and present examples.

Conclusions

A Scrum maturity model for the banking sector has been proposed. Using this model, allows bank organization to see how mature the organization in terms of Scrum is and to plan the changes. It also gives the ability to compare the maturity results with other banks. The model is adjusted to the needs of banking sector, is adjustable (its parameters are systematically updated) and allows to measure the maturity in two dimensions and two levels. It also allows the identification of Scrum elements that are problematic and need to be removed or changed from the compliance with bank regulations point of view. The model is simple (it is based on Yes/No questions) and can be applied in any bank that has the structure of Squad, Tribes and Chapters. The idea of model improvement has also been presented in this work. Further research that is being planned should include more enterprises to increase the model universality. Despite this fact, the model is universal enough and easy enough to be applied in any bank organization with appropriate Agile organizational structure.

Abstract

The article conducted a study of the impact of climate change on the state of the environment. A comprehensive analysis of climate change indicators and environmental financing indicators in Russia was carried out. The object of the article is the dynamics of indicators of sustainable development to increase adaptation to climate change. The purpose of the article is to analyze the change in indicators of sustainable development and determine the contribution of Russia to climate conservation. Official data of Russian and international statistics on economic security indicators of Russia were used, for the processing of which dialectical methods were used (comparison and synthesis). The ways of environmental and economic transformation towards sustainable development of the country are outlined.

Keywords: Sustainable Development, Indicators, Climate Change, Environmental Protection, Pollution, Environmental Measures

Introduction

Environmental issues have long worried scientists. The history of the emergence of concepts related to nature protection begins in the 19th century and ends in the modern period. As you know, there are 17 goals of the concept of sustainable development. All goals are closely related. Environmental objectives play an important role among them. Goal 13 reflects the need to combat climate change.

Climate change affects the economy, the environment, and the social development of the country. Warming processes also have a detrimental effect on the reduction of biodiversity, leading to a decrease in forest areas. Efforts to combat climate change are aimed at developing cost-effective and efficient measures to stabilize the climate. This will reduce the number of emergencies. A big role is assigned to financing activities in this direction: both capital investments and current costs.

The importance of combating climate change is supported by scientists around the world. Our country is also taking measures to contain dangerous processes. The causes of negative environmental events lie in short-sighted economic policies. So, in many countries of the world, until recently, significant subsidies were made for the development of environmental exploitation sectors of the economy. These include agriculture (pesticide subsidies), extractive industries (oil spills, soil and soil destruction), forestry (deforestation, deforestation). The lack of consideration of environmental factors adversely affected the state of the environment and led to its pollution. To combat these phenomena, it is necessary to adhere to the principles ensuring environmental safety [1].

Cite this Article as: Olga LUKINA, Anna KUROCHKINA , Ekaterina PETROVA , Irina NIKITINA and Andrey PANARIN " Analysis of Indicators of Sustainable Development to Enhance Adaptation to Climate Change and The State of The Environment" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

Such principles should include the dissemination and expansion of knowledge about the laws of the development of environmental systems, taking into account the long-term effects of significant government programs. The delineation of ownership of natural resources between central and local authorities has an important role to play. One of the main tasks is to preserve the health of the population. Currently, the situation is complicated due to the epidemiological situation, which leads to a reduction in the income of enterprises, bankruptcy, and a tightening of the financial situation. As a result of these factors, significant savings in environmental costs are possible, which is highly undesirable.

Materials and methods

Analysis of climate change indicators in Russia

We will analyze indicators reflecting Russia's contribution to climate conservation. Note the positive developments in this area and the shortcomings that will have to be overcome. Russia pays considerable attention to sustainable development, including measures to reduce greenhouse gas emissions. High levels of greenhouse gas emissions lead to warming, an increase in average air temperature.

Consider the changes in the average air temperature in the Federal Districts of Russia in 2019 in table 1 [2].

Table 1: Analysis of the average air temperature change in the Federal Districts of Russia in 2019

	January			July		
	norm	in fact	aberration	norm	in fact	aberration
1	2	3	4	5	6	7
Central	-10,1	-7,8	2,3	18,0	16,7	-1,3
North-West	-14,5	-12,5	2,0	14,9	13,7	-1,2
South	-5,3	-2,3	3,0	23,1	23,0	-0,1
North Caucasian	-3,6	-0,3	3,3	21,6	21,7	0,1
Volga	-13,9	-11,7	2,2	19,0	18,0	-1,0
Ural	-21,7	-18,9	2,8	15,6	17,0	1,4
Siberian	-24,8	-22,8	2,0	15,0	15,6	0,6
Far East	-30,4	-27,6	2,8	14,0	14,8	0,8

It follows from the table that in 2019, the actual air temperature values in January (the coldest month of the year) exceeded the standard values in all 9 districts. Particularly high rates were observed in the North Caucasus Federal District (by 3.3 degrees) and in the Southern Federal District (by 3 degrees). Closer to the normative values are the indicators of the North-West and Siberian Federal Districts, where the temperature exceeded the normative values by 2 degrees.

However, when analyzing the air temperature indicators in July (the hottest month of the year), it is clear that in some districts the average monthly temperature was below normal. So, in the Central Federal District, it fell by -1.3 degrees, in the North-West - by -1.2 degrees, in the Volga region - by -1 degree. So it is premature to conclude that there is a significant warming of the air in Russia.

Consider the dynamics of precipitation in the Federal Districts of Russia in 2019 in table 2 [2].

Table 2: Rainfall dynamics in the Federal Districts of Russia in 2019

	January			July		
	norm, mm	in fact, mm	Aberration (growth rate)	norm, mm	in fact, mm	Aberration (growth rate)
1	2	3	4	5	6	7
Central	49	64	1,31	88	94	1,07
North-West	44	58	1,32	85	109	1,29
South	59	83	1,40	74	122	1,65
North Caucasian	26	26	1,01	87	115	1,32
Volga	46	62	1,34	62	58	0,93
Ural	23	21	0,92	62	59	0,94
Siberian	12	8	0,68	59	44	0,75
Far East	16	14	0,86	68	68	1,00

When analyzing the amount of precipitation, it is clear that in a number of regions of the Russian Federation there is an increase in the growth rate of precipitation, both in winter and in summer. This is characteristic of the Southern, North-Western, Central and North Caucasus Federal Districts. The remaining 4 districts have drier weather, that is, a decrease in precipitation in January and July. In general, it can be concluded that there are slight fluctuations in the dynamics of precipitation in Russia during the study period.
Consider the dynamics of the number of dangerous hydrometeorological phenomena in the territory of the Russian Federation during the period from 2017 to 2019 in Table 3 [2].

Table 3: Dynamics of the number of hazardous hydrometeorological phenomena in the territory of the Russian Federation

	2017		2018		2019	
	in fact	change from the previous year	in fact	change from the previous year	in fact	change from the previous year
1	2	3	4	5	6	7
Number of hazards - total	907	-81	1040	+133	903	-137
including hazards that caused significant damage	378	-2	465	+87	346	-119
of which the number of unintended hazards	22	+5	20	-2	17	-3
Proportion of hazards causing significant damage in the total number of hazards in%	41,7	+3,2	44,7	+3,0	38,3	-6,4
Proportion of unintended hazards in the total number of hazards in%	2,4	+0,7	1,9	-0,5	1,9	0

It follows from the table that the number of hazards has changed unevenly over 3 years. So, in 2018 it increased, and in 2019 it decreased. These changes concern both the number of all hazards and those that have caused significant damage to the economy and the population. However, the number of unintended hazards in the study period decreased, which positively characterizes the activities of the state. The share of dangerous phenomena that caused significant damage in the total number of phenomena is over 40%, although in 2019 there is a decrease in this indicator.

It should be concluded that more attention should be paid to the prevention of hazards that threaten lives and the destruction of the economy.

We will analyze the dynamics of the number of natural emergencies that occurred on the territory of the Russian Federation in table 4 [1].

Table 4: Analysis of the dynamics of the number of emergencies that occurred in the territory of the Russian Federation

	2017		2018		2019	
	in fact	change from the previous year	in fact	change from the previous year	in fact	change from the previous year
1	2	3	4	5	6	7
In total Including:	42	-12	44	+2	49	+5
- landslides, sat down, collapses, showers	2	0	0	-2	2	+2
- storms, hurricanes, tornadoes, squalls, heavy blizzards	3	-3	1	-2	2	+1
- avalanches	1	+1	0	-1	1	+1

- heavy rains, heavy snowfalls, large hail	14	-7	11	-3	9	-2
- frosts, drought	4	-3	14	+10	12	-2
- separation of coastal ices	0	-1	1	+1	0	-1
- dangerous hydrological phenomena	13	-2	12	-1	17	+5
- major natural fire	5	+3	5	0	6	+1

The analysis of the table shows that the number of emergencies has increased over 3 years. Among these situations, dangerous hydrological phenomena, frosts, drought and heavy rains, snowfall, large hail are distinguished. Their share in 2019 amounted to the total number of emergencies: 35% (dangerous hydrological phenomena), 25% (frosts and drought), 18% (heavy rains, snowfall, large hail).

The analysis of the table suggests an increase in tension in this area and the need to increase the cost of protecting against emergencies and pay more attention to civil defense.

Analysis of indicators of financing of environmental measures in Russia

As noted above, environmental finance has an important role to play in combating climate change.
We will analyze the dynamics of environmental expenditure in Russia in table 5 [1].

Table 5: Analysis of the dynamics of environmental protection expenditures in the Russian Federation in billion rubles

	2017		**2018**		**2019**	
	in fact	growth rate compared to the previous year of%%	in fact	growth rate compared to the previous year of%%	in fact	growth rate compared to the previous year of%%
1	2	3	4	5	6	7
In total Including:	658	111	720	109	871	121
- Protection of the air and prevention of climate change	123	121	131	107	139	106
- protection of water resources	239	101	247	103	257	104
- address with waste	79	118	92	116	112	122
- protection of lands	34	77	31	91	36	116
- preserving of a biodiversity	43	119	46	107	49	106
other	140	132	173	124	278	161

The table shows that the costs of environmental protection are increasing in all areas. Moreover, the highest growth rates are observed in the areas of waste management and in other measures. The share of costs for the protection of the atmospheric air and the prevention of climate change in 2019 of the total amount of costs amounted to 16%, while the share of costs for the protection of water resources was significantly higher - 30% and the share of other costs reached 32%.

Changes in the pattern of environmental costs may need to be made to increase the share and amount of mitigation costs, as climate change also affects the reduction of all environmental indicators.

Table 5 presents the total environmental costs, including capital investments and current (operating) costs.
We will analyze the current (operating) costs of environmental protection in Russia in billion rubles in Table 6 [1].

Table 6: Analysis of the dynamics of current costs for environmental protection in the Russian Federation in billion rubles

	2017		2018		2019	
	in fact	change from previous year in%%	in fact	change from previous year in%%	in fact	change from previous year in%%
1	2	3	4	5	6	7
In total Including:	321,0	105	345,0	107	374,0	108
- Protection of the air and prevention of climate change	57,0	100	61,0	107	64,0	105
- protection of water resources	163,0	106	174,0	107	175,0	101
- address with waste	70,0	109	80,0	114	102,0	128
- protection of lands	15,0	75	15,0	100	16,0	107
- protection against noise and other physical effects	0,3	75	0,4	133	0,4	100
- preserving of a biodiversity	0,4	100	0,5	125	0,6	120
- ensuring radiation safety	6,0	100	8,0	133	8,0	100
- research activity	0,5	83	0,2	40	0,2	100
- other	8,8	176	5,9	67	7,8	132

Table 6 provides a more detailed analysis of environmental costs than table 5. Table 6 identifies additional areas: protection against noise and other physical effects, radiation safety, research activities [3, 4].

The analysis of the table shows that recurrent expenditures have increased over 3 years. The highest growth rates are observed in waste management, other activities and biodiversity conservation.

The share of costs for the protection of the atmospheric air and the prevention of climate change in 2019 is 17% of the total cost, while the share of costs for the protection of water resources is 47%, the share of costs for waste management is 27%.

Similar calculations and conclusions were made in the analysis of Table 5.

Conclusion

The analysis showed that significant changes in climatic phenomena in the Russian Federation (changes in average air temperature, precipitation dynamics) have not yet been noted.

Our country has made progress in reducing the number of unintended hydrometeorological hazards. There are favourable trends in this area. However, the number of dangerous hydrometeorological phenomena, although decreasing in the study period, requires attention from the authorities. The dynamics of the number of emergencies in the Russian Federation is alarming and indicates tension in this area. A possible way to reduce tensions is through changes in fiscal policy towards increased spending on protection against these phenomena. Measures should also be taken to strengthen civil defence [5, 6].

In the analysis of environmental costs and current cost trends, positive changes towards these costs should be concluded. It should be noted that the role of environmental protection measures is great. However, the current focus is on the construction of treatment facilities, the use of filters, waste disposal, etc. But the listed measures are aimed at eliminating the consequences of anthropogenic impact on the environment. It is important to prevent and eliminate the causes of natural destruction. Investment is needed in alternative solutions to environmental problems. The solution of these problems is possible only with the help of the state, since this is associated with the structural restructuring of the economy, with the development and introduction of low-waste and resource-saving technologies, with the greening of the country's economic development.

The protection and restoration of ecosystems and sustainable forest management receive considerable attention from our State. Russia is the largest state in the world. In Russia, an array of natural ecosystems (8 million square kilometers) is preserved. It serves as a reserve for the stability of the Earth's biosphere. The concept of sustainable development emphasizes the need to assess the economic capacity of the country's local and regional ecosystems, as well as the obligation to monitor a number of indicators. Such indicators include, inter alia, the quality of natural and modified areas, the availability of forests, taking into account their productivity, degree of preservation and a number of others. However, attention should be paid to the development of measures to preserve and expand specially protected areas, state reserves, as well as to prevent the death of forest plantations in the country.

Overall, it can be concluded that environmental-economic change requires deeper efforts to achieve sustainable development goals. Financing, combining the potential of science, technology and innovation with an emphasis on digital transformation will give global sustainable development processes the right vector. It is necessary to switch to clean energy sources, to combat deforestation, to change production and consumption patterns.

Abstract

This article points to the internal problem of nation states and the Warsaw Pact at the turn of the 1950s and 1920s. It also indicates the threats to European security. Events threatening destabilization in the Warsaw Pact countries took place in Poland (1967-1968) and Czechoslovakia in 1968. The events in Poland had a background in the Middle East events.

Keywords: Management**,** Internal Problems, NATO, Warsaw Pact, European Security.

Introduction

At the beginning of this article, a period of analysis was adopted, dated after the death of Joseph Vissarionovich Stalin, changes in foreign policy are taking place in the Soviet Union, in order to indicate the essence of managing internal problems of NATO countries and to identify threats to European security.

Following the death of Joseph Vissarionovich Stalin, changes in foreign policy are taking place in the Soviet Union. The media of the time have knocked it off as a time to relax, in relations between East and West. The new leader of the USSR, Nikita Khrushchev, was seen as the one who will guarantee international security. As it turned out over time, the changes made to the state leadership were only the proverbial 'smokescreen' to hide the true face of the new authorities. The United States, too, under the leadership of President Dwight D. Eisenhower (1953-1961), received positive signals from a powerful Eurasian power. It was then that the proposal was made to reduce the number of American soldiers stationed on European territory (Buchanan 2010, s. 130).

Management of relations between Western Europe and the USA. Has Western Europe found itself at the grace of the proverbial and not the grace of the United States?

Both the United Kingdom and France have been working towards the possession of nuclear weapons, as confirmed in 1952, when the first nuclear test was carried out by the United Kingdom and by France in 1960. This showed that these European countries (particularly France) wanted to pursue their own foreign and security policy on the European continent, without the restrictions imposed by the US. Unfortunately, economic considerations were the problem. In addition, France's military involvement in the war in Indochina and the so-called Algerian crisis (which led to the collapse of the Fourth Republic and the return of Charles de Gaulle to power), was not viewed positively by the French (Wegs and Ladresch 2008).

Management of Anglo-French policy

The failure of the common British-French policy was the Suez crisis. It was then, under pressure from the Soviet Union and the UN, that, in November 1956, US President Eisen-hower forced the British and French (partly Israel)

Cite this Article as: Jerzy BĘDŹMIROWSKI and Miłosz GAC " Management of the Internal Problems of NATO Countries: Threat to European Security" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

to give up his attempt to take control of the Suez Canal away from Egyptian President Gamal Abdel Nasser (Guilmartin 2009, p. 439). Undoubtedly, it was the proverbial 'nose to nose' given to these two countries. It did not take too long for a quick response from France. In the spring of 1959, the French President decided to withdraw the fleet from the Mediterranean and refused to allow the US Government to deploy nuclear cargo on French territory. This was an unprecedented event, since the refusal of the 'main dealer' in NATO demonstrated the great political determination of its President. Was this a single French incident? No. Once again, it took advantage of the negative position of Konrad Adenauer, Chancellor of West Germany, against the US, because it was denied the opportunity to dispose of nuclear weapons on German territory. President de Gaulle was probably counting on Bonn to direct his loyalty towards Paris, thereby making it clear to both the US and the UK that all NATO members have the same rights as regards the possession of nuclear weapons (he did not take into account the fundamental difference that the UK and France were the manufacturers of these weapons and Germany was only a 'storehouse' for the US). To this end, he used the press conference held in January 1963, at which he expressed his support for Germany's possession of nuclear weapons. This was, undoubtedly, an unprecedented behaviour of France, especially considering its previous position towards Germany, including when voting on the issue of its accession to NATO, or the historical relations between these countries.

Germany - US relations

In spite of this heated support, the German side did not assume for a moment that relations with the US would be broken off in favour of cooperation with France. This situation was rightly assessed by Henry Kissinger, de Gaulle correctly analysed the international situation at the time, but overestimated France's ability to use it in its own interests. Germany was not prepared to turn its back on the USA, although some German politicians were interested in de Gaulle's vision (Kissinger 1966, p. 807).

A year later, once again, the French President 'stood up' against NATO's foreign policy by refusing to sign a no-trial agreement on nuclear weapons (this would mean shutting down his own production facilities), and in 1966 he decided to withdraw the French armed forces from NATO. This decision also resulted in NATO headquarters being moved from Paris to Brussels. We must agree with the words of Walter Laqueura, who said that the Americans treated France as one of the European countries, just like Germany and Italy, while in the eyes of de Gaulle, his country should be counted among the world powers . Could an event by France have made the Americans afraid that this would escalate to other NATO countries?

Political scenario by the United Kingdom

A certain signal that such a political scenario cannot be ruled out was the information coming from the United Kingdom. It was the second political loser after France, after the Suez conflict. It is worth stressing that most British politicians considered the events associated with this conflict to be a tactical political mistake, which led to Britain being placed on the opposite side of the US. This was confirmed by the events of the first 1960s, when France tried to persuade the United Kingdom to join the EEC, and thus to integrate it in the military sphere and with EEC countries.

After the meeting with Harold Macmillian, Prime Minister of the United Kingdom, in the autumn of 1962, President de Gaulle was almost convinced that this would be a reality. At that time, the US decided to stop the production of the Skybolt nuclear missiles ordered by the British party. In seeking a solution to this problem, the British Prime Minister decided to meet with US President John F. Kennedy. During the meeting it was agreed that the Skybolt missiles would be replaced by Polaris missiles for submarines.

This was undoubtedly a proverbial slap in the face for de Gaulle, who has been very much counting on the British Government to cooperate with France in the field of nuclear capacity-building. At a press conference in January 1963, the French President spoke out against the admission of Britain to the EEC (Calvocoressi 2002, p. 261-266).

France offers close cooperation to the most important countries in Europe, namely Great Britain, Germany and Italy

In 1969, France again took the initiative to the United Kingdom, which ended up with the de Gaulle compromise. It turned out that during secret talks, the French President offered close cooperation to the most important countries in Europe, i.e. Great Britain, Germany and Italy (creating something like the Directoire, or the Holy Alliance of 1815, or the 1933 Pact of Four promoted by Benita Mussolini), which was decisive for political, military and economic issues in Europe. This information was received by the other EEC countries as an attempt to dismantle this institution and limit NATO's role in Europe, which had a significant impact on de Gaulle's resignation from the presidency.

The United Kingdom, too, has been struggling with problems in its colonial estates. Almost in parallel, its colonial policy to date has found itself on the proverbial slope. All of this has led to some political turmoil within the country's government. Many politicians thought that the United Kingdom was losing its position in the international arena, particularly in Europe, when it was alongside the US. There was still a famous saying by many British dyplomats that Britain only has eternal interests. And these interests were shrinking year by year, losing their influence in the overseas colonies. This was a consequence of commitments by the British Government, back in the Second World War, when it sought the support of the US.

The consequences of the British Government's commitments, back in the Second World War, when it sought the support of the USA

Could this state of affairs have affected European security? Rather not, because, firstly, each of the member states had the opportunity to join or withdraw from the pact, without any consequences, and secondly, the Americans had the greatest military potential in NATO. This potential was built up over the years. Although figures and proportions talked about the military superiority of the US over the USSR, the events of 1957, some American politicians cooled their heads, among which was the head of a mine. John Foster Dulles, US Secretary of State. It was he who, in 1954, at the NATO Council meeting, said: the United States believes that, in view of the current threat to the possibility of using nuclear weapons, it is essential to defend the territory of the NA-TO countries. In short, it must be assumed that these weapons have in fact become conventional weapons (Gaddis 2007, p. 82).

These events were the first attempt at an intercontinental ballistic missile and, a few months later, the launch of 'Sputnik', which showed the US citizens of the AP that their level of security had been significantly changed. As it turned out, these concerns also arose among the British people, which was confirmed by the so-called private statement of the British Prime Minister Harold Macmillan: They [the Soviets] are no longer afraid of attack. They have at least as powerful a nuclear force as the West. They have internal [communication] lines. They have a thriving economy and will soon outstrip capitalist society in the race to material wealth (Wegs and Ladrech, op.cit., p. 112).

A time of political-military-economic consolidation of Western Europe under the US flag

The 1950s are described by many analysts of the international arena as a time of political-military-economic consolidation of Western Europe under the US flag. A particular role was played by economic consolidation (although some Western European countries did not join the emerging EEC), which in a relatively short period of time led to an economic boom, which was tantamount to an improvement in the mood of the people of this part of Europe. In the first half of this decade, there has been a very sharp rise in anti-communist sentiment in the West. The American people have added their voice, and they have demanded, as never before, effective action by the US Government to liberate Eastern European countries from communism. The events in Hungary in 1956 convinced them that the chances of achieving these demands are zero.

Unfortunately, the situation in the eastern part of the European continent was quite different. Although consolidation efforts in the area of the economy were carried out with the creation of the Council for Mutual Economic Assistance [GCC], the effects were not in line with the expectations of the societies of these countries. T. Buchanan rightly points out that the countries of Eastern Europe remained surprisingly unintegrated and the political lines of influence and diplomatic (as well as trade) continued to spread from the centre in Moscow. Eastern European leaders united sincerely only in the face of an ideological threat such as the Prague Spring or the West German "Ostpolitik". Stalin Konse- quently preferred bilateral - and exploitative - relations with the countries of Eastern Europe, so both institutions (Comecon and the University of Warsaw - note: J.B.) remained in a dormant state until the early 1960s, when Khrushchev called for closer military and economic ties (Buchanan, s. 183).

International confusion - Germany's integration into NATO

The incorporation of Germany into NATO has caused a great deal of confusion in the international arena, especially among the countries influenced by the USSR. Nikita Khrushchev has made perfect use of it, obliging all these countries to sign a joint document on friendship and mutual cooperation. These countries have already signed bilateral agreements with the Soviet Union. We must agree with David R. Marples' thesis that the Warsaw Pact could be regarded as the Soviet Union's belated response to the creation of NATO, or to the emergence of militarised West Germany, but it can also be seen, and this is probably closer to reality, as a guarantor of both Soviet hegemony in Eastern Europe and the maintenance of the Eastern European alliance. The agreement prevented Eastern European countries from freeing themselves from Soviet control to a greater extent than it opposed NATO's aggression (Marples, 2006, p. 235).

The block of Eastern European countries also faced many problems which, compared to the misunderstandings among NATO countries, were unfortunately bloody in some of them. The exception was Yugoslavia, which, in June 1948, took the path of so-called non-aligned countries. It was Josip Broz Tito and his partisans, not the Red Army, who liberated Yugoslavia. Unfortunately, Czechoslovakia, which at the beginning of 1948 was described as the only democratically governed state in Eastern Europe, was not so lucky.

The use of non-conventional measures to solve the problems of the countries under the Kremlin - the Berlin crisis

The Berlin crisis was an important political and military event which confirmed the use of non-conventional measures to solve the problems of the countries subordinated to the Kremlin. The significance of the crisis for the USSR is demonstrated by the following statement from 1958, the then leader of the USSR, Nikita Khrushchev, who said: Berlin is 'the eggs of the West', it is enough for him to 'squeeze' them for the opponent to raise his scream (Large,..., p. 39). According to American intelligence, there were 84 divisions of the Soviet Army in Germany and the Soviet Union, against which the countries of Western Europe (the domination of American forces) could only oppose 16 divisions. This situation was humorously, although it did not allow it, presented by the American Under-Secretary of State Robert Lovett: To get to the Rhine, the Russians only need shoes (Ibidem, s. 42).

The end of the Berlin crisis has shown, both on one side (the USA, France, Great Britain) and on the other (the USSR), that the problems of the inhabitants of any country cannot be solved in this way. The greatest surprise, for the USSR and the rest of Eastern Europe, was the proposal of the SED secretary, Walter Ulbricht, who had been planning since 1952 to build a wall separating West Berlin from the East and the rest of the GDR. This proposal did not find acceptance among the leaders of the USSR, nor among the other countries of so-called popular democracy. This was confirmed by a statement by the USSR Foreign Minister, Viacheslav Molotov: "This is caused by the bitterness and aversion of the Berliners to the GDR government and Soviet forces in Germany. Ulbricht would not have taken up this subject if it had not been for the fact that in the GDR, signs of disapproval of the government and the existing system were increasingly frequent. It was at that time that the people of Berlin were increasingly often passing on a speech to each other, one of their residents: It was enough to take the underground or the train [...] and go to another world. [...] In two minutes you could move from socialism [...] to capitalism (Carroll 2008, p.412-416).

Not only the GDR, it was a problem for the Soviet authorities. The threats that were the result of distillation began to 'get out of control' in Poland and Hungary. It can be assumed that what happened in the USSR had some impact on events of this kind. Both the so-called 'unbalancing' of power in the Kremlin, as a result of the struggle for Stalin's succession, and the controlled leaks from the secret paper 'On the cult of the individual and its consequences', delivered on 25 February 1956 at the 20th Congress of the Communist Party of the Soviet Union.

Poland - tackling the crisis

While in Poland the crisis was successfully contained (there were victims, although there was a great possibility that it could be drowned in a sea of blood) by means of political actions, in Hungary, there was a rise in society and the intervention of the Soviet Army (the actions of the army in Budapest were coordinated by Yuri Andropov, head of the KGB and later leader of the USSR). In Poland, changes were made at the highest levels of party and governmental authorities, and Marshal Konstantin Rokossovsky, the former Minister of the Republic of Poland, left Poland, along with many Soviet officers holding high positions in the Polish Army (Nalepa 2013). Poland has gained some control over the Soviet troops according to the signed agreements.

The events in Hungary were tragic, with more than 700 Soviet soldiers and more than 2 500 Hungarians killed in the fighting. All this undoubtedly intensified American rhetoric about 'liberating' the oppressed peoples of Eastern Europe. It is worth noting another important element, namely the lack of reaction from France and Great Britain to Soviet intervention. This was due to the fact that both countries were busy with activities in the Suez Canal area.

Another 'turmoil' in the international arena occurred in the autumn of 1958, when the so-called West Berlin problem arose. Although this crisis caused a significant increase in international tension, it did not have serious consequences. According to many political scientists, including Professor Zbigniew Brzeziński, it was not Berlin that was at stake, but the displacement of the United States from the European continent, which would allow the USSR to take control of Western Europe in a short time. The end of this event was the construction of the wall dividing Berlin (Feifer 2009, p. 217-235). And the shooting down of the US reconnaissance aircraft U-2 has led to a drastic 'cooling' of US-Soviet relations.

The events to date in the countries of Eastern and also Western Europe related to the Suez crisis, the arms race and the development of military (atomic) capabilities resulting from the new NATO strategy MC14/2 (Gaddis 2007), led the Soviet side to decide in 1958 to equip the Polish, Czechoslovak and East German armies, and later the Bulgarian, Hungarian and Romanian armies, i.e. the Warsaw Pact countries, with aircraft and rockets capable of carrying nuclear weapons. Of course, nuclear weapons were the responsibility of Moskva and these states did not have the right to decide on their use (a situation appropriate to the relationship between the USA and Germany in this matter).

The turn of the 1950s and 1960s was a time of many political and military events on the European continent and in its immediate vicinity. Both NATO and the Warsaw Pact led to an "increase in pressure" of the international community. The most serious of these were the events in Cuba, described by many analysts of the international arena as a test for the leaders of both nuclear powers - the USA and the USSR. It was then that the world came to the brink of nuclear war. It undoubtedly made many 'hot' politicians realise that the world is very close to self-destruction. There were signs that solutions were being sought to eliminate potential armed conflict, particularly with the use of nuclear weapons. At the same time, work continued on the installation of tactical nuclear-headed missiles in NATO and UW countries on the European continent. All of this was increasingly often viewed negatively by the inhabitants of Western European countries, and especially by young people, who are aware of the potential threat of nuclear conflict. In many countries, there has been a 'verification' of the governing parties, which has resulted in social democratic parties coming to power.

Let us come back to the problems that the Warsaw Pact countries had to face in the 1960s. The events that took place in Czechoslovakia, the GDR, Poland and Hungary at the turn of the 1940s and 1950s were not the last to worry about Moscow, but also Western Europe. Were they a threat to European security? Some probably did. Taking into account the Kremlin's operating principles, they could have led to the outbreak of social conflicts in these countries, and they would have escalated into conflicts in the Warsaw Pact, and this would already pose a huge threat to European security.

"A 'fire starter' was set in Moscow. It was there, at the beginning of October 1964, that the coup d'état began to be finalised. The initiator of these actions was Leonid Brezhnev. Can you believe the words of the head of the KGB, Gen. Semichastny, who said that Brezhnev proposed to eliminate Khrushchev several times. A car accident or a plane crash could have been arranged. [...] I rejected all these proposals (McCauley 2010, p. 386). Taking into account the political mechanisms of action which were part of the history of this country, it can be said that they did not deviate from the standards in force in many countries.

Power in the Kremlin is taken over by Leonid Brezhnev, who exercised power until his death, letting himself be known as a ruthless companion in Moscow, who knew who and what would play a part in socialism in the world. In 1966, Brezhnev becomes primusinterpares, and the apparitions in Czechoslovakia make him number one in the USSR.

A very unfavourable event for the former sphere of influence of the Soviet Union in the Mediterranean basin was the 1961 event concerning the loss of the Soviet naval base located on Albanian territory, on the Adriatic coast. As a result, diplomatic relations with Tirana broke off in late autumn 1961. In the following years, Albania withdrew from the Warsaw Pact. From this point of view, according to Tirana, the enemies of the world were the USA and the Soviet Union (like the Maoism). Within a few years, Albania underwent a cultural revolution, and in 1966, it established close cooperation with Beijing.

Another worrying signal came from Bulgaria. In June 1964 it was reported that there is an opposition group within the ranks of the Bulgarian Communist Party. In a relevant document prepared by Department I of the Ministry of Foreign Affairs for the head of the Foreign Department of the Central Committee of the Polish United Workers' Party (KC PZPR), Mr Józef Czesak, reads as follows In his speech, Teodor Żiwkow at the G.S.S. Rakowski Military Academy in Sofia and in the Sofia garrison, he spoke openly for the first time about the existence of the opposition group. "Currently, in the west, the enemies of socialism are waging a vicious campaign against our country and, above all, against the People's Army. Bourgeois propaganda is trying to oppose the Party Army and that a conspiracy is being organised. A group of lamentable troublemakers, career elements and people without any rules, no powers, who are in the hands of the investigating authorities, have indeed been detected and disposed of. Among them are also some of the military'. Among them was Colonel Sławomir Trymski, about whom the Western press has written extensively that he is being mixed up in this group1.

[1] Archive of New Files [hereinafter AAN] ref. 237 / XXII-1460, Central Committee of the Polish United Workers' Party Foreign Department Documentation and information sector Bulgaria 1964-1967, Note on the opposition group in the ranks of the Bulgarian Communist Party, prepared by the First Department of the Ministry of Foreign Affairs (deputy director J. Dryglas) of June 30, 1965. to the Head of the Foreign Department of the Central Committee of PZPR, comrade J. Czesak, pp. 44-46.

A group of oppositionists, including the commander of the Sofia garrison, General CvetkoAnew, attempted a coup d'état in March 1965. They probably identified themselves with an ideology described as Titoism, and the aim was to enter the path that Yugoslavia had already set out. The group was 'worked out' by the Bulgarian security service, some of its members committed suicide and some were brought to justice and received high prison sentences.

There is another problem with the GDR. It concerned the events that took place during the convention of the West German CDU party in Düsseldorf. It was at that time that the East German side of the GDR recognised that, alongside its economic and political frontal attack on the GDR, the West German government was increasingly bringing to the fore the concept of a flanking attack. The aim of this is to isolate the GDR from the socialist states and to cut it off from other socialist states.2. For the Soviet Union, this was an unmistakable signal that these statements are not isolated, and that they represent a larger area of NATO's future foreign policy, and that Germany is its relay. Later in this document, this theory is confirmed in a way: Comrade Rapacki informed us of the plan for two zones put forward by the Belgian Foreign Minister, Spaak. It seems to us that Spaak would like, by means of this project, to discuss with individual Member States of the University of Warsaw, leaving aside the GDR - matters relating to our sovereignty, territorial integrity and military security - and to distract attention from Western Germany's complicity in NATO armaments. From the known details of Spaak so far, it appears that he wants to come to terms with the participation of West Germany in the multilateral nuclear forces of the NATO countries. The Spaak Plan aims to demilitarise most of the territory of the GDR, while West German NATO units would still have most of the territory of the GDR as a site for stationing and developing troops against the GDR and as a base for further intensified military action, including nuclear weapons. It follows from all of this that the Spaak Plan would be conducive to the Bonn plans to absorb the GDR by means of a diversion war or an open military operation and to creating the facts of the past. As Rapacki informed us, Spaak also developed the idea that a group of NATO countries could hold talks on these matters with a group of UW countries, excluding the USSR. This shows that the unity of the UW is being undermined. According to all the proposals, under the Washington and Bonn concept, the GDR is not to be an entity, but only the subject of negotiations between NATO countries and the UW3.

When analysing this document, the Soviet side probably considered it to be the proverbial 'joyful work' of the Belgian Foreign Minister. How could it be assumed that such procedures, although minimal in number, are feasible. On the NATO side, the USA was the main 'dealer', and on the UW side, the USSR, and it was they who decided on all actions for the foreign and security policy of these two political and military blocs. It can be assumed that this was another so-called 'balloon' checking the effectiveness of action and consolidation of the UW countries. At this point, it would be worth asking the question: was it just a Belgian initiative or a joint NATO? We are unlikely to receive an answer to this question. Erhard and Schreder took the floor at the CDU meeting on political and economic relations between socialist countries and the EEC. They both stressed that the NRF's trade relations with the socialist countries are primarily intended to serve to push through its retaliatory objectives. Erhard made it clear that trade expansion depends on political compensation. Schroder pointed out openly that it was necessary to ensure "that the EEC takes account of the vital political interests of German reunification when shaping its foreign trade policy"4.

All these statements have become the subject of meetings between the leaders of the socialist countries, at which these and other statements, the main West German politicians, were analysed. Some of the statements were 'modified' and, in the following years, were indicative of a change in their tone and claims. They were evaluated during the meeting of the UW countries to discuss the foreign policy of the NRF towards the countries of Eastern Europe5.
These issues, i.e. the relations between the University of Warsaw and Germany, were highlighted during the meeting of the First Secretary of the Central Committee of the Polish United Workers' Party (KC PZPR) with the participants of the meeting of the Ministers of Foreign Affairs of the University's members, in Warsaw on 9 February 1967. During his speech, Wł. Gomułka said, among other things, that the issues of security in Europe can be resolved if the GDR government meets several conditions. The main, fundamental issue, which would show that the GDR government is entering a new political line, would be the GDR government's renunciation of the thesis about the exclusive representation of the whole Germany. This is a precondition without which the road to security in Europe

cannot be opened. Poland and other socialist countries are demanding recognition of the GDR. For its part, Poland, for its part, has recently particularly strongly emphasised the need for the GDR to meet three main conditions: recognition of borders, recognition of the GDR and renunciation of nuclear weapons[6].

Gomułka, when he talked about the change in the German Democratic Republic's foreign policy towards the countries of Eastern Europe, he meant the changes that had taken place in Bonn. However, when he talked about the recognition of the GDR, he was probably referring to the GDR's renunciation of its claims to represent the so-called whole of Germany on the international stage. Unfortunately, these problems remained unresolved until the turn of the 1980s and 1990s.

In the early 1960s, problems arose with Romania. Well, Romania, without consulting its diplomatic activities, established diplomatic relations from the NRF (31 January 1967, case -34th anniversary of Hitler's rise to power). It can be assumed that it did, and relatively quickly, what the Soviet Union allowed it to do. The Romanian side, it said, did not exceed the provisions of the Bucharest conference, that they were satisfied when, in 1955, the USSR established relations with Bonn, and the establishment of diplomatic relations with the GDR by Romania corresponded to the policy of relaxation and helped to create conditions conducive to further settlement of the German problem. Romania believed that the CSRR, Hungary, Bulgaria and, after a period of delay, Poland would sooner or later follow suit. This has brought Romania forward to a number of socialist countries.

However, the event associated with the visit of the Soviet delegation to Beijing was received negatively in Moscow. A neutral stance towards China, promoted by Romania, was known (the other countries held the Kremlin line), but Romanian diplomats were not expected to be as ostentatious as they were during the departure of the Radical De-plats and their families from Beijing. No one from the Romanian embassy in Beijing came to say goodbye. This was noticed by the press, which posted the text on the front pages of the most popular daily newspapers: Romania has a fundamental problem," writes the correspondent, "its key slogan in political orientation, which is 'independence'[7]. These were not isolated cases, demonstrating Romania's attempt to pursue its own independent policy, which was very badly perceived by the Soviet Union.

Another event confirming Romania's so-called 'own foreign policy' was the expression of disapproval of the idea of supporting the economies of well developing countries by the weaker ones, as part of the cooperation of socialist countries. Romania's negative stance on the Warsaw Pact states' provision to condemn Israel for its conflict with the Arab states (1967) has had a broad international impact. Romania's negative position on the Warsaw Pact's wide-ranging cooperation was highlighted by Vladislav Gomulka during the talks with the First Secretary in Budapest on 16 May 1968: Romania is not involved in military matters and not only are they not involved in military matters themselves, but they do not allow us to improve forms of cooperation in this episode. We must decide against the Romanians and without them, we will otherwise be at an impasse. The military issue of part of the Agreement has to do with the situation which may arise within socialist countries, specifically Czechoslovakia. The Czechoslovak army is spread out and incapable of any military action[8].

Once again, Romania has confirmed its political independence, in the summer of 1968, when the UW forces began operating in Czechoslovakia. It refused to participate
in these activities, and also in some way tried to support the Czechoslovak Government. The Romanian Parliament adopted a resolution, the content of which coincided with the previous statement made by the Albanian Prime Minister quoted earlier. The Romanian side, probably after the statements made by its representatives and the resolution of the parliament, was afraid of the Kremlin's military response and made preparations to defend the country. Fortunately, nothing like this has happened.

Conclusion

Undoubtedly the most serious events, threatening to destabilize in the Warsaw Pact countries, they took place in Poland (1967-1968) and Czechoslovakia in 1968. The events in Poland had a background in Middle Eastern events. There was a defeat of the Arab coalition troops, mostly equipped with military equipment and trained by the University of Warsaw and mainly the USSR9.

Many Polish military analysts and politicians have said that this was decided by the use of Soviet-made military equipment handed over to Egypt. In order to calm the very nervous atmosphere, including among the countries of the University of Warsaw, the Polish side, through the mouth of W. Gomułka, blamed the Egyptian side, accusing it of poorly trained soldiers. After the meeting of the leaders of the Warsaw University party, great activity in condemning Israel and providing aid to the Arab states was shown by the GDR leader Walter Ulbricht, who, in a letter addressed to Mr Gomułka, proposed convening a meeting of the Ministry of Foreign Affairs of the countries of the University of Warsaw, in order to show solidarity with the Arab states. He believed that it was necessary to provide comprehensive assistance to the Arab countries, as such assistance is already offered by NATO, EEC and GDR countries10.

In Poland, among the political and military elites, there were many of Jewish descent who enjoyed this state of affairs and pointed to the advantage of Western over Eastern armaments. Perhaps the most dangerous thing for them was to criticise the Kremlin's policy towards the Arab states. Such an attitude among its closest ally (Poland) was not expected in Moscow. The consequence of this was a sharp reprimand from L. Brezhnev for Vltai Gomulka. There was nothing else left for him to do but to start action to "purge" the ranks of the party and army from people of Jewish origin. The army was a sensitive environment, which is why the main 'strike' was directed there.

In June 1967 in Moscow there was a meeting between Polish Marshal Marian Spychalski and USSR Marshal Andrei Gretchka11.

It came about on the initiative of the Polish Ministry of Defence, and it can be assumed that it was intended to convince the Soviet side of the loyalty of the Polish armed forces. In the course of the conversation, Marshal A. Grechko informed his interlocutor of the Soviet side's priorities in building the defence capabilities of the Arab countries. In addition to the existing European and Far Eastern issues, the problem of the Middle East has grown on a large scale before the USSR Ministry of Defence, which has seriously changed the planned ways of resolving military issues. This is due to the fact that, in addition to the United Arab Republic and Syria, which are receiving extensive assistance in the form of equipment and organisation to rebuild the army, and Algeria, whose serious delegation is currently agreeing with the USSR Ministry of Defence the scope of increased military assistance. Other Arab countries, such as Sudan, have asked for help in building their armed forces. In this situation, the attention of Soviet comrades is focused mainly on the Middle East, where even the leaders of the USSR Ministry of Defence - the deputy ministers Marshal Zacharov and General Sokolov's army - are currently staying, helping to rebuild the USSR army and Syria on the ground12.

During this meeting, the two ministers exchanged views on the possibility that imperialism might be causing tensions or even provoking military provocations at different times and in different sequences in other regions of Europe, such as the GDR, Albania and other continents - the escalation of the war in Vietnam , the resumption by Israel of aggressive actions against Arab countries, another provocation against Cuba, with the possibility of transforming the local conflicts thus provoked into a war of increasing scope after a widespread nuclear war. Soviet comrades believe that another country threatened by imperialist aggression is Yugoslavia. Therefore, in the Armed Forces of the USSR, as stated by Marshal A. Grechko, appropriate steps are being taken in this regard: a number of meetings have been

[12] Ibidem, p. 46. Information on the meeting of the Ministry of the People's Republic of Poland and the USSR on June 28, 1967, on the initiative of the Ministry of the People's Republic of Poland, Marshal of Poland Marian Spychalski, on June 26, 1967 in Moscow. Working meeting with the Ministry of National Defense of the USSR, Marshal A. Greczko.

held with senior commanders, the air-desant troops have been put on standby for immediate action (even with a change of deployment), and the readiness of special measures to the highest standards has been increased[13].

During this meeting, the Soviet side signalled threats to the unity of socialist countries, but did not mention Prague. Whether it was convinced that there was no threat to the most pro-Russian ally among the countries of the University of Warsaw, or deliberately, it did not inform the Polish side about the so-called 'turmoil' in the parties and authorities there. For the Greek woman, in accordance with the above quoted records of the meeting with Spychalski, and thus for the USSR, the priority was to take full political and military control in the Arab states. There, in the opinion of the USSR Marshal, political action should have been carried out effectively to convince the authorities of these countries to join the Soviet Union. He mentioned some of the threats that could threaten the consolidation of socialist countries in the future. This was initiated by imperialist countries. He made no mention of Czechoslovakia. As it turned out over time, these were only appearances, as the proverbial 'bomb' installed under the political scene in that country was ticking. There was a meeting of the leaders of the UW countries in Dresden (March 1968), at which the Czechoslovakian leader's attention was drawn to bad internal politics and thus sending out negative signals. Although Dubček tried to direct these concerns to Poland (the events of March 1968 in Poland), Gomułka gained greater understanding in Brezhnev's eyes. The fact that the reforming events in Czechoslovakia are a threat to the security of the UW (Yugoslavia and Romania supported Czechoslovakia), and that Moscow will not accept this state of affairs, was demonstrated by the actions of the military leadership of the countries - parties to the UW, under the leadership of the new commander of the UW USSR, Marshal Ivan Jakubowski. In addition, talks have been held at various political and military levels within the troops of the UW. More and more alarming signals were coming from units of the Czechoslovak army. What had hitherto included a 'civil society' began to infiltrate the armed forces of that country, and this was already very dangerous. They led to another meeting of the UW states (May 1968), without Romania and Czechoslovakia, where statements were made to the effect that if Czechoslovakia did not deviate from its previous 'course', which was dangerous for the cohesion of the UW, armed intervention on the territory of that country should be expected. It was there that the idea of carrying out long-lasting military exercises of the UW states on Czechoslovakian territory emerged. The so-called 'behind-the-scenes' talks between representatives of the army of the countries of the University of Warsaw's parties, and representatives of the Czechoslovak People's Army, have begun.

Unfortunately, these types of speeches, as well as the aforementioned meetings of the heads of counter-intelligence of the UW countries, were not convincing for Moscow. This was confirmed by the meeting in Warsaw, a meeting of representatives of the UW countries, without representatives of Romania and Czechoslovakia, which had the tangible effect of issuing an appropriate resolution, which had the characteristics of a warning to the Czechoslovak Government. The 'guidelines' it contained for Prague were not accepted, which must have affected the position of Moscow and the other UW countries.

Abstract

This paper examines the perceived ease of use, perceived security control, behavioral intention, and intention to recommend an online accommodation booking platform by the Generation Z cohort. Additionally, it segments the Generation Z market based on these variables. A total of 632 consumers who belong to the Generation Z cohort participated in the online study. Data analysis included descriptive statistics, reliability, factor, and K-Means cluster analysis. Segmentation revealed three segments of Gen Zers, namely the Positives, the Neutrals, and the Negatives. Based on the results, the paper offers suggestions for more effectively targeting this generational cohort.

Keywords: Generation Z, Segmentation, Marketing communication, Online booking, Consumer behavior.

Introduction

Technological advancement greatly affects the tourism industry in various ways (Law, 2009; Inversini and Masiero, 2014; Buhalis, 2003), an example being the booking procedure. Preceding the web, accommodation reservation in the tourism sector involved a phone or an in-person visit to a tour operator or accommodation provider. Specifically, digital technologies advanced a swift from the traditional booking conditions, i.e., through tourist operators, to online booking channels (Berne et al., 2012; Amaro and Duarte, 2015). The actual or potential customer through online channels may make a thorough information search, such as reviews or prices, and make comparisons, in order to end up to the most profitable for him/her final purchase (Vermeulen and Seegers, 2009; Inversini and Buhalis, 2009). Thus, online booking technologies significantly influence the tourism industry. As to Lock (2020), the global digital (online) travel sales are 564.87 bn $ US, with a 15.4% growth. Also, according to the Online Travel Booking Platform Market (2020) report, the "online travel booking platform market is poised to grow by $ 204.81 bn during 2020-2024 progressing at a CAGR of 5% during the forecast period" (CAGR: Compound Annual Growth Rate).

Today, due to digital transformation in the tourism industry, online accommodation can be booked either directly from the accommodation provider website either through digital intermediaries, i.e., through online travel agencies, i.e., OTAs (Talwar et al., 2020). Hotel Tech Report (2020) assesses, "While OTAs are no longer considered new technology, they are a huge driver of hotel room sales and online bookings in the hotel industry." As Prieto (2020) states, for the year 2019, the leader in the OTA market is Booking.com (Booking Holdings (BKNG)), followed by Expedia (Expedia Group).

Moreover, consumers nowadays are technologically advanced and require their encounter with a corporate website to give them ease in use and security in their transactions. Perceived ease of use (PEU) is exceptionally significant for the customer. Davis (1989, p. 320) states that perceived ease of use "refers to the degree to which a person believes that using a particular system would be free of effort." Accordingly, the definition of "ease" could be the:

Cite this Article as: Irene (Eirini) KAMENIDOU, Aikaterini STAVRIANEA, Aikaterini VASSILIKOPOULOU, Ifigeneia MILONA and Spyridon MAMALIS "Segmenting the Generation Z Cohort Based on Online Booking Platform Users Behaviour" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

"freedom from difficulty or great effort. Effort is a finite resource that a person may allocate to the various activities for which he or she is responsible". PEU directly or indirectly affects online purchases from a website (Cho and Sagynov, 2015; Cheng et al., 2006; Salisbury et al. 2001).

Additionally, equally, if not more important, is perceived security control (PSC) since consumers are increasingly interested in security (Lee and Lai 2007). Nasir et al. (2007) argue that consumer's concern about online trust was initially connected to internet privacy and security issues. According to Cheung and Lee (2001), perceived security (PS) is important for web transactions, which may also strengthen consumers' trust. It also may pose a threat that could have negative economic consequences (Kalakota and Whinston,1997). Security favorably influences consumers' belief that online technology will effectively work (Hoffman et al. 2006). The use of the latest security technology (O'Reilly and Finnegan, 2005) and advanced infrastructure (Bus, 2005) could ameliorate trust levels, and as a result, users could form a more favourable intention to make online purchases (Lian and Lin, 2008). Charney (2008) agrees that security aims at protecting, among others, confidentiality and integrity. There are consumers who do not trust purchases through the Internet due to perceived merchants' ineffectiveness and security issues (Lee and Turban, 2001). According to Cheung and Lee (2001, p.682). "perceived security control refers to the Internet users' perception on the Internet vendors' ability in fulfilling security requirements, such as authentication, integrity, encryption, and non-repudiation". As Ray et al. (2011) state PSC "is a measure of how users perceive risk at specific online situations" and is similarly described as "perceived security protection" (Kim et al., 2008). Concerns regarding PS could also be connected to the system level; for example, the number of credit cards or various personal information shared online (Gao, 2005). PSC is extremely significant for the web-based company, whereas consumers believe that it will ensure security protection applications (Connolly and Bannister, 2008). Previous studies have shown that PSC impacts consumer trust towards the provider and consequently impacts shopping behavior (Zhang et al., 2019; Inegbedion et al., 2016; Cheung and Lee, 2016; Koufaris & Hampton-Sosa, 2004). Cheung and Lee, 2006).

Taking the above into consideration and having in mind the changes due to technological advancement in accommodation distribution channels in the tourism industry, the following research questions (RQ)arose:

1. RQ1: What is the PEU of the online booking platform (OBP) that consumers use in accommodation (room- house) booking?
2. RQ2: What is their PSC towards the OBP?
3. RQ3: Do they have the intention to keep using this OBP in the future?
4. RQ4: Are they willing to recommend this OBP?
5. RQ5: Can users be grouped based on similar behaviour?
6. RQ6: If users can be grouped based on similar behaviour, what is the profile of each group?

These research questions were used as guidance for the aim and objectives of this study. Specifically, and accordingly, to the above research questions, the aim of this study was to investigate PEU, PSC, behavioral intention (BI), and intention to recommend (IR) the OBP they used for accommodation booking (answering RQ1-4). Additionally, the objectives formulated were to segment users based on the aforementioned variables and profile these segments (answering RQ5-6).

In order for the aim and objectives to be tested, a sample drawn from the Greek Generation Z cohort (Gen Zers) was examined. Gen Zers are born between 1995-2009 (Toth-Kaszas, 2018), are technologically knowledgeable since they have been "born in technology," while they constitute the youngest adult population (Kamenidou et al., 2020; 2019).

This research paper minimizes the following gaps in the literature:

1. It deals simultaneously with PEU, PSC, BI, and IR in an online booking setting.
2. It focuses on generational cohorts rather than age as a consumer characteristic, which is an understudied topic. Research suggests that generational cohorts are better demographic indicators than age since it incorporates situations that have affected the behaviour of the cohort (Meredith and Schewe,2002; Schewe and Meredith, 2004; Williams and Page, 2011; Eastman et al., 2013; Pitta et al., 2012; Kamenidou et al., 2019; 2020).
3. It focuses on the generation Z cohort (Gen Z), which is the youngest adult consumer segment, the cohort which will have families (if not already) in the future and thus its impact is worldwide (Stavrianea and Kamenidou, 2017). Additionally, this cohort is an emerging marketing topic since their behaviour is still being shaped (the youngest members of this cohort was ten years old when the research was undertaken)
4. It segments the Gen Z cohort, based simultaneously on PEU, PSC, BI, and IR, which to our knowledge has not previously been studied.

Literature Review

Perceived ease of use in online settings-behaviour has been studied mainly through the TAM model or its variations. Examples of such settings refer to online shopping, online banking, and online booking (Bhatt, 2016; Casaló et al., 2010; Castañeda, Frías, & Rodríguez, 2009; Faqih, 2013; Tong, 2010). It is proposed by Davis (1986) that people will accept the technology that is perceived as easy to use and requires the least effort to achieve a task. Researchers found that PEU influences directly or indirectly attitudes and technology adoption in the travel and tourism industry (Ayeh et al., 2013; Casaló et al., 2010). Singh and Srivastava (2019) found that PEU is an important predictor of social media usage by outbound travelers. Wibasuri et al. (2018) examined (amongst others) PEU influence on attitude toward e-tourism usage (N=216) and revealed that PEU significantly influences tourists' attitude. Peng et al. (2012) found that there are positive correlations between online shoppers' PEU and perceived usefulness and purchase intention (N=413 B2C customers). Yu et al. (2010) also found that perceived usefulness and PEU have a positive direct impact on purchase intention. Lin and Lu (2000), through applying the TAM model, investigated customer usage toward websites, and found that PEU is positively related to perceived usefulness, which is positively correlated to use willingness. Lastly, Mahmood et al. (2001), from their meta-analysis (N=57) regarding constructs of information technology usage in organizations, found a significant relation between PEU to the actual usage of technology.

Past studies have demonstrated that PSC is positively connected to trust in e-commerce (Koufaris and Hampton-Sosa, 2004; Suh and Han, 2003). Suh and Han (2003) named the key five dimensions of PSC, i.e., authentication, nonrepudiation, confidentiality, privacy protection, and data integrity. The authors proved a positive relation between the adoption of e-commerce and (a) nonrepudiation, (b) privacy protection, and (c) data integrity (Suh and Han, 2003). Suh and Han's (2003) studied Korean bank's customers and users (N=502) of internet banking services and found that three of the five dimensions of PSC had a significant impact on consumer trust. Hwang (2008) investigated if security and privacy signals have an effect on consumers' trust and on their subsequent behavior to purchase online and found that PSC both was associated. Koufaris and Hampton-Sosa (2004) found that PSC of the website affects consumers' acceptance of web-based companies since it is an important antecedent of initial trust towards the company. Moreover, Koufaris and Hampton-Sosa (2002) found that PSC was a substantial precursor to the perceived usefulness of a web site and important in defining customer perceptions of the company's trustworthiness. Zhang et al. (2008) in their study regarding internet online banking (IOB), found that PSC has a significant and positive effect on customer interactions with IOB.

Methodology

An online questionnaire was used to obtain data regarding PEU and PSC from online accommodation booking. The variables that referred to PEU were seven and were adopted from Palvia (2009) and Davies (1989). PSC variables were four and adopted from Cheung and Lee (2001) and Koufaris and Hampton-Sosa (2004). BI and IR are measured by one item and adopted from Stavrianea et al. (2019) and Zeithmal et al. (1996). All answers were rated on a 7-point Likert scale. The quantitative study took part from July 2019-December 2019, utilizing a non-probability sampling method and gathering data via the internet following Kamenidou et al.'s (2019) procedure and focusing on Gen Zers as a sample. Totally 632 valid questionnaires were gathered and analyzed. From the 632 participants, males were slightly overrepresented (52.5%) compared to females (47.5%), in their vast majority single (94.0%), university students (76.3%), residing in an urban area (74.1%), and with a net family monthly income up to 1500.00 € (71.2%). The analysis of the data encompassed descriptive statistics (frequencies, percentages, and mean scores), factor and reliability analysis, K-means cluster analysis, and chi-square tests (crosstabs). All tests were preset at a=0.05.

Results

Online booking platform used

Table 1 presents the online accommodation booking platform that participants usually used. The question was presented as "the last time that you booked online accommodation, the platform that you used was….." (twelve OBP were presented). Results showed that the OBP mostly used were Booking.com and Trivago.

Table 1: Online booking platforms used by participants

Online booking platforms	N	%
Booking. Com	274	43.4
Trivago	178	28.2
Airbnb	68	10.8
Accommodation's website	40	6.3
Other OTAs	72	11.3
Total	632	100.0

Perceived ease of use

Table 2 presents PEU of the online booking platform that the participants used. From Table 2, it is observed that no item has MS>5.50, with all items 4.8<MS<5.3, implying that participants somewhat agree with these statements. Moreover, the statement with the highest rating is "The online booking platform opens quickly and easily," and the one with the lowest rating is "This platform does not take much time for me to interact with it."

Table 2: Ease of use of booking

Perceived ease of use	1 (%)	2 (%)	3 (%)	4 (%)	5 (%)	6 (%)	7 (%)	MS
The online booking platform opens quickly and easily	3.5	2.8	8.2	13.6	16.1	32.0	23.7	5.27
The online booking platform is easy to use	3.5	4.7	7.0	12.0	17.1	32.0	23.7	5.25
It's easy to navigate through the website of the platform I use to book rooms	3.5	3.8	7.3	13.0	19.3	33.2	19.9	5.20
It is easy to access the website of the platform I use for booking rooms	2.8	4.1	7.9	13.6	21.8	29.7	19.9	5.17
The online booking platform is user friendly	4.1	4.1	6.3	11.4	23.7	31.6	18.7	5.16
My interaction with this platform does not require much mental effort to be perceived.	5.4	5.4	7.3	16.1	22.8	23.4	19.6	4.94
This platform does not take much time for me to interact with it	5.1	5.4	8.2	15.8	23.1	25.9	16.5	4.90

Perceived Security Control

Table 3 presents the results of PSC of the online booking platform that the participants usually use. From Table 3, it is observed that no item has MS>5.00, with all items 4.9<MS<5.0 implying that participants somewhat agree with these statements since the MS focus around 5.00 with a very small range of answers.

Table 3: PSC of the online booking platform

Perceived security control	1 (%)	2 (%)	3 (%)	4 (%)	5 (%)	6 (%)	7 (%)	MS
I feel secure about the electronic payment system of the web site	3.8	4.7	7.9	18.7	20.3	26.6	18.0	4.99
The web site implements security measures to protect its online shoppers	3.5	4.7	9.2	18.4	18.7	27.8	17.7	4.98
The web site usually ensures that transactional information is protected from being accidentally altered or destroyed during transmission on the Internet	3.8	5.4	8.5	17.7	20.9	26.3	17.4	4.95
The web site has the ability to verify online shoppers' identity for security purposes	3.8	5.7	7.3	19.9	20.6	26.6	16.1	4.92

Behavioral intention (BI) and intention to recommend (IR)

BI (intention to use the platform in the future) and IR were also rated on a 7-point Likert scale. Table 6 presents the results in percentages (line 1, 1-7) and mean scores (MS). Results revealed that IR is rated higher than BI. One possible reason could be that Greek individuals do not travel very often due to the economic crisis that the country is going through. Thus, they may not intend to book a room in the near future, although they would be willing to recommend the website.

Table 4: Behavioral intention and intention to recommend

BI and IR	1	2	3	4	5	6	7	MS
I am willing to use this online platform to book a room when I travel in the future (BI)	6.0	6.0	7.6	21.5	19.6	24.4	14.9	4.75
I'm willing to recommend the online platform I use to others (IR)	5.1	5.1	8.5	13.0	24.1	23.7	20.6	4.99

Factor analysis- cluster analysis

Factor analysis with varimax rotation on the seven variables consisting of the PEU produced one factor accounting for 79.9% of the total variance (KMO=0.946; BTS=4696,425; df=21; p=0.000), with mean factor score (MFS): MFS=5.127 and reliability (α) of the factor: α=0.957. Moreover, factor analysis with varimax of PSC (four items) also produced one factor, accounting for 80.20% of the total variance (KMO=0.858; BTS=1791,019; df=6; p=0.000), with MFS=4.961 and the reliability of the factor α=0.918.

The MFS of PEU and PSC with additional variables BI and IR were continuously used to segment Gen Zers in homogenous behaviour groups. K-Means cluster analysis was applied, which provided three groups with similar behaviour (Table 5). In Table 5, the 1st column refers to the segmentation variables, columns 2-4 refer to the final cluster centers (FCC) per variable (row) and per cluster (column 2-4), as well as the number of subjects per cluster (N). Lastly, Table 5 also incorporates the ANOVA results, which reveal that all variables contribute to cluster differentiation.

Table 5: Segments of Gen Zers

Segmentation Variables	1 N=330	2 N=224	3 N=78	F	Sig.
Perceived ease of use	6.04	4.67	2.57	590.651	.000
Perceived security control	5.77	4.59	2.58	364.456	.000
Behavioral intention	5.93	3.84	2.41	481.258	.000
Intention to recommend	6.08	4.46	1.92	642.183	.000

Source: The authors

Profile of clusters

Additionally, chi-square tests were employed in order to investigate if there were differences between clusters and participants' socioeconomic variables (sex, education, net monthly family income, and area of residence, i.e., rural vs. urban area). Data analysis revealed that for sex (χ_2^2=2.045, p=0.373), education (χ_4^2=1.710, p=0.789), and area of residence (χ_2^2=0.424, p=0.812), no statistical differences exist; while for family income (χ_8^2=20.790, p=0.008) statistical differences between clusters and participants net monthly family income, do exist.

Cluster I: This cluster is named the “Positives." It is comprised of 330 Gen Zers, accounting for 52.2% of the sample. In all cases, the FCCs were 5.51< FCC<6.50. They are the ones that have the most positive attitude towards the platform that they used. Male subjects are over-represented in this group. Compared to the other two segments, this group has the highest percentage of participants having secondary education and the lowest of those with high education (university +). It also contains the highest percentage of those residing in rural areas. Lastly, the Gen Zers net family monthly income ranges between 1000-1500€.

Cluster II: This cluster is named the "Neutrals." It is comprised of 224 Gen Zers, accounting for 35.4% of the sample. In all cases the FCCs were 3.51< FCC<5.00. They are the ones that have an indifferent attitude towards the OBP they used for accommodation booking. Males and female subjects are equally represented in this group of Gen Zers. Compared to the other two segments, this group has the highest percentage of participants having high education (university +education) and net family monthly income ranging between 1000-1500€ (middle-class families as regards income).
Cluster III: This cluster is named the "Negatives." It is comprised of 78 Gen Zers, accounting for 12.4% of the sample. In all cases, the FCC<3.00. They are the ones that have the most negative attitude towards the OBP that they used. Compared to the other two segments, females are over-represented. This segment has the highest percentage of participants having postsecondary education and residents in urban areas. Lastly, in this group, two opposite subgroups exist in the income category. They are considered as the low income since compared to the other groups, about one-third of its members have net family monthly income under 600.00€, while simultaneously, it has the largest percentage of Gen Zers with net monthly family income > 2500€.

Conclusions- Recommendations

The first cluster scores highly in the perceived ease of use and security control factors. Overall, these Gen Zers present a very positive attitude towards the website. They are more likely to use the platform in the future to book a hotel/holiday package and recommend it to others. Websites that target this cluster should try to keep these individuals (mainly men, low education level, living in rural areas) satisfied. For example, they could offer discounts or other rewards. They are the ones who are more likely to use the platform and spread positive WOM.

The second cluster, which mostly includes highly educated Gen Zers, score higher, in all factors, compared to the third cluster, but reveal an indifferent behaviour. These customers are not loyal to the OBP and will easily change to another one if the "deal is better." However, online platforms should still invest in creating more favourable ease of use and security control perception in order to spur favourable behaviour towards it.

The third cluster (i.e., the "Negatives") presents low PEU and PSC score. As the past literature demonstrates, these two factors significantly influence users' behaviour and e-services patronage (Koufaris and Hampton-Sosa, 2004). Although OBP, such as booking.com, offer nowadays advanced technologies to ensure security control, as proposed by the relevant literature (Connolly and Bannister, 2008), consumers who belong in this cluster still feel reluctant to use such websites. OBP should clearly inform their customers that their data is well protected, and all security measurements have been taken to ensure that customers are secure. The ease of use should also be emphasized, e.g., by writing that the booking procedure is extremely easy and just needs 2 minutes.

Limitations and directions for further research

This research study has specific constraints that could be considered in future research.

Non-probability sampling and the use of online data collection techniques are the main limitations of the current paper. Moreover, only Greek individuals participated in the research study, which could not permit the reliable generalization of the results. Moreover, the items and components incorporated in the study are adopted from Palvia (2009), Davies (1989), Cheung and Lee (2001), and Koufaris and Hampton-Sosa (2004). Hence, additional items could be existent that measure PEU and PSC towards online booking platforms, not incorporated into this study, and thus other segments would arise. Irrespective of the above-mentioned constraints, its impact is critical in delivering information on tourism-related behavior as it offers insight into an understudied issue, as well as to an understudied generational cohort.

Eco-Innovation Measurement by the European Observatory on Eco-Innovation (EIO)

Pawel BARTOSZCZUK

Warsaw School of Economics
Al. Niepodleglosci 162 Warsaw, Poland
pbarto1@sgh.waw.pl

Abstract

To date no uniform proposal for measuring and analysing eco-innovation in the literature has been emerged. The main challenges in this regard are the need to establish indicators at micro level, taking into account the life cycle and the separation of eco-efficiency from the economic category of eco-innovation, the definition of levels of eco-innovation analysis and the careful development of data aggregation methods, in addition to understanding the effect of eco-innovation and the relationship of eco-innovation indicators to key indicators for measuring sustainable and sustainable socio-economic development. The effects of eco-innovation can be measured on a micro scale (for product or service, process, enterprise), meso (sector,) and macro. Despite the high investment of companies, eco-innovation activities are producing results in the longer term on a micro scale by reducing the negative impact of its activities on the environment, while at the same time leading to the impact of eco-innovation on the company's performance in the form of lower environmental pollution charges and lower energy costs.

Keywords: Eco-Innovation, Eco-Innovation Activities, Eco-Innovation Observatory.

JEL: Q50, Q55, Q59

Introduction

Eco-innovation contributes to the company's sustainability in reducing costs. In addition, consumers are more interested in purchasing environmentally friendly products supplied by companies using eco-innovative technologies. As entrepreneurs point out, employees engage in believing in company missions and the deeper meaning of their own work in ecoinnovative and modern tial organizations (Rutkowska and Kamińska, 2020). The European Commission members pay particular attention to the factors determining the success of eco-innovation, namely the acquisition of business benefits and environmental protection. One is to reduce energy efficiency to reduce carbon emissions in order to meet the commitments contained in the Kyoto protocol. Comprehensive solutions, including the Eco-IS methodology, as well as tools developed by the Community Innovation Survey (CIS) in the European Union and proprietary proposals for eco-innovation assessment, are noteworthy.

European eco-innovation research was carried out systematically, and was limited to sources of eco-innovation, determinant, barriers in selected industrial sectors in western European countries, mainly Germany, which in turn resulted in a large shortage of eco-innovation research introduced by companies operating in Central Europe, especially in Poland. Only selected aspects of the activity have so far been the subject of comprehensive analyses carried out m.in. by the Central Statistical Office, PSDB in cooperation with GfK Polonia on behalf of PARP (Kornecki et al., 2010), the Environmental Partnership Foundation, as well as the Gallup Institute as part of the Eurobarometer survey (Gallup, 2011).

Methodology and Goal

The main goal of the article is to prove the thesis that eco-innovation and allow countries economies to increase their performance in the longer time period, Another aim was to analyse ecoinnovation scoreboard data and to unveil the low index value reasons for Central Europe countries. To gain so declared goals, a research question was formulated as follow: do countries with less developed economies have lower eco-innovation performance? The performance measurement was based on secondary data analysis obtained from Eco-innovation observatory. These

Cite this Article as: Pawel BARTOSZCZUK "Eco-Innovation Measurement by the European Observatory on Eco-Innovation (EIO) " Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

basic indicators and trends described European countries ec-oinnovations performance. The analysis is based on comparative research and available data. We identified a problem with the establishment of measures for the effects of eco-innovations. In the further part of article European countries were indicated with the highest, medium, lower eco-innovation performance. Hence, the research question was addressed describing the economy transformation towards the eco-innovation. The search in the main scientific databases and a review of the literature revealed an unfocused approach of the relationship between eco-innovations indicators performance, which shows a research gap regarding this subjectWe decided to analyze the data, by assuming that eco-innovations scoreboard' factors are capable of explaining the companies' slow and moderate performance.

Measuring the effect of ecoinnovation (CIS)

Measuring the effects of eco-innovation is very difficult to carry out throughout the innovation chain (including R&D, the dissemination of innovative products and the use of innovative processes or organisational methods). Furthermore, the value of these innovations makes it difficult for companies to access data due to companies not identifying such solutions as eco-innovation. It is also impossible to obtain them through the national accounts of the sector's production, as they occur in different areas of the economy. The main challenges in creating and operationalising eco-innovation concepts are: defining indicators at micro level, taking into account the life cycle and distinguishing eco-efficiency from the economic category of eco-innovation, naming eco-innovation analysis levels and establishing an operational approach to eco-innovation analysis in order to properly understand the effect of eco-innovation. The possible impact of eco-innovation on the competitiveness of the company is also highlighted. This, in turn, seeks to active information on the factors (the condition of competitors, the type of competing products or services) that will affect its activities over the next few years, which will enable it to survive in the longer term on the market (Woźniak, Strojny and Wojnicka, 2010; Tutaj, Rutkowska and Sulich, 2019). Considering the traditional theory of innovation, Wagner (2008) concluded that innovation affects companies' social performance.

Community Innovation Survey (CIS) is conducted in the European Union by Eurostat and based on the methodology described in Oslo Mananual (Development and Communities, 2005). From the perspective of this article, the 2008 CIS study, which introduced a module on eco-innovation, i.e. eco-innovation, is noteworthy. The off study covered innovations introduced between 2006 and 2008. The environmental benefits of implementing innovation are divided into:

1) environmental benefits that may arise during the period of manufacture of the product or service:
    1. reduction in material consumption per unit of product,
    2. reduction in energy consumption per unit of product,
    3. reduction of carbon dioxide emissions by the company,
    4. the use of less polluting or environmentally hazardous materials,
    - re-use (recycling) of waste, water or materials,
2) environmental benefits that may arise during the useful life of the purchased product or the use of the service by end-users:
    1. reducing energy consumption,
    2. reducing air, water, soil or noise pollution,
    3. improving the reusability (recycling) of the product after its useful life.

European Observatory on Eco-Innovation (EIO)

In this context, however, there is a problem with the establishment of measures for the effects of eco-innovation. The most well-known initiative to consider eco-innovation in the European Union is a study by the European Observatory on Eco-Innovation (EIO). On the basis of numerous data collected from European countries, a for individual countries eco-innovation scoreboard has been developed (O'Brien, 1999; O'Brien and Miedziński, 2012). This index consists of 16 indicators divided into 5 groups. Three of them directly relate to eco-innovation: expenditure on eco-innovation, eco-innovation activities and eco-innovation results. The other two groups of indicators are the effects resulting from the introduction of eco-innovation – environmental and socio-economic (development of the "eco-industry" of the economy). Their detailed description is given in the following list: (Eco Innovation Observatory - Annual Reports - Annual Reports, no date)

1. *inputs*– the share of government resources and expenditure spent on environmental and energy R&D in relation to GDP, the share of R&D participants in the number of all employees, the volume of green investments under PE/VC funds;
2. activities –*participation* of eco-innovation companies improving material and energy efficiency in the number of companies in the country in total, the number of organisations holding ISO14001 environmental management certificates (in relation to the number of citizens in a given country);
3. outputs –*number* of patents, scientific publications (in relation to the number of citizens in a given country), information in the media on eco-innovation (in relation to the number of electronic media available);
4. *environmental outcomes – efficiency* of energy, raw materials, water and greenhouse gas emission factors;
5. *socio-economics outcomes*– the share of environmental exports in general exports, the share of workers employed in the environmental sector in the total number of employees, the overall turnover generated by the environmental industry.

Results

The composite index relating to both eco-innovation and innovation in general reflects the disadvantage of Polish economy belonging to non-innovative and non-ecoinnovative European countries (Fig. 1). Poland is in the low eco-innovation performance group of countries, as are most Eastern European countries and some Western countries (such as Malta). Even against the background of these countries, there is a great distance of Poland to the New Member States eg. the Czech Republic and Estonia. The results of these indices indicate insufficient implementation of eco-innovation in enterprises in Poland. Currently available data presented by the European Ecoinnovation Observatory confirm a significantly insufficient degree of eco-innovation of the Polish economy (*Eco Innovation Observatory - Annual Reports - Annual Reports*, no date; *Eco-innovation Action Plan - European Commission*, no date; Bleischwitz *et al.*, 2009; Doranova and Roman, 2016).

The negative assessment covers almost every of the five sub-elements of the index, except for the socio-economic effects that have been positively assessed. The level of involvement of Polish companies in the implementation of eco-innovation meant that Poland, together with Bulgaria, took the last place in the 2011 ranking with an index of only 41 points (while in 2013 and 2015 it was the penultimate place and 22nd place with 59 points in the 2019 ranking). Other countries that joined the EU at the same time as Poland achieved much higher index values in 2011, e.g. The Netherlands. Czech Republic – 171 points (in 2019 – 96 points(Fig.1) and Slovenia – 119 points (in 2019 – 94 points). These results confirm that Poland is in a rather unfavourable climate and that the interest of companies in introducing eco-innovation is insufficient.

Fig. 1. EU eco-innovation ranking in 2019 (EU average-27=100)

Source: own study based on Eco-innovation at the heart of European policies, European Commission, 2020, https://ec.europa.eu/environment/ecoap/scoreboard_en (20.09.2020).

Compared to 2011, Poland moved from last to 6th last place in the eco-innovation ranking in 2019, which gave it a slightly higher score (59) than the one previously obtained (50). Poland is still ahead of countries such as the Czech Republic, with a much better result close to the EU average. Luxembourg came first in the latest eco-innovation ranking, with a score of 162 points, ahead of Denmark by 18 points. Bulgaria, on the other hand, came last in the ranking of European countries.

Fig. 2. Eco-innovation gap in five themes Polish (relative to the EU average between Poland and the Czechia and eco-innovation leader Germany, EU = 100)

Źródło: own study based on, Eco-innovation at the heart of European policies, European Commission, 2016, no other data were available,(The Eco-Innovation Scoreboard and the Eco-Innovation Index - Eco-innovation Action Plan - European Commission, no date) (Bleischwitz et al., 2009)
https://ec.europa.eu/environment/ecoap/scoreboard_en (20.09.2020).

In the Polish case, there is a considerable distance within the five groups of indicators of the complex eco-innovation index compared to the Germany and even the Czech Republic (Figure 2). Only in terms of socio-economic performance, Poland leads the ranking, but for all others it ranks below the EU average. These data should be treated with a degree of caution, as not always, for example, higher employment in eco-services contributes to greater eco-innovation and results. Three component indicators on socio-economic outcomes were highlighted:

1. export of products from the eco-industry (% of total exports – Eurostat),(*Database - Eurostat*, no date)[1]
2. employment in the eco-sector and circular economy (% of total employment in all enterprises – Orbis base),
3. profits in the eco-sector and circular economy (share % of total employment in all enterprises – Orbis base). (*International Company Information Database | Bureau van Dijk*, no date)

Fig. 3: Indicator for social economic results of eco-innovation for European Union countries

Source:own study on the basis of: Eco-innovation at the heart of European policies, European Commission, 2016, other data were not available https://ec.europa.eu/environment/ecoap/scoreboard_en (20.09.2020).

In terms of indicators reflecting expenditure on eco-innovation and performance, Poland did not even reach half the average value of European countries (as it scored only 40 points). Please note that the eco-innovation index has some drawbacks. For example, the definition of eco-industry adopted by Eurostat and Ecorys, on the basis of which socio-economic indicators were created, refers to a large range of green activities (e.g. recycling, wastewater treatment, the introduction of renewable energy sources), with competitiveness and employment levels in some of them not necessarily directly derived from eco-innovation (e.g. hydropower plants). At the same time, an important part of the economic impact of the implementation of eco-innovation is becoming apparent in many other sectors where companies that have introduced eco-innovation were not motivated by eco-innovation, but by the need to improve productivity and reduce costs. Therefore, performance indicators do not differ between the EU-27 countries to the same extent as those directly related to eco-innovation, as is also evident in the case of Polish. In addition, performance indicators are poorly correlated with indicators of the intensity of the development and implementation of eco-innovation. The environmental effects are measured by static indicators, which depend to a large extent on the historical development paths of economies and not necessarily on eco-innovation introduced in the last dozen years.(Park et al., 2017) (Bilsen, 2009).

Contrary to expectations, countries with a higher resource of scientific and technical staff do not necessarily achieve better results in the implementation of eco-innovation. Countries such as France, Italy, Spain and Poland have a high share of research staff in general, but it is much less efficient than countries that have achieved a lower eco-innovation rate (e.g. Denmark).

Table 3: Eco-innovation indicators for European countries by Ecoinnovation scoreboard

		Eco-innovation input	innovative capacity	Eco-innovation efects	Effectiveness	Social economic effects	Eco-IS
Leaders	Germany	174	149	141	110	129	140

Fig. 4: Eco-innovation Scoreboard for European Union countries

Source. Own elaboration based on Ecoinnovation data 2019https://ec.europa.eu/environment/ecoap/indicators/index_en

Conclusion

The considerable concerns related to the development of eco-innovativeness are observed in some European countries, particularly Central European member countries, including Poland. First, politicians do not fully recognize the significance of eco-innovation effects, or generally – innovations. Strong lobby supports obsolete industries and it is not interested in development of eco-innovations. On the one hand, there is no pressure on research in new eco-innovative solutions. On the other, academic a R&D centers are unable to satisfy the demands of the industry. It is of key importance that eco-innovations are perceived as the driving factor of the third transformation in Poland and other EU new members (following system transformation and the EU accession).

This research have some caveats. For example, except for Eco-innovation scoreboard, other data were available only from the earlier periods. We observed shortcomings of the sub-indicators that are part of the index e.g. expenditure. This is particularly true under the heading government outlays and expenditure on research and development in the field of environment and energy. It only includes part of the expenditure and does not consider the expenditure incurred by organisations from their own resources or from bank loans, EU funds or other sources (e.g. in Poland most innovations are financed by non-governmental funds). In situation, when the structure of eco-innovation funding sources were similar in all EU countries, this would not affect the ranking. However, if this were not the case, it could turn out that the position of countries in terms of R&D expenditure is different from that of government expenditure only (Pakulska, 2020). It seems that more attention should be paid to this issue in further research.

Abstract

The paper contains an empirical demonstration of the beneficial effect, obtained by combining physical activity - which includes a program for the whole body - together with going out in nature, applied to sedentary people, who work in the office. The study presented in this paper was conducted during and after lockdown, by monitoring the effect of physical activity - at home, in the gym or in nature - on the following systems: cardio-respiratory system, musculoskeletal and neuro-muscular system, metabolic system and immune system. By using the questionnaire method, it was possible to demonstrate that the physical activities performed had a great impact on improving the mental state of the participants for the better.

Keywords: physical activities (PA), exercises, sedentarism, lockdown, diseases.

Introduction

Several studies (Diaz et all. 2017) show that prolonged sitting on the stool, contributes as a risk factor for deadly diseases, such as would be: diabetes, cardiovascular disease. Those who work in offices are part of the population with the highest degree of sedentary lifestyle (Parry et all. 2013)

Symptoms include: muscle pain, headaches, knee pain are associated with what we call "office syndrome", which is not a syndrome in itself but rather a combination of these symptoms. Due to the current situation, in which people are forced to work from home, the physical activities is even more restricted, making people move even less than they did before the pandemic, raising the rate of sedentarism. (Booth et all. 2017)

If in ancient times the physical work associated with gathering food, respectively the effort to build the shelter were the fundamental daily actions of our ancestors, the advent of modern technology has made PA only a lifestyle option for some people. As a result, inactivity and sedentary lifestyles have become a major risk of cardiovascular disease and diabetes for those who do not opt for PA, leading to mortality. Exercises promotes cardiometabolic health, improves cognitive performance, and effectively helps prevent and treat a variety of health conditions, including cardiovascular disease, diabetes and other metabolic disorders, neurological disease, sarcopenia, osteoporosis, and cancer. (Sonne et all. 2010)

The study process during the lockdown, must include a strategical approach, which contain exercises that impact the body systems responsible for maintaining health and quality of life: the cardio-respiratory system, the musculoskeletal and neuro-muscular system, the metabolic system and the immune system. (Trost SG et all. 2014) Also, the physical activity carried out had a great impact on improving the mental state of the participants for the better.

Research Methodology

This study was conducted over a period of 7 months, more specifically during the lockdown period in Romania, ie March - May 2020 and respectively, after the lockdown in June-September 2020. The study followed the real performance of each subject in the following directions :

1. Carrying out PA at home, during the whole lockdown period. Once every two days, the participants received a set of exercises to perform at home.

2. Continuation of the physical exercise program in the gyms, after their reopening.

3. The participants took part in nature and mountain hikes between 2 and 3 weeks a month, during the weekend, after the lockdown.

The aim of the study consist of exercises designed to work the whole body, considering the increase of the body's capacity for effort, the hypertrophy of the muscle mass, the increase of the mobility. The program followed the principles of accessibility: from easy to difficult, from simple to compound, from known to unknown. Movements such as kneeling, jumping jackets, push-ups, abdomen, squats were used. The exercises were dosed for each participant. During the lockdown, each participant received an exercise program once every two days, being also advised to take a short walk near the house, during the break days. The program continues in the gym, after the reopening of the sports centers. Participants did 3 training sessions per week under the guidance of an instructor. After the lockdown, the study participants engaged in mountain trips for 3 months, 3 weekends per month.

A. Physical inactivity and the immune system

Immunosenescence, related the cellular& molecular alterations that affect the innate and adaptive immunity, resulting to a higher risk of morbidity and mortality all over life, appears to be an important part in the covid pandemic19. So , it is important to acknowledge that the immune system is not functioning in isolation, it is influenced by surroundings factors, such as physical activity. (Gleeson et all. 2011)

B. Physical inactivity and the musculoskeletal and neuromuscular system

The negative results of physical inactivity on the neuromuscular structure have been reported since 1920s by Cuthbertson (Cuthbertson, 1929), it is suggested that a long time without activity in healthy subjects leads to a loss of nitrogen, phosphorus and calcium due to lack of muscle use and bones. Recent results shows that inactivity also motive damage to the neuromuscular junction and muscle denervation, this show us that muscle atrophy occurs not just from reduced mechanical load but on the other way from neurodegenerative processes.

C. Physical inactivity and the metabolic system

The situation in this times will reduce activity to levels well under the daily recommendation of 7,500-10,000 steps a day, highlighting health problems resulting from physical inactivity. It is important to understand that the negative effects on health are observed quickly (4-15 days) when the decrease in activity is point up, as will be the case worldwide in this pandemic. (Narici et all. 2020)

Evidence provide that 7-10 days of bed rest or absence of physical activity in healthy people brings to a 10-35% decrease in insulin sensitivity in the body. (Stuart CA et all. 1988)

D. Physical incapacity and the cardio-respiratory system

The VO2max variable is the one based on which the maximum capacity of both the cardiorespiratory system and the skeletal muscles in the process of transporting and using oxygen (O2) is evaluated. This variable represents the maximum capacity of the lungs to take oxygen from the environment and to transport it in the blood and muscles of the body. (Myers et all. 2002)

For both healthy subjects and patients with cardiovascular disease, "exercise capacity is one of the strongest predictors of mortality, even more so than other established risk factors for cardiovascular disease." (Bassett et all. 2000).During a sudden decrease in activity, as was the lockdown situation for COVID-19 for a period of 2 months, a linear decrease of up to 30% of the VO2max variable was observed in all subjects studied.

A questionnaire was set up reviewing the 3 approaches, presented above, based on physical activities, offered to a sample of 40 people, who work in the office and who were forced to work from home during the pandemic. The 40 people participated in all three programs and gave their consent to participate in this study.

The objectives of the study were to analyze the effect of physical activity combined with going out in nature, on the health - physical and mental - perceived by those surveyed. Due to the fact that the only measuring instrument was the questionnaire, the study data are empirical but certainly they are supported by other studies in the field.
The study participants followed a program of various physical exercises, for the whole body, this being a new aspect brought by the study in this case. The exercise program included movements for the whole body, training all the kinetic chains and aimed at improving the functionality of the whole body. Methods of increasing body strength and mobility have been applied

Data collection

The questionnaire consisted of 13 questions, configured in 5 sections, as follows:

Section 1 - physical activity during lockdown
1. How much did your physical activity during the lockdown help you stay healthy from a muscle-joint point of view?
2. How much did your physical activity during the lockdown help you to stay healthy from a cardiovascular point of view?
3. How much did physical activity help you during the lockdown to maintain your physical capacity?

Section 2 - improving the quality of life in general
4. How much did physical activity help you during the lockdown to keep you physically and physically healthy?
5. How much did physical activity help you during the lockdown to alleviate your mental stress?

Section 3 - resumption of physical activities in the gym
6. Did you feel an evolution of your physical condition when you continued training in the gym from a muscular-articular point of view?
7. Did you feel an evolution of your physical condition when you continued training in the gym from a cardiovascular point of view?

Section 4 - Nature Hiking
8. Hiking in nature has increased my level of good mood.
9. Nature hiking has increased my professional performance.
10. Nature hiking has alleviated my mental stress.
11. Nature hiking has increased my physical capacity.

Section 5 - The combination of physical exercises with hiking in nature
12. Do physical exercises combined with going out in nature have a beneficial effect on physical health?
13. Do physical exercises combined with going out in nature have a beneficial effect on mental health?

The results of the survey were systematized in table 1.

Table 1 - Survey results

Section	Question number	NOT AT ALL # respondents	A LITTLE # respondents	A LOT # respondents	VERY MUCH # respondents
Section 1	1	10	20	10	-
	2	4	16	20	-
	3	3	17	10	10
Section 2	4	1	5	22	12
	5	2	4	22	12
Section 3	6	-	3	25	12
	7	-	2	25	13
Section 4	8	-	1	22	17
	9	-	2	20	18
	10	-	1	19	20
	11	-	1	21	18
Section 5	12	-	-	10	30
	13	-	-	11	29

Findings and Suggestions

Through a holistic approach to life we can conclude that each aspect influences the other. Through PA we increase the energy level which decreases the present and increases the ability to concentrate. PA helps to improve the immune system, which leads to a lower rate of illness. 22 subjects reported the improvement of mental quality which leads to increased concentration (Question 5 and Question 10 - figure 1; 2; 3; 4). Through physical activity in nature, referring to hiking in this text, stress relief is created, a statement made being "VERY MUCH" from 20 of the subjects interviewed for question 10 (50%) and respectively 29 of the subjects interviewed for question 13 (65%) (figure 4).

If we follow the trends of the answers of the four diagrams, it can be clearly noticed that the answers "NOT AT ALL" and "A LITTLE" have a decreasing trend, the answer "A LOT" has an average trend from 40% of respondents (figure 3) and the answer “VERY MUCH” has a clearly increasing tendency from 60% of the respondents, the conclusion being the obvious one of the benefit combinations of exercise and physical activity in the gym or at home with hiking in nature.

Subjects due to the fact that they did PA during the lockdown reported an easier passage through the isolation period, they stated that this aspect related them to the activity before isolation and that they felt mentally better after moving. During and after PA, endorphins are released, they are responsible for the perception of the feeling of happiness, which helps prevent burnout.

Figure 1 - Distribution of “NOT AT ALL” answers

Figure 2 - Distribution of "A LITTLE" answers

Figure 3 - Distribution of "A LITTLE" answers

Figure 4 – Distribution of "VERY MUCH" answers

Conclusions

Although the data in this study are empirical, they are supported by studies done by BMC Public Health.

From the collected data, we deduce that the physical activity practiced regularly, together with the outings in nature have a synergistic effect, the combination of the two increasing the beneficial effects. I believe that the introduction of PA during the work schedule would increase the energy level of employees. It is necessary that the program stay focused on several components: cardio-respiratory, strength, mobility. These branches can be worked in the same time interval or in separate days.

Résumé

Étant l'une des "tendances" qui ont eu un impact significatif sur le secteur touristique, le rôle et l'utilisation des médias sociaux dans les opérations de gestion et promotion des destinations ont été largement discutés dans les travaux de recherche sur le tourisme et l'hospitalité.

Cette étude a pour vocation l'exploration de la manière dont l'Office National Marocain du Tourisme utilise les médias sociaux pour promouvoir et commercialiser le Maroc comme destination pour les voyageurs. Ceci, en analysant les plateformes en ligne officielles du Maroc « Visit Morocco » (Facebook, Twitter, Instagram et YouTube) sur toute la période de l'année 2019. Les résultats suggèrent que l'Office National Marocain utilise les médias sociaux comme un outil de marketing traditionnel, plutôt que de les exploiter pour interagir avec les touristes afin d'atténuer les problèmes potentiels des touristes.

Mots clés : Médias sociaux, Destinations, OGD/DMO, Office National Marocain du Tourisme.

Introduction

L'émergence du Web 2.0 et des plateformes en ligne a profondément transformé le comportement des consommateurs ainsi que les approches marketing sur le Web.

Cette évolution a eu un réel impact sur l'hôtellerie et le tourisme d'au moins trois façons fondamentales: Premièrement, la prolifération de nombreuses communautés en ligne centrées sur les discussions de voyage telles que TripAdvisor, Virtual Tourist, Igo Ugo, Independent Traveler, et même les sites de réseautage social comme Facebook, Twitter et MySpace; deuxièmement, l'évolution des comportements des voyageurs en ce qui concerne la recherche d'informations et la planification de voyage ; et troisièmement, l'intégration des médias sociaux dans les stratégies marketing des organismes d'hôtellerie et de tourisme. Cette tendance a donné lieu à la popularité croissante des médias sociaux qui incarnent un large éventail d'applications Internet qui s'appuient sur les fondements idéologiques et technologiques du Web 2.0.

L'industrie de tourisme est considérée comme l'une des premières industries directement touchées par le Web, car sur le marché très concurrentiel du voyage d'aujourd'hui, les destinations commencent à ajouter des outils numériques à leurs pratiques commerciales traditionnelles pour attirer les visiteurs.

En effet, les médias sociaux en tant qu'outil marketing puissant et peu coûteux ayant une portée mondiale sont devenus les nouveaux intermédiaires entre les consommateurs et les destinations touristiques pour fournir des informations, leur permettant ainsi de connaître la destination et d'influencer leur processus de prise de décision (Simon Hudson & Karen Thal, 2013).

Bien que l'utilisation des plateformes de médias sociaux dans l'industrie du tourisme connait une réelle extension, les recherches scientifiques sur l'utilisation des médias sociaux dans le secteur touristique restent limitées (Chan & Denizci Guillet, 2011 ; Gretzel, Fesenmaier, Formica, & O'Leary, 2006 ; Xiang & Gretzel, 2010). Les recherches

Cite this Article as : Asmahane TAHIRI and Ez-zohra BELKADI " Les Médias Sociaux Comme Outil De Marketing De Destination : Examen De L'utilisation Des Médias Sociaux Par l'Office National Marocain Du Tourisme" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN : 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

existantes se sont principalement concentrées sur le : (1) l'utilisation des médias sociaux par les touristes (contenu généré par les utilisateurs) et (2) l'adoption des médias sociaux par les entreprises touristiques. Par conséquent, l'utilisation des médias sociaux par les organismes de gestion de la destination (OGD), - connus par leur acronyme anglais DMO (*Destination Marketing Organization) -,* qui sont responsables de la gestion des destinations et leur promotion, restent largement inconnus (Munar, 2012).

L'une des peu nombreuses études pionnières dans ce domaine a été réalisée par Hays et al. (2013). Dans cette étude exploratoire, Hays et al. (2013) ont étudié l'utilisation des médias sociaux par les OGD des 10 pays les plus visités en analysant le contenu de leurs pages Facebook et comptes Twitter. Les résultats ont révélé que l'utilisation des médias sociaux par les OGD de ces pays était encore purement expérimentale et que des recherches supplémentaires, avec un échantillon plus important, étaient nécessaires.

Dans une optique de prolongement des recherches précédentes sur les OGD européens, la présente étude vise à analyser l'utilisation des médias sociaux par l'OGD d'un pays nord-africain qui est le Maroc. La présente étude vise à analyser l'utilisation des médias sociaux Facebook, Twitter par l'OGD au Maroc qui est représenté par l'Office National Marocain du Tourisme, ainsi que deux plateformes supplémentaires, notamment Instagram et YouTube sur une période d'une année complète (2019) afin d'assurer une analyse plus complète.

Adoption des médias sociaux dans le secteur touristique : implications pour les OGD

Les médias sociaux ont modifié de façon fondamentale la manière dont la société crée et diffuse l'information (Buhalis & Law, 2008 ; Xiang & Gretzel, 2010), entraînant ainsi un changement à la fois au niveau de la demande (c'est-à-dire le processus de prise de décision du consommateur) et l'offre (c'est-à-dire les pratiques marketing et gestion des entreprises et des organisations).

Litvin et al. (2008) ont considéré les médias sociaux comme une source importante d'informations stratégiques pouvant être utilisées pour le développement d'un certain nombre de stratégies commerciales, notamment l'amélioration de la satisfaction des visiteurs par l'amélioration des produits, la résolution des problèmes des visiteurs, la découverte de l'expérience des visiteurs, l'analyse des stratégies concurrentielles ainsi que le suivi de l'image et de la réputation d'une entreprise. De l'autre côté, Schegg, Liebrich, Scaglione et Ahmad (2008, p. 152) affirment que l'évolution du Web 1.0 - 2.0 marque un changement de cap, les utilisateurs aujourd'hui prennent les commandes d'Internet au lieu des organisations.

Auparavant, Internet ne fonctionnait que dans un seul sens, en mode « lecture seule » (Borges, 2009). Les informations publiées étaient statiques et l'interaction avec d'autres utilisateurs d'Internet et / ou éditeurs était pratiquement inexistante. Aujourd'hui, le Web 2.0 est alimenté en continu par du contenu généré par les utilisateurs via les médias sociaux (Brake & Safko 2009 ; Buhalis & Law, 2008).

En somme, les médias sociaux sont un phénomène actuel en constante évolution impliquant le partage en ligne de contenu généré en ligne soit par les consommateurs ou les organisations (Stankov, Lazic et Dragicevic, 2010 ; Xiang et Gretzel, 2010). Une définition proposée par Brake et Safko (2009) stipule que les médias sociaux font référence aux activités, aux pratiques et aux comportements des communautés de personnes qui se rassemblent en ligne pour partager des informations, des connaissances et des opinions à l'aide de médias conversationnels. Les médias conversationnels sont des applications Web qui permettent de créer et de transmettre facilement du contenu sous forme de mots, d'images, de vidéos et d'audios. (P. 6)

En ce qui concerne le secteur touristique « industrie à forte intensité d'information », on considère l'utilisation des médias sociaux comme particulièrement pertinente (Gretzel et al., 2000, p. 147 ; Wang, Quaehee, & Fesenmaier, 2002).

Pour les voyageurs, les médias sociaux sont devenus une source d'information essentielle (Amaro, Duarte, & Henriques, 2016 ; Hudson & Thal, 2013 ; Zeng & Gerritsen, 2014), pour les aider dans le processus de planification de voyage et pour prendre des décisions éclairées sur les destinations, l'hébergement, les restaurants, les visites et les attractions (Chung et Buhalis, 2008 ; Ruzic et Bilos, 2010 ; Thevenot, 2007 ; Xiang et Gretzel, 2010).

Etant donné que les expériences touristiques ne peuvent pas être évaluées avant la consommation car elles sont intangibles, les voyageurs comptent sur les informations et recommandations publiées sur les médias sociaux pour minimiser les risques de prendre de mauvaises décisions de voyage (Leung, Schuskert & Yeung, 2013), puisque les produits touristiques sont généralement considérés comme des achats très risqués (Kim, Qu, & Kim, 2009). C'est ainsi que les voyageurs ont de plus en plus tendance à utiliser les médias sociaux avant le voyage pour la recherche d'informations sur les destinations, pendant leur visite de la destination choisie, en publiant du contenu lié à leurs séjours (photos, vidéos par exemple), et aussi après leurs retours afin de partager leurs expériences de voyage avec d'autres personnes (Munar & Jacobsen, 2014).

Cela veut dire que la ligne de communication ne se limite plus au producteur à consommateur, mais peut être de consommateur à consommateur et de consommateur à producteur (Buhalis, 2003). C'est ainsi que l'utilisation des médias sociaux a deux conséquences, d'un côté ils peuvent être un outil précieux pour recueillir les réactions, qui seront utilisées pour attirer de nouveaux clients et garder les consommateurs actuels en créant une relation client forte et efficace qui renforce la fidélité, ou bien la détérioration de la confiance des consommateurs s'ils ne sont pas utilisées correctement d'un autre côté (Salkhordeh, 2009)

De ce fait, les OGD ont intérêt à utiliser les médias sociaux pour essayer de stimuler la conversation, encourager l'interaction et s'engager de la même manière que le marketing traditionnel (Tuten, 2008). En effet, parmi les avantages des médias sociaux on peut citer le fait que les OGD peuvent collaborer et rationaliser leurs informations, ce qui apporte une valeur ajoutée aux consommateurs, tout en renforçant l'image de destination par une interaction directe avec le consommateur et une réponse immédiate à ses questions et préoccupations. Cette implication peut être vitale pour fidéliser, générer des contenus intéressants et accroître la notoriété (Parise, Guinan, & Weinberg, 2008).
Munar (2010) dans son étude portant sur le contenu généré sur les médias sociaux par les OGD et les voyageurs en Europe, a identifié trois principales stratégies adoptés par les OGD : stratégie mimétique, stratégie publicitaire et stratégie analytique. La première stratégie consiste à reproduire le même concept et spécificités des médias sociaux pour créer les plateformes en ligne des destinations afin de permettre aux touristes de créer, partager et télécharger du contenu. Cet outil facile et peu couteux d'adoption de la technologie Web 2.0 permet aux OGD de garder le contrôle du contenu généré sur leurs plateformes en ligne.

La stratégie publicitaire se caractérise par l'utilisation des bannières et d'autres dispositifs par les OGD pour promouvoir et faire connaitre leurs destinations. Dans ce cas, les médias sociaux sont considérés comme de simples canaux publicitaires qui peuvent être utilisés pour accroitre la notoriété des destinations. Autrement dit, les OGD ne tirent pas profit de la masse d'informations fournies par les touristes en raison de l'absence d'interaction. En ce qui concerne la stratégie analytique, elle est utilisée par les OGD selon deux différents niveaux. Le premier niveau consiste à comprendre le développement du contenu généré par les utilisateurs/touristes par rapport à la destination. Si des contenus négatifs sont publiés par les touristes, les OGD prendront les mesures nécessaires afin de minimiser les dommages ou bien ils vont procéder à l'amélioration de leur démarche marketing. En ce qui concerne le deuxième niveau, il consiste à la conversion grâce à l'intelligence artificielle, des données issues du contenu généré par les utilisateurs des médias sociaux en connaissances stratégiques. La limite de cette stratégie réside dans l'importance de l'investissement financier nécessaire à la mise en œuvre de cette stratégie car elle implique un usage intensif des technologies de l'information.

Munar (2010) a conclu son travail en déclarant que la stratégie analytique pourrait apporter de nouvelles opportunités pour améliorer l'efficacité de la marque de destination.

D'autres recherches plus récentes ont révélé que les OGD utilisent le plus souvent les médias sociaux à des fins de marketing, étant donné que les médias traditionnels ne sont plus suffisants et en raison de la popularité de ces derniers auprès des consommateurs (Denizci Guillet et al., 2016, Hays et al., 2013 ; Kim, Koh, Cha & Lee, 2015 ; Kim, Lim, & Brymer, 2015). Toutefois, cette utilisation des médias sociaux comme outil marketing est encore au stade expérimental (Hays et al., 2013 ; Milwood, Marchiori, & Zach, 2013) puisque de nombreuses organisations se contentent de transférer leurs activités de marketing existantes sur les plateformes de médias sociaux, plutôt que d'exploiter le potentiel de ces derniers. En effet, des travaux indiquent que les organisations touristiques ont généralement de mauvais résultats en matière de développement de l'interaction et de la communication avec les touristes sur les médias sociaux (Chan & Denizci Guillet, 2011 ; Denizci Guillet et al., 2016 ; Hsu, 2012 ; Kim, Lim & Brymer, 2015 ; Phelan et al., 2013 ; Wattanacharoensil & Schuckert, 2015) malgré le fait que cette interaction avec les touristes représente une question cruciale dans le domaine touristique, car une réponse tardive ou inexistante aux préoccupations soulevées sur les médias sociaux indique que cet organisme touristique fait preuve d'une faible réactivité vis-à-vis de ses clients, contribuant ainsi à une perte potentielle d'activité (Chan & Denizci Guillet, 2011).

Donc, l'idée d'intégrer les médias sociaux dans la démarche marketing et communication n'est pas de remplacer les outils traditionnels, mais plutôt de les utiliser pour des activités de marketing plus poussées et plus sophistiquées, telles que la réalisation d'études de marché, la gestion des crises, le développement de l'interaction avec les internautes et l'analyse des contenus générés par les voyageurs afin d'utiliser ces informations pour éclairer la prise de décision.

Méthodologie

La présente étude a été menée pour développer une meilleure compréhension de l'utilisation des médias sociaux par l'organisme de gestion de la destination Maroc, qui est notamment l'Office National Marocain du Tourisme. Cette compréhension s'est basée sur une analyse du contenu pour évaluer les publications sur les plateformes officielles en ligne de la destination Maroc.

En ce qui concerne la sélection des plateformes de médias sociaux pour analyse, bien que Facebook et Twitter étaient considérés comme les plateformes de médias sociaux les plus courantes auxquelles les organisations touristiques participaient (Hays et al., 2013 ; Hsu, 2012 ; Jabreel, Moreno, & Huertas, 2016 ; Kwok & Yu, 2013 ; Mariani et al., 2016 ; Philander & Zhong, 2016 ; Stankov et al., 2010), d'autres plateformes de médias sociaux comme Instagram et YouTube doivent également être étudiées afin de contribuer au corps de recherche existant sur les médias sociaux (Usakli, A., 2017).

Au final, les plateformes en ligne qui ont été sélectionnés pour être analysés dans le cadre de cette étude sont les suivants :

Facebook : Site de réseautage social lancé en 2004, compte en moyenne moins de deux milliards (2,5 milliard au quatrième semestre de 2019) d'utilisateurs actifs par mois (Facebook, 2019), ce qui le place comme la plateforme de médias sociaux la plus utilisée au monde jusqu'à cette date.

Twitter : Site de microblogging lancé en 2006 qui permet aux utilisateurs de poster des messages ("tweets") ne dépassant pas 140 caractères (Jansen, Zhang, Sobel, & Chowdury, 2009), compte environ 330 millions d'utilisateurs actifs mensuels (Twitter, 2019).

Instagram : Lancé en 2010 et détenu par Facebook, Instagram est une plateforme de médias sociaux relativement nouvelle, qui permet aux utilisateurs de partager des photos ou des vidéos. Instagram revendique plus d'un milliard d'utilisateurs actifs mensuels avec plus de 50 milliards de photos partagées depuis son lancement et plus de 100 millions de photos et vidéos publiées quotidiennement (Instagram, 2019).

YouTube : Créé en 2005, YouTube est un site de partage de vidéos appartenant à Google. Parce que l'on peut utiliser YouTube pour regarder des vidéos sans avoir de compte, il est difficile de mesurer le nombre exact d'utilisateurs (Golbeck, 2015) ; cependant, la société recense plus de 2 milliards d'utilisateurs actifs par mois (YouTube, 2019).

En ce qui concerne la collecte de données, elle a commencé par une analyse initiale des plateformes en ligne de la destination Maroc en utilisant des mots clés comme site web officiel marocain du tourisme et des voyages, Office National Marocain du tourisme, site web officiel marocain du tourisme et des voyages…etc., afin d'obtenir des liens vers les comptes officiels des médias sociaux gérés par l'Office National Marocain du Tourisme et écarter les comptes non officiels administrés par d'autres entités.

Après avoir confirmé que « www.visitmorocco.com » était le site internet officiel géré par l'Office National Marocain du Tourisme, les liens des comptes de la destination Maroc sur les plateformes des différents médias sociaux (Facebook, Twitter, Instagram et YouTube) ont été obtenus à partir de la page d'accueil.

L'examen de l'utilisation des médias sociaux par l'Office National Marocain du Tourisme a été fait sur une période d'une année complète (2019) en utilisant des mesures d'analyse du contenu tirées des études de Usakli, A., (2017) et Hays et al. (2013).

À la suite cette démarche, un total de 155 publications sur les médias sociaux (63 sur Facebook, 62 sur Instagram, 22 sur Twitter, et 8 sur YouTube) ont été obtenues. Il est important de noter que plusieurs feuilles de calcul de Microsoft Excel ont été utilisées à la fois pour la collecte et l'analyse des données.

Résultats et discussion

Afin d'effectuer une analyse comparative, les résultats ont été illustrés et discuté sur la base des quatre plateformes de médias sociaux.

Statistiques de base des comptes officiels gérés par l'Office National Marocain sur les médias sociaux

Premièrement, les dates de création des plateformes « Visit Morocco » sur les différents médias sociaux vont de 2008 (compte YouTube), 2012 (compte Facebook) et 2015 (compte Instagram et Twitter). Il convient de mentionner qu'Instagram ne fournit pas explicitement la date d'adhésion pour les comptes ; par conséquent, la date d'adhésion pour le compte Instagram a été générés en utilisant la date de la première publication. Le tableau 1 présente les dates d'adoption de chaque plateforme de médias sociaux.

Tableau 1 : Création des plateformes « Visit Morocco » sur les différents médias sociaux

Facebook	Twitter	Instagram	YouTube
Novembre 2012	Décembre 2015	Décembre 2015*	Avril 2008

*Date de la première publication

La figure 1 montre la répartition du nombre total des publications sur les plateformes en ligne « Visit Morocco » pour chaque type de médias sociaux. Comme indiqué, Facebook était de loin la plateforme de médias sociaux la plus utilisée par l'Office National Marocain du Tourisme, indépendamment d'un certain nombre de facteurs susceptibles de fausser cette distribution (par exemple, la date de création de chaque plateforme de médias sociaux). Les publications sur Facebook ont représenté 54 % du total des publications sur les plateformes « Visit Morocco », Instagram (25%), Twitter (14%), et YouTube (7%), ce qui indique clairement que l'Office National Marocain du Tourisme a plus souvent eu recours à Facebook pour partager des publications sur la destination.

Fig. 1 : Répartition du nombre total de publications (à partir de la date d'adhésion au 31/12/2019).

Afin de mesurer la taille de l'audience, les variables suivantes ont été utilisées : nombre total de personnes abonnées sur les pages Facebook, Twitter et Instagram, et nombres d'abonnés (personnes ayant un compte) et de vues sur YouTube. La mesure nombre de vue a été utilisées pour avoir une idée du nombre de followers sur YouTube puisque les utilisateurs peuvent regarder des vidéos avec ou sans compte. Néanmoins, il faut garder à l'esprit que le nombre total de vues ne correspond pas directement au nombre de followers puisque YouTube peut prendre en compte chaque vue du même utilisateur comme si c'était un utilisateur différent.

Ainsi, les tailles d'audience jusqu'au premier semestre de 2020 sont les suivantes : **137 914** pour Facebook, **10,3K** pour Twitter, **73.8k** pour Instagram, et environ **4,41 k** pour YouTube (en termes d'abonnés). Compte tenu du fait que la chaîne YouTube a atteint plus de **1 518 678** vues, on s'attend à ce que la taille exacte de l'audience de YouTube est bien supérieure à **4,41 k** personnes.

Analyse du contenu des publications

Les résultats présentés ci-après ont été obtenus à partir de l'analyse des données (un total de 155 publications) pendant la période d'étude (1/1/2019-31/12/2019).

Contenu

L'analyse des publications de l'Office National Marocain du Tourisme sur les médias sociaux selon la catégorisation de contenu de Usakli, A., (2017) : personnes taguées, hashtags, photos, vidéos et liens vers des sites internet, a révélé les résultats suivants (Figure 2) :

- Aucune personne n'a été tagués au niveau des 8 vidéos postés sur YouTube durant l'année 2019.
- Le nombre moyen de personnes taguées était égal à 1 pour les trois autres plateformes (Twitter 2,1 ; Facebook 1,2 ; Instagram 0,5).
- Le nombre moyen de Hashtag par publication était de 3 pour les quatre plateformes. Les hashtags étaient le plus souvent utilisés sur Twitter (5), suivi de Facebook (4,3), YouTube (1,6) et Instagram en dernier lieu avec 1 hashtag en moyenne.
- Sur 155 publications, les photos représentaient 71%, les vidéos 37% et 12% pour les liens vers d'autre sites internet.

- Instagram était la plateforme avec le plus grand nombre de publications comportant des photos, puisqu'il s'agit principalement une plateforme de partage de photos (43 photos, 69% des publications sur Instagram), suivi de Facebook (39 photos, 62% des publications sur Facebook) et Twitter (15 photos, 68% des publications postées).
- Contrairement aux prévisions, YouTube avait le nombre inférieur des vidéos postés (8 vidéos seulement), tandis que sur Facebook et Instagram 19 vidéos ont été publiées (31% des publications sur Instagram et 30% des publications sur Facebook), suivi par Twitter avec 4 vidéos (18% des publications sur Twitter).
- En ce qui concerne les liens vers les autres sites internet, ils étaient présents surtout sur Facebook (5 liens, 8% des publications), suivi de Twitter (3 liens, 14% des publications), avec une absence de lien sur Instagram en vertu de ses conditions d'utilisation, pour éviter les spams et sur YouTube qui est un site de partage de vidéos.

Fig. 2 : Distribution des types de contenu inclus dans les publications sur les médias sociaux en 2019.

Thèmes principaux des publications

Les études récentes soutiennent que les OGD utilisent les médias sociaux non seulement pour informer visiteurs mais aussi et surtout pour développer l'image de la destination. Etant donné que chaque publication sur une plateforme de médias sociaux contient un thème spécifique, chaque publication a été classée en utilisant des catégories d'attributs cognitifs de l'image (Tableau A1) dérivés d'études antérieures sur l'image des destinations (par exemple, Sönmez & Sirakaya, 2002 ; Beerli & Martín, 2004 ; Stepchenkova & Zhan, 2013). D'autres attributs ont été ajoutées notamment, catégorie "Général" pour les publications qui ne correspondaient à aucun attribut (Usakli, A., 2017) et une autre catégorie pour les événements marquants.

Tout le contenu textuel et visuel (les photos uniquement) a été évalué en utilisant une approche holistique pour son thème principal. Les vidéos n'ont pas été analysées car elles incluent simultanément plusieurs attributs d'image. Un total de 97 publications (43 sur Instagram, 39 sur Facebook et 15 sur Twitter,) a été analysé (Figure 3).

Les résultats indiquent que le thème principal le plus fréquent projeté par l'Office National Marocain du Tourisme dans ses publications sur les médias sociaux était les "Personnes : Touristes et habitants" (16 %), "Bâtiments et architectures" : 15% et "Paysages et nature" : 14% sur toutes les plateformes. Parmi les autres thèmes majeurs fréquents, on peut citer les sites historiques et les évènements (11 %), Les hôtels et infrastructures touristiques (10 %). Ces grands thèmes représentent plus de 79% de tous les publications analysées.

Fig3 : Diffusion des thèmes principaux des publications en 2019.

Engagement

L'engagement du client a été définit par Van Doorn et al. (2010, p. 254) comme étant "des comportements qui vont au-delà des simples transactions, et peuvent être spécifiquement définis comme des manifestations comportementales du client qui sont axées sur une marque ou une entreprise, au-delà de l'achat, résultant de facteurs de motivation". En ce qui concerne l'engagement des internautes sur les médias sociaux, il peut être négatif (par exemple, un commentaire négatif sur la destination) ou positif (par exemple, partage de post et recommandation de la destination à d'autres personnes). Ainsi, pour évaluer l'engagement des internautes/Touristes envers les plateformes "Visit Morocco", un certain nombre de mesures ont été calculées (le nombre moyen de mentions "J'aime/favoris", mentions "Je n'aime pas/ smiley en colère" de "partage/retweet", et commentaires/réponses). Le tableau 2 présente les principaux résultats de notre étude.

Tableau 2 : Nombre moyen de données d'engagement par poste en 2019

	Facebook	Twitter	Instagram	YouTube
Mentions j'aime/favori	136,9	16,4	3 311,4	26,9
Mentions je n'aime pas/ smiley "en colère" [a]	0,2	-	-	0,9
commentaire	12,2	1,5	24,5	1,8
Partage/retweets [b]	49,5	7,7	-	-

[a] La fonction "Je n'aime pas" n'est disponible que sur YouTube. Sur Facebook le smiley "En colère" remplace la fonction "Je n'aime pas"
[b] Nombre de partage n'est pas disponible à la fois sur Instagram et YouTube.

Comme indique le tableau, les publications de l'Office National Marocain de Tourisme sur Instagram a un nombre moyen de mention "j'aime" le plus élevé (3 311,4) suivi de Facebook (136,9), YouTube (26,9) et Twitter (16,4).

Le "Partage/retweets" représente le deuxième niveau d'engagement qui amène les internautes à partager les publications des OGD sur les médias sociaux. Dans la présente étude, les paramètres de partage ont été calculées uniquement pour les publications Facebook et Twitter, car le nombre de partage n'est pas disponible sur Instagram et YouTube malgré que cette option est activée. Les résultats étaient les suivants : une publication sur la page Facebook "Visit Morocco" a été partagé par 49,5 personnes en moyenne et un tweet a été retweeté par un nombre moyen de 7,7 internautes. En ce qui concerne les commentaires, qui représentent un niveau élevé d'engagement car il faut plus de temps pour écrire un commentaire que pour aimer ou partager une publication (Mariani et al.,2016). Les résultats indiquent qu'Instagram (avec un nombre moyen de commentaires de 24,5) offre le plus haut niveau d'engagement des touristes, suivi de Facebook (12,2) et au final YouTube et Twitter respectivement avec un nombre moyen de 1,8 et 1,5 commentaire. Ce qui nous laisse en dernier lieu la mention 'je n'aime pas' qui n'est disponible que sur YouTube et smiley "en colère" sur Facebook qui est considéré similaire à la mention 'je n'aime pas' dans cette étude. Les vidéos sur YouTube ont donné lieu à un nombre moyen de 0,9 de mention "je n'aime pas" et 0,2 smiley "en colère" en moyenne au niveau des publications Facebook.

Interactivité des OGD avec les internautes (Service client)

La dernière catégorie s'est concentrée sur les questions liées à l'interactivité avec les internautes afin de comprendre si les DMO utilisent ou non les médias sociaux pour fournir un service à la clientèle. À cette fin, les publications sur les plateformes "Visit Morocco" ont été analysées pour voir s'il y avait des réponses aux critiques, aux demandes de renseignements et aux compliments.

Les résultats ont montré que l'Office National Marocain du Tourisme n'utilise pas les médias sociaux comme outil de service client pour interagir avec les touristes. Cela se reflète dans l'absence de réponses par commentaire ou mention "j'aime" aux compliments écrits par les touristes, les demandes d'informations et commentaires négatifs sur l'ensemble des 155 publications postées en 2019

Conclusion

La présente étude explore la manière dont l'Office National Marocain du Tourisme utilise les médias sociaux pour promouvoir et commercialiser le Maroc comme destination touristique. Les résultats apportent d'importantes contributions à la compréhension de l'utilisation des médias sociaux dans le contexte touristique.

En analysant quatre plates-formes de médias sociaux, la présente étude contribue non seulement à une compréhension plus large de l'utilisation des médias sociaux, mais minimise également les défis méthodologiques associés aux études sur une seule plate-forme (Tufekci, 2014) en rendant les mesures compatibles sur toutes les plates-formes. Elle fournit également une vue d'ensemble de l'utilisation des médias sociaux en analysant le contenu des publications de l'Office National Marocain du Tourisme sur les quatre plateformes de médias sociaux populaires durant une année complète.

Il est intéressant de noter que l'adoption des médias sociaux par l'Office National Marocain à partir de l'année 2008, ce qui représente une période d'utilisation assez importante. En prenant en compte le nombre total de publications, Facebook s'est avéré être la plate-forme de médias sociaux la plus utilisée, tandis que YouTube était la moins utilisée. La popularité de Facebook s'explique par le nombre important d'utilisateurs actifs qui avoisine 2,5 milliard (Facebook, 2019). En ce qui concerne l'utilisation moins fréquente de YouTube, elle pourrait s'expliquer par le fait que la réalisation des vidéos promotionnelles nécessite plus de temps et de ressources.

En termes de contenu, les résultats indiquent que les OGD partagent moins souvent des vidéos que les photos et que les mentions "tags" sont moins utilisées que les hashtags.

En tenant compte du fait que les OGD utilisent les médias sociaux pour développer leur image de destination, la présente étude a classé le thème principal (c'est-à-dire l'image de destination projetée) de chaque publication sur les réseaux sociaux en utilisant un ensemble d'attributs d'image cognitive. Sur toutes les plateformes, le thème majeur le plus fréquemment projeté sur les plateformes "Visit Morocco" était les touristes et leurs bien-être, suivi par "les bâtiments et architectures, les paysages et nature, sites historiques et événements puis les hôtels (Riads) et infrastructures touristiques". Ce qui laisse "le mode de vie des habitants, produits et vêtements traditionnels et la cuisine marocaine en dernier lieu" malgré qu'ils font partie intégrante de l'image de la destination Maroc. De plus, les résultats montrent que les publications Instagram et Facebook créent des niveaux d'engagement client beaucoup plus élevés que les publications Twitter et YouTube.

En ce qui concerne le niveaux d'interaction avec les touristes sur les plateformes "Visit Morocco", il s'avère que l'Office National Marocain du Tourisme utilise toujours les médias sociaux comme un outil de marketing traditionnel, plutôt que de l'exploiter en tant qu'outil de service client afin de répondre aux compliments, demandes d'information ou commentaires négatifs pour atténuer les problèmes des touristes, ce qui présente des similarités avec les résultats de recherches antérieures sur les destinations européennes (exemple : Hays et al. (2013) ; Usakli, (2017).

Limites et Recherches Futures

Les résultats de cette étude sont spécifiques à un seul pays. Par conséquent, les futures recherches reproduisant cette étude avec des OGD d'autres pays arabes ou africains permettront d'améliorer notre compréhension de cet important domaine de recherche au niveau de cette zone géographique. Ainsi, l'extension de la période d'analyse à plusieurs années pourrait fournir des résultats plus généralisables.

Enfin, la présente étude a analysé uniquement les publications sur les réseaux sociaux, une approche plus qualitative impliquant des entretiens avec les responsables à l'Office National Marocain de Tourisme, offrirait un aperçu précieux pour comprendre pourquoi les OGD utilisent les médias sociaux dans un contexte de marketing.

Annexes

Tableau A1 : Description des thèmes d'images (Stepchenkova, S., & Zhan, F., 2013)

Catégories	Descriptions
Paysage et nature	Fait référence à la nature vierge avec des éléments mineurs liés à l'homme. Cette catégorie comprend les montagnes, les déserts, les forêts, les jungles, les rivières et les lacs, les plages, etc. Elle peut inclure des ruines/sites archéologiques et des attractions naturelles comme des grottes, des cavernes, etc.
Personnes	Comprend la population locale, les voyageurs, etc. Les personnes doivent raisonnablement se trouver au centre de l'image, ou dans un des foyers de l'image.
Sites historiques	Comprend les monuments historiques et sites archéologiques et éléments/designs de ces structures ou leurs éléments décoratifs.
Bâtiments et architectures	Fait référence à l'intérieur et à l'extérieur du style oriental/à l'architecture andalouse/moderne dans les zones urbaines et rurales. Cette catégorie comprend les Mosquées, églises, les monastères, les palais, les bâtiments publics (Non destinés à l'usage quotidien des résidents locaux), etc. Les images en gros plan d'éléments de bâtiments tels que les portes, les fenêtres ou les ornements sont incluses.
Mode de vie	Fait référence à la façon dont les populations locales vivent et reflète leurs conditions de vie, leur logement ou leurs activités quotidiennes. Elle peut inclure les maisons et architectures qui sont à l'usage des résidents et les activités traditionnelles comme le tissage et la fabrication d'objets d'art et d'artisanat. Et également les activités "modernes" comme la réparation d'une voiture, les travaux agricoles, la vente de marchandises et de souvenirs dans la rue, Cette catégorie est destinée à représenter les conditions de vie naturelles des populations locales. Si une image est "mise en scène", elle n'est pas incluse
Produits et vêtement traditionnels	Désigne les costumes traditionnels ou les costumes de fête qui reflètent la culture. Ainsi que les produits artisanaux.
Gastronomie	Comprend les plats marocains et les différentes spécialités culinaires
Hôtels et infrastructures touristiques	Désigne les hôtels, Riad, maisons d'hôtes, les restaurants, les stations balnéaires et les spas, les plages et piscines avec chaises et parasols, les terrains de golf, etc.

Michael Cabanillas-Carbonell
Universidad Autónoma del Perú, Lima, Perú, mcabanillas@ieee.org

Abstract

In early 2020, a COVID-19 pandemic emerged, generating a totally atypical turn in the world business market. Currently the work environment is destabilized to some extent, seeking, and trying to create new methods of work as social distancing is an alternative to prevent the spread of this disease. This study is a systematic review that shows and analyzes the best alternatives, trends, and impact of teleworking worldwide. To execute this study and analysis a bibliographic and conceptual review was carried out in the Scopus, IEEE Xplore, ScienceDirect databases, identifying 49 articles from the databases, as a result it is obtained that the main aspects are the impact of teleworking, research on teleworking and the types of teleworking.

Keywords: "Teleworking", "social distancing", "digital platforms".

Introduction

The labor framework in recent times was changing according to the needs that originate in society, due to this change companies and businesses tend to reinvent themselves to achieve satisfaction with their products or services they provide to the customer (S. Zhang, R. Moeckel, A. T. Moreno, B. Shuai, and J. Gao, 2020). In recent times the market has changed more than usual, following the appearance of COVID-19 the business sectors most affected were hotels, restaurants, and the manufacturing industry, with private companies having better responses to this global problem and being better capitalized economically (K. G. Davis, S. E. Kotowski, D. Daniel, T. Gerding, J. Naylor, and M. Syck, 2020)

Teleworking is one of the work modalities in which the functions of the worker are carried out from a place other than the office where the company and operator are located, through the use of information and communication technologies (K. Wang and B. Ozbilen, 2020)

The digital platforms are a means of communication and development of activities that facilitate various processes that were done in person, the areas that already use this mode are the health sector, education, administration, telecommunications and more (A. P. Rudke, V. A. Sikora de Souza, 2020). After the declaration of the state of emergency, several companies have implemented teleworking, also called home office. This modality has forced us to quickly immerse ourselves in the digital and corporate world. With this, many technology companies created and improved certain software's that facilitate the development of activities in a virtual way, such as meetings and conferences (A. Hook, V. Court, B. K. Sovacool, and S. Sorrell, 2020).

Digitalization has been bringing positive and innovative results in large companies, so much so that all economic sectors are using digital platforms as an improvement to automate certain processes. With this change, personnel and collaborators are the participants in the use of this technology and work method (J. I. Dingel and B. Neiman, 2020).

Methodology

For the development of the following article, the methodology of search in scientific repositories and databases such as IEEE Xplore, SCOPUS and ScienceDirect was used. The search keywords were "telecommuting" O "impact of telework" O "remote work" O "technology in remote work" O "technological advance for teleworking"

Cite this Article as: Gregory Quiroz-Sandoval and Michael Cabanillas-Carbonell "Analysis of The Evolution and Impact of Teleworking with The Use of Technology: A Scientific Literature Review 2010-2020" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

A. Research Questions

The research questions used were the following:

RQ1: What are the areas where teleworking has the greatest effect?
RQ2: What are the background studies and predictions on teleworking?
RQ3: What types of telework are more common in recent times?

B. Search Strategies and Processes

The research considered the field of action of the issues raised, taking into account the following key words and criteria of inclusion and exclusion.

Fig 1. Prisma Diagram Methodology

C. Inclusion and Exclusion Criteria

For the study, the following exclusion and inclusion criteria were applied as shown in the following table.

TABLE I: EXCLUSION AND INCLUSION CRITERIA

Criteria's		
Inclusion	I01	Articles mentioning the impact of teleworking
	I02	Articles that reference the advance of technology in companies.
	I03	Articles mentioning remote work and its development.
Exclusion	E01	Items that are not related to the objective to be achieved.
	E02	Duplicate articles or articles with the same content.

Results

Research results are oriented to research findings. The process of analysis that was carried out was the following.

A. Extracted and Analyzed Articles

76 articles taken from the various databases and repositories were reviewed, discarding and excluding 27 articles that were not taken due to the parameters and the review that was given to the content of each one, 49 articles were obtained that do contribute to the analysis of the points to be achieved in this review.

Fig 2. Item selection flowchart

As a result, 49 articles were obtained that meet the requirements for inclusion and, above all, that refer to the analysis of this work. The searches were carried out in 3 databases that have worldwide repositories.

Fig 3. Representation of the repositories and continents of each article.

Within the 49 articles, the following classification of each one of them is made according to the content, it will be verified which is the impact of the Telework, the new advances and which are the types and headings where these practices of work are made more.

TABLE 2: ARTICLE CONTENT CATEGORIZATION

Article content categories	Article number	Count
Study of the Impact of Teleworking	(S. Zhang, R. Moeckel, 2020), (K. G. Davis, S. E. Kotowski, 2020), (K. Wang and B. Ozbilen, 2020), (A. P. Rudke, V. A. Sikora de Souza, 2020), (A. Hook, V. Court, B. K. Sovacool, 2020), (A. Ahmed, A. Ishaque, T. Nawaz, Y. Ali, and F. Hayat, 2014), (N. E. M. Elshaiekh, Y. A. A. Hassan, 2019), (T. Golden, 2010), (E. Clark, 2011), (T. D. Golden and K. A. Kim, 2010), (H. Chen, L. Xiao, H. Jin, and Z. Wen, 2011), (G. Wasson and M. Humphrey, 2012), (H. B. Prajapati and V. A. Shah, 2014), (K. Subrahmanyam, S. Ibrahim, and R. A. A. De Lara, 2012), (E. Tamrat and J. Warren, 2015), (Y. P. Gupta, J. Karimi, and T. M. Somers, 2011), (S. J. Harrington and C. P. Ruppel, 2010), (S. M. Park, G. Wasson, and M. Humphrey, 2013), (D. T. Prystash, 2014), (V. Brugliera, 2010), (R. D. Wilton, A. Páez, and D. M. Scott, 2011), (T. Golden, 2012), (M. Babilon and K. O'Keefe, 2013), (F. D. Ismail, A. A. K. Hamsa, 2014), (S. N. Kim, S. Choo, and P. L. Mokhtarian, 2015), (L. Leung and R. Zhang, 2017), (L. Leung and R. Zhang, 2017), (R. De', N. Pandey, and A. Pal, 2020), (W. O'Brien and F. Yazdani Aliabadi, 2020), (T. Bayrak, 2012), (S. Chakrabarti, 2018), (B. De Borger and B. Wuyts, 2011), (R. Paleti, 2016), (A. Atalan, 2020), (J. I. Dingel and B. Neiman, 2020)	**29**
Analysis of the most common types of telework	(J. I. Dingel and B. Neiman, 2020), (F. D. Ismail, A. A. K. Hamsa, 2014), (S. N. Kim, S. Choo, and P. L. Mokhtarian, 2015), (L. Leung and R. Zhang, 2017), (K. G. Davis, S. E. Kotowski, 2020), (K. Wang and B. Ozbilen, 2020), (S. Chakrabarti, 2018), (B. De Borger and B. Wuyts, 2011), (R. Paleti, 2016)	**9**

Through the categorization of the articles, a specific analysis of the contents is made so that they can be related to each of the questions posed. The topics most touched in the articles according to the categorization are the following:

Fig. 4: Highlights of the articles.

Within the result the most outstanding points in the different articles are validated, in the category of the impact of teleworking 5 aspects were obtained, within the framework of the investigation on teleworking 3 important points were obtained and, on the types, also 3 important subjects were obtained each one of them shows us information on the relation that according to the antecedents and the present time the teleworking is developed in the world environment.

Fig. 5: Representation of article categories according to the databases.

Within the representation by categories, it is identified that, of the 49 articles, 21 mention and refer to the impact that causes the telework in the diverse scopes, 27 make reference and investigate the advance of the telework projecting itself forward and 1 article mentions the types of teleworking that exist and that are more common.

TABLE 3: CATEGORIZATION OF THE STUDY OF THE IMPACT OF TELEWORKING

Study of the Impact of Teleworking		Count
Impact of Teleworking on the Family	(S. Zhang, R. Moeckel, 2020), (K. Wang and B. Ozbilen, 2020), (A. Ahmed, A. Ishaque, T. Nawaz, Y. Ali, and F. Hayat, 2014), (N. E. M. Elshaiekh, Y. A. A. Hassan, 2019), (T. Golden, 2010), (B. Fallon et al, 2020), (M. M. Jaff and A. A. K. Hamsa, 2018), (Y. K. Dwivedi et al, 2020), (E. Glenn Dutcher, 2012), (S. Y. He and L. Hu, 2015), (P. O'Keefe, B. Caulfield, W. Brazil, and P. White, 2016), (H. Asgari, X. Jin, and M. B. Rojas, 2019)	**12**
Professional impact of teleworking	(S. Zhang, R. Moeckel, 2020), (K. G. Davis, S. E. Kotowski, 2020), (K. Wang and B. Ozbilen, 2020), (A. P. Rudke, V. A. Sikora de Souza, 2020), (A. Hook, V. Court, B. K. Sovacool, 2020), (A. Ahmed, A. Ishaque, T. Nawaz, Y. Ali, and F. Hayat, 2014), (N. E. M. Elshaiekh, Y. A. A. Hassan, 2019), (T. Golden, 2010), (E. Clark, 2011), (T. D. Golden and K. A. Eddleston, 2019), (H. He and L. Harris, 2020), (A. Atalan, 2020), (Y. K. Dwivedi et al, 2020), (E. Glenn Dutcher, 2012), (P. O'Keefe, B. Caulfield, W. Brazil, and P. White, 2016), (H. Asgari, X. Jin, and M. B. Rojas, 2019)	**16**
Impact of teleworking on travel	(M. M. Jaff and A. A. K. Hamsa, 2018), (H. Asgari and X. Jin, 2018), (H. Budnitz, E. Tranos, and L. Chapman, 2020)	**3**
Impact of teleworking on travel	(A. P. Rudke, V. A. Sikora de Souza, 2020), (A. Hook, V. Court, B. K. Sovacool, 2020), (A. Atalan, 2020), (H. Asgari, X. Jin, and M. B. Rojas, 2019)	**4**
Impact of Teleworking on Health	(S. Zhang, R. Moeckel, 2020), (K. G. Davis, S. E. Kotowski, 2020), (K. Wang and B. Ozbilen, 2020), (A. P. Rudke, V. A. Sikora de Souza, 2020), (A. Hook, V. Court, B. K. Sovacool, 2020), (A. Ahmed, A. Ishaque, T. Nawaz, Y. Ali, and F. Hayat, 2014), (P. O'Keefe, B. Caulfield, W. Brazil, and P. White, 2016)	**7**

Within the impact of teleworking, the various articles are classified according to the content referred to, 12 articles mention the family, 16 the professional environment, 3 the travel environment, 4 the environmental aspect and 7 the health environment, all related to the impact of teleworking.

TABLE 4. CATEGORIZATION OF TELEWORK BACKGROUND AND PREDICTIONS

Background research and predictions on telework		Cant.
Advancement of telecommunication for teleworking	(H. Chen, L. Xiao, H. Jin, and Z. Wen, 2011), (K. Subrahmanyam, S. Ibrahim, and R. A. A. De Lara, 2012), (Y. P. Gupta, J. Karimi, and T. M. Somers, 2011)	**3**
Evolution of technology in relation to telework	(T. S. Ellis and R. L. Webster, 2011), (S. J. Harrington and C. P. Ruppel, 2010), (S. M. Park, G. Wasson, and M. Humphrey, 2013), (T. Golden, 2012), (M. Babilon and K. O'Keefe, 2013), (F. D. Ismail, A. A. K. Hamsa, 2014), (S. N. Kim, S. Choo, and P. L. Mokhtarian, 2015), (H. J. Rhee, 2010), (R. De', N. Pandey, and A. Pal, 2020), (W. O'Brien and F. Yazdani Aliabadi, 2020), (S. Chakrabarti, 2018), (B. De Borger and B. Wuyts, 2011), (R. Paleti, 2016)	**13**
Relationship of the techniques and technological tools with the human being	(T. S. Ellis and R. L. Webster, 2011), (K. Keefe, Q. Mitchell, E. Rozier, 2011), (T. P. Caudell, A. L. Janin, 2012), (W. Lee, J. Kim, and H. Y. Kim, 2010), (G. Wasson and M. Humphrey, 2012), (H. B. Prajapati and V. A. Shah, 2014), (K. Subrahmanyam, S. Ibrahim, and R. A. A. De Lara, 2012), (E. Tamrat and J. Warren, 2015), (D. T. Prystash, 2014), (V. Brugliera, 2010), (R. D. Wilton, A. Páez, and D. M. Scott, 2011), (L. Leung and R. Zhang, 2017), (T. Bayrak, 2012)	**13**

In the second category the articles are classified as follows, 3 articles refer to telecommunication, 13 to the evolution of technology and 13 to the relationship of technological tools with the human being, all of them regarding the influence of teleworking in each of the identified categories

TABLE 5: CATEGORIZATION OF TYPES OF TELEWORK

Analysis of the most common types of telework		Cant.
Corporate teleworking	(J. I. Dingel and B. Neiman, 2020), (T. S. Ellis and R. L. Webster, 2011), (R. De', N. Pandey, and A. Pal, 2020), (R. Paleti, 2016)	**4**
Marketing techniques	(J. I. Dingel and B. Neiman, 2020), (T. S. Ellis and R. L. Webster, 2011), (S. M. Park, G. Wasson, and M. Humphrey, 2013), (F. D. Ismail, A. A. K. Hamsa, 2014), (H. J. Rhee, 2010)	**5**
Independent Teleworking	(J. I. Dingel and B. Neiman, 2020), (R. De', N. Pandey, and A. Pal, 2020), (S. Chakrabarti, 2018), (R. Paleti, 2016)	**4**

And in the last table of the category of telework types is categorized as follows, 4 articles make mention of corporate telework, 5 to marketing techniques and 4 to independent telework, all related to telework and its types.

Fig. 6: Percentage representation of articles according to the year of publication of each one.

Discussion

In the present study and analysis of the various articles, the most popular aspects, and the influence that teleworking has were identified, being more common this method of work in these times of global pandemic. As shown in Table 2, of the 49 articles the most popular aspects of which studies relate to teleworking are 3, the study of the impacts left by teleworking, research on the background and predictions of teleworking and the types of teleworking most common in the last 10 years, these analyses contextualize the advance and growth of remote working worldwide.

RQ1: What are the areas where teleworking has the greatest effect?

In Table 3, the concepts that are most analyzed and studied in the articles are categorized, the mentioned points that generate more content are referring to the impact that teleworking causes in 5 main environments at a general level, family impact, professional, travel, environment and health, these studies allow to raise techniques that favor positively each of the approaches such as flexible schedules, training and motivation to the employee, saving resources for the environment and above all methods that do not affect the health of the human being who uses the modality of teleworking.

RQ2: ¿What are the background studies and predictions on teleworking?

In Table 4, we identify the studies of the advance of telecommunications, the evolution of 3G for the speed of connectivity and above all how this advance in favor of digital connection, generating more comfort and speed for the remote worker. It also identifies the advance of technologies such as software and hardware having greater effect today due to the capacity and performance that are gaining thanks to the innovative and futuristic idea of the manufacturer, finally it mentions the relationship of these technologies with the human being, going from the old tools to those that currently exist and especially as the human being has the ability to adapt immediately to changes in this area, being a fundamental ally for the evolution of man.

RQ3: What types of teleworking are more common in recent times?

Finally, in Table 5, the types of teleworking are mentioned. In recent years, the public and private corporate sector have been the ones that have used this modality the most, due to their resource capacity. On the other hand, the digital business has also been growing in these last 5 years, considered as a virtual work as well as the independent entrepreneurship, since, by using technology as a tool, they create new business items in the digital era. These approaches allow us to analyze various global aspects, even more so if we are currently experiencing a pandemic. The world had an exceptional growth in the sale of hardware and software, the technology manufacturer has more demand in recent years, since the new business idea of entrepreneurs and organizations is to develop and implement the technique of labor more common in this time making mention of the Telework.

Conclusion

The study carried out presents a systematic review of the literature on the evolution and impact of teleworking with the use of technology in the last 10 years, as a result it was found that the aspects where teleworking has more effect are in the family, in the professional, in the environment, in health and in travel. This allows us to analyze better alternatives regarding these 5 categories and thus generate positive results for people who use this modality of work. On the other hand, it was also analyzed the research and evolution of remote work, it was identified that since the emergence of the pandemic the world, businesses were forced to implement this modality, having better results the organizations with greater economic power. According to the current results, remote work is one of the most used modalities, due to the good response that it has in this last time. Future research can focus on some of the following questions: What impacts in the future will the modality of remote work have? What technological tools generate the best results to carry out teleworking? What positive and negative effects did the global pandemic leave on teleworking? With these questions it will be possible to analyze the various changes, evolution and impact that teleworking can have and thus generate ideas and techniques that contribute positively to organizations and to the collaborator who carries out the modality of digital work.

Abstract

Security with respect to the platforms of companies or other institutions is a problem in these times, therefore, this article is a systematic review of the literature on the analysis of the use of biometrics as access authentication to different platforms. The present review has been based on published articles from 5 databases that are IEEE Xplore, Scopus, ScienceDirect, Scielo, EBSCOhost where 58 articles were found that will be included or excluded according to our own criteria. The collected articles talk about the use of biometrics and the most used types of biometrics. Where later it is concluded that biometric means for authentication cover many fields such as those of medicine, online payments, migration, user or human authentication.

Keywords: Use of Biometrics, Biometric Means, Access Authentication, Scientific Literature Review.

Introduction

In recent times, the demand for security in many applications or platforms has increased, making biometric recognition the most prominent authentication system. This is mentioned because user authentication through face and voice are biometric techniques to improve security (Debnath and Roy, 2020), but this does not mean that they are the only ones since there is fingerprint and iris authentication. It is worth mentioning that facial recognition modules have surpassed most traditional forms of access control (Rao *et al.*, 2020), such as the user - password, access card or record books.

Although the use of biometrics is expensive, this does not mean that everything is negative, since with the advance of technology these means of authentication have appeared, which not only save time, but also labor, so this makes the efficiency a hundred times(Rai *et al.*, 2020). In addition, the use of these means is fast, easy to use, defined, reliable and more profitable compared to traditional forms of access control being some of these forms obsolete, since they only consist of knowledge and cards (Conejar *et al.*, 2016).

A biometric system consists of a pattern recognition system that recognizes a person by determining the authenticity of one of his or her specific physiological and/or behavioral characteristics (Debnath and Roy, 2020), These characteristics are unique features of each person that no other person has so the biometric system determines if the person trying to enter certain platforms is authentically her and not someone else.

For all these reasons, this review will analyze the use of biometrics as access authentication.

Methodology

Type of study

The systematic review of scientific literature defined in the PRISMA (Preferred Reporting Items for Systematic Reviews and Meta-Analyses) guide will be used for the elaboration of the article.

Research questions

For the development of the investigation, we ask ourselves the following questions:

Cite this Article as: Jorge Salcedo-Prado, Marielena Mamani-Campos and Michael Cabanillas-Carbonell "Analysis of The Use of Biometrics as Access Authentication, A Review of Scientific Literature 2015-2020" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

RQ1. What are the most used biometric means for authentication?

RQ2. What is the most commonly used biometric media category?

RQ3. What is the impact of using these biometric means in authentication?

Search strategies

In order to provide an evidence-based answer to each question posed for the development of the research, a search for scientific articles was carried out in the Scopus, IEEE Xplore, ScienceDirect, Scielo and EBSCOhost databases, finding a total of "58" articles, of which 43 are between the years 2015-2020. For the search of previously mentioned articles, the following keywords are considered, classifying them according to the database:

IEEE Xplore, EBSCOhost and Scielo: “biometric recognition”, “biometric authentication” and “systematic review”

Scopus and ScienceDirect: “biometric” or “use of biometrics” or “authentication” or “recognition” and “systematic review”.

Fig 1. Search Strategies

Inclusion and exclusion criteria

For the review, 4 inclusion and exclusion criteria were taken in order to answer the questions posed above.

Table 1: Criteria

Criteria		
Inclusion	CI-1	Articles related to research.
	CI-2	Articles in the range of 2015 - 2020.
Exclusion	CE-1	Articles out of range (2015 - 2020)
	CE-2	Articles that do not answer the research questions.

Results

Extracted and analyzed articles

For this systematic review, 5 databases were taken in which 58 articles were found regarding the use of biometrics as access authentication. After compiling these articles, we selected 35 used for the development of the review, discarded 1 for duplication, and excluded 22 articles for not meeting the criteria defined in the inclusion and exclusion criteria stage.

The following details the process carried out for the selection of the articles based on the PRISMA methodology.

Fig 2. Selection process

Distribution of articles according to database

The 35 articles that were taken meet the criteria presented above, and among the articles that were chosen are 12 articles from Scopus, 14 from IEEE Xplore, 5 in ScienceDirect, 2 in EBSCOhost and 2 in the SCIELO database.

Fig 3. Articles by database

Distribution of articles according to year of publication

The figure 4 shows the distribution of the articles taken for the research with respect to the years 2015-2020. It is clear that research has been increasing over the years, evidencing the need for research in the field of biometrics.

Fig 4. Articles by year of publication

Distribution of articles according to country of origin

The Figure 5 shows the cumulative number of items taken for research according to their country of origin. It can be seen that the country with the largest amount of research related to biometrics is India with 17 articles, followed by the United States with 4 articles, then Pakistan with 2 articles and a total of 12 articles from the different countries.

Fig 5. Articles by country of origin

Systematization of research

For this review, a synthesis of the selected articles was made in order to obtain the answers to the questions posed in the methodology stage of this document (II.B). This synthesis considers only 33 articles of the 35 taken, since 2 of them are used to contextualize the present review.

Biometric

The following table shows a summary of the different biometric means used in the different investigations.

Table 2: Biometric means

Biometrics	Articles	#
Behavior	(Eremin, Kogos and Filina, 2017),(Peng, Choo and Ashman, 2016)	2
Fingerprint	(Rao *et al.*, 2020), (Ogbanufe and Kim, 2018), (Abazi, Qeliaja and Hajrizi, 2019), (Gehrmann, Rodan and Jönsson, 2019), (Kaur and Sengupta, 2018), (Hemalatha, 2020), (Meena and Malarvizhi, 2016), (Razaque *et al.*, 2020), (Sapkale and Rajbhoj, 2016)	9
Face recognition	(Debnath and Roy, 2020), (Rao *et al.*, 2020), (Kanak, 2018), (Abazi, Qeliaja and Hajrizi, 2019), (Sati *et al.*, 2018), (Meena and	9

	Malarvizhi, 2016), (Carlos-Roca, Torres and Tena, 2018), (Shah *et al.*, 2015), (Kar *et al.*, 2006)	
Iris recognition	(Abazi, Qeliaja and Hajrizi, 2019), (Meena and Malarvizhi, 2016), (Vishwakarma and Patel, 2019), (Supriya and Manjunatha, 2016), (Noma-Osaghae *et al.*, 2018)	5
Hand recognition	(Roopa and Veluchamy, 2019), (Jemimah, Muthumeenakshi and Radha, 2018)	2
Retinal Vasculature	(Jiu, Noronha and Jayaswal, 2017)	1
A card with biometric	(Dharminder *et al.*, 2020), (Sudhakar and Natarajan, 2020), (Kathrine, 2018)	3
Labels based on biometrics	(James, Thomas and Alex, 2015)	1
Hair	(Kar *et al.*, 2006)	1
Speech	(Debnath and Roy, 2020), (Kaur and Sengupta, 2018)	2
Electrocardiogram	(Khan *et al.*, 2019), (Ingale *et al.*, 2020)	2
Fingernails	(Barros Barbosa, Theoharis and Abdallah, 2016)	1
Tactile keystrokes	(Alpar, 2018)	1
Human DNA	(Zahid *et al.*, 2019)	1

Categories of biometrics

The following table shows the systematization of the categories to which the biometric means used in the different articles belong.

Table 3: Categories of biometrics

Category	Articles	#
Behavioral biometrics	(Alpar, 2018), (Eremin, Kogos and Filina, 2017), (Peng, Choo and Ashman, 2016)	3
Physical Biometric	(Dharminder *et al.*, 2020), (Sudhakar and Natarajan, 2020), (James, Thomas and Alex, 2015)	3
Physiological Biometric	(Debnath and Roy, 2020), (Rao *et al.*, 2020), (Kanak, 2018), (Belkhouja *et al.*, 2019), (Ogbanufe and Kim, 2018), (Abazi, Qeliaja and Hajrizi, 2019),(Gehrmann, Rodan and Jönsson, 2019), (Sati *et al.*, 2018), (Khan *et al.*, 2019), (Kaur and Sengupta, 2018), (Ingale *et al.*, 2020), (Zahid *et al.*, 2019), (Kathrine, 2018), (Hemalatha, 2020), (Meena and Malarvizhi, 2016), (Vishwakarma and Patel, 2019), (Supriya and Manjunatha, 2016), (Carlos-Roca, Torres and Tena, 2018), (Roopa and Veluchamy, 2019), (Shah *et al.*, 2015), (Razaque *et al.*, 2020), (Jemimah, Muthumeenakshi and Radha, 2018), (Jiu, Noronha and Jayaswal, 2017), (Kar *et al.*, 2006), (Noma-Osaghae *et al.*, 2018), (Sapkale and Rajbhoj, 2016)	26
Transient biometrics	(Barros Barbosa, Theoharis and Abdallah, 2016)	1

Field of use

The table below shows the field of use of the different biometric means found in the different articles collected for the review.

Table 4: Field of use

Field of use	Articles	#
User authentication	(Debnath and Roy, 2020), (Barros Barbosa, Theoharis and Abdallah, 2016), (Alpar, 2018), (Abazi, Qeliaja and Hajrizi, 2019), (Gehrmann, Rodan and Jönsson, 2019), (Sati *et al.*, 2018), (Kaur and Sengupta, 2018), (Sudhakar and Natarajan, 2020), (Zahid *et al.*, 2019), (Eremin, Kogos and Filina, 2017), (Kathrine, 2018), (Hemalatha, 2020), (Supriya and Manjunatha, 2016), (Razaque *et al.*, 2020), (Jemimah, Muthumeenakshi and Radha, 2018), (Noma-Osaghae *et al.*, 2018), (Sapkale and Rajbhoj, 2016)	17
Access validation	(Kathrine, 2018), (Noma-Osaghae *et al.*, 2018), (Sapkale and Rajbhoj, 2016)	3
Human authentication	(Rao *et al.*, 2020), (Kanak, 2018), (Belkhouja *et al.*, 2019), (Khan *et al.*, 2019), (Ingale *et al.*, 2020), (James, Thomas and Alex, 2015), (Meena and Malarvizhi, 2016), (Vishwakarma and Patel, 2019), (Roopa and Veluchamy, 2019), (Shah *et al.*, 2015), (Jiu, Noronha and Jayaswal, 2017), (Kar *et al.*, 2006)	12
Border control processes	(Carlos-Roca, Torres and Tena, 2018)	1
Intrusion detection	(Peng, Choo and Ashman, 2016)	1
Authentication scheme	(Dharminder *et al.*, 2020)	1
Electronic payments	(Ogbanufe and Kim, 2018)	1

Discussion

The use of biometrics comes from some years ago and while every year advances its usefulness increases in different areas of our lives.

Therefore, at the beginning of the article we ask ourselves three questions, which are the following:

RQ1. What are the most commonly used biometrics for authentication?

Table 2 shows which biometrics are present in our life and how they influence it, according to the different articles taken for this review. Based on this, it can be said that these biometric means not only use parts of our body, but also use our behavior as a means of authentication. Therefore, the most used means according to the table are facial recognition and fingerprint.

RQ2. What is the most widely used category of biometrics today?

Table 3 helps us to have a better visibility of this categorization. Therefore, it can be seen that physiological biometry is one of the most used in the market since from the articles collected 26 of them fall into this category, where it covers the use of permanent features such as the face, the iris, the DNA, the hair, the fingerprint, among others, but there was something curious in this review since it gave us a different perspective with transitory biometry. This biometry is a good option for those who do not want to use their permanent features to authenticate themselves in different platforms, so transitory biometry proposes the use of human features that can change in 6 months.

RQ3. What is the impact of using these biometrics on authentication?

In Table 4 it is about the fields of use of biometrics, and which areas it covers in our lives. It has more impact on user authentication, since of the 35 articles, 17 are related to this field of use. This does not detract from the other fields, but rather shows what is currently being covered most. However, if we also notice that these biometric means are entering the fields of migration, such as the border control process field or the medical field, which use a patient authentication scheme.

Conclusion

It is concluded that the most used biometrics are those of fingerprint and facial recognition because in more than half of the articles they mention it. Therefore, physiological biometrics is the category with the greatest presence since the biometrics mentioned above fall into this category.

In addition, the impact that the use of biometrics has generated is evident, since we use it every day either to unlock the cell phone or to access an area of our work, so the use of biometrics is nothing new, but it has covered many areas of our lives as shown in the systematic review conducted. Likewise, biometrics has acquired a level of improvement because now not only parts of our body are used, but also our specific behaviors or functionalities of our body such as heart beats are used to authenticate our identity, as can be seen the use of biometrics in our lives has come so far.

Some authors mention that in the not-so-distant future the use of biometrics will become part of our lives so future research could focus on the following question What other parts of our body can be used as a means of access authentication?

Abstract

Low academic performance is a problem that affects a large number of Latin American educational institutions, this being the main problem of university dropouts. Educational data mining is an essential part in the detection of low academic performance. The present document is a systematic literature review which obtained 220 documents collected from the BD Dialnet, IEEE_Xplore, IOP Science, ProQuest, Redalyc, Science Direct, Scopus. Managing to systematize 49 documents with the best data mining techniques, reflecting them in tables and illustrations, in which we determine that the impact generated by the use of data mining techniques is positive since more than 80% accuracy is obtained.

Keywords: Academic performance, data mining, student's performance, data mining techniques.

Introduction

Education is an important factor with respect to the academic performance of students, knowing that in Latin America they do not have a policy to improve the level of student learning, which results in a low percentage of student achievement, which affects in certain mode to the development of a country (Cacho, 2017).

Academic performance refers to the evaluation of the knowledge acquired in the student environment (school-university). Some Latin American universities design timely strategies to promote academic success and improve the academic experience of students. To achieve this, educational institutions are realizing the potential of studying educational data to improve the quality of their educational management decisions (Rico Páez and Sánchez Guzmán, 2018). One issue to consider is the poor academic performance of students, which can lead to poor academic performance or to the disapproval of their courses, this is one of the problems that Universities must face (Menacho Chiok, 2017) .

Data mining is primarily aimed at finding hidden information from a data set (Morales Carrillo *et al.*, 2019). The process involved in applying data mining is part of a massive analysis in large amounts of data with the purpose of extracting significant and relevant knowledge, as well as predictive models that provide knowledge patterns for decision making (Hidalgo Cajo, 2018).

The concept of Data Mining is applicable to the Educational Area, calling it EDM or Educational Data Mining (Lopez Guarin, Guzman and Gonzalez, 2015) which in the last decade has grown enormously because it allows Education Professionals to discover patterns or relevant knowledge that help to improve the quality of teaching and better understand the learning environment of students.

With respect to recent years, it has been shown that predicting student academic performance has become an important issue for educational institutions (Mutrofin *et al.*, 2020). However, there are many factors that influence academic performance, so it is easy to predict this issue, but with the application of EDM there is the possibility of overcoming this obstacle (Farissi, Dahlan and Samsuryadi, 2020). By carrying out these procedures to the set of data mining techniques, it could allow institutions to take more effective pedagogical actions for the advice of students who require them (Li *et al.*, 2019). Therefore, this research is intended to analyze the impact of the use of data mining techniques for the detection of low academic performance.

Methodology

A. Type of study

The systematic review of the scientific literature defined in the PRISMA guide (Prefered Reporting Items for Systematic Review and Metaanlyses) will be used.

B. Research Question

The proposed Research question was the following:

RQ1. What is the impact generated by the use of data mining techniques in the detection of low academic performance?

.RQ2. What is the most effective technique to detect poor academic performance?

C. Search strategies

In order to provide an answer to our research question, a search was made for scientific articles from the following databases: Dialnet, IEEE_Xplore, IOP Science, ProQuest, Redalyc, Science Direct, Scopus where 49 documents were collected considering the period 2015 -2020.

At the time of conducting the searches for our research, the following keywords were considered: "academic performance" or "data mining" or "EDM" or "data mining" or "low academic performance" or "Predict low Academic Performance" and "Data Mining Techniques".

Fig 1. Study database.

D. Inclusion and exclusion criteria

The following inclusion and exclusion criteria shown in the following table were applied for this literature review.

Table 1: Inclusion and exclusion criteria

RESEARCH CRITERIA		
Inclusion	CI-1	Articles related to the study of student data mining techniques.
	CI-2	Years of publication between 2015-2020.
	CI-3	Articles written in English, Spanish.
	CI-4	Articles developed in the European and Latin American context.
Exclusion	CE-1	Some documents are not articles.
	CE-2	Some articles do not cover data mining techniques.
	CE-3	Some articles do not apply in the area of engineering and education.
	CE-4	Some articles are not associated with the study variable.

Results

A. *Articles extracted and analyzed*

The results of the investigations revolve around the findings of the investigation, the scientific journals and their stratification by names and year. The analysis process that was carried out was as follows.

Fig 2. Items extracted

The 49 articles chosen contemplate the inclusion criteria identified above, finding: 5 articles from Dialnet, 9 articles from Ebsco, 7 from IEE_XPLORE, 7 from IOP Science, 4 from ProQuest, 1 from Redalyc, 9 from ScienceDirect and 7 from Scopus.

Fig 3. Database Quantity

*B. **Quantity and demographics of selected documents***

Fig 4. Number of Publications by Country

In this Graph it can be seen that the countries with the most publications selected within the year 2015-2020 are China with 6 and India also with 6.

*C. **Continental quantity and demographics of selected documents per year***

Fig 5. Number of documents per year and continents

In this graph it can be seen that the Asian Continent is the one that published the most documents in the 5 years followed by America and the one that was least found was Oceania.

*D. **Publication Languages Table***

Table 2: Language of the Articles

LANGUAGE	ARTICLES
English	(Lopez Guarin, Guzman and Gonzalez, 2015) (Mutrofin *et al.*, 2020) (Farissi, Dahlan and Samsuryadi, 2020) (Li *et al.*, 2019) (Miguéis *et al.*, 2018) (Rosado, Payne and Rebong, 2019) (Chanlekha and Niramitranon, 2018) (Farrah Siddiqui and Ali Arain, 2019) (Abdulazeez and Abdulwahab, 2019) (Injadat *et al.*, 2020) (Acosta-gonzaga and Ramirez-arellano, 2020) (Hooshyar, Pedaste and Yang, 2020) (Naicker, Adeliyi and Wing, 2020) (Conijn *et al.*, 2017)(Raga and Raga, 2019) (Burman and Som, 2019) (Gyimah and Dake, 2019)(Ekubo and Esiefarienrhe, 2019) (Chui *et al.*, 2020) (Talingdan, Trinidad and Palaoag, 2018) (Giap *et al.*, 2018) (Huang, 2020)(Kumar, Singh and Handa, 2017) (Oreski, Konecki and Pihir, 2019) (Namomsa and Prasad Sharma, 2019) (Helal *et al.*, 2018) (Shahiri, Husain and Rashid, 2015) (Badr *et al.*, 2016) (Asif *et al.*, 2017) (Yang and Li, 2018) (Adekitan and Salau, 2019) (Fernandes *et al.*, 2019) (Czibula, Mihai and Crivei, 2019) (Waheed *et al.*, 2020) (Anuradha and Velmurugan, 2015) (Mayilvaganan and Kalpanadevi, 2015) (Devasia, Vinushree and Hegde, 2016) (Marbouti, Diefes-Dux and Madhavan, 2016) (Burgos *et al.*, 2018) (Almayan and Al Mayyan, 2016) (Wati *et al.*, 2018) (Foster and Francis, 2020) (Ifenthaler and Yau, 2020)
Spanish	(Cacho, 2017) (Rico Páez and Sánchez Guzmán, 2018) (Menacho Chiok, 2017) (Morales Carrillo *et al.*, 2019) (Hidalgo Cajo, 2018) (Reyes *et al.*, 2019)

In this table it can be seen that more articles were found in English with a number of 43 and in Spanish only 6.

E. Category Publication Table by year

Table 3: Category of the Articles

CATEGORY	ARTICLES
Algorithm Application	(Farissi, Dahlan and Samsuryadi, 2020)
Data mining	(Chanlekha and Niramitranon, 2018) (Talingdan, Trinidad and Palaoag, 2018) (Giap *et al.*, 2018) (Huang, 2020) (Yang and Li, 2018) (Almayan and Al Mayyan, 2016) (Wati *et al.*, 2018)
Educational Data Mining	(Morales Carrillo *et al.*, 2019) (Hidalgo Cajo, 2018) (Mutrofin *et al.*, 2020) (Rosado, Payne and Rebong, 2019) (Farrah Siddiqui and Ali Arain, 2019) (Injadat *et al.*, 2020) (Hooshyar, Pedaste and Yang, 2020) (Adekitan and Salau, 2019) (Fernandes *et al.*, 2019) (Devasia, Vinushree and Hegde, 2016) (Foster and Francis, 2020) (Ifenthaler and Yau, 2020)
Model Classification	(Gyimah and Dake, 2019) (Ekubo and Esiefarienrhe, 2019) (Czibula, Mihai and Crivei, 2019) (Anuradha and Velmurugan, 2015) (Mayilvaganan and Kalpanadevi, 2015)
Predictive Model	(Rico Páez and Sánchez Guzmán, 2018) (Lopez Guarin, Guzman and Gonzalez, 2015) (Abdulazeez and Abdulwahab, 2019) (Naicker, Adeliyi and Wing, 2020) (Conijn *et al.*, 2017) (Raga and Raga, 2019) (Burman and Som, 2019) (Chui *et al.*, 2020) (Helal *et al.*, 2018) (Badr *et al.*, 2016) (Asif *et al.*, 2017) (Waheed *et al.*, 2020) (Reyes *et al.*, 2019) (Marbouti, Diefes-Dux and Madhavan, 2016) (Burgos *et al.*, 2018)
Data Mining Techniques	(Cacho, 2017) (Menacho Chiok, 2017) (Li *et al.*, 2019) (Miguéis *et al.*, 2018) (Acosta-gonzaga and Ramirez-arellano, 2020) (Kumar, Singh and Handa, 2017) (Oreski, Konecki and Pihir, 2019) (Namomsa and Prasad Sharma, 2019) (Shahiri, Husain and Rashid, 2015)

In this table it can be seen that the Predictive Model articles are the ones that were published the most in 2020.

F. Most Used Data Mining Techniques

Fig 6. Most Used Data Mining Techniques by Year

In this graph it can be seen that the most used Data Mining technique is the Naive Bayes algorithm followed by Support Vector Machines.

*G. **Accuracy measurement in documents***

Fig 7. Accuracy Measurement in documents

In these graphs, we can see that the application of data mining techniques is highly effective in detecting poor academic performance.

*H. **Accuracy measurement in documents***

Fig 8. Data Mining Techniques that are 80% - 99% Accurate

In this graph it can be seen that the Naives Bayes algorithm has 8 documents with more than 80% accuracy followed by neural networks with 6 documents.

Discussion

Taking the aforementioned as a reference, an answer to the research question can be made.

a) RQ1: What is the impact of the use of data mining techniques in detecting low academic performance?

According to Fig 7, it can be seen that the application of data mining techniques has a high percentage of effectiveness in detecting low academic performance, with the highest result being ranges of 80% -90% accuracy (indicator of accuracy) which gives us as a result that the impact that would be generated by applying said data mining techniques would be positive since it guarantees a high population capacity to achieve the objective that is the detection of low academic performance.

b) RQ2: What is the most effective technique to detect poor academic performance?

According to Fig 6 it can be seen that the Naive bayes algorithm is one of the most preferred and used for the detection of poor academic performance followed by the technique of Support Vector Machines (VME) and Neural Networks, in addition, according to Fig 8 it is You can see that the Naive bayes algorithm is the data mining technique that has the most documents with 80% - 99% accuracy followed by neural networks with 6 documents.

Conclusion

The use of data mining techniques for the detection of low academic performance is feasible and would generate a positive change since most generate an accuracy (Accuracy) of more than 80% which would guarantee that the detection of low performance is optimal, thus Likewise, the use of the Naive Bayes algorithm in the different research works analyzed shows that it is one of the most used data mining techniques for detecting poor academic performance. The process of building a Bayes Naive RB is based on performing parametric learning that consists of building programs that automatically improve their performance with experience (Menacho Chiok, 2017).

Another important point that we can highlight is regarding the use of Neural Networks and why we decided not to use it for the study we are conducting. Thanks to the systematization that we were building according to studies carried out by other researchers, we learned about the different obstacles that the application of neural networks presents. We realized that the application or use of this data mining technique requires a high amount of data for training, the more flexible the neural network is required to be, the more information it will have to teach it to properly perform the identification. . On the other hand, with the application of the Naive Bayes algorithm, this small study of the data can be carried out and according to it choose the best characteristics that will be used to perform the classification,

Recommendations

Once the development of this research work is completed, it is considered relevant to investigate other aspects related to the mechanisms of study of educational data:

- Work on improving the classification model normally used in some application research to increase efficiency and improve the precision of results.
- Analyze in greater detail about possible alternatives in statistics that can be used to carry out this type of study or in relation to its application in the education sector to take better educational strategies.

The Use of Selected PPS Sampling Methods in the Polish Non-Profit Sector Analyses

Sabina AUGUSTYN

Cracow University of Economics
Cracow, Poland
e-mail: sabina.augustyn@uek.krakow.pl

Abstract

The non-profit sector is also called the third sector and this term refers to the organizations operating independently of any government (NGOs), whose purpose is usually to conduct social, environmental or political activities. In Poland dedicated research methods have been developed solely for the purposes of analyzing this sector. These methods allow to take into account the diversity of the surveyed organizations and are typically based on the stratified sampling methods, however the purposive selection is also in use.
In this paper, a preliminary assessment of the applicability of the new method of researching the NGO sector in Poland is made. This method is based on selected PPS (Probability Proportional to Size) sampling plans such as sieve sampling and Lahiri sampling. A proposal of adapting these sampling schemes to the study of the NGO population is presented. A comparative analysis is also carried out in relation to the currently used method, including sample size and the population structure.

Keywords: NGO, sieve sampling, Lahiri sampling, survey sampling, PPS, estimation

JEL classification: C13, C15, C83, L31

Introduction

The NGO sector (non-governmental organizations, third sector) plays an increasingly important role in most modern economies. Non-profit institutions (NPIs) usually operate independently of national governments, and their main focus is social, environmental or political activities.

As with many analyzes of socio-economic phenomena, it is difficult or even impossible to fully research various aspects of NGOs' activity due to the large size of the population of interest. Therefore, sampling methods based on sampling theory are used. A number of research methods are proposed, which allow conducting sample surveys and estimating various parameters of the studied populations.
When conducting research for the analysis of the nonprofit sector, there is a problem of non-response, the consequence of which may be distortion of the results obtained, which will not sufficiently describe the actual condition of the entire third sector.

All this causes a constant need to search for appropriate research methods and tools that will allow obtaining valuable and reliable results.

The NGO sector in Poland

As mentioned before, the institutions in the third sector carry out many different activities. However, there is a set of certain characteristics of their activity. According to the definition of the United Nations (2018), a characteristic feature of NPI is the combination of three elements:

1) They are private (not controlled by government).
2) Their main purpose is to serve a social or public purpose rather than to maximize and distribute returns on invested capital.
3) Engagement in them is voluntary (done by free will and without coercion).

The scope of activities of NPIs varies considerably from one country to another. The names and definitions associated with many types of activity also vary from country to country, which is a major challenge in international comparative analyzes.

In Poland, the third sector includes (Statistical Office Poland, 2018):

- foundations,
- associations and similar organizations:
    - typical associations,
    - sport clubs,
    - voluntary fire brigades,
    - hunting clubs,
- faith-based charities,
- business and professional associations:
    - farmers organizations,
    - other business associations,
    - other professional associations.

The official reports are issued every second year, and according to the latest one there were 91.8 thousand of NPIs in Poland in 2016 (it is the latest available data). Figures 1-3 present the structure of Polish third sector in 2016.

Fig.1. Polish third sector in 2016 by the type of organization
Source: own calculations based on (Statistical Office Krakow, 2018)

Fig.2. Polish associations and similar organizations in 2016 by type of organization
Source: own calculations based on (Statistical Office Krakow, 2018)

Fig.3. Polish business and professional associations and similar organizations in 2016 by type of organization
Source: own calculations based on (Statistical Office Krakow, 2018)

As long as the form of employment is considered, most of the NPIs in Poland do not have paid workers (see Fig.4).

Fig.4. Polish third sector in 2016 by the form of employment
Source: own calculations based on (Statistical Office Krakow, 2018)

Due to the form of employment, the only exception (among other NGOs) are faith-based charities, 75% of which employ people on a regular employment contract.

Current NGO sector research methods in Poland

The methods of analyzing the non-profit sector vary from country to country. In Poland, a mixed method of purposive and random selection is in use (Statistical Office Cracow, 2018, pp.155-163). The basis for the study is the Statistical Units Database (SUD) from which non-profit organizations with legal personality, and having a legal form and economic activity defined in SUD as an active entity conducting business or an inactive entity that does not conduct business but is preparing to start it, were selected.

The study was carried out on the basis of SOF-1 and SOF-4 forms. SOF-1 form is based on a survey on typical associations and similar organizations, sport clubs, voluntary fire brigades, hunting clubs, foundations, and faith-based charities, while SOF-4 survey is a survey on farmers organizations, other business associations, and other professional associations (see also: Central Statistical Office, 2016, pp. 22-32). The SOF-1 based survey covered 28,92% of the population of interest. The survey sample was based on the purposive selection of 12 types of

organizations (which covered 14.59% of the study frame) and the random stratified sampling procedure, on the basis of which 14.33% of entities from the study frame were selected for the further analysis.

The stratified sampling procedure was carried out on the basis of 16 voivodships (provinces) with 9 largest urban areas (25 groups as a total), and then two different legal types of organizations were also considered: 1) foundations and 2) associations and similar organizations. As a result, 50 different groups were recognized, and the organizations were selected randomly from each of these groups with respect to the counties (powiats) population size. When the associations are considered, the following categories were defined: voluntary fire brigades, hunting clubs, sports associations and other organizations. The sample size was determined under the assumption that the maximum relative standard error of estimates is 5%. Moreover, as the 15% level of non-response was expected, the initial required sample size was deliberately increased by 20% before sampling.

The SOF-4 based survey was complete, therefore all the objects were included in the study.

Selected sampling plans – sieve sampling and Lahiri sampling

One of the common methods of sampling (i.e. drawing a sample from a population) is sampling with probability proportional to size (PPS) of the elements in the population (with or without replacement). In this sampling plan, the larger a given item is (in terms of the value of the variable of interest), the more likely it is to be selected. This procedure is widely presented in the statistical literature (Cochran, 1953), (Des Raj, 1954), (Kish 1965), (Zasępa, 1972), (Sudman 1976), (Stuart 1983), (Thompson 1992), (Steczkowski, 1995), or (Lohr 1999).

Many of these methods have been widely used in financial auditing, i.e. to detect possible errors in accounting book values. Sampling without replacement techniques (in which an object once selected does not return to the population and cannot be re-drawn) include, among others, *sieve sampling*, while sampling with replacement procedures (resulting in a possible selecting the same object more than once) include *Lahiri sampling* and other plans. It seems that implementing of both these methods in NGO sector study is possible.

Sieve sampling as a method of selecting a sample of the size of n was introduced to auditing by Rietveld (1978). Assume the accounting population consists of N book values, denoted by x_i each. Let $T_x = \sum_{i=1}^{N} x_i$ be the total book value of the accounting population. The purpose is to select a sample of the target size of n. According to Horgan (1997b, p.43) the steps of this methods are as follows:

1. For each book value separately a number r_i (i=1,..,N) is being randomly selected from between 0 and $\frac{T_x}{n}$ (both inclusive).
2. A book value is selected when its value (x_i) is at most equal to the corresponding random number r_i ($x_i \geq r_i$).
3. If any book value $x_i \geq \frac{T_x}{n}$, it is always being selected.

It's worth noting that all the book values are being "tested" in terms of being selected, no book value is selected more than once (which satisfies the „without replacement" requirement), and that the effective (achieved) sample size n_e can be different from the target sample size of n.

As Horgan (1997b, p.43) and Augustyn (2014, pp.127-128) mention, the probability of the inclusion of the *i-th* book value (x_i) in the sample is:

$$\pi_i = \frac{nx_i}{T_x}. \tag{4.1}$$

The expected value of the achieved sample size n_e can be found by (see also: (Horgan, 1997b, p.43) and Augustyn (2014, pp.127-128):

$$E(n_e) = \sum_{i \in U} \pi_i = \sum_{i \in U} \frac{nx_i}{T_x} = n \tag{4.2}$$

and its variance by:

$$V(n_e) = \sum_{i \in U} \pi_i (1 - \pi_i) = \sum_{i \in U} \frac{nx_i}{T_x} (1 - \frac{nx_i}{T_x}) \leq n. \tag{4.3}$$

The big advantage of this method is the ease of its use, however, the samples selected this way are characterized by a large variability in the number of elements included in it, so the actual (achieved) sample size n_e of the sieve sample

may be much higher or lower than initially planned one (n). This may result in an increase in the time and cost of the study (*when* $n_e > n$) or in drawing incorrect conclusions about the population due to the study of a sample that is too small (when $n_e < n$).

The modification of the sieve sampling plan – *stabilized sieve sampling* – enables two-stage sample selection with the achieved sample size equal to the target size. For this purpose, the initially selected sieve sample is modified (stabilized) by either increasing or decreasing its size. The procedures of augmenting and reducing the sieve sample size were introduced by Horgan (1997b). See also: (Augustyn, 2014, pp.129-130).

When the achieved sample size is greater then the target size ($n_e > n$), it can be reduced by selecting a simple random sample (s) of the size equal to the target size n. As Horgan (1997b, p.44-45) shows (see also: (Augustyn, 2014, p.129)) the inclusion probability in the second stage is equal to:

$$\pi_i^* = \frac{n^2 x_i}{n_e T_x}. \tag{4.4}$$

If the achieved sample size is less than the target size ($n_1 < n$), it can be augmented by additional selection of n-n_e book values carried out on the basis of the Lahiri sampling plan, first introduced in (Lahiri, 1951). It is another PPS procedure of determining sample of the target size of n. For the first time it was used in auditing by Horgan (1997a) according to the following procedure:

1. A random number i is being selected between 1 and N. It represents the book value that can be included in the sample.
2. Another random number (r) is being selected between 1 and the maximum book value (x_{max}).
3. For each $r \leq x_i$, the corresponding book value is being selected as a sample item.

This procedure is repeated until n book values are being selected. The inclusion probability of any book value in the sample is:

$$\frac{x_i}{N \cdot x_{max}}. \tag{4.5}$$

Lahiri sampling is a fixed-size sampling plan – but it is a procedure of sampling with replacement, therefore the achieved sample size may be different from the target one. Moreover, there are trials with no book values being selected. According to Horgan (1997a) the average number of trials for selecting one single book value is:

$$\frac{N x_{max}}{T_x}, \tag{4.6}$$

which may be quite large when the extreme maximum book value appears.

As mentioned before, the Lahiri sampling plan can be use to augment the sieve sample, when its achieved size is less then desired ($n_e < n$). In this stage additional n-n_e book values are being selected (Lahiri, 1951). The inclusion probability of the i-th book value in this two-stage sampling procedure is (Horgan, 1997a):

$$\frac{x_i}{T_x}. \tag{4.7}$$

One should note, that stabilizing the sieve sample with Lahiri procedure means that the sampling in the second stage is based on the entire population, which may result in reselection of the objects already selected in the first stage. It is also possible that an object will be selected more than one in the second stage, while augmenting the sieve sample, that is during the Lahiri sampling. However, Horgan (1997b, pp. 49-51) proves that the probability of multiple selection of any book value decreases with the increase of the target sample size (n) and is likely to be near 0 in large samples.

When stabilizing sieve sampling is considered, one should notice that, even if the sieve sampling plan is based on the PPS method of sampling without replacement, the second stage of the sampling procedure (augmenting or reducing the sample size) does not meet the conditions for the PPS methods without replacement, as the inclusion probabilities of the book values are not proportional to their size (value).

Application of the sampling procedures to NGO research study

As mentioned before, the sieve sampling and the Lahiri sampling both are procedures based on the probabilities proportional to size of the elements of the population. When adapting these procedures for financial auditing purposes, the total book value (T_x) of accounting population of the size of N is considered, that is based on the sum of all the book values of the population (x_i).

As the NGO sector represents objects other than the accounting book values, essential updates of the sampling procedures have to be introduced first. Let then assume that the analysis will be based on the counties (powiat) data. The number of counties will be denoted by N, and the number of the NGOs in a county will be x_i (i=1,…, N). However, the data such as the number of NGOs is available only for voivodships (of which there are only 16 in Poland), the simulation of the distribution of the number of NGOS per county will be based on data on the number of inhabitants in counties, as it was assumed that the number of NGOs in counties would be proportional to the number of inhabitants in counties.

Then $T_x = \sum_{i=1}^{N} x_i$ will be the total number of the NGOs in Poland. The next steps will be based on the sieve and Lahiri sampling respectively, i.e selecting random values ri, and electing the corresponding values of xi . When an object is selected, it is the corresponding county, and all the elements (NGOs) in this county will be included in the sample.

The evaluation of the results will be based on two approaches:

1) the comparison of the achieved sample size (official data vs. sieve/Lahiri sampling)
2) the comparison of the proportions of the main categories of NGO objects in the population under study and in the samples (same approach).

Database description

The simulation study was carried out on the basis of actual data provided by Statistics Poland (formerly known as Central Statistical Office). The population of interest was the population of counties (314 in 2016) and city counties – cities with county rights (66), which made the population size 380. As mentioned above, the data on the frequency distribution of the NGOs in counties is not available in Poland, and therefore was simulated on the basis of the distribution of the number of inhabitants per county. The population was also stratified on the basis of four categories (types of organizations), that is (see Fig.1):

1) foundations,
2) associations and similar organizations,
3) faith-based charities,
4) business and professional associations.

On this basis, three sample plans were applied: current official sampling plan (plan O), sieve sampling (stabilized – plan S) and Lahiri (L). As the official sampling plan is a mixed purposive selection and stratified sampling technique, it is impossible to identify the objects being selected on purpose. Therefore, the stratified sampling scheme was applied as the substitute of the official sampling plan, by replacing the purposively selected object with the objects randomly selected from the population. Moreover, the assumption of the non-response share in the population equal to 15% has been omitted.

On the basis of the sampling theory, the minimum required stratified sample size has been determined (sample target size, n). When selecting the samples, 1000 of iterations of each procedure have been carried out, and the results have been registered. The relative maximum tolerable error was 0.05.

Results of the simulation study

On the basis of the simulation study, the average achieved sample size (n_e) has been computed for three of the above mentioned procedures, as well as the average proportion (share) of each of the four categories (types of organizations) has been registered.

Achieved sample size

As mentioned before, 1000 iterations were carried out respectively according to the three sampling plans. Then the average achieved sample sizes have been calculated for these plans, along with their standard deviations. At the end,

the two sample tests for population means have been conducted at the 0.05 significance level respectively for any two of the sampling plans. Table 1 shows the results of the hypothesis testing procedures.

Table 1: The results of the testing the difference of population means

Comparison	Difference of the means
$\mu_O = \mu_S$	significant
$\mu_O = \mu_L$	significant
$\mu_S = \mu_L$	significant
$\mu_T = \mu_S$	not significant
$\mu_T = \mu_L$	significant
$\mu_T = \mu_O$	not significant

Source: own calculations
Note: μ_T *– the average target size of a sample*
μ_O *– the average achieved sample size in the "official" plan*
μ_S *– the average achieved size of the stabilized sieve sample*
μ_L *– the average achieved size of the Lahiri sample*

On the evidence of the sample data one may say that the average sample size is significantly different when comparing the results of any two of the sampling plans. This can be a proof that different sampling plans may affect the quality of the estimation procedure, in terms of accuracy of prediction. Also, the average achieved sample size was closest to the target sample size in case of the official sample and the stabilized sieve sample. This may suggest that the stabilized sieve sampling can be used as a sampling plan in the studies of the NGO sector research.

Moreover, the variability of the achieved sample sizes in each of the plans is the largest in the case of the Lahiri sampling, which may be a result of the nature of this plan, as sampling is carried out with replacement. This may then result in selecting some objects more than once, and, because of this, the sample sizes can be smaller than expected. This is a very big flaw of this plan.

The proportion of the categories in the samples

After 1000 of the samples of each type (official, stabilized sieve, Lahiri) had been selected, each time the proportion of the categories was determined in order to recognize the frequency distribution of the categories, and then, the average proportion of any of the following categories was calculated:

1) associations and similar organizations,
2) foundations,
3) faith-based charities,
4) business and professional associations.

In the population the proportion of the associations and organizations was 0,7995 (nearly 80%) of the total number of organizations, making this category the largest in a study, and the foundations with the share of 0,1481 (14,81%) constituted the second largest category.

The tests of the difference of the two means were conducted for any two of the sampling plans with reference to all of the categories of interest, respectively. The significance level was 0.05. The results show that the average share of the two largest categories (associations and similar organizations as well as foundations) are equal (or, to be more specific, there are no significant differences between any sampling plan result and the population, as well as between any two sampling plans respectively).

When considering the difference between the proportions of the two smallest categories in population (that is, faith-based charities and business and professional associations), the comparison of any different sampling plans and the

population, shows, that, on average, in Lahiri samples, the share of those categories is significantly different from the results based on the other plans (official and sieve), as well as in the population. Moreover, the results show that, when referring to the population results, the closest values of the proportion were found on the basis of the official plan and stabilized sieve sampling plan.

Conclusions

On the basis of the simulation study the following can be stated:

1) When sampling from a population, the achieved sample size may be different from the target sample size.
2) When comparing the average achieved sample size in each of the plans presented above, there is always a significant difference when comparing any two sampling plans, however the achieved sample size is different from the target sample size only when the Lahiri sampling is in use.
3) When analyzing the structure of the population and the samples based on the three sampling plans, the average proportion of any of the two largest categories in the population and the all of the samples, there's no significant difference detected among them. But when considering all of the four categories, the official plan is the best method of selecting the sample.
4) The stabilized sieve sample produces the results that are almost so close to the population results, as the official plan.
5) Stabilized sieve sampling can be considered as an alternative to the sampling plan, that is currently officially in use in the study of the NGO sector.
6) However, the stabilized sieve sampling may be more time consuming, as two stages of the sampling procedure are required, as the initial sample can be either larger than, or less than the required (target) sample size.
7) Moreover, one may not forget that as long as the results of the simulation study are considered, the results may be different when analyzing the true population of NGOs in Poland.
8) Finally, the actual results may be distorted by the non-response error, as it is estimated to be 15%.
9) The next steps in the analysis will be to measure the effect of the non-response, to extend the analysis by the estimation of selected population parameters, such as the average number of employees, to determine the actual structure of the NGO population in Poland on the county level.

Exploring Relationship Between the Characteristics of a Region and The Effectiveness of Innovative Activities of The SME Sector in Poland

Tomasz NOREK

University of Szczecin, Poland
tomasz.norek@usz.edu.pl

Abstract

The main research objective of the article is to answer the question whether there is a interrelation between determinants of the region's innovativeness and the effectiveness of innovative activities carried out by the SMEs operating in the examined region. The author formulated the following hypothesis: (H1) *There is a positive correlation between the determinants of innovativeness of the region and the effectiveness of innovative activities implemented by the SMEs operating in the region.*
In the study, an exploratory-descriptive method was used, involving a statistical aggregation of obtained results in selected analytical sections. The survey covered 1920 enterprises from all regions of Poland. The data necessary to assess the effectiveness of innovation processes of the surveyed entities were collected by means of an online survey. The study was carried out in the period from June 2019 to September 2019. Moreover, the data published by EUROSTAT and the Polish Central Statistical Office concerning innovation in Polish regions were used.
The completed study confirmed the research hypothesis – regional determinants significantly influence the effects of innovative activities. The effectiveness of implemented innovation processes is higher in the surveyed SMEs operating in regions with greater innovative potential.

Keywords

Introduction

Innovation is recognized as a fundamental determinant of economic growth in individual countries. As the theory of economic growth shows, the long-term dynamics of GDP depends on three key factors: capital accumulation, population growth and technological progress. In the European Union's strategy, support for innovation is considered to be a condition for the dynamic development of the whole Community which allows it to be remain competitive with the economies of the USA, Japan or China. This position is reflected in the currently implemented Community strategy – Europe 2020 - and is widely discussed in literature (Kasperkiewicz, 2016; Janger et al., 2016; Camagni, Capello, 2013).

Currently, more and more emphasis is placed on the development of innovation at the regional level. The confirmation of such a policy is the creation of regional innovation systems, which include economic entities, research units and administrative institutions cooperating with each other in order to effectively create, support and diffuse innovation. Regional studies in recent years have strongly emphasised that innovation processes are territorial in nature. The fact that innovation is a local process is highlighted (Mitra, 2019). The region is no longer perceived as solely a physical space, a place where business activity is located (considered in classical economic theories in terms of transport, land or labour costs). Today, the region is interpreted as an incubator of knowledge and innovation processes and a basic level of organisation of innovation capacity of entities (Parrili er al., 2016).

Modern innovation processes are primarily based on endogenous resources, and as a consequence, innovation is considered as a geographically dependent process, significantly stimulated by regional potential (Giannakis, Bruggeman, 2017). In this context, regional conditions are conducive to reducing the risk of innovative activities for business entities operating on this territory. Similarly, regions without appropriate characteristics fail to support enterprises operating on their territory in undertaking innovative activities.

This situation is mainly due to the fact that the last dozen or so years have seen a radical revaluation of the importance of the socio-economic development factors. Today, the primary focus is on information and knowledge resources and the related innovations (the modern economy is referred to as the knowledge-based economy). Many socio-economic

processes have been transferred from the national to the regional level. The region has become a key plane for development processes and economic policy-making and is viewed as a kind of knowledge and innovation incubator, an essential element for the creation, absorption and diffusion of innovation. According to Cappelo and Lenzi, the evolution of regional innovation support systems, resulting in new understanding of their role in the modern economy, determines the effectiveness of innovation processes undertaken by enterprises (2019).

Poland is a country with a low level of innovation compared to other European Union countries. The latest European Commission report entitled European Innovation Scoreboard places Poland on the 25th position (Hollanders et al., 2019). The low level in the national perspective is a direct result of low innovativeness of Polish regions. The highest rated Polish region – Małopolska is ranked 155 out of 239 examined regions. The Polish regions are classified as having a moderate or low level of innovation (Hollanders et al., 2019).

Due to the low level of innovativeness of the Polish regions, it is necessary to identify regional factors which enable initiation of effective innovation processes and the factors which inhibit the development of innovativeness at the regional level. Moreover, research in this area will particularly contribute to the creation of mechanisms for improving the innovativeness of regions with a lower development potential and, consequently, increasing their competitiveness (Asheim, 2019).

Determinants of regional innovativeness and effectiveness of innovative activities undertaken by SMEs

In today's generally accepted economic paradigm, innovation is considered to be a key factor determining development opportunities – both at the macro- and microeconomic level. In the macroeconomic perspective, innovation is a crucial factor of economic growth, and in the microeconomic perspective, innovation directly increases the competitiveness of economic entities (Farinha, Ferreira, Gouveia, 2016; Carayannis, Grigoroudis, 2013). The purpose, the role and the importance of innovation are described in detail in the literature. Review of the literature clearly indicates that the role of innovativeness is emphasised especially in the operation of SMEs. It results from the importance of SMEs in the contemporary economy (Dibrell, Davis, Craig 2008, pp. 203-218; Salvato, Lassini, Wiklund 2007, pp. 282-305; Low, Chapman 2007, pp. 878-891).

The innovative activity of an enterprise is carried out in specific conditions, constituting determinants for innovativeness, which may be divided into internal (endogenous), involving its internal resources and subject to the process of enterprise management, and external (exogenous), i.e. related to the environment in which the enterprise operates. In this context, the specific characteristics of the region in which the enterprises operate should be considered exogenous.

The literature provides different typologies to classify exogenous factors (Romao, Neuts, 2017). Considering the examined research area, the following division of regional innovation determinants should be applied:

1. economic factors;
2. social factors;
3. spatial factors,
4. environmental factors,
5. technical and technological factors.

The described features of the region may directly and indirectly stimulate regional development, however they may also inhibit development (Pytla, Wojnicka-Sycz, 2017). Considering the stimulating and inhibiting nature of the described features of the region, it is clearly evident that the determinants of innovativeness provide an opportunity for enhanced innovativeness of enterprises through the development of regional potential, however do not provide a guarantee that the undertaken innovative activity will be effective and efficient. In this context, it is necessary to identify the features of the region directly affecting the effectiveness of innovative activities undertaken by the local enterprises. This identification is the basis of the research hypothesis that will be examined in the research part.

The main aspect of all innovation processes is their economic effectiveness. The implementation of innovations always involves costs and capital expenditures related to their production. Profits resulting from effective implementation of new solutions are (possibly) generated only in the last phase of the process – after the implementation stage.

The concept of performance effectiveness is often applied in economic sciences, in which it assumes particular importance in the context of evaluation and rationalisation of activities. The literature usually defines effectiveness as the result of actions taken, determined by the relation between the obtained effects and the incurred outlays (Stoner

1994, pp. 29-30). The issue of effectiveness as an economic category is supported by many comprehensive theories. As the literature indicates (Foreman-Peck 2013), essentially the same methods are used to assess innovative activity as those used to assess investment projects (commonly known static and dynamic methods of investment project assessment, such as: NPV, IRR, MIRR or profitability index – PI).

In this publication, in order to precisely define the subject of the study, the definition of innovation effectiveness (effectiveness of innovative activity) proposed by Sukanlaya Sawang, Kerrie Unsworth and Tamma Sorbello was adopted: "innovation effectiveness is the overall result of the benefits of implementing innovation" (Sawang, Unsworth, Sorbello 2012).

In the literature, there is a common view that the main indicator assessing the effectiveness of innovative activities is ROI2 (Return on Innovation Investment) based on the calculation of the sum of profits obtained from the sale of innovative products and services over a certain period of time in relation to the expenditures incurred on innovative activities over a certain period of time.

The concept of evaluating effectiveness of innovative undertakings by means of ROI2 and the calculation methodology were described by Alexander Kandybin (Kandybin 2014), Miles Drake (Drake et al. 2006) and Thomas Kuczmarski (2000). The return on innovation (ROI2) may be calculated in several ways. In the article, the method proposed by Bernard Marr (2012) will be used:

$$ROI2 = \frac{\sum of net\ profits\ from\ innovations}{\sum of\ innovation\ implementation\ costs}$$

ROI2 indicator is generally used to assess the effectiveness of individual innovative undertakings (Bloom et al., 2013), however, it seems that in practice it may also be used to assess the innovativeness of groups of enterprises (industry, sector) and the results obtained may be aggregated at the regional level.

Hypothesis and research method

The issue of the relationship between innovation in regions and economic effects achieved by enterprises operating in these regions is discussed in a number of currently conducted scientific research (Martinze-Romano, Gamero, Delgado-Gonzalez & Tamayo, 2019; Capello & Lenzi, 2019). Based on empirical research carried out in European enterprises of the SME sector, the indicated authors showed:

1. Innovation and market extension show a positive and non-linear relationship.
2. Increasing innovation has no relevant effect on risk in market extension.
3. Greater influence of innovation and lower risk in Higher-tech industries.
4. Greater effect in developed countries, though with more decreasing performances.
5. Clear differences exist between Western countries and transition economies.

The main research objective of the article is to answer the question whether there is a interrelation between determinants of the region's innovativeness and the effectiveness of innovative activities carried out by the SMEs operating in the examined region.

The author formulated the following hypothesis: (H1) There is a positive correlation between the determinants of innovativeness of the region and the effectiveness of innovative activities implemented by the SMEs operating in the region.

In the study, an exploratory-descriptive method was used, involving a statistical aggregation of obtained results in selected analytical sections. The analysis was carried out in two stages:

1. Empirical research on the effectiveness of innovative activities of SMEs in particular regions of Poland.
2. Comparison of the assessed effectiveness of innovative activities carried out by SMEs operating in the examined regions with the published regional determinants of innovative processes.

In the research it was assumed that the research object defined as a region is equated with the administrative unit of Poland, i.e. province [voivodeship] – division according to the European NUTS 2 classification. The first part – an empirical research – was carried out by means of an online survey questionnaire containing 64 questions. The survey collected detailed descriptive data:

1. the number of successful and unsuccessful innovation implementations;

2. directions of implemented innovations (absorption/diffusion);
3. the type of innovation being implemented;
4. total expenditure on innovative activities;
5. total net revenues from innovative activities;
6. market assessment of acceptance of implemented innovations;
7. period of implementation of innovative activities;
8. sources of funding for innovation (use of EU funds or their unavailability).

The survey examined 1920 enterprises from each region of Poland. The survey was carried out in the period from June 2019 to September 2019. The enterprises to be surveyed were selected at random on the basis of data from the Central Registration and Information on Business and had to meet the criterion of belonging to the SME sector determined through the number of employees, i.e. enterprises employing up to 250 employees. The sample did not differentiate between enterprises according to the type of business, legal form or ownership.

The collected data enabled the calculation of ROI2 indicator for all surveyed enterprises – assuming that the cumulative stream of profits/expenditure for each of the surveyed enterprises was realised (documented) within at least one year. The results obtained were aggregated at the level of individual country regions.

In the second stage, the results of the innovation effectiveness indicator ROI2 were compared with the regional innovation determinants. The author used EUROSTAT data and data derived from the report "Millennium Index 2019 – Regional Innovation Potential" (Millennium, 2019), describing innovation in Polish regions, published by the Polish Central Statistical Office. The author selected the following determinants of regional innovation:

1. Labour productivity in the region, understood as gross value added generated by one employee (in thousand PLN);
2. Expenditure on research and development (R&D) in the region, understood as the relation of R&D expenditure to GDP (in %);
3. Number of persons working in R&D in the enterprise sector per 1,000 professionally active persons;
4. Higher education in the region – number of students per 10,000 inhabitants.
5. Number of patents, calculated as an arithmetic mean of the patents registered in the region over the last 3 years per 1 million inhabitants of the region.

For the purpose of the survey, all analysed categories were assigned the same weight and the results of individual provinces were evaluated on a scale from 1 to 100 (where 100 could be awarded to the best region in all categories). On this basis, the authors of the report calculated an average value of innovation potential, referred to as the Millennium index. The calculated index will be used to analyse the relation between the innovation effectiveness and determinants of the innovation potential of the examined regions.

Study Results

In order to test the formulated research hypothesis (H1), the author, in accordance with the adopted method, calculated the arithmetically averaged ROI2 indicator for all surveyed enterprises of the SME sector. The indicator demonstrates the effectiveness of innovative activities, i.e. the level of return on funds invested in innovative activities carried out by the surveyed enterprises. The obtained data, ordered from the highest to the lowest values and aggregated at the level of the region, are presented in Table 1 (the values of the first quartile, the values of the last quartile and the values above the average were marked in colour).

Table 1: Effectiveness of innovative activities of SMEs on the regional level

Region	ROI2 indicator	Average share of profits from innovations in total profits	Average share of innovation development costs in total costs
Małopolskie	2.481	0.382	0.154
Dolnośląskie	2.217	0.337	0.152
Mazowieckie	2.214	0.434	0.196
Wielkopolskie	2.198	0.378	0.172
Pomorskie	2.134	0.303	0.142
Śląskie	2.115	0.294	0.139

Lubelskie	2.044	0.325	0.159
Łódzkie	2.020	0.301	0.149
Podkarpackie	2.018	0.337	0.167
Zachodniopomorskie	2.007	0.299	0.149
Kujawsko-pomorskie	1.831	0.293	0.16
Opolskie	1.777	0.318	0.179
Warmińsko-mazurskie	1.454	0.189	0.13
Podlaskie	1.254	0.212	0.169
Lubuskie	0.980	0.149	0.152
Świętokrzyskie	0.950	0.115	0.121

Own work

The leaders in effectiveness of innovative activities measured by the ROI2 indicators are SMEs from the following regions: Małopolskie, Mazowieckie, Dolnośląskie and Wielkopolskie. The enterprises from these regions obtained results falling within the first quartile of normal distribution for the presented list.

The value of ROI indicator above the average was also obtained by the following regions: Pomorskie, Śląskie, Lubelskie, Łódzkie, Podkarpackie, Zachodniopomorskie.

The regions in which SMEs were characterised by the lowest effectiveness of innovative activities include: Podlaskie, Lubuskie, Świętokrzyskie. These regions obtained results falling within the last quartile of the normal distribution for the presented list. It should also be noted that the arithmetically averaged result for enterprises from the Lubuskie and Świętokrzyskie regions is less than 1. This means that the local enterprises are not efficient innovators – the profits from the sale of the innovations do not cover the expenses incurred for their development.

The relation of average shares of profits from innovations in total profits to average shares of innovation development costs is presented in Figure 1.

Figure 1: Relation of the ROI2 indicator to profits and outlays on innovations of the examined SMEs

The second step in the conducted research was the comparison of the obtained arithmetically averaged ROI2 indicator for the examined regions with the published data concerning the evaluation of determinants of regions' innovation potential. The list is presented in Table 2 (the values of the first quartile, the values of the last quartile and the values above the average were marked in colour).

Table 2: The effectiveness of innovative activities of SMEs in relation to the innovative potential of the examined regions.

Region	ROI2 indicator	Millennium Index	Labour productivity	R&D expenditure	Post-secondary education	Persons working in R&D	Number of patents
Małopolskie	2.481	82.6	66	100	97	73	77
Dolnośląskie	2.217	72	86	49	89	52	84
Mazowieckie	2.214	99.4	100	97	100	100	100
Wielkopolskie	2.198	53.6	75	34	73	31	55
Pomorskie	2.134	61.8	78	59	77	46	49
Śląskie	2.115	54.4	83	34	54	32	69
Lubelskie	2.044	54.4	53	48	71	30	70
Łódzkie	2.020	54	70	39	65	32	64
Podkarpackie	2.018	45.4	53	56	48	37	33
Zachodniopomorskie	2.007	46.6	77	24	51	21	60
Kujawsko-pomorskie	1.831	43.4	69	27	59	25	37
Opolskie	1.777	43.2	72	25	46	21	52
Warmińsko-mazurskie	1.454	36	68	27	42	19	24
Podlaskie	1.254	39.6	60	32	55	25	26
Lubuskie	0.980	31.4	73	20	29	16	19
Świętokrzyskie	0.950	30.4	56	17	42	10	27

Own work

The above ranking clearly indicates that in regions with high innovative potential – Małopolskie, Dolnośląskie, Mazowieckie – the surveyed SMEs achieve higher innovation effectiveness (the distribution of effectiveness of SMEs is very similar to the distribution of innovation potential of regions). The only difference observed concerns the Pomorskie region, whose innovative potential is high (the first quartile of the distribution) and the effectiveness of innovative activities of the surveyed SMEs is outside the first quartile of the sample.

The observation is also confirmed by the analysis of the regions with the lowest innovative potential in the ranking (regions: Warmińsko-mazurskie, Podlaskie, Lubuskie and Świętokrzyskie) – the surveyed SMEs in these regions achieve significantly lower effectiveness of innovative activities than other surveyed enterprises.

Figure 2 presents the relation of the calculated ROI2 indicator to the index of innovation potential of the analysed regions.

Figure 2: Relation of the ROI2 indicator of the examined SMEs to the index of innovative potential of regions

A detailed analysis of determinants of regional innovativeness indicates that the following factors have the greatest influence on the effectiveness of the examined SMEs: post-secondary education, i.e. highly qualified human capital available in the region, the number of R&D employees and the number of patents registered in the region. The data obtained reveal that the work productivity or R&D expenditures are less important.

Conclusions

The comparison of the effectiveness of innovative activities of the examined SMEs in relation to the innovative potential of the regions in which the examined enterprises operate leads to the confirmation of the research hypothesis (H1): enterprises operating in regions with a higher innovative potential achieve higher effectiveness of innovative activities. This is confirmed by the results obtained for the surveyed enterprises from the following regions: Małopolska, Dolnośląskie, Mazowieckie and Wielkopolskie. Similarly, enterprises operating in regions with a low innovative potential are clearly less effective in terms of innovative activities, which is illustrated by the enterprises from the following regions: Warmińsko-Mazurskie, Podlaskie, Lubuskie, Świętokrzyskie.

The main determinants affecting the effectiveness of innovative processes are the highly qualified human capital available in the region, the number of R&D employees and the number of patents registered in the region. Labour productivity and R&D expenditures incurred by the surveyed enterprises are of lesser importance.

It should be emphasised that, according to the adopted research method, the obtained results enable comparison of the empirically examined effectiveness of innovation processes implemented by the surveyed SMEs in relation to the innovative potential of regions where these enterprises operate. The aim of the author's work was not to determine the statistical correlation of cause-effect relations between the established effects of the innovative activity undertaken by the surveyed enterprises and specific features of regions.

It seems that the research on cause and effect relationships should be the next stage of research on the effectiveness of innovation processes in the regional context. Such research could result in the creation of a complete list of innovation determinants and the precise determination of their significance in terms of innovation processes.

Another area of research may involve a comparison of Polish SMEs' innovativeness determinants from the regional point of view with foreign enterprises – especially those that are leaders of innovativeness (e.g. the most innovative European Union countries). A comparative analysis in this respect would contribute to the development of a model of optimal regional innovativeness determinants and thus remove barriers to effective and efficient innovative activity conducted by Polish SMEs.

Abstract

The ongoing processes of globalisation are leading to transformations at many levels - national, regional and global. The answer to the challenges of the modern world is the interdisciplinary nature of sciences, visible in this article. By means of this criterion, the threats resulting from globalization movements affecting the area of economic security are presented in this article.

Keywords: Economic Security, Globalisation, Geoeconomics, Management, Economic Integration.

JEL classification: A11, A13, D31, E24, E32, L26, M12.

Introduction

Barry Buzan, who made the sectoral division of security, is the author of the thesis that economic security is the result of the relationship between economics and military capabilities or social identification (Buzan., 1991, p.124). In contrast, the Polish researcher Stanisław Michałowski proposes to interpret economic security as "[...] an idea of the actual or potential economic risks of a country, shaped by the general state of the country's economic dependence, which determines the degree of effectiveness of external economic integration into the internal economic development, defence capability and stability of the social and political system of a given country […]" (Michałowski, 1990, p. 176).The aspect of opening up to international cooperation, which Stanisław Michałowski describes as external economic integration, is the main determinant of economic security according to Elizabeth Kapstein (Kapstein 1992, p.188). The above observations lead to the conclusion that one of the main challenges and threats to economic security is the process of globalisation.

Globalisation As A Challenge and A Threat

Symptoms of globalization should be seen in the efforts of many ancient states: Egypt, Babylonia, Persia, Macedonia, Rome, Mongolia and many others. The assumptions of the globalization movements are visible in the later trade expeditions of the Greeks, Phoenicians and the great geographical discoveries of Christopher Columbus - the discovery of America - and Ferdinand Magellan - a global expedition (Gulczyński 2004, p. 418-419).

It is in the geographical discoveries that one should look for the beginning of globalization, which influenced the expansion of perception and social awareness that has become global (Foreman- Peck 1998, p. 14-15).

However, in the indicated periods, globalization still lacks some attributes. In antiquity there was a socio-economic system for which the phenomenon of slavery was of paramount importance (Cimek 2016, p. 163).

Cite this Article as: Mateusz ZIĘTARSKI, Miłosz GAC and Henryk WOJTASZEK“ Globalisation Processes as A Determinant of Economic Security” Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

The breach in the completeness of the attributes of globalization is being filled by the development and increasing universality of the capitalist system. The Encyclopedia Britannica contains the following description of the term: "[...] Capitalism is an economic system dominating in the Western world, after the fall of feudalism, which means that most of the means of production belong to private owners who run them, and their income is largely the result of market activities [...] " (The New Encyclopaedia Britannica, 2002, s. 831).

The features of capitalism that link this system with globalization are presented by Peter Berger, pointing to: • Free market • Rational technique based on business • Rational legal system • Free labor (as opposed to slave systems) • Increase in trade and trade (Berger, 1995, p. 53).

The capitalist system made it possible to create an integrated economic world, which is the overriding principle of globalization. Contributed to the generation of mobility of capital, information, goods, people Conditions, which should be defined as rudimentary determinants of globalization (Cimek 2016, p. 163).

The globalization paradigm based on these considerations began to emerge at the end of the 19th century. It mainly referred to the free movement of people, goods and services, the backbone of which is the transnational network, which is manifested in international corporations and organizations as well as transnational communities. The lack of an unambiguous, consistent definition of globalization should be pointed out. Roman Kuźniar writes about a specific ambiguity, referring to the descriptions of globalization in political science, international relations, but also in many analytical works, commentaries and in the rhetoric of political leaders (Kuźniar 2000, p. 6-7).

The source and inspiration for research on globalization is seen in the statement of Herbert McLuhan - the author of the term "global village". In fact, its definition perceives the crossing of time and space using modern mass media. Referring to McLuhan, it is indicated, inter alia, J. Orzeszyn, R. Borkowski, who defines globalization as a concept which means that regional phenomena, still remaining in a real geographical distance, have their counterparts in another part of the world (Kucharczyk, P. Łajca,2017, p. 117).
Roland Robertson describes globalization as "[...] shrinking the world and increasing the degree of understanding of the world as a whole […]" (Robertson, 1992, p. 65).

A. McGrew, claiming that "... globalization consists in the multiplicity of connections and reciprocity of interactions between states and societies that make up the present world system. Globalization is therefore characterized by two dimensions: scope (range) and intensity (depth) " (McGrew 1992, p. 28).

The paradigm of globalisation began to emerge in the late 19th century. It refers to the free movement of people, goods and services, at the heart of which is a transnational network. It manifests itself in international corporations and organisations and transnational communities. The core that determined the process of globalisation was economics, but over time, in addition to purely economic issues, a political process also emerged. The globalisation process changed global politics by moving away from structures representing the interests of the nation state to supranational institutions (Castles, 2011, p. 75-77). Globalisation therefore leads to nation states and their political and economic situation being dependent on global conditions. It is a kind of apogee for the internationalisation of trade at the level of markets, sectors and businesses (Fiszer 1998, p. 164-165). The interdependencies that form the body of connected vessels make the symptoms of growth or crisis felt globally. According to the definition of the International Monetary Fund, globalisation is a constantly evolving network of interdependencies between countries, particularly during the flow of goods, services and technologies (Księżopolski 2004, s. 31). Interdependence also means the implementation of solutions developed by Western experts as part of corporate effectiveness. An example is the process of improving the transport of Polish vans to distribution centres in Western European countries. Insufficient capacity resulted in too high distribution costs for an international corporation, which also included Polish logistics companies.

In order to improve and increase efficiency, a project developed in Western European countries based on the DMAIC method was introduced. Mapping and detailed analysis proved the relationship between the weight of goods and the packaging method. The implementation of the developed method resulted in the minimisation of costs by 10%, which translated into savings of up to EUR 500,000 per year and equalized the disproportions between individual branches of the corporation (Śliwka et al 2016, s. 27). The above example is part of the trend referred to as postfordism. In describing the above phenomenon, Gracjan Cimek refers to a situation in which "[...] the processes of deregulation and internationalisation of capital mean changes in terms of management, fragmentation of work, and limiting the role of trade unions, and, above all, undermine the function of the nation state as a regulator. There is a shift away from vertically integrated companies, where all elements of the production process of a given product were concentrated in one place […]" (Cimek, 2016, p. 149).

The Role of Multinational Corporations

The author writes the above trend into the broader trend of geoeconomics, which he gives as its creator - Edward Luttwak. According to Gracjan Cimek, the essence of geoeconomics is cooperation, which excludes rivalry and logic of the zero-sum game (Ibidem, p. 147). In the meantime, Krzysztof Księżopolski, while making the process of security economisation visible, believes that the above trend means competition in the economic sphere between countries. A view of the rivalry between countries is closer to the actual conditions. International corporations should be added to the entities mentioned by Krzysztof Księżopolski. The phenomenon of shaping the world structure by them is irreversible (Księżopolski, p. 22). A view of competition between countries is closer to the realities. International corporations should be added to the entities mentioned by Krzysztof Księżopolski. The phenomenon of shaping the world structure by them is irreversible (Toeplitz, 2006, s. 22).

The influence of transnational corporations is currently stronger than that of nation state governments, and corporate lobbying is an argument that undermines or changes the decisions made by national parliaments in the legislative process.

A global policy that focuses on the processes of globalization is indicated and criticized as a source of disproportions between countries and societies. An example of disapproval is the numerous protests and demonstrations that are organised at meeting places of representatives of institutions such as the International Monetary Fund, the World Bank and the World Trade Organisation. The large-scale protest movements that emerged with the protests in Seattle in 1999 have contributed to an escalation in action. They have resulted in a de facto war against globalisation. The death of an anti-globalist demonstrator in Genoa in 2001 is considered to be the beginning of the war, its casus belli (Stiglitz 2004, p. 21).

Competition in The Age of Globalisation

(PL) Mr President, international relations, which are today full of processes of globalisation and geoeconomics, are an arena in which there is a dispute and rivalry in the background of cooperation and collaboration. In line with Ryszard Zięba, four areas of economic rivalry should be identified. In accordance with the proposed classification, we can identify threats to economic security, which are the result of the rivalry focused around us:

- - Energy resources;
- - Water resources;
- - Food resources;
- - Strategic raw material resources (Ibidem, p. 19).

The economic interests of the Russian Federation run along the line drawn by the chief strategist and ideologist in the Kremlin, Alexander Dugin. At the energy and raw material level, this materialised in the contracts that linked Russia with Germany, bypassing the region of Central and Eastern Europe (Święchowicz, 2015, p.151).

On 29 August 2006 in Moscow, representatives of Gazprom, E.ON Ruhrgas and BASF signed an agreement on the construction of the Northern Gas Pipeline. It was to run on the bottom of the Baltic Sea and supply gas from Russia to Germany. The pipeline would strengthen cooperation on the Berlin-Moscow line, marginalising the role of Poland and Ukraine in the region of Central and Eastern Europe, because gas would reach Germany without both countries. According to Edward Lucas, this project is [...] the fruit of the most infamous diplomatic alliance in contemporary Europe [...]' . Radosław Sikorski, the then Polish Minister of Foreign Affairs, spoke in an even sharper tone about the Northern Gas Pipeline, using a comparison of the Nord Stream project with the Molotov-Ribbentrop Pact. Former German Chancellor Gerhard Schröder played an important role in the decision to build the gas pipeline. He was a great enthusiast of the project, which strongly lobbied for the construction of the Northern Gas Pipeline. After leaving the Chancellor's office, he sat in the consortium preparing the investment. In addition, a few days before the end of Schrödera, a secret transaction took place - a loan of EUR 1 billion was flown from Russia (Lucas, p. 215).

This fact casts a shadow over the integrity and honesty of the former Chancellor. In the face of these reports, it makes sense to ask about the determinants that guided the German authorities. Was concern for energy security in the foreground, or did the particular interests of the leaders of both countries prevail? Independent experts point to the second answer in the explanatory memorandum, arguing that this was due to the much higher cost of building underwater pipelines, the presence of numerous explosives on the bottom of the Baltic Sea and a number of environmental concerns. After the change of government in Germany, the new government's attitude to the gas

pipeline project was equally enthusiastic. Attention should be paid to the environment during the construction of the Northern Gas Pipeline.

In 2009, on the initiative of scientists from the University of Warsaw, work began on a vision of foreign policy based on rapprochement with Germany and Russia. This concept, called the Royal Triangle, indicated Poland's correct relations with its two powerful neighbours. However, the thaw in relations created by this forum did not change the behaviour of Russia and Germany. On 8 November 2011, the first line of the gas pipeline was put into operation, and on 8 October 2012, blue fuel flowed through the second line. In addition, Poland's position has been de-played, playing no role in the construction of the pipeline, and has not received any benefits, although it was the bottom of the Baltic Sea - the most important sea area in the context of Poland's maritime safety - where the pipeline ran. Criticism of the Nord Stream project should, however, point out the wrong strategy for the foreign policy of the Republic of Poland. The passive attitude, which is exemplified by the lack of debates in political and public spaces undertaking to include Poland in the project, and the erroneous perception of economic relations in contemporary international relations, are a burden on Polish diplomacy. The simplification of foreign policy to bilateral relations between states without taking into account supranational organisations and alliances is evident from the example of the above gas project (Rewizorski et al., 2013, s. 297).

Talks are currently under way on the launch of the Nord Stream II gas pipeline. The environment for this project is different from that of the Nord Stream project. There has been a clear cooling off of the Russian Federation from both Poland and Germany. Following Russia's aggression against Ukraine and its support for the separatists, it was decided to impose economic sanctions and isolate Russia in the international arena. The vision of the Royal Triangle was outdated, and the Polish position on foreign policy was almost identical to the German position in opposition to the Russian one (Lucas, p. 22).

The use of the modus vivendi strategy has also proved effective in this case and has brought Russia closer to the desired goal.

The attitude of the Russian Federation towards Ukraine, which was divergent and a hardly consensual issue, business and economic issues have been left out. In response to a question from Polish MEPs about the euro, Angela Merkel pointed out that the construction of the Nord Stream II [...] this is a purely commercial venture and most importantly, gas will flow into Europe [...]" (Skiweciński, 2015, p. 74-76).The arguments of the German Chancellor must be considered in two respects: the activities and principles followed by Gazprom, the main shareholder of the project, and the strategy for energy security taken by the European Union. Edward Lucas is the author of the thesis that "[...] Gazprom is the gas branch of the Kremlin Inc. and was directly involved in suppressing press freedom in Russia: it took control of the unruly media, such as NTV, and bent it at the will of the Kremlin [...]" (Lucas, p.. 213). In addition, it is a monopoly that excludes all competition, resorting to unworthy treatments. Western companies that have experience in dealing with Gazprom "[...] they say they do not accept thievery, censorship and attempts at intimidation [...]" (Ibidem, p. 213-216).

Mr President (PL), energy security is an issue frequently raised by European politicians and is on the agenda of talks at meetings of leaders of European Union and NATO countries. At the North Atlantic Alliance Summit in Warsaw, recommendations were coined to diversify oil supplies and natural gas. Its consequence is to be a process of strengthening resistance to political and economic energy blackmail (Turowski 2016, s. 153).

The result is an energy union project to ensure the energy security of Member States. Among the priorities of the energy union are: diversification of gas supply, elimination of the huge diversity of gas prices, greater market integration and ensuring security of supply. The German Chancellor is strongly involved in the energy union project. However, when you compare what Angela Merkel said about the energy union and the Nord Stream II project is born of cognitive dissonance. Support for one idea is contradictory with support for the second idea because they are incompatible with each other (Pratkanis and Aronson 2004, s. 41).

However, Russian President Vladimir Putin has reduced cognitive dissonance. The omission of the irritant issue - Russia's role as an aggressor in Ukraine - made it possible to reach agreement on a kind of contract, launching the Nord Stream II project (Łastawski, 2012, p. 162).

In the context of European Union solidarity, the Polish initiative should be cited from 2006, called the Musketeers' Pact, which was supposed to weaken the dictates of the Russian Federation and weaken the opportunities for energy blackmail. Poland called for the inclusion in the new EU Treaty of the issue of energy security, which was supposed to be the European Union's assistance to Member States which will be struggling with the supply of raw materials or which will be subject to price collusion or energy blackmail. The idea was lost among the numerous

business and economic links between the countries of the Community and the Russian Federation (Turczyński, 2016, p. 614).

Nowadays, the so-called Arctic Five are competing hard for raw materials, the riches of which the Arctic contains. Price diktat and rivalry between the powers can have a significant impact on our economic security. In addition, the main player In the race for the Arctic deposits, there is the Russian Federation, which is claiming to be a raw material superpower that will distribute and dictate access to energy resources.

Already today, the Arctic is becoming a militarised zone, and this is confirmed by the presence of the Northern Fleet in this region of the world - the strongest point of the Russian Navy . It should be pointed out that the Arctic and its riches of raw materials are also visible in the eyes of China and the European Union. This interest is confirmed by the European Commission document entitled 'The European Union and the Arctic region' (Rokiciński, 2012, p. 33). However, the Russian determination, which is reflected in the resources allocated and the broad and effective equipment, the creation of formations that operate in the Arctic region makes Russia a leader in the fight for the Arctic, which is part of the process of satisfying national interests. The above determination of Russia results from the provisions of its maritime doctrine, in which the Arctic is defined as one of its priorities (Kaszuba and Minkina 2016, s. 143).

The dominant role of Russia may lead to economic blackmail, which should be indicated as a threat to Polish economic security. An example of economic blackmail is the increase in the price of gas transmission for Ukraine after the annexation of Crimea to USD 485.5 per 1 000 m3 . It has been raised by around 80%, and Ukraine has thus become the country from which the highest rate for the transmission of this raw material is demanded (Ziętarski 2016, s. 116). Another demonstration of strength in the energy space was the cutting of Russian gas supplies to Ukraine (Roxburgh 2012, s. 249). Before the start of the Russian-Ukrainian conflict, the Russian Federation used economic blackmail - the Yamal II project, i.e. the construction of Line 2 of the Yamal pipeline, also known as Pieremychka, was to be a project to bypass Ukrainian territory. The countries participating in the project could count on a reduction of around 15% in the current gas price. The negotiations on Yamal II, which has become a priority project, as a result of the difficult talks on South Stream, have introduced discrepancies between the countries around the Visegrad Group. As the talks on the above matter were conducted without an official procedure - the memorandum was signed with EuRoPol Gaz, which consists of representatives of Poland and Russia - the Polish side did not let this investment go. The Slovak and Hungarian governments, on the other hand, were favourable to the Yamal pipeline extension project.

At a similar time to the so-called Pieremyczka talks, the then Hungarian Prime Minister Victor Orban led a further energy offensive. In August 2013, he held a meeting with Sergei Kirijenko, representative of Rosatom. As a result of the talks, a contract for a Russian nuclear power company to expand and modernise the Hungarian nuclear power plant in Paks was agreed. In exchange for this declaration, the Russian side agreed to provide a billion-dollar loan for this investment. The Russian-Hungarian negotiations were followed by declarations by the Hungarian Government to join the gas pipeline project: Nord Stream II and South Stream (Kacewicz, 2018, p. 46). Russia's rapprochement with Turkey, which is described in this chapter, makes the issue of building the South Stream gas pipeline a realistic political and energy project.These examples show the danger of economic blackmail. The above description of events also highlights the broad scope of Russia's energy policy. The Arctic's raw material wealth is therefore a key challenge for the Russian Federation. Russia's current advantage over the other countries of the so-called Arctic Five is linked to equipment that has been tested in the difficult terrain of Siberia.

- Another threat to economic security is the demographic crisis and its impact on social security.
- The connotation between economic security
- and social security is evident in the permanent deepening of social disparities. In terms of economic threats, the causes of the above process will be presented, and the effects will be described in the further part of the work, devoted to social issues. The main cause of the process is indicated as globalisation, which has become the starting point of this subsection. Jeffrey Garten, Riccardo Petrella and Robert Reich present the current of antiglobalism in economics, arguing that the main threat is global domination and global monopoly. Globalisation in the economy marginalises or excludes social ties, which leads to the possibility of the most qualified getting rich at the expense of unskilled groups, plunging them into poverty and deprivation. This process results in lesser phenomena such as these:

- - Weakening of human solidarity;
- - Pauperisation of certain social groups;
- - States' problems with solving social problems;
- - Difficulties in taxing citizens;
- - Increasing competition between citizens in the race for goods;

- - Unification of society, killing its traditions and culture (Księżopolski, p.. 154-155).

Conclusion

The dynamism that characterises the 21st century, driven by the processes of globalisation, has led to an escalation in social disparities. The enrichment has been laboriously pushed out by the computerisation of banking, stock exchange and finance. Transfers between companies on different continents, amounting to billions of euros, are carried out by means of autonomous computer programmes during milliseconds of financial transactions. As a result of the progressive enrichment of the most qualified and rich social influenza, 1% of the world's population has assets of 40% of all wealth. In addition, the richest 10% of the world's population owns 85% of the wealth of all households. The richer half of humanity owns 99% of the world's wealth, while the poorer half of the world has 1% of the world's wealth. It should be added that social inequalities caused by economic considerations affect all countries - poor, developing and developed countries alike (Popkiewicz 2013, s. 43-44).

The deepening of disparities leads to the serious threat of economic enslavement of many generations. Poor countries are being held hostage by economic giants. These threats are evident in contemporary international relations, where multinational corporations are playing an increasingly strong role. The governments of the nation states are often overwhelmed by the role and significance of their governments and are making great changes to the global economy.

Contemporary Conditions of Digital Security Management in An Organization 4.0 (Selected Aspects)

Joanna GRUBICKA

Cyberspace Protection Faculty, Security and Management Department, Safety and Management Institute, Pomeranian University in Slupsk, Poland, ORCID: 0000-0001-7934-6044;
E-mail: joanna.grubicka@apsl.edu.pl

Abstract

The article takes up the subject of the determinants of digital security management in 4.0 organizations perceived through the prism of development and gaps in digital competences of work resources. It presents the distinctive features of the digital revolution technology and the competency challenges facing the 4.0 organization. The evolution of the conceptualization of the concept of digital competences in the strategic development documents of the European Union is outlined, taking into account the area of digital security. The progress of digital transformation of selected countries is analyzed on the basis of the Digital Economy and Society Index (DESI 2019-2020). The conclusions lead to recommendations in the area of directions for the development of digital competences of work resources.

Keywords: Digital Security, Organization 4.0.

Introduction

Recently, the number of studies devoted to the concept of "Industry 4.0", the so-called the fourth industrial revolution (German: *Industrie 4.0*) and its changes has increased significantly. The interest in this topic stems primarily from the belief that the industrial revolution 4.0 will bring about a jump in the efficiency of enterprises and the emergence of new business models, services and products, which will consequently determine the economic position in the world (See: Kagermann 2014: 607-609). The changing balance of power on the global market, as well as demographic trends and the deepening deficit of qualified workforce in highly developed countries of the world are also of no less importance. The concept of "Industry 4.0" developed in Germany is generally based on the use of the processes of automation and digitization of industry that have been taking place in the German industry for years to transform existing factories into self-steering and self-adapting social engineering systems (*Smart Factories*), allowing the creation of intelligent value chains. The above concept, despite the fact that it is only a general vision of changes in the industry, brings with it significant changes in the area of work. This applies in particular to the role of man in a smart factory and the necessary qualifications and competences related to it.

The digital economy, however, requires labor resources with appropriate competences, while one of the burning problems in the global economy is the shortage of modern professional competences of current and future employees (Deloitte, Global Human Capital Trends 2017). These include *digital competences* enabling the effective functioning of modern organizations, the so-called organization 4.0. These organizations make intensive use of the digital competences of their work resources, and their vital goal is the safe conduct of their activities. Since they actually operate in the digital economy, they must be provided with digital security. The aim of this article is to present the issues of digital security management through the prism of the analysis of needs and the state of digital competences of work resources necessary for the functioning of modern organizations, the so-called organization 4.0.

Organization 4.0 - competency aspects of digital security

The beginning of the current breakthrough - the so-called digital revolution dates back to 1989 - the popularization of the Internet, which opened a new era of technological applications not only in production or management, but also in social life (Kosieradzka 2018). Definitely, the fourth industrial revolution includes technologies that apply systematically: 1) cyber-physical modeling (cyber-physical systems); 2) Internet of things, Internet of services; 3) the possibility of cloud computing; 4) Internet of Everything (See: Furmanek 2018: 56–65). New technological solutions, such as advanced automation and robotisation of manufacturing processes, intensive processing and exchange of large

Cite this Article as: Joanna GRUBICKA“ Contemporary Conditions of Digital Security Management in An Organization 4.0 (Selected Aspects)” Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

amounts of data (big data), autonomous systems and additive manufacturing - are revolutionizing traditional ways of creating value (Hermann 2015). Technology implementation costs are falling, and international differences in labor costs are no longer the decisive factor in choosing a production location, which favors globalization and the rapid diffusion of new technology (Deloitte, Global Human Capital Trends 2017). It should be noted that the digital revolution fundamentally changes the paradigm of functioning not only of industrial organizations, but all types of organizations. It creates a general model of a *process-oriented organization* - the so-called organization 4.0 (Binner 2018), fundamentally different from the model of functional organization, anchored in the system paradigm (See: Koźmiński 2011: 9–37) strongly established in the sciences of organization and management.

A distinctive feature of the 4.0 organization is the systematic increase in the flexibility of products and processes through automation, extensive networks and decentralized control mechanisms, as well as data acquisition and integration through modern information and communication technologies and digital technologies: i.e. data storage in the cloud (cloud storage), data processing in the cloud (cloud computing), processing of large amounts of data (big data), mobile applications (mob apps), geolocation (global positioning system - GPS), Internet of things (IoT), robots and learning machines, artificial intelligence (AI) -augmented reality (AR), virtual reality (VR). Organization 4.0, using the integration of new information technologies, achieves a competitive advantage by building a strong customer orientation by providing it with an optimal and tailor-made value chain (Wodecki 2018).

Authors of the report of the global consulting company Deloitte entitled *Global Human Capital Trends 2017. Changing the rules in the digital age* note that intensive technological changes in companies are accompanied by a very slow increase in terms of efficiency (Deloitte, Global Human Capital Trends 2017). Thus, expensive technological investments, especially in the area of digital technologies, in the absence of full use of their power, may be ineffective, and in some cases - companies investing in them may even lose financial liquidity and disappear from the market. Therefore, before purchasing modern ICT technology, it is necessary to analyze the production and operational processes in terms of the currently created and possibly new value chain (Bogner 2016). Management specialists emphasize that digitization activities, which are usually performed by the so-called technical and IT departments of companies should not be treated as an isolated function or as an element only supporting corporate operations (back-up), but as an element of strategic management. Traditional "systemic" thinking about management functions makes it impossible to take full advantage of the process and network connections of digital technologies.

The rapidly growing number of sensors, embedded systems and connected devices, as well as the multi-level network of value chains in the 4.0 organization, first and foremost result in a huge and continuous flow of data. However, the constantly growing flow of information would only be a burden, not a value, without the use of appropriate analytical and security techniques. Using them requires specific skills - the so-called *advanced digital competences* (Regulation of the European Parliament and of the Council establishing the Digital Europe programme for the period 2021-2027, 2018) which are defined in strategic development policies as personal *sine qua non* conditions for the development of modern organizations.

Digital security (cybersecurity, security in the digital environment) is usually understood as information security, (...) "as an element of an IT system (...), as a synonym for computer, telecommunications or network security"(See: Więcaszek-Kuczyńska 2014: 212). Digital security aims to ensure the safe activity of various entities in the digital environment and to counteract threats related to the security of networks, servers, data on devices, etc. This general description of the scope of digital security, in fact, includes the postulate of having appropriate knowledge, skills and attitudes of device and computer, IT or network tools users. Therefore, digital security should be included in the broader perspective of the conceptual framework of digital competences of users. It is facilitated by a well-developed conceptual and operational system concerning the priority of development and promotion of modern digital competences of current and future employees, contained in strategic development documents of the policies of global, regional or national institutions.

In the policy of the European Union, the subject of digital security is included in the key strategic development documents concerning the promotion of the security of economic transactions and the development of the information society. The 2010 Digital Agenda for Europe is implemented within the Digital Single Market Strategy for Europe (2015), the New Skills Agenda for Europe (2016) and the Digital Education Action Plan (2018). In 2019, the Cybersecurity Act (CA) was adopted in Europe, strengthening the role of the European Union Agency for Cybersecurity (ENISA) and initiating the European certification of information and communication technology (ICT) products and services.

In line with the assumptions underlying the legal solutions proposed in CA, the consumer is able to choose devices and solutions that are tested and meet the relevant safety standards. Companies, on the other hand, have to apply for a certificate only in one member state, which is honored throughout the EU. It is intended to support the development

of the digital single market and facilitate rise in the level of security, as well as build the technological advantage of European companies.

The Act on Cybersecurity also covers the issue of the appropriate level of security of next-generation networks, the so-called 5G networks as the latest and fastest generation of mobile technology. The European Commission defined the 5G network as a set of network infrastructure elements for mobile and wireless communication, the main advantages of which are:

- very high data transmission speed and bandwidth,
- low latency communication,
- very high reliability,
- support for a large number of connected devices (Commission Recommendation of 26 March 2019 on Cybersecurity of 5G networks 2019).

In March 2019, the European Commission presented its recommendations on the cybersecurity of 5G networks, and in October of the same year - the EU coordinated cybersecurity risk assessment in fifth generation networks. It is estimated that 5G-related revenues will reach EUR 225 billion in 2025, therefore in Europe it is necessary to take appropriate action to be able to compete in the global market effectively. Ensuring an appropriate level of security for next-generation networks is necessary to be able to fully use its potential in the organization's operations (ABI Research projection 2016).

Digital security in the policy of the European Union

The development of digital competences is of key importance for the development of the current economy and determines the growth of innovation, employment and the competitiveness of the digital economy (See: Balcewicz-Majewska 2020: 121-122). The issue of facilitating the development of citizens and workers skills necessary in a modern society and economy is visible in the initiatives of global organizations such as the OECD (See: Ferrari 2019) is adapted to the expectations of the changing world and takes into account current trends such as globalization, digitization, migration and aging of the society, which define key skills in the near future both in social life and the economy.

Digital competences in strategic development documents of the European Union have been included since 2006 in the set of the so-called *key competences* (See. A Strategic Approach to Skills Policies 2012). The new OECD Skills Strategy 2019 (See: European Parliament and the Council, Recommendation of the European Parliament and the Council of 18 December 2006 on key competences for lifelong learning 2006) and many initiatives and projects have been dedicated to their promotion and development over the last several years. One of the most recent flagship initiatives is the Digital Europe Program in the 2021-2027 funding framework, which is at the heart of the European Commission's comprehensive confrontation with the current challenges of digital transformation. The program covers five development goals, namely: large-scale data processing, artificial intelligence, cybersecurity, advanced digital skills and ensuring their wide use in the economy and social life. A special category of organizations that are vitally interested in the supply of labor resources with "advanced digital skills" are enterprises that form the so-called industry sector 4.0, or more broadly - organizations 4.0.

Digital competences were recognized as one of the eight key competences of workers and citizens in 2006 in the European Commission document *Recommendation of Key Competences for Lifelong Learning* (See: European Parliament and the Council, Recommendation of the European Parliament and the Council of 18 December 2006 on key competences for lifelong learning 2006). This reflects the importance attributed to modern technical competences at the time of the so-called knowledge-based economy, in which various jobs: administrative, management, industrial, commonly require knowledge of at least the basics of information and communication technologies (computer literacy). In this sense, digital competences still meant *stricte* technical skills.

Along with socio-economic changes and the development of the digital economy, the content scope of the concept of digital competences systematically expanded, and most importantly, it exceeded the narrow scope of "technical skills" understood as operating computer hardware and using basic software programs. Since 2012, in EU studies, a wide scope of this concept has already appeared, in line with the understanding of the concept of "competence" as a set of knowledge, skills and attitudes appropriate for a given task area (Filipowicz 2004):

(…) "*Digital Competence is the set of knowledge, skills, attitudes (thus including abilities, strategies, values and awareness) that are required when using ICT and digital media to perform tasks; solve problems; communicate; manage information; collaborate; create and share content; and build knowledge effectively, efficiently,*

appropriately, critically, creatively, autonomously, flexibly, ethically, reflectively for work, leisure, participation, learning, socialising, consuming, and empowerment "(See: Ferrari 2012).

Seven areas of digital competences were distinguished:

- *information management* - identifying, locating, accessing, retrieving, storing and organizing information;
- *collaboration* - linking with others, participating in online networks and communities interacting constructively;
- *communication and sharing*- communicating through online tools, taking into account privacy, safety and netiquette;
- creation of content and knowledge - integrating and re-elaborating previous knowledge and content, constructing new knowledge;
- *ethics and responsibility* - behaving in an ethical and responsible manner, awareness of the legal frames
- *evaluation and problem solving* - identification of digital needs, problem solving through digital means, assessment of retrieved information.
- *technical operations* - the use of technology and media, performing tasks through digital tools.

The analysis of the above approach shows that digital competences are much more than just a 'technical alphabet' of operating devices and basic computer programs. This aspect, as a competence entitled 'Technical operations' is in fact the least complex and most obvious component of all digital competences. The remaining elements are more important, that is:

- *Social competences*: Collaboration, Communication and Sharing,
- Ethics and Responsibility;
- *Cognitive competences*: Create content and knowledge, Assess and solve problems,
- *Managerial competences*: Information management.

A team of experts gathered at the Joint Research Center of the European Commission was perfecting the study entitled *The Digital Competence Framework for Citizens* (The Digital Competence Framework - DigComp), first publishing DigComp 1.0 (2012), then Dig Comp 2.0 (See: Vuorikari 2016) and most recently, in 2017 - Dig Comp 2.1 (See: Polish version of DigComp can be fund on the platform). From the point of view of cybersecurity issues, in DigComp 1.0 the safety area in digital competences was not distinguished and appears only in 2016 in the Dig Comp 2.0 concept, as one of the five competence areas. DigComp developed free-of-charge tools to improve citizens' digital competences in work and employment, learning, leisure, consumption and social participation DigComp can be successfully used to self-test digital competences and is included in the European Computer Driving License (ECDL) training program.

The full matrix of 21 digital competences currently defined in the European Union and covering the area of "security" in 2017 in terms of topics covers: protection of devices, personal data and privacy, protection of health and well-being of users, and protection of the environment (See: Carretero 2017) In the *Recommendation of the EU Council on Key Competences in the Lifelong Learning Process*" (European Parliament and the Council, *Recommendation of the European Parliament and the Council of 18 December 2006 on key competences for lifelong learning*), published on May 22, 2018, we find confirmation of the assumptions developed in the work on DigComp 2.1. The Annex to the Recommendation contains a list of eight areas of *key competences*, including: 1) competences in understanding and creating information; 2) multilingual competence; 3) mathematical and natural sciences, technology and engineering competences; 4) digital competences; 5) personal, social and self-learning competences; 6) civic competences; 7) competences in the field of entrepreneurship; 8) competences in the field of cultural awareness and expression.

The document explains that the current competency requirements have changed due to the growing number of jobs subject to automation and the increasingly important role of technology in all areas of work and life (revolution 4.0). Key competences, including digital ones, have the importance of *transversal competencies* - that is, those that are used in various contexts and roles of social and professional life. Therefore, they should constitute the basic guideline in building lifelong learning educational programs. Responsible education and development of key competences plays a strategic role in building the resilience and adaptability of community citizens and employees to the constant changes in the socio-economic environment. The last example of unexpected changes is the crisis caused by the COVID-19 pandemic and the fact that the digital model of remote work is popularized due to its pressure.

In this paper, digital competences, (…) *include the confident, critical and responsible use of interest in digital technologies for learning, working and participation in society. These include information and data literacy, communication and collaboration, media literacy, digital content creation (including programming), security (including digital comfort and cybersecurity competency), intellectual property issues, problem solving and critical*

thinking (European Parliament and the Council, *Recommendation of the European Parliament and the Council of 18 December 2006 on key competences for lifelong learning*).

The above definition highlights:

- importance of the critical and responsible use of digital technologies;
- the fact that they are necessary to understand how digital technologies are used, to build awareness of opportunities, threats and benefits, as well as to understand the general principles and mechanisms underlying the development of modern technologies.

In the Council's Recommendations of 22 May 2018 on Key Competences in Lifelong Learning (Regulation of the European parliament and of the council establishing the digital europe programme for the period 2021-2027, 2018), we can also find a description of the necessary knowledge, skills and attitudes related to digital competences, namely:

- understanding of how digital technologies can help in communication, creativity and innovation, and awareness of the opportunities, limitations, impacts and risks associated with them.
- understanding of the general principles, mechanisms and logic underlying evolving digital technologies, and being familiar with the basic functions and use of different types of devices, software and networks;
- adopting a critical approach to the relevance, credibility and impact of information and data provided digitally, and awareness of the legal and ethical principles related to the use of digital technologies.

Another important document is the strategic development program of the European Community *Digital Europe* Learning (Regulation of the European parliament and of the council establishing the digital europe programme for the period 2021-2027, 2018) adopted in June 2018. It is part of the European Union's multiannual financial framework for 2021-2027 and its implementation is to take place from January 2021. The program is at the heart of the European Commission's comprehensive confrontation with the current challenges of digital transformation. It should be emphasized that the starting point of the program initiative was a diagnosis indicating significant security shortcomings of the digital economy in the EU, which reduce its global competitive position in comparison with other world economies, mainly - the United States, China and Japan. The signs of weakness in the EU digital economy relate largely to cybersecurity and include the following facts:

- fragmentation and low levels of public investment in cybersecurity;
- the strong fragmentation of the European cybersecurity industry and the difficulty of identifying entities with established market power;
- jobs in the EU that require highly specialized technical knowledge and skills in areas such as artificial intelligence, data analytics and cybersecurity - remain largely vacant. Learning (Regulation of the European parliament and of the council establishing the digital europe programme for the period 2021-2027, 2018)

The program covers five development goals for the coming years:

- large-scale data processing,
- artificial intelligence,
- cybersecurity,
- advanced digital skills and ensuring their wide use in the economy and in society.

Advanced digital skills are defined in Art. 7 in the *Digital Europe* program as: (…) "*skills especially regarding high performance computing, big data analytics, cybersecurity,(…) and artificial intelligence*" Learning (Regulation of the European parliament and of the council establishing the digital europe programme for the period 2021-2027, 2018).

Program activities are aimed at simultaneously supporting these areas in creating an efficient digital economy based on data. They should also contribute to promoting social inclusion and greater employability in a transforming economy.

In summary, digital competences are complex behaviors that include adequate cognitive, social and technical knowledge and skills related to the critical, ethical and responsible use of digital means and devices and, as cross-cutting competences, essential for the effective and personally satisfying human functioning in a digital state. However, their development and promotion requires systemic support through comprehensive program initiatives and aid projects. It is also important to monitor and evaluate the state of development of digital competences of citizens and employees systematically in order to respond to the identified competency gaps with increased assistance activities.

Status of development of digital competences in the light of research

In June 2020, the European Commission published the latest results of the DESI index, which presents the current state of the digital economy and society in EU countries. The index covers five areas: connectivity; human capital, the use of internet services, the use of digital technologies, digital public services. Data for all EU countries published in DESI 2020 (collected for 2019) are shown in Fig 1.

Fig 1. Digital Economy and Society Index – Member States' progress, 2015-2020.
Source: DESI 2020, European Commission.

Figure 1 shows the progress of Member States as regards the overall level of digitisation of the economy and society over the last 5 years. It is measured in terms of the progression of their DESI score over that period of time. The most significant progression is noted in Ireland, followed by the Netherlands, Malta and Spain. These countries also perform well above the EU average as measured by the DESI score. Common to these Member States are robust policies and targeted investment in all the areas measured by DESI. Finland and Sweden are amongst the leaders in overall performance in digital, but in terms of progression over the last five years they are just slightly above average, together with Belgium and Germany. Denmark, Estonia and Luxembourg show a relatively low progression in digitisation over the last five years, even though they remain amongst the well performing Member States in the overall DESI ranking. In Denmark, the largest challenge is to further improve on advanced digital skills whilst in Luxembourg the digitisation of businesses is relatively low. In Estonia, there is a relative weakness as regards connectivity and the digitisation of businesses. Significantly, the majority of the countries, which are below the EU average in the level of digitisation have not progressed much in the last five years. This is the case notably for Bulgaria, Greece and Romania. All these Member States, however, have recently launched several initiatives in the various areas monitored by the DESI and results may be visible in the coming years (Digital Economy and Society Index (DESI) 2020).

Summary - competency challenges for the 4.0 organization

According to the research, the shortage of employees with competences needed from the point of view of employers creating jobs in the 4.0 economy is systematically deepening and transforming into a long-term crisis, which may increasingly reduce the chances of economic growth (See: Deloitte, Global Human Capital Trends 2017). Organizations operating in a changeable and dynamic market must protect their unique and difficult to duplicate resources to remain competitive. That is why it is so crucial to organizational cybersecurity. When implementing an information security policy, companies first try to identify threats related to information loss. To do this, they need the right technology and advanced digital skills of workers. When investing in modern technology, companies need to monitor to what extent their employees understand it and are able to use its potential.

Research in the industrial sector shows that the biggest challenges in the field of digitization relate to internal issues such as culture, organization, leadership and workers' skills, rather than external issues such as whether the company has appropriate standards, infrastructure and security intellectual property or technical data or privacy security (Industry 4.0: Building the digital enterprise, PWC 2016). The lack of digital culture and appropriate training was considered the greatest challenge by the largest number of companies, regardless of industries and regions, including

companies that consider themselves to be advanced in digitization processes. An organization's digitization policy offers opportunities to build a competitive advantage, but it is also risky if it is not based on solid digital competences and digital security. However, in the face of the increasingly changing social and economic environment, the search for innovative, low-cost chains of creating value for customers seems inevitable. As the burden of struggling with the digital mismatch of work resources is still mostly placed on employers and employees themselves, further system solutions and support programs at the institutional level are necessary.

These conclusions are more relevant than ever in the light of the economic crisis initiated by the unexpected COVID-19 pandemic, in which forced lockdown intensifies the development of the e-commerce sector, intensive use of remote work and digital tools and solutions, but also intensifies tensions on the labor market in connection *with insufficient supply of advanced digital skills.*

Abstract

Worldwide, there is a convergence of web services and mobile technology. Applications that initially existed only on computers have also been developed for smart equipment, such as tablets and mobile phones. The applications' need for portability led to the establishment of cloud services and cloud computing, which allow users to no longer invest in their own infrastructure, maintenance and upgrade, but merely lease from a certain data processing and storage services' provider. In this paper we conducted a qualitative study through which we aimed to identify the general opinion of IT employees on disruptive technologies, and how they use them in the organisations in which they work. The qualitative analysis was performed among 10 experts working in the IT field.

Keywords: disruptive technologies, cloud, qualitative study, IT&C.
JEL Classification: M31, O14, C10.

Introduction

The implementation costs of the wireless technology, as well as the costs of using 3G/4G data have significantly decreased in comparison with the 2000s. However, the infrastructure allows GSM signal coverage for most of the population, especially in the urban area, where many of the services and IoT product costumers are found (cisco.com). The limit between real, digital and virtual can be overcome, and technology can create intelligent environments that can manage transport, produce green energy, ultimately leading to the smart city.

IoT designates the network of smart objects (home appliances, sensors and other devices) which allow remote control (using the already existing network), and can be integrated in systems to have an increased efficiency, a greater accuracy or to be economically sound in terms of consumption. Each of these objects can be detected using a unique identifier, and can act alone or within an interconnected network. The purpose of IoT is to allow connecting from anywhere, at any time, with everyone and everything via a network (Internet) and a service. IoT represents the revolution of the Internet. Objects can recognise themselves and become smart by taking decisions based on the information received from this interaction.

The Internet of Things (IoT) is represented by the interconnection between smart objects, capable of exchanging information based on an initial established protocol. It is known that an increasing number of objects possess integrated sensors. As a result, the IoT era only has to interconnect these objects and collect the information coming from the sensors with the purpose of accomplishing the objectives of interest (Vermesan, Friess, 2013, p.8). Currently, the IoT era represents one of the most promising emerging technologies with an emphasis on integrating solutions that lead to the interoperability of various existing technologies.

Cite this Article as: Anamaria-Cătălina RADU, Andra Ileana DOBRESCU , Larisa Gabriela OFIȚERU and Ivona STOICA (RĂPAN)" Perceptions of IT Employees Regarding the Use of Disruptive Technologies in The Organisations in Which They Work " Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

All smart objects collect data and automatically transmit them to the beneficiary via a network with an Internet connection. In the future, the processing power, data storing and communication services will be universal and distributed, the real-time bidirectional communication between humans, smart objects, machines and surrounding environment platforms with the help of sensors (wireless or not), M2M technology (machine-to-machine) or RFID labels (Radio Frequency Identification Labels) being allowed. In the IoT era, the objects have an active role due to the Internet connection, and a global network of objects, humans and computers interaction will be created.

The platform's use becomes increasingly easier due to cloud development, its infrastructure allowing the emergence of several applications and services that can be accessed worldwide. The result is accessibility to a network of objects at global level, in which users can meet developers, create businesses or contribute with content, i.e., participate in creating new services. The success of a network of objects is given by the large number of objects, information/ knowledge acquired about the objects, and the rapidity and stability of the Internet connection (Vermesan, Friess, 2013, p.9-10).

Technologies that are based on AI have the ability to diagnose faster and more accurately. Thus, by using these technologies, human error is eliminated. AI helps doctor's access knowledge existing in the medical system more easily. AI-based applications have the capacity to memorise a series of medical knowledge in various fields, and provide health professionals the relevant information for their cases by matching the existing databases in the system with a certain patient's medical case.

Augmented reality can be achieved with the help of several devices, which bring additions to the environment through a computer system (tablet, smartphone or a device specialised in this regard). Here are the following augmented reality variants (vr.google.com):

1. *Use of a smart device with camera (phone, tablet, laptop)* – this variant allows real-time modification of everything that is filmed, being used by a regular user of a smart device (e.g., IKEA's application that allows users to view furniture in the house in real time). Another application is Google Translate that translates in real time the information captured using the smart device's camera.
2. *The use of dedicated glasses* – digital reality elements, displayed by a minicomputer, are added over the field of view. This type of glasses can be used both as eyeglasses and as a screen (Sherman, Craig, 2003).
3. *Head-up display* – information such as speed, vehicle condition, fuel consumption, distance, or GPS information is displayed on the windscreen of a car.

Virtual reality is limited by the processing capabilities of the devices used, which are often small in size, and have limited processing power. Another limitation of the devices is given by the capacity of the batteries, the devices that allow the visualisation of the virtual reality not having very great autonomy. Virtual reality is a new and expanding technology, with multiple companies developing projects in this direction, but investments in technology must be intensified in order to have concrete results and useful applications in everyday life (Sherman, Craig, 2003).

Literature Review

An important aspect that we set out to study is the evolution of disruptive technologies globally. This aspect will help us understand better the impact that these technologies have both on the consumption of raw materials and materials and on the evolution of the labour force, but also on the general evolution of the economy. The new applications that are currently appearing on the market are meant to permanently convince us that they can change our lives but also that they have the ability to improve our standard of living. They offer both consumers and organisations a number of advantages, giving them the opportunity to help them permanently in all their activities.

On the other hand, these disruptive technologies have affected many industries, such as those related to car rentals (people can call a taxi online or rent cars through websites), robots replacing many employees, people being able to share large documents with others that are far away, etc. These new technologies have improved market activity but, on the other hand, have removed traditional producers.

Forbes (forbes.com) conducted a study which found that digital disruption is not just a concept that is studied in detail in the literature, but is a phenomenon that permanently affects the activity of organisations. In this research it was noted that more than 1/3 of the executives who participated in the study mentioned that they feel the impact that digital disruption has on the organisation. They said that the risks posed by the emergence of these disruptive technologies are quite high, their impact being felt in many organisations. More than half of them stated that, in the next 5 years, these technologies are expected to have a strong impact on market share as well as on their revenues.
As previously mentioned, the development of disruptive technologies will automatically lead to a decrease in traditional production. Specialists mentioned that, before observing the positive effects of using these technologies,

we will first feel their effect on the traditional market, due to the loss of jobs and the decline of various industries that will be technologized. The development of specialised applications will have a major impact on the middle and lower classes in the coming years (http://www3.weforum.org/).

The table below shows how disruptive technologies are predicted to impact the economy in 2025, per types of technology, with low and high estimates. Specialists consider that the Internet of Things will have an economic impact reaching up to 11.1 trillion U.S. dollars per year by 2025.

If we analyse comparatively these disruptive technologies, we can note that by 2025 the Internet of Things (IoT) technology will have the largest impact on the economy (high estimate – 11.1 trillion dollars), followed by mobile internet (high estimate – 10.8 trillion dollars), as well as automation of knowledge work (high estimate – 6.7 trillion dollars). In the coming years, cloud technologies as well as advanced robots are expected to have a fairly high impact on the economy (statista.com).

Table 1 – Forecasts on the evolution of disruptive technologies by 2025

Technologies	Estimate	Trillion U.S. dollars
Internet of things	High estimate	11.1
	Low estimate	3.9
Mobile internet	High estimate	10.8
	Low estimate	3.7
Automation of knowledge work	High estimate	6.7
	Low estimate	5.2
Cloud technology	High estimate	6.2
	Low estimate	1.7
Advanced robotics	High estimate	4.5
	Low estimate	1.7
Autonomous and near-autonomous vehicles	High estimate	1.9
	Low estimate	0.2
Next- generation genomics	High estimate	1.6
	Low estimate	0.7

Source: Adapted after: statista.com

Based on the data presented above, we considered it necessary to conduct a study to identify employees' views on disruptive technologies currently on the market, and how they are used in the companies in which they work.

Materials and Methods

In order to establish a more complete framework regarding the complexity of disruptive technologies and their evolution, we decided to develop a survey among specialists who integrate disruptive technologies in their professional activity. Looking from this perspective, an overview will be outlined in terms of the use of disruptive technologies, as well as the potential directions for their development. Moreover, the information will focus on the use of Web 3.0 technologies in their work and in mobile marketing, respectively. Another interesting aspect that will be delivered by experts is the outlining of the ideal web technology, considering the essential parameters used to describe a technology in general. Given that disruptive technologies have experienced an accelerated development trend and a high capacity for applicability in recent years, more and more companies choose to integrate them into their business. Thus, the centre of interest focuses on the people who use such technologies, as well as on the capacity with which experts manage to streamline their professional activity using disruptive technologies.

Figure 1: Objectives of the decision-making problem and the purpose of the research stated

Source: Authors own research

Selection of information collection method

Given the large number of objectives to be achieved in this research, we decided to use the *semi-directed in-depth interview* to collect data from respondents. This method involves an in-depth discussion between the operator and the interviewee, which follows the interview guide to meet all the previously proposed objectives (Cătoiu et al, 2009, p.220). The interview guide was structured in five discussion topics, as follows: "Introduction", "Disruptive technologies in general", "Integration of disruptive technologies in the activity that employees carry out", "Integration of disruptive technologies in the activity of mobile marketing", and "Description of the ideal disruptive technology".

The discussion topic "Disruptive technologies in general" as well as the last topic include projective techniques to complete the sentence, experts being invited to formulate a definition for "disruptive technology", to compare current disruptive technologies with those that existed five years ago, and to describe the ideal disruptive technology, considering the main features of a disruptive technology in general. The use of *projective techniques* was selected because more accurate answers are given compared to asking a series of questions on the investigated subject (Cătoiu et al., 2009, p.232). The time allocated to each in-depth interview was about 90 minutes.

Conducting the research

In order to capture a detailed picture of the subject under investigation, 10 in-depth interviews were conducted with IT experts. They were male and female, aged between 30 and 50 years, the last form of education they graduated was a master's or doctorate program, and they work in companies in Bucharest. The sample was structured as follows: 1 expert in the field of cyber-intelligence, 2 experts in the field of network architecture, 1 expert in the field of social media, 1 expert in the field of online events, 4 experts in the field of online marketing: SEO (Search Engine Optimization) and online market research, 1 expert in the fields of web design. In the following, we will name the experts as follows: Expert 1, Expert 2, Expert 3, Expert 4, Expert 5, Expert 6, Expert 7, Expert 8, Expert 9, and Expert 10. The selection of experts in the field followed a selection questionnaire, composed of four questions. With it, we selected the eligible participants for this study.

The research was conducted among experts in the field between 2017 and 2020. The questions included in the interview guide were addressed to the respondents progressively, in order to obtain answers for each issue. Following the data collection, they were processed and analysed, and later interpreted.

Results

In terms of the analysis of the experts' lifestyle, most adopt **an unhealthy lifestyle (very stressed, workaholic, focused on the job the enterely day with no moments of realxation and wellbeing)**, specific to those in very

crowded cities. However, almost all experts are **receptive** when thinking about possible **changes** that may occur in their lives. Two of the experts consider **change to be beneficial to evolution**.

The most common **hobby** among experts is **the passion for technology** (Internet, web technologies, blogging, and integrated technologies in the automotive industry). Considering the experts' field of activity, they are up to date with the latest technologies, applicability methods, but also with the latest devices for their use.

Technology is constantly present in the lives of experts. **The passion for technology** exceeds the professional barrier, and manages to be successfully **integrated** into personal life.

Moreover, Experts 1 and 2 have integrated technology in their own homes, in order to ensure increased comfort, following the example of smart homes, which use **smart technologies**. They have chosen to adopt these facilities provided by modern technology to reduce utility expenses, to reduce environmental pollution (they use photovoltaic cells and wind power plants to produce green energy), and to ensure the remote control and security of the properties (cameras that stores images in the cloud, ambient temperature control sensors). Expert 1 said: *"I find everything technological and that can make my life easier useful. I even chose to make my own smart home, because I like to take care of the environment, and I like to have control over all my assets. I even have a GPS on my electric car."* Expert 2 is of the same opinion, saying: *"I can't live or imagine my life without technology. My watch, phone, tablet, car and home are smart. The air conditioning at home asks me what time I arrive, to start. I don't waste, I take care of the environment, and I'm fine. I intend to buy an electric car, but they don't have enough autonomy to move without worrying."*

The most common device used by experts is **the smartphone**. The respondents preferred more Apple and one of them, Samsung gadgets.

In general, experts **spontaneously associate** the term "disruptive technology" with aspects related to **the Internet and its use** (*"Internet", "websites", "web applications", "browser multimedia content", "social networks"*), but also the **hardware and software components** underlying the provision of these services (*"server", "programming language", "metadata", "HTML", "networking", "smart devices"*). Regarding **the definition** of the term **"web technology"**, experts believe that it is identified with the following:

Prior to 2010, **the Internet did not have the high speeds** that are currently available, and disruptive technologies **were not open to use by the general public**, but rather intended for IT&C specialists. Since 2010, disruptive technologies have been directed towards meeting the needs of **niche consumers**, by creating **customer-oriented applications** to meet their specific requirements. Moreover, disruptive technologies have facilitated the access to applications on various smart devices.

Starting in 2010, software developers began **to integrate cloud services into applications** because they noticed the customers' need to have a secure and cheaper storage space than investing in their own infrastructure. Experts 4 and 5 support the idea that cloud services will have a rapid development in the future because technology is becoming cheaper and cheaper, and cloud service providers have identified a high potential in their use.

Opinions are divided among experts on the ability of disruptive technologies to meet the needs of the Internet. On the one hand, existing **technologies** at the time **met the requirements of the general public**.

At present, disruptive technologies **have developed considerably and have applicability in vast fields** compared to those existing in 2010, and more, are continuously developing.

Experts also believe that **modern technologies simplify the user's life** because they cover a wide range of services, such as multimedia content sharing, cloud computing and online questionnaires, and *"wireless technology can be applied to any object (luggage that connects via Bluetooth to the phone, and "tracks" the user with the help of the phone without having to touch the object; moreover, it is not even necessary to weigh it because this information can be viewed directly on the phone",* disruptive technologies *"have evolved a lot and improved a lot. SIRI from Apple, 3D Maps (for example, Google Maps), artificial intelligence (for example, RankBrain from Google), there are even websites that allow you to make a phone application with drag and drop."*

Majority provides a more technical perspective on disruptive web technologies *"Online payments that are very diverse and are more trusted by customers/users than in the past."* Regarding the possible problems encountered by experts following **the use** of disruptive technologies, it was noted that most of them **had no difficulty** in this regard. The main reason stated by experts refers to the fact that they are constantly evolving, and are constantly updated to meet the needs of people as accurately as possible.

Disruptive technologies will continue their natural evolution in the future, **new ones will be developed**, and **current ones will mature and will be interconnected**. Expert 3 believes that, in the future, disruptive technologies *"will become interconnected. We will have applications that use modules written in various programming languages, but that will provide a similar user experience regardless of the device used to access the application."* In turn, **the activity in all areas will be carried out exclusively in the online environment**, as one of the experts mentions: *"Everything will be online! A relevant example is Chromebook, whose files are stored exclusively in the cloud, and are accessible via the Internet."* Expert 1 is of the same opinion: *"We will be witness a process of moving information to the cloud. There will be no more physical storage space, like an external HDD. All applications will run on online servers, all information will be stored there. It's cheaper for the public, because they no longer have to invest large sums of money on laptops, computers or high-capacity HDDs/SSDs. They only need a stable and fast Internet connection."* ***Government institutions will*** *also* ***move their services online****."*

Regarding the main areas of applicability of disruptive technologies, experts spontaneously responded with fields such as: *"Medicine", "Cloud", "Entertainment", "Social Networking", "Advertising", "Virtual Reality", and "Marketing"*. In the future, application developers will *"**focus much better on the niche**, and try to better serve certain homogeneous categories of people, so that their demands and needs are best met." "The focus lies more on niche segments, given that their application must be differentiated according to the audience and their needs."* Thus, it is noted that niche segments are a potential source of development in the future.

The third-generation Internet, Web 3.0, includes technologies that help streamline activities in the business environment. It can also support personal use.

In this context, one of the experts declared that "Disruptive *technologies (Web 3.0) are those that decode semantically, do more than just associate/search databases by certain characters/words, etc. Web 3.0 was also created to interconnect devices and everything related to the web pages that a user uses, without having to use each element (device or web page) separately. The browser should become a phone that encompasses all "applications", applications meaning everything related to the web pages they frequent, including online banking, social networks, etc. Until now, these things were done on different devices, and could not match information."*

Two experts believe that this new generation of disruptive technologies will be the one that **will transfer all professional and personal activity to the cloud**. When experts were asked to use their memory and think about the most representative disruptive technologies of the new generation that they integrate in their professional activity, they showed their willingness and provided a wide range of answers. However, **the most common** are programming languages used to develop the vast majority of web applications: HTML5, CSS3, Java, Go, Swift, PHP, along with cloud computing, IoT (Internet of Things), and artificial intelligence. Moreover, experts tend to use in their work services based on disruptive technologies such as: cloud, cloud computing, iGoogle, DBpedia, LifeStreaming, Wordpress.

The benefits of the projects that were observed by the experts refer to the efficiency of the working time, the improvement of communication, and the reduction of costs involved The most common barriers encountered by experts in projects based on various disruptive technologies are related to the degree of knowledge of the technologies involved in the process, allocated budgets, Internet connection, and the time allotted for projects. In this context, they are presented as follows:

Continuing with the weaknesses identified in the projects based on various disruptive technologies, most experts did not encounter any difficulties in this regard. Experts believe that there may be solutions to improve projects based on various disruptive technologies.

Another objective of this study was to identify how the interviewees use the mobile marketing activity within the company.

The next step in the discussion with the experts was an exercise to carry out the personal design of the ideal technology. Thus, the ideal was delimited taking into account the most representative parameters of a disruptive technology in general. However, given the speed with which technology is evolving, identifying the features of an ideal technology is difficult to achieve, because the areas of applicability are completely different, and have specific particularities.

In terms of **scope**, experts concluded that the ideal technology should be applicable in any field (mainly in areas such as e-commerce, banking, and customer relations), should be flexible, efficient and adaptable on any platform, and, last but not least, should be affordable. Experts say that **the architectural structures** of an ideal technology will be complex, but the user interface must be simple to be **easy to use**, even by an uninformed person. They will also be

based on the cloud infrastructure, to allow use on any platform, without the need to install complex software. **The content** must be strictly related to the topic, to allow the user to work efficiently, and, in terms of **communication**, the ideal technology must use and integrate multiple channels and ways of communication, so that, regardless of nationality or language spoken, the interlocutors have the ability to understand each other. In this context, a possible variant could be a real-time translator integrated directly into the new technology's platform. Regarding **the added value of an ideal technology** compared to a technology from previous generations, experts support the idea of integrating multiple technologies into a single search engine, in order to generate a complex answer (semantic query of a search engine).

Given the three main criteria that experts consider when thinking about the ideal technology, the vast majority believe that its benefits (usefulness) come first, followed by data security, and user-friendly interface. Criteria such as low cost, high response speed and the ability of the system to adapt to the devices used were also mentioned.

Conclusions

Following this research, the ***lifestyle*** of the experts was outlined as *disorganised*, *characteristic of large and crowded cities*, with *changes* encountered everywhere, and which they *easily accept*, out of the desire to *constantly evolve* and *get rid of the daily routine*. As expected, the experts' most common ***hobby***, which occupy their free time and more, is technology in general, the preferred device being *the smartphone*. Experts constantly keep up to date with emerging technologies, but also with their application, whether it is the technology present in the virtual environment, or in the automotive industry. Moreover, some experts choose to use smart technologies in order to have permanent control over the perimeter of their homes (home monitoring, security systems, ambient temperature control, etc.). Experts are also passionate about traveling and participating in various *sports and artistic activities*.

Spontaneously, "disruptive technology" is associated with aspects of the *Internet and its use* (websites, web applications, multimedia content using a browser, social networks), but also with certain *hardware* (server, networking, smart devices) and *software components* (programming language, metadata, HTML) that provide these services. Regarding ***the evolution of technologies since 2010***, it is noted that they are mainly aimed *at meeting the needs of niche consumers* using applications aimed at meeting the exact requirements of the customer. Starting with this period, an exponential increase of applications for smart devices could be also observed, mainly due to the hardware evolution and the decrease of the production costs of the devices. Also, since 2010, cloud services have been integrated into applications, giving users the ability to easily store information on the same platform they were working on.

The emergence of the HTML5 standard is worth mentioning, which has greatly improved the way we interact with data. Opinions are divided among experts on the ability of disruptive technologies to meet the needs of the Internet in 2010. On the one hand, some experts argue that they were sufficient for the general public because it does not use cloud services and the applications ran on personal computers, while for specialists, they made it much more difficult to carry out daily activities due to interruptions and interconnection problems.

Currently, **disruptive technologies are constantly evolving**, focusing on **cloud services developed for portable devices**, regardless of the operating system. ***Spontaneously***, "***modern*** disruptive ***technology***" is associated with terms such as *IoT (Internet of Things), AI (artificial intelligence), intelligent online search, graphical interface, virtual reality, wearables, cloud computing,* and *voice search*. Modern technologies simplify the user's life, covering a wide range of services such as multimedia content sharing and cloud computing, with applicability on a lot of smart devices (tablets, mobile phones, wearables, etc.). The emergence of the HTML5 standard is also notable.

It is also worth mentioning that most websites are agnostic devices, and can be viewed correctly, regardless of the device used, tablet or smartphone. We can also note the efforts made in terms of *security and integrity of data stored in the clouds*, but also the fact that *online payments* have increased exponentially, which indicates the confidence of users in online banking services, but also the online migration of many businesses. **In the future**, current technologies **will evolve, new ones will emerge, but most importantly, they will all interconnect**. Thus, *all programming languages will be compatible*, providing a better end-user experience. Experts believe that, in the future, there will be a **process of moving information to the cloud**. The applications will also run from the cloud on various devices, which no longer need high-capacity HDDs/SSDs, but only a *stable and high-speed Internet connection*. Some experts argue that disruptive technologies will serve *the specific needs of niche segments*, and certain homogeneous categories of people, as this is a segment that has not been sufficiently exploited. Others believe that they will serve mainly for the *mass-market*.

The main **field of application** of **future technologies** is *medicine*, according to the spontaneous answers of experts. Other areas in which future web technologies could be integrated are: *"Cloud", "Entertainment", "Social*

Networking", "Advertising", "Virtual Reality", and *"Marketing"*. Among the **benefits** identified in projects using disruptive technologies are aspects related to more efficient working time, improved communication, and reduced costs, while the main **barriers** mentioned refer to the degree of knowledge with respect to the technologies involved in the process, allocated budgets, Internet connection, as well as the time allotted for the implementation of projects. In contrast, most experts believe that there were no weaknesses in the projects they worked on, projects that had integrated disruptive technologies. However, experts are confident that technologies can be continuously improved and that there can be directions for their development. In terms of **integrating disruptive technologies in the mobile marketing activity**, experts believe that marketing through smartphones is *a source with high development potential*, the intention being to exploit it in the future. Experts strongly believe that, in the future, people will access information exclusively from smartphones.

Identifying an **ideal technology** is difficult, given the speed with which technology is evolving, and the many features that need to be considered. However, experts believe that it would be ideal for the technology to be applicable in any field, to be complex and flexible as an architectural structure, but easy to use, even by a non-specialist. Moreover, it should integrate multiple communication channels and be available in different versions, adapted and translated into as many foreign languages as possible.

Physical and Digital Security in Schools and Educational Institutions Preliminary Study: Security Organisation in Schools and Educational Institutions

Ryszard SZYNOWSKI

WSB University, Dabrowa Gornicza, Poland
rszynowski@wsb.edu.pl
szynrys@interia.pl

Abstract

The proposed study topic is of significant cognitive and application importance. In recent years, the issue of ensuring security in the school environment has been the focus of attention of educational authorities, parents and students, as well as scholars, which is why the researchers of the WSB University in Dąbrowa Górnicza joined forces with the Department of Education of the Municipal Office in Jaworzno to jointly undertake the "Physical and digital security in schools and educational institutions" project, the main objective of which will be the development of solutions ensuring physical and digital security of children and youth in schools and educational institutions in Jaworzno. This paper outlines the preliminary results of the first stage of the survey conducted in the environment of school headmasters and headmistresses, as well as managers of educational institutions. The objective of this preliminary study was the diagnosis of the scale and types of threats concerning physical security of children and youth, as well as the analysis of the process of organising security in schools and educational institutions by heads and managers of these institutions.

Keywords: Schools and educational institutions, physical security, digital security, external threats, internal threats, digital threats, security organisation.

Introduction

Methodology and results of preliminary studies

The implementation of the project fills the observed research gap in contemporary academic and practical discourse on student security in schools and educational institutions. A cognitively valuable result of the study will be the analysis of the obtained results of a survey concerning threats occurring in the area of schools and educational institutions of the city of Jaworzno, and – in consequence – working out preventive measures. The study comprises three stages: a preliminary study stage, which involves all heads and managers of educational institutions, a fundamental study stage involving teachers, administration employees and staff, students and their parents, as well as the third stage, which involves working out the procedures and the transfer of practical knowledge on how to behave properly at school, in the public space and at home to students and youth.

The problem area of the preliminary stage of the study concerned finding answers to the following research questions: "What, according to the heads and managers, are the threats to physical and digital security dominant in schools and educational institutions"" and "How does security organised by heads and managers of schools and educational institutions work?"

The study was carried out on the basis of the "Educational institutions monitoring sheet concerning the identification of needs and resources for strengthening the security of children and youth in the city of Jaworzno" developed by the Department of Education and the Department of Crisis Management of the Jaworzno Municipal Office in cooperation with the heads of schools and educational institutions. Due to the nature and subject matter of the project, an anonymous community survey (Babbie 2007; Krok 2015) was chosen as the most appropriate study form, addressed to a small group of experts, namely heads and managers of schools and educational institutions. The self-guided questionnaire comprised 50 questions, including 48 semi-open questions, one open question and an exploratory question. In order to increase the study sample, an online survey was used, sent out to heads of schools and educational institutions. The study was carried out in the school year 2019/2020.

Cite this Article as: Ryszard SZYNOWSKI "Physical and Digital Security in Schools and Educational Institutions Preliminary Study: Security Organisation in Schools and Educational Institutions" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

Any school/institution can be looked at from the point of view of at least two aspects, as an educational institution and as the seat of this institution. In the first case, we will be considering an educational institution that deals with education and upbringing. The issue of upbringing itself encompasses a component of teaching, care and prevention. Care focuses on ensuring the child's safety and meeting their spiritual, mental and physical needs. In the latter case, the school/institution is understood as the building used by its students, teachers and staff. In this case, two factors are crucial from the standpoint of ensuring security, namely the material factor (the school building, its equipment and surroundings – the area adjacent to the building with the infrastructure belonging to the institution, limited by a fence or visible markings) and the human factor (heads and teachers who are responsible for the safety of students during the time they spent at school).

Heads of schools and educational institutions are workplace managers within the meaning of the provisions of the Labour Code and they carry out tasks related to ensuring the safety of students and teachers during classes organised by the school or institution (according to the Education System Act). As employers, they are held responsible for the state of workplace health and safety in the company, and as such they are bound by the obligation to protect the health and life of employees and to know the regulations on labour protection, including, but not limited to, regulations and rules of workplace health and safety. Heads of schools and educational institutions are also obliged to provide information concerning hazards in the workplace, protective and preventive measures and employees designated to provide first aid and perform fire-fighting and evacuation activities to its staff, according to the Labour Code Act.

These two provisions confirm that it is the heads who are responsible for the state of security, including risk analysis and the process of organising security management projects in schools and educational institutions.

Thus, the analysis concerning physical and digital security should start with an assessment of the organisation of this process by the heads of these institutions based on surveys. The following issues were taken into account in the conducted surveys:

- threat identification and assessment;
- formalisation of security issues;
- security in the school grounds;
- occupational safety and health;
- technical security in the workplace;
- employee training;
- security checks.

Analysis of preliminary study results

Threat identification and assessment

The term "threat" can be understood instinctively and it is commonly used; however, it can be interpreted in a variety of ways. The PWN dictionary of the Polish language offers the following definition: "a situation or condition that threatens someone, or in which someone feels threatened" as well as "someone who creates such a situation." Thus, the interpretation of the noun "threat" requires the verb "to threaten", which can have two meanings: 1) "to scare someone in order to force them to behave in a certain manner" or 2) "to become an actual danger to someone or something." Here, threat refers to a certain state of mind or consciousness caused by perceptions of phenomena that are assessed as unfavourable or dangerous (Zięba 2001; Hołyst 1997).

An adequate knowledge of the threats that may manifest themselves in schools/institutions helps to prevent or minimise their consequences. Thus, it is necessary to identify and define a number of present threats, as well as phenomena, which are not specified in the regulations but are noticed as a result of the survey. That is why the issue concerning physical and digital safety in schools and educational institutions is very broad and includes, among others, identifying threats, as well as material and human resources related to the neutralisation of the following threats:

a) external threats (intrusion of an attacker (terrorist), setting up an explosive, leaving a suspicious package, chemical or biological contamination incident);
b) internal threats (occurrence of aggressive behaviour at school, finding drugs at school, theft, cases of paedophilia, distribution of pornography at school, prostitution, disturbing sexual behaviour, accident at school, criminal acts);

c) cybersecurity threats (access to harmful content, cyberbullying, invasion of privacy, children's health risks stemming from Internet use, unsafe contacts on the Internet, sexting, copyright infringement, technical security of networks, computers and resources).

Threat analysis at schools schools/institutions concerned the following issues:
- the types of external threats involved;
- the types of internal threats that have occurred in the last three years and their rate;

In all 50 analysed schools/institutions, a total of 335 cases of risky behaviour of students were reported. The most frequently occurring incidents (more than 50 cases) in schools/institutions concerned verbal aggression and excessive use of Internet-enabled devices. Violent and brutal behaviours (verbal aggression) was reported in 74 cases in 36 schools/institutions. Another key dangerous behaviour of children and youth in terms of an absolute number of reports was excessive use of Internet-enabled devices, with 57 cases were reported in 26 schools/institutions. At the same time, when assessing the frequency of occurrence of risky behaviours in children and youth on a scale from 0 (no occurrence) to 4 (very frequent), the heads stated that verbal aggression occurs very often and often in 11 (22%) schools/institutions, with “rarely” and “very rarely” picked by 25 (50%) institutions, and “not at all” in 14 (21%) institutions. By contrast, excessive use of Internet-enabled devices occurs frequently and very often in 8 (16%) schools/institutions, rarely and very rarely in 18 (36%) institutions, while in 24 (48%) of institutions it does not occur at all.

The second largest group of events in terms of an absolute number of cases (varying between 20 and 50) includes physical aggression, smoking, destruction of property, cyberbullying and deliberate exclusion from peer groups, with a total of 167 cases in 116 schools/institutions.

In the case of physical aggression, 40 events of this kind were recorded in 31 schools/institutions. Another worrying phenomenon is smoking/vaping, with 37 cases reported in 20 schools/institutions. Respondents also pointed to 31 cases of destruction of property in 26 schools/institutions. At the same time, when assessing the prevalence of risky behaviours of children and youth, they stated that physical aggression does not occur in 19 (38%) institutions, and that in 31 (62%) of them it is either rare or very rare. According to the heads, smoking does not occur in 30 (60%) schools/institutions, while in 11 (22%) it is very rare, and rare in 3 (6%) of cases. In 6 (12%) institutions it occurs frequently or very frequently. The phenomenon of destruction of property does not occur in 25 (50%) institutions, while in the remaining 25 (50%) schools/institutions it occurs rarely or very rarely.

In the case of cyberbullying and deliberate exclusion from peer groups, a similar number of events were reported, with 24 events of cyberbullying and 28 cases of deliberate exclusion from peer groups in 20 schools/institutions. The heads assessed the prevalence of these events in a similar manner – cyberbullying and deliberate exclusion from peer groups occur very rarely and rarely in 20 (40%) cases, whereas in 30 (60%) institutions, according to their managers, these phenomena do not occur at all.

The smallest number of incidents (between 1 and 20) includes self-mutilation, theft, possession of dangerous objects, alcohol consumption, use of smarties and drugs. The most common issue reported by heads is self-mutilation (17 cases in 15 schools) and theft (16 cases in 15 schools). Another issue concerns the possession of dangerous objects: 10 cases in 10 schools/institutions, with additional 5 cases related to alcohol consumption in 4 schools/institutions. There were also a similar number of cases related to the use of drugs and smarties with 2 cases each, in 2 schools/institutions, respectively.

The analysis of the survey results shows the particularly low prevalence of the described phenomena. In the opinion of school/staff directors, self-mutilation and theft are rare and very rare in 15 (30%) schools/institutions, while in 35 (70%) schools they do not occur at all. Possession of dangerous objects is very rare in 10 (20%) institutions and does not occur at all in 40 (80%) schools. On the other hand, according to school/institution heads, issues such as alcohol consumption and the use of smarties and drugs occur, respectively: rarely 1 (2%) and very rarely 3 (6%), as well as in 2 (4%) schools each, and does not occur at all in 46 (92%) and 48 (96%) institutions, respectively.

As far as external threats are concerned, principals point out that over the course of the last three years, 15 schools/institutions had a Blue Card procedure (16 Blue Cards) (see the Regulation of the Council of Ministers on the Blue Card procedure) and during the secondary school graduation exams in 2018, e-mails informing about an explosive device being planted were sent to some schools. In the analysed period there was no case of an invasion of an assailant on the school grounds.

To conclude, it needs to be stated that in the opinion of heads, the overwhelming number of incidents that occurred in schools/institutions concerned internal threats, mainly risky behaviours of students; however, they were not particularly prevalent. On average, 65.1% of the respondents believe that there are no risky student behaviours in schools/institutions, while 30.9% consider these cases to be very rare and rare. Only 2.8% of respondents believe that negative behaviours of students in their school are frequent, with 1% considering them very frequent. Among the most frequently mentioned, the respondents indicated verbal aggression, excessive use of Internet-enabled devices, smoking/vaping Physical aggression and destruction of property, as well as exclusion from peer groups are very rare. The rarest issues at school include the possession of dangerous objects, the use of smarties and drugs and the consumption of alcohol.

The threats to digital security pointed out by heads and managers included excessive use of Internet-enabled devices by children and youth, as well as the relatively rare phenomenon of cyberbullying.

Evaluation of the process of organising safety measures in schools/educational institutions

The evaluation of security projects encompasses:

- formalisation of security process;
- materials and assets (passive protection, active protection, threat prevention systems);
- human factor (employment and competencies of teachers and staff);
- cooperation with the institutions responsible for security and public order in the city.

Formalisation is a process in which the goals and structure of the school/institution are regulated by means of legal acts and internal regulations, building patterns of conduct and dependencies, as well as procedures of their operations and functioning. For the proper functioning of schools/institutions, it is necessary to develop written regulations that define objectives and tasks of the institution and its organisational units, responsibilities and powers, and models of activities. Taking into account internal (endogenous) factors, which can be shaped by school/institution directors, security documents and procedures, such as statutes, rules, regulations, plans and procedures in force at schools and institutions were evaluated.

In all analysed cases, according to the principals, the statutes contain security provisions. Similarly, the workplace regulations of work in schools/institutions also contain security provisions in the cases of 48 schools/institutions, in the remaining 2 cases the respondents chose “not applicable”, while others pointed to the need to update the documents in question. In 45 schools/institutions, the Regulations of the Board of Teachers, in the opinion of the heads, contain provisions concerning the protection of personal data. In 22 cases, the schools/institutions have an updated Civil Defence Plan, in 28 cases the plan is being revised or needs to be updated, because as the respondents stated, the plans were drafted in 1987 or 2005. 90% of schools/institutions (45 cases), according to the respondents' answers, had an up-to-date fire safety manual, while 5 institutions need to update their documents.

In 30 schools/institutions, the educational and health prevention curriculum includes content on diagnosed risky behaviours. The diagnosis is carried out using a survey, observation and interviews.

One of the key elements aimed at ensuring security in the schools/institutions is a set schedule of duty teachers. The heads were asked a question on this issue: Does the teachers’ duty schedule cover all places, breaks and time before and after classes? In 40 schools/institutions, a duty schedule was drawn up, with teachers familiarised with the regulations and duty schedule. In 10 cases, however, no such plan has been drawn up, with 6 heads stating that such a plan does not concern their institution.

In addition, it should also be pointed out that in 47 cases there is a register of student group outings, which is usually maintained by the head or manager. In 49 schools/institutions there are trip regulations in force, which envision a trip sheet, list of trip participants, parents’ consent, settlement of trip costs, as well as the regulations of individual trips.

The timetable of didactic and educational activities took into account the need for a balanced educational load on particular days of the week in the case of 47 schools/institutions, which accounted for 97% of respondents’ answers. In the case of 3 institutions (6%), the answer was negative. In their comments, the heads pointed out that this was difficult to achieve due to many teachers being employed for part-time positions in at least two schools, and the timetable being adapted to the availability of teachers. Vacancies among pedagogical staff and insufficient resources were also posted as arguments justifying the difficulties in developing an optimal schedule of educational activities for students.

To sum up, it should be noted that in most schools/institutions, the security documentation is prepared on an ongoing basis. Nevertheless, the greatest shortcomings can be seen in the development of the civil defence plan, with slightly less concerning conclusions concerning educational and prevention programmes and duty schedules.

An important part of dealing with a threat is to develop appropriate response procedures. In 46 schools/institutions a procedure has been developed to deal with an accident involving a student, 43 schools/institutions have a procedure for dealing with an alert and evacuation. Similarly, procedures have been developed in 39 schools/institutions to deal with an entry of strange people on the school grounds. Other areas include procedures concerning theft, which are in force in 34 institutions, planting an explosive charge (in force in 33 institutions), a suspicious package (30 institutions), and discovering psychoactive substances at school (31 institutions). The procedure for dealing with the intrusion of an attacker (terrorist) into the building has been developed by 30 schools/institutions, and response procedures in the case of aggressive behaviours or bullying are in force in 28 schools/institutions. 27 institutions have a procedure for dealing with a student who commits a criminal offence and 22 institutions for dealing with a student who is the victim of a crime. Other procedures concern responding to breaches of privacy, which includes using personal data or image (25 schools/institutions), chemical or biological contamination (21 schools/institutions), threat to the technical security of networks, computers and online resources, (21 schools/institutions), cyber-bullying (19 schools/institutions), threat to children's health from excessive use of the Internet (14 schools/institutions).

In 13 institutions, procedures have been developed to respond in the event of students' access to harmful, undesirable, illegal content, and 11 institutions have procedures in the event of the distribution of pornography in school. Some schools also prepared procedures concerning paedophilia at school (11 institutions) and dangerous contacts on the Internet (9 institutions), disturbing sexual behaviour of students at school (9 institutions), as well as prostitution, sexting and sexual activity as a source of income (7 institutions). 7 schools/institutions have developed procedures concerning uncritical belief in online content and harmful advertising, while 8 schools/institutions have proper procedures for responding in the event of copyright infringement.

In terms of the security procedures in place, we can see a considerable variety of these documents, which concern both external and internal threats. According to the directors' responses, the procedures for dealing with emergencies such as: accident, evacuation, invasion of the school premises, or planting an explosive device or suspicious package, aggressive behaviour, criminal acts were developed in the vast majority of schools/institutions. Less than half of the schools/institutions have prepared procedures related to Internet security, cyberbullying, as well as threats to technical security on the network. The fewest number of procedures include risks concerning dangerous sexual behaviour, pornography, paedophilia, sexting, and prostitution.

Passive security measures

The security of the school premises involves both tangible and intangible factors. In the analysis of the tangible measures, the study covered both active and passive security measures, as well as measures counteracting threats.

During the analysis of passive security measures, the heads found that in 45 cases the school/institution area is fenced, with 5 schools stating otherwise. In 7 cases, however, the fence needs a comprehensive renovation, in two cases the pitch and the school front yard were not fenced. In their explanations, the heads pointed out the need to supplement these safeguards. In 43 cases, communication routes outside the school/institution are secured in such a way as to prevent direct access to the roadway, and in 7 cases they are not properly secured. Respondents pointed out that in two cases communication routes lead directly to the public road and there are no barriers or obstacles. In two further cases, the school operates in two buildings which are separated from each other, in other cases, the exit from the school grounds leads to a housing estate road. In most (44 cases) of the school/outbuilding site is properly illuminated, in 6 cases the directors chose “not applicable.” In one case the evacuation area and the pitch are not illuminated, and in the other case the lighting of the pitch is not working and needs to be renovated. In 31 schools/institutions, the surface of roads, passageways and pitches is level and does not pose a risk to users. In 19, on the other hand, it was stated to be dangerous for users. In their explanations, the heads pointed out that the surfaces of the school square, communication routes (pavement, stairs), sports pitch and asphalt access road require renovation. In all schools/institutions, manholes and other such places are properly secured.

Active security measures

In 34 cases, the school/institution area is covered by video surveillance, with 16 heads pointing out otherwise. In 11 explanations, the respondents pointed out that the video surveillance covers the exterior of the school, focusing on

individual areas – only the entrance to the school, school grounds, school pitch and playground. In one of the schools, an indoor video surveillance system was installed, with 9 cameras inside the building. In 44 cases the school/institution area hired an external security company. The security is provided at certain times, generally from 4.30 p.m. to 6 a.m.

Threat prevention (in terms of health and safety)

The school/institution health and safety policy applies to both students and staff. The school premises tend to offer students the possibility to leave some of their textbooks and school supplies. This was the case in the case of 31 institutions, or 62% of schools/institutions, whereas in 19 cases (38%) the heads responded with "not applicable" – this concerned kindergartens and clinics. In their explanation, they pointed out that they teach individual students and small children who come with their parents. Usually students had access to individual lockers or separate shelves. Workspaces and premises to which unauthorised access is prohibited in all schools/institutions are properly marked and secured. In all schools/institutions, the premises, in particular the teachers' lounge, laboratories, studios, common rooms, school workshops, the PE teachers' room, the dormitory manager and the kitchen are equipped with first-aid kits, containing first-aid equipment and instructions on how to provide first aid. The first-aid kits are not expired and are checked on an ongoing basis by the heads and the health and safety officer. In 32 cases chemicals are stored in closed rooms adapted for this purpose, in 1 school/institution, it is unfortunately not the case. 17 institutions are not concerned with this issue. As a rule, substances are stored in a separate room where only teachers have access or are secured in lockable metal cabinets. Similarly, in 31 cases, chemical substances and are stored in appropriate containers protected from their harmful effects and marked with labels including the names and dangers to health.

In 80% of cases (40 schools/institutions), classrooms and pitches, as well as places designated for PE, games and recreation have information boards, which outline the rules of safe use of sports equipment and devices. In 2 cases (4%) there were no such boards, while 8 cases (16%) were not concerned with this requirement. The heads pointed out that regardless of the information boards, the teachers reminded the children of the safety rules. The escape routes in the 49 schools/institutions are clearly and permanently marked and checked by the heads and the health and safety officer. Similarly, repair, renovation or installation work sites are protected against unauthorised access in 49 schools/institutions through the use of limiting tapes and warning signs. Larger repairs and maintenance work are carried out during winter holidays and summer breaks.

Employing and preparing staff for shaping security at school/educational institution

Ensuring security does not only refer to technical aspects, as the human factor is also of key importance due to individual characteristics of people, which encompass professional skills, knowledge and understanding of safety rules and regulations, rational work organisation, work and study discipline, as well as security procedures concerning the given school or educational institution. There is no doubt that teachers play a key role in ensuring security during classes, breaks, sports competitions, school events, as well as on trips outside the school premises.
In addition, the survey asked heads of schools about the employment of educators, psychologists and nurses – people who support the process of ensuring the security of children and youth by teachers. The employment of educators, psychologists and nurses in schools/institutions varies. 29 schools/institutions employ educators, 21 employ nurses, while 16 employ psychologists. On the other hand, as many as 17 schools/institutions do not employ any of the specialists mentioned above. Working hours also vary.

The assessment of the working hours of educators, psychologists and nurses shows the following:

- educators are generally employed on the basis of a full-time working contract;
- psychologists usually work part-time;
- nurses usually work several hours a week, on the basis of an agreement with the Outpatient Health Care Team.

A very important element in shaping the attitudes of the employees is the training courses that are conducted, which are aimed at:

- acquainting employees with methods of performing work safely;
- identifying threats to children and youth and defining the ways of dealing with them.

An analysis of the studies carried out to date shows that all 50 schools/institutions have trained their staff in first aid. Most of the trainings took place in 2019 and were attended by teachers, administration and service staff. In the area of physical and digital threats, in 2019, teachers from 43 schools/institutions participated in 107 training courses, lectures, talks and other forms of security classes. The training courses were organised by Crisis Intervention Centre (27 cases), the Police (33 cases), Psychological and Pedagogical Clinic (18 cases), Fire Brigade (17 cases), Municipal Guard (6 cases), Outpatient Health Care Clinic (16 cases) and Crisis Management Department of Jaworzno Municipal Office (7 cases). In addition, the teachers participated in 3 training courses organised by other institutions, not listed in the survey. In the case of the majority of training courses, meetings and talks, the topics covered included: workplace health and safety, fire protection, procedures for dealing with crisis situations, first aid, changes in the rules of school trips, safety of a child at home and in the kindergarten, addiction prevention, antisocial behaviour, safety in the network, cyberbullying, aggression, coping with difficult situations, dealing with the intrusion of an attacker into school and planting a suspicious package. The majority (41) of the schools/institutions took part in external prevention programmes in this area. These programmes cover various issues pertaining to the security of children and youth, such as healthy eating, the negative effects of smarties, nicotine and alcohol on the human body. In general, they can be divided into three groups: food safety, environmental safety, and personal safety.

School educators prepare and familiarise students with security issues and threats. In 47 schools/institutions security issues are promoted in the form of a bulletin and information boards. Similarly, in the case of 46 schools/institutions, their websites contain security content, with information submitted by relevant institutions (school superintendent, sanitary services) posted on a regular basis. In addition, 45 schools/institutions organised parental conferences concerning security issues. The subject matter of these meetings varies, but is related to the security of students and youth, concerning shaping healthy attitudes, safe breaks, cyberbullying and others.

Security audit

An audit is a set of activities aimed at checking the actual state or activities undertaken on behalf of an authorised body, consisting of examining and assessing the compliance of the inspected entity with the provisions of laws. The analysis of the statements presented shows that in all schools/institutions the head carries out an audit at least once a year to ensure safe and hygienic conditions and designates areas for improvement. Usually, the audits (checks) take place twice a year during summer and winter breaks, in the presence of the Social Labour Inspector and Health and Safety Inspector. A register of accidents is kept in 49 schools/institutions and the heads talk with staff to determine the causes and circumstances of accidents in order to identify the measures required to prevent them. In the past school year a trial evacuation was carried out in 41 schools/institutions. Most of the evacuations were carried out in the autumn (September, October, November) and spring (March, May) months.

Cooperation of the school with other institutions responsible for security and public order
In the assessment of the cooperation of schools/institutions with external entities in the scope of planned security and prevention activities, it turned out that the Police was the first-choice partner for cooperation in this regard.
In the analysed period of three years 47 schools/institutions (94%) cooperated with the Police. Within the framework of this cooperation, meetings, workshops, lectures on safe movement on the roads, proper behaviour in of a terrorist attack, legal responsibility of children and youth, consequences of illegal acts, cyberbullying, addiction prevention and peer violence were organised.

The Fire Brigade was the second go-to partner for 42 schools/institutions (84%) in the process of carrying out tasks concerning security. These included mainly training courses for children and teachers, trial fire alarms, contests on firefighting knowledge, presentation of firefighters' skills, preventive actions (concerning burning grass), trial evacuations, meetings, workshops, lectures, demonstrations, fire safety instructions, educational projects, reviews of firefighting equipment.

Other partners with whom schools cooperated included: Outpatient Health Care Clinic (ZLO), Psychological and Pedagogical Clinic and Crisis Intervention Centre, with 39 (78%) working with the former, primarily on issues concerning health and addiction prevention, providing health and dental care, organising trainings, workshops, lectures, conducting surveys and diagnostic studies at the school. 78% of schools/institutions (39) cooperated with the Psychological and Pedagogical Clinic, which organised training courses for children and youth, workshops, consultations, mediation, provided help to students with learning difficulties, issued opinions, as well as carried out psychological and pedagogical diagnoses for students. It also intervened in difficult situations, organised individual counselling for teachers, carried out preventive actions concerning aggression, violence and cyberbullying, conducted educational and preventive activities, classes for parents and parental education. 37 schools/institutions (74%) cooperated with the Crisis Intervention Centre. This cooperation concerned the organisation of training

courses, workshops, consultations, lectures, psychological assistance as part of crisis intervention, running prevention programmes, participation of teachers in training courses, individual counselling for parents, support for student families. 44% of schools/institutions (22) cooperated with the Crisis Management Department of the Jaworzno Municipal Office. The Department organised training courses for heads and teachers, participated in the organisation of school events, organised meetings, workshops and lectures. It also organised the annual Jaworzno Security Conferences, implemented the "Safe School" Programme and carried out training courses on terrorism. Only 30% (15) of all institutions cooperated with the Municipal Guard. This cooperation concerned the organisation of the Jaworzno Security Conference, additional patrols in the evening and on days off, intervention in case of improper behaviour of third parties entering the school grounds, organisation of interdisciplinary teams and meetings with children.

In addition, the schools/institutions have started to cooperate with 18 other institutions not listed in the survey to ensure the safety of children and youth. Respondents mentioned: District Sanitary and Epidemiological Station, Regional Sanitary and Epidemiological Station, Jaworzno Municipal Office, Municipal Social Welfare Centre, Municipal Commission for the Solving of Alcohol Problems, educational centres: WOM Regional Centre for the Improvement of Teachers, METIS Regional Methodological and Educational Centre.

Conclusions

The survey carried out among heads of schools/institutions operating in Jaworzno enabled the identification and assessment of threats occurring in this area. In 50 analysed schools/institutions in 2016-2019, 335 disturbing events posing a security risk were reported.

The respondents usually pointed out internal threats as having the most significant impact on security in the school/institution, including dangerous behaviour of students, in the form of verbal and physical aggression, smoking, destruction of property, exclusion from peer groups, self-mutilation, and possession of dangerous objects. Among the external threats, the directors pointed out domestic violence (16 Blue Card procedures), the threat of a terrorist attack (6 cases of false information about an explosive device planted at school), fire (1 case), and spraying a dangerous substance at school (1 case).

Threats to digital security identified by the respondents are: excessive use of Internet-enabled devices by students, cyberbullying, sexting (1 case).

In the opinion of the respondents, these phenomena are hardly prevalent. On average 65.1% of the respondents believe that students in their school/institution do not exhibit any dangerous behaviours, while 30.9% believe that these cases are rare and very rare. Only 2.8% of respondents believe that negative behaviour of students is frequent and 1% that it is very frequent.

Concerning the projects undertaken by the heads to ensure the security of students and teachers, it can be generally stated that they correctly implement safety projects in schools/institutions in the City of Jaworzno. The security audits in schools/institutions is at a very good level – regular audits are carried out; registers of accidents are maintained and trial evacuations take place in 93.4% of schools/institutions. The passive security of the area of the institutions should also be commended, especially the protection of manholes, fences and illumination of the school grounds, as well as ensuring the safety around communication routes (85.2% of schools/institutions). Similarly, the formalisation of the security process in the form of regulations, instructions, programmes and procedures also goes well (84% of schools/institutions). The activities aimed at preventing threats to occupational health and safety (79.32% of schools/institutions) as well as employing and preparing employees for shaping security in educational institutions (73.26% of schools/institutions) is on an average level. The schools' cooperation with other institutions responsible for security and public order in Jaworzno (60.58% of schools/institutions) and active protection of the institutions' grounds against external threats (52.6% of schools/institutions) remains less effective.

According to the study carried out among the heads of schools/institutions of the city of Jaworzno, they have a good opinion of the state of security in the institutions they manage. They recognise the threats arising from past events and take action to eliminate them.

What remains is the search for answers to the next two questions: "What is the extent of knowledge of security procedures in schools and educational institutions?" and "What are the rules of communication and cooperation between the heads, teachers, students and parents?"

To conclude, it is necessary to undertake further studies among teachers, administration and service staff, children and youth, as well as their parents.

Acknowledgment

The author, Ryszard Szynowski, would like to thank the authorities of the WSB University in Dąbrowa Górnicza for financial support of the study, and the Department of Education of the Municipal Office in Jaworzno for enabling the study to be conducted.

Preparation of Security Professionals or from Security Education To National Security Studies

Eugeniusz NOWAK

WSB University, Dąbrowa Górnicza, Poland
enowak@wsb.edu.pl

Abstract

Objective: To propose solutions ensuring continuity and effectiveness of teaching security at all stages of education, in order to properly prepare security professionals.
Security is becoming increasingly desirable asset, both from the individual and collective standpoint. Ensuring security is a fundamental duty of the state, which is by its very nature called upon to ensure national security. These expectations are met by the *National Security* Studies, preparing staff of bodies and organisations dealing with ensuring security in the case of threats of non-military nature. Despite this, even the best curriculum can fall victim to the so-called isolationism or siloisation of individual study topics, which leads to a number of unfavourable phenomena, including underestimation of didactic unitarianism, lack of educational content correlation between various subjects, redundant educational content, difficulties in implementing innovations, and many more. These problems with study curricula can and should be eliminated. The presented paper offers a number of proposal in this regard.
A professional is defined as a person who possesses great skills in a given job and who does their job as well as they can. Therefore, the process of *National Security* studies should be determined by shaping the professional skills of the graduates.
Methodology
The solutions proposed in the article are based on the results of studies presented by subject literature [1, 2]. Theoretical methods (analysis, synthesis and analogy) and empirical methods were used in the study process. Empirical methods were dominated by the survey method, mostly focusing on the interview technique.
Article type: academic paper.

Keywords: Security, State Security, Safety Education, National Security Studies.

Introduction

Security is becoming increasingly desirable asset, both from the individual and collective standpoint. Ensuring security is a fundamental duty of the state, which is by its very nature called upon to ensure national security.[1] Individual and social awareness in this area is increasing and the world expects systemic solutions.[2] These expectations are met by the National Security Studies, preparing staff of bodies and organisations dealing with ensuring security in the case of threats of non-military nature. Graduates of these studies are predisposed for working in managerial and expert positions in bodies dealing with the security of citizens and businesses, in public administration bodies (for example security and crisis management departments), as well as in education and academic institutions dealing with security issues. Nowadays, the universities offer bachelor's, master's and doctoral studies.

Focused and organised teaching of safety and security issues in Poland begins in the 8th grade of primary school with the Safety Education subject, which is continued in secondary schools. This education can be then continued

[1] According to the author [E.N.], national security in democratic countries can be conflated with state security, due to the fact that the governing bodies in these countries are appointed by way of general democratic elections, which means that they govern by the will of the general populace and serve their voters. with National Security studies. Since education encompasses all the experiences that make up an individual's knowledge and skills, the process of teaching security issues should be continuous, thus enabling a smooth transition to the next, higher levels. Despite this, even the best curriculum can fall victim to the so-called isolationism or siloisation of individual study topics, which leads to a number of unfavourable phenomena, including underestimation of didactic unitarianism, lack of educational content correlation between various subjects, redundant educational content, difficulties in implementing innovations, underappreciation for the Safety Education subject at universities and many more. These problems with study curricula can and should be eliminated. The presented paper offers a number of proposal in this regard.

A professional is defined as a person who possesses great skills in a given job and who does their job as well as they can. Therefore, the process of National Security studies should be determined by shaping the professional skills of the graduates. This is what should determine the outstanding quality of education at universities.[3]

Study Methodology

The objective of the study process was to obtain answers for two basic questions:

1) What are the expectations concerning security issues taught at different stages of youth education?
2) How can and should security professionals be prepared?

In order to answer the first question, theoretical and empirical methods were used in the study process. The key theoretical methods employed in the study included:

1) Analysis, which was used for critical analysis of the subject literature concerning the organisation of security education at different stages of youth education. The subject literature analysis focused on [1,2,3,4].
2) Analogy, which was used to formulate proposals relating to the expectations of teaching the *Safety Education* subject at different stages of youth education, as well as training security professionals.
3) Synthesis, which was used to formulate conclusions (proposals concerning the organisation of security education in the case of *National Security* studies) obtained through inductive reasoning and deductive reasoning, as well as by means of analogy.

The key empirical method, on the other hand, was the opinion polling method, in which the expert interview technique was employed. The interviews were conducted with experienced, long-serving academic teachers of National Security, as well as employees of public administration offices at provincial and district level responsible for crisis management

In order to answer the second question, namely how can and should safety professionals be prepared, the analogy and survey methods were used in the study process.
The former was used to come up with proposals for the organisation of the National Security education process. The model solutions used in this respect for this study, were previously used and verified in the former Academy of National Defence and the former Higher School of Management and Entrepreneurship (Warsaw Branch).

Study Results

Objectives and educational content of the Safety Education subject in schools and educational institutions

In Poland, the beginnings of *safety education* are connected with civil defence classes for youth, which have been a mainstay in education for many years. These classes taught young people knowledge shaping their patriotic feelings and attitudes as well as skills necessary to defend the independence of their homeland. The main educational objective was to prepare young people for group self-defence from the effects of threats of during peace and war time, as well as leading small civil defence teams.

In terms of etymology, the notion of *safety education* first emerged at the National Defence Academy in Warsaw as part of a research project on the Polish security system carried out in 1993-1995. At the time, the currently used definition of the concept of *safety education* did not exist yet. The then Ministry of Science and Higher Education

[3]Universities strive to build their image by offering high-quality education, which translates into the demand for their graduates on the labour market.

defined it as a *branch of national education, whose main objective is to prepare young people to face civilisation and military threats*[4]. The document of the Ministry of Interior and Administration released in September 2004[5] indicates that *the aim of safety education is to promote awareness and knowledge of the sources, nature and impact of everyday and emergent threats, as well as to teach the skills of recognising, preventing and combating these threats.*

The subject referred to as *Safety Education* was introduced to Polish schools on 1 September 2009.[6] It was taught in the third and fourth stage of general education, namely in middle and secondary schools (vocational schools, general high schools, specialised high schools and technical schools, except for students of adult schools). The process of teaching this subject was based on the curriculum implemented by the Ministry of Science and Higher Education.

Safety Education was aimed at preparing students (youth learning in middle schools and high schools) for proper behaviour and appropriate response in situations posing a threat to health and life. The subject covered varied educational content concerning state security, organisation of rescue operations, health education and first aid.

State security was perceived as a subject explaining the mechanisms for ensuring order, stability of human societies, as well as the accompanying concepts, methodologies and measures. In terms of preparation for conducting rescue operations in emergency situations, the education was interdisciplinary and aimed at effective action and responding to different types of threats.

The most important skill acquired at school was the ability to provide first aid by undertaking life-saving measures.

The educational reform carried out in the Republic of Poland in 2017[7], which removed middle schools from the educational system, resulted in – among other things – the introduction of *Safety Education* in the 8th grade of primary school. This required the development of new curricula for teaching this subject in primary and secondary schools.

In primary schools the objectives of *Safety Education* include:

I. Understanding the essence of state security.
II. Preparing students for emergency situations (disasters and mass accidents).
III. Developing basic first aid skills.
IV. Shaping healthy individual and social attitudes.

The teaching content of *Safety Education* in the 8th grade of primary school covers[8]:

I. State security – basic concepts pertaining to state security and understanding of the essence of security and its components; geopolitical conditions of security resulting from Poland's place in the world and the role of international organisations in ensuring Poland's security.
II. Responding to emergency situations (catastrophes and mass accidents) – examples of emergencies (natural and human-made); rules concerning alerting the population to risks; alert signals and emergency measures; rules of appropriate behaviour in the event of alerts; responsibilities of the population in situations requiring evacuation; roles of authorities and other rescue actors; rules of responding to fire, traffic accident, flood risk, intense snowstorm, release of dangerous chemicals and terrorist attack.

---

[4] The definition of *safety education* was presented by a representative of the Ministry of Science and Higher Education at the international seminar *Safety Education in the Visegrad Group Countries* , which was held on 19-21 May 2004 in Warsaw. https://www.mswia.gov.pl/ftp/pdf/edukacja-dla-bezpieczenstwa.pdf. [1.06.2017].

[5] *Edukacja dla bezpieczeństwa. Informacja,* Wyd. MSWiA, Warszawa 2004, s. 3. https://www.mswia.gov.pl/ftp/pdf/edukacja-dla-bezpieczenstwa.pdf. [1.06.2017].

[6] *Rozporządzenie MEN z dnia 28 sierpnia 2009 r. w sprawie sposobu realizacji edukacji dla bezpieczeństwa,* Dz. U. Nr 39, poz. 1131.

[7] *Ustawa z dnia 14 grudnia 2016 r. – Prawo oświatowe*, Dz. U. z 2018r., poz. 996.

[8] *Rozporządzenie Ministra Edukacji Narodowej z dnia 14 lutego 2017r. w sprawie podstawy programowej wychowania przedszkolnego oraz podstawy programowej kształcenia ogólnego dla szkoły podstawowej, w tym uczniów z niepełnosprawnością intelektualną w stopniu umiarkowanym lub znacznym, kształcenia ogólnego dla branżowej szkoły I stopnia, kształcenia ogólnego dla szkoły specjalnej przysposabiającej do pracy oraz kształcenia ogólnego dla szkoły policealnej*. Dz.U. z 2017r., poz. 356.

III. Basics of first aid – first aid provided by eye witnesses; rules of safe conduct at the scene of the incident.
IV. Health education – individual and collective health; healthy behaviours; individual responsibility for health; rational nutrition; physical activity; impact of stress on health; availability of publicly funded health services; health problems in a collective dimension: environmental factors, culture, social norms and habits; social support concerning health.

In the process of teaching *Safety Education* in primary schools, in addition to basic classes in the classroom, other forms are recommended, such as:

– students' visits to state institutions: Crisis Management Centres, State Fire Brigade units, Emergency Medical Service facilities;
– specialised training and recreation camps during the summer breaks, courses in *Safety Education;*
– meetings, lectures, courses with police officers, municipal guard, emergency medical services, veterans, environmentalists, psychologists, etc.;
– participation in competitions on *Safety Education.*

In secondary schools, the objectives of *Safety Education* are[9]:
I. State security (knowledge of the state security structures).
II. Preparing for emergency situations (disasters and mass accidents).
III. Basics of first aid (mastering first aid).
IV. Health education – individual and collective health; Healthy behaviours.

Teaching content of *Safety education* in secondary schools includes[10]: knowledge of the state defence structures; civil protection and defence; sources of nuclear radiation and its effects; alerting the population about dangers and threats; first aid in emergency situations; lifestyle diseases; elements of mental health; physical activity; nutrition; addictions.

In the process of teaching *Safety Education* in secondary schools, in addition to classroom activities, other forms of education are recommended, including:

– students' visits to state institutions: Crisis Management Centres, State Fire Brigade units, Emergency Medical Service facilities;
– specialist training and recreation camps (connected with *Safety Education* issues);
– excursions (connected with *Safety Education* issues);
– outdoor activities (connected with *Safety Education* issues);
– exhibitions of individual, classroom and school works promoting a healthy lifestyle and proper behaviour in emergency situations;
– visiting exhibitions related to *Safety Education* issues;
– meetings (for example participation in classes), lectures, meetings with employees of key security institutions (Police, State Fire Service, Polish Armed Forces, Municipal Guard, Emergency Medical Services, veterans, environmentalists, psychologists;
– participation in competitions on *Safety Education.*
– cooperation with local units of the Police, State Fire Service, Polish Armed Forces, Volunteer Fire Service, Polish Red Cross, National Defence League etc.

Table 1: Comparison of the objectives of *Safety Education*

Learning objectives of SE Elementary School (8 grades)	Learning objectives of SE Secondary schools
I. Understanding the essence of state security.	I. State security (knowledge of state defence structures).
II. Preparing students for emergency situations (disasters and mass accidents).	II. Preparation for rescue activities in emergency situations (disasters and mass accidents).
III. Developing basic first aid skills.	III. Basics of first aid (mastering first aid).
IV. Shaping healthy individual and social attitudes.	IV. Health education – individual and collective health; healthy behaviours (knowledge of healthy individual and social attitudes).

[10] Ibidem.

The analysis of the objectives of *Safety Education* presented in the table clearly shows that the focus of the teaching effort is aimed at teaching practical skills needed in everyday life. However, in both primary and secondary school, they only concern first aid in emergency situations.[11] Moreover, a comparative analysis of the objectives of primary and secondary education shows that they are not only similar, but also identical. It can be assumed that education in secondary schools is aimed at improving students' knowledge and skills acquired in primary school; however, by the end of an 8-year primary school, the student already has some knowledge of security, which is the basis for not only consolidating this knowledge, but above all for building upon it. Taking into account the further education of secondary school graduates in the field of *National Security*, according to the opinion of the author [E.N.], the broadening of their knowledge should include some of the educational content previously taught as part of *Civil Defence* (such as *Terrain Studies, International Humanitarian Law*), as well as the *Basics of Security Management* and *Social Policy*.

Table 2: Comparison of the educational content of *Civil Defence* and *Safety Education*

Civil defence Secondary school	Safety education Primary school	Safety education Secondary school
	State security	Polish defence system
Threats to the people in the time of peace and war		Sources of nuclear radiation and its effects
Basic tasks of Civil Defence	Responding to emergency situations (disasters and mass accidents)	Civil defence
Selected issues of international humanitarian law		
Protection of people as part of universal self-defence	Responding to emergency situations (disasters and mass accidents)	Protection of people Alerting the public of threats
Emergency medical assistance	First aid basics Health education – individual and collective health; Healthy behaviours.	First aid in emergency situations. Lifestyle diseases; mental health elements; physical activity, nutrition, addictions.

When analysing the objectives and educational content of *Safety Education*, we cannot overlook post-graduate studies for teachers of this subject in schools and educational institutions, as well as *National Security* studies.

The aim of postgraduate studies for teachers of t *Safety Education*[12] is to teach interdisciplinary knowledge concerning the types and sources of contemporary threats, as well as ways to prevent them and the rules of providing assistance in situations of threat to life and health during peace and war. The knowledge and skills acquired by the students are to contribute to increasing professionalism and effective search for solutions to problems occurring in crisis situations. The post-graduate studies enable teachers to gain practical skills concerning independent teaching of *Safety Education*, as well as first aid courses in schools and educational establishments.

The educational content of post-graduate *Safety Education* studies usually comprises 5 modules:

1st module – state security (educational content: national security; social security policy; security management; state defence in the time of peace; economic security; sport and combat shooting; organisation and management).

2nd module – emergency situations (educational content: principles of Civil Defence; detection of contamination, infections, protection; alert and warning system; emergency situations, crisis management; logistics in emergency situations).

3rd module – first aid, resuscitation (educational content: emergency medical system in Poland; respiratory and cardiovascular system; basics of first aid; diagnosis and rescue activities in life-threatening situations).

[11] Gaining first aid skills, as well as health education, are among the most important topics covered during *Safety Education* classes, due to the highest probability of using them in real-life settings.

[12] Cf.:, Centrum Kształcenia Podyplomowego, Łódź, ul. Sterlinga 26.

4th module – health education (educational content: individual and collective dimension; personal communication for health and safety; activities, healthy behaviour; conditions, social and environmental factors impacting health).
5th module – apprenticeship/*Safety Education* teaching methodology (work experience in schools).

The above shows that the graduates of the post-graduate *Safety Education* studies are well-prepared to teach *Safety Education* in both primary and secondary schools.

The *Safety Education* subject as part of the *National Security* studies is offered at the master's level (bachelor's level in some cases). The educational objectives and content, in accordance with the principle of autonomy of universities, are left for the universities to decide, and thus based on original curricula prepared by teachers responsible for this subject.

Objectives and educational content of the National Security studies.

The studies in *National Security* are civil studies, preparing staff for the bodies dealing with security in situations of non-military threats. Graduates of these studies are predisposed for working in managerial and expert positions in bodies dealing with the security of citizens and businesses, in public administration bodies (for example security and crisis management departments), as well as in education and academic institutions dealing with security issues. Nowadays, the universities offer bachelor's, master's and doctoral studies.

Graduates of first cycle degree of *National Security* studies should have basic knowledge and skills in general security and crisis management issues, based on the foundations of the humanities. They should be able to take advantage of the knowledge and skills they have acquired in their professional work, while respecting legal and ethical principles, as security specialists working for the authorities, institutions and public bodies that ensure the security of citizens and businesses. According to the author [E.N.], a graduate should have the ability to solve professional problems, collect, process and share (written and oral) information related to the organisation and implementation of rescue and prevention tasks. Educational content on the bachelor's degree level[13] typically covers: scope, tasks and basic categories of crisis management; theoretical aspects of crisis management; legal aspects of crisis management; natural disasters and their consequences for the population, property, infrastructure and environment; tasks and competences of public authorities, state institutions and organisations in crisis situations; organisation and tasks of a crisis management centre in a municipality, district and region; establishing a municipal (district and regional) crisis management team; forces and resources of the municipal crisis management team; working methodology of the municipal crisis management team during a natural disaster, in some cases also elements of planning and managing the rescue action by the municipal crisis management team[14].

Graduates of second cycle degree of *National Security* studies should have extended knowledge and skills to creatively solve security and crisis management problems, including in non-standard situations, based on incomplete information, compared to first cycle degree graduates. They should be able to use the knowledge and skills they have acquired in their professional work in accordance with legal and ethical principles. According to the author [E.N.], a graduate of these studies should be able to competently and ethically manage teamwork, as well as organise rescue and prevention actions. What is more, they should be prepared to work in public administration structures in managerial positions, organisations preoccupied with national and international security, as well as research, educational and higher education institutions dealing with security issues.

The educational content on the master's degree level usually covers: organisation and functioning of the crisis management system at the state and regional level; tasks of institutions, authorities, inspectorates, guards and other organisational units at the district and regional levels in crisis situations; methodology of decision making process and working out the intentions of the crisis management authorities; principles and procedures of staff work in crisis management teams in the county and region; organisation and management of rescue and prevention actions by crisis management teams on the district and regional level; organisation and management of exercises (decision games) with members of crisis management teams, as well as with commanders who manage rescue or prevention actions.

Graduates of postgraduate *National Security* studies should have the required skills and competencies that enable them to become skilled researchers, capable of conducting independent research on the issues of national security. Some graduates of these studies are expected to continue their research in both public and private institutions, while

[13] In line with the principle of university autonomy, educational content is decided by individual universities.
[14] This is confirmed by the author's professional experience [E.N.].

other graduates are expected to use their competences in other professions. Post-graduate studies, in addition to scientific training, may also include the so-called "transferable skills" and expert optional courses.

Training "transferable skills" in PhD candidates may include research dissemination, teaching security issues at the university level, subject literature analysis and more, while optional courses may cover research project management, establishing national and international contacts, supervising the work of staff, etc.

The analysis of the objectives of students' education in the field of *National Security* , it is easy to see that they are and should be oriented primarily towards shaping professional skills. In the case of the bachelor's degree studies, these skills are related to the performance of tasks as a security expert
working for authorities, institutions and public bodies concerned with the security of citizens and businesses. On the other hand, in the case of master's degree, the professional skills of the graduate are mainly related to work in managerial positions in public administration structures and organisations dealing with the security of citizens and businesses.

The didactic success in shaping the professional skills of graduates of the *National Security* studies is determined primarily by two basic sets of elements: the first is related to the curriculum of the studies and involves the key subjects module, while the other covers the scope and manner of implementation of this module by academic teachers.

The subject module can be conventionally divided into key and supporting subjects. The key subjects in bachelor's degree studies usually include: *Crisis management* and *Basics of logistics in crisis situations,* while the supporting subjects are: *Introduction to security theory, Security policy, Security strategy* , etc.

On the other hand, the leading subjects in master's degree studies usually include: *Crisis management using staff games, Security management in public spaces, Logistics management in crisis situations, Safety education.* And the supporting subjects include: *Contemporary security threats, State security system, Social security, Protection of social infrastructure, Security of local communities, Protection of people, property and areas*, etc.

However, the professional experience of the author [E.N.] indicates a number of drawbacks related to the achievement of the main educational objectives, which is to shape the professional skills of graduates of *National Security*. These drawbacks primarily concern underestimation of didactic unitarianism, isolationism and underestimation of the role of *Safety Education,* in the process of shaping students' skills, as well as correlation[15] of the subjects.

The underestimation of didactic unitarianism[16] in the process of developing curricula is seen in, among other things, the equal treatment of all subjects which are given the same number of hours (usually 30 hours). This causes the key subjects to be limited to a few hours, which is hardly enough when it comes to their mission.

Isolationism is seen in the lack of correlation between the educational content of key subjects and supporting subjects, as well as the content of other courses. In this respect, there may be at least two detrimental phenomena – the first being the redundancy of some educational content, while the second being the lack of continuity and gradation of the knowledge and skills provided to students.

The *Safety Education* subject presented as a course during *National Security* studies should internalise – in the author's opinion [E.N.] – key subjects [17] in terms of shaping the professional skills of the graduates.

3. How to ensure the preparation of security professionals?

Professionalisation[18] is the acquisition of skills required to work in a given profession. Given this, the objectives of security education should be formulated in an operational manner[19], diverting students' attention to acquiring skills.

[15] Correlation – interdependence, interconnection.

[16] It should encourage consensus building – building bridges between academic teachers teaching key and supporting courses, as well as other courses coinciding with the key subjects.

[17] Internalisation – accepting values, norms, social principles, etc., which have been imposed from outside for some time, and recognising them as one's own. *Słownik języka polskiego*, tom pierwszy, Wyd. PWN, Warszawa 1978, s. 810.

[18] A professional - a specialist, an expert in a given field, a person who knows their profession well. *Słownik języka polskiego*, tom trzeci, Wyd. PWN, Warszawa 1978, s. 929.

Of course, in relation to the teaching of *Safety Education* in schools and educational institutions, it is difficult to talk about professionalisation. However, given the need to maintain continuity in teaching concerning security issues, there should be a progression in the transfer of basic safety knowledge and behaviours in secondary schools, as well as appropriate responses in situations that pose a threat to health and life. However, during the *National Security* studies, there are many areas where *"things can be done better."* According to the author's opinion [E.N.], these areas include:

– the process of creating (developing) study curricula;
– the process of selecting the educational content of the courses;
– correlation of educational content between courses;
– correlation of the content of the basic modules with the contents of the key courses;
– pragmatism of educational effort aimed at shaping professional skills;
– a "new approach" to the role of the *Safety Education* course presented during the *National Security* studies;
– expert preparation of academic teachers conducting major courses, including key courses.

The number of teaching hours is always fixed and limited, which makes it difficult to increase. Therefore, there is a need to move away from a static (equal) treatment of all major courses, allocating varying number of hours to each of them. Thus, we can see a need to renormalise the courses aimed at getting rid of inefficient solutions. Shaping professional skills is time-consuming. Therefore, while developing the curricula, major and key courses should be preferred when it comes to the allocation of the number of hours. How many hours should be assigned to individual subjects should be determined by original study curricula.[20]

The selection of the contents of the courses should serve to prepare a graduate of bachelor's degree studies to working as a security specialist for authorities, institutions and public bodies concerned with the security of citizens and businesses., while graduates of master's degree studies should be ready for working on managerial positions in public administration structures and organisations dealing with the security of citizens and businesses. It goes without saying that the most realistic situation, which can be encountered by *National Security* graduates in their future line of work involves crisis situations which are used as the backdrop for team exercises conducted with crisis management teams and commanders who lead rescue or prevention actions. Therefore, such exercises should have a special place in the process of teaching key and major courses. According to the author's opinion [E.N.], bachelor's degree studies should involve group exercises[21] and study exercises.[22] On the other hand, master's degree studies should include staff and command exercises.[23] However, the educational content of particular major courses should be determined by original curricula aimed at acquiring professional skills.

Correlation of the content of education between major subjects should prevent redundancy of educational content between courses, as well as determine the scope and order of the content taught to students, while ensuring the continuity and clarity[24] of acquiring skills.

The correlation between the content of basic modules with the contents of the key courses should make it possible to use the knowledge and skills acquired in the course of some basic module subjects in the process of developing professional skills. According to the author [E.N.], such subjects include primarily Organisation and management and Security geography.

The pragmatism[25] of the teaching effort should be expressed in the selection of educational content that serves shaping professional skills. According to the author [E.N.], in the case of bachelor's degree studies, this should concern knowledge and ability to develop plans and directives concerning rescue (prevention) operations and crisis management. On the other hand, in the master's degree studies, this should focus on assessment of a crisis situation,

---

[19] Operational objective – a specific objective, presented in a precise manner.

[20] The universities compete with each other in terms of quality of education, among other aspects. Bespoke and original curricula can play a very useful role in this respect.

[21] Group exercises are the simplest form of exercises, during which all participants play the same role simultaneously.

[22] Study exercises are a special kind of a group exercise. They involve a small group of students who are prepared to perform specific functions in staff exercises.

[23] Staff exercises conducted with students of *National Security* are a form of team exercise, the aim of which is to prepare the participants for optimal response in non-military crisis situations.

[24] The author [E.N.] means vertical clarity, concerning the order of acquisition of skills.

[25] Pragmatism - an attitude envisioning a realistic assessment of reality and taking only actions that guarantee effectiveness.

analysis of a rescue (prevention) operation, decision making, working out an intention to carry out rescue (prevention) operations, organising the work of command and crisis management teams, setting tasks, checking performed tasks, reporting on operations, etc.

According to the author [E.N.], a "new approach" to the role of the *Safety Education* course presented during the *National Security* studies should encompass giving it a leading role in preparing students for staff exercises, as well as in teaching them an ability to prepare documents related to the preparation and running team exercises (group exercises, study exercises, staff exercises). Other desirable outcomes include preparing term papers and theses (bachelor's and master's theses) related to the preparation and running team exercises concerning security issues.

Expert preparation of academic teachers running major and key courses, including in particular courses involving staff training, should be carried out similar to post-graduate studies organised for *Safety Education* teachers in schools and educational institutions. The author's [E.N.] teaching experience shows that such subjects are currently entrusted to the most experienced academic teachers; however, it is not a perfect solution!

The above-mentioned areas which are conducive to the development of professional skills of *National Security* students are not fully exhaustive. In accordance with the study plans, apprenticeships are conducted. An old Polish proverb says, *"It's better to see something once than hear twice"*. The effectiveness of these apprenticeships depends to a large extent on the so-called circumstances, namely the synchronisation of the apprenticeship with training projects organised by institutions (authorities, public bodies) responsible for security, as well as random (crisis) events that may occur during the apprenticeship.

Conclusions

1. In primary and secondary school, the focus of teaching effort in the scope of the *Safety Education* subject is directed at teaching practical skills needed in everyday life. Unfortunately, they are not only similar, but also identical in primary and secondary school. Therefore, it is important to ensure that a student graduating an 8-year primary school has the opportunity to broaden their knowledge of security and safety issues in secondary education. This broadening should include the teaching content presented in the past as part of the *Civil Defence* classes (for example *Terrain Studies, International Humanitarian Law*), as well as the *Basics of Security Management* and *Social Policy*.
2. Graduates of first cycle degree of *National Security* studies should have basic knowledge and skills in general security and crisis management issues, based on the foundations of the humanities. They should be able to take advantage of the knowledge and skills they have acquired in their professional work, while respecting legal and ethical principles, as security specialists working for the authorities, institutions and public bodies that ensure the security of citizens and businesses. According to the author [E.N.], a graduate should have the ability to solve professional problems, collect, process and share (written and oral) information related to the organisation and implementation of rescue and prevention tasks.
3. Graduates of second cycle degree of *National Security* studies should have extended knowledge and skills to creatively solve security and crisis management problems, including in non-standard situations, based on incomplete information, compared to first cycle degree graduates. They should be able to use the knowledge and skills they have acquired in their professional work in accordance with legal and ethical principles. According to the author [E.N.], a graduate of these studies should be able to competently and ethically manage teamwork, as well as organise rescue and prevention actions. What is more, they should be prepared to work in public administration structures in managerial positions, organisations preoccupied with national and international security, as well as research, educational and higher education institutions dealing with security issues.
4. Graduates of postgraduate *National Security* studies should have the required skills and competencies that enable them to become skilled researchers, capable of conducting independent research on the issues of national security.
5. Teaching security professionals requires the formulation of training objectives in an operational manner, which should focus students' attention on acquiring the skills they need for future jobs in the bodies responsible for ensuring the security of citizens and businesses . Thus, a renormalisation of study curricula is required to get rid of the solutions that are not effective when it comes to the acquisition of professional skills. Since shaping these skills is time-consuming, the development of study curricula should put a strong emphasis on key subjects concerning security issues, and an appropriate number of hours should be allocated for their implementation.

Sustainable Development of Project Management in Energy Companies: The Digital Economy Context

Grzegorz KINELSKI
WSB University, Dąbrowa Górnicza, Poland
grzegorz.kinelski@gmail.com

Abstract

Sustainable development is a concept that has recently appeared in economics. The question is what influences the sustainability of development? Can the systematization of project management have a positive impact on the sustainability of the development of a company, sector or economy? How is industry and digital economy influencing sustainable development? We now call Industry 4.0 the fourth industrial revolution. Like the previous ones, it also has the ability to transform economies, jobs and societies. Our expectations are changing to the speed of obtaining answers to the questions asked. This is done by introducing new technologies and processes. Nowadays, it is said that the Industry 4.0 the fourth industrial revolution. Like the previous ones, it as well has the ability to transform economies, jobs and societies. Our expectations are changing to the speed of obtaining answers to the questions asked. This is done by introducing new technologies and processes. This is an opportunity for Polish participants of local heat markets, or participants of the power or energy market. who are currently facing profound changes and investments forced, among others, by BAT conclusions. Such mega-processes as digitization, automation, artificial intelligence, IoT, machine learning is increasingly penetrating the world and business. More than 200 years have passed since the first industrial revolution, which was the use of the steam engine, and the requirements for testing the efficiency of enterprises have changed, which themselves are changing very quickly. The basic efficiency measures used in a given sector often result from the specifics of the sector and its degree of development on a macroeconomic scale. Therefore, it is worth placing the energy company in this environment and presenting its role to better match the instruments used. The above is also associated with increased reporting and the need to use additional evaluation measures, e.g. effectiveness of individual projects. It is therefore worth analyzing the available literature in this area, and the performance measures available and used in it, which will help in assessing the effectiveness of management, despite political and regulatory turmoil, and help us use the opportunities brought by the fourth industrial revolution.

Keywords: Energy management, Sustainable development, project management, economic efficiency, digital economy, energy efficiency.

Introduction

Recently, the concept of sustainable development often is discussed in economics. Therefore, questions are asked what makes development sustainable? Can the systematization of project management positively influence the fact that the development of enterprise, sector or economy is sustainable? How do industry and digital economy impact sustainable development? Project management, understood in terms of processes within energetic enterprises, impacts many areas crucial for a company. One of them is efficiency measurement. The measures of the efficiency of company's activities should be considered in the context of its goals, including those that it wants to achieve in short- and long-time perspective. Project management, in the understanding of processes taking place in energy enterprises, tackles many key issues for the company. One of them is the measurement of effectiveness. Business performance measures should be considered based on the company's goals. Among them, these goals which it intends to achieve in the short as well as in the long term. The above becomes dependent on the time of the analysis. These goals change depending on the environment, currently the digital economy or Industry 4.0 (Miśkiewicz 2017) is a very demanding one which forces the continuous adjustment of objectives, i.e. increased and continuous measurement of indices, including performance indicators. This is an opportunity for Polish participants of local heat markets, or participants of the power or energy market, who are currently facing deep changes and investments forced, among others, by opening markets, connecting markets, changes in the balancing market and BAT conclusions (Saługa and Szczepańska-Woszczyna and Miśkiewicz and Chłąd 2020). BAT conclusions are an element whose implementation in all energy or heat and energy generation installations, i.e. combined installations, is treated as a must-have project. The monitoring of emissions to air and also to water in these installations is an important element in preventing and

reducing pollution from energy producing installations and in ensuring a full high level of environmental protection (Kamiński 2014). Consequently, the EU's established Industrial Emissions Directive (IED) [24, EU 2010] addresses the monitoring of emissions in many cases, including the following:
• The BAT conclusions contain the emission levels associated with the best available techniques (BAT) and associated monitoring (Article 3 (12) of the IED).
• The exchange of information on BAT for the preparation and review of BREFs concerns the techniques used and the associated monitoring (Article 13 (2) (b) of the IED).
• Permits should contain appropriate requirements for emission monitoring (Article 14 (1) (c) and (d) of the IED).
• The monitoring requirements in the permits, where applicable, should be based on the conclusions of the monitoring described in the BAT conclusions (IED Art. 16 (1)).
• The EU Competent Body makes the results of emission monitoring publicly available in line with the permit requirements and held by the Competent Body (Article 24 (3) (b) of the IED).

It also produces the JRC cyclical reference report on monitoring (ROM) that summarizes the information on the monitoring of emissions to air and water from IED installations, thus providing practical guidance on the application of BAT conclusions on monitoring to help competent authorities define monitoring requirements in permits. IED installation. In addition, the information and recommendations provided in this document can help the Technical Working Groups (TWGs) to draw conclusions on BAT when developing and reviewing BREFs (Kamiński 2010). Such mega-processes as digitization, automation, robotization and artificial intelligence supporting them, IoT (*Internet of Things*), machine learning is increasingly penetrating the business world and the power sub-sector. The production of heat or energy changes with technological progress (Kamiński and Saługa 2014). Production technologies as well as measurement technologies and accuracy are changing, including measurements of production efficiency indicators (Kinelski, G. 2020). The technological progress shows that the management of energy production or transmission management is changing more than the production technologies themselves (Zamasz 2019). It is also worth remembering that the current phase of innovation and inventiveness is taking place as part of sustainable development (Szczepańska-Woszczyna and Kurowska-Pysz 2016). To learn about these changes and choose the methodology for measuring effectiveness effectively in the current environment, it is worth exploring the next ranges of industrial revolutions. This is what we call industrial use of great inventions.

In this context the main aim of the paper is to analyze the possibilities, relationships, solutions and efficiency measures available and used in energy companies, which may be helpful to assess the effectiveness of management, despite political and regulatory turmoil, and also in order to better use the opportunities offered by the fourth industrial revolution (Wójcik-Jurkiewicz and Sadowska 2018).

The present time is the next, ongoing fourth industrial revolution. It is the use of communication and information technologies in industry. It is often referred to as the "Digital Economy" or "Industry 4.0" (Tarafdar et al. 2017). Fully computerized production systems are additionally equipped with network connections and their digital systems are created, real-time models, information is collected in the clouds. This enables communication with other objects and the transfer of information about the devices themselves, their condition, consumption, speed of work, necessary changes (Czarnecka 2018). Networking all systems leads to the creation of "smart" factories. These processes are controlled by cognitive technologies, commonly known as artificial intelligence, including neural networks, which will be discussed in the next chapter of the article.

Development of management practices in the field of measuring efficiency and development Industry 4.0

The literature on the subject in the area of efficiency does not present a unified position in determining the purpose of enterprises. One can even distinguish different approaches to this issue in the light of different theories (Skrzypek 2007).

For the owner of the enterprise, economic efficiency, increasing his profits, is the key. It is defined as the difference between the results and the expenses incurred to obtain them (Berniak-Woźny and Walotek-Ściańska and Wójcik-Jurkiewicz 2020). However, not only the owner or the main shareholder is interested in increasing profits. It is in the interest of all stakeholders related to the enterprise, including managers and employees, but also suppliers. Therefore, the measures and levels of economic efficiency of an enterprise are of interest to both internal and external stakeholders. Therefore, there is a reason to be guided by economic efficiency in making decisions in enterprises. This is a condition for their survival and development, and for maximizing the benefits for their owners (Wrzosek 2005). New technologies, and in principle the priority of their implementation, can also contribute to increasing profits. Digitization or robotization can give priority in implementing new products and market flexibility (Chudziński 2019).

These technologies in popular magazines are called artificial intelligence. Nowadays, basic needs in business operations still refer, among others to increase the efficiency of their functioning (Czarnecka 2013). This has a significant impact on the desire to maximize profitability in the short term and increase the value of the company in the long term (Pająk and Pająk 2016). The differences in the applied performance indicators in various sub-sectors of the economy often result from the specificity of the environment of the given sub-sector and its degree of development on a macroeconomic scale. The article discusses issues of efficiency and competitiveness management in the power subsector, in the environment of the digital economy. Currently, this era is called the Digital Economy or Industry 4.0. These concepts determine the modern directions of changes and opportunities for the economy (Gorynia and Mińska-Struzik 2018). Therefore, it is worth placing an energy company in this environment and presenting its role to better match the efficiency management instruments used. There are attempts in the literature to structure the implementation of artificial intelligence (Kasperski 2003). Among other things, it is believed that artificial intelligence has four recognizable implementation waves: Internet, business, perceptive and autonomous (Lee 2019). According to the author, the first two waves already surround us in our daily lives - mobility, digitization and facilitation of shopping, financial analyzes and medical diagnoses. The next wave, i.e. perceptive digitizes our current surrounding world. Artificial intelligence in this phase learns to recognize objects, as well as our faces, our emotions and our commands. The last of the phases, the autonomous, will appear last and will most affect our lives (Kinelski 2019) . Autonomous cars, drones and agricultural machinery will change our economy and the structure of our, as a human, participation in creating GDP (Sadowska and Lulek 2016).

Concepts such as artificial intelligence, artificial neuron or neural network are used interchangeably in cognitive technologies, and their origins date back to the first algorithm proposed by McCulloch and Pitts (Belda 2012) in the 1940s. An artificial neuron is just a reflection of this algorithm. These technologies, based on artificial neuron structures, are currently used in various sectors of the economy of leading countries of the world, mainly in the space, military and medicine sectors. Neural networks are special computational structures (Wójcik-Jurkiewicz and Karczewska 2019). They are modeled on biological neuron networks and in such models perceptrons are created, including the Adaline model discussed in this article (Kurzyński 2008).

For the considerations in this article, this means that if the stimulus, which is the sum of products and weights, results of decomposition of basic data, exceeds a certain threshold, then the neuron is activated (Rutkowski 2012). So we are looking for solutions always closer to the purpose of the search. This will maximize the quality of prediction of subsequent results, and by building a network based even on this type of simple neurons, we can expect results of sufficient quality (Kasperski 2003).

What is an artificial intelligence or, more generally, cognitive technology? Artificial intelligence (abbreviated AI) is defined by Webster's Dictionary as a "branch of computer science that simulates intelligent behavior in computers" (Merriam-Webster 2019). The Oxford Dictionary explains this basic definition by calling it "computer theory and development systems capable of performing tasks normally requiring human intelligence, such as visual perception, speech recognition, decision making and translation between languages" (Oxford Dictionaries 2019).

Artificial intelligence is mainly about increasing the ability of computers to match or transcend human intelligence in its various forms, by imitating the human ability to discover, reason, and conclude (Nowak-Nova 2018).

Until now, there was a close correlation between the tendency to computerization and automation, and the performance of simple, manual tasks. Such activities were most often replaced by IT systems and robots. It has been observed for several years that automation and algorithmizing increasingly penetrate mental activities. Until recently, such tasks were in the area of only human activities, such as reasoning, sensing and making decisions (Brynjolfsson and McAfee 2014).

The energy subsector is increasingly strategic for the national economy. It is regulated at the national and European level, specifically conditioned on the competitive market. Enterprises of this subsector are from the research point of view economic entities whose functioning and development is based on a number of complex exogenous and endogenous factors (Pająk et al. 2017). The former are economic, political and social. They are complemented by internal ones, such as: company security, organization of basic and ancillary activities, contacts with the environment, and finally exchange and provision of services within the organization, where the environment of the digital economy becomes important. It should be noted that the basic efficiency measures used in a given sector often result from its specificity and degree of development on a macroeconomic scale (Drożdż 2012).

The question becomes justified: What factors influence the competitiveness and efficiency of energy sector enterprises in the era of the digital economy? They should be considered in a comprehensive approach, also taking into account their interrelationships and interdependencies.

Technologies based on cognitive processes (Kasperski 2003) are currently considered as strategic investments in many enterprises. It can be assumed that they will soon become so common that they will affect most processes, not only in industrial enterprises (Rutkowski 2012). It is not excluded that this will start with the improvement of already existing processes, and then to their replacement with completely new, much more effective ones. A revolution is coming, where much higher efficiency will be expected, with less and less human resources involved. The surprising growth dynamics of these solutions can be found in the IBM report from 2017 (IBM Developer 2017), which shows that in 2014, the total value of the artificial intelligence market in the world is $ 2.5 billion, currently in 2019 the market for such solutions is worth $ 12.5 billion, and in 2025, it will be worth about $ 180 billion (IBM 2019a).

What is machine learning? Machine learning is the foundation of artificial intelligence and computer science. Machine learning has its roots in statistics and mathematical optimization. Machine learning includes both supervised and unsupervised learning techniques. We use them mainly for forecasting, as well as in data analysis and mining (Jones 2017). Machine learning can (and often is) be used independently of other AI or cognitive technologies. In fact, this is the most common type of artificial intelligence we can observe today. Many machine learning algorithms and techniques are already used in various solutions that look for patterns or anomalies in the data.

As a result of the development of "learning" or "learning further self-teaching" of computers or robots, they were given the ability to replicate and map human actions and almost feelings and behaviors. Therefore, automation processes can include not only repetitive, routine activities. Not only individual tasks are automated, but also entire processes, and often the variability of these processes is automatic and is not programmed in advance. In recent years, significant progress has been made in the development of Cognitive Systems (CS). This is not about semantics and logic, but about imitating human thinking in the strict sense. The result is that we extract the intelligent one from all automation. Such intelligent processes are not only subject to routine tasks requiring only physical activity, but more importantly, also tasks previously reserved for people, based on understanding. Mainly those tasks that have the character of intellectual work. The benefits we can achieve thanks to cognitive technologies depend mainly on the type of system we use (Kasperski 2003). This also applies to those activities in which activities can be performed quickly and efficiently by computers that are susceptible to intelligent algorithmizing, e.g. tasks related to supporting decision-making, expertise, forecasting, as well as administrative services, calculating, collecting and processing data. Currently, for purposes related to enterprise management, its processes, results, efficiency or competitiveness, we should use specialized multidimensional systems and simulation systems.

Deep machine learning (Rutkowski 2012) is a relatively new set of methods that fundamentally changes machine learning towards greater cognitive capabilities. Deep learning is not in itself an algorithm, but rather a family of algorithms. These algorithms couple wide networks (e.g. neural networks) with unattended learning, i.e. with unattended machine learning algorithms. Deep learning has significant potential for a certain class of problem solving, but it is not suitable for all situations, it is difficult, expensive and time consuming.

It can be seen in our environment that computers, which in some way register the surrounding reality, understand it better and better. This does not apply only to new types of sensors, sensitive to smell, and for example feelings. Based on these advanced analyzes, these intelligent machines draw new conclusions and learn (Trocki 2012). Cognitive solutions are different from other new technologies. They have a unique distinguishing feature. It is the execution of commands that until now could only be carried out by man (Koźmiński 2000).

Thanks to machine learning, as discussed above, computers have gained the ability to recognize images and interpret speech, and even mood or feelings. Currently, their efficiency is already high. However, we can expect that at the current pace of development, the gap between man and machine will soon decrease significantly.

An important element of artificial intelligence is cognitive processing. Cognitive computing is the basis of artificial intelligence, which is based on neural networks and deep learning. They use knowledge of cognitive science to build systems that simulate human thought processes. Instead of focusing on a single set of technologies, however, cognitive processing involves several disciplines, including machine learning, natural language processing, vision, and human-computer interaction. Cognitive processing currently focuses the most on processing natural language as well as the emotions contained in it. Cognitive computing is artificial intelligence technology, but there are other aspects of artificial intelligence that do not include cognitive function. Deep learning is a special type of machine learning. Cognitive computers use both of these elements.

Artificial intelligence in the form of functioning cognitive technologies is used in manufacturing companies. It currently plays an important role in the analysis of data provided by sensors, for example: the Internet of Things. Also, the use of special harmonic variable analyzers in power grids and the analysis of such a data stream gives broad possibilities in the detection and identification of specific faults in the field of energy parameters of the device. This can often be detected before the entire machine is damaged and the production process is halted (Lock 2003).

Cognitive technologies often disappear from our view and are treated as ordinary data processing. This is what happens, for example, with speech recognition. We use this solution on a daily basis, so we no longer consider it artificial intelligence. Learning networks, including: Markov models (Walsh 2018) and deep-learning networks, are something that we do not think about every day, but use.

Referring to the possibility of using cognitive technologies to assess indicators relating to enterprise products, the most often taken into account are such parameters as: offers in mobile technologies, quality of services, price, diversity of offered products and services, product and service compatibility, flexibility in adapting services to the needs of recipients. In addition, automation, computerization, higher frequency of introducing new services, good access to services, product range, advertising and sales promotion. Also in the scope of services: scope of pre-sales and after-sales services, prices of after-sales products and services, quality of after-sales services, conditions and warranty period, company image and brand (Kurowska-Pysz and Szczepańska-Woszczyna and Štverková and Kašík 2018).

Some researchers of cognitive technologies and artificial intelligence have adopted a set of basic definitions of the word 'pattern' that are fairly consistent with the definitions used by scientists in other fields (e.g. 'numerical taxonomy', 'behavioral psychology', 'theoretical linguistics') (Jackson 2019). Definitions are not very difficult to understand, although the word "pattern" is usually not defined in most current scientific considerations. It is worth discussing its use in Al research and discussing some of the general problems associated with "formulas".

New mega-processes in enterprises such as digitization, automation, artificial intelligence, IoT, machine learning is increasingly penetrating the world and business. Over 200 years have passed since the first industrial revolution, which was the use of a steam engine, and the requirements for testing the efficiency of enterprises have changed as well.

The above is also associated with accelerated reporting and the need to use additional evaluation measures, e.g. current efficiency or the effectiveness of individual projects. Therefore, it is worth analyzing available and used efficiency measures and competitiveness factors, taking into account the possibility of using cognitive technologies for their calculation.

Project management and success factors in making changes

The term 'Project' or 'Project Management' used in everyday corporate communication is a ubiquitous term. The project, in most definitions, is called, written down our intentions, plans, described technologies and solutions, and finally the project is an organized enterprise with a specific start, end, goal, budget and time frame. It happens that the ambiguity of this term causes inaccuracies and misinterpretation of the concept. For the purposes of this trend analysis, let us assume that the above is the most relevant, and in this context will be used later in the article.

Innovation and technology help energy companies in project management. They enter all its areas. The development of solutions such as Artificial Intelligence and cognitive science allows you to accelerate and simplify processes.

However, the more complicated we create machines, programs, processes, the more they are failing. The same happens in projects. The more stakeholders, the more differences of opinion and views. The more you create in the enterprise, project phases, steps, the more complicated our final product is, the more we are exposed to surprising events. This means that running projects, even with the use of modern technologies, will never become tedious. It will not become boring even in 10 or 20 years. Why? Is an energy company significantly different from average enterprises operating in other sectors of the economy?

The differences in the applied project management methodologies in various subsectors of the economy in relation to energy often result from the specificity of the environment of the given subsector and its degree of development on a macroeconomic scale. Therefore, it is worth considering the issues of future project management in the energy sector, in the environment of the digital economy. Currently, this era, popularly called Industry 4.0, defines modern trends of change and opportunities that the economy has thanks to the development of information technology. Therefore, it is worth placing an energy company in this environment and presenting its role to better match the applied project management instruments.

Project managers may encounter problems with meeting deadlines and thus reduce efficiency because they often try to assign tasks to team members rather than broader areas of responsibility. This is due to the belief that a highly structured form of management is preferred in project management, and they ignore the need to provide team members with a larger task.

Trends indicate that individual members and experts will need more freedom and independence in projects. This is due to the increasing scope and complexity of the projects discussed above.

These trends are also reinforced by new methodologies of project management, such as Agile. Agile methodology (PMI 2017) is an iterative approach, narrowing the goal along with work on achieving it. It is a total change in project management, also changing the way of thinking about an end in itself. It is not he who becomes the most important, time and costs, prototyping and quick introduction of even incomplete products to the market in order to improve them later. Many companies have believed that it is better to provide an incomplete prototype quickly than to implement the ideal solution in a controlled and slow manner.

In many cases hybrid solutions are used and will be used, thus combining Agile with a cascade approach. Probably the next step will be management with a smooth scope, a liquid budget and a consistent time, and the project agile periods will last one day or less.

Historically, mega-processes, processes, subprocesses, procedures for describing and measuring them are now the domain of the organization. The design era has now begun. The process will be just one cog in the organizational machine called the project. The project is quickly changing, but the environment in which it operates is slowly changing. The ability to find a compromise is mainly the communication skills of all participants in the project. A good project communication plan is also crucial.

Effectiveness and competitiveness as trend indicators in project management

As discussed above, Industry 4.0 includes using cloud solutions to manage organizations. It is an indication for the implementation of many changes in the field of: strategy changes, supply chain transformations, preparation of staff or investment-friendly factors. EU integration, having both an economic and political dimension, played a large role in the restructuring of the Polish energy sector. This process, above all, was determined by the adaptation of the Polish economy to EU requirements, harmonizing Polish legislation with European Union law and ensuring equal, compared to other Member States, pace of introduction of competition, e.g. in the energy sector (Kinelski and Pająk 2017).

Therefore, enterprises from the energy sector face a big challenge of improving the efficiency of their activities. This is directly related to the financial situation, impending lack of liquidity, exceeded covenants for loans, debt to income ratios higher than acceptable. There are many opportunities in this area related to their restructuring, consolidation and selection of investment areas. On the one hand, Industry 4.0 requires significant investment outlays to be in the main stream of changes in the digital economy, while on the other it allows significant cost reduction.

Enterprise performance measures should be considered based on the company's objectives. Performance management using the opportunities of the digital economy provides companies with the opportunity to develop and build a market position. Professional project management can greatly simplify the implementation of changes. Project management is a dynamic process, it requires the support of the entire organization, all participants, even if they do not participate as team members or experts. This environment, if it is open to new ideas, supports development, guarantees that projects will be successful.

Currently, cost reduction, a flexible need for human resources and access to unique competences at a specific moment leads to intensification of pressure and causes a flood of remote teams. On the other hand, the development of communication technologies will result in greater efficiency of these teams, and thus a decrease in communication costs over any geographical distance. Probably all the studies on the future of project management maintain the thesis about the very possible development of their remote management. The future definitely belongs to remote teams. It is a kind of cascade-agile hybrid, taking into account the fact of communication restrictions in a geographically dispersed team.

Energy efficiency measures and directions of development of these measures

Measures of effectiveness in the operation of enterprises are one of the key issues undertaken by researchers in the field of economics and management sciences. Efficiency provides companies with the opportunity to develop and build a market position, which is a key condition for achieving other goals such as capital appreciation, product development, innovation, maximizing managerial benefits and increasing market value so significantly.

Efficiency as a concept in economic terms is itself a subject of measurement. Of course, using indicator analysis methods. He systematized the indicators used in literature (Copeland et al. 1990), distinguishing three groups from them (Jaki 2012):

- accounting indicators, based on liabilities and assets,
- financial ratios based on cash flows,
- market indicators. based on changes in the environment.

Accounting indicators are the most common indicators used to measure effectiveness in ratio analysis (Wilczyński 2014). They treat efficiency directly as a relationship only between revenues and expenses. These indicators mainly measure profitability at various levels of the financial result. In addition, they can find the relationship between profitability and the size of capital employed in an enterprise and the value of its assets.

The next group of effectiveness measures are the financial indicators used. They are based on one main measurement parameter. It's financial flows. They eliminate imperfections of accounting indicators. This mainly applies to the application of different accounting principles. In addition, it also eliminates difficulties in the area of asset and liability valuation methods.

Described selected indicators, for example NPV, DCF, IRR type, are mainly used to assess investment profitability. They try to estimate the future, so the results of such an assessment are always risky. Energy companies also use these indicators to evaluate projects such as new energy investments, e.g. new wind sources, photovoltaics or distributed generation. To minimize the risk, professional paths are used to change ingredients such as Energy Prices, Property Rights Prices, Emission Rights Prices, and Fuel Prices. Such ready paths are provided by analysts, e.g. REDPOint from Baringa's Energy Advisory (BEA 2018).

The next group of indicators are market indicators. They also allow you to assess the company's effectiveness, mainly from the perspective of external stakeholders. The market valuation of equity, in this case, always takes into account past financial results. It also takes into account the current situation and predictions about the future of the company. The valuation of shares in an energy company may already be strongly influenced by the degree of computerization or process automation in a manufacturing company. Although, such a valuation can be considered the most objective, it should not be forgotten that the price of shares is not just based on the value of capital.

Market indicators are widely used to assess effectiveness. Thanks to the absolute ratios, which can be easily compared, the analysis becomes attractive for comparative studies in practical terms. In this assessment, there is a market background in the form of invested capital.

Expected changes resulting from the environment of the digital economy require the use of new varieties of performance indicators.

Surrounded by new communication and automation technologies, we can measure multiple parameters simultaneously and provide results in real time. It is worth giving examples that can be used for further scientific development:

- the production efficiency index per information unit, or its inverse.
- indicator of the efficiency of computing power involvement per unit of net energy produced
- failure efficiency ratio for communication networks and control systems
- indicator of the efficiency of the use of database resources per unit of produced or consumed energy.
- indicator of the effectiveness of decisions of automation systems and artificial intelligence
- indicator of the effectiveness of information acquisition in the field of machine learning
- the process efficiency indicator can also be defined in the future as the ratio of digital to analog technologies used.
- indicator of the efficiency of using cloud computing resources to produce energy units
- process and resource sharing efficiency indicator

Such considerations, of course, should be supported by the usefulness and need to analyze specific quantities, but it can be assumed that most of them in the near future will become important for the efficiency of manufacturing enterprises.

Summary and Conclusions

Negative changes in the economic situation may affect the deterioration of operating conditions for enterprises. The desire to make a profit, of course, still does not decrease, but digital technologies, including cognitive processes, are gaining more importance. Until recently, the basic goal of the company was survival, now it is development, which until now stood in second place. In addition to expanding markets, development is just new technologies.

The main condition for survival was to maintain financial liquidity, and the factor determining this liquidity is the efficiency of operating activities (Wilczyński 2014). However, currently the main condition for development is keeping up with changing technologies and skillful use of them.

Innovation and technology help energy companies to manage their projects. They are covering all areas of its functioning. The development of solutions such as Artificial Intelligence and cognitive science allow to accelerate and simplify processes. Thanks to this, projects can be carried out in accordance with the schedule, without exceeding the previously set budgets. Energy companies face also a major challenge related to the efficiency of their operations improvement. It can be directly connected with the financial situation of a particular company.

In the current research, the indicators for assessing efficiency cover only selected goals of the functioning of enterprises. They pay too little attention to operational efficiency, speed of processes, digitization, process efficiency and financial liquidity as key factors in the development of enterprises. In addition, they have a limited scope, because a significant number of indicators (accounting, financial, market) require information that is difficult to access or obtained in large periods of time. Data is obtained quarterly or annually. At the present time, the dynamic development of information technologies and the need to use more information to calculate indicators, the time to obtain results is also playing an increasingly important role. To analyze the present using cognitive technologies, we need access to online data. The same applies to future predictions. It is not excluded that we will soon be using quantum technology to measure process efficiency.

This specific combination of the analogue and digital world creates a digital enterprise. An enterprise that is not only connected to artificial intelligence, but also capable of more holistic, conscious decision making. Maybe even to make decisions or suggest solutions.

The impact of the digital economy on the energy market, power market and heat market is inevitable (Zamasz 2015). For a comprehensive analysis of the effectiveness of an enterprise, appropriate indicators should be selected depending on the degree of achievement of objectives, especially in the era of the digital economy. In addition, the adoption of modern relative indicators will allow comparability of results between different enterprises. The analysis of the huge amount of data from devices and sensors in real time gives us the key information needed to manage the company. Acquiring them online allows you to teach cognitive processes. In a digital enterprise, data collected from systems and machines are used to intelligently and more effectively manage the operation of an organization. As a result of these changes, new products and services, more attractive ways of customer service, new professions and completely new business models are developing, in a way.

Analytically desirable situation will include in the calculation of indicators of information not only included in the financial statements of enterprises, but also information received in real time from the inside of production and service processes. The challenge for the economy, including the energy sector, is to change the way of thinking and to learn how to use our exponential technology development to create value for our organization. Although today the hypothetical efficiency indicator, e.g. speed of access to information in the cloud per unit of heat energy produced, seems to be useless, it may soon prove to be a very helpful tool, e.g. in distributed generation networks or virtual power plants. We can therefore use cognitive technologies for fast-changing data that are basically obtained in all energy processes in the energy sector.

Abstract

The primary objective of this study was to explore the effect of child caring roles (CCR) on job performance of female employee in public sector of Nigeria. The present day study examines this issue, stressing on the level of job commitment and number of children as well as its effect on mother's job performance in north central, Nigeria. Raw data were collected from the civil servants across twenty-one (21) ministries in Kwara State, Nigeria through the use of questionnaire and interviews. A total of 422 employees (mothers) made up the respondents through simple random sampling (SRS) method. 420 questionnaire were administered with a breakdown of 20 respondents selected randomly from the 21 parent ministries which include the Governor's office and the office of the head of service. Two respondents from the ministry housing the entire staff in the state i.e the office of the head of service and the Governor's office were interviewed. Responses received were subjected to chi square analysis to determine child caring roles impact on job performance. The study revealed that Child caring role has significant impact on job performance and commitment. Coping strategies are suggested to help women balance the dual role.

Keywords: Child; Women employees; Job performance; job commitment.

Introduction

Over the years, men worked to be financially independent by making money, while women were responsible for household duties and fulfilled the mission of educating children (Abbott, Wallace, & Tyler, 2005). The pattern has changed, however. Customary sexual orientation jobs that saw male as a retailer of needs and female as a homebuilder are increasingly evolving from time to time and there has been an expansion of families led by two partners in working life (Perrone, Wright and Jackson, 2009) and support for this concept continues to grow (Gallup, 2009). In not many of the social orders because of people both working, men have begun adding to family unit errands (Lewis, 2012). Still in numerous social orders, because of their socially decided sexual orientation belief systems, the obligation of youngster care and other relatives stays with ladies (Barksdale, Reeves and Baden, 2000). They are confronted with shuffling the job of mother, accomplice and girl just as representative (Austen and Birch, 2000). Ladies' support in the workforce has expanded all around the globe, this expansion has fundamentally influenced families .Women's association in paid work added to the ascent of double worker family and has become the standard in numerous social orders. These progressions may force some noteworthy effect on ladies in executing their jobs at work place and in the family (Davidson and Burke, 2004).

The cleavage between the mentalities in modern and pre-mechanical nations towards the "double job of ladies" was self-evident, for example, at an ongoing congress held in Istanbul by the International Council of Women on the topic of "Ladies and the Family in a Changing World" The issues of wedded ladies with occupations outside the home ruled the enthusiasm of the Western designations, while the issue was of less worry to the delegates of the developing nations who acknowledged without question the way that ladies complete two employments, one at home and one in the fields. It is experimentally clear that working ladies pay double duty and just 7 % of ladies appeared to adjust their

Cite this Article as: Festus Femi ASAMU, Eyitayo Joseph OYEYIPO, Jemimah Habila AMOS, Chisaa IGBOLEKWU and Olubukoye Opeyemi OYE "Child Caring Roles and Job Performance of Female Employees: Evidence from North Central, Nigeria" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

double jobs (Pillai and Sen, 1998). Doing paid employment and family unit exercises are difficult for hitched ladies having a place with every single social class (Davendran, 2008). Hitched working ladies need to pay second move at home (Hochschild, 1989). They were overburdened with family unit errands alongside occupations (Tripathi and Bhattacharjee, 2012).

Research has demonstrated that ladies experience more difficulties adjusting their work-life and family. Ladies with home and non-home work had conflicts when completing job applications (Begum and Tasneem, 1984). Because of accepting various careers, working moms are particularly vulnerable to work stressors. They face different job stressors in terms of quality and power (Vermeulen and Mustard, 2000). Work-family struggle is a type of burial job struggle in which job stresses from the workplace and family areas become a hindrance to representatives' activity execution. It was likewise discovered that ladies' encounters of work-family strife affected adversely on their degree of employment execution and profitability. (Ogbogu, 2013). Double obligation (at home and work environment) devours twofold vitality, comprises a period weight and difficulties which, some of the time, bring about weariness and affects their job performance in an organization. It is in this context that the present study set out to know how these women balance their dual roles and to consider the effect that this may have on their job performance in an organization.

1. Objectives of the Study

The central aim of this study is to examine the child caring roles of married women and its effects on the job performance among academic and non-academic staff in Landmark University. To achieve this aim, the following specific objectives are outlined for this study.

1. To examine the extent to which child caring affects the job performance of female workers in organizations.
2. To examine how child caring affects female level of commitment in paid employment.
3. To determine how the age group of children cared for affect the mothers job performance in an organisation.
4. Recommend possible coping strategies that can be adopted by female workers to balance child caring and job performance.

2. Research Hypotheses

The general hypothesis of this study is to examine the relationship between the child caring roles of married women and their job performance. The research hypotheses formulated are:

H_1. There is a significant relationship between the child caring and the job performance of female employees in an organization.

H_2 There is a significant relationship between child caring and workers commitment to job.

H_3 There is a significant relationship between ages (age group) of children cared for and mothers job performance.

3. Theoretical Framework

The Gender role theory is adopted for this study. Gender roles are shared cultural desires which are performed by people dependent on their socially-distinguished sexual orientation (Eagly and Karau, 1991; Kidder, 2002). Sexual orientation job hypothesis proposes that "people disguise social assumptions regarding their sex since social weights outer to the individual kindness conduct reliable with their recommended sex job" (Kidder, 2002). Individuals, regularly apply such desires to portray themselves as well as other people; in this manner, such factors lead people toward their own individual and progressively broad social characters. These orders have basic impact on people's lives and connections (Donaghue and Fallon, 2003; Williams, Consalvo, Caplan, and Yee, 2009). Sexual orientation job hypothesis recommends that ladies are urged to keep up connections and be social and mindful; henceforth society for the most part maintains a strategic distance from them to perform exercises characterized as manly (Williams, Consalvo, Caplan, and Yee, 2009)

The position of gender has a lot of cultural morals that guide what kinds of practices are generally considered fit for a person based on their actual or seen sex. These are typically based, despite the fact that there are heaps of special cases and types, on limiting the roots of femininity and manliness. As it varies generously between cultures, the specifics surrounding these gendered desires are varied, whereas different attributes across a variety of societies may

be regular. There is an on-going debate concerning what degree of sex jobs and their varieties are spontaneously determined, and to what degree they are socially established.

The definition of 'gender roles' applies to the exercises, based on their obvious contrasts, assigned to women and men. Sex jobs are collectively determined, change over time and space and are influenced by demographic, social and environmental components that define a particular community, network or chronicled age. In terms of both the general population and private spaces, sexual orientation jobs seek to establish boundaries between what is considered as proper for women and for men in the general public.

As a possible theoretical explanation for understanding how women offer meaning to their experiences of balancing motherhood and job performance, gender role theory was considered for this research. This is because it explains why parenting primarily falls into the motherhood realm, thus restricting their possibilities of discovering the world as they wish.

Socially distinguished as males and females will in general possess diverse credited jobs inside social structures and will in general be decided against different desires for how they should carry on. As an outcome, the hypothesis predicts guys and females will create various abilities and perspectives and that they will act in an unexpected way. Correspondence scientists have utilized sex job hypothesis to clarify and anticipate (a) the correspondence practices of females and guys and (b) the assessment of a similar correspondence conduct, when guys and females perform it. This exploration has prompted extensive discussion about whether the attention ought to be on gendered contrasts or similitudes. (Shimanoff, 2009).

Gender role theory was investigated as a potential hypothetical clarification for understanding the encounters of moms who work in associations. Ladies may accept a few jobs simultaneously, for example, mother, accomplice, representative and understudy. Job struggle may happen when ladies endeavor to satisfy different jobs. Googins (1991) presented the expression "job strain" to portray the subsequent strain that happens when an individual attempts to fulfil the needs of different jobs.

In applying the gender role theory to this study, there is a solid sign of job clashes in adjusting the family and work duties of ladies. In light of this hypothesis, it tends to be concluded that ladies have jobs which they are required to act in each general public. These jobs incorporate the conceptive, gainful and network administrations. This hypothesis clarifies why childcare prevalently falls into the space of parenthood, subsequently constraining their chances to seek after exercises outside mothering. In particular, men are required to be providers and ladies are relied upon to be guardians.

However, women’s roles are in conflict because they both require time and must be performed simultaneously for instance, the child caring roles of mothers require them to spend much time with their family thus affecting their job performance in an organization. Mothers are expected to take proper care of not just their children but also their husbands, the community and themselves at the expense of their presence in the public sphere, their personal achievements and job performance. It is very role-conflicting for mothers to be totally involved in both the public and private spheres. Also, these dual roles may have effects on their job performance and balancing their homework.

4. Materials and Methods

Both secondary and primary data were gathered for the study. The secondary data included published empirical studies related to child caring roles and job performance of female employees. While the primary data were derived from the survey of four hundred and twenty (422) female employees was randomly drawn from all the twenty-one (21) ministries including the office of the Head of Service and the Governor’s office of Kwara State, North Central of Nigeria. The choice of this institution is based on the large number of married women in the institution workforce and accessibility to researcher. Key informant interviews were used for some experienced married women.

A structured questionnaire was designed and distributed to a simple random sample of four hundred and twenty (420) married women with children drawn from all the twenty-one (21) ministries including the office of the Head of service and the Governor’s office of Kwara State, Nigeria.

The questionnaire included close and open-ended questions addressing the women demographic characteristic, knowledge of child caring roles and job performance / commitment of female employees. In conformity with ethical principles of the social sciences, the purpose of the study was communicated to the respondents for obtaining their voluntary assent.One respondent from the two parent Ministries which are Office of the Head of Service and the Governor’s office were involved in Key In-depth interview to draw information regarding the subject respectively. The data were processed using the SPSS software, while the results were presented in univariate and bivariate forms through percentages and chi-square tests to establish relationship among core variables and the interview was processed using content analysis.

5. Results/ Findings

Table 1. Socio-Demographic Characteristics of Respondents

Variable	Frequency	Percentage
Age		
25-29	68	16.1
30-34	109	26
35-39	132	31.4
40-44	57	13.6
45 and above	54	12.9
Marital status		
Married	269	64.1
Divorced	49	11.7
Separated	52	12.4
Widowed	50	11.9
No of Children		
0-2	148	35.2
3-5	194	46.2
6-8	52	12.4
Above 8	26	6.2

Others	76	18.1

Source: Survey, 2020

Table 4.1 reveal that 68 (16.1%) of the 420 respondents used in this study are within the age group 25-29, 109 (26%) are within the age group 30-34, 132 (31.4%) are within the age group 35-39, 57 (13.6%) are within the age group 40-44 while the remaining 54 (12.9%) are above 45 years of age. This shows that a larger percentage of respondents used for this study are within age group 30-34. Also, majority of the respondents being 269 (64.1%) are married, 49 (11.7%) are divorced and 52 (12.4%) are separated, while 50 (11.9%) are widowed. From this, it can be seen that majority of the respondents are married this is because married women are in a better position to discuss family-work conflicts. Few widowed, separated and divorced respondents were also covered; the researcher discovered that these women are the bread winner and care taker of their home.

In addition, 148 (35.2%) of the respondents have 0-2 children, 194 (46.2%) of the respondents have 3-5 children, 52 (12.4%) of the respondents have 6-8 children while just 26(6.2%) respondent has above 8 children. This depict that most of the respondents covered in this study have between 1 to 5 children. Very few have 6 and above. Also, the table above shows that 103 (24.5%) of the respondents have children between that ages of 0-5, 180 (42.9%) of the respondents have children between the ages 6-10, 62 (14.8%) of the respondents have children between that ages 11-15, 35 (8.3%) of the respondents have children between the ages 16-20 and the remaining 40(9.5%) of the respondents have children from ages 21 and above among others.

In terms of education, 60 (14.3%) of the respondents possesses secondary school education, 74 (17.6%) of the respondents had OND/NCE education, 59 (14.1%) had HND education, 58 (13.8%) had B.sc education, 48 (11.4%) had M.sc education, 45 (10.7%) had PhD education and the remaining 76 (18.1%) had other forms of educational attainment not mentioned above. From the conducted research, it was discovered that very few of the respondents have high educational attainment such as PhD and M.sc, few of the respondents have B.sc, while a large number of the respondents have secondary, OND, HND and other form of education when combined together. The lower level

of education can be explained by the fact that women are more likely to work in informal jobs and majority of the women are non-teaching staff who do not need higher education attainment or qualification.

Table 2: Cross Tabulation of Relationship between Child Caring and Job Performance.

Count

		Performance			Total
		high	average	low	
caringrole	Yes	28	65	128	221
	No	45	18	5	68
	Sometimes	18	77	36	131
Total		91	160	169	420

Source: Survey, 2020

DECISION RULE:

The number of the degree of freedom at (3-1) (3-1) =4. The chi square value =9.488 at df of 4 of 0.05 significance level, this means P value= 0.000< chi square value at 0.05 (P<0.05) this leads to rejection of the null hypothesis (H_0) which states that there is no significant relationship between child caring and job performance is REJECTED and the alternative hypothesis is ACCEPTED. This shows that there is a relationship between child caring and job performance. However, it was discovered that child caring roles affects the job performance of women in the lower class more than those in the upper class. Based on the findings and interview conducted, the women in the lower class do not have access to some coping strategies. Most of them cannot afford crèches; household appliances, gadgets and other technologies that help balance the dual roles.

This is corroborated by an interviewee thus:

> Child caring is not an easy task at all, but if you are blessed with a man who understands the roles involved in caring for a child or children he will always be available to give a helping hand. Also, there are so many things to ease the caring role of a child but it demands financial resources and when it is not in place it also makes the caring role less easy. In other words, the financial resources at ones disposal which is an indication of the social status of the woman or the family determines if caring role would be make less ease or loaded with stress (KII/ Female, Office of the Head of Service, Kwara State, January, 30, 2020)

Table 3: Cross Tabulation of Relationship between Child Caring and Commitment to Work
caringrole * commitment Crosstabulation

Count

		Commitment			Total
		high	average	Low	
Caringrole	Yes	22	63	136	221
	No	51	14	3	68
	Sometimes	15	69	47	131
Total		88	146	186	420

Source: Survey, 2020

DECISION RULE:

The number of the degree of freedom at (3-1) (3-1) =4. The chi square value =9.488 at df of 4 of 0.05 significance level, this means P value= 0.000< chi square value at 0.05 (P<0.05) this leads to rejection of the null hypothesis (H_0) which states that there is no significant relationship between child caring and job performance is REJECTED and the alternative hypothesis is ACCEPTED. This shows that there is a relationship between child caring and job commitment. The implication of this is that child caring consume the better part on the woman's time and therefore reduces the concentration at the work place. This to a length affects the commitment of women to work as commitment to the family is place a priority over the workplace.

Table 4: Cross Tabulation of age group of children and Age of Children

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	0-5	103	24.5	24.5	24.5
	6-10	180	42.9	42.9	67.4
	11-15	62	14.8	14.8	82.1
	16-20	35	8.3	8.3	90.5
	21 above	40	9.5	9.5	100.0
	Total	420	100.0	100.0	

Source : Survey, 2020

Table 4 above shows the age group of children as per how they are cared for. The table indicates that age group 0-5 represents 25.5% and age group 6-10 represents 42.9% of children are mostly cared for. This account for the effect it has on the performance of women at workplace. Where a woman is to cater for infants, it is more demanding and takes the better part of the woman.

This is corroborated by an interviewee:

> Caring for children is not an easy task especially where you have most of your children within the ages of 0-10. It is clear that most of what they do is highly influenced by the mother and it is important to bring them up in sound training. The age group of 0-10 is the best time to do so and it tells on the woman even at work. A good example of this is myself where I need to drop the children in school first thing in the morning before going to work, and all I think about is how not to make them stranded in school at the close of the day. To make the matter worse is even when the schools are on mid-term break, it is a huge of a task to imagine. (**KII/Female, Office of the Secretary to State Government, Governor's office, Ilorin Kwara state, January 30, 2020**)

6. Summary and Discussion

The results of the study are based on the effects of child caring roles on job performance of female employees in Kwara State, Nigeria. The first objective of this study is based on the extent to which child caring affects the job performance of female employees. The results showed that there is a significant relationship between child caring and job performance. Numerous studies have found similar results. This study therefore confirms the studies conducted by Ogbogu (2013) that the work-family dispute is a type of inter-role conflict in which job and family role pressures become an obstacle to the job performance of employees. It was also found that the work-family conflict experiences of women had a negative effect on their level of job performance and productivity.

It also corroborates with Ogbogu and Eroro (2009) findings that affirm Child care is a major source of stress that adversely affects the efficiency, well-being and relationships of employees. This study also supports Bryon (2005) research that demonstrates that conflicts between work and family roles are bi-directional, suggesting that work to family conflict can be experienced, whereas family to work conflict can be experienced at the same time. In the specific area in which interference is encountered, both disputes have been found to reduce efficiency and satisfaction.

The result of the second objective reveals that there is a significant relationship between child caring of female employees and their commitment to paid employment. However, during the interview it was indicated that it is safe to say that family duties has effect on the commitment of a large number of female employees to their jobs. It therefore means that while they are solely responsible for taking care of their children, their commitment to their jobs is affected. Some of the respondents were asked to what extent family duties affect their commitment to work.

The third result is to be determined by how number of children affects the mother's job performance. The result revealed it has a lot of effects. The result corroborates that of keith & Schafer (1980) that a source of work-family role strain among women with job and families was number of children. From this study, women with higher number of children experience more family-work conflict because they have more responsibilities than women with few

children. Also, the finding is in line with that of Fapohunda (2014) which revealed that women have been seen as caregivers, mothers and spouses, regardless of society, whose primary occupations are child rearing and taking care of domestic matters.. It is also evidence that the age group of children also have an effect on the job performance of female employees. This finding has given further usefulness of the gender role theory which explains why childcare predominantly falls into the domain of motherhood.

The study concludes that child caring roles has high level impact on their job performance. Coping strategies like dependable childcare crèches, gadgets and technology appliances and support from husband will help women balance the dual role.

Compliance with ethical standards:

Every operation involving human subjects in this study was consistent with the ethical approval received from the Ethical Review Committee of Landmark University. Prior to the commencement of data collection, oral permission was demanded from the Commissioners of Ministries.

Informed consent

Informed voluntary consent was gotten from all respondents with a reassurance of the anonymity and confidentiality of the research.

Funding:

The authors received no direct funding for this research.

Conflict of Interest

All the authors affirm to no conflict of interest in respect to this paper

Ethical Approval

Ethical approval obtained from Landmark University Ethical Review Committee. Oral permission was sought from the Commissioners of the ministries before commencement of data collection

Abstract

The specificity of the work of taxi companies operating at airports has been presented in this paper. Attention was drawn to the importance of conducting the CVP analysis, which is aimed at increasing the efficiency of operations of this type of enterprises. In order to make this possible, it is necessary to precisely define in advance and under real conditions the scope of services provided, as well as various scenarios of the transport offer. It is, therefore, reasonable to use simulation methods that enable quick and reliable comparison of the potential effects of implementing individual solutions. The author's own simulation model is universal, it can be used to analyze the taxi service of any airport serving the city to which it belongs. The model makes it possible to determine the percentage of profitable trips (i.e. with a client) and to determine the duration of individual service processes, such as acquiring a client, the trip itself or operating activities when alighting and boarding. At the same time, the variability of duration of the above service processes has been taken into account, including the variability of the travel time resulting from changing traffic conditions. It is the stochastic nature of the model that enables a significant increase in the quality of CVP analyses. An example of using the model to determine the optimal division of the day into work shifts as one of many of its applications has been presented in this paper.

Keywords: CVP Analysis, Taxi Services, Simulation Model.

Introduction

The development of cities, agglomerations, regions and countries is closely related to the opportunities created by the transport system. It is essential for the mobility of people and the transport of goods. However, in order to perform these functions effectively, it must be organized at a high level. This is not easy because the transport system is characterized by immense complexity, and its functioning is influenced by many external factors, including those related to demography, spatial planning and economy. In turn, the transport system itself influences the changes in the living conditions of residents, including their transport needs and travel time, and is not without effects on the environment.

The essence of transport and its importance are reflected in scientific research. One of the many research areas is that concerning economic analyses in the transport industry. Research indicates, inter alia, that transport can bring significant losses and requires subsidies (Bąk (Ed.), 2010). The problem of high costs and the need to subsidize transport, the use of promotional ticket prices to encourage the use of the carrier's services applies to a large extent to public passenger transport (cf., inter alia, Matas, 2004; Buehler and Pucher, 2011; Redman, Friman, Gärling and Hartig 2013; Mouwen 2015). However, it should be remembered that among transport companies there are also those whose aim is to generate profits. These companies include the private taxi transport (Bauer and Bauer, 2018).

Companies from the taxi industry in Poland are profit-oriented entities. Therefore, earning income is a prerequisite for their survival. The income of enterprises, whose goal is to generate profits, is closely related to the pricing policy they adopt, which in turn affects the financial condition of the entity. The market conditions and the amount of costs incurred should be the basis for calculating the prices of taxi services. The proposed prices must cover the costs the business incurs, but at the same time must be acceptable for the customers. Pricing strategy decisions may depend on the reliability of information on costs, supply-demand relationship, and the level of competitiveness in

comparison to other industry members (see, for example, Mattila and Choi, 2006; Noone and Mattila, 2009; Sadowska and Lulek, 2015). The problem of cost-benefit analyses becomes more significant when taxi companies operate under conditions of high uncertainty. This uncertainty is related not only to aspects such as the activities of competitors, seasonality of income, decisions of potential customers or fuel cost variability, but also results from the variability of traffic conditions or the condition of the road infrastructure. The COST-VOLUME-PROFIT (CVP) analysis may bring support to activities aimed at generating profits for companies in the taxi industry. As a rule, the use of management accounting tools may contribute to achieving the organization's goals in a more effective manner.

The aim of this article is to show that simulation modeling can be an effective tool that supports the planning of taxi services, also in terms of estimating customer income, depending on different traffic conditions. As the issue is very broad, the focus was on airport taxi services, where taxi services are of particular importance, resulting, inter alia, from the high standard of all air services. For this purpose, a universal, proprietary model of taxi service between the airport and the neighboring city center has been developed. The model takes into account all the important processes of the taxi service; it is also stochastic, as it takes into account the variability of the duration of these processes.

The essence of the COST-VOLUME-PROFIT analysis in the context of companies from the taxi industry

Despite a relatively long history, cost-volume-profit analysis (CVP) is still useful in business management. The starting point for the CVP analysis was the break-even concept. Over the years, the CVP analysis has been modified and improved in order to reduce its limitations and develop the possibility of its application in as many business situations as possible. It was created as a mathematical formula to calculate simple dependencies of costs, prices, production and profit in an enterprise producing and selling only one good. This limitation had caused criticism of this calculation method, and therefore it was developed to be applicable to various economic activities (Cafferky, 2010, pp. 1-3).

In the basic math formula for breakeven point, total costs for period equal total revenue for period. Where total costs are equal to the sum of fixed costs and variable costs. Total revenue is equal to the product of the unit selling price and quantity sold. The expanded formula includes the production of a variety of goods, as well as investment calculations (cf., inter alia, Drury, 1992; Garrison and Noreen, 1994; Dobija, 1999; Piosik, 2006). The formula in the basic version is expressed by:

Net profit = (unit sold * unit selling price) – (unit sold * unit variable cost) – total fixed costs

In CVP analysis, it is assumed that the relationships that occur between the categories are linear. In a given range, both the total fixed costs and unit variables are treated as immutable. Potential sales volumes are also determined. It is essential to define the maximum production capacity. Due to the variability of the parameters of the CVP analysis over time, the study covers a short time period (Drury, 1992).

The subject of research on CVP analysis pertains mainly to manufacturing companies. However, the need to make profits and be a competitive entity makes the use of CVP not only possible, but also recommended in the services sector. The difficulty in simulating the results in the CVP analysis in service providers is that the sale of services is highly volatile over time. Moreover, this type of activity is usually associated with high fixed costs, which may be difficult to cover in the case of income volatility (Cafferky, 2010, p. 16). Scientific research on the CVP method does not pertain to all enterprises, but only to particular industries (e.g. Greenberg, 1986; Basu and Conrad, 1994; Anderson, Fok and Scott, 2000; Cafferky, 2010). Therefore, it is necessary to explore the specifics of a given type of enterprise. In the context of the topic under discussion, it is the taxi industry that will be referred to.

The demand and supply of taxi services are related to economic parameters such as the price of the service and the cost of providing it. Setting the right price for a taxi service is a difficult task. It involves the analysis of the costs of the service provided, but also the quality of the services provided (Schaller, 1998). The problem of the balance of supply and demand for taxi services also depends on the specificity of this market in a given country. For example, in the regulated market of taxi services in Hong Kong, studies on the balance of supply and demand will deviate from classical economic analysis and will focus on the efficiency of the entire system (Yang, Wong and Wong, 2002). However, even in a monopoly market, it is advisable to create models of taxi services and conduct research

on changes in business behavior of drivers, influenced by the actions of potential passengers (Yang, Wong and Wong, 2010). For economic analyses, it is necessary to learn about central regulations or deregulation introduced in the taxi services market, as well as to develop models focused on market organization, operational organization and regulation issues (see, among others, Foerster and Gilbert, 1979; Morrison, 1997; Litman, 2005; Seibert, 2006; Moore and Balaker, 2006; Salanova, Estrada, Aifadopoulou and Mitsakis, 2011).

Pricing of taxi services has a particular specificity, which results from the non-linearity of service prices per unit of time. The specificity of the calculated profit requires not only the calculation of the travel time with the customer, but also the travel time to reach the customer, waiting time and duration of operational activities. Moreover, the extension of the travel route may affect the promotional travel rates. Therefore, in the case of taxi services, it is not possible to convert the number of services (and prices) easily into 1 km, as the average price of a kilometer of travel will vary depending on its length. (Yang, Fung, Wong and Wong, 2010). The imperfection of information on the deregulated taxi market is also problematic and requires searching for additional solutions that favor activities aimed at increasing competitiveness (Seibert, 2006).

The complexity of the issue discussed necessitates looking at economic analyses in taxi companies differently. The parameters for CVP analysis should be defined in relation to the situation on the market on which the companies operate. It is advisable, for example, to analyze studies of communication behavior, which will affect the reported demand and the offered supply, as well as the variability of traffic conditions.

Determining revenues from taxi transport is possible both, through research of the current condition, as well as using simulation analyses. The latter method makes it possible to find the best solutions and avoid unfavorable solutions - without incurring additional costs and the risk of losing customers in the case of implementing experimental solutions, which turn out not to be successful. The simulation approach facilitates, among others:

- determining the need for taxis at different times of the day,
- determining optimal working hours in multi-shift mode,
- adopting a strategy for dealing with return journeys (City-Airport),
- determining service prices,
- applying solutions conducive to the implementation of the city's transport policy,
- developing guidelines for improving the quality of the transport infrastructure.

Simulation Model

In order to enrich the CVP analyses, an original model was built, to be used for simulation analyses of the work of a taxi company, with particular emphasis on airport service. It is a specific form of the taxi business which is usually carried out by companies owned (or jointly owned) by airports and which offer high-quality services. These companies focus mainly on trips between the airport and the city in close proximity. It is characterized by repetitive trips along the same or very similar routes and a strong directional asymmetry: the vast majority of commercial trips are carried out from the airport, while the trips towards the airport are mostly without customers. A distinguishing feature of such taxi companies is also the assignment of drivers to particular vehicles - they are often the property of the drivers. It is an extended version of the model described in (Bauer and Bauer, 2018), enriched with additional service processes and the variability of the duration of individual service processes. The model represents the work of taxis during an average working day. Four types of processes occurring during standard passenger service have been distinguished:

- customer acquisition (including waiting for the customer resulting from a standstill in the taxi queue or / and the lack of waiting customers and the drive to a parking stand or drive to the customer),
- activities when boarding the vehicle (boarding customers, loading luggage, finding the address, information on travel conditions, including transport prices),
- trip between the airport and the destination in the city center or vice versa,
- activities when alighting the vehicle (disembarking customers, unloading luggage, paying the fare).

The occurrence of individual processes depends on whether a given trip is profitable - then all four processes occur. On the other hand, if the trip takes place without a passenger, the structure of the model simplifies to two (when the waiting is not successful) or even one process (when the driver immediately decides to go without a passenger. The list of possible scenarios is presented in Figure 1.

Fig. 1: Taxi service processes during the completion of a full cycle Airport - City Center – Airport

The probabilities of carrying out profitable trips (with clients) are therefore of key importance, hence their estimation should be based on real data about how the airport taxi service functions, taking into account a completely different specificity of the trips made to and from the airport. The scale of the probabilities depend, inter alia, on the actual time when air operations at the airport are performed (arrivals and departures), conditions of arrival to the airport by various means of transport (public transport offer, road conditions and parking conditions at the airport, taxi offer), as well as travel costs by various means transport.

There is an assumption in the model, as is the case of real conditions, that the duration of all taxi service processes is characterized by greater or lesser variability, therefore, apart from the average duration, the model also includes random components of a given service process. The presented model is therefore stochastic, enabling the mapping of the variability of the duration of service processes, similar to the variability observed under real conditions. Variability in customer acquisition times is due to the randomness of the process of a customer requesting a taxi service, and is slightly different in the case of the airport and the city center. In the first case, after aircraft arrival, there is an increased use of taxi services, which helps to shorten the waiting time in the taxi queue; more often it is passengers waiting in queues for vacant vehicles. However, during the break between arrivals, customer acquisition times are longer. The situation is slightly different in the case of return journeys (from the center to the airport) - depending on whether a potential passenger is reported or the trip is without a passenger, in which case the trip back to the airport is performed swiftly in order to pick up the next passenger.

In turn, the variability of the taxi travel time between the airport and the city center (and in the opposite direction) is mainly due to the variability of traffic conditions on the road network. Travel time is usually longer during the periods of communication peaks (most often: morning rush and afternoon rush), when most trips take place, also those unrelated to the airport. Travel time is usually the longest of the analyzed taxi service processes. Travel times during peak hours can be even more than twice the night travel times, when traffic volumes are usually the lowest. As a result, at peak hours, maintaining taxi service requires the engagement of more vehicles to provide the same level of transport offer as outside of peak communication periods.

The times passengers alight and board are relatively the least important. Usually, they are in the range of 2-3 minutes, and also in this case we are dealing with variability resulting from the different physical characteristics of customers, the level of communication (in different languages - which is the specificity of airport-related trips), type and size of luggage, and methods of payment for the trip.

The total duration of the trip in the direction Airport – City Center (TAC) and City Center – Airport (TCA) is the sum of the duration of individual service processes during the trip in this direction:

$$T^{AC} = t_w^{AC} + t_b^{AC} + t_{tr}^{AC} + t_a^{AC} \quad \text{and} \quad T^{CA} = t_w^{CA} + t_b^{CA} + t_{tr}^{CA} + t_a^{CA} \quad \text{[min]}$$

stand for:

t_w^{AC}, t_w^{CA} [min] – time of customer acquisition (including travel to queuing position and waiting for the customer),

t_b^{AC}, t_b^{CA} [min] – boarding time and accompanying activities,

t_{tr}^{AC}, t_{tr}^{CA} [min] – travel time on the road network,

t_a^{AC}, t_a^{CA} [min] – time of alighting and accompanying activities.

Then, the time of completing the full taxi cycle is the sum of the time of completing the trips (for profit or not) in both directions:

$$T^{ACA} = T^{AC} + T^{CA}$$

In the simulation model of completing a trip, the duration of all service processes are determined with the use of pseudorandom number generators, taking into account the probability of acquiring a customer. Then, the time of full cycle for a taxi (in minutes) can be determined with the formula:

$$\hat{T}^{ACA} = \hat{a}_w^{AC} \cdot \hat{t}_w^{AC} + \hat{a}_{ba}^{AC} \cdot \hat{t}_b^{AC} + \hat{t}_{tr}^{AC,k} + \hat{a}_{ba}^{AC} \cdot \hat{t}_a^{AC} + \hat{a}_w^{CA} \cdot \hat{t}_w^{CA} + \hat{a}_{ba}^{CA} \cdot \hat{t}_b^{CA} + \hat{t}_{tr}^{CA,l} + \hat{a}_{ba}^{CA} \cdot \hat{t}_a^{CA}$$

Stands for:

$\hat{t}_w^{AC}$, $\hat{t}_w^{CA}$ [min] – acquiring time from Normal distribution $N[\mu_w^{AC}, \sigma_w^{AC}]$ and $N[\mu_w^{CA}, \sigma_w^{CA}]$,

$\hat{t}_b^{AC}$, $\hat{t}_b^{CA}$ [min] – boarding time from Normal distribution $N[\mu_b^{AC}, \sigma_b^{AC}]$ and $N[\mu_b^{CA}, \sigma_b^{CA}]$,

$\hat{t}_{tr}^{AC,k}$, $\hat{t}_{tr}^{CA,l}$ [min] – travel time from Normal distribution $N[\mu_{tr}^{AC,k}, \sigma_{tr}^{AC,k}]$ and $N[\mu_{tr}^{CA,l}, \sigma_{tr}^{CA,l}]$ for a specified period of time k, l [-],

$\hat{t}_a^{AC}$, $\hat{t}_a^{CA}$ [min] – alighting time from Normal distribution $N[\mu_a^{AC}, \sigma_a^{AC}]$ and $N[\mu_a^{CA}, \sigma_a^{CA}]$,

$\hat{a}_w^{AC}$, $\hat{a}_w^{CA}$ [-] – coefficient from Binomial distribution $B[1, p^{AC}]$ and $B[1, p^{CA}]$,

$\hat{a}_{ba}^{AC}$, $\hat{a}_{ba}^{CA}$ [-] – coefficient from Binomial distribution $B[1, r^{AC}]$ and $B[1, r^{AC}]$.

The total time of a work day can be determined as the sum of the duration of consecutive trips:

$$T = \sum_i \hat{T}_i^{AC} + \sum_i \hat{T}_i^{CA} \text{ [min]}$$

with a limiting condition resulting from the maximum working time of the driver; usually it is 8 hours. If this time is exceeded, the driver stops working after the completion of the current trip with a passenger. However, if he is during a trip without a passenger, he no longer tries to acquire another client.

An Example of Applying the Simulation Model

Below is a presentation of one of the many possible examples of how to apply the model, such as using it to determine the best working hours of taxi drivers in handling passenger traffic between the airport and the city center. It is not an example of a particular airport and city, but the data selected is real. The model is universal – it enables simulation of such connections for any airport.

For the purposes of the calculations, it was assumed that the maximum working time of one driver is 8 hours, during which he strives to complete the largest possible number of paid trips, i.e. trips with a client. Therefore, in

order to ensure continuity of service throughout the day, three vehicles are theoretically needed for one service unit - assuming for the purpose of this paper that the demand for taxis is constant throughout the day. This means, of course, that it is need to engage many vehicles - for example, if we assume that a taxi leaves the airport regularly every 5 minutes, and the time of a full cycle (there and back) is 90 minutes - then you need 18 taxis at the same time, and there is a demand for 54 vehicles per day. In practice, the working times of a given vehicle are different than 8 hours - which results from the variability of the duration of individual processes. It is therefore possible that more vehicles are in operation at the same time than would result from theoretical calculations. It was also assumed that the fare - regardless of the direction – was 22 EUR. In this example, eight-hour work shifts starting every 2 hours, with the first starting at midnight, were chosen to determine the best time to rotate vehicles. Table 1 presents Data needed for the calculations is presented in table 1.

Table 1: Summary of input data for the simulation of taxi service on airport – city centre route

Variable		Direction: Airport – City Centre	Direction: City Centre – Airport
Distribution of probability of completing a paid trip [-]		B [1, 0.98]	B [1, 0.14]
Distribution of time to acquiring a client [min]		N [25, 5]	N [10, 3]
Distribution of boarding time [min]		N [3, 1]	N [3, 1]
Distribution of time of trip [min]	22:00-05:59	N [22, 3]	N [24, 3]
	6:00-07:59	N [28, 5]	N [28, 5]
	08:00-14:59	N [33, 6]	N [34, 7]
	15:00-18:59	N [37, 9]	N [36, 8]
	19:00-21:59	N [28, 6]	N [28, 4]
Distribution of alighting time [min]		N [2, 1]	N [2, 1]

The probabilities of completing trips with a passenger were strongly diversified, as is often the case with this type of service. Importantly, the day was divided into periods with different travel times, both in terms of the average value and in terms of the standard deviation. The duration of other service processes - also taking into account randomness - was assumed to be the same for the whole day. 100 simulation runs were performed for each starting hour of an 8-hour working day of a single taxi (00:00, 02:00, 04:00,…, 22:00). The average numbers of completed trips (including trips with clients) per one vehicle and average income for one 8-hour working day - are presented in Table 2.

Table 2: Summary of the simulation results - the number of completed trips and revenues from transport per 1 vehicle during an 8-hour working day

Period	Number of courses			Number of paid courses			Incomes [EUR/veh]
	Airport – City Centre	City Centre - Airport	Total	Airport – City Centre	City Centre - Airport	Total	
00:00-08:00	6.7	6.0	12.8	6.6	0.8	7.3	161.3
02:00-10:00	6.2	5.7	11.9	6.1	0.9	7.0	154.2
04:00-12:00	6.1	5.4	11.4	5.9	0.6	6.5	143.4
06:00-14:00	5.8	5.0	10.8	5.7	0.8	6.5	142.1
08:00-16:00	5.3	4.8	10.2	5.2	0.7	5.9	129.8
10:00-18:00	5.2	4.8	10.0	5.1	0.6	5.8	126.5
12:00-20:00	5.2	4.7	9.9	5.1	0.7	5.8	127.6
14:00-22:00	5.8	5.0	10.8	5.7	0.6	6.3	138.6
16:00-00:00	6.1	5.3	11.4	5.9	0.7	6.7	146.3
18:00-02:00	6.4	5.9	12.3	6.3	0.9	7.2	158.0
20:00-04:00	6.8	6.0	12.8	6.7	0.9	7.6	166.5
22:00-06:00	6.7	6.0	12.7	6.5	1.0	7.5	165.2
Average	6.0	5.4	11.4	5.9	0.8	6.7	146.6

As can be seen, the average total number of trips completed during different times of day varies significantly - from 9.9 to 12.8, in the case of trips with a passenger it ranges from 5.8 to 7.6. This translates into differences in incomes: from EUR 126.5 to as much as EUR 166.5 for just one 8-hour working day of one taxi. Table 3 presents the total income for four analyzed cases in which the day was divided into three work shifts.

Table 3: Summary of simulation results - total revenues from transport per 1 vehicle per day at different work shifts

Work shifts	**00:00-08:00 08:00-16:00 16:00-00:00**	**02:00-10:00 10:00-18:00 18:00-02:00**	**04:00-12:00 12:00-20:00 20:00-04:00**	**06:00-14:00 14:00-22:00 22:00-06:00**
Incomes [EUR/veh/ day]	437.4	438.7	437.6	**445.9**

The table above shows that, of the analyzed case, the best day distribution is into three shifts: 06:00-14:00, 14:00-22:00 and 22:00-06:00. With this division of the day into 8-hour periods, it is possible to obtain the highest incomes for transport (with an even distribution of the taxi offer throughout the day) - it gives a total of 445.9 [EUR/day]. In the case of multiple vehicles operations, differences in income should be considered significant. On the other hand, table 4 presents the duration of particular service processes.

Table 4: Summary of simulation results - average duration of particular service processes per 1 vehicle during an 8-hour work day

Shift time	**SUM acquiring time**	**SUM boarding time**	**SUM travel time**	**SUM alighting time**	**TOTAL TRAVEL TIME**
00:00-08:00	172	23	299	14	508
02:00-10:00	162	21	307	14	503
04:00-12:00	153	20	318	13	504
06:00-14:00	149	19	332	13	513
08:00-16:00	139	18	340	12	508
10:00-18:00	135	18	342	12	506

Figure 2 shows a graphical comparison of the total duration of particular service processes and revenues from trips completed with customers for cases that were analyzed.

Fig. 2: Comparison of totaled shares of the duration of individual processes to incomes from transport - for one vehicle during an 8-hour work day

There is a strong diversification among the shares of travel time and time of acquiring customers. It can also be seen that the greater the share of travel time, the lower the incomes. It can be observed from the obtained results that traffic conditions are of fundamental importance in reference to income. It is possible to carry out a larger number of profitable trips by one driver during off-peak hours, and this has a positive effect on the efficiency of the entire taxi system servicing the airport.

Conclusions

Simulation methods are a very useful tool facilitating more efficient planning of taxi services. Thanks to this, it is possible to adjust the service to current needs, and at the same time to achieve the highest possible income, by using, among others, an optimal division of the day into work shifts. For this to be possible, the model must take into account the diversity of the service processes; it is also useful to use a stochastic approach, which makes it possible to obtain results similar to real observations. The presented model is universal and can be used for various connections between airports and city centers, provided that reliable information on the duration of individual processes is taken into account - obtained as a result of carrying out measurements under real conditions.

Future work will include surveys conducted among taxi drivers at Polish airports and determining detailed models of the time to acquire a client as well as boarding and alighting - at airports and city centers. Further expansion of the model is planned, towards the possibility of taking into account the diversification of trip destinations and the length of the routes served, and thus the differentiation of fares.

Maciej RZEMPOŁUCH

Abstract

The article presents an approach to redesigning the existing way of distributing goods, which rely on introducing an intermediate link into the direct channel in the form of a distribution centre. The aim of the article is to reorganize the goods distribution process, taking into account the optimization of transport work, improving cooperation in the supply chain and maintaining an appropriate level of supply security. The proposed solution will rationalize the transport process related to the delivery of an appropriate number of pallets to end customers of the company and will contribute to the improvement of cooperation in this area. The use of IT tools to determine the location of the distribution centre allows to find quick solution to the problem, and also allows for appropriate adaptation in the event of emerging new collection points. The course of activities during the distribution process with the use of the centre developed by a logistics operator ensures the maintenance of an appropriate level of security of delivery.

Keywords: Reorganisation, Distribution, Security, Location Selection.

Introduction

Companies currently operating on the market, especially from the FMCG branch, must face serious challenges related to the complexity, volatility and uncertainty of the conditions that occur in market environment. The constant changes result in the emergence of previously unknown organizational forms and the creation of new elements in traditional organizations. Moreover, the reorientation of the economy from the "seller's market" to the "buyer's market" means that not only the product, price and quality is essential, but also the delivery method and the related logistic service (Ślaski, 2018). The above-mentioned conditions mean that the competition impels the continuous improvement of logistics processes. If there is no such possibility, companies, reducing operational costs, outsource some processes to external entities (Moreira, Leite, & Silva, 2019; Teoh, Kunze, Teo, & Wong, 2018).

The importance of logistics in the global economy is growing every year. The dynamic development of this field in its many aspects is dictated by more and more new requirements dictated by growing competition and consumer expectations (Yang, Ji, & Tan, 2020; Gopi, & Samat, 2020; Mathur, & Kumar, 2019; Clausen, 2013). This results in a fight for each customer through all possible ways that pursue one goal, which is the purchase of the product by the final recipient (El Ouardighi, & Shniderman, 2019). This generates new process optimization opportunities to meet the growing demands for product availability in terms of quantity, place and time. This is to the buyer as the most frequent interaction with the product, which affects the ease of purchase decision (Kijek, Brzeziński, & Zelkowski, 2016; Zhao, 2014). It also influences the development of new technologies (Prasanna, & Hemalatha, 2012; Rykała, Typiak, & Typiak, 2020; Sun, 2012; Wang, Yuan, Laur, & Lang, 2011; Yu-fang, & Qing-lu, 2009).

The article focuses on the analysis of the goods distribution process on the example of an FMCG company. As a result of the research, problems were observed in the existing direct sales channel. In order to rationalize transport

work and improve cooperation in the supply chain, it was proposed to reorganize the currently existing distribution method, which consists in introducing an additional link - the distribution center. The article uses an IT tool (X-Cargo plugin for Ms Excel software) to solve the discussed problem. In addition, by using the above-mentioned software, special attention was paid to ensure the maintenance of an adequate level of security of delivery.

Identifying the problem

The appearance of many different factors in the company's environment causes it to look for alternative solutions that will improve its logistic processes. This applies in particular to the product distribution process.

In the analysed case, the production company operates in the FMCG industry and currently does not have a distribution centre, and all its orders are shipped from 3 factories located in Bydgoszcz, Zielona Góra and Radzymin. The manufacturer fulfils all orders through a permanent network of transport subcontractors, and all deliveries to customers are shipped individually, directly after their completion in the production plants (Fig. 1). This is due to the lack of warehouses near the production plants that could be used to consolidate orders. The manufacturer asked the logistics operator to optimize the manufacturer's distribution process through a distribution centre.

Fig. 1. The current distribution process of a manufacturing company

The selected logistics operator operates in the market for air, sea, road, rail shipping, contract logistics, project logistics and integrated logistics. This enables the customers of the logistics company to find a logistics offer tailored to their individual needs and thus optimise their supply chain.

Shipped deliveries are constantly protected by a dedicated, standardised network and continuous control of processes in the supply chain, which ensures an optimal level of shipment security. The logistics operator adapts its offer to individual customer's requirements, including companies from the pharmaceutical and medical industries, automotive, aerospace, high-tech and consumer goods industries.

According to the guidelines of the manufacturer, the task of the operator is to carry out the part of the distribution process which lasts from the collecting of the goods from the distribution centre until the order is delivered to the end customer (Fig. 2). Therefore, the operator carries out the "last mile" transport to the final customer through a group of subcontractors cooperating with the company, which realize transport orders using 13,6 m long and 7,8 m long semi-trailer vehicles.

Fig. 2. Proposal for the distribution process

Proposal of the course of activities performed by the logistics operator within the distribution process

In the analyzed case, the operator's cooperation with a company from the FMCG industry consists in carrying out warehousing activities for a given company in a separate warehouse space in its own building or leased for a long-term from the developer. In addition, the logistics operator is obliged to organise the transport of cargo to the next customer after releasing from the warehouse. The contract is signed for a minimum of two years due to high costs of organisation, technical infrastructure of the warehouse and IT systems integration. This type of cooperation ensures the stabilisation of processes in the distribution centre in the long term.

The distribution process at the logistics operator's premises, offered to the analysed company, starts with the receiving of goods from the manufacturer at the respective distribution centre, upon information arrival from the manufacturer. Once the delivery specification is determined and a time window is reserved for the selected vehicle, unloading and a quality and quantity check take place. Depending on the outcome of the inspection, the goods may be withdrawn to the manufacturer or transferred to the storage area (Fig. 3).

Fig. 3: Scheme of admission of the manufacturer's goods to the distribution centre managed by the logistics operator

The key stage of the distribution process on the part of the logistics operator is the execution of deliveries under individual customer orders. For this purpose, after the manufacturer initiates the order execution, the order is verified in the logistics operator's IT system in terms of the availability of goods on the racks (Fig. 4), and then route planning is carried out. Then the IT system allocates resources from among those currently available in the database (car, semi-trailer and driver). The next step is to calculate transport costs and confirm the planned routes, which results in the generation of transport documents. The goods are loaded onto the semi-trailer, the transport documents are handed

over and the driver starts the route. After the transport is completed and the relevant documents are collected, the shipping agent passes the information about the completed transport to the logistics operator by phone. In the end, the driver is obliged to return the documents, which the operator sending on to customer as a confirmation of order completion.

Fig. 4: Scheme of the distribution process implemented by a logistics operator using a distribution centre

Analysis of the manufacturer's order structure

The analysis was based on the annual list of completed orders from 2019 by a manufacturer who, without warehouses at its 3 factories located in Bydgoszcz, Zielona Góra and Radzymin, carries them out through a direct channel. All orders were carried out by the manufacturer through a permanent network of transport subcontractors, and deliveries were shipped individually immediately after completion in the production plants. The XCargo software was used to present a procedure for selecting the logistics centre during the calculations.

The data provided included information on the number of pallets, date and place of delivery of the order (city name and postcode). All end customer locations are located in Poland and each line in Excel corresponds to one order. The total annual number of pallets handled by the distribution centre is 388 837. Products in the warehouse are accepted on standard EUR pallets (1200x800), both at the warehouse entry and exit (regardless of the number of pallets for a given order).

Orders on an annual basis, as compared to a monthly basis, show a slight imbalance between them (Fig. 5). The highest number of pallets is in March and October (37 616 and 37 649 pallets respectively), while the month with the lowest number of pallets is April (26 992 pallets). This gives a difference of 10 705 pallets between the period with the highest number of pallets and the period with the lowest turnover.

Fig. 5: Distribution of the number of pallets sent to the customer by month per year

Analysing the data on a weekly basis (Fig. 6), it can be observed that the smallest number of pallets was shipped on Sunday (9 491 pallets per year). Apart from Sunday, a relatively similar load during the week is shown on Monday and Saturday (11,7% and 10,6% turnover respectively). The remaining days present a similar structure of orders, with a slight advantage of Friday, during which 79 062 pallets are delivered annually, which corresponds to 20,3% of the total volume.

Fig. 6: Order structure in pallets with a breakdown by day of the week during the year

Figure 7 presents data showing that less than 50% of the orders comprise up to 5 pallets, which can potentially be consolidated with the orders on the right-hand side of the graph, in order to optimally fill the vehicle's semi-trailer. A relatively high percentage of orders are those of more than 29 pallets, which can be called FTL (Full Truck Load) orders due to the level of filling of the vehicle's loading space. Taking into account the total turnover during the year, we can see on average 10 pallets per order.

Fig. 7: Accumulated structure of orders per year

Methodology for determining the potential location of a manufacturer's distribution centre

All 388 837 pallets shipped during the year were delivered to 215 cities, represented by 331 postcodes throughout Poland, which corresponded to the respective end customers. Aggregated data is presented in Figure 8, where each location was marked with a separate symbol. The size of the location on the map corresponds to the number of pallets delivered to this place during the year, where the largest end customer corresponds to the largest symbol. It can be seen that the most of the volume is delivered to large Polish cities and distribution centres in their vicinity (e.g. Mszczonów and Teresin between Łódź and Warsaw).

Fig. 8: Map showing the locations of end customers of the production company under analysis

Based on the size of the annual volume and the specification of the goods sold by the manufacturer, an analysis of the available warehouses owned by the operator was conducted. In addition, the developers and warehouse managers cooperating with the operator have made a survey and provided information on the locations that could be offered as a distribution centre for that particular manufacturing company. The data collected were sorted in alphabetical order and is presented in Table 1, which shows 50 potential distribution centre locations.

All data concerning completed deliveries have been consolidated based on the postal code and the city of delivery and put into a previously prepared Excel sheet, which operates on the basis of the XCargo software (Jlassi, Tamayo, & Gaudron, 2017; Teoh, Kunze, Teo, & Wong, 2018). The software is used to calculate the distances between individual towns and then multiply them by the annual number of pallets. Thanks to this, the locations with the largest number of delivered pallets will have an increased influence on the calculation result. The appropriate distance between the points is calculated by using the XC_DISTANCE formula which determines the number of kilometres between them based on the actual mileage a trailer would have to cover on the roads.

Table 2 shows an excerpt from the sheet used to calculate the centre of gravity based on data provided by the manufacturer. The cells showing potential locations as the distribution centre are marked in green. The consolidated historical data presented by the manufacturer consolidated by city and postcode are marked in grey. White cells are used to calculate the distance between potential distribution centre locations and historical delivery locations multiplied by the annual number of pallets per location.

The formula that was used to calculate the distance between the locations is:

$$=\text{XC_DISTANCE}\left(\begin{array}{c}\text{Gecoding Engine;Start Country;Start Zip;Start City;}\\ \text{Dest Country;Dest Zip;Dest City}\end{array}\right) \quad (1)$$

where:

- Gecoding Engine - geocoding engine, e.g. "mgeurope";
- Start Country - the country of initial location;
- Zip start - postal code of the starting location;
- Start City - the city of initial location;
- Dest Country - the country of destination;
- Dest Zip - the postcode of the destination;
- Dest City - the city of destination.

Cells with a red background are responsible for the annual sum of the product of pallets and kilometres for a given potential location, this sum is calculated using the formula:

$$Sum = \sum_{i=0}^{n}\sum_{j=0}^{m} p_{ij} \times d_{ij} \quad (2)$$

where:

- p_{ij} - number of pallets transported from the distribution centre (CD) to the final customer;
- d_{ij} - distance from the distribution centre to the end customer's target location;
- n - number of potential distribution centre locations (CD);
- m - number of locations to which goods have been delivered.

20	PL	04-242	WARSZAWA	239	48 834	35 936	45 186

Identical operations were done in relation to the data of deliveries to the distribution centre, i.e. sent by the manufacturer (Tab. 3). In this case, in the grey colour cells data on the share of individual factories in supplies (annual number of pallets) with their location (country, postcode, city) were entered.

Formula (1) was used to calculate the distance between the locations. In turn, the following relationship was used to calculate the sum of the product of pallets and kilometres for each potential distribution centre location:

$$Sum = \sum_{i=0}^{n} \sum_{j=0}^{m} z_{ij} \times g_{ij} \tag{3}$$

where:

- z_{ij} - number of pallets shipped from the manufacturer to potential distribution centre locations (CD);
- g_{ij} - distance from the manufacturer's factories to the potential location of the distribution centre (CD);
- n - number of manufacturers' factories;
- m - number of potential distribution centre locations (CD).

Table 3: Aggregated data for the determination of the distribution centre containing deliveries from production facilities

				Country	PL	PL	PL
				Zip	97-400	21-500	15-023
				City	Bełchatów	Biała Podlaska	Białystok
				Sum of Pallets*km	115 927 749	149 735 257	155 959 205

3	PL	05-250	Radzymin	174 977	36 620 586	29 889 396	29 730 692

The next sheet (Tab. 4) shows the potential locations for the centre of gravity together with the sum of the product of the pallets and kilometres. The values calculated in the previous two sheets for the product of pallets and kilometres for each location are marked in red. The data obtained in this way are summed up in the next column called "Sum". (marked in yellow), which lowest value after taking into account the previous calculations is the optimal location.

For each of the 50 locations, a position has been assigned which will row it in terms of optimal location, with 1 being the optimal location and 50 being the least favourable location for the calculation.

Table 4: Potential distribution centre locations

Table 5 shows in order ten optimal locations for the previous scoreboard. The best location among those accepted for the calculation is the one in Łódź with postal code 90-001, which has the lowest value for the analysed data. On its basis, the percentage difference of the remaining locations was determined according to the relationship:

$$R = \left(\frac{a}{b} - 1\right) \times 100\ \% \tag{4}$$

where:

- a - the sum of the product of the pallets and kilometres of the analysed location;
- b - the sum of the product of the pallets and kilometres of the centre of gravity.

Table 5: Top ten potential locations

Ranking position	Country	Zip	City	Sum of Pallets*km	Difference
1	PL	90-001	Łódź	175 910 635	0,0%
2	PL	99-300	Kutno	180 236 278	2,5%
3	PL	96-500	Sochaczew	182 898 500	4,0%
4	PL	05-800	Pruszków	185 602 722	5,5%
5	PL	00-002	Warszawa	190 794 827	8,5%
6	PL	97-300	Piotrków Trybunalski	192 341 819	9,3%
7	PL	05-270	Marki	193 198 641	9,8%
8	PL	09-400	Płock	196 013 833	11,4%
9	PL	87-800	Włocławek	197 724 297	12,4%
10	PL	97-400	Bełchatów	201 921 281	14,8%

All 50 considered locations are shown on the map (Fig. 9) using the XCargo software. The best location has been marked green and another 9 locations in the ranking are those shown in yellow, the remaining locations have been marked in orange and red.

Fig. 9: Map with potential locations

Based on the calculations, the logistics operator proposed the manufacturer the location in Łódź with postal code 90-001 due to the lowest sum of the product of pallets and kilometres. The decision is also supported by the proximity

of the intersection of the A1 and A2 motorways, which in the long run would facilitate the transport of products to foreign markets.

Conclusions

Companies constantly strive to optimise their processes taking into account the current market situation. Distribution of the offered products is an important area in which process improvements can be made. The significant benefits can be achieved through appropriate shaping of distribution channels determined by the requirements set by the company, the tasks it performs and the number of entities participating in the channel. The proposed solution consisting of the introduction of an intermediate link in the form of a distribution centre may significantly improve the delivery performance. A large number of aggregated data indicates the need to use IT tools which will help to solve the problems of locating this type of logistics facilities. In the article, on the basis of the manufacturer's annual statement of activities, 50 potential locations that may constitute its distribution centre have been selected. After the calculation, based on 331 orders for end customers and the location of the manufacturer's factories, the lowest sum of the product of pallets and kilometres (optimal location) was obtained for the location in Łódź, which was chosen as the manufacturer's distribution centre. Therefore, the proposed approach indicates that the current distribution process of the manufacturer can be significantly improved by including an additional link in the distribution centre of the logistics operator. As a result of this re-modelling, the manufacturer can also ensures continuity of supply to its customers by eliminating the impact of production plant downtime on its operations.

To sum up, logistic processes require continuous optimisation, simulation and the search for new solutions in order to meet the requirements presented by the market. At the same time, with increasing demands and the complexity of factors in the logistics environment, new tools and methods are developed to improve those processes. Particularly large possibilities of the reorganisation of logistics processes are presented by IT tools due to the ease of their implementation and the possibility of application both on a micro and macro scale of a given enterprise.

Abstract

Understanding consumer motivation in online shopping is essential for a successful digital business. In a global online marketplace, competition is no longer limited to physical stores during business hours. Increasing competition, combined with the need for consumers to have a richer shopping experience, inevitably induce the need for retailers to rethink their online strategy. For many retailers, creating an online experience, enhanced by technologies such as 3D or virtual reality, is becoming at least as important as providing easy and personalized ordering, payment and delivery solutions. In this context, the definition of the consumer in the digital age leads to the realization and adaptation of online marketing strategies. The authors aim to present the main types of consumers, the factors that influence their behavior in order to achieve basic patterns. Based on the onset of the COVID 19 pandemic, this behavior has undergone changes due to a reconfiguration of consumer types. This aspect was illustrated by the authors by conducting a quantitative research through the questionnaire at the Romanian level.

Keywords: consumer behavior, buying patterns, behavioral segmentation

Introduction

The impact of the Internet on companies and organizations made itself felt after 1990. In ten years, however, the evolution of technology was significant, and the major change was the transition from analog to digital communication. The Internet and digital technologies have created new ways to promote, sell and distribute products. The emergence of social networks created a favorable environment for the creation and aggregation of communities, Voramontri (2019), Kizgin (2018). The Internet and the multitude of associated technologies have generated many names and labels for terms related to performance and marketing practice in this new context, Mukherjee (2019). Often the terms overlap, although most practitioners and theorists agree that digital marketing is more comprehensive and covers a wider range of activities and processes. Ellis-Chadwick (2012) synthesizes the elements the key that should be considered in online marketing planning.

Consumer behavior refers to the study of consumers and the processes they use to choose, use (consume) and give up products and services, including their emotional, mental and behavioral responses, Hoyer (2020). Consumer behavior includes ideas derived from several sciences, including psychology, biology, chemistry, and economics. Studying consumer behavior is important because in this way marketers can understand what influences people's buying decisions, Sharma (2020). By understanding how consumers decide whether or not to buy a product, they can fill in the gaps in the market and identify products that are needed and products that are outdated, Katsikeas (2019). Studying consumer behavior helps marketers decide how to present their products in a way that generates maximum impact on consumers. Understanding consumers' buying behavior is the key secret to reaching and engaging your customers, converting their interest into purchases. An analysis of consumer behavior should reveal:

- what consumers believe and how they feel about various alternatives (brands, products, etc.)
- which determines consumers to choose between the various options
- consumer behavior while documenting and buying
- how the consumer environment (friends, family, media, etc.) influences their behavior

Cite this Article as: Olivia Doina NEGOIȚĂ, Mirona Ana Maria POPESCU and Ramona Mihaela BULBOACĂ "The Transformation of Consumers Behavior: A Study Realised on Romanian Consumers" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

Consumer behavior is often influenced by different factors. Marketers should study consumers' purchasing patterns and discover buying trends. In most cases, the brand influences consumer behavior only about the things they can control. The COVID-19 crisis has generated in a very short time a transformation of the way people buys and consume, whether it is products, services, media channels or social experiences.

This paper aims to present the main features of the consumer in the digital age. A quantitative research was conducted through Google Forms between September 15 and October 21, 2020, in Romania. The number of respondents was 492. Questions from the questionnaire address both consumer behavior before the pandemic breaks out and during social isolation, as well as questions about possible scenarios for their behavior in the near future - when social distancing measures will relax.

An overview regarding consumers behavior in digital era

The explanation of the consumer's behavior is based on the succession of acts through which it takes possession of the service, a succession that defines the decision - making process of purchase.

Today, the consumer no longer follows the pre-established scheme of the marketing funnel. The way he makes the purchase decision and makes the purchase has changed, Patro (2018). Consequently, marketers should also adopt a distinct approach, along with this change that has taken place in consumer behavior. The purpose of marketing is to get in the way of the consumer at the right time, in other words, when the decision can influence them.

Fig. 1: Factors that influence the consumer behavior

When referring to the 4 main types of consumers behavior presented in Fig 1, there are different factors that influence their buying decision.

There are 4 main types of consumer behavior:

1. Complex buying behavior
This type of behavior is encountered when consumers buy an expensive product, rarely purchased. They are very involved in the acquisition process and in the documentation before committing to invest.
2. Purchasing behavior that reduces dissonance
The consumer is very involved in the acquisition process but has difficulties in determining the differences between brands. "Dissonance" can occur when the consumer worries that he will regret the choice made.
3. Ordinary buying behavior
Regular purchases are characterized by the fact that the person has very little involvement in the category of products or brands.
4. Purchasing behavior focused on diversity
In this situation, a consumer buys a different product not because he was not satisfied with the previous one, but because he is looking for variety.
Many things can affect consumer behavior, but the most common factors that influence it are:
1. Marketing campaigns

Marketing campaigns greatly influence purchasing decisions. If done correctly and regularly, with the right marketing message, they can even persuade consumers to change their brand or opt for more expensive alternatives. Marketing campaigns can even be used as reminders for products / services that need to be purchased on a regular basis, but they are not always in the minds of customers at all times (for example, insurance). A good marketing message can influence impulse buying.

2. Economic conditions
Especially in the case of expensive products (houses or cars), economic conditions play an important role. It is known that a positive economic environment makes consumers more confident and willing to shop, regardless of personal financial situation. Consumers make decisions over a longer period of time for expensive purchases, and at the same time, the buying process can be influenced by more personal factors.
3. Personal preferences
Consumer behavior can also be influenced by personal factors (what everyone likes / dislikes, priorities, morals and values). Of course, advertising can help, but in the end, consumers' choices are largely influenced by their preferences.
4. Group influence
The pressure of others also influences consumer behavior. Social psychology has an impact on consumer behavior. The level of education and social factors can have an impact.
5. Purchasing power
Consumer segmentation based on their purchasing power helps marketers determine eligible consumers and get better results, Galati (2020). Patterns of buying behavior are not synonymous with buying habits. Habits are developed as predispositions to action and become spontaneous over time, while patterns show a predictable mental design. Each customer has their own unique buying habits, while patterns of buying behavior are collective and offer marketers a unique characterization. Customers' buying behavior patterns can be grouped as in Table 1:

Table 1: Patterns of customers buying behavior

Pattern	Description
Buying place	When a customer has the opportunity and access to purchase the same products from different stores, he will not be loyal to any store, unless that store is the only one, he has access to. Studying customer behavior when choosing a place to shop helps marketers identify key store locations.
Purchased items	Factors to consider: the items that were purchased and how much of each item was purchased. Necessary items can be bought in bulk, while luxury items are rather purchased less often and in smaller quantities. The quantity of each item purchased is influenced by the perishability of the item, the purchasing power of the buyer, the unit of sale, the price, the number of consumers for which the object is intended, etc. Analyzing a shopping cart can give marketers a lot of information about consumers.
Time and frequency of purchase	Customers will shop according to their availability and expect to be served according to requirements. It is the responsibility of the store to meet these requirements by identifying a purchasing model and matching the services offered with the time and frequency of purchases.
The method of buying	A customer can either enter a store and buy a product on the spot or can order it online and pay by credit card or on delivery. The purchase method may also induce expenses on Tuesday from the customer (for online shopping, you may be charged a shipping fee, for example). The way a customer chooses to purchase an item also says a lot about what type of customer he is.

Customer segmentation, types of buyers have always been important, but now that customer customization and experience are factors that determine the success of a business, efficient segmentation is even more important. Traditionally, most marketers use the 6 main types of behavioral segmentation shown in Table 2. In addition to these traditional ways, another type of segmentation is the RFM model. RFM comes from the Latest Acquisition, Frequency and Monetary Value.

o Latest Acquisition = how recently a customer placed the last order on your site
o Frequency = how many times a customer bought something from your site, in the analyzed time period
o Monetary Value = how much each customer spent on your site, from the first order since

The analysis of the RFM model can be done in 2 ways:

o manual - manual export of your database in a spreadsheet and analysis of customers respecting the rules for RFM analysis

o Automatically - through certain tools that create RFM dashboards

From RFM segmentation and analysis it can be highlighted the most loyal and profitable customers, which are the least profitable customers, but also:

- Find out what brands and products are pulling a business down
- Create personalized recommendations for customers
- It solves certain problems related to the customer experience

Table 2: Types of behavioral segmentation

Type	Description
The benefits sought	When customers document a product / service, their behavior can reveal valuable information about what benefits, features, values, use cases or issues are the most important motivating factors that influence their purchasing decision. When a customer gives a much higher value to one / more benefits compared to the others, these primary benefits become the defining motivating factors that determine that customer's purchase decision.
The occasion or the moment	Behavior and moment-based behavioral segments refer to universal and personal occasions. o Universal occasions apply to most clients or target audience. For example, holidays and seasonal events when consumers are more prone to certain purchases. o Recurring personal occasions are buying patterns of an individual customer that are constantly repeated over a period of time. For example, birthdays, anniversaries or holidays, monthly shopping or even daily rituals. o Rare personal occasions are also related to individual clients but are more irregular and spontaneous (more difficult to predict).
Usage rate	Using the product / service is another common way to segment customers by behavior, based on how often they buy a product / service or how often they interact with a product / service. User behavior can be a strong predictive indicator of loyalty or lack thereof and therefore of value in life.
Brand loyalty status	Loyal customers are the most valuable assets of a business. They are cheaper to keep, usually have the highest life value and can become brand ambassadors. By analyzing behavioral data, customers can be segmented according to their level of loyalty, so that marketers understand their needs and make sure they meet them. Loyal customers are those who should receive special treatment and privileges (such as exclusive rewards programs) to nurture and strengthen the brand-customer relationship and to stimulate continued shopping in the future.
User status	There are many different user statuses, depending on the business: o non-users o potential users o first time buyers o regular customers o defectors (former customers who switched to a competitor)
The stages of the clientele journey	Segmenting the audience based on shopping availability allows marketers to align communication and personalize experiences to increase conversion at each stage of the shopping journey. Moreover, it helps them discover the stages in which customers do not progress, so that they can identify the biggest obstacles and opportunities for improvement, even about post-acquisition behaviors.

Consumer behavior in pandemic COVID 19

The research developed was a primary one, of quantitative type, carried out through the distribution of a questionnaire in the online environment, on the Romanian territory, Bucharest. The Google Forms platform was used to develop the questionnaire, which was then sent via a link to respondents. The development period was between 15 September and 21 October 2020.

The study is developed exclusively on Romanian consumers and identifies the emergence of 4 new types of consumers, as a direct result of the epidemic and measures instituted in the last months as in Figure 2.

Figure 2: Type of consumers

A major trend among Romanian consumers has been the reduction of budgets for non-essential expenditures, which can become permanent for about a quarter of those interviewed. Another quarter of consumers believe that they will not fully return to the consumption habits of previous years. There are specific types of behavior that consumers have developed during the pandemic, Figure 3.

Figure 3: Types of behavior

Respondents are increasingly interested and concerned about the behavior adopted by companies in the COVID-19 crisis (store safety measures, disinfection of marketed products, etc.), as well as their overall business strategy. Consumers are more attracted to companies that invest and donate resources to public health infrastructure and also prioritize the care and protection offered to their employees as seen in Figure 4. Advertising plays a secondary role.

Figure 4. Consumers towards companies

Conclusion

The alignment of all marketing elements - strategy, budget, proper management of promotion channels and the message sent - and the consumer's journey when making a purchase decision, and the integration of all these elements in the structure of the entire organization becomes an important element. When marketers understand the consumer's journey and direct the budget and messages at key moments in this process, in order to have as much influence as possible on the purchase decision, the chances of them getting in the way of the consumer at the right time with the right message increase considerably.

First of all, a thorough understanding of how consumers make decisions is needed. In some cases, the direction of marketing efforts must be changed, for example, from brand advertising in the first phase of the decision-making process, to help consumers gain a better understanding of the brand when they actively evaluate it. Other marketers will need to change loyalty programs and focus primarily on loyal but active customers rather than loyal but passive ones. The growing complexity of the decision-making process will force virtually all companies to adopt new ways to measure and evaluate consumer attitudes, brand performance and the efficiency of marketing spending throughout the process.

In most companies, different departments of the organization deal with different activities that focus on customers: PR, loyalty programs, etc. Often, activities are not coordinated or communication between departments is lacking. All activities should be integrated and under proper management, so that the efforts of the different departments and the communication between them are as well synchronized as possible. In order to achieve a better marketing strategy for consumers today, it is important to segment them, as a result the authors highlighted the types of consumers before and after the COVID 19 pandemic. Due to the current context, their classification and behavior have changed.

Abstract

Environmental awareness become a real variable in all today competitive scenarios. Thus, environmental management system (EMS) implementation could be considered as the main vector associated to organizational sustainable development. In the literature the "relation" analysis between specific factors associated to organization's orientation on environmental issue and the EMS implementation quality variables are debatable. Hence this paper has as main purpose to assess the "relation" between various representative organizational barriers (corporate environmental orientation) and EMS implementation quality.

Keywords: Statistical Analysis, Correlation, Environmental Management System (EMS), Organizational Barriers, Success Factors, EMS Implementation.

Introduction

The environmental management system (EMS) is a tool that identifies issues, but also contributes is solving these issues; according to continual improvement concept – this principle can be organizational implemented taking into account (i) the way in which it is perceived by the management and also (ii) the companies' activity sector (Perotto et al., 2008; Herghiligiu, 2013).

In the literature many scholars approach EMS considering: (i) various external factors that have an impact on the measures taken by the organization in order to modify the environmental strategy (Darnall, 2003), or (ii) various internal factors (Christmann, 2000; Darnall, 2003) that have a role in determining the management process quality concerning environmental issues, but that do not analyses the relation between the factors that influence / determine the EMS implementation quality (Herghiligiu, 2013).

The most important aspect for a EMS successful implementation is the organization support and commitment (Pun and Hui, 2001). This environmental commitment was also emphasized by Fernandez et al. (2003) in their studies; these authors state that the nature (positive or negative) of the human resource orientation to environmental actions can represent an obstacle or a successful factor on EMS. Hence a EMS successful implementation and an improvement in environmental performance are determined by environmental practices integration on human resource level. This approach includes top management support, environmental trainings, team work, motivation system, and so on (Daily and Huang, 2001; Herghiligiu, 2013).

Daily et al. (2007) studied the perception of human resource concerning the environmental performance. Thus, according to their analysis, these authors discovered that managerial involvement in environmental issues, environmental training, employee training, as well as various motivational benefits, are directly linked to the way as environmental performance is perceived (Herghiligiu, 2013).

Kaur (2011) supports the theoretical framework developed by Govindarajulu and Daily (2004) that shows that the managerial involvement in environmental issues, the monitoring, control and employee motivation, are crucial factors for EMA successful implementation; the author also states that relation between motivational benefits and environmental performance is very weak and cannot be supported (Herghiligiu, 2013).

The relation between the ISO 14001 certification, organizational investments concerning non-polluting technologies and the development of those products that have a low impact on the environment, also are identified in the literature. Likewise, is a link between EMS implementation and organizational economic performance. Hence, investments concerning new non-polluting technologies – and, implicitly, the pollution prevention have a direct impact on production process (stimulate productivity) (Radonjic and Tominc, 2006/ 2007; Herghiligiu, 2013).

Cite this Article as: Ionuț Viorel HERGHILIGIU, Ioan-Bogdan ROBU and Anca Laura ASANDULUI "Statistical Analysis on Dimensions Associated to Environmentally Sustainable Main Vector – EMS" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

Bansal and Hunter (2003), Kaur (2011) also emphasize the fact that investments in technologies and processes generate changes at organizational production system.

Organizational pollution prevention may improve efficiency, may reduce costs associated to energy consumption, improve row material consumption, or avoid fines (Rondinelli and Vastag, 2000a/b; Herghiligiu, 2013).

Another scholar considered to be important for EMS integration the so-called environmental practices. According to Gonzalez-Benito and Gonzalez-Benito (2005) the environmental practices include: environmental planning and organizing, operational environmental practices, and communicative environmental practices (Herghiligiu, 2013).

Regarding these environmental practices, it could be noticed that these specific organizational practices are directly linked to the planning and organization process, and include: environmental policy, environmental objectives and targets, environmental liabilities, environmental information, human resource training and involvement, environmental performance analysis, contingency plans, and so on. Hence operational environmental practices are associated to goods production, ecological goods development, as well as long-term commitment to protect the environment (Sarkis and Gonzalez-Torre, 2010; Gonzalez-Benito and Gonzalez-Benito, 2005). Environmental operational practices include processes that have as a main objective the development and implementation of various environmental methods (Gonzalez-Benito and Gonzalez-Benito, 2005), And the environmental communicative practices are those practices that contribute to the organizational image improvement - cordial relations with all the parties involved in the process; these practices have a commercial objective, being associated in the scientific literature to organizational environmental commitment (Florida and Davison, 2001; Gonzalez-Benito and Gonzalez-Benito, 2005; Herghiligiu, 2013).

Research process structure and description

This research has as main purpose to assess the “relation” between various representative organizational barriers (corporate environmental orientation) and EMS implementation quality (Figure 1).

In order to achieve the paper purpose, it was conducted a research, based on survey method - questionnaire instrument, with a 70 organizations sample, from N-E area of Romania.

Fig 1. Research methodology

Source: adapted after Herghiligiu, 2013; Herghiligiu and Robu, 2019

In order to assess "relation" between corporate environmental orientation (CEO) and EMS implementation quality (EMSIQ) was considered various representative variables (CEO and EMSIQ), as follows (Figure 1, Table 1 and Table 2) (Herghiligiu, 2013; Herghiligiu and Robu, 2019):

(i) independent variables: 7 for CEO;
(ii) dependent variables: 6 for EMSIQ.
Internal consistency the constructs was tested; Cronbach Alpha index was applied (Jaba and Grama, 2004). Obtained Cronbach Alpha index values indicate a high internal consistency.

Research Results

In the following table (Table 3) it could be observed synthetically the correlation analysis between specific factors associated to organization's orientation on environmental issue and the variables which define the EMS implementation quality.

Table 3: Correlations between the research variables

(i) According to Table 3, regarding the link between the **Environmental strategic leadership** factor (II.1.) and the specific variable for the implementation/ integration quality of the EMS - *The relationship between the organization's activities and the state of the environment* (I.6.) it can be can observe a significant link to a confidence level of 99%, which is highly intense, indicating a positive linear relationship between the two variables (r = 0.659). Also, looking at the determination coefficient R^2 between the two variables above, we can conclude that the 43.4% of the variation in the quality aspect for *The relationship between the organization's activities and the state of the environment* is determined by the *Environmental strategic leadership* factor. The link between "Environmental strategic leadership" (II.1.) and the variable specific to the implementation/ integration quality of the EMS - *Environmental operational performance* can be characterized as being weak in intensity, but also indicating the positive linear relationship between the two variables (r = 0.396) (Herghiligiu, 2013).

In qualitative terms, for the first case, namely the relationship between the variable "Environmental strategic leadership" (the factor variable) and the "Environmental operational performance" variable it could be said that

synergistic combination of the elements that constitute the first variable (the organization's environmental vision, the organizational structure "flexibility", the environmental objectives and targets, and the evaluation and analysis of EMS) determine in a direct but relatively reduced level (15.6%) the organization's environmental operational performance quality (Herghiligiu, 2013).

In the second case of the relationship between the considerate factor represented by the variable "Environmental strategic leadership" and "The relationship between the organization's activities and the state of the environment" variable we can see that is a close relation of determination (43.49%) between the constituent elements of the factor, mentioned above, and the (a) noise monitoring, level of air pollutants emissions, and respectively the modernization possible measures - for air quality, the (b) monitoring level of pollutants in water, monitoring process of the water variables that is released into the environment, respectively the compliance process with the maximum permissible rates on levels of pollutants discharged into the environment – for water quality, (c) monitoring the emission levels of pollutants inside the soil, monitoring soil variables (e.g. levels of surface erosion at the site of the organization), and the compliance with environmental regulations concerning soil - soil quality, (d) monitoring the effects on human population as a result of the organization activities, (e) monitoring of the flora variables on the organization site, and (f) monitoring the fauna variables of the organization site. This phenomenon can be considered to be mainly a consequence of the level of environmental regulations that organizations are required to comply, taking into account the qualitative interpretation of the first relationship examined (Herghiligiu, 2013).

(ii) Regarding the relationship between the **Environmental management of financial resources** factor (II.2.) and specific variables of the implementation/ integration quality of the EMS, it can be see from the above table that there are statistically significant correlations for most couples of variables, except II.2. - I.4.. This enables us to conclude that between the *Environmental management of financial resources* factor (II.2.) and the *Environmental operational performance* (I.4.) its no exist a significant statistical link. The strongest connections occur between *Environmental management of financial resources* factors and the aspects of the implementation quality of an EMS - *Environmental financial performance* (I.3.) - R = 0.813, respectively the relationship with *The relationship between organizational activities and state of the environment* (I.6.) - r = 0.841. We thus conclude that among the variables mentioned above there is a very intense bond, direct and positive. By interpreting the determination coefficients, we can see from the above table that *Environmental management of financial resources* factor determines in approximately 66% the quality variation of the I.3. variable, and the quality variation of I.6. variable in 70.7% level (Herghiligiu, 2013).

Qualitatively speaking, for the first case, namely the relationship between the variable "Environmental management of financial resources" (factor) and the variable "Environmental financial performance" it could be said that the synergistic combination of elements that constitute the first variable (the allocation from organization's budget of financial resources for environmental issues, and fundraising by accessing various environmental projects) it can be notice a strong direct link of determination (66%). (Herghiligiu, 2013).

For the second relation between considered factor and variable "The relationship between organization activities and state of the environment" it can be specified that this connection and intensity are perfectly understandable. Increasing the quality factor mentioned above results an improvement of process quality related to: (a) monitoring the noise and air pollutant emissions, (b) modernization/ refurbishment, (c) monitoring the level of pollutants emissions in water, (d) monitoring of water variables released in the emissary, (e) monitoring the pollutants emissions level arrived inside the ground, (f) monitoring soil variables, (g) monitoring effects on human population/ flora variables/ fauna variables of the organization location due to activities carried out by it (Herghiligiu, 2013).

(iii) Regarding the relationship between the **Human resource management in environmental management** factor (II.3.) and the specific variables of the EMS implementation/ integration quality, it can be seen in Table 3 that there are statistically significant correlations for most couples of variables, except for II.3. - I.4.. Thus, between the *Human resource management in environmental management* factor and *Environmental operational performance* variable (I.4.) doesn't exist a significant statistical link. Between factor II.3. and the rest five variables that define the implementation/ integration quality of the EMS, significant links were obtained for a confidence level of 99%, positive and straightforward. Nevertheless the factor II.3. has the strongest influence on the aspects - *The relationship with various external entities* (I.5.) - r = 0.682, respectively with *The relationship between organizational activities and state of the environment* (I.6.) - r = 0.636. In other words, by analyzing the determination coefficient, the factor II.3. influences at a rate of 46.5% the quality variation of I.5., and in 40.4% the quality variation of I.6. variable. Another statistically significant influence of the factor II.3. is exerted on the quality aspect of I.3. - *Environmental management of financial resources,* by an average rate of 35% (Herghiligiu, 2013).
From the qualitative point of view, for the first case, namely the relationship between the variable "Human resource management in environmental management" (factor) and the variable "Environmental financial performance" we

might say that synergistic combination of the elements that constitute the variable factor (environmental training sessions, staff engagement in environmental issues, environmental responsibilities, relationship reward system - environmental performance, and the relationship between employee motivation - environmental performance) determine environmental financial performance (Herghiligiu, 2013).

Also it can be observed that an improvement of the elements that constitute the variable factor determines an improvement of (a) the relationship between organizations and state institutions that monitor the compliance with environmental regulations, (b) the relationship between the organization and the local community, and (c) the link between the organization and its stakeholders (internal/ external stakeholders) - for connection II.3 - I.5. This effect it could be observed also in the relationship between the considered variable factors (II.3) and the relationship between the organization activities and the state of the environment (the elements of this aspect is detailed above) (Herghiligiu, 2013).

(iv) The link between the factor **Environmental information management** (II.4.) and the variables that characterizes the EMS implementation/ integration quality is statistically significant for most qualitative aspects except for I.4 - *Environmental operational performance*. By analyzing the relationship between II.4. and all the other quality aspects of the EMS, we can conclude that they are positive, direct, of average and above average intensity. The strongest intensity occurs between the *Environmental information management* factor and the qualitative aspects of the *Implementation of environmental policies and programs* (I.1.) - R = 0.732, respectively with the *The relationship between organizational activities and state of the environment* (I.6.) - R = 0.744. Interpreting the determination coefficients, we can see in Table 3 that the influence of qualitative aspects I.1., respectively I.6. is achieved by the action of the II.4 factor in a proportion of 53.5% and respectily 55.3%. The influence of the *Environmental Information Management* (II.4.) factor it manifests also on the quality variation of *Compliance with environmental regulations* (I.2.) aspect at a rate of 44.4,% (Herghiligiu, 2013).

From the qualitative point of view, for the first case, namely the relationship between the variable "Environmental information management" (factor) and the variable "Compliance with environmental regulations" we might say that the synergistic combination of the elements constituting the variable factor (environmental decision making process, environmental informational systems, environmental knowledge management system and process monitoring and control) directly determine (a) the level of compliance with environmental regulations, (b) internal findings process regarding environmental issues, and (c) the quality level of the analyzes performed to quantify the environmental impact induced by the specific activities carried out of the organization (Herghiligiu, 2013).

For the second relation between considered factor and variable "The relationship between the organization activities and state of the environment" may indicate that the connection and intensity of these is perfectly explainable because improving aspects of the variable factor (mentioned above) leads to an improvement of environmental aspects associated with the organizations activities (considering the same logical reasoning as in the first relationship) (Herghiligiu, 2013).

(v) According to Table 3 a significant influence (with 99% confidence) of the factor **Systemic-technological "infrastructure" with impact on environmental management** (II.5.) is exerted on the qualitative aspects related to the EMS implementation/ integration, with the exception of the variable *External environment with direct/ indirect implication in organization's environmental management* (I.6.). Overall, the links are characterized by a direct direction, positive, but of low intensity. The highest intensity occurs between II.5. and I.5 - *The relationship with various external entities,* r = 0.501. Thus the variation of the I.5. quality aspect is determined in proportion of 25.1% by the influence of the factor II.5 (Herghiligiu, 2013).

From the qualitative point of view, for the first case, namely the relationship between the variable "Systemic-technological <infrastructure> with impact on the environmental management" (factor) and the variable "Environmental operational performance" it can be observed that the synergistic combination of the elements that constitute the variable factor (the technological level of the organizations and its orientation towards clean technologies, respectively the existence of other management systems implemented at the organizational level) does not have a significant impact on environment operational performance. This phenomenon is a result of the lack of available resources (financial/ logistical and human) at the N-E area of Romania organizations; also, this "situation" it can be generated also due to the lack of long-term vision, plus the lack of awareness regarding the environmental importance (Herghiligiu, 2013).

On the relationship level between considered factor (II.5) and the "Relationship with various external entities" variable it can be observed a low degree of determination (only 0.501) explained by the fact that organizations consider that: (a) relations with state institutions that monitor compliance with environmental regulations, (b) relationships with the local community, and (c) relationships with the stakeholders (internal/external stakeholders),

to be links mainly governed by environmental legislation and by the patrimonial interests. The characteristics of these investigated relationships (if are maintained) may have medium - and long-term negative effects on the EMS implementation and integration quality at the organizations level from N-E area of Romania, characterized by decreasing the level of environmental performance and even through various fines received from the institutions empowered to monitor compliance of environmental regulations (Herghiligiu, 2013).

(vi) The **Organization's orientation to the environmental innovation** factor (II.6.) is significantly correlated with most variables related to the EMS implementation/ integration quality, with the exception of *Environmental operational performance*. The *Organization's orientation to the environmental innovation* does not determine a significant impact on the *Environmental operational performance*. The II.6 factor is strongly correlated with the variable I.6. - *The relationship between organizational activities and state of the environment* (r = 0.642), respectively with I.2 - *Compliance with environmental regulations* (r = 0.498), and I.1. - *Implementation of environmental policies and programs* (r = 0.479). Therefore, with a 99% confidence it can be conclude that the *Organization's orientation to the environmental innovation* factor causes a significant influence I.2. (24.8%) I.1. (23%) and I.6. (quality determined in proportion of 41.2%) (Herghiligiu, 2013).

From the qualitative point of view, for the first case, namely the relationship between the variable "Organization's orientation to the environmental innovation" (factor) and the variable "Implementation of environmental policies and programs" we might say specifically that (a) modern techniques (e.g. brainstorming) used at organizations level to find new ideas to improve processes, and (b) working groups where it can be approach the possibility of improving environmental procedures, determined in a relative percentage (23%) the improvement in the development of the environmental objectives and targets, organizations environmental policy clarity, respectively the improvement of environmental management programs that are implemented at the organizational level. Taking into account the same aspects of the factor variable it can be also specify that in the case of this relationship between II.6 and I.2, these aspects determine the quality of compliance with environmental regulations of the organization, but still in a small percentage, 24.8 % (Herghiligiu, 2013).

On the relationship level between considered factor (II.6) with the variable "Relationship between the organization activities and state of the environment" it can be specified that it has a normal behavior; thus constituting issues of variable factor determine in a percentage of 41.2% the quality of relationships developed between organization and (a) state institutions that monitor compliance with environmental regulations, (b) the local community, and with the (c) stakeholders (internal/ external stakeholders), because the orientation towards innovation has always been a factor of progress (Herghiligiu, 2013).

Conclusions

Based on the statistical analysis operated and, on these results, presented previously it could be mentioned several remarks, that could be concluded as it follows.

Even if (a) would be improved and clarify the organization's environmental vision of North-Eastern Romania organizations, and/ or (b) their organizational structure would be more conductive to change associated with the EMS implementation, and/ or (c) the environmental objectives and targets should be clearly drafted and would not be confused with other management systems implemented goals, and/ or (d) the EMS internal audit would improved, it would result, in a small percentage, a positive change in the organizations environmental operational performance quality. Concretely it can be notice a formalism associated to EMS operation, as a result of a low level regarding the environmental awareness, or as a consequence of low resources allocation to EMS development.

An increased level of environmental issue funding, from organization's budget, or by accessing environmental projects, would lead to (a) an increased level associated to costs tolerability (operating and capital) - environmental activities and (b) an improved level associated legal liability regarding to specific financial environmental management, and also to (c) an increased level of environmental benefits (direct or indirect).

Any improvement associated to environmental human resource management will lead directly to increased level of environmental benefits and also to an improvement of legal liability process associated with environment financial management.

Great benefits in EMS implementation ca be generated by (a) use of specific techniques and methods of environmental management, (b) decentralization of environmental decision-making process in certain circumstances, (c) creation of a database that contains all environmental decisions, (d) increasing the environmental awareness level and making decisions that do not have only as main objective the environmental regulatory

compliance, (e) increasing the effectiveness associated to environmental information system, and (f) real implementation of an environmental knowledge management system.

Taxonomy of Risks That Can Be Identified in the Financial Statements

Ewa W. BABUSKA

Cracow University of Economics, Cracow, Poland
babuskae@uek.krakow.pl

Abstract

The article presents the taxonomy of risks that can be identified in financial statements. The aim of the article is to systematize, characterize and interpret the risks that may be recognized in financial statements by their users, especially investors. The research method is to analyze the financial statements in terms of revealing potential risks. The research focuses on the possibility of identifying risks by analyzing the balance sheet, profit and loss account, cash flow statement, statement of changes in equity and additional information in notes. The analysis shows what types of risk are included in the financial statements and how to read them in order to identify the potential risks associated with them. The novelty of the article is an attempt to present a taxonomy of type of risks in the area of accounting based on financial statements analysis. The article confirms the informative and prospective function of financial statements in identifying possible types of risk in enterprises.

Keywords: Taxonomy of Risks, Risks Identification, Types of Risks, Analysis of Financial Statements.

JEL classification: G32, M41

Introduction

Risk accompanies every business activity. Currently, the COSO-ERM model is used in risk management in enterprises (Enterprise Risk Management - Integrated Framework, Summary, 2004). However, the article addresses the issue of disclosing information about risks in the accounting discipline. Risks are included in the financial statement data, but these data must be properly read by users to identify potential risks. Data presented in the financial statements must be useful, relevant and reliable according to the Conceptual Framework of International Financial Reporting Standards (IFRS). Financial statements are published and thus made available to a wide audience, including investors who expect a high rate of return on capital invested in a given venture. Financial statements allow for the identification of many risks related to running a business. The article systematizes, characterizes and interprets potential risks identified in the balance sheet, profit and loss account, notes, cash flow and statement of changes in equity. The use of these statement analysis as a method allowed to identify potential risks inherent in them. The article presents the taxonomy of risks that can be read from the information contained in the financial statements and it is the original value of the article. It confirms the informative function of financial statements in identifying possible risks in enterprises. Many authors have dealt with the issue of risk disclosure in financial reports. In 2003, Cabedo and Tired developed a risk typology, identifying all types of risk faced by companies, and proposed a quantitative model for each of them. These were non-financial risks such as business and strategic and financial risks such as market risk, credit risk, operational risk and liquidity risk. However, these financial risks did not include many other specific risks that can be identified from the data shown in the financial statements of companies. At the same time risk reporting practices are a subject of great interest from the accounting literature. The problem of the quality of risk reporting was raised by Ryan (2012) and in the ACCA report (2014). Some of the research concerned the impact of enterprise characteristics on risk disclosure. It was found that company size, leverage ratio, profitability and risk factor are positively associated with risk reporting (Khlif and Hussainey, 2014, 181-211). Also Demina and Dombrovskaya (2020) referred to the preparation of risk-based financial reports. The references are only a few examples of papers dealing with risk in financial statements.

Risks identifiable based on the financial statements

Based on the financial statements, you can disclose and identify a variety of risks associated with running a business. The types of risks that can be identified in the financial statements are presented in Table 1.

Table 1 Risk that can be read from the financial statements

Balance sheet
Risk resulting from negative trends of change in structure of assets and liabilities and the balance sheet sum (dynamic measures)
Risk resulting from structure of fixed assets and its change as of a particular day (static measures)
Risk resulting from structure of current assets and its change as of a particular day
Risk resulting from structure of own equity and its change as of a particular day
Risk resulting from structure of external capital and its change as of a particular day
Reserve made for known risk, losses and effects of other events as of a particular day
Operational risk, associated with managing operational assets and liabilities (number and structure of stocks, system of monitoring and making settlements, securing payments, credit policy and level of maintained cash)
Risk of liquidity loss
Risk of working capital management
Risk of lower profitability of assets
Risk of lower profitability of capital
Profit and loss account
Risk of fluctuation of results in examined periods
Risk of not achieving results
Risk of result measurement
Risk related to the whole activity, influencing results and associated with:
the choice of a legal form of conducting activity
the concept of managing the enterprise and the concept of its development (including research and development work, new projects, technologies and products)
the concept of human resource management
the organization of the accounting system (including: company plan of accounts, accounting software, internal instructions)
the balance sheet and tax policy
the organization of a system of internal control and audit
the organization of controlling and budgeting
Risk connected with operational activity of an entity, concerning:
managing operational assets and liabilities and organization of operational activity
adopted: strategy for the company, marketing policy, method of creating and maintaining production capacities
Organization of logistics of the supply system and the sales system
Risk associated with investment activity and other, non-operational activity of the entity, combined with:
used practice of predicting effectiveness and assessment of investment ventures
adopted policy of acquiring own capital and external sources of financing
Additional information
Introduction to the report
Risk denoting threat to continuation of activity in the declaration of the management
Additional information and explanations (notes)
Description of uncertainty concerning the possibility of continuing activity and indication whether the financial report contains related corrections.
Description of undertaken or planned activities aimed at eliminating indicated uncertainties.
Market risk (including: risk of changing prices, currency exchange rates, interest rates).
Cash flow statement
Risk of losing solvency and liquidity, that is continuation of company activities
Risks concerning operational activity

Risks concerning financial activity, especially mistakes in managing sources of financing business activity
Risk concerning investment activity, especially related to investment policy of an entity
The statement of changes in own equity
Risk of mistakes in managing sources of financing business activity and obtaining basic capital
Risk resulting from structure of own capital
Risk to capital profitability of the entity
Risk of the entity bankruptcy
Risk of conservative attitude of owners
Risk of expansive dividend policy

Source: own elaboration based on Karmańska, (ed), (2008), 449-470.

Some risks listed in Table 1 that stakeholders can identify based on the data disclosed in the financial statements published by enterprises will be discussed below based on theoretical studies of several authors and the Polish Accounting Act (AA). These risks will be characterized in the order of their possible reading from financial statements.

Risks identifiable based on balance sheet data

Risks resulting from negative trends in the structure of assets and liabilities and the balance sheet sum are identifiable based on structure ratios and growth ratios. The structure of assets depends on the type of business. A large share of fixed assets may create risks, as fixed assets restrict cash flows and freeze capital for a long time. The reason is technical progress and high fixed costs (Waśniewski, Skoczylas, 2002, 348). Various authors have developed relevant ratios for this purpose, e.g.: assets tangibility (fixed assets to current assets) and assets productivity (tangible assets to financial assets). A higher growth rate of current assets needs to be ensured. The value and growth rate of assets is expressed by absolute differences and growth rates of total, tangible and current assets (with fixed and variable bases). A distorted relationship between equity and liabilities is an unwelcome trend. A correct structure and growth rate of equity ensures stability and liquidity. Change trends in equity structure show the scale of financial risks related to debt capital and the capability to continue operating. The respective values of equity capital and debt capital should correspond to the value of financed asset groups, i.e. equity should correspond to fixed assets and debt should correspond to current assets. Changes in equity and debt over time are demonstrated by growth rates of total capital as well as by respective growth rates of equity and debt. An industry-correct structure of assets and liabilities means correct trends and lower risks. Balance sheet amount changes reflect an increase or a decrease in assets which is a symptom of development and low risk, or stagnation and high risk, respectively. There is also the risk resulting from the structure of fixed and current assets and from its changes as of a particular date. Fixed assets are typically long-term and low-liquidity. Their prolonged use creates the risk of investment choices, high expenditures and financing sources. New fixed assets make it possible to manufacture high-quality products, but economically and physically depreciated assets generate risks. Such risks are reflected by the fixed assets to total assets ratio. Risks are also generated by the ongoing depreciation of fixed assets. An appropriate structure of fixed assets may reduce business risks. Skillful fixed asset risk management has an effect on operating risks. In their turn, current assets are short-term and fast movable. Their higher share in total assets improves liquidity; they can be quickly and easily sold or used for an alternative purpose (Gabrusewicz, 2014, 74-76). Current assets create various levels of risk. Both excessively high and too low inventories are risk factors. Outstanding receivables also generate risks. Too much cash means lack of investments and over-liquidity, cash shortages – imprudence and loss of liquidity. A sudden change in long-term trends in the current assets structure also involves risks (Bareja, Giedroyć, 2008, 450).

The next are the risks resulting from changes in the structure of equity and liabilities and from their changes as of a given date. Equity secures financial independence. The greater the value of equity, the easier access to long-term debt. The aggregated value of debt capital and equity capital corresponds to fixed capital which reduces debt risk (Sierpińska, Jachna, 2004, 75-76). The greatest risk is related to revaluation reserve and financial results. Changes in equity and debt involve revaluation of fixed assets and long-term investments (e.g. if their value does not grow as a result of unfavourable market price trends, mostly those of financial instrument). Losses, low profits and low profit-to-equity ratios reflect high business risks. In its turn, the structure of debt is formed by liabilities and provisions for liabilities. The proportion of debt to total capital is related to the scale of debt and debt limit, and the types of debt capital have an effect on risks affecting the capacity to pay. In accordance with article 35d of the AA provisions are created for certain or highly probable future liabilities, including those related to restructuring. These include liabilities of uncertain amounts or maturity dates, that can be estimated and match the definition of a liability. The need to make provisions follows from the principle of prudent valuation. The financial result includes

provisions for risks known to the entity, threatening losses and consequences of other adverse events (art.7 par.1 point 5 AA). Provisions safeguard the entity against known or expected risks of various costs, losses and liabilities that may occur in the future. Excessively high provisions may create a risk of reduced economic gains, whereas insufficient (or missing) create a risk of imprudent valuation. Operating risks are related to the management of operating assets and liabilities (amount and structure of inventories, system of monitoring and effecting payables and receivables, securing payments, credit policy and cash levels). An analysis of assets from the viewpoint of operating risks should involve the fixed to current assets ratio. Fixed assets increase overheads and operating risks. A similar effect is caused by a growth trend in investment assets that are contingent on speculative deposits of spare cash in relation to operating assets. Such a trend may indicate that the company is active in a high-risk area, with simultaneous reduction of its core business (Bareja, Giedroyć, 2008, 451-452). Operating risks are also generated by the level, structure and management of inventories. A high level of inventories involves added cost, while low inventories cause bottlenecks in production and/or sales, and increase the cost of supplies. As a rule, inventories should be reduced and their structure should be optimized depending on inventory groups and business types. Management of inventory is illustrated by turnover ratios, expressed in the number of cycles and cycle length measured in days (Gabrusewicz, 2014, 95-111). The value of inventories disclosed in the balance sheet may include the risk of changes in prices on commodity markets, especially in material-intensive production (Waśniewski, Skoczylas, 2002, 348).

Operating risks also affect trade accounts with suppliers and customers in the balance sheet. Accounts receivable are seen as positive, as long as debtors pay them on time and in full. Delays in payment mean greater risk. Regularly incoming receivables create liquidity and are necessary for on-time payment of accounts payable. In addition, they improve the structure of assets. Foreign exchange risks may occur if purchase and sale transactions are made in foreign currencies, and accounts receivable and payable in the balance sheet are expressed in the national currency. This transactional risk (of revaluation of trade accounts due to exchange rate fluctuations) is illustrated by the scale of payable / receivable currency differences and by the possibility to adjust sale prices accordingly. Conversion and long-term foreign exchange risks also exist. Businesses are also exposed to interest rate change risks, as long as they possess variable-interest debt capital (Waśniewski, Skoczylas, 2002, pp. 349-350). Interest rate risks cannot be fully determined on the basis of the balance sheet, because fixed-interest loans cannot be differentiated from variable-interest loans. Susceptibility to exchange rate changes is observed with regard to long and short-term loans, financial leasing and debt securities (Bareja, Giedroyć, 2008, 456-457). On the basis of balance sheet information, stakeholders can also identify:

- risk of liquidity loss,
- risk of lower return on assets,
- risk of lower return on capital

Determining financial liquidity is a priority in risk assessment and may exhaust management issues. High liquidity compensates for cash flow waves caused by endo- and exogenous factors, reducing the entity's profitability [Waśniewski, Skoczylas, 2002, 349]. Liquidity expresses the ability to pay current liabilities on time [Sierpińska, Jachna, 2004, 145]. The risk of liquidity loss follows from the ratio of current assets to current liabilities. It is defined by the degree of assets liquidity and capital maturity. Timely debt repayment depends on the availability of liquid assets and the capability of obtaining third-party financing. Theorists propose static and dynamic analysis of liquidity loss. The static analysis uses current, quick and cash liquidity that reflects the ability to repay current liabilities from current assets, current assets excluding inventories and cash. In the dynamic analysis, ratios are based on the balance sheet and the cash flow statement and these are primarily indicators of cash efficiency and cash sufficiency (Bareja, Giedroyć, 2008, 452; Gabrusewicz, 2014, 329-340). It should be added here that excess cash in companies does not have to be perceived negatively by investors, as proved Huang and Mazouz (2018, 275-291). They assessed the costs and benefits of surplus cash and showed that it improved trade continuity and liquidity risk.

Return on assets means their profit generating potential. As a ratio, ROA shows the amount of net profit per one unit of assets employed, as well as the efficiency of their management. The greater the ROA, the better the financial condition. The lower the ROA, the worse the condition and the greater the risk of decreased return on assets. The ROA formula is modified by using various forms of profit (gross, gross incl. interest) and assets groups (fixed, current, net). Different ratios may show diverse levels and trend directions; by elaborating on the general formula, they can also extend the scope of the examined business, thus disclosing detailed risks. High return on sales is accompanied by low assets turnover, which has an effect on the choice of risk mitigation strategies. Theorists suggest two such strategies: 1) high prices and high profits accompanied by adequately low assets turnover, 2) low prices and low profits accompanied by relatively high sales. The choice of the strategy reflects the type of and conditions affecting the company's business (Gabrusewicz, 2014, 311-316). ROE means return on equity. A higher ROE shows a more favourable financial condition and greater development potential. ROE measures the efficiency of invested equity. It is

important for owners who consider alternative forms of using equity (Bareja, Giedroyć, 2008, 454). Return on equity allows investors to set the rate of return on investment in the company's stock (shares). A higher ROE ensures higher dividends, growing stock prices and lower investment risks. Assets are also financed using debt capital. To increase sales and profits, debt may sometimes be more efficient than equity. The financial leverage effect (growing rate of return on equity) will be observed if the loan interest rate is lower than return on total capital, as long as its structure has been optimized (Sierpińska, Jachna, 2004, 203-206).

Risk identifiable based on profit and loss account data

Examples of business risks that can be identified based on the income statement data are presented below according to the study by Wachowicz and Klimczak, 2008, 460–470. The risk of results variability in examined periods manifests itself in the volatility of results and periodical fluctuations of revenues and costs. Risk mitigation involves separation of revenues and costs with a high likelihood of repeatability from those that are more incidental and relate to such events as sale of assets, penalties, fines, compensation for damages, donations or force majeure. When analyzing this risk, it is necessary to differentiate between costs that are controlled by the company in a long term from those that cannot be controlled by it. Uncontrollable costs follow from applicable laws and public liabilities.
The risk of not achieving the assumed results is associated with the so-called alleged costs and revenues, which should be distinguished from actual costs and revenues. The risk of results measurement is related to the fact that management estimates the value of revenues and costs. Such estimates can be biased and can thus create the risk of results measurement.

Risks on business activity as a whole and affecting the company's results are linked with: 1) the concept of managing the company and the concept of its development (including: research and development, new projects, technologies and products) – management of the company and its development cannot be spontaneous, but should rather follow a project reflecting the company's needs and its specific nature. The risk of a mistaken management idea has a bearing on the company's operations and manifests itself in increasing costs and decreasing revenues. The risk of research and development, implementation of new projects, technologies and products is high, and setbacks in this regard involve an unwarranted increase in overheads; 2) the concept of human resources management cost – cost of labour in Polish companies is very high (amounts actually received by employees are increased by over 40% in taxes and obligatory social security paid by the employer). The risk of human resources management manifests itself in growing cost of employment; 3) balance sheet and tax policy – the balance sheet policy is part of the economic policy in company management and differs from the accounting policy. The results of changes in estimated values that accompany changes in accounting rules are shown in the profit and loss account. The company's tax policy allows it to optimize the amount of taxes paid by choosing a more profitable form of taxation. Such decision are risky and must be preceded by a tax simulation.

Risks connected with the company's operations are related to the management of operating assets and liabilities and to how operations are organized. Risk factors may be linked to how operations are organized, how technological processes are implemented, how product quality is monitored, or how complaints and product returns are handled. The consequences will be included in operating results presented in the profit and loss account. Risks related to financial and investment activity are connected with:

1) the company's financial assets management strategy; it may involve risks related to: inappropriate investment strategy, financial assets structure or value change, portfolio design (diversification), collaterals policy, interest and foreign exchange rate fluctuations. In the profit and loss account the results of these risks are charged to financial costs and revenues;
2) the policy of securing equity and debt capital. The choice of financing sources depends on how realistic it is to obtain capital from a given source as well as on the cost and structure of capital. The risk of procuring capital and shaping its structure has a bearing on financial costs and revenues and may be related to: inappropriate equity capital ownership structure, defective debt capital structure and overall capital structure, choice of external sources of capital injections, issue of securities (with the choice of the issuing entity), preparation of the prospectus, fixing nominal and issue prices, emission and redemption of debt securities;
3) the practice of investment project efficiency assessment. Investment project assessment requires an analysis of incurred cost and gains that can be achieved through the investment. The risk of investment project assessment is not easily reflected in the profit and loss account because implementation commenced after selecting a given project involves actual costs and revenues presented in the account. Actual economic results of the project may differ from forecasts. Projects are assessed on the basis of informed forecasts of investment outlays, future revenues and macroeconomic parameters related to foreign exchange rates, inflation, interest rate, taxes. Risk results are visible when actual effects are compared against forecasts.

Risk identifiable based on cash flow statement data

Business activity risks, identifiable on the basis of the cash flow statement, are related to three types of activity: operating, investment and financial. They will be presented below.

1. Operational risk results from the fact that operating activities may also create a risk of loss of payment capacity and solvency. It is possible to determine whether the structure of operating revenues and expenditures is typical or untypical for a given industry. The assessment of operating cash flows in terms of risk must take into account the scope of business and the current stage in the market lifecycle (Karmańska, 2008, 473).

2. Investment activity risks, including chiefly those related to the company's investment policy. By analyzing investment activity cash flows it is possible to define the company's investment policy risk. The risk of a change in the company's economic preferences may be shown by financial investments accompanied by incurring new debt and by weakening operating activities. If this option is not available, risks can be assessed based on investment revenues and expenditures grouped by investment instruments. Knowing the external motives for investing in various instruments helps investors to assess a company's investment strategy. The risk of default and insolvency may be shown by negative cash flows from investments. To assess whether the risk results from increased investments or inappropriate management, it is also necessary to analyze other activities in the CF statement. All circumstances have a bearing on the assessment of risk investing faced by the firm (Karmańska, 2008, 472-474).

3. Financial activity risks result *inter alia* from mistakes in the management of business financing sources. The risk groups discussed above are inter-related. For instance, the risk of default may be caused by inappropriate management of business activity financing sources. Such risk can be detected by analyzing cash flows. Mistakes in the management of business financing sources and the related risks are hinted by: taking a loan accompanied by bond redemption, similar timing of bond issue on the one hand and loan or financial leasing repayment on the other (Karmańska, 2008, 473).

Risk identifiable based on statement of changes in equity data

The statement of changes in equity contains data that supplements the balance sheet. It informs on the structure and changes in equity. It informs on the structure and extent of changes in equity. The balance sheet and the statement of changes in equity present seven items in the equity structure. Changes can be observed by analyzing the following aspects: opening balance, increase / decrease by titles, closing balance (Annex 1 to the AA). In this way, each component can be tracked in terms of risks. If the reasons for increasing or decreasing equity and its components are known, equity can be properly managed. Some risks identifiable based on of the statement of changes in equity data are presented below.

1. Risks caused by the structure of equity are related to such items as revaluation reserve and net profit or loss. Revaluation reserve is often adjusted downwards in the face of unfavourable changes in market prices and fair value valuation. Low net profits or losses indicate a high level of risk. Reduced net profit to equity ratios indicate lower return on equity and higher risk, although this also depends on income taxes paid (Bareja, Giedroyć, 2008, 451) An increase of this ratio does not necessarily denote greater operating efficiency and lower risk (Nowak, 2017, 165-174).

2. The risk of return on capital can be inferred by assessing the efficiency of contributed capital measured with the financial result to capital ratio (i.e. profit per unit of capital employed). Such ratios come in a variety of configurations, depending on the type of profit used in the nominator and capital used in the denominator. What matters from the risk perspective is the return on equity capital, as owners expect high returns on capital employed by the company (Wędzki, 2015, 462-466). The statement of changes in equity makes it possible to track changes in return on equity and its components throughout the reporting period. A detailed analysis of the statement reveals information on the causes of such changes

3. A realistic risk of bankruptcy is a high risk. A negative value of equity indicates high risk, as it shows that balance sheet losses have accumulated and owners have failed to intervene. This statement of changes in equity contains information on the coverage of losses and division of profits. An analysis of previous years' statements makes it possible to evaluate the owners' risk response, i.e. whether they took attempts at improving the situation or did nothing to minimize risks (Karmańska, 2008, 474; Nowak, 2017, 286-290).

4. The risk of a conservative attitude of the owners (low risk appetite) should be expected if shares are not contributed to the company over lengthy periods, if new stock is not issued, if dividends are paid, or when losses are not covered (or are covered in fractional amounts). In a young company, such an attitude may be attributed to

lack of faith in success due to the lack of vision and action strategy, or to the shortage of funds necessary to finance further operations. A strategic investor could thus introduce changes in such a company in line with his own vision and plans; alternatively, he could provide capital in return for a high profit share. This risk is easier to diagnose and respond to if changes in equity are monitored, as the statement of changes in equity explains the causes of equity increases and decreases across all equity components (Karmańska, 2008, 474-475).

5. The risk of expansive dividend policy results from the company's preference for payment of excessive dividends, using not only previous years' profits, but also advances towards profits expected in the current year. A radical dividend policy may be due to owners' pressure (as owners may be impatient having waited for return on invested funds), even in the face of unfavourable forecasts of future results. General (rather than detailed) interpretations may suggest that the company's financial condition is sound, while in fact it is poor. The aim may be to attract new capital by publishing information on allegedly appropriate management. This risk can be detected from the analysis of changes in the previous years' results and the write-offs of the current year's result made during several consecutive reporting periods (Karmańska, 2008, 475).

Risk identifiable based on additional information and explanations (notes)

Other risks can be identified by stakeholders on the basis of notes to the financial statements. For instance, operating risks faced by companies may be attributable to:

1) how operating assets / liabilities are managed and how operating activity is organized – operating assets are used for core business purposes and for the administrative activities;
2) the company's strategy – the risk of strategy involves questions about whether or not the management board has formulated a mission / vision or developed a company development strategy in the form of an official document (and whether strategic controls are in place). Lack of strategy or neglect for its objectives in regular operations (or lack of strategic controls) may lead to stop-gap measures that fail to address the long-time perspective and are generally chaotic and increase operating overheads;
3) the company's marketing policy – a description of the marketing policy risk may include solutions used in such domains as advertising, product promotions, rebates available, bonuses, discounts, choice of customer segments, product portfolio structure, etc. The costs of or gains from the marketing policy are part of the company's core operations;
4) the method of building and maintaining production capacity - creating and maintaining material business potential is determined by the company's production capacity plan. Such capacity should not be too high or too low. Overcapacity runs the risk of under-utilization, and the shortage of capacity prevents the generation of potentially available revenues. Material resources should be kept in good condition by ensuring regular technical inspections, thus eliminating equipment disruptions and failures resulting in downtime and product shortages or defects. This risk has an impact on operating costs and revenues;
5) supply and sales logistics – the use of logistic solutions in supply and sales processes must be appropriately organized. Necessary resources must be ensured, including vehicles, storage facilities and IT systems for supply management. What matters apart from transport and logistics potential is the choice of supply sources and the development of distribution channels. The consequences of this risk may adversely affect the company's operating results (Wachowicz, Klimczak, 2008, 467-468).

As the selected risks described above show, each of the financial statements enables the detection and identification of many types of business risk. However, the above-mentioned financial statements do not allow to detect by stakeholders many significant risks and risk factors related to, *inter alia*, the business environment, the operations of the enterprise and its capital group as well as the capital market and secondary trading in shares (Karmańska, 2008, pp. 475-476). Financial statements also do not allow to disclose the risks associated with the management and measurement of intangible assets, i.e. intellectual capital or corporate social responsibility activities These sample risks require separate reporting.

Conclusions

The article emphasizes the usefulness and importance of financial statements in identifying potential risks contained therein. It presents a classification of risks recognizable on the basis of data included in the financial statements as well as a description and interpretation of these risks. The risks that can be read from the disclosed figures and items in the financial statements are characterized in detail. The applied research method was the analysis of financial statements. The analysis related to the risks that can be identified in the balance sheet, profit and loss account, cash flow statement, statement of changes in equity and in the additional information (in the notes). The performed analytical studies made it possible to present the taxonomy of types of risks that can be recognized in the financial statements and to comment them in depth. The article confirms the information function of financial statements in

risk identification and assessment, which supports the risk management process in enterprises. At the same time, the prospective function of financial statements in terms of the possibility of risk prediction was indicated. However, on the basis of financial statements, it is not possible to identify non-financial risks, e.g. in the field of corporate social responsibility, including environmental protection. Such risks should be presented in separate reports, e.g. in CSR or integrated reports, and this issue can be indicated as the direction of further research.

Abstract

The global conception of sustainable development includes a mechanism for achieving the economic goal by which all fundamental human needs are met by the use of technology with simultaneously taking care of our natural environment. To reduce air pollution and traffic we need to begin with optimizing the supply chain processes that occur on our globe every day and night. This purpose also serves every citizen by reducing everyday traffic congestions. Even minor savings produced by optimizing transportation problems are significant from the cost point of view. This paper shows recent advancements in solving the Vehicle Routing Problem (VRP) which has direct applicability in the industry. We present state-of-art machine learning and deep learning algorithms for solving VRP and Dynamic VRP where the latter makes use of simulation techniques to bring the problem near to real-world like scenarios. In the end, we propose future directions that can be further explored: a generalization of methods for arbitrary input network and the problem of multi-agent setting in non-stationary environments.

Keywords: vehicle routing problem, machine learning, deep learning, multi-agent reinforcement learning

Introduction

Logistics plays a crucial role in the sustainable development of the competitive world economy. At the same time transporting massive amounts of people and goods takes its toll on the natural environment negatively affecting pollution, noise, and traffic congestion. Hence supply chain processes have such an impact on the environment, optimization of such processes is crucial.

Intelligent transportation systems (ITS) are a collection of technologies whose goal is to increase the security of road traffic participants, the effectiveness of transportation systems, and preserving natural resources. The following paper presents problems related to processes involving delivering products to customers. Supply chain optimization is one of the toughest challenges among all enterprise applications of data science and machine learning. Solutions for Vehicle Routing Problems (VRP) minimize the time and costs of transportation processes. The VRP is one of the most popular problems in the Operation Research domain due to its practical applications. Unfortunately, most real-world problems are far more complex than the classical formulations of VRP. Hence for these methods to be used by industry, they need to be augmented by the number of constraints.

Mańdziuk (2018) groups VRP variants into two dimensions: static or dynamic and deterministic or stochastic. Behind them hides the possible applicability of specific VRP formulation and the inherent difficulty of the VRP variant. The first one is static VRP problems, where a partial solution that is forming during the algorithm run does not change after construction. The second group consists of dynamic VRP formulations. Partial solutions can change after construction (removal or addition of customer to already constructed route) due to unknown dynamic factors. The penultimate group includes deterministic VRP problems where all variables are deterministic while stochastic formulations assume that some parameters are random variables (for example customer demands or time of travel between customers). The latter one assumes also the use of some kind of simulation technique. Usually, it is a Discrete Event Simulation (DES). The hardest VRP formulation consists of dynamic and stochastic versions. Such problems need appropriate methods to be solved with.

Cite this Article as: Przemysław CZUBA and Dariusz PIERZCHALA "Machine Learning methods for solving Vehicle Routing Problems " Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

VRP is an NP-hard type of problem. Due to that fact, all exact approaches to solve VRP-type problems are computationally expensive. They can tackle only up to a hundred customers, therefore they are not applicable in real-world settings. Nevertheless have been designed exact and heuristic methods to solve the VRP problem, although there is still a need to improve the results for tasks with large network sizes. Toth and Vigo (2002) propose a set of exact and heuristic methods. Mentioned researchers classify algorithms in three approaches: Branch and Cut and Price, Branch, and Cut, and reduced set partitioning. Additional information about the exact methods of solving VRPTW extension of classical problem reader can find in Baldacci, Mingozzi, and Roberti (2012).

Real-world complex problems need complex algorithms. Making such methods with hand-engineered reasoning is inherently complex or even unfeasible. Machine learning methods have a lot of potential in solving complex problems without the neediness to construct complex algorithms that take into consideration multiple constraints and huge solution space. In this area with success were applied various machine learning techniques starting from pointer networks, graph neural networks, recurrent neural networks (RNN), deep reinforcement learning (DRL) methods, and ending on methods that incorporate heuristic search algorithms like Monte Carlo tree search (MCTS). A more detailed description of the mentioned approaches will be presented in the upcoming sections of this paper.

The natural extension of any single agent algorithms is a multi-agent setting. This allows for agents placed inside the environment to cooperate to accomplish a common goal which in our case is optimal routes between customers. Arising problem is that with simultaneous acting agents inside the environment (VRP network) the problem becomes non-stationary because we cannot predict how independent agents will behave. Moreover, to construct algorithms that produce solutions for arbitrary graphs we need to use better methods for training data generation. These directions will be raised at the end of the article.

Vehicle Routing Problem

The classical version of the Vehicle Routing Problem (VRP) is used to find a set of optimal routes for a fleet of homogenous vehicles (carriers) that need to serve a set of customers with routes beginning and ending at a specified depot. Each vehicle route must start and end in the depot.

The optimization goal is to find an optimal solution according to a condition, which could be the total length of routes or total traveling time. Known combinatorial optimization problem - Traveling Salesman Problem (TSP) is a special case of VRP. The problem can be extended by a set of constraints so there are several variants of VRP. The most popular constraint is a capacity limit that is imposed on a set of vehicles which leads to a Capacitated VRP Problem. Another version is Vehicle Routing Problem with Time Windows (VRPTW) which adds for every customer a time window in which the carrier needs to deliver the demanded products. Furthermore, we can apply a set of supplementary constraints like time windows (each customer must be served in the specified period), multiple depots, or homogenous vehicles (with varying travel speed). With each added constraint we receive more similar to the real-world representation of the problem.

VRP can be modeled as an undirected graph $G = (V, E)$, where $V = \{v_{0,} v_1, \dots, v_n\}$ is a set of vertices which represents customers and $E = \{(v_{i,} v_j) : v_i, v_j \in V, i < j\}$ - set of edges that correspond to the connection between customers. One of the vertices (v_0) is a depot and the problem is solved for a fleet of m vehicles. Each edge has associated a cost (time or length between customers or customer and depot) that is represented by weight c_{ij}. Additionally each customer has associated demand d_i which must be fulfilled by a single-vehicle.

In the next sections will be provided methodologies and related works examples. All methods presented in this section are based on static and deterministic environments (easier environment version).

Neural Networks

There are not many deep neural networks methods being proposed in the literature. It looks like neural networks in their classical architecture are not suited to the dynamic and stochastic type of problems due to the problem with capturing the changing structure of the underlying network or graph. It means that the goal function also evolves with time.

Vinyals et al. (2015) propose a method based on the sequence to sequence models. Sequence to sequence models map one sequence to another. The general architecture is based on two recurrent neural networks: encoder and decoder. The main goal is to map fixed-length input with a fixed-length output but input and output lengths do not have to be the same. Encoder network reads input sequence and then preserves knowledge about it in a vector representation.

The decoder takes encoded information and converts it back to the output sequence. Mentioned researchers introduced a Pointer Network model which finds near-optimal solutions for Traveling Salesman Problem (TSP) in a supervised setting. The presented algorithm has a big limitation connected to supervision. It prevents the Pointer Network from finding better solutions than presented in the training data.
Nazari et al. (2018) propose a method based on the Pointer Network model. Their neural network was trained with the use of the deep reinforcement learning technique. They propose to get rid of the encoder network from the Pointer Network model. They argue that there is no meaningful order in the input set for combinatorial optimization problems. They use RNN to model the decoder network with dynamic elements added to the attention layer. Computational experiment was performed on synthetic data generated from following set up: node locations and demands were randomly generated from uniform distribution in the unit square $[0, 1] \times [0, 1]$. Authors claim that their framework has the potential to be extended to multiple depots or multiple vehicle problems. Adding competition or collaboration among the vehicles (agents) would be an extension in the multi-agent reinforcement learning direction.

Graph Neural Networks

The use of Graph Neural Networks (GNN) for solving Vehicle Routing Problem is a relatively fresh and emerging direction of research. There is increasing interest in GNN, one of the firsts papers concerning this area emerged in 2019. From there only a few tried to apply such models to combinatorial problems (Lemos et al. (2019)).

Prates et al. (2019) show, that GNN can be used with little supervision to solve TSP. The idea behind GNN is the following: network assigns to each vertex a multidimensional embedding and then performs message passing task from embeddings to their adjacencies. Vertices aggregate incoming messages and pass them to RNN. After many message passing interactions, the model is asked to decide whether a specific route with cost $< C$ exists. The maximum number of cities used in the training dataset was 40. Model degenerates for graphs with many cities $n \approx 75$.

The most recent paper concerns merging an idea of GNN with Monte Carlo Tree Search (GNN-MCTS). MCTS is recently very popular since it uses in AlphaGo (Silver et al. (2016)) and other DeepMind algorithms related to decision problems. The core idea of Xing et al. (2020) is to convert classical TSP to a tree search problem. Authors claim that this is the first use of GNN and MCTS in one model for solving TSP. The synthetic instances generator used by researchers was from DIMACS TSP Challenge (Johnson et al. (2001)). This method produces "random" instance of n cities uniformly distributed in the $[10^6, 10^6]$ square and "clustered" instances that include n cities clustered into $\frac{n}{100}$ clusters. Their method produces shorter routes than other machine learning methods.

Reinforcement Learning

VRP type problems can be view as choosing the optimal sequence of decisions for the given graph. This approach is the most popular among the machine learning techniques for solving VRP. From the reinforcement learning perspective usually, the state of the environment is seen as a partial solution of the instance and each node features, the action is seen as a choice of next customer to visit, the reward is the negative route length and the overall policy corresponds to strategy given by the neural network. Attention models (AM) are increasingly more popular in routing-type of problems. Because VRP can be seen as a sequential decision making problem, an effecting framework to apply in this kind of setting will be encoder-decoder architecture. Peng et al. (2020) propose a Dynamic Attention Model (AM-D). The solution is gradually built by the decoder. Because the state of the network changes with each algorithm step hence feature embedding of all vertices should be changed dynamically. At each algorithm step new instance is being constructed from the remaining customer nodes. Proposed by researchers method has good generalization performance. This is related to solving subproblems at each step of learning.

Multi-agent Reinforcement Learning

All formerly presented papers focus on machine learning single-agent setting where the environment is stationary (which means what in every step agent knows what was the previous state of the environment). There are not many research articles regarding multi-vehicle VRP or generally speaking multi-agent setting. In history, there were many attempts to challenge this problem but there is still a need for better and reliable solutions. Deep reinforcement learning provides a great framework for solving decision problems in dynamic environments.

Zhang et al. (2020) undertook the task of solving multi-vehicle VRP with soft time windows. Introducing multiple vehicles into the problem creates few difficulties: coordination of multiple agents inside a time-dependent environment, incorporating soft time windows into the framework, the algorithm should be scalable and should reach

good results with acceptable computational effort. They propose a multi-agent attention model (MAAM) to solve MVRPSTW. In the beginning, they build an encoder-decoder system with multi-head attention layers to compute routes for vehicles iteratively. Agent state consists of vehicle location and remaining capacity and environment state – from unvisited customer and depot location. Agents observe state from the environment and other vehicles. Next, their method proposes to handle communication between agents and customers. Test data is generated from a uniform distribution $[0, 10] \times [0, 10]$ where instances have from 20 up to 150 customers. MAAM outperforms Google OR-Tools and known heuristics for MVRPSTW. Researches state at the end of the paper, that a more challenging task will be to generalize the framework into online problems, to address real-time requests (like adding or removing a customer during the process) as well as stochastic traffic conditions.

Vera and Abad (2019) proposed an actor-critic (A2C) model which takes into account multiple vehicles with heterogenous capacities. Their trained model, unfortunately, falls short of Google OR-Tools. In their VRP definition vehicles cooperate to satisfy the customers. All agents have an independent internal policy and state with the use of shared information between all agents. This means that in each time step state of the environment is the same for all vehicles. Because agents consecutively take action, the environment is stationary for all vehicles. This makes the problem simpler because the agent only needs the last environment state and can omit other agent actions. Authors say that interesting research could be conducted to explore the non-stationary environment setting, where agents take simultaneous actions at each timestep. Then environment state is not preserving all information, because the state will be different immediately after the agent acts (because another agent will act at the same time). This kind of formulation needs a communication framework for agents to prevent the situation when multiple vehicles go to the same customer. Hernandez-Leal et al. (2017) provide an exhaustive overview of modeling non-stationary environments in multiagent reinforcement settings.

Other related papers with multi-agent settings include Silva et al. (2019) which uses a multi-agent framework with metaheuristics for VRPTW. In their formulation agents are cooperative and communicative. Carriers between each other can share a solution for the rest of the agents in the system. In their setting agent is independent and share information with others to learn via interaction. Authors propose a novel and flexible solution for combinatorial optimization problems called Multi-Agent Architecture for Metaheuristics. Results show that agents learn from interaction and that behavior directly impacts the quality of the solutions. Results are very promising and deserve a closer look. Authors share their interest in applying such methods in the non-stationary environment.

Dynamic and stochastic settings for VRP will be discussed in the following section.

Dynamic Vehicle Routing Problem

Dynamic Vehicle Routing Problem (DVRP) is a stochastic transportation problem. Kucharska (2019) states that Dynamic VRP is one of the most important problems in the transportation domain. DVRP is focused on representing more real-world system behavior by introducing dynamicity and stochasticity to the problem. The dynamic appearance of new customers, stochastic travel times, or event-based vehicle availability are bringing problem formulation closed to real-world. The most popular aspect of DVRP is the changing availability of the customers. Kucharska states that we can distinguish following dynamic parts of DVRP:

- dynamic consumers - the information about customers is revealed gradually and concurrently with actual route execution. In particular, the changes regarding consumers are related to dynamic requests, dynamic localization, dynamic demands, dynamic customers' availability,
- dynamic order time - including changes in required by the customer serving or delivery time (customers usually speed up the serving or delivery deadline),
- dynamic travel - travel times can be time or environment-dependent, e.g., weather or traffic conditions delay arrival at the given customer,
- dynamic service times - the planned repair time may change depending on the problems identified on the site.
- dynamic vehicle availability, including unexpected events like vehicle breakdowns;

DVRP is closely related to simulation. To apply random changes to the environment some kind of simulation method must be used. DVRP is well suited for Discrete Event Simulation as changes show up according to discrete time steps.

There are not many papers regarding the application of machine learning techniques to DVRP. Waldy and Hoong (2020) wrote an article about the dynamic addition of new customers while the agent is already on the route. Their idea was to combine the Simulated Annealing (SA) method with reinforcement learning. During training, the model is learning based on historical data to which were applied dynamic changes (removing and adding orders) to simulate additions or removals of customers. Learned neural network approximates value function which is used by SA to update the routes on the fly.

Świechowski and Mańdziuk (2016) proposed a novel method with the use of MCTS for dynamic CVRP problem. Baseline CVRP was extended with random events that correspond to traffic jams on the road. Traffic jams can be applied to a single connection in the network between customers or depot and the customer. The occurrence of such an event causes a temporal increase in driving time via this edge. Traffic jams can occur at any given timestep with a certain probability. The author's approach is similar to the human way of thinking while solving such problems. Using the predefined set of actions whose purpose is to alter routes and based on the idea of checking possible scenarios that emerge from applying those actions agents behave 'human-like'. Their paper is the first attempt to use Upper Confidence Bounds applied to Trees (UCT, the extension of MCTS method) in the domain of dynamic transportation problems. UTC performs multiple simulations to check which action will produce the best payoff. Results are confronted with a fine-tuned Ant Colony Optimization algorithm and the static solution and their solution is better in 22 out of 30 cases. Experiments were conducted on test instances consisting of up to 150 customers. Researchers conclude that method gives promising results for further research in other types of stochastic transportation problems and beyond.

Table 1 presents a summary of surveyed recent papers that address different VRP variants with methods that were used to solve a particular version of the problem.

Table 1: VRP variants and machine learning methods

Variant	Methods
Static	• Pointer Network - Vinyals et al. (2015) • Pointer Network with DRL - Nazari et al. (2018) • Graph Neural Network - Prates et al. (2019) • Actor-Critic Model - Vera and Abad (2019) • Multi-Agent Architecture for Metaheuristics - Silva et al. (2019) • GNN with Monte Carlo Tree Search - Xing et al. (2020) • Dynamic Attention Model - Peng et al. (2020) • Multi-agent Attention Model – Zhang et al. (2020)
Dynamic	• UCT, the extension of MCTS method - Świechowski and Mańdziuk (2016) • Simulated Annealing with RL - Waldy and Hoong (2020)

Future Directions

Having in mind previous considerations and analysis of existing works we can say that Dynamic VRP is very important from the perspective of bringing better supply chain routes to the industry. We have found that the integration of deep learning into vehicle problems can bring this research area to a new level. It looks like the most promising research direction would be a multi-agent setting with nonstationary environments and collaboration. It would give us some more insights on what agents can do while sharing information about changing environment and cooperate to collectively solve the task the best possible way. Pierzchała and Czuba (2020) proposed a framework for using reinforcement learning in a multi-agent setting. One of the most promising directions could be to implement a solution that combines both worlds – multi-agent, stochastic, and dynamic VRP. This direction is promising from the real-world application point of view. Additionally, since applying DVRP in practice is an inherently hard problem in its very nature, simulation frameworks (like Discrete Event Simulation framework, Pierzchała, and Najgebauer (2016)) should be an almost integral part of future developed methods to achieve consistent applicability of stochasticity in transportation problems. That will ensure the stochastic element in the system. A further step forward, the prospective application of the above methods will be an area of research on autonomous vehicles. We think, an open and expandable framework dedicated to teaching, research and testing via simulation should enable comprehensive investigation of agent-based autonomous systems. Key features of the framework might be: the ability to learn and change agent behavior during simulation and the extensibility of the algorithms for agents. On the basis of experiments in such environment, some behaviors and characteristics of autonomous systems might be assessed as correct and accepted to implementation, while other should be modified or removed.

Conclusion

We presented in this paper a review of the use of Machine Learning methods in transportation problems. We looked at the problem from multiple angles (static, deterministic vs dynamic, stochastic formulations) and techniques. Machine Learning methods are becoming increasingly popular and are used in complex scenarios, where the implementation of hand-crafted algorithms is very hard or even unfeasible. They give a unique way of creating

algorithms to solve complex problems without explicit hand-engineered reasoning. ML methods have great applicability and give very promising results in transportation problems, even in dynamic ones. The authors of this paper will continue research to improve the mentioned problems.
Table 1 shows that there is a strong interest in static and deterministic versions of the VRP problem. Although dynamic variant is more useful from the applicability point of view it is under-explored by the researchers in the field. The main focus should be directed to dynamic and stochastic routing problems as they give the premises to be used in real-world applications and make a difference from the sustainable development point of view.

Abstract

The aim of this article is to analyze and discuss the socio-cultural barriers related to entrepreneurship. At the same time, an attempt was made to show the connections between gender stereotypes and values. The article distinguishes female values against male values and determines their significance for functioning in the business world.

Keywords: Stereotypes, Values, The Concept of Female Values in Business, Entrepreneurship, Economy.

JEL classification: A13, D1, D61, G41, J7, K38.

Introduction

Women often do things differently and for different reasons than men, and for different reasons than men (Carter et al., 2006). It would be difficult to agree that the gender criterion does not cause enlargement and does not enrich the field of business and economic considerations. It is a determinant which should be given increasing importance in business analyzes. There are at least a few premises that may constitute the basis for the conclusion that gender differences will also translate into differences in the approach to the economy-management-entrepreneurship triad. Research shows that the same behavior of men and women can be treated in completely different ways and assessed according to a different, subjective scale. “The subtle influence of gender on our perception may be different for everyone, and gender may influence our actions both consciously and unconsciously” (Wojciszke, 2002). Undesirable or irritating behaviors of a person of a different sex in a group of men are perceived much more negatively than similar behaviors that characterize members of the same group. In other words, in the case of people outside the group, there is the so-called the polarization effect or the effect of a homogeneous foreign group, with which the tendency to judge these people to an extreme correlate usually. Bogdan Wojciszke formulates the view that an employer who opposes the so-called aggressiveness in women, in a situation where their occupational position requires them to have such a feature, places them in a situation with no solution. They face the risk of losing their job both when they behave aggressively and when they do not show such aggression. The perception of women through gender-related characteristics and skills is known as "paragraph 22". It is also known as a vicious circle or a double dilemma, which means that in the area related to professional activity, women can be punished for displaying typically feminine features. The backslash effect, however, is based on the fact that when displaying typically male features, women are also assessed poorly because these features do not match their stereotypical image (Różycka, 2019).

Literature Review

The word "stereotype" was first used by Walter Lippmann (1889–1974), an American writer, journalist and political commentator, who in his book Public Opinion (1922) described stereotypes as persistent and resistant to change thought patterns. Shared by a large number of people, they result from prejudices and, according to Lippman, are negatively evaluating, false and emotionally tinged (Lisowska, 2011). Both Lippmann and Gordon Allport (in 1954), who advocated a similar view of the stereotype, concluded that, as a result of a strong emotional tinge, beliefs about others would persist even in the presence of data that contradicted them.

Stereotypes associated with mis-generalization, schematisation of thinking or unjustified categorization will sustain prejudices and be a factor that inhibits change. On the other hand, considered to be part of common human beliefs derived from cognitive processes, stereotypes are currently considered not only as more or less negative generalizations, mental images, mental constructions, unsupported by experience or deeper knowledge, but also as a lesser or lesser phenomenon. or more positive. Human cognitive abilities are limited, and multiple empirical studies have confirmed Gordon Allport's hypothesis that "the human mind must think in terms" (Wojciszke, 2002). The heterogeneous and chaotic amounts of information that constantly bombard us make it necessary to simplify it (Kadłubek & Miciuła, 2019). According to the "cognitive miser" approach, in everyday relationships with others, stereotypes relieve the cognitive system and facilitate orientation in a complicated reality. Thus, it is indicated that stereotypes play an adaptive role, justifying the individual behavior, social system or behavior of the group with which we identify. By enabling faster processing of information and classification of phenomena, they fulfill the function of integrating a given community and contribute to positive changes. Thus, stereotypes can be used not only to depreciate, but also to affirm the characteristics of a given group or community. Schemas or stereotypes facilitate contacts, speed up the concretization of conclusions, and help to remember patterns of social interactions. This type of activation occurs quickly, automatically and spontaneously. Today, there is a mosaic of cultural and social stereotypes, many unconscious assumptions that are unknowingly made about gender. They are indicated as barriers to the professional development of women.

Heidi Rozen – case study

No one will ever admit - as Sheryl Sandberg believes - to stereotyping based on gender, but that's what we do. Francis Flynn, Cameron Anderson and Sebastian Brion conducted an experiment to check how men and women are seen in the workplace. The study involved MBA students from New York University, who were provided with a case study material - a description of the career of a businesswoman Heidi Roizen. Some students got a success story with a female name Heidi, others the same story with a male name, Howard. The participants of the study were to assess the impressions that Heidi or Howard evoke in them, and such features as kindness, good-naturedness, ambition, tendency to manipulate, caring and others, stereotypically considered feminine or masculine. The group of respondents - having exactly the same information about Heidi and Howard - perceived Heidi as "a selfish, less polite and benevolent person" than Howard, but "more assertive, power-hungry and prone to manipulation", with whom " you'd rather not work and you'd rather not hire her "(Sandberg, 2016). Both women and men found Heidi competent, less predictable, and more Howard, in turn, was assessed as "an equal guy with whom you can get a beer" (Brzezinski, 2012). The evaluating men were more critical of a woman than a man. In turn, women criticized both women and Interestingly, although the group of respondents previously firmly declared that they certainly do not treat women differently, the confrontation with their own subconscious prejudices was also a big surprise for them.

The above case of Heidi Roizen exemplifies that women - unlike men - experience the challenge of their professional competences much more often than men with the same responsibilities. The same actions, when the only difference was gender, may evoke completely different impressions, feelings and emotions in the respondents. Not only employers and students are subject to stereotypes, but also from the point of view of clients or consumers, women can be treated through the prism of gender. A business e-mail sent to one of the clients by Martin R. Schneider, who signed himself as a friend named Nicole, was treated very differently than if it had been sent by a signed named Martin. The experiment, which was continued for two weeks, showed that the client - convinced of exchanging correspondence with a woman - constantly challenged her competence, was rude and had higher expectations than usually for a sender who was a man.

Stereotypes can be misguided, for example, when we attribute too little or too much trait to a given group, or when we underestimate the group's variability in terms of a given trait. Misconceptions about valence are common, where the incidence of negative traits is overestimated and positive traits are underestimated, or vice versa. With regard to femininity, the problem may be related to the low - as until recently - value ascribed to female features, and higher to male features. One can also focus on different types of group misconceptions when individuals are assigned group traits that they do not really have.

The concept of cultural gender roles

The concept of cultural gender roles assumes that strong definition of gender begins at birth by differentiating and grouping children by gender, reinforcing gender expectations, and treating boys and girls differently by parents, teachers or other people. The results of the research show that men behave differently towards their daughters, to whom they pay more attention and react faster to their crying and calls. In contact with them, they use a more emotional language. With their sons, on the other hand, they more often engage in dexterity games and use

statements focused on strength and achievement (Mascaro et al., 2017). On the other hand, there are studies that show that girls in infancy are more interested in looking at other people's faces than at moving objects and are more likely to make eye contact, which is considered a sign of the beginning of empathy. For thirty years, the phenomenon of a little girl affectionately comforting another person has been observed (Pinker, 2009). Stereotypes of the social roles of women and men and professions to which representatives of a given gender are predestined, may have sources e.g. in beliefs about their cognitive abilities (Miciuła & Miluniec, 2019). In particular, in the field of the so-called the triad of differences - linguistic, mathematical and spatial, the linguistic differences between the sexes are manifested in the neurological background of earlier and faster speech development, the range of vocabulary and memory of girls. Their advantage in this area also applies to less frequent or lower degree of verbal disorders (Lisowska, 2011). Empirical studies show that women are actually better at verbal fluency, articulation, memory and better remember landmarks in the field. Men have an advantage in spatial rotation, i.e. imagining the rotation of a shape or object in two-dimensional and three-dimensional space, and orientation in the field, in particular through a mental description of a route, e.g. drive five kilometers north, then a kilometer to the east. However, it has been shown that training by playing computer games can alter the level of gender differences in this regard. A woman who practices spatial orientation is not inferior to men in these abilities and vice versa in relation to men, who may find it easier than acquiring social signals to master complicated spatial systems. By the same token, it is believed that women have more agile hands and a faster metabolism, allowing them to recover from exercise. Despite this, there are, after all, many men who can outperform women in this respect (Hofstede and Hofstede, 2007).

The differences between women and men are visible in the nature of the workplace. Nearly one-third (32.4%) of women work in the public sector, while among men it is less than 17% (GUS, 2016). It is still the case - despite many equality efforts - that more women continue to work in professions such as nurses, teachers, kindergartens and social workers. Sociologists and psychologists have long observed among women a desire for mutual altruism. Behavioral studies have shown that when it comes to sharing a certain amount of money with others, women tend to be more generous than men. Scientists from the University of Zurich explain that when women decide to do something good for other people, the striatum, the part of the brain related to the reward system, is more stimulated. This means, they claim, that women enjoy pro-social behavior. In men, the striatum is more strongly stimulated at the time of making selfish decisions. Blocking the reward system with drugs makes women selfish and men pro-social (Soutschek et al., 2017). It is indicated that women prefer such activity because they are not indifferent to the welfare of people and the general public. Some researchers also believe that men are altruistic when it comes to heroism or risk and there is a need to bring about a final solution, especially in public situations (Pinker, 2009; Sandberg, 2016).

Polish managers participating in the survey conducted by Price -waterhouseCoopers considered mining, defense and energy industries the least attractive for them - due to their specificity. On the other hand, as many as 40% of women indicated that they are open to a career in companies regardless of the sector they represent (PwC, 2015). On the other hand, according to a survey conducted among millennial adults, women less often than men agree with the statement that they aspire to a managerial position, regardless of the field in which they work (Goux, 2012). The interest of women in this professional activity, which requires frequent business trips, seems to be much lower. Subconscious beliefs in this regard manifest regardless of gender. In other words, both a woman and a male manager will hesitate to entrust a woman with a job that requires numerous journeys, and they have no such doubts in the case of a man. All the above-mentioned variables, combined with the tendency that men work full-time more often and show readiness to work overtime, combined with a greater desire to earn money - strengthen men's professional careers. In Europe, especially in the Scandinavian countries, which are pioneering policies to help women find employment outside the home, women tend to focus more on traditionally female rather than male professions (Wolf, 2015).

Career in business and gender

The concept of career seems universal today. However, the results of the Implicit project carried out by scientists from Harvard University, which consists in examining subconscious prejudices using verbal associations, show that the words "career" and "power" are still most often associated with the male attribute while "family" with a woman. This type of association applies equally to both women and men. Representatives of both sexes consider men to be more valuable employees (Implicit Association Test) (Brzezinski, 2012). In the absence of professional experience, a man is chosen as an exemplification of power, and only the acquisition of experience can verify this type of view (Delloite, 2012). Research on preferences in choosing a job indicates that more men than women prefer work characterized not only as full of challenges, giving power and influence over others, but also involving high responsibility, risk, opportunities for promotion and achievement, and high prestige. Women, in turn, tend to work that helps other people, develop their skills and abilities, and at the same time allows them to spend more time with their families. they are in power in the sense of prestige and social position. They often define their masculinity

themselves through power and money, which requires putting the professional work first. Career and professional development are more important for men between the ages of 30 and 50. During this time, the man has to prove to himself that he has been successful. An analysis of highly qualified women in the US showed that only 15% of them chose an influential position as an important goal in their careers. Some educated women now choose a compromise that allows them to combine three priorities: work, being faithful to their own values and time for the family. Therefore, it happens that they are more interested in achieving satisfaction from being guided by individual preferences and fulfilling the role of a mother. They do not want to put a career above the family and pay less attention than men to the characteristics of high-level jobs, such as high salaries, power and prestige. Moreover, although times change, there is still some pressure from society that women should think about marriage and marriage from an early age (Sandberg, 2016).

Women more often than men emphasize the importance of health (about 91% of respondents), family, family happiness (about 85%) and love (21%), the level of qualifications achieved, while men usually pay more attention to well-being, friendship and patriotism. (GUS, 2016). Education indicators inform that women - unlike men - attach more importance to education and raising the level of education, which is confirmed by earlier data on the percentage of university graduates.

Research Results

The analysis of literature and empirical research makes it possible to identify the catalog of women's values, i.e. values chosen by women as their priorities and preferences, on the basis of which they function and which they present in external relations. It is a set of areas and spheres of activity that the average woman considers and considers valuable, i.e. desirable and good, and will give them a positive value. These are women's choices and decisions made based on their inclinations and preferences. These values are not related to race, age, social class, place of residence, or other such variables. They embrace the range of traditionally and stereotypically understood interests towards which women, in the public opinion, as well as women themselves - provided that their interests are correlated with the general public perception - are particularly inclined to understand the choices they make in Than the choices made by the male gender in economic, economic, social, educational and social terms. These are the things that the average woman values, prefers and considers more important - chooses before others. According to Sandra L. Bem, they contain a stereotypical network of associations and beliefs directly related to gender, concerning, for example, division of labor (Kuczyńska, 1992).

These values are not constant and may be temporally changeable, susceptible to cultural changes in the history of history, although the process is evolutionary. The values of women on the professional ground depend on external conditions - more or less favorable to the possibility of taking up professional activity, which has significantly accelerated in the last century. Women's values constitute a catalog of things to which a statistical woman assigns a positive value (good value), among them are the values listed in table 1.

Table 1: Catalog of stereotypical values of women

Number	Catalog of stereotypical values of women
1	Family, home and children - understood in the context of starting and having a family, feeling emotional comfort and maintaining family warmth
2	Help, care and health - understood as caring, helping and caring for the family, especially for children, the sick and the elderly
3	Security and altruism - in relation to the so-called sense of security in professional and personal life and greater selflessness, understood as the choices of those areas with which women can identify themselves in terms of family, moral and humanitarian aspects important to them
4	Education - that is the emphasis on continuous improvement of the level of education

Source: own study.

In turn, the areas particularly desirable, considered to be things that men give positive (good) value, are in particular the values identified in table 2.

Table 2: Catalog of stereotypical male values

Number	Men values catalog
1	Career and power - understood as the pursuit of a career in the context of striving for professional advancement and the company's success on the market, and power in the sense of holding, exercising leadership and prestige
2	Material status - that is, taking care of its appropriate level, achieving prosperity, luxury, in connection with the above-mentioned social domination
3	Winning and risking - understood as winning, defeating others, feats or success
4	Higher self-esteem - for men, greater care and concentration on a positive self-image and belief in their knowledge and values

Source: own study.

There are values that can be seen as common to women and men. These include social justice, understood as respect for the rights of social minorities, i.e. the poor, the excluded, the disabled, protection of animal rights, ecology and environmental protection, or others, related to the pursuit of more or less sustainable development, balance and harmony in life personal and professional (work-life balance). Research shows, however, that the above-mentioned categories are still considered less neutral, and more typically feminine - especially those related to work-life balance, preventing social exclusion or discrimination (Gerzema & D'Antonio, 2014). Although every human being tends to be guided by stereotypes, not everyone will succumb to them. The increased likelihood of prejudice against other people is associated with cognitive rigidity, the inability to change the established order, and the tendency to primitive and rigid structuring of perceptual areas, and has also been observed in people intolerant to ambiguity.

Gender stereotypes at the individual level among men may be determined by aversion to women, which is usually associated with alleged admiration for them. These types of negative emotions are often learned during early childhood socialization and can therefore be so ingrained that they are not very susceptible to change. The motivation of men consists of three determinants that permeate and reveal to a greater or lesser degree: first, paternalism, which includes elements of protectionism and domination; second, the identified own gender identity and the related desire for complementarity and, at the same time, competition with a woman; third, the power of heterosexual attraction and its two faces - the pursuit of intimacy and the intensification of hostility.

Today, people still feel less anxious and defend themselves less against the label of sexist than that of the racist. It is not uncommon to find statements that express opposition to affirmative actions in favor of women. Arguments are used that women receive a disproportionate amount, that they are trespassing places where they are undesirable, or are too violently seeking change. Due to the prevailing social climate, which to some extent prohibits the expression of sexism, the need for cognitive consistency may lead modern neo-sexists to adapt negative emotions to the egalitarian behavior they are forced to do. In the long run, therefore, there is a basis for moderate optimism in this regard, provided that there is a favorable political ambivalence, primarily racist, paraphrased norm: "A good man cannot be sexist, and a sexist cannot be a decent person" (Macrae et al., 1999).

Theories and research on stereotypes indicate that the processes associated with them can be controlled and stereotypes can change. Currently, we are participants in the process of wide transformation, as there are profound changes in the gender roles of women and men. For example, the strictly patriarchal family model in which the traditional roles of the middle class were simple - the woman took care of the house and the man earned his living - is a thing of the past. Thus, the historically and culturally determined position of women in the labor market and in business is changing. Unlike women - organizing in response to patriarchy and androcentrism - no movement has yet emerged to update the role of men in society. With men today considered less educated than their fathers, women make up the majority of university graduates - all their possible new roles seem to threaten the traditional view of masculinity. A man who according to Philip Zimbardo takes all possible alternative roles, is less respected by other men, has fewer opportunities to develop relationships with women. Especially in the situation of the emergence of a new category of women, who, however young, are more mature, and at the same time attractive, well-educated, focused on achieving their goals, and in addition financially independent. These women - as Zim¬bardo argues - have more than men overworked with clearly defined goals or awareness of basic social skills, and men simply find it difficult to get along with these women. Previously award-winning traditional male role models: the ability not to express emotions, to be tough, strong and dominant, no longer work. The ongoing changes mean that we can deal with a certain crisis of masculinity, which culturally tends towards recognizing that a man is no longer an icon of versatile agency - after all, men are told that you can and even know how to cry, but at the same time mass culture does not allows them to do so (Zimbardo & Coulombe, 2015). Attributing traditional masculinity to a wider set of feminine traits is intended to defend and enhance the feminine subject. Excessive glorification of femininity carries the risk of generalizing stereotyping, which may give the impression of strengthening the stereotype, but in a broader perspective, it should contribute to increasing the strength and appreciation of women.

Summary

The doctrine proposes many solutions for stereotyped people, and in this case, women themselves are undoubtedly the most influential in shaping the image of women. Scientists have shown that in both individual and group situations, women should emphasize the positive aspects of their gender identity. It is important to emphasize the functions performed as a manager, leader or acquired education. Moreover, repeated contact with people who deny the characteristics considered stereotypical, may lead to the disappearance of the stereotype. Changes occur when the observed outcomes, such as the success of a woman in a male-dominated occupation, are attributed to the characteristics of the perceived person or group - in this case it may be a learning mindset, skill improvement or multitasking, which is then generalized. on the entire population. Importantly, however, if any external reasons for the observed result are available or emphasized, such a generalization does not occur. If, therefore, the success of women is attributed to the implementation or assistance of special programs, traditional beliefs about them, rather than changing, will be reinforced.

An effective method of fighting negative stereotypes is associating them with socially recognized values, such as team work, building empathy and trust. In this case, the values symbolize the generalized notion of other, undefined third parties who may or may not approve of certain behaviors. Stereotyped people should try to evoke the clarity of those values that most people recognize, even if they do not always act accordingly. The expressiveness of commonly recognized values is conducive to radical changes in social norms that determine the appropriate manner of expressing gender attitudes (Macrae et al., 1999). There is no doubt that people who have activated positive values try harder to act in harmony with them. It is therefore worthwhile for stereotyped groups to remind others more of these common values, even during interviews or at meetings. This should trigger the best instincts in others, since referring to values is correlated with a greater willingness to conform to them. In connection with the above, another method may bring great effectiveness, namely assigning features related to the female gender to the qualitative, good categories, which should force the verification of negative and simplified stereotypes. An important role in this respect can be played by institutions, media and organizations, including professional ones, which, by including gender exposure in their messages, should avoid negative stereotypes and promote the values represented by a given gender, targeted at a wide audience.

In conclusion, it is difficult to make unequivocal conclusions regarding the determinants of differences between the sexes: to what extent they are inborn, and to what extent they result from the socio-cultural environment and are a consequence of upbringing, different expectations towards both genders and stereotypes. Cultural and social patterns and stereotypes have a strong influence on the gender sets of traits. We are not biologically programmed or designed to travel through the air or under water, yet we overcome the limitations of biology and explore different kinds of space, or at least try to do so. Since in many areas - despite the existence of evolutionary grounds for a different behavior - we manage to change these biological determinants, we can, thanks to greater awareness, try to change knowledge in the field of socio-cultural expectations towards women and men so that both one and the other and the other sex could easily pursue the goals they chose.

Funding

The project was financed within the framework of the program of the Minister of Science and Higher Education in Poland under the name “Regional Excellence Initiative” in the years 2019–2022, project number 001/RID/2018/19.

Abstract

The investigation focuses on the identification of actions and strategies that hoteliers apply on their websites, to capture direct bookings versus their dependence on the OTA, to evaluate the importance and function of the websites of the 4- and 5-star hotels in Porto and Northern Portugal. Online distribution is a necessity for a hotel, either to reach the largest number of customers or to give visibility to the brand. Hotel websites, however, allow greater proximity and communication with the customer, potentiating hotels' possibility to increase direct bookings. It is therefore necessary to understand which actions and strategies hoteliers must consider for capturing direct bookings.
Thus, the main objective of the study is to identify the hoteliers' dependence on the OTA and the consequent actions and strategies they apply on their websites to capture direct bookings.
In the present investigation, the quantitative methodology was chosen, and the data collection instrument was a questionnaire survey, applied in a total universe of 150 hotels, 4- and 5-star hotels in the Region of Porto and Northern Portugal, where 55 responses were obtained. The data obtained were treated and analysed using the SPSS software.
The results obtained confirm the existence of actions and strategies in hotels to capture direct reservations; hotels consider these strategies as an essential condition for increasing direct bookings.
Limitations have arisen in the collection of questionnaires due to the Covid-19 pandemic. Most hotels closed due to lack of customers and consequently, the sample for the present study is limited in the diversity of the typology of respondents. It is intended with this work to understand what actions and strategies hotels apply on the website, as well as to understand if hotels follow the new technological trends, in what the contact and communication with the client concerns.

Keywords: online distribution, hotel website, 4- and 5-star hotels.

Introduction

With the technological evolution and sales of hotel rooms to be made mostly through the internet, it is necessary that the hotel units are present in the different distribution channels and that they have a website with the possibility of direct bookings. The internet thus presents itself as an innovative and high-reach marketing tool, enabling one-to-one marketing, requiring greater creativity in the approach of customers and potential customers.

The distribution and online presence are an important and essential component for the commercial success of the hotels and aim to get the product to the end customer, so that the end customer makes a reservation and, when arriving at the hotel, this reservation turns into a real sale.

The internet has revolutionized hotel distribution (Chatterjee and Wang, 2012) and hotels have had to adapt to each of these new paradigms, as well as customers, who today plan and share information more easily.

Hotel websites can be especially important marketing tools and an effective distribution channel, as all content is controlled by the hotel (Hayes and Miller, 2011). They are also important sources of information for electronic

FERREIRA , Joaquim RIBEIRO and Daniela MENESES "Actions and Strategies on Hotel Websites: Case Study Of 4- And 5-Star Hotels in Porto And Northern Portugal" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

marketing, namely about the number of people searching the website, their area of residence, their search time on the page and where the search ended. In a way, they are important providers of customer information because they provide important data for the customization of offers (Toh, Raven and DeKay, 2011).

Online distribution channels, such as OTA and GDS, are in some cases important media outlets for reaching a particular customer (Hayes and Miller, 2011). Many customers search the distribution channels for information about the hotels and later look for the hotels' websites to make reservations, if they find advantages, free parking, movies, or breakfast, end up making their reservation via the hotel's website or call centre (Toh, Raven and DeKay, 2011). It is therefore important to understand whether hotels implement different actions and strategies on their websites to attract customers and increase direct bookings.

This research is organized by different sections: Section 2. Literature Review; Section 3. Methodology followed by Section 4. Analysis of results. Finally, in Section 5. Conclusions, limitations of the study and guidelines for future investigations.

Literature review

Today, most hotel units have an online presence, providing the client with a website with information about the hotel, location area and points of interest, hotel images, rooms, services provided, prices for different times or days of the year, contacts (telephone and email), offers and special promotions and online reservations.

According to Lindon (2008), online presence presupposes four dimensions: traditional presence, through informative websites; the presence on websites, for interaction in communication with users, being collected information and opinion of potential users; forms of e-commerce, including websites; and the application of virtual distribution, applied to intangible products and goods, enhancing the speed of delivery of products or services.

Technological innovations are an indispensable tool in the hospitality sector to succeed, according to Zafiropoulos, Vrana and Paschaloudis (2006) (Cit. by Inversini and Masiero, 2014). Online distribution has been changing from traditional channels to online channels, stimulating disintermediation. However, Christodoulidou Brewer, Feinstein and Bai (2007) identify the five major problems and challenges for hotel distribution: i) Control of rates; ii) Staff training; iii) Customer loyalty; iv) Interface of the hotel's website; v) Control of the hotel's image and brand.

According to a study by Deutsh Bank Securities (Cit. by Cunha and Abrantes, 2019), it is estimated that by 2020 mobile hotel reservations will triple worldwide. The European Commission study (Cit. by Cunha and Abrantes, 2019) states that "Europeans, when deciding to make a trip, 58% organize it and book individually, 21% buy a group trip, and only 23% use travel agencies to organize their trip".

In order for the conversion rate of direct bookings to be increasingly effective and for the communication strategy to be factual, hotel units on their websites must take into account key points to facilitate this process, such as: quality website design (Wang, Law, Guillet, Hung and Fong, 2015), with the production of quality content, text, photos, videos or mixed formats (Costa, 2017); intuitive mobile platforms – user-friendly (Costa, 2017); optimization and facilitation of the purchase process on the website (Costa, 2017); offer the best rate (Toh, Raven and DeKay, 2011); offer discounts or promotions to customers who make reservations on the site (Toh, Raven and DeKay, 2011); offering return-to-guest incentives (Christou, 2011; Toh, Raven and DeKay, 2011) or loyalty program (Liu and Zhang, 2014). The presence of these key points may be added value in customer relationships, as loyal customers will typically have repeat purchases and consequently attract new customers, according to Vinod (2011) (Cit. by Liu and Zhang, 2014).

The website of a hotel, according to Majó, Vall-Llosera and Moya (2020) should provide up-to-date information, reservation policies and explicit cancellations, as well as contacts to clarify questions and option for direct reservation. In a research study, Aljukhadar and Senecal (2015) mentioned site aesthetics, information quality, site interactivity and site trust, the main features that drive the attitude and purchase intentions of users on online booking.

A website, when it allows the collection of information about the customer and the execution of the reservation in a safe and reliable way, guarantees, before the OTAs, a different service and added value: the customization of reservations and offers (Toh, Raven and DeKay, 2011; Majó, Vall-Llosera and Moya, 2020).

Nevertheless, as mentioned by Kang, Brewer and Baloglu (2007), for an effective interorganizational management, it is important for hoteliers to know the mix of the chosen channels and the dependence on certain channels, since the use of multiple channels maximizes the possibilities of customer reach (Abou-Shouk, Megicks and Lim, 2013), and, at the same time, a greater number of channels increases distribution management (Kracht and Wang, 2010).

OTA emerged in the 1960s and adapted to customer needs and requirements. Today, they are powerful online distribution companies, and some cases determine that the hotelier sells most of its inventory through its channels and third-party channels at lower prices (Carrol and Siguaw, 2003). These major distributors have adapted to customer needs, offering them a user-friendly experience or mobile apps (Law, Lo, Leung and Leung, 2015; Camilleri, 2018). For their part, online booking systems have seen a significant increase in home users, who, from home, access online hotel reservations, search for local restaurants and attractions. Anyone who has a device with internet access, computer, tablet or smartphone, has access to the online services of public electronic networks. According to a study by e-Marketer (2017) (Cit. by Camilleri, 2018) 40% of the U.S. market makes purchases by mobile phones. In their study, Kracht and Wang (2010) report that when a customer does not know the hotel's website, they will use a search engine, for example Google, to find that same website.

Xiang and Gretzel (2010) mentioned the consumers are strongly influenced by the information they have collected from the internet. Hotel website quality profoundly and positively influence the consumers to booking room online (Wang, Law, Guillet, Hung and Fong, 2015).

The trust, mentioned for Ling, Daud, Piew, Keoy and Hassan (2011), is an important determinant, directly influencing the user's behavioural intentions to purchase online. Hotels must establish trust relationship with their online consumers (Wang, Law, Guillet, Hung and Fong, 2015), influencing the consumers to book online.
In a research study, Chang (2017) identified a clear link between promotions and purchase intention. Christou (2011) reveals the consumers' preferences for reward points and prices discounts, with largest impact on client decision booking intentions and Ip, Law and Lee (2012) in their study, considered reservation information as the most important criterion of the hotel website functionality.

Methodology

For the present investigation, the descriptive quantitative investigation method was applied, responses were described using means and coefficient variation. The questionnaire survey was used as data collection instrument and sent to 150 hotel units (the population of this study), from which 55 responses are obtained (the sample study). The resulting data were treated and analysed using the SPSS software. The questionnaire was divided into four parts: first part, sociodemographic characterization; second part, hotel features; third party, performance of the hotel website; and finally, the fourth part, actions, and strategies.

Descriptive analysis was used to analyse the profile of the respondents, which will show the absolute and relative frequencies. The first part of questions is related to each respondent's profile.

The sample of questionnaires collected shows that 50.9% are male and 49.1% are female. It is verified that the age groups with the highest representativeness are between 25-34 years, with 34.5%; 35-44 years, with 34.5%; 45-54 years old, with 14.5%; followed by the age group of 18-24 years, with 9.1%; and, finally, with less representativeness, the age group of 55-64 years, with 7.3%.

Figure 1: Department and Education level

Regarding educational qualifications (figure 1), it was found that most respondents have a higher education level: 70.9% have a degree, 16.4% have qualifications from 3rd cycle (7th to 12th grade) and 12.7% have a master's degree. Regarding the work area, it was found that most respondents belong to the front-office/rooms department (27.3%), administrator/manager (18.2%), assistant director (18.2%), marketing and sales (14.5%), commercial (12.7%), revenue manager (5.5%) and finally, F&B – food and drink (3.6%).

Figure 2 - Location

Regarding the location of the hotel units, according to NUT-II, Porto and Northern Portugal, it was concluded that most respondents belong to the Metropolitan Area of Porto (34.5%), followed by Alto Minho (18.2%), Ave (10.9%), Alto Tâmega (9.1%), Alto Tâmega and Sousa (9.1%), Cávado (9.1%), Douro (7.3%) and, with less representativeness, Trás-os-Montes Lands (1.8%).

The second part of questions relates to the hotel's characteristic, classification, size, core business and whether it belongs to a hotel group. Table 1 shows the frequencies for this question group.

Table 1 : Table of frequencies hotel characterization section

Classification		**N**	**%**
	4 Stars	49	89.1%
	5 Stars	6	10.9%
Hotel Dimension		**N**	**%**
	Less than 26 rooms	4	7.3%
	Between 26 to 50 rooms	16	29.1%
	Between 51 to 164 rooms	30	54.5%
	More than 165 rooms	5	9.1%
Hotel Core Business		**N**	**%**
	Individuals	35	63.6%
	Groups	9	16.4%
	Groups and Corporate	11	20.0%
Do you belong to a hotel group?		**N**	**%**
	Yes	29	52.7%
	No	26	47.3%

Regarding the classification of the hotel unit, these are mostly units of 4 stars (89.1%) and, with lower representativeness, the units of 5 stars (10.9%). Regarding the size of the hotel unit, most of the units surveyed are medium-sized - between 51 and 164 rooms (54.5%), followed by small units - between 26 and 50 rooms (29.1%) and

large hotel units - more than 165 rooms (9.1%). With less representation are the hotel microunits – less than 26 rooms (87.3%).

Regarding the core business of the hotel units, 63.6% of respondents answered that their target customer is individual customers, 20% answered that the target customer of the hotel unit is the groups and corporate, while 16.4% of respondents have as target customer only groups. Regarding belonging to a hotel group, 52.7% of respondents answered that they belong to a hotel group, while 47.3% of respondents answered that they did not belong to a hotel group.

Finally, we tried to understand if all hotels of the sample under study have a website and if it is possible to make reservations through the websites.

Table 2 : Hotel website (n=55)

	4 Stars		5 Stars	
Hotel has website?	**N**	**%**	**N**	**%**
Yes	49	100%	6	100%
No	0	0%	0	0%
Hotel website is user-friendly?	**N**	**%**	**N**	**%**
Yes	45	91.8%	6	100%
No	4	8.2%	0	0%
Do you have full access to the hotel's website backoffice?	**N**	**%**	**N**	**%**
Yes	31	63.3%	3	50.0%
No	18	36.7%	3	50.0%
Is it possible to book through the hotel's website?	**N**	**%**	**N**	**%**
Yes	48	98.0%	6	100%
No	1	2.0%	0	0%

Analysing the data (table 2), we conclude that 54 units have their own website with booking engine and that only one hotel unit has only website available. Also, Brewer, Feinstein and Bai (2006) in their study confirm the importance of websites for hotels. In the same study, the authors identify as the greatest challenges of hoteliers: i) the control of rates; ii) the formation of the team; iii) customer loyalty; iv) the control of the hotel's brand/image.

Regarding the adaptation to the website to be user-friendly, adapted for mobile devices, all 5-star hotels claimed to have the offer of this functionality available to the customer; however, in the 4-star units, 45 of the hotels in 49 respondents said they had this same functionality available. According to the study by Ip, Law and Lee (2011) it was predicted that a user-friendly site would increase the probability of selling products directly to the customer, since it allows access to the backoffice of websites, making it possible to change information whenever necessary, not being dependent on third parties. Not accessing the backoffice of websites can, in many cases, make it difficult to promote and disseminate campaigns whenever necessary.

According to the answers obtained, 31 respondents from 4-star units said they had access, while 18 said they did not have access to the backoffice. In the 5-star units, 3 respondents answered affirmatively to the question and 3 others answered that they did not have access to the backoffice.

Regarding the possibility of bookings through the site, 54 have this functionality available to the client and only one 4-star hotel does not have this functionality.

Results

The performance of the website was analysed for the present investigation, so in relation to the booking window, 32.7% of the hotel units are in the 10 days before check-in, while for 29.1% the time in advance of bookings is between 2 and 3 days before check-in. It is understood, therefore, that customers, regarding the reservations made on

the website, do not allow to define a standard time, which may vary for reasons of the client's trip, or the fact that the hotel units, in need of increased occupancy, make available on their websites "last-call" or "last-minute" campaigns to captivate more customers.
According to a study by Chen and Schwartz (2013), some customers make their reservation a week before check-in, while others make their reservation a few days before check-in with the expectation of getting better conditions (prices).

In relation to the average stay and according to the results, 69.1% of bookings are 2 nights or less and only 29.1% of bookings are from 3 to 7 nights.

According to the data of the National Institute of Statistics (INE, 2020), the average stay for the region of Porto and Northern Portugal is 1.84 nights, so the data presented are close to the official statistical results.

Analysing the results of the website online bookings it is concluded that the average rate of direct bookings with greater representativeness (54.5%) is from 51 to 100€ room/night, then followed by the value of 101 to 150€ (25.5%). The average rate of accommodation, according to INE (2020), is 87.70€ for 4-star hotels and 163.90€ for 5-star hotels. We can conclude from the data presented that the values are close to the official statistical results.

Regarding the cancellation fee for bookings from the hotel website, 70.9% of the respondents point between to 0 and 10% of cancellation rate for bookings from the website and only 23.6% point to a rate of 11 and 20%.

Table 3: Cancellations fee for bookings from hotel website

	N	%
From 0 to 10%	39	70.9%
From 11 to 20%	13	23.6%
From 31 to 40%	1	1.8%
From 41 to 50%	1	1.8%

The following group corresponds to the actions and strategies adopted on the website to attract direct bookings. In the table below the frequency table for each answered question is represented, according to the Likert Scale, in which 1 corresponds to totally disagree, 2 corresponds to partially agree, 3 neither agree nor disagree, 4 partially agree, and 5 totally agree.

Table 4: Strategies and actions for direct reserves

	1	2	3	4	5	Mean	Coefficient of Variation
There are rates only for the hotel's website.	8 (14.5%)	1 (1.8%)	2 (3.6%)	13 (23.6%)	30 (54.5%)	4.04	35%
The availability of the number of rooms is the same for OTA and for the hotel website.	7 (12.7%)	5 (9.1%)	5 (9.1%)	15 (27.3%)	22 (40.0%)	3.74	38%
The hotel's website has exclusive promotions for those who book directly.	-	1 (1.8%)	1 (1.8%)	15 (27.3%)	37 (67.3%)	4.63	13%
There is a Loyalty Program at the hotel.	6 (10.9%)	3 (5.5%)	11 (20.0%)	10 (18.2%)	24 (43.6%)	3.8	36%

Analysing the results from the table, regarding actions and strategies adopted on the websites for attracting direct reservations, it is verified that 67.3% of the hotels offer exclusive promotions for direct reservations, representing an average value of 4.63, followed by the availability of rates only (exclusive) for websites with 54.5% and average value of 4.04. With lower relevance is the loyalty program, with 43.6% and average value of 3.8, and the availability of equal inventory for OTA and website, with 40% and average value of 3.74.

These results are in accordance with different studies and authors who mention some of these analysed results. As a reference, Toh, Raven and DeKay (2011) mentioned in their study the offering of the best rate on the website or the offering of discounts or promotions to customers who make a reservation from the website as some of the actions and strategies hoteliers should follow; also, as mentioned by Liu and Zhang (2014) the presence of a loyalty program is equally seen as a good strategy for hotels.

Other authors recommend as incentives for direct reservations offering return-to-guest incentives (Christou, 2011; Toh, Raven and DeKay, 2011). The consumers prefer reward points and prices discounts, representing a large impact on the client decision for booking intentions (Christou, 2011). In a research study by Aljukhadar and Senecal (2015) site aesthetics, information quality, interactivity and site trust are considered the main features that drive the purchase intentions of customers to use online booking.

Conclusions

According to the objectives of this investigation, to identify the actions and strategies that hoteliers apply on websites to communicate with their clients and to enhance direct bookings, different considerations were observed. First, most of the studied hotels have their own website and only four hotels do not have the website adapted to the different online platforms – user-friendly. At the same time, it is also possible to note that only one hotel does not offer the option of direct reservations in the hotel website.

From this point on, it is possible to conclude that most of the studied hotels have the major requisite for facing real actions and strategies able to increase direct bookings: the existence of a website able to offer direct reservations, which increases the possibility of a variety of coadjacent offers, services, and access to clients' information, according to the set of actions and strategies the hotels decide to implement in their communication with the clients.

For Majó, Vall-Llosera and Moya (2020), a website allows the reservation to be made safely and reliably, and guarantees, in view of the OTA, a different service and added value: the customization of reservations.

It turns out that there is an effort on the part of the hotels of higher segments, 4 and 5 stars, to offer on their website better conditions to communicate with their clients and to attract customers. This fact is also confirmed by Chan and Law (2006) (Cit. by Inversini and Masiero, 2014), who argue that the website is the core of communication and business of a hotel. A hotel unit, when communicating directly with the customer, through direct sales through the website, allows anticipating and reducing distribution costs, as well as customizing their offers.

Therefore, having access to the back-office of the website, which, according to Majó, Vall-Llosera and Moya (2020), provides hotels with up-to-date information, reservations policies, explicit cancellations, as well as contacts to clarify questions and option for direct reservation, must be considered as a priority for hotels to balance their dependence on the OTA, on what concerns the possibility of enhancing the customization of a client's reservation.

From this point of view, on what concerns the access to the back office of the website, 34 respondents claim to have access, while 21 of them claim that they do not have access to the back office of the website.

Having this into consideration, we addressed the performance of the hotels websites' direct bookings and found the following results: on what concerns the booking window, 32.7% of the respondents mention 10 days before the check-in; regarding the average stay, 69.1% of the respondents refer between two days or less; on what refers to the average rate for bookings from the hotel's website, 54.5% of the respondents mention a rate between 51€ and 100€ per night; finally, regarding the cancellation rate, 70.9% of respondents refer a 10% rate.

Observing the data results and the actions and strategies that the studied hotels apply on their websites to enhance customer communication and capture direct bookings, it was possible to conclude that most hotels already face their communication with the client as a priority, as an effort not only to customize their relationship with their customers but also, at the same time, to enlarge their direct bookings. As mentioned by Liu and Zhang (2014), as personalized services, hotels can make available exclusively on their websites the top-end typologies, and, as recommended by Toh, Raven and DeKay (2011), premium rooms only available on the hotel's website, creating the idea of an exclusive product, only accessible on the hotel's website, or even to grant access to different services provided at more accessible values.

There are many actions and strategies hotels can adapt to improve their direct communication with the customer. Through the present study it was possible to observe that Hotels centre their online offers' attractiveness in creating specific rates for the hotel's websites, because clients' preferences go for lowest prices and price discounts, as well as developing exclusive promotions for direct booking, as a direct attempt of adding value for the costumers' relationship, and offering the customer a Loyalty Program to create a trustful relationship with online consumers.

The work developed for the present study coincided with a worldwide state of pandemic that led, compulsively, to the closure of numerous accommodation units, due to the lack of clients, specifically those geographically located in large centres.

Florida (2020) refers Covid-19 led different services to stop, planes were parked, and hotels closed, paralyzing the entire tourism and travel industry (Niewiadomski, 2020; Wen, Wang, Kozak, Liu and Hou, 2020). In hospitality, one of the sectors that suffered the most from the pandemic, the consequences for employment are catastrophic (Gössling, Scott and Hall, 2020), some countries' traveling ban is still enforced (Yeh, 2020) and there is no movement of tourists.

The pandemic situation prevented hotels from developing these actions and strategies to capture direct reservations and greater possibility of customization their services and products because costumers do not exist now. In a post-Covid era, the customer will value customized communication much more, which should therefore lead hotels to invest, more than ever, in the development of increasingly better websites to allow some important independence from the OTA, enhancing the possibility to offer a different service and an added value: the customization of the hotel reservation and its offers (Toh, Raven and DeKay, 2011; Majó, Vall-Llosera and Moya, 2020).

Abstract

The article presents a problem of corporate dividend policy. The research goal was to present the corporate dividend policy in the context of economic conditions related to the SARS-CoV-2 pandemic.
The research has shown a significant impact of the pandemic on dividend policy. Most of the analyzed companies reduced the amounts of dividends or froze dividends payouts. One of the reasons was the deterioration in the financial performance of some companies. It was reflected in the profitability, financial liquidity and financial leverage. The reduction of dividends payouts also took place in companies in good financial condition. It indicates a conservative dividend policy aimed at mitigating the negative economic effects of the pandemic.

Keywords: Corporate Dividend Policy, SARS-Cov-2 Pandemic.

Introduction

The stock market allows investors to invest financial assets in companies that will allow them to generate profits. The source of the investor's profits is not only the increase in the value of shares but also the share in the income generated by the company. The dividend policy means the strategy adopted by the issuer to distribute profits and pay them out as dividends or to keep and reinvest them in the company. One of the most important tasks of the dividend policy is to provide current and potential investors with information about the benefits they can expect by investing their capital in the shares of a given company. In this way, the management board builds the long-term trust of stock market participants, trying to present the company as well-managed, stable, and profitable. Many theories emphasize the relationship between the dividend policy and the value of the company, what is more, there are also company valuation models based on current and future dividends (e.g. the Gordon model).

Therefore, dividend policy seems to be an important area of corporate management. Based on research, economists suggest that dividend payments depend on the financial life cycle of the enterprise. According to this theory, large companies are more likely to pay dividends, while small companies with limited resources are more likely to retain earnings. Periods of turbulence on financial markets and socio-economic crises are a particularly big challenge for managers. The following questions arise: should the dividend policy be modified and to what extent? How will investors react to a possible change?

The year 2020 will go down in history as one of the world's biggest health, social, and economic crises. The epidemiological situation caused by SARS-CoV-2 and its impact on the global economy and financial markets is unprecedented. Stock market investors faced tremendous uncertainty over the economic and financial impact of the pandemic. As indicated by Gorsmen and Koijen (2020), the capital markets of the European Union, Japan, and the United States recorded over 30% declines. Baek, Mohanty and Glambosky (2020) noted that, with the first wave of the pandemic and the need to pause the economy, there was uncertainty about its economic and financial

Cite this Article as: Konrad SZYDLOWSKI and Karol WOJTOWICZ " Corporate Dividend Policy In The Context of The SARS-Cov-2 Pandemic" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

consequences. As a result, households, entrepreneurs, the financial sector as well as policymakers have had great difficulties in predicting future effects. The boards of listed companies also faced an attempt to estimate the long-term effects of the pandemic and the possible need to adjust the dividend policy. The economic problems that are currently observed did not affect the companies' results in 2019, but they should be expected in 2020, possibly as well in the following years.
The main aim of this paper is to present the dividend policy of companies in the context of economic conditions related to the SARS-CoV-2 pandemic. The subject of the research were the amounts of dividends paid out, dividend per share, and dividend yield. The financial performance of the companies was also analyzed taking into account profitability, financial liquidity, and financial leverage.

Literature Review

The decisions of financial managers focus on two areas - investments and sources of financing. The investment area relates to the selection of specific assets, while the financial area relates to the sources of financing. Al-Malkawi, Rafferty and Pillai (2010) mentioned, that in a situation where the company generates a profit, the financial manager faces another dilemma – a possible division and payment of dividends to shareholders. Decisions regarding the payment of dividends depend on many external and internal factors, and their results may affect the company's valuation. According to Czapiewski and Kubiak (2016) the dividend policy implemented by a listed company affects not only the investment attractiveness of the entity but also the shape of the structure and the cost of capital. Economists cite several theories that describe and explain the impact of the dividend policy on the value of the enterprise.

The dividend policy is the subject of numerous studies, as a result of which various theories were developed describing the impact of the adopted strategy on the enterprise. However, no coherent position has been developed, and the theories presented differently characterize the significance of dividend decisions. Some studies prove the positive impact of dividends on the value of the company (pro-dividend theories), there are also opinions suggesting no relationship between these categories (neutral theories), while some economists indicate that dividend payment has a negative impact on the company's value (anti-dividend theories).

In one of the most cited papers, Miller and Modigliani (1961) argue that the dividend policy has no impact on the company's value. The authors in their article titled "Dividend Policy, Growth, and the Valuation of Shares", show that from the investor's point of view, dividends and capital gains are equivalent, and the only factor affecting the company's valuation is profits. Miller and Modigliani's dividend irrelevance theory is based on the assumption of a perfect capital market where there are no transaction costs and taxes on dividends and capital gains are equal or absent. Shareholders are primarily interested in the investment policy of the company, which is the source of profit, therefore the investment activity, not the dividend policy, influences their decisions.

The representatives of the anti-dividend theories point to the fact that the dividends distribution has a negative impact on the company's value. One of the main reasons for this is the tax aspect. Investors are interested in the net return, so differentiation of the taxation of dividends and capital gains may affect their level of expectation concerning dividends. According to tax theories, a low dividend payout ratio lowers the cost of capital and increases the share price (company value). Moreover, dividends are to immediate taxation, while capital gains taxation occurs when shares are sold. Research on the tax aspects of asset valuation was conducted by Brennan (1970). To verify the relationship between the rate of return adjusted for tax risk and dividend income, he modified the CAPM. Brennan showed that the profitability of shares before taxation correlated with its dividend rate and systematic risk. A similar stance was presented by Litzenberg and Ramaswamy (1979). They extended the Brennan model to account for income constraints on borrowing that can be used to deduct from the dividend income generated by their portfolios. Moreover, in subsequent studies on common stocks, the authors (1982) showed that although there is a positive, non-linear relationship between the rates of return on ordinary shares and dividend income, it is not possible to clearly explain profitability based on information regarding the forecast dividend. Another argument for limiting or resigning from dividend payments is the poor financial situation and the possibility of bankruptcy.

However, unlike the theories of irrelevance or anti-dividend theories, many investors believe that according to the popular proverb "bird in the hand", dividends paid by a company are reflected in its valuation. The inherent feature of capital markets is a risk, and the natural propensity of investors is risk aversion. Receiving dividends is, therefore, more valuable than the promise of future capital gains. Gordon (1959) draws attention to three reasons why investors buy shares of certain companies: (1) they expect a dividend, (2) they count on a dividend and an increase in the value

of shares, (3) they want to profit from the increase in the value of shares. In his opinion, dividends have a greater impact on the value of the company than retained earnings. Lintner's research (1956) also proved that paid dividends have more value for shareholders than retained earnings. Moreover, he emphasizes the importance of dividend yield stability. Whereas DeAngelo and DeAngelo (2006), questioning the arguments of Miller and Modigliani, emphasize that the dividend payment policy is not without significance, and the investment policy is not the only determinant of value, even in perfect markets. The signaling theory also provides arguments for the pro-dividend policy. Its assumptions are related to information asymmetry. Proponents of signaling theories believe that the dividend policy is a tool that provides information on the potential condition of an enterprise to the market. The dividend policy adopted by the company is a qualitative signal for current and potential investors. quality has a lower cost than other alternatives.

The dividend policy can also be a tool for controlling and supervising the activities of the management board. Managers of companies are agents of shareholders, and there are conflicting interests in the relations between the two groups. The goals and motivations of management and shareholders are contradictory on issues such as the optimal size of the company and the payment of cash to shareholders. As emphasized by Wrońska(2008) in public companies, shareholders expect the management board to generate certain benefits. The agency's costs are related to the fact that due to the information asymmetry, the management board may take actions that do not bring value to shareholders. Also Jensen (1986) mentioned that dividends paid to shareholders reduce the resources under the control of managers, thus limiting the freedom of action of managers and increasing the likelihood of making effective decisions.

The impact of dividend policy on investor behavior is also justified in terms of behavioral finance. Due to the lack of control and delayed gratification, market participants prefer dividends to capital gains even without taking into account transaction costs and taxes. Thaler (1980) points out that, the payment of dividends is valued by market participants more than potential future capital gains, because it allows investors to control the level of expenses. Also, Kahneman and Tversky (1982) drew attention to the phenomenon of loss aversion. In their opinion, receiving a dividend is more advantageous than capital gains, because selling shares involves more regret and anxiety than spending cash from paying a dividend. Moreover, the subsequent increase in the prices of the shares sold further intensifies the grief of the shareholders.

The issue of dividend policy is of particular importance in the event of turbulence in the financial markets. As Lintner emphasizes (1956), the most important determinant of the dividend amount is the amount of the company's net profit. Numerous studies show that there is a correlation between the amount of profit and dividend policy. DeAngelo, DeAngelo, and Skinner (2004), among others, mentioned that despite a lower dividend propensity among industrial companies, most high-income companies do pay dividends. Moreover, they pointed out that the lack of dividend payments applies to those industrial companies that had poor financial results or losses. Also, Kumar and Lee (2001), analyzing the determinants of dividend smoothing, focused on income volatility, financial difficulties, and the risk of bankruptcy. They showed that the dividend policy is conditioned by the aforementioned factors that influence the function of investors' demand for the company's shares.

Unexpected economic events, crises, and geopolitical instability are factors that may contribute to the modification of the principles of profit distribution adopted by the company. The effects of unfavorable events may translate into both a decrease in production and an increase in costs as well as reduce revenues and profits.

The year 2020 will go down in history as one of the biggest crises, the effects of which are observed both in the social and economic spheres. The epidemiological situation caused by the COVID-s pandemic has led to the need to lockdown most countries in the world. Starting from mid-March 2020, the economic activity of most enterprises has been significantly reduced, and in extreme cases completely suspended. The most disadvantaged sectors include tourism, services, catering, and broadly understood entertainment. The crisis also affected financial markets, including stock exchanges. The high level of risk aversion, which was mainly related to the uncertainty about the impact of the SARS-CoV-2 on the global economy, caused a sharp decline in many asset classes and indices in mid-March. The situation on the Warsaw Stock Exchange mirrored the trends in global markets. Investor uncertainty contributed to the increase in supply, which in turn translated into a fall in equity valuation across all sectors.

Fig. 1: Main Warsaw Stock Exchange (WSE) indices (November 2019 – November 2020)

Source: the Authors, based on stooq.pl

According to the Report on the Stability of the Financial System (by the Financial Stability Department of the NBP), some of the declines resulted from the operation of industry-specific factors. In particular, factors specific to energy sector companies were a significant drop in global oil prices, while large drops in banks' share prices were the result of expectations for a decline in their profitability amid the expected economic slowdown, increased credit risk, and the expected suspension of dividend payments by banks[1].

Research Goal and Methods

The research goal is to present the corporate dividend policy in the context of economic conditions related to the SARS-CoV-2 pandemic. The subject of the research was the amounts of dividends payouts, the amounts of dividends per share, and the dividend yield. The financial condition of the companies was also analyzed taking into account profitability, financial liquidity and financial leverage.

The following research hypothesis was formulated: „due to the SARS-CoV-2 pandemic, enterprises change the current dividend policy, which results in a decrease in the amounts of dividend payouts and dividend yield". The justification for such a hypothesis is the deterioration of the financial performance of enterprises as an effect of the pandemic. As a result, enterprises' ability to pay dividends decreases. An important argument is also the increase in risk and economic uncertainty inducing shareholders to reduce dividend payouts and accumulate profit by the company.

Thirty-four companies listed on the Warsaw Stock Exchange were analyzed. All enterprises belonged to the WIGdiv index, which represents companies that have regularly paid dividends for the last five years. The three out of thirty-four analyzed companies were the largest listed enterprises in Poland. These are companies listed on the WIG20 index. Another group (13 companies) were medium-sized enterprises, belonged to the mWIG40 index. The group of small companies was the most numerous (19 entities). These are companies listed on the sWIG80 index. The analyzed enterprises represented various industries and economic sectors, including construction, fuel production, food production, chemical industry, media, IT, automotive industry.

The analysis was carried out for the period 2015-2019. The source of the data was: the Thomson Reuters database, financial reports issued by the analyzed companies, internet portals on economic issues - stockwatch.pl, biznesradar.pl, stooq.pl.

[1] Financial Stability Report. Special Issue: Effects of the COVID-19 Pandemic. Financial Stability Department, National Bank of Poland, Warsaw 2020.

Empirical results

One of the most measurable effects of the corporate dividend policy is the amount of dividend payout. Thus, the first research problem was the amount of dividend paid out by the analyzed enterprises. The data is presented in table 1.

Table 1: Amounts of dividends payouts by the analyzed companies in 2015-2019 (in thousand PLN)

Source: the Authors, based on biznesradar.pl.

The total amount of dividends paid by all companies for 2015-2019 was PLN 15.9 billion. A characteristic is a significant decrease in this amount in 2019 – it amounted to PLN 2.1 billion and was more than 44% lower than in 2018. Thirteen analyzed companies reduced the amount of dividend, and nine entities froze dividend payouts. It means that the problem of dividends reduction concerned as many as 64.7% of the analyzed enterprises. These were both large companies (3 entities), medium-sized companies (6), and small enterprises (13). The rest of the entities increased the amounts of dividends (10 entities) or kept them at the level from 2018 (2).

The next research problem was the dividend per share. The research results are comprised in table 2.

Source: the Authors, based on stockwatch.pl.

The figures confirm the observed decrease in the amount of dividends payouts for 2019. In twenty-two cases, the dividend per share fell. It should also be emphasized that the average ratio decreased significantly in 2019. Compared to 2018, this it decreased by as much as 38.2%.

The above data is supplemented by the analysis of the dividend yield ratio. The data is shown in Figure 1.

Fig. 2: The average dividend yield ratio in the period 2015-2019 (in %)

Source: the Authors, based on stockwatch.pl.

The data very clearly confirm the observed phenomenon. In 2019, the average ratio significantly decreased and was at the lowest level in the entire analyzed period. It was observed for as many as twenty-eight companies. In the rest of the enterprises, the ratio increased.

The observed phenomenon is also reflected in the WIGdiv index. It is an index based on stock prices of companies, dividend income and subscription rights. The data is shown in Figure 2.

Fig. 3: WIGdiv index in the period 2015-2020

Source: Thomson Reuters.

In the first quarter of 2020, the index decreased significantly. At the beginning of March 2020, it dropped to 654.22 points. It was the lowest level in the entire analyzed period. This decrease indicates a strong negative investors' sentiment on the expected reduction in dividends.

As indicated in the theoretical part of the article, one of the main factors determining the amount of dividend paid is the financial condition of enterprises. Therefore, another research problem was the financial condition of the analyzed companies. Table 3 shows the average ratios of profitability, financial liquidity and financial leverage.

Table 3: The financial condition of the analyzed companies in 2015-2019

Ratios	*Year*									
	2015	**2016**	**2017**	**2018**	**2019**				**2020**	
					Q1	**Q2**	**Q3**	**Q4**	**Q1**	**Q2**
ROE (w %)	19.0	20.5	19.4	1.2	3.2	4.3	4.3	4.8	1.3	2.4

Debt/Equity	0.3	0.3	0.3	0.4	0.6	0.7	0.6	0.6	0.7	0.7

Source: the authors, based on the Thomson Reuters database.

The results of the analysis indicate various trends in the volatility of each ratio. In 2015-2019, the companies generated a relatively high level of return on equity (ROE). A significant decrease was observed in the first quarter of 2020. It is important that as many as 10 companies generated a net loss in this period. However, special attention should be paid to the second quarter of 2020. It was a time when the initial effects of the pandemic were reflected in companies financial performance. In this period, a significant decrease in the average ROE ratio was noticed compared to the individual quarters of 2019 (including the quarter 2). However, the situation varied concerning individual companies. In seventeen enterprises, the ratio decreased compared to the second quarter of 2019. Five of them generated a negative value of the ratio, which means that these companies generated a net loss. In the rest of enterprises, the ratio increased or remained at the previous level.

Another step of the research was the analysis of financial liquidity. In every period the average current ratio was at the generally acceptable level (1.2 - 2.0). This also refers to the second quarter of 2020. However, it should be noted that in eleven companies the ratio was too low, which may signal emerging problems with financial liquidity. The situation is slightly different concerning the quick ratio. In the second quarter of 2020, its average value was at an acceptable level (1 or more). However, in as many as twenty companies this value was at a lower level. In fifteen companies, the ratio was below 0.8, which indicates a possible problems with financial liquidity.

The leverage ratios were also analyzed – debt to equity ratio, and assets to equity ratio. In the analyzed period, the average values of both ratios increased, which indicates the growing indebtedness of each company. The second quarter of 2020 is the period in which the highest ratio was also observed. In this period twelve companies generated the increase in the assets to equity ratio (compared to the end of 2019.). In the rest of the companies, the ratio decreased or remained unchanged.

The results of the analyzes indicate, that for some companies their current financial condition could be a factor influencing the dividend policy. Special attention should be paid to the second quarter of 2020. This is the period when the financial effects of the pandemic are already visible, but it is also the time when most companies made decisions on dividends payouts. Eleven out of twenty-two enterprises which reduced or froze dividend payments generated a decrease in the return on equity (ROE). The deterioration of profitability could therefore be an impulse to decide on dividend reduction and accumulate this capital in the enterprise. It is worth noting that five companies generated a net loss in this period, which significantly limited their ability to dividend payouts.

The dividend policy also depends on financial liquidity. Problems in this field may induce shareholders to reduce dividends. The funds accumulated in this way can be used to the repayment of liabilities or to create cash reserves in the event of problems with financial liquidity. This thesis is confirmed by a significant percentage of companies with a relatively low level of liquidity ratios. It was observed in the second quarter of 2020. The research indicates that in thirteen out of twenty-two companies that reduced the amount of dividend (or ceased the payouts), the quick ratio was below the acceptable level. The percentage (51.9%) was therefore significant. The observed phenomenon, similar to the previously indicated decrease in profitability, could be an impulse to reduce the dividends payouts.

The research also indicates that in the group of companies limiting the amount of dividend, ten of them (45.5%) generated an increase in the debt-to-equity ratio, and eight of them (36.4%) generated an increase in the assets to equity ratio. Thus, the increase in risk resulting from the increased level of financial leverage could be another impulse to reduce the amounts of dividends.

However, it should be emphasized that the financial condition is not the only factor determining a corporate dividend policy. This is confirmed by the results of the analysis. It was observed that the reduction of dividend payouts also took place in enterprises in good financial condition[2]. This group includes eleven companies that generated an increase in profitability. Quite a significant percentage were companies with acceptable levels of financial liquidity and financial leverage. It indicates a conservative dividend policy, which is fully justified given the significant economic risk caused by the SARS-CoV-2 pandemic.

Conclusions

Dividend policy is one of the key areas of corporate financial management. It determines the distribution of the profit into the part remaining in the enterprise and the part paid to shareholders. Decisions in this regard have a significant impact on the company's market value as well as its attractiveness for investors.

The research goal was to present the dividend policy of companies in the context of economic conditions related to the SARS-CoV-2 pandemic. The analysis indicates that the pandemic deteriorated the economic conditions of doing business. It was reflected in the financial performance of enterprises, including profitability, indebtedness and financial liquidity.

The economic situation also influenced the dividend policy of enterprises. A significant number of companies reduced the amounts of dividends or froze dividend payouts. These were both, companies whose financial performance had deteriorated, as well as entities in good financial condition. It indicates that enterprises pursued a conservative dividend policy, which is related to the economic uncertainty caused by the pandemic.

The analysis indicates a significant negative impact of the pandemic on the corporate dividend policy. It confirms that due to the pandemic, enterprises change the current dividend policy, which results in a decrease in the amounts of dividend payouts and dividend yield. This confirms the research hypothesis.

Abstract

The paper presents a comparative analysis of revitalization management models based on the European experiences and framework of the revitalization operator model in Poland, in particular in the Silesian Voivodeship. Four European countries (i.e. France, Germany, Great Britain and Poland) have been selected for the research where revitalization processes are conducted on a large scale. Strategic approach proposed by the first three countries were benchmarks for the Revitalization Operator Model framework in Poland. The analysis of revitalization management models was conducted in five areas (based on the Business Model Canvas, the New Age of Innovation and Balanced Scorecard conceptions): ownership, organizational, market, resource and financial.

Keywords: Revitalization, Revitalization Management Models, Revitalization Operator

Introduction

The process of deep restructuring of industry in Poland has caused considerable changes in revitalization processes. Restoring and giving new economic, spatial, ecological and social functions to the degraded areas became a challenge but encountered a number of problems: starting from the lack of necessary regulations through the lack of necessary technologies and financing and ending up with social resistance. Those problems have been partly overcome by introducing the Act on Revitalization (Ustawa o rewitalizacji, 2015) and through allocation of EU funds to revitalization and also by indicating in domestic strategic documents that revitalization activities are an important element of shaping the spatial governance. All of those factors have contributed to the increasing intensity of revitalization in Poland which could have been observed over the last few years. However, there is a necessity to apply effective revitalization management in order to accelerate and take more widespread, multi-sector and more integrated effort to take the degraded areas out from their crisis situation (Nijkamp et al., 2002; Vejre et al., 2012).

Revitalization management focused on post-industrial areas does not mean just finding a solution to the problem but rather creation of specific economic, market or social values (Acioly Jr., 2001). This requires innovation challenges, creation of value in a competitive, global economy and new methods and instruments concerning design and application of new or modified business models. The problem of developing a model of a revitalization operator, discussed in this paper, for the purpose of creating a broadly understood value with the use of innovation is relatively weakly represented in the Polish management literature and in academic and research projects and studies.

The purpose of this paper is to carry out a comparative analysis of revitalization management models and to present the assumptions for the Revitalization Operator Model proposed for application in Poland, in particular in the Silesian Voivodeship. The research methodology is based on structural and comparative analysis of revitalization

management models implemented in selected European countries in which revitalization processes have been taking place for several decades.

The comparative analysis covers five key areas: ownership, organization, market, resources and finances.

Business model and revitalization process – focus on value creation

The problem of business models has recently become very popular both among management theorists and practitioners. There are very diversified approaches and understanding of business modeling. However, the opinion that there is a necessity to create a common academic platform allowing a better and more effective study of business models is increasingly often expressed (Zott et al., 2010). Cognitive difficulties result from the fact of a multidimensional and interdisciplinary character of the business model which has been studied from different perspectives, in different scopes and levels of detail. Theoretical deliberations on business models are usually based on choice, activity and normative perspectives (Kalinowski and Vives, 2013; Afuah, 2004). Regardless of the approach, the category of value, its creation, transfer of ownership and recipients is always one of the elements of relevant perspective.

The research on business models has delivered many different definitions and concepts of business models (Zott et al., 2010; Chesbrough, 2010; Teece, 2010). The definitions and concepts which are crucial in the context of this study are those which apply to value creation and the importance of innovation in business modeling. A business model can be treated as a system of configurations of resources and actions focused on value creation. The architecture and configuration of such activities and resources and network of values, allowing to carry out such activities in cooperation with partners or clients, depends on the adopted business model (Boulton et al., 2000; Jelonek, 2015; Zott and Amit, 2010). Concepts of a business model focus mainly on its two major aspects. The first one answers the question: how is customer value created, and in particular which elements of the business model play the substantial role and how will that value be provided (Osterwalder and Pigneur, 2010; Prahalad and Krishnan, 2008; Zott and Amit, 2010). The second important aspect of a business model is seizing the value for the enterprise which is the source of its income (Brzóska, 2014; Zott and Amit, 2010).

The problem of revitalization is related to implementation of a various social, economic and ecological goals and values (Xian and Chen, 2015). The term "revitalization" has been used in various meanings depending on the discipline (architecture, social sciences, economics etc.). Revitalization is a process of "taking brownfields out of their critical condition, carried out in a complex way, through integrated activities for the benefit of the local community, space and economy, territorially concentrated and carried out by revitalization stakeholders on the basis of a commune revitalization program" (Ustawa o rewitalizacji, 2015). A broader scope of revitalization assumes "intervention activities the main purpose of which is to reverse unfavorable trends in problematic areas" (Lechman, 2007), and more specifically revitalization means „intentional and structural changes in spatial development as a reaction of various entities to degradation effects posing a threat to private and public interests" (Zuziak, 1998). Revitalization is also treated as a tool of stimulating sustainable development through planned, mutually integrated and complex activities of various entities in order to stop degeneration and create the conditions required for the growth while maintaining cultural, social and environmental quality.

Combining the problem of business modeling with revitalization processes is a challenge involving many different entities: local and regional authorities, investors and local communities. Creation of unique value and competitive advantage based on comprehensive management of revitalization process requires to a large extent a number of innovative solutions delivered by appropriate business model.

This paper presents an original concept of the Revitalization Operator Model, using the assumptions of the concept of the Business Model Canvas (Osterwalder and Pigneur, 2010), the New Age of Innovation (Prahalad and Krishnan, 2008) and Balanced Scorecard (Kaplan and Norton, 1992).

Research Methodology

Revitalization management processes implemented in various organizational configurations with the use of many sources of financing require development of new business models which take into account operators of those processes, business partners, public organizations (including local government entities) and academic entities. Business models based on extensive cooperation require working out key principles of functioning of revitalization operators. Examples of successful development and application of such models can already be found in Europe.

Therefore, based on these experiences, a comparison has been made of the European regions which undertook complex (operator-based) revitalization management of post-industrial areas.

Comparative analysis of revitalization management models was carried out based on the implemented and functioning models of restructuring degraded areas and restoring them to social and economic use. The analysis was performed in five areas of revitalization operators' functioning: ownership, organizational, market, resources and financial. Such a representation combines the Balanced Scorecard and the New Age of Innovation concept (Olko and Brzóska, 2017). It comprises elements of technical, social and informational architecture and prospects for development, processes and customer as well as financial prospects. Comparison of areas had been preceded with a short description of the main problems and values (in accordance with the Business Model Canvas) which are formed through the process of revitalization management.

The research covered three countries in which revitalization management processes are deemed to be exemplary, i.e. France, Germany, Great Britain. The identified managerial approaches constituted benchmarks for the proposal of revitalization model in Poland. The scope of the research included:

- in France – the Nord-Pas-de-Calais (NPdC) region, including in particular the Public Agency for Land Policy of the Nord-Pas de Calais (EPF-NPdC) Region;
- in Germany – the Ruhr region in North Rhine-Westphalia, including in particular NRW.URBAN GmbH & Co.KG as an entity managing the Real Property Fund;
- in Great Britain – National Coalfields Programme, including the National Regeneration Agency – English Partnerships (currently Homes and Communities Agency) and Land Restoration Trust;
- in Poland – the Revitalization Operator Model (national and regional level).

Results of comparative analysis of revitalization management models in selected European countries

Revitalization processes have been implemented in many European countries already for several years. These experiences are valuable sources of a broad knowledge about managerial implications and implementation of the operator-based system of revitalization as an effective practice for stopping degradation and restoring the economic and social value of post-industrial areas. The experience of France and Germany shows application of the operator-based revitalization management model on a regional level, whereas the experience of Great Britain is related to the implementation of the revitalization management operator on the national level.

Results of comparative analysis of the revitalization management models functioning in France, Germany and Great Britain are presented in Table 1.

Table 1: Comparative analysis of revitalization management models

France	Germany	United Kingdom
Object of revitalization		
• Post-industrial areas, previously used by coal mining, steelworks or textile industry, occupying 10 thousand hectares.	• Industrial territories dominated by the mining and steelwork industries; areas characterized by high unemployment.	• Over 23.5 thousand hectares of land included in the National Land Use Database of Previously Developed Land.
Values and goals		
• Ensuring a possibility of competitive development. • Environmental protection and management of natural resources. • Guaranteeing social cohesion and fairness.	• Complex social, economic and ecological activities. • Transformation of the most industrialized area in Europe into the region of business and culture while retaining its mining and steelwork identity.	• Creation of new jobs; • Improvement of life quality; • Adapting wastelands to the needs of a public space; • Improvement of the quality of environment.
Ownership area		
• Public Agency for Land Policy of the Nord-Pas de Calais Region (EPF-NPdC) as commercial regional industrial agency and operator of revitalization possess the title to the land and is in its possession.	• NRW.URBAN as the main trustee of cities purchases post-industrial areas and then carries out its reclamation process. After that it sells the area to the buyer (in compliance with the decision of local authorities).	• English Partnerships – the National Regeneration Agency was responsible for land acquisition. • Over 70% of all degraded areas were private.
Organizational area		

Regional operator • EPF-NPdC as an operator for local governments managed by the Director appointed by the Minister for Town Planning upon the request of the Regional Prefect after consulting the Board of Governors.	**Regional operator** • The Real Property Fund managed by NRW.URBAN as operator of the most effective model of development of post-industrial areas in Germany.	**National operator** • The Land Restoration Trust as revitalization operator responsible for long-term management of the areas. • Urban Regeneration Companies – private companies most usually incorporated as partnerships.
Market area		
• Clients include communes or commercial entities appointed by the communes.	• Local authorities, private investors – buyers of regenerated post-industrial areas and commune residents.	• Local authorities, local community of coalfields and land owners.
Resources area		
• Knowledge and competence in provision of specific services within the revitalization process. • Unique competences related to land diagnosis, acquisition and transformation methods, and optimization of land repurchase. • Broad cooperation with state, regional and local authorities, investors, academic units and clusters.	• Complementary use of knowledge and competence in wide range of specialist services (i.e. project management, preparation of development strategies, spatial planning). • Synergistic use of key operations: land purchase, revitalization, development, management and selling. • Broad cooperation with state, regional and local authorities and investors.	• Complementary use of knowledge and involvement of individual partners. • Close cooperation with local community and directing financing to the locations with greatest needs. • Systematic development of specific abilities, knowledge and innovative solutions. • Partnership and cooperation with key stakeholders of revitalization.
Financial area		
• Diversified financing of revitalization projects (i.e. special local tax, income from the sale of land and buildings, grants from the government and local authorities, EU Structural Funds and loans).	• Revitalization projects financed by Real Property Fund (mainly subsidized by the land and federal government); part of funds obtained from the sale of regenerated lands.	• Diversified financing of revitalization projects (i.e. funds from the state's central and EU budget, private investors, public programs, non-profit organizations and pension funds).

Source: Own elaboration based on (Ostręga, 2013; Skalski, 2009; Neill and Schlapp, 2016; BRINGUp Project, 2010; Bryx and Jadach-Sepioło ed., 2009; Guzik ed., 2009).

The European experience in revitalization management processes allowed to formulate main conclusions and recommendations for the Revitalization Operator Model in Poland. These findings point out:

- the importance of a systematized law and formal procedures of revitalization,
- the possibility to obtain a public status (public purpose) for the operations which are important for the development of a region or commune,
- the usefulness of the functioning in post-industrial areas of an institution (operator) responsible for complex revitalization management (carrying out revitalization processes or participating in them and bearing the consequences of such activities) on a national or regional level,
- that activity of such an operator might not have a competitive character and therefore it stays outside the reach of stringent European directives,
- the importance of complementary use of unique knowledge and competence in provision of specific outputs within the revitalization management process,
- diversified financing of revitalization projects,
- a partnership model, as a key organizational solution, which can be forced by the regulations on competition-based financing of revitalization – existence of a partnership is a prerequisite.

Framework of the Revitalization Operator Model in Poland

Revitalization in Poland, particularly in the Silesian Voivodeship, is a specific challenge due to the scale and complexity of that issue. It has been classified, apart from reindustrialization and metropolization, to the group of subjects forming an integrated policy for development of the Silesian Voivodeship. A large number of post-industrial areas requiring an urgent and economically reasonable and socially responsible revitalization is a particularly complex issue of that region. For many years a large part of this region has been dominated by the polluting industries, including, in particular, the mining and metallurgy (Szmal, 2013). The process of revitalization management of post-industrial areas in the Silesian Voivodeship is facing a large number of problems, including socioeconomic (e.g. complexity and scale of post-industrial areas, necessity to stop degradation and restore the economic and social value of post-industrial areas), formal and legal (e.g. lack of institutionalized, operator-based model of revitalization, diversified structure of brownfield owners and entities in their possession, inconsistency in the provisions of the Act on Revitalization, lack of procedures for revitalization and certification of restored post-industrial areas), organizational

(e.g. lack of consistent revitalization policy and action plans, lack of strategic roadmaps of integrated revitalization actions) and technological (e.g. insufficient and incomplete data on post-industrial areas, considerable variability of occurrence of heavy metal contamination in the brownfields, difficulties with the surface revitalization process) issues. It should be noted that these problems also constitute challenges related to region's potential (Knop and Krannich, 2017).

The identified problems, challenges and potential of the Silesian Voivodeship as well as the knowledge derived from revitalization management experience of other European countries allow to develop a proposal for the managerial implications which apply not only to one of the most degraded areas in Poland (i.e. the Silesian Voivodeship), but may also become the first, exemplary Revitalization Operator Model in Poland. Frameworks of this model, on the national and regional level, are presented in Figure 1 and Figure 2.
The proposal for the revitalization management model in Poland is characterized by the following features:

- Object of revitalization: approximately 7. thousand hectares of brownfields and post-industrial areas surveyed in the Silesian Voivodeship.
- Values and goals: providing an opportunity for competitive development of the region on the basis of sustainable development of economic, social and ecological values based on the concept of circular economy. The success of a revitalization operator depends on managing the strategic portfolio of complementary revitalization projects, scale and synergy effect and dynamic development and innovations.
- Ownership area: over 36% of brownfields in the Silesian Voivodeship is in possession of enterprises (mostly state-owned), over 26% belongs to communes and districts. In the case of more than 25% of areas their possessor could not been recorded in the inventory. Most of the areas in possession of enterprises belongs to coal companies. At the moment no revitalization operator has been established.
- Organizational area: the proposed management model assumes establishment of a regional operator with a substantial support on the governmental level (combination of regional and national operators – example of France and UK). It is suggested to appoint a Government's Representative for Revitalization (based on British experiences). On the regional level a Regional Revitalization Council (as an Organizer – based on French and German models) would be established, assembling regional authorities, owners of brownfields and Government's Representative. The organizer initiates the steps leading to the transfer (by way of brownfield acquisition or a trust deed for brownfields as well as sale or handing over of revitalized areas) of land and supports financing of the project. The Operator performs, in the operator-based system, operating functions, including planning and implementation of revitalization project packages (in accordance with the algorithm of standard revitalization procedures), updates brownfield databases, cooperates with investors and supporting entities. On the national level a Team for Brownfields was established in 2016 year and further supporting entities might be established (suggested as an optional solution): National Social Committee for Revitalization, Inter-ministerial Committee for Revitalization and National Revitalization Fund. On the regional level a network would be established of cooperation between R&D and certification bodies, cooperation between the Operator and Regional Directorate for Environmental Protection and Voivodeship Inspectorate for Environmental Protection and, optionally, establishment of a Regional Social Committee for Revitalization.
- Market area: Beneficiaries of revitalization include: local authorities of the communes in which post-industrial areas were situated (during the entire process of revitalization communes cooperate closely with one another) and private investors – purchasers of reclaimed real property and commune residents. Developing the projects which combine the values of many stakeholders seem to be of key importance. Synergic and complementary actions are crucial to produce suitable economic, ecological and social effects.
- Resources area: according to the proposed model the Regional Operator might be established on the basis of an existing company (majority owned by the state) which runs its business in the area of waste-processing in hard coal mines. It continuously leads to minimizing the quantity of generated waste both by way of looking for innovative ways of its management and through continued use of existing technologies. Existed experience and competence, gained also in cooperation, allow to efficiently implement the Revitalization Operator Model in the Silesian Voivodeship.
- The scope of financing of the Revitalization Operator Model assumes that:
  - internal sources of financing include the funds gained by the Operator during its functioning, mainly from implementation of revitalization projects,
  - external sources of financing include borrowed capital (aid funds, loans, leasing) and shareholders' equity obtained through issuance of bonds,
  - effective use of EU funds and funds from R&D sources.

More details related to the structure and explicit assumptions of the Revitalization Operator Model in Poland can be found in (Strategia, 2017).

Figure 1. The Revitalization Operator Model – national level (own elaboration)

Figure 2. The Revitalization Operator Model – regional level (own elaboration)

Conclusion

Revitalization management processes have already been implemented in many European countries for several years. These experiences constitute sources of a broad knowledge about solutions and implementation of the operator-based system of revitalization management as an effective practice for stopping degradation and restoring the economic and social value of post-industrial areas. The experience of France and Germany shows application of the operator-based revitalization management model on a regional level, whereas the experience of Great Britain is related to implementation of the revitalization management operator on the national level. The presented revitalization management models established in France, Germany and Great Britain are deemed to be an exemplary models of involvement and effective alignment of public and private interests based on civil society, community awareness and trust. In the case of Poland the Revitalization Operator Model is proposed especially at regional level, but with substantial support and monitoring on the national level.

The proposed Revitalization Operator Model is under consultation on the regional and national level. Undertaking revitalization measures is intended to be strongly connected with management of stakeholders' values and complex project management, because the scope of actions necessary for the effective revitalization management can be seriously different in the case of every type of brownfield.

Project management constitutes for a Revitalization Operator the crucial element of business model implementation which allows to establish market relations and gain competitive advantage combined with the quality of performance. The projects realized by the Revitalization Operator should be classified into groups and managed on portfolio basis in a coordinated way in order to gain optimal benefits. For that reason the priority tasks of the Revitalization Operator should include determination of the directions of required actions, including indication of complex activities involving a synergic revitalization management of various types of land.

Abstract

This paper presents the results of an analysis of selected issues related to organizational impression management in the context of sustainability reporting. The research was based on eight case studies of sustainability reports from the energy sector companies and, in particular, it concerned issues related to greenhouse gas emissions and circular economy (GHG and CE issues). The analysis focused on the disclosures which refer directly to GHG and CE issues in the statements from senior decision-makers. These statements were confronted with the occurrence of GHG and CE issues in the list of material topics, the scope of information and indicators related to GHG and CE issues, the accuracy of information related to GHG and CE issues, as well as the clarity and comparability of relevant information.

Keywords: sustainability reporting, impression management, energy sector, case study

Introduction

Impression management is an important organizational phenomenon because it has broad implications for individuals and organizations (Bolino et al. 2008). Gardner and Martinko (1988) defined organizational impression management as a process through which organizational members create and maintain desired impressions. Therefore, organizational impression management refers to behavior that organizations use to actively shape the impressions that others hold of them (Sandberg and Holmlund, 2015). Based on comprehensive organizational taxonomy, Bolino at al. (2016) identified the following impression management behaviors: (1) Ingratiation, self-promotion, exemplification, intimidation, supplication, (2) Tactical-assertive tactics, tactical-defensive tactics, strategic-assertive tactics, strategic-defensive tactics, and (3) Supervisor-focused tactics, self-focused tactics, and job-focused tactics.

Various impression management strategies have been identified in the literature. For example, according to taxonomy proposed by Merkl-Davies and Brennan (2007), seven main impression management strategies are used in corporate narrative documents (i.e. annual reports). Six strategies are used for concealment. Two of these obfuscate bad news by manipulating verbal information either by (1) reading ease manipulation (e.g. making text more difficult to read) or (2) rhetorical manipulation (e.g. using persuasive language). Four strategies emphasize good news by manipulating verbal and/or numerical information: (3) thematic manipulation (e.g. emphasizing positive words and themes, or emphasizing positive financial performance), (4) visual and structural effects (e.g. manipulation involves the way in which verbal/numerical information is presented), (5) performance comparisons (e.g. choosing benchmarks that portray current financial performance in the best possible light), and (6) choice of earnings number (e.g. selecting one of a number of earnings amounts for disclosure to favorably portray current financial performance). The seventh impression management strategy in this taxonomy is the attribution of organizational outcomes.

There is also the notion of organizational impression management tactics defined as different ways in which companies can use impression management, that is, specific types of behavior designed to create a desired image. (Bolino et al., 2008). According to Sandberg and Holmlund (2015) impression management tactics aim to shape the

Cite this Article as: Agnieszka JANIK, Adam RYSZKO and Marek SZAFRANIEC "Sustainability Reporting and Organizational Impression Management – An Analysis of Selected Issues Based on Case Studies from the Energy Sector Companies" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

impressions that stakeholders hold or tactics that more neutrally inform stakeholders about corporate actions. Therefore, companies need to make a choice between the two, considering expectations of stakeholders regarding sustainability reporting (Sandberg and Holmlund, 2015). Mohamed et al. (1999) developed a taxonomy of organizational impression management tactics and suggested the following categorization: direct tactics (i.e. discussing the company itself) or indirect tactics (i.e. discussing third parties to which the company is associated) and assertive tactics (i.e. the company actively trying to change its image) or defensive tactics (i.e. used by the company to respond to a threat to its image).

Sandberg and Holmlund (2015) identified eight organizational impression management tactics used in sustainability reporting. These tactics embrace two groups: (1) describing how companies present specific actions, and (2) characterizing the writing styles that companies use. Presenting actions include: (1) description (i.e. giving information about company's actions, (2) praise (i.e. presenting company's actions in a way that is overly favorable, (3) admission (i.e. admitting to instances that do not support the favorable impression company attempts to convey, and (4) defense (i.e. attempting to justify instances that do not support the favorable impression company attempts to convey). Writing styles comprise: (1) subjective style (i.e. discussing matters only from company's own point of view, the account being colored by company's opinions and/or one-sided arguments in one's favor), (2) positive style (i.e. overly emphasizing favorable aspects over unfavorable aspects, thus giving an unbalanced account of events), (3) vague style (i.e. giving unspecific information that gives no clear account of events, and (4) emotional style (i.e. making the text personal and feeling-evoking).

Moreover, Hooghiemstra (2000) analyzed sustainability disclosure of the Shell company and indicated two distinctive tactics: acclaiming (i.e. presenting a favorable event in a manner that maximizes positive impacts on the company) and accounting (i.e. presenting an unfavorable event in a manner that minimizes negative impacts on the company). Based on the study of environmental reporting practices Bansal and Kistruck (2006) distinguished two characteristic tactics: demonstrative (i.e. a company gives detailed explanations of its operations by providing extensive information, quantitative data, examples and graphs), and illustrative (i.e. a company gives verbal and pictorial images that are simple and lack detail). In order to investigate persuasion in social/environmental reports, Higgins and Walker (2012) adopted the classic focus on Aristotle's rhetorical 'proofs' (strategies): *ethos* (i.e. credibility described by similitude, ingratiation, deference, expertise, self-criticism, inclination to succeed, and consistency), *logos* (i.e. reason characterized by argumentation, logic, warrants/justifications, claims, data, and evidence/examples), and *pathos* (i.e. emotion – metaphors and identification).

Talbot and Boiral (2018) observed three interdependent and non-exclusive issues affecting the credibility and transparency of corporate environmental statements, i.e. (1) disclosure of non-compliant information, (2) legitimation of negative aspects through neutralization techniques, and (3) obfuscation of negative aspects and enhancement of positive aspects. Disclosure of non-compliant information include: (1a) uncertainties concerning measurement methods and emission calculations, (1b) incomplete or unrepresentative information on performance indicators, and (1c) lack of information. Legitimation of negative aspects through neutralization techniques comprises: (2a) minimizing the impact of non-measured emissions and (2b) excuses and future commitments. Obfuscation of negative aspects and enhancement of positive aspects embrace: (3a) strategic omission and (3b) manipulation of numbers. The same authors identified six main tactics that industrial emitters use to rationalize their impacts: self-proclaimed excellence, promotion of a systemic view, denial and minimization, denouncing unfair treatment and deceptive appearances, economic and technological blackmail, and blaming others. It should be noted that these solutions might be applied simultaneously to better influence the perceptions of stakeholders and to justify negative impacts (Talbot and Boiral, 2015).

Merkl-Davies and Brennan (2007) argue that corporate reporting can be viewed in two different ways, either as the company giving incremental information to support stakeholders' decision-making or as organizational impression management and opportunistic behavior designed to benefit the company. It must be noted that GRI Standard emphasizes the role of sustainability reporting in giving incremental information to stakeholders. However, some researchers (Onkila, 2009; Sandberg and Holmlund, 2015; Talbot and Boiral, 2015; Talbot and Boiral, 2018) criticize that sustainability reporting is used to manipulate stakeholders and create favorable impressions of companies' operations that may not accurately reflect reality.

Although the importance of the manner in which information is presented and disclosed in sustainability reports is more and more emphasized, there is still the scarcity of the research exploring the organizational impression management concept to analyze this issue. Therefore, there is the need to further understand and explore the manner in which impression management is used in sustainability reporting. This also concerns current research on the greenhouse gases (GHG) emissions and circular economy (CE) issues reporting which is still insufficient. Moreover, the GHG and CE issues are crucial areas to achieve climate neutrality in the EU by 2050.

Therefore, the aim of this paper was to analyze selected issues related to organizational impression management in the context of sustainability reporting. The research was based on eight case studies of sustainability reports from the energy sector companies and, in particular, it concerned issues and specific organizational impression management tactics related to greenhouse gas emissions and circular economy (GHG and CE issues). The analysis focused on the disclosures which referred directly to GHG and CE issues in the statements from senior decision-makers. These statements were confronted with the occurrence of GHG and CE issues in the list of material topics, the scope of information and indicators related to GHG and CE issues, as well as the accuracy and comparability of information related to GHG and CE issues.

Materials and Methods

In order to determine whether and to what extent companies use organizational impression management tactics in sustainability reports it was decided to indicate disclosures which refer directly to GHG and CE issues in the statements from senior decision-maker. Then, it was to confront with the occurrence of GHG and CE issues in the list of material topics, the scope of information related to GHG and CE issues, as well as the accuracy and comparability of information related to GHG and CE issues. The analysis was carried out using selected case studies (Knop and Olko, 2018) based on the sustainability reports published by companies representing the energy sector in the European Union. The GHG and CE issues were selected because these areas are crucial to achieve climate neutrality in the EU by 2050. The energy sector, in turn, was analyzed due to the fact that this sector generates the most GHG of all sectors (European Commission, 2018; Jonek-Kowalska, 2019).

It was assumed that the research sample will consist of the reports that are: prepared by companies from the energy sector whose headquarters are located in the EU countries; prepared based on the up to date GRI Standards guidelines; available in an English version; and available in PDF format or online version on the company's website or on websites where information on sustainability reports is collected. Moreover, it was decided that two databases (i.e. GRI's Sustainability Disclosure Database (SDD) and Corporate Register (CR)) would be used to achieve a suitable sample of sustainability reports. Due to the fact that GRI guidelines published in 2016 became effective for reports published on or after 1 July 2018, it was decided that only reports published after that date would be selected for analysis. In addition, it was assumed that the latest report disclosed by companies during this period would be considered for further investigation.

The selection of the research sample took place in January 2020. The exploration of the GRI SDD resulted in identification of 260 organizations representing the energy sector or energy utilities sector that have published at least one sustainability report. The examination of CR database made it possible to achieve 152 companies from the electricity sector. To remove duplicated organizations from the research sample data from the SDD and CR databases were combined. Consequently, the research sample was limited to 326 organizations. Taking into account availability of reports in an English version and in PDF format or online version on the company's website as well as elaboration of reports based on the GRI guidelines published in 2016, it was determined that 61 organizations from the energy sector in the EU publishing sustainability reports could be included in the final research sample. Next, the latest available sustainability report was found for each organization from the research sample. The collection of reports took place between February and April 2020. As a result, 61 reports were collected (Janik et al., 2020). After initial content analysis of these disclosures, 8 sustainability reports were found to include both GHG and CE issues directly mentioned in the statements from senior decision-maker. The identified reports were prepared by the following companies: ENI SpA, A2A SpA, ENEL SpA, Hera Group, Iren SpA from Italy, Naturgy Energy Group and REPSOL Group from Spain as well as ALTEO Group representing Hungary.

In the next step, the qualitative content analysis of each of the identified reports was carried out (Mayring, 2000; Guthrie and Abeysekera, 2006). This approach makes it possible to assess what is disclosed and how it is done by analyzing the content using and scoring specific criteria (Helfaya and Whittington, 2019). In this study, to determine scope and specificity of organizational impression management tactics qualitative content analysis was focused on the selected general and topic-specific disclosures included in GRI Standards identified as potentially related to GHG and CE issues. The following issues were analyzed:

- The direct reference to GHG and CE issues in the statement from senior decision-maker.
- The occurrence of GHG and CE issues in the list of material topics.
- The scope of information related to GHG issues, determined by inclusion of indicators concerning direct GHG emissions (Disclosure 305-1), energy indirect GHG emissions (Disclosure 305-2), other indirect GHG emissions (Disclosure 305-3), GHG emissions intensity (Disclosure 305-4), and reduction of GHG emissions (Disclosure 305-5).

- The scope of information related to CE issues, defined by indicators concerning materials used by weight or volume (Disclosure 301-1), recycled input materials used (Disclosure 301-2), energy consumption within the organization (Disclosure 302-1), energy consumption outside of the organization (Disclosure 302-2), energy intensity (Disclosure 302-3), reduction of energy consumption (Disclosure 302-4), and waste by type and disposal method (Disclosure 306-2).
- The accuracy of information related to GHG issues, based on description of the specific methods used to gather, compile, and analyze information related to disclosures on emissions (Disclosure 305-1, 305-2, 305-3, 305-4 and 305-5).
- The accuracy of information related to CE issues, based on description of the methods used to gather, compile, and analyze information related to disclosures on materials (Disclosure 301-1 and 301-1), energy (Disclosure 302-1, 302-2, 302-3 and 302-4) and waste (Disclosure 306-2).
- Comparability of relevant information, based on the assessment of the consistency of reported information and presentation of this information in a manner that empowers stakeholders to analyze changes over time, analytical comparisons on a year-to-year basis, including total numbers as well as ratios (e.g., normalized data per unit of production), and supporting analyses relative to other organizations.

In order to identify specific organizational impression management tactics the taxonomies proposed by Bansal and Kistruck (2006), Mohamed et al. (1999), and (Talbot and Boiral, 2015) were applied.

Results and Discussion

The analysis of the information reported by all analyzed companies begins with a description of main parameters of their activity, including: the area of activity, the type of business activity, the type of sustainability reporting, external assurance and the report option. Next, the manner in which GHG and CE issues are taken into consideration in the statement from senior decision-makers and material topics as well as information on quality of reporting GHG and CE issues (i.e. scope, accuracy and comparability) are presented. Moreover, the specific impression management tactics are determined for each analyzed company.

Case study of ENI SpA

ENI SpA is an Italian multinational company headquartered in Rome operating internationally with a diversified business activity including the energy sector. The company has prepared stand-alone sustainability report that was externally assured and is prepared according to GRI Core option. The statement made by a senior decision maker included a direct reference to the GHG and CE issues. The management board of ENI SpA was aware of the need for continuous improvement and transformation of the organization in the context of GHG and CE issues, with such phrases as *climate change*, *decarbonized energy product* and *circular economy* directly stated in the report. The company's authorities had the ambition to become a leader in supplying *the decarbonized energy product*. These declarations were reflected in the determined material topics. Among the identified material topics there was one which is directly related to GHG issues: *Climate change and energy efficiency* and one directly related to CE issues: *Circular economy*. All indicators pertaining to GHG-related issues were very well documented, and the range of indicators for CE was quite modest. However, the analyzed organization reported only a few of them in the partial scope. The methodology of calculation of indicators was described partially, but only with regard to GHG issues. The organization reported the amount of its carbon footprint and provided information about the methodology used to calculate it. The values for the last three years were reported and some of them were related to the production volume, which allowed to compare the results with other organizations. Considering identification of specific impression management solutions, the analysis revealed that ENI SpA used, in particular, assertive as well as demonstrative or illustrative tactics. In addition, the company focused on self-proclaimed excellence and promotion of a systemic view. Table 1 provides a synthetic overview of the results achieved for ENI SpA.

Table 1: A synthetic overview of the reported GHG and CE issues and specific organizational impression management tactics applied by ENI SpA

Specific statements from senior decision-maker	Occurrence in material topics	Scope of information	Accuracy of information	Comparability of information	Impression management tactics
GHG Issues					
"The commitments we have made to continue our transformation process (…) remain intact, as our determination to fight climate change and our efforts towards a just energy transition (…) we want to be leaders in supplying decarbonized energy products, by combining economic and environmental sustainability."	GHG issues mentioned directly	Indicators compliant with the disclosure requirements: 305-1; 305-2; 305-3; 305-4; 305-5	Methods partially described	Indicators enable determination of the trend of changes in ratios on a year-to-year basis	Assertive tactic Demonstrative tactic Self-proclaimed excellence Promotion of a systemic view
CE Issues					
"We often talk about long-term vision, circular economy, about the need to find a new development model fit for human beings."	CE issues mentioned directly	Indicators partially compliant with the disclosure requirements: 302-1; 302-3; 302-4; 306-2 Lack of specific indicators: 301-1; 301-2; 302-2; 306-4	Methods not described	Indicators include total and absolute numbers at least per two years or ratio per one year	Assertive tactic Illustrative tactic Self-proclaimed excellence Promotion of a systemic view

Case study of A2A SpA

A2A SpA is an Italian company that has significant presence in Italy and Greece with a diversified business activity, including the energy sector. The company prepared an integrated report that had been externally assured and prepared according to the GRI Core option. The statement made by a senior decision maker included a direct reference to the GHG and CE issues. In the context of GHG-related issues, the management board of A2A SpA used such phrases as *climate change* and *reduction of CO_2 emissions* and in the CE context – *360° circular economy*. These declarations were reflected in the determined material topics. Among the identified material topics there was one directly related to GHG issues: *Fight against climate change and containment of atmospheric emissions* and one related to CE issues: *Circular economy and responsible use of resources*. The organization reported almost all indicators related to GHG and CE issue, including the carbon footprint. Only one group was missing: 301-2. The values of some indicators are difficult to determine and are deeply rooted in the content. The methodology of calculation of indicator values was provided in a very general way and there was a lack of precise information in this respect. Some information was provided in the form of footnotes. The values of indicators were provided for the last three years and many of them were related to the production volume. Their comparability to other organizations had a high potential with regards to GHG issues and an average potential for CE issues. Taking into account specific impression management solutions, the analysis showed that A2A SpA applied assertive and demonstrative tactics. Moreover, the promotion of a systemic view was emphasized in relation to GHG and CE issues and self-proclaimed excellence with regard to GHG issues. Table 2 provides a synthetic overview of the results achieved for A2A SpA.

Table 2: A synthetic overview of the reported GHG and CE issues and specific organizational impression management tactics applied by A2A SpA

Specific statements from senior decision-maker	Occurrence in material topics	Scope of information	Accuracy of information	Comparability of information	Impression management tactics
GHG Issues					
"Renewable sources, district heating and energy efficiency for the fight against climate change: (…) In 2018, we reduced CO_2 emissions per kilowatt hour produced by 10% compared to 2017."	GHG issues mentioned directly	Indicators compliant with the disclosure requirements: 305-1; 305-2; 305-3; 305-4 Indicators partially compliant with the disclosure requirements: 305-5	Methods partially described	Indicators enable determination of the trend of changes in ratios on a year-to-year basis	Assertive tactic Demonstrative tactic Promotion of a systemic view
CE Issues					
"360° circular economy – more resources with less resources: We maximize the recovery of material and energy from waste, in full compliance with the objectives of the European Union."	CE issues mentioned directly	Indicators compliant with the disclosure requirements: 301-1; 302-1; 302-2; 302-3; 306-2; 306-4 Indicators partially compliant with the disclosure requirements: 302-4 Lack of specific indicators: 301-2	Methods partially described	Indicators include total and absolute numbers at least per two years or ratio per one year	Assertive tactic Demonstrative tactic Self-proclaimed excellence Promotion of a systemic view

Case study of ENEL SpA

ENEL SpA is an Italian multinational company headquartered in Rome operating internationally in the energy sector. The company published a stand-alone sustainability report that had been externally assured and is prepared according to the GRI Core option. The statement made by a senior decision maker included a reference to GHG and CE issues. In the context of GHG issues, the management board of ENEL SpA used the following phrases: *specific CO_2 emissions*; *climate change*; *circular development* and *circular economy* directly in the report. The company's authorities showed their burning ambition declaring that the issue in which: *Enel wants to play a leading role is undoubtedly the fight against climate change*. These declarations were reflected in the established material topics. Among the determined material topics there was one directly referring to GHG issues: *Decarbonization of the energy mix*. There was also one indirect reference to a CE issue, namely *Environmental compliance and management*. The GHG indicators were very well documented, in terms of CE the range of indicators is smaller – several of which were not featured in the report at all, while several others were not covered in full. The methodology for calculating indicators was partially described for both GHG and CE issues and was included in the description of the general reporting methodology. Only a part of the indicators were related to production volumes and their values were almost always provided for the last three years. Considering specific impression management solutions, the analysis revealed that ENEL SpA used, in particular, assertive as well as illustrative or demonstrative tactics. In addition, the analyzed company focused mostly promotion of a systemic view. Table 3 provides a synthetic overview of the results achieved for ENEL SpA.

Table 3. A synthetic overview of the reported GHG and CE issues and specific organizational impression management tactics applied by ENEL SpA

Specific statements from senior decision-maker	Occurrence in material topics	Scope of information	Accuracy of information	Comparability of information	Impression management tactics
GHG Issues					
"A commitment that Enel has strengthened and expanded, revitalising the targets for reducing specific CO_2 emissions (…). An issue of primary importance in which Enel wants to play a leading role is undoubtedly the fight against climate change."	GHG issues mentioned directly	Indicators compliant with the disclosure requirements: 305-1; 305-2; 305-3; 305-4 Indicators partially compliant with the disclosure requirements: 305-5	Methods partially described	Indicators include total and absolute numbers at least per two years or ratio per one year	Assertive tactic Demonstrative tactic Promotion of a systemic view

Case study of Hera Group

Hera Group is a multiutility company based in Bologna (Italy) operating on the domestic market with a diversified business activity, including the energy sector. The company prepared stand-alone sustainability report that had been externally assured and prepared according to the GRI Related option. The statement made by a senior decision maker included a reference to GHG and CE issues. In the context of GHG issues, the management board of the Hera Group used the following phrases: *impact on the climate*; *circular economy* and *circularity* directly in the report. These declarations were reflected in the determined material topics. Among the identified material topics there was one directly referring to GHG issues: *Reduction of greenhouse gas emissions (climate change)* and one directly related to CE issues: *Transition towards a circular economy* and one indirectly related to CE issues: *Promotion of energy efficiency and spreading renewable energy*. The description of the latter also mentioned issues characteristic for the circular economy concept. The GHG indicators were very well documented, the range of reported indicators in the CE area is smaller, while some of them were not covered in the report at all. The methodology of calculation of indicators was very well described for GHG and partially described for CE issues. Indicator values were often related to production volumes, and sometimes even were compared to the values found in the Eurostat database. Their values were almost always provided for the last three years. The analysis revealed that Hera Group applied assertive as well as illustrative or demonstrative impression management tactics. The company was also focused on promotion of a systemic view (GHG and CE issues), and self-proclaimed excellence (CE issues). Table 4 provides a synthetic overview of the results achieved for Hera Group.

Table 4. A synthetic overview of the reported GHG and CE issues and specific organizational impression management tactics applied by Hera Group

Specific statements from senior decision-maker	Occurrence in material topics	Scope of information	Accuracy of information	Comparability of information	Impression management tactics
GHG Issues					
"Decarbonisation has become a signature part of our commercial offer (…) we are committed to reducing our impact on the climate by acquiring renewable electricity for all the Group's main companies."	GHG issues mentioned directly	Indicators compliant with the disclosure requirements: 305-1; 305-2; 305-3; 305-4 Indicators partially compliant with the disclosure requirements: 305-5	Full description of relevant methods	Indicators enable determination of the trend of changes in ratios on a year-to-year basis	Assertive tactic Demonstrative tactic Promotion of a systemic view
CE Issues					
"Hera is almost 20 years ahead of the EU's circular economy goal and ranks at the same level as the most advanced European countries. (...) important initiatives intended to improve the "circularity" of our operating activities were introduced in 2019.	CE issues mentioned directly	Indicators compliant with the disclosure requirements: 302-1; 302-3; 302-4; 306-2 Lack of specific indicators: 301-1; 301-2; 302-2; 306-4	Methods partially described	Indicators enable determination of the trend of changes in ratios on a year-to-year basis	Assertive tactic Illustrative tactic Self-proclaimed excellence Promotion of a systemic view

Case study of Iren SpA

Iren SpA is an Italian company operating on the domestic market with a diversified business activity, including the energy sector. The company disclosed a stand-alone sustainability report that had been externally assured and prepared according to the GRI Comprehensive option. The statement made by a senior decision maker included a reference to GHG and CE issues. In the context of GHG issues, the management board of Iren SpA used the following phrases: *climate-changing emissions* and *circular economy* directly in the main text. These declarations were reflected in the determined material topics. Among the identified material topics there was one which indirectly refers to GHG issues: *Emission*. Three topics referred to CE issues, including one making a direct reference: *Circular economy: management, separated waste collection and reuse of waste* and two making indirect

references: *Sustainable use of water resources* and *Use of energy resources (produced from renewable and non-renewable sources)*. The indicators were very well described with regard to GHG issues. In case of CE issues, the reported indicators were smaller in scope and two of the indicators were absent. However, there was information that these indicators were not related to the organization's activities. The methodology of calculation of indicators was clear and very well described both before each presented section of indicators and in footnotes. Their values were provided for the last three years with few exceptions, and some of them were related to the production volume. Considering specific impression management solutions, the analysis revealed that Iren SpA applied assertive as well as demonstrative or illustrative tactics. Moreover, the self-proclaimed excellence and promotion of a systemic view were emphasized. Table 5 provides a synthetic overview of the results achieved for Iren SpA.

Table 5. A synthetic overview of the reported GHG and CE issues and specific organizational impression management tactics applied by Iren SpA

Specific statements from senior decision-maker	Occurrence in material topics	Scope of information	Accuracy of information	Comparability of information	Impression management tactics
GHG Issues					
"The reduction of climate-changing emissions saw us involved in many initiatives in 2018." Case study of Naturgy Energy Group

Naturgy Energy Group is a Spanish multinational company with administrative headquarter in Barcelona (while legally registered in Madrid) operating internationally with a diversified business activity, including the energy sector. The company prepared a stand-alone sustainability report that had been externally assured and prepared according to the GRI Comprehensive option. The statement made by a senior decision maker included a reference to GHG and CE issues. In the context of GHG issues, the management board of Naturgy Energy Group used the following phrases: *fight against climate change*; *emissions of greenhouse gases* and *circular economy* directly in the report. These declarations were reflected in the determined material topics. Among the identified material topics there was one which directly refers to GHG issues: *Emissions and climate change* and one referring indirectly to CE issues: *Energy efficiency and energy consumption*, the description of which included typical CE issues. The GHG indicators were very well documented. In terms of CE, the indicators described had a smaller range and the values of two indicators were not provided at all. However, the report lacks the description of the methodology of their calculation. The values of the indicators were provided for the last three years in most cases. Some of them were also related to the production volume, but often, these values were only provide for the past year. The analysis showed that Naturgy Energy Group used assertive as well as demonstrative or illustrative tactics. This company mainly focused on promotion of a systemic view. Table 6 provides a synthetic overview of the results achieved for Naturgy Energy Group.

Table 6. A synthetic overview of the reported GHG and CE issues and specific organizational impression management tactics applied by Naturgy Energy Group

Specific statements from senior decision-maker	Occurrence in material topics	Scope of information	Accuracy of information	Comparability of information	Impression management tactics
GHG Issues					
"Within the context of the fight against climate change and technological transformation, our Strategic Plan is focused on renewable energies and natural gas (…). Emissions of greenhouse gases were reduced by about 11%."	GHG issues mentioned directly	Indicators compliant with the disclosure requirements: 305-1; 305-2; 305-3; 305-4; 305-5	Methods not described	Indicators include total and absolute numbers at least per two years or ratio per one year	Assertive tactic Demonstrative tactic Promotion of a systemic view
CE Issues					
"Naturgy has continued to introduce measures in 2018, which have enabled the business to reduce its externalities in the three company-defined strategic axes: climate and air quality, circular economy and natural capital and biodiversity."	CE issues mentioned indirectly	Indicators compliant with the disclosure requirements: 302-1; 302-3 302-4 Indicators partially compliant with the disclosure requirements: 301-1; 302-2; 306-2 Lack of specific indicators: 301-2; 306-4	Methods not described	Indicators include total and absolute numbers at least per two years or ratio per one year	Assertive tactic Illustrative tactic Promotion of a systemic view

Case study of REPSOL Group

REPSOL Group is a Spanish company based in Madrid operating internationally with a diversified business activity, including the energy sector. The company disclosed integrated report comprising sustainability issues that had been externally assured and prepared according to the GRI Comprehensive option. The statement made by a senior decision maker included a reference to GHG and CE issues. In the context of GHG issues, the management board of the REPSOL Group used the following phrases: *climate solutions to achieve net zero emissions* and *circular economy*. These declarations were reflected in the determined material topics. Among the identified material topics there were three which directly refered to GHG issues: *GHG emissions and strategies for the energy transition*; *Future technologies for mitigating climate change* and *Energy and climate policies and regulation* as well as one directly referring to CE issues: *Circular economy and waste management*. The indicators in the GHG range were very well documented, while the indicators related to CE were documented in a narrower scope and the values of two of them were not provided at all. The calculation methodology of their values was partially described. The calculation methodology for indicators from the disclosure group GRI301 was absent. The values of the indicators were provided for the last three years in most cases. A part of them was also referred to the production volume. Considering specific impression management solutions, it was revealed that REPSOL Group applied assertive as well as demonstrative or illustrative tactics. Moreover, the emphasis was placed on the promotion of a systemic view. Table 7 provides a synthetic overview of the results achieved for REPSOL Group.

Table 7. A synthetic overview of the reported GHG and CE issues and specific organizational impression management tactics applied by REPSOL Group

Specific statements from senior decision-maker	Occurrence in material topics	Scope of information	Accuracy of information	Comparability of information	Impression management tactics
GHG Issues					
"With the technological advances of today, we envisage that we can achieve, at least, a 70% net emissions reduction by 2050, and we are committed to applying the best technologies to raise this figure (…). If this should prove not to be enough, we shall offset emissions through reforestation and other natural climate solutions to achieve net zero emissions by 2050."	GHG issues mentioned directly	Indicators compliant with the disclosure requirements: 305-1; 305-2; 305-3; 305-4; 305-5	Methods partially described	Indicators include total and absolute numbers at least per two years or ratio per one year	Assertive tactic Demonstrative tactic Promotion of a systemic view

Case study of ALTEO Group

ALTEO Group is an Hungarian company operating internationally with a diversified business activity, including the energy sector. The company prepared integrated report comprising sustainability issues that had been externally assured and prepared according to the GRI Core option. The statement made by a senior decision maker included a reference to GHG and CE issues. In the context of GHG issues, the management board of the ALTEO Group used the following phrases: *Energy and climate goals* and *Circular Economy Platform*. These declarations were reflected in the determined material topics, but were only indirectly covered within them, among which are: *environmental effects of products and services*; *environmental compliance* and *energy consumption*. The report contained only a few indicators relating to GHG and CE issues, with only three of them being documented in full. As many as eight groups of indicators were absent from the report. There were differences in the description of the methodology for calculating their values. In case of GHG issues the report featured full descriptions of relevant methods, while for CE issues only partial ones. The values of the indicators were provided for the last four years. A part of them was referred to the production volume. Considering specific impression management solutions, the analysis revealed that ALTEO Group applied assertive and illustrative tactics. In addition, the promotion of a systemic view was emphasized in relation to GHG and CE issues and self-proclaimed excellence was demonstrated considering GHG issues. Table 8 provides a synthetic overview of the results achieved for ALTEO Group.

Table 8. A synthetic overview of the reported GHG and CE issues and specific organizational impression management tactics applied by ALTEO Group

Specific statements from senior decision-maker	Occurrence in material topics	Scope of information	Accuracy of information	Comparability of information	Impression management tactics
GHG Issues					
"ALTEO has reached a stage where it is able to substantially contribute to accomplishing energy and climate goals and - in respect of its activities and mission – it is able to serve as an example for other companies."	GHG issues mentioned indirectly	Indicators compliant with the disclosure requirements: 305-4 Indicators partially compliant with the disclosure requirements: 305-1; 305-2 Lack of specific indicators: 305-3; 305-5	Full description of relevant methods	Indicators include total and absolute numbers at least per two years or ratio per one year	Assertive tactic Illustrative tactic Self-proclaimed excellence Promotion of a systemic view
CE Issues					
"ALTEO was actively involved in sustainability-related knowledge sharing in 2018 (...) I find the establishment of the Circular Economy Platform to be a very forward thinking initiative."	CE issues mentioned indirectly	Indicators compliant with the disclosure requirements: 302-1; 306-2 Lack of specific indicators: 301-1; 301-2; 302-2; 302-3; 302-4; 306-4	Methods partially described	Indicators include total and absolute numbers at least per two years or ratio per one year	Assertive tactic Illustrative tactic Promotion of a systemic view

Source: Own elaboration based on the analysis of "Integrated report 2018. With energy in mind, ALTEO Group"

Conclusion

The performed analysis based on case studies from the energy sector companies revealed that disclosures on GHG and CE issues in the sustainability reports varied considering their scope, accuracy and comparability. In general, the scope and accuracy of reported GHG issues was relatively better compared to CE issues. However, the declared importance of GHG and CE issues at the strategic level was not consistently reflected in providing high-quality and more detailed information at the operational level. Therefore, it was often the case that the declarations included in

the statements from senior decision-makers, which were to show the importance of GHG and CE issues in the organization activity, were not always reflected in specific priorities and adequately described indicators.

It must be noted that this research comprised sustainability reports which included both GHG and CE issues directly mentioned in the statements from senior decision-maker. Nevertheless, the in-depth analysis showed that GHG and CE issues were not always included in material topics directly. Companies reported various indicators which were characteristic of GHG and CE issues, but it was made to a different extent. In addition, relevant descriptions often were missing of the methods used to determine the values of disclosed indicators. Moreover, the values of the disclosed indicators were showed in a way which prevented comparisons with other organizations. There was a wide variety of presented methods of determination of the value of individual indicators. However, some companies hardly ever presented the methods or presented them only for selected groups of indicators. Others presented them in fair detail but in different ways, using solutions such as: inserting a general description constituting a separate paragraph of the report, inserting descriptions before each thematic section, using footnotes to values mentioned in the text or to tables gathering values of indicators, etc.

Considering specific organizational impression management solutions, the research results showed that the analyzed companies from energy sector applied most often assertive (i.e. designed to actively improve or change image) as well as demonstrative (i.e. giving detailed explanations of operations by providing extensive information, quantitative data, examples and graphs) or illustrative (i.e. giving verbal and pictorial images that are simple and lack detail) impression management tactics. Demonstrative impression management tactics were specific for GHG issues while illustrative impression management tactics concerned mainly disclosures on CE issues. In addition, the analyzed companies mainly focused on promotion of a systemic view (i.e. extended vision of the life cycle of the product, emphasis on economic, social and environmental benefits of the company's activities; emphasizing the importance of company's products and its contributions to society in a comprehensive and systemic manner) and self-proclaimed excellence (i.e. promoting an idealized green image, focus on commitments and awards received, and exemplification of the company; claiming to be the best in the field of activity).

Abstract

This paper presents the results of a qualitative content analysis of sustainability reports published by companies representing the energy sector in the European Union. In order to determine the specificity of organizational impression management used in the reports based on the latest GRI Standards, it was decided to explore the inclusion of issues related to greenhouse gas emissions and circular economy (GHG and CE issues) in the analyzed disclosures. In particular, the relationships between the occurrence of GHG and CE issues at the strategic level and the scope, accuracy, clarity and comparability of information related to GHG and CE issues were investigated and determined.

Keywords: Public Disclosures, Sustainability Performance, Impression Management, Energy Sector

Introduction

The notion of impression management was originally developed in social psychology in relation to behavioral strategies used by individuals to create desired social image (Tetlock and Manstead, 1985), and has been mainly applied to explain the behaviors of individuals in organizations (Bolino et al., 2008). Tedeschi & Melburg (1984) suggested that impression management can be either tactical (short term) or strategic (long term) and assertive (initiated by the individual person) or defensive (used by the individual person to respond to an undesired image). However, Elsbach et al. (1998) suggested that impression management strategies concern any action purposefully designed and carried out to influence an audience's perceptions of an organization. Therefore, in recent years, this concept has gained greater attention at organizational level in corporate narratives, including strategies to influence stakeholder perceptions (Bansal and Clelland, 2004;, Patelli and Pedrini, 2013; Talbot and Boiral, 2015; Talbot and Boiral, 2018).

Bansal and Kistruck (2006) conceptualized organizational impression management as a discrepancy between a company's substantive actions (i.e. real change in the company's operations) and the symbolic representations of the substantive actions (i.e. the ways in which the company presents its actions to others). This means that organizational impression management concerns the shaping of those representations in order to influence stakeholder perceptions, by controlling what is disclosed and how (Bansal and Kistruck, 2006). Various impression management strategies have been identified in the literature. However, it should be noted that these strategies can also be used to hide or manipulate the manner in which information is presented and disclosed (Talbot and Boiral, 2018). Therefore, for some researchers impression management means that senior decision-makers select the information to display and present that information in a manner intended to distort readers' perceptions of corporate achievement (Godfrey et al., 2003). Merkl-Davies and Brennan (2007) argue that corporate reporting can be viewed in two different ways, either as the company giving incremental information to support stakeholders' decision-making or as organizational impression management and opportunistic behavior designed to benefit the company.

Cite this Article as: Agnieszka JANIK, Adam RYSZKO and Marek SZAFRANIEC "Public Disclosures on Sustainability Performance and Organizational Impression Management – An Analysis of Greenhouse Gases and Circular Economy Issues in Sustainability Reports from the Energy Sector in the European Union" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

According to taxonomy proposed by these authors, we can distinguish strategies aimed at obfuscating the under-performance of the company (i.e. reading ease manipulation, and rhetorical manipulation), strategies intended to emphasize good news by manipulating verbal or digital information (i.e. thematic manipulation, visual and structural effects, performance comparisons, choice of earnings number), and attribution of organizational outcomes (Merkl-Davies and Brennan, 2007).

The organizational impression management can be applied to a variety of contexts, including sustainability reports (Boiral, 2016; Talbot and Boiral, 2015). In addition, there are various strategies that can be used to respond external pressures regarding information disclosures related to sustainability or environmental performance. However, research shows that in order to meet the expectations of stakeholders concerning complex environmental issues some organizations tend to show a symbolic rather than substantial engagement in this area (Bansal and Kistruck 2006). In particular, this is the case when stakeholders are not able to verify the validity and credibility of relevant information. Therefore, companies may use assertive impression management strategies designed to improve their image or defensive impression management strategies to protect or repair their image, including justification of behaviors and practices deserving condemnation (Ogden and Clarke, 2005; Talbot and Boiral, 2018). The defensive strategies (i.e. apologies, excuses and justifications) are related to specific neutralization techniques designed to protect or repair companies image as well as are used to deny responsibility or to rationalize ethically questionable behaviors (Bolino et al., 2008).

In this line of research, the literature on environmental disclosure also highlights that companies tend to present an idealized image of reality and to hide negative aspects of their activity (Boiral, 2013; Cho et al., 2010). Moreover, Cho et al. (2012) indicated that companies may intentionally present misleading information to improve their image. Based on a counter accounting approach in assessing the quality of sustainability reports, Boiral (2013) identified several types of simulacra in this area demonstrating that the use of impression management strategies in sustainability reports may be described as a simulacrum manifested by the reporting of unreliable, misleading or non-transparent information and images that tend to highlight and artificially inflate the corporate commitment to sustainable development. (Boiral, 2013).

Considering the neutralization impression management techniques, Talbot and Boiral (2015) identified six main solutions that industrial emitters use to rationalize their impacts. These neutralization techniques embrace: self-proclaimed excellence (i.e. promoting an idealized green image, focus on commitments and awards received, and exemplification of the company; claiming to be the best in the field of activity), promotion of a systemic view (i.e. extended vision of the life cycle of the product, emphasis on economic, social and environmental benefits of the company's activities; emphasizing the importance of company's products and its contributions to society in a comprehensive and systemic manner), denial and minimization (i.e. trivialization of the potential impact of global warming and minimizing corporate responsibility; denial or minimization of significant environmental impacts of the company), denouncing unfair treatment and deceptive appearances (i.e. criticism of simplistic interpretations of the environmental impacts of businesses, need to provide context information on the subject; the negative image of the industry is simplistic one that relies on deceptive appearances that do not reflect the complex reality of organizations and their real environmental commitments), economic and technological blackmail (i.e. emphasis on economic and technological constraints of environmental commitments, which may threaten the survival of businesses; presentation of the organization as vulnerable and threatened by government action to reduce environmental impact), and blaming others (i.e. search for scapegoats, relativization of the company's impacts and focus on organizations or sectors considered to be more polluting; concealment of the negative image associated with the impact of a company by focusing on the situation of other companies or sectors). Moreover, companies tend to apply these techniques simultaneously to better influence the perceptions of stakeholders and to justify environmental impacts (Talbot and Boiral, 2015).

The GRI Standards emphasize the role of sustainability reporting in giving incremental information to stakeholders. However, it should be noted that literature on sustainable reporting highlights the lack of transparency and problems concerning the quality and validity of the information disclosed. Moreover, some researchers (Coupland, 2006; Onkila, 2009; Sandberg and Holmlund, 2015; Talbot and Boiral, 2015; Talbot and Boiral, 2018) criticize that sustainability reporting is used to manipulate stakeholders and create favorable impressions of companies' operations that may not accurately reflect reality. Therefore, there is the need to understand sustainability reporting from the viewpoint of organizational impression management. This also concerns current research on the reporting greenhouse gases (GHG) emissions and circular economy (CE) issues which is still insufficient. However, the GHG and CE issues are crucial areas to achieve climate neutrality in the EU by 2050 (European Commission, 2018; Jonek-Kowalska, 2019).

Therefore, the aim of this paper was to determine the specificity of organizational impression management used in the sustainability reports based on the latest GRI Standards, It was based on a qualitative content analysis of sustainability reports published by companies representing the energy sector in the European Union. The exploration covered the inclusion of issues related to greenhouse gas emissions and circular economy (GHG and CE issues) in the analyzed disclosures. In particular, the relationships between the occurrence of GHG and CE issues at the strategic level and the scope and accuracy of information related to GHG and CE issues as well as clarity and comparability of relevant information.

Materials and Methods

It was assumed that the research sample will consist of the reports that are: prepared by companies from the energy sector whose headquarters are located in the EU countries; prepared based on the up to date GRI Standards guidelines; available in an English version; and available in PDF format or online version on the company's website or on websites where information on sustainability reports is collected. Moreover, it was decided that two databases (i.e. GRI's Sustainability Disclosure Database (SDD) and Corporate Register (CR)) would be used to achieve a suitable sample of sustainability reports. Due to the fact that GRI guidelines published in 2016 became effective for reports published on or after 1 July 2018, it was decided that only reports published after that date would be selected for analysis. In addition, it was assumed that the latest report disclosed by companies during this period would be considered for further investigation. Three main types of reports were analyzed: sustainability/CSR reports, integrated reports, and annual reports.

The selection of the research sample took place in January 2020. The exploration of the GRI SDD resulted in identification of 260 organizations representing the energy sector or energy utilities sector that have published at least one sustainability report. The examination of CR database made it possible to achieve 152 companies from the electricity sector. To remove duplicated organizations from the research sample data from the SDD and CR databases were combined. Consequently, the research sample was limited to 326 organizations. Taking into account availability of reports in an English version and in PDF format or online version on the company's website as well as elaboration of reports based on the GRI guidelines published in 2016, it was determined that 61 organizations from the energy sector in the EU publishing sustainability reports could be included in the final research sample. Next, the latest available sustainability report was found for each organization from the research sample. The collection of reports took place between February and April 2020 (Janik et al., 2020). As a result, 61 reports were collected. All reports were prepared based on the GRI Standards, of which 45 in core option, 9 in comprehensive option, and 7 as GRI-related.

In the next step, the qualitative content analysis of each of the identified reports in the final sample was carried out (Mayring, 2000; Guthrie and Abeysekera, 2006). This approach makes it possible to assess what is disclosed and how it is done by analyzing the content using and scoring specific criteria (Helfaya and Whittington, 2019). In this study, qualitative content analysis was focused on the selected general and topic-specific disclosures included in GRI Standards identified as potentially related to GHG and CE issues. In order to assess the quality of the analyzed sustainability reports a measurement system was adopted. The following assessment criteria and relevant variables were established:

- The occurrence of GHG issues at the strategic level (OSL_{GHG}), defined by their occurrence in the statement from senior decision-maker ($OSL_{GHG\text{-}SDM}$ – Disclosure 102-14), key impacts, risks, and opportunities ($OSL_{GHG\text{-}IRO}$ – Disclosure 102-15), list of material topics ($OSL_{GHG\text{-}LMT}$ – Disclosure 102-47), explanation of the material topic and its boundary and the management approach and its components ($OSL_{GHG\text{-}BMA}$ – Disclosure 103-1 and 103-2).
- The scope of information related to GHG issues (SI_{GHG}), measured by indicators concerning direct GHG emissions ($SI_{GHG\text{-}DE}$ – Disclosure 305-1), energy indirect GHG emissions ($SI_{GHG\text{-}IE}$ – Disclosure 305-2), other indirect GHG emissions ($SI_{GHG\text{-}OE}$ – Disclosure 305-3), GHG emissions intensity ($SI_{GHG\text{-}EI}$ – Disclosure 305-4), and reduction of GHG emissions ($SI_{GHG\text{-}RE}$ – Disclosure 305-5).
- The accuracy of information related to GHG issues (A_{GHG}), based on description of the specific methods used to gather, compile, and analyze information related to disclosures on emissions ($A_{GHG\text{-}E}$ – Disclosure 305-1, 305-2, 305-3, 305-4 and 305-5).
- The occurrence of CE issues at the strategic level (OSL_{CE}), described by their occurrence in the statement from senior decision-maker ($OSL_{CE\text{-}SDM}$ – Disclosure 102-14), key impacts, risks, and opportunities ($OSL_{CE\text{-}IRO}$ – Disclosure 102-15), list of material topics ($OSL_{CE\text{-}LMT}$ – Disclosure 102-47), explanation of the material topic and its boundary, and the management approach and its components ($OSL_{CE\text{-}BMA}$ - Disclosure 103-1 and 103-2).
- The scope of information related to CE issues (SI_{CE}), defined by indicators concerning materials used by weight or volume ($SI_{CE\text{-}MU}$ – Disclosure 301-1), recycled input materials used ($SI_{CE\text{-}RM}$ – Disclosure 301-2), energy consumption within the organization ($SI_{CE\text{-}ECW}$ – Disclosure 302-1), energy consumption outside of the

organization (SI_{CE-ECO} – Disclosure 302-2), energy intensity (SI_{CE-EI} – Disclosure 302-3), reduction of energy consumption (SI_{CE-RE} – Disclosure 302-4), and waste by type and disposal method (SI_{CE-WD} – Disclosure 306-2).

- The accuracy of information related to CE issues (A_{CE}), based on description of the methods used to gather, compile, and analyze information related to disclosures on materials (A_{CE-M} – Disclosure 301-1 and 301-1), energy (A_{CE-E} – Disclosure 302-1, 302-2, 302-3 and 302-4) and waste (A_{CE-W} – Disclosure 306-2).
- Clarity of relevant information (CLR), based on the assessment of their content with regard to information available and required by stakeholders, the avoidance of excessive and unnecessary detail, possibilities of finding the specific information without unreasonable effort, the avoidance of technical terms or other content which may be unfamiliar to stakeholders, and the inclusion of relevant explanations.
- Comparability of relevant information (CMP), based on the assessment of the consistency of reported information and presentation of this information in a manner that empowers stakeholders to analyze changes over time, analytical comparisons on a year-to-year basis, including total numbers as well as ratios (e.g., normalized data per unit of production), and supporting analyses relative to other organizations.

A 3-point scoring system similar to the scales applied in previous studies was used (Morhardt et al., 2002; Tsalis et al., 2020). In general, the scale was as follows: 0 – when relevant information for a specific disclosure topic was not mentioned or described, 1 – when relevant information was partially provided or partially compliant with the specific disclosure requirements, and 2 – when relevant information was compliant with the specific disclosure requirements.

The statistical analysis of collected data was carried out in two steps. The first step was to calculate the descriptive statistics for all variables (e.g. mean values). In the second step an analysis of relationships between the analyzed variables was carried out using the Spearman's rank correlation coefficient. In particular, this analysis concerned determination of links between the occurrence of GHG and CE issues at the strategic level and the scope and accuracy of information related to GHG and CE issues as well as clarity and comparability of relevant information.

Results and Discussion

The first step of the results analysis was presentation of the descriptive statistics obtained for all analyzed variables.

The analysis revealed that the occurrence of GHG issues at the strategic level (OSL_{GHG}) is by far the most advanced – its mean reached the highest value (1.66). The scope of information related to GHG issues (SI_{GHG}) was assessed at the level of 1.19, and the mean for accuracy of information related to GHG issues (A_{GHG}) totaled 1.07. With respect to detailed variables describing OSL_{GHG}, the highest mean (1.79) was obtained for the explanation of the material topic and its boundary and the management approach and its components ($OSL_{GHG-BMA}$), while the lowest mean (1.56) was achieved for key impacts, risks, and opportunities ($OSL_{GHG-IRO}$). All variables in this case reached relatively high values. Considering detailed variables characterizing SI_{GHG}, the direct GHG emissions (SI_{GHG-DE}) achieved far the highest mean of 1.62, and the lowest mean was obtained for the reduction of GHG emissions (SI_{GHG-RE}).

With respect to variables characterizing the reporting CE issues the achieved mean values were lower compared to the same variables adopted for GHG issues. The occurrence of CE issues at the strategic level (OSL_{CE}) was the most developed, but the mean obtained for it was still relatively low – 1.16. Scope of information related to CE issues (SI_{CE}) was assessed at the level of 0.74, and the mean value for accuracy of information related to CE issues (A_{CE}) totaled 0.47. Considering detailed variables describing OSL_{CE}, the lowest mean value (0.92) was achieved for statement from a senior decision-maker (OSL_{CE-SDM}), and the highest mean value (1.39) was found for the explanation of the material topic and its boundary and the management approach and its components (OSL_{CE-BMA}). In the case of detailed variables characterizing SI_{CE}, the decidedly highest mean of 1.39 was obtained for energy consumption within the organization (SI_{CE-ECW}), while the decidedly lowest mean of 0.13 was obtained for recycled input materials used (SI_{CE-RM}). With respect to specific variables describing A_{CE}, disclosure on energy (A_{CE-E}) achieved the highest mean of 0.64, and the lowest mean of 0.28 was obtained for disclosure on materials (A_{CE-M}).

Comparing the values of descriptive statistics obtained for variables concerning the reporting GHG and CE issues, it can be noticed that the means of all variables related to GHG issues were higher than those obtained for the CE issues. The biggest difference of 0.60 was found for A_{GHG} and A_{CE}. For OSL_{GHG} and OSL_{CE}, the difference totaled 0.50 and the smallest difference of 0.45 was observed between SI_{GHG} and SI_{CE}. The research results also revealed that the analyzed reports were characterized by a relatively high value of clarity (CLR) – the obtained mean totaled 1.56, and rather low level of comparability (CMP) (1.08).

Figure 1 shows the mean values obtained for the main variables characterizing the reporting GHG and CE issues. In addition, Figure 2 shows the mean values achieved for the detailed variables describing the main analyzed variables.

Figure 1. Mean values of the main variables characterizing the reporting GHG and CE issues

Figure 2. Mean values of the detailed variables describing the main analyzed variables characterizing the reporting GHG and CE issues

In order to determine the existence and specificity of organizational impression management used in the sustainability reports, the second step of the analysis comprised the investigation of relationships between the analyzed variables characterizing the reporting GHG and CE issues. It was carried out using the Spearman's rank correlation coefficient. In particular, this analysis included determination of links between:

- detailed variables describing the occurrence of GHG issues at the strategic level,

- detailed variables describing the occurrence of CE issues at the strategic level,
- main and detailed variables describing the occurrence of GHG issues at the strategic level and other variables characterizing the reporting GHG issues (i.e. the scope, accuracy, clarity and comparability of relevant information),
- main and detailed variables describing the occurrence of CE issues at the strategic level and other variables characterizing the reporting CE issues (i.e. the scope, accuracy, clarity and comparability of relevant information).

Table 1 presents correlations (i.e. Spearman's rank correlation coefficients) between the detailed variables describing the occurrence of GHG issues at the strategic level. The results of the analysis indicated that there were statistically significant correlations in three cases (i.e. $OSL_{GHG\text{-}SDM}$ & $OSL_{GHG\text{-}LMT}$; $OSL_{GHG\text{-}SDM}$ & $OSL_{GHG\text{-}BMA}$; $OSL_{GHG\text{-}BMA}$ & $OSL_{GHG\text{-}LMT}$). However, the obtained values of the correlation coefficients proved that these relationships were low or moderate. These results indicated that making declarations about GHG issues in the statements from senior decision-makers had a relatively weak association to their inclusion in the explanation of the material topic and its boundary and the management approach and its components, in the list of material topics, and, in particular, in the key impacts, risks, and opportunities.

Table 1. Correlations between variables describing the occurrence of GHG issues at the strategic level

Variable	$OSL_{GHG\text{-}SDM}$	$OSL_{GHG\text{-}IRO}$	$OSL_{GHG\text{-}LMT}$	$OSL_{GHG\text{-}BMA}$
$OSL_{GHG\text{-}SDM}$	1,00			
$OSL_{GHG\text{-}IRO}$	0,12	1,00		
$OSL_{GHG\text{-}LMT}$	0,31*	0,15	1,00	
$OSL_{GHG\text{-}BMA}$	0,42*	0,22	0,50*	1,00

** Correlation coefficients significant at the 0.05 level*

Table 2 presents correlations (i.e. Spearman's rank correlation coefficients) between the detailed variables describing the occurrence of CE issues at the strategic level. In the case of CE issues, there were statistically significant correlations in four cases (i.e. $OSL_{CE\text{-}SDM}$ & $OSL_{CE\text{-}IRO}$; $OSL_{CE\text{-}SDM}$ & $OSL_{CE\text{-}BMA}$; $OSL_{CE\text{-}SDM}$ & $OSL_{CE\text{-}LMT}$; $OSL_{CE\text{-}BMA}$ & $OSL_{CE\text{-}LMT}$). However, the values of the correlation coefficients were even lower than those achieved for GHG issues. This showed that the declarations concerning the importance of CE issues in the statements from senior decision-makers had relatively weak influence on explanation of the material topic and its boundary and the management approach and its components, presentation of key impacts, risks, and opportunities, and, in particular, explanation of the material topic and its boundary and the management approach and its components.

Table 2. Correlations between variables describing the occurrence of CE issues at the strategic level

Variable	$OSL_{CE\text{-}SDM}$	$OSL_{CE\text{-}IRO}$	$OSL_{CE\text{-}LMT}$	$OSL_{CE\text{-}BMA}$
$OSL_{CE\text{-}SDM}$	1,00			
$OSL_{CE\text{-}IRO}$	0,30*	1,00		
$OSL_{CE\text{-}LMT}$	0,26*	0,10	1,00	
$OSL_{CE\text{-}BMA}$	0,31*	0,20	0,49*	1,00

* Correlation coefficients significant at the 0.05 level

Tables 3 presents correlations (i.e. Spearman's rank correlation coefficients) between the main and detailed variables describing the occurrence of GHG issues at the strategic level and other variables characterizing the reporting GHG issues (i.e. the scope, accuracy, clarity and comparability of relevant information). The analysis of obtained results showed the existence of statistically significant correlations between some variables describing OSL_{GHG} and other specific variables characterizing reporting GHG issues. The highest correlation coefficients values were indicated for the following relationships: $OSL_{GHG\text{-}LMT}$ & $SI_{GHG\text{-}OE}$; OSL_{GHG} & $SI_{GHG\text{-}OE}$; OSL_{GHG} & SI_{GHG}; $OSL_{GHG\text{-}LMT}$ & SI_{GHG}. However, it should be noted that these relationships were at most moderate.

Table 3. Correlations between variables describing the occurrence of GHG issues at strategic level and variables describing the scope, accuracy, clarity and comparability of relevant information

Variable	SI_{GHG}	SI_{GHG-DE}	SI_{GHG-IE}	SI_{GHG-OE}	SI_{GHG-EI}	SI_{GHG-RE}	A_{GHG}	A_{GHG-E}	CLR	CMP
OSL_{GHG}	0,48*	0,33*	0,32*	0,49*	0,25	0,34*	0,08	0,08	0,32*	0,30*
$OSL_{GHG-SDM}$	0,24	0,12	0,19	0,26*	0,23	0,01	0,06	0,06	0,18	0,21
$OSL_{GHG-IRO}$	0,24	0,10	0,14	0,29*	-0,01	0,29*	0,10	0,10	0,07	0,11
$OSL_{GHG-LMT}$	0,48*	0,43*	0,34*	0,51*	0,30*	0,19	0,11	0,11	0,27*	0,30*
$OSL_{GHG-BMA}$	0,29*	0,13	0,09	0,24	0,31*	0,24	-0,12	-0,12	0,35*	0,38*

** Correlation coefficients significant at the 0.05 level*

Tables 4 presents correlations (i.e. Spearman's rank correlation coefficients) between the main and detailed variables describing the occurrence of CE issues at the strategic level and other variables characterizing the reporting CE issues. The analysis of obtained results showed the existence of statistically significant correlations between very small number of variables describing OSL_{CE} and other specific variables characterizing reporting CE issues. Moreover, the values of the correlation coefficients were lower than those indicated for GHG issues. The highest correlation coefficient value was observed for the link between OSL_{CE-SDM} & SI_{CE} and this relationship was moderate. The other relationships were weak or insignificant.

Table 4. Correlations between variables describing the occurrence of CE issues at strategic level and variables describing the scope, accuracy, clarity and comparability of relevant information

Variable	SI_{CE}	SI_{CE-MU}	SI_{CE-RM}	SI_{CE-ECW}	SI_{CE-ECO}	SI_{CE-EI}	SI_{CE-RE}	SI_{CE-WD}	A_{CE}	A_{CE-M}	A_{CE-E}	A_{CE-W}	CLR	CMP
OSL_{CE}	0,32*	0,25	0,28*	0,02	0,11	0,32*	0,15	0,31*	0,11	0,19	0,02	0,26*	0,02	0,31*
OSL_{CE-SDM}	0,43*	0,32*	0,35*	0,23	0,11	0,37*	0,19	0,22	0,27*	0,29*	0,21	0,25*	0,06	0,30*
OSL_{CE-IRO}	0,20	0,19	0,20	0,12	0,00	0,15	0,13	0,13	0,14	0,16	0,10	0,14	0,10	0,19
OSL_{CE-LMT}	0,04	0,05	0,15	-0,19	0,06	0,11	0,00	0,12	-0,12	0,00	-0,17	0,07	-0,10	0,09
OSL_{CE-BMA}	0,18	0,08	0,18	-0,21	0,14	0,24	0,14	0,32*	-0,14	0,02	-0,23	0,10	-0,09	0,28*

** Correlation coefficients significant at the 0.05 level*

Conclusion

The research results indicated that companies from the energy sector in the European Union tend to focus more on GHG issues than CE issues. Comparing values obtained for variables characterizing the reporting GHG and CE issues, the means of all variables related to GHG issues were higher than those achieved for the CE issues. This means that the analyzed companies declared importance of GHG issues more often than of CE issues at strategic level in sustainability reports. However, the biggest difference was found for the accuracy and the smallest was observed between the scope of information related to GHG and CE issues. Moreover, the results revealed that the analyzed reports were characterized by a relatively high clarity and rather low level of comparability.

The obtained results showed that making declarations about GHG and CE issues in the statements from senior decision-makers had a relatively weak relationships with presentation of the relevant key impacts, risks, and opportunities, the list of material topics as well as the explanation of the material topic and its boundary and the management approach and its components. It should be also emphasized that declarations from the analyzed companies as to their intentions related to GHG and CE issues at the strategic level found a rather poor reflection in the description of specific actions in this area or in demonstrating appropriate indicators at the operational level. In addition, the analyzed companies insufficiently described the methods they used to gather, compile and analyze information on the effectiveness of actions taken to address GHG and, in particular, CE issues. Considering the values of Spearman's rank correlation coefficients for variables describing the occurrence of GHG and CE issues at

strategic level and variables characterizing the scope, accuracy, clarity and comparability of relevant information these correlations were in the vast majority weak or insignificant. There was, for example, significant correlation between the occurrence of CE issues in the statement from senior decision-maker and the scope of information related to CE issues but this relationship was only moderate.

In general, taking into account mean values obtained for variables describing the scope, accuracy and comparability of reported information on GHG and CE issues, it was indicated that analyzed companies tend to use demonstrative and illustrative impression management strategies. However, demonstrative impression management strategies (e.g. explanations of operations by providing extensive information, quantitative data, examples and graphs) were specific for GHG issues, while illustrative impression management strategies (e.g. verbal and pictorial images that are simple and lack detail) concerned mainly disclosures on CE issues. Nevertheless, it must be noted that declarations about GHG and CE issues in the statements from senior decision-makers were not sufficiently reflected in the appropriate actions and accurate indicators at the operational level.

It is suggested that the future studies should be focused on the exploration of sustainability reporting practices development and evolution. This would make it possible to better understand impression management strategies applied by companies to conceal specific information and to reveal reasons demonstrated by companies to justify the failure to prepare and disclose transparent and reliable information (Talbot and Boiral, 2018).

Abstract

The primary aim of this study is to demonstrate the role of innovative strategies as an important element of SMEs performance and long-run development. A secondary purpose of the research is to identify the best practices of innovative strategies used by European SMEs, which could be adapted by local SMEs from Republic of Moldova.
In order to meet the goal of the research an analysis of secondary data resources has been carried out, using scientific methods, in particular logical methods, such as comparative analysis, synthesis, induction and deduction. International comparisons used statistical survey CIS, provided by EUROSTAT and designed for monitoring the progress on innovation activities in SMEs sector. The current study has been drawn up, using the official data offered by the National Bureau of Statistics (NBS), Organization for Small and Medium-Sized Enterprises Sector Development (ODIMM), the Ministry of Economy from Republic of Moldova, the most recent data and references in this field of research and own reflections of the authors. As a result, of the made analyses we state that SMEs as a social economic phenomenon has not become yet a key link in the development of the national economy. This conclusion is based on the fact that the largest share of SMEs sector from Moldova is still in the wholesale and retail trade. The innovation capacity of SMEs in the Republic of Moldova is low, as a result of lack of public funds to innovate. Development of innovative small business companies involves comprehensive solutions. The future prospects for encouraging SMEs in Moldova in accordance with the best European practices are as follows: development of innovation infrastructure; supporting public-private partnerships in research; adopting the framework on innovation and venture funds. Small business from Moldova also, miss new business practices for organizing procedures (supply chain management, business re-engineering, knowledge management, quality management), thus limiting the development of organization innovative enterprises. The majority of the studies concerning SMEs, analyses the small business sector as a whole, without pointing out the huge potential that small business companies that applies innovation strategies have. This study reveals the importance of innovative strategies for SMEs, such as the innovation of products and /or processes of the enterprise, implementing significant changes to the design or packaging of a good or service, a new media or techniques for product promotion, new methods for product placement or sales channels and introduction of innovations in logistics for developing and improving the performance of SMEs. From the best practices of European SMEs, innovative strategies may become an effective tool in the creation of competitive advantage of national SMEs and the key success for their development.

Keywords: SMES, Innovation, Strategies, Development.

Introduction

Small and medium sized enterprises (SMEs) have become one of the most important sectors of economy in many countries over the last decades. SMEs are characterized by flexibility, low cost of management, ability to foster scientific and technical progress, innovation, and the social role of this sector. At the same time, SMEs are characterized by weaknesses like excessive dependence on the external environment, lack of resources and difficulties in terms of marketing their production. Evidence shows that small businesses that are aware that they have to continually create, evaluate and successfully exploit their new ideas are more likely to survive and prosper in the competitive global economy. The development of the SMEs sector in the Republic of Moldova in terms of innovations will increase the competitiveness of the small business and, consequently, will promote the intensification of growth rates, market expansion, export development, increasing sales and thus profit.

Cite this Article as: Lica ERHAN and Tatiana GAUGAS "Trends and Prospects for the Development of Small and Medium Sized Enterprises through Innovative Strategies in the Republic of Moldova" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

Competitiveness based on innovation must become a priority for national SMEs. This means that, in addition to the legal framework that encourages them, entrepreneurs also need knowledge in the field of innovation, the development of their capacity to absorb technologies and to adapt these technologies to the needs of the markets.
In the last years, a number of public-private projects and international financing have been launched in the Republic of Moldova, meant to contribute to the increase of the innovation and competitiveness capacities of SMEs. Several business incubators have been opened and the process has been extended to creating a network of business incubators. Industrial parks were opened and feasibility studies were carried out for their regional expansion. This support infrastructure is extremely important for SMEs, as it contributes to their efficient activity, offering them opportunities to launch and expand their business. However, it is the innovation activity of SMEs that is a decisive factor in the competitiveness and development of this sector. Economic reality shows that businesses that are aware of the need to successfully create, evaluate and exploit new ideas are more likely to survive in the competitive global economy.

Starting from this reality, the current research is dedicated to the topic of evolutionary development of SMEs sector in the Republic of Moldova, pointing out trends and future prospects for SMEs development through innovative strategies. The current study has been drawn up, using the official data offered by the National Bureau of Statistics (NBS), Organization for Small and Medium-Sized Enterprises Sector Development (ODIMM), the Ministry of Economy from Republic of Moldova, the most recent data and references in this field of research and own reflections of the authors. Statistical survey CIS, provided by EUROSTAT and designed for monitoring the progress on innovation activities in SMEs sector was also used in this study. In order to meet the goal of the research an analysis of secondary data resources has been carried out, using scientific methods, in particular logical methods, such as comparative analysis, synthesis, induction and deduction.

Analysis

Thus, to achieve the goal of this research, first off all we started an analysis of the current situation in the field of SMEs from the Republic of Moldova, in order to identify the most acute challenges from this sector and suggest solutions and recommendation that will help to overpass pointed out problems. Small and medium enterprises (SMEs) sector in the Republic of Moldova during the last 30 years of independence has developed qualitatively and quantitatively. In 2019 SMEs: constitute 98.6% of the total number of enterprises (from them 84.7% was micro enterprises, 11.4% small enterprises and only 2.4% medium-sized enterprises); assures 61.6% of all employed persons; contribute with 39.5% from total number of sales.

Beginning with 2006 in the Republic of Moldova according to the recommendation of the European Commission and present legislation were adjusted criteria used in the classification of SMEs (table 1).

Table 1: criteria used in the Republic of Moldova to define SMEs sector

Firm size	Headcount (persons)	Turnover and balance sheet total (mil. lei)
micro	1-9	≤ 3
small	10-49	≤ 25
medium-sized	50 - 249	≤ 50

We mention that in Republic of Moldova an enterprise must meet all these three criteria at the same time in order to be one of SMEs. During the last years in the Republic of Moldova there have been made considerable efforts by the Government to renew the legislative framework in the activity of SMEs.

As a result of these actions, a legislative framework has been created. Still, we do not have any specific framework that will encourage and support the activity of innovative SMEs.

The most attractive domains in the activity of SME_s in the Republic of Moldova are: whole sale and retail trade, real estate business, agriculture and processing industry (table 2).

Table 2: share of SMEs by major types of activity over the years 2015-2019, %

Types of activity	2015	2016	2017	2018	2019
Total	100.00	100.00	100.00	100.00	100.00
agriculture, hunting and forestry	6.2	6.6	7.1	7.5	7.9
processing industry	8.5	8.5	8.4	8.4	8.4
electric energy, gas and water	0.2	0.2	0.1	0.2	0.2
water distribution, sanitation	0.7	0.7	0.8	0.8	0.8
constructions	5.8	5.8	5.7	5.7	5.9
whole sale and retail trade	39.7	39.3	38.4	37.5	36.3
transport and stoking	5.3	5.2	5.2	5.2	5.3
public alimentation	3.5	3.5	3.6	3.6	3.7
communication	3.9	3.9	4.1	4.2	4.4
real estate business	6.9	6.5	6.3	6.4	6.6
scientific and professional activity	8.3	8.6	8.8	8.9	8.7
other types of activity	11.1	11.2	11.4	11.6	11.9

The activities that produce most of the revenues from sales for the national SMEs during 2015-2019, are presented in table 3. The revenues from sales of SMEs in 2019 were 157 335.6 million lei, or 39.5% per economy. The revenues of small and medium-sized enterprises increased in all areas.

Table 3: evolution of SMEs revenues from sales in dynamics, according to sector over the years 2015-2019 (million lei)

Types of activity	2015	2016	2017	2018	2019
Total	119 566.1	124 954.4	137 506.1	144 159.9	157 335.6
agriculture, hunting and forestry	9 019.1	10 366.8	12 194.5	12 431.7	13 937.0
processing industry	13 694.5	13 787.6	14 820.9	15 215.7	15 843.8
electric energy, gas and water	147.4	195.9	292.2	215.1	466.8
water distribution, sanitation	571.4	622.1	737.30	766.0	860.1
constructions	9 451.6	8 675.1	9 573.8	11 222.0	11 915.2
whole sale and retail trade	57 700.5	60 750.7	67 235.6	67 881.0	73 529.2
transport and stoking	8 861.5	9 338.0	10 072.2	10 978.5	11 629.1
public alimentation	1 903.3	2 130.4	2 389.1	2 856.7	3 544.0
communication	3 048.1	3 469.7	3 516.3	3 767.4	4 897.2
real estate business	3 017.4	3 474.9	3 354.9	3 813.9	3 864.7
scientific and professional activity	3 665.0	3 749.6	4 041.9	4 110.0	4 140.9
other types of activity	8 486.4	8 393.6	9 277.4	10 901.9	12 705.5

Taking into consideration the social function of SMEs that is expressed through creating places of work, we can mention the number of the persons who are engaged in small and medium enterprises in 2019 was – 335.8 thousand persons, which constitute 61.6% from the total number of employees (table 4).

Table 4: share of the numbers of workers occupied in SMEs over the years 2015-2019, thousand persons

Enterprise size	2015	2016	2017	2018	2019
Total	281.4	313.5	323.3	328.0	335.8
medium-sized	82.4	101.5	103.5	99.3	102.9
small	115.1	107.2	112.0	117.0	118.6
micro	83.9	104.8	107.8	111.7	114.2

Competitiveness describes the ability of SMEs to generate income/output and maintain employment levels in the face of domestic and global competition. Literature recognizes that small companies cannot compete using economies of scale; therefore, their competitive advantage lies on the development of innovative products or processes. Innovation may be seen as a critical drive of economic performance for small and medium businesses. According to Salazar (2012), an innovation may be the introduction of a new or significantly improved product, process, organisational method, or marketing method by the enterprise.

- A product innovation is the market introduction of a new or significantly improved good or service or a good or service with respect to its capabilities, user friendliness, components or subsystems.
- A process innovation is the implementation of a new or significantly improved production process, distribution method, or support activity for your goods or services. Exclude purely organisational innovations.
- An organisational innovation is the implementation of a new organisational method in the firm's business practices, workplace organisation or external relations. Exclude mergers or acquisitions, even if for the first time.
- A marketing innovation is the implementation of a new marketing concept or strategy that differs significantly from the enterprise's existing marketing methods and which has not been used before. It requires significant changes in product design or packaging, product placement, product promotion or pricing.
- Innovation in logistics - logistics is a set of services including the planning, organisation, management, execution and monitoring of an enterprise's entire material, goods and related information flows (flows from purchasing, production and warehousing, to added value services, distribution and reverse logistics).

The first two are traditionally more closely related to technological innovation. The SMEs are considered innovative if they have implemented an innovation during the reporting period.

Researchers state that organisational learning and knowledge management directly influenced organisational innovation, whereas organisational learning and organisational innovation directly influenced organisational performance. According to Tidd et al. (2006), innovation contributes to achieving a competitive advantage in several aspects. The most important characteristics of innovations include:

1. A strong relationship between market performance and new products.
2. New products help maintain market shares and improve profitability.
3. Growth also by means of non-price factors (design, quality, individualisation, etc.).
4. Ability to substitute outdated products (shortening product lifecycles).
5. Innovation of processes that lead to production time shortening and speed up new product development in comparison to competitors.

Less formal organisational structures, such as those of SMEs, have been identified as innovation-friendly, as they may encourage a corporate culture that allows participation, flexibility, networking, inclusion and experimentation across the organisation. Challenges of the external environment faced by SMEs could lead to an innovative response to establish a competitive advantage. Small firms can innovate in response to two factors: appropriate business environment and limited growth conditions. The more diverse and compromised the environment faced by SMEs, the higher the level of proactive innovative behaviors. However, experts found that in cases where small businesses do not have the resources, innovation could suffer.

A comprehensive study on business innovation was conducted and completed in 2014-2016 by the EU through the "Community Innovation Survey", published in 2019 it contains detailed data on innovation activity indicators in 28 European countries. The statistical research is based on the Community Innovation Survey, abbreviated as the CIS, provided by the European Commission through EUROSTAT. This questionnaire is used by all State Members of the European Union, but also by other European countries and aims to monitor the progress of innovative activity in Europe. It allows a better understanding of the innovation process and analyses the link between innovation and economic areas such as: competitiveness, employees, growth. The survey showed that approximately 51% of enterprises with 10 or more employees reported innovative activity in the period 2014-2016, compared to 49% in 2012-2014. The share of innovative companies has increased or remained at the same level in 20 states EU member and fell in eight countries. The highest progress was reported by Estonia, Portugal, Finland and Croatia, with an increase from 54% to 67% in Portugal and from 55% to 65% in Finland, which climbed to the top five. The highest share of innovative enterprises was registered in Belgium (68% of all companies), Portugal (67%), Finland (65%), Luxembourg (64%) and Germany (64%). At the other extreme of the top are Romania with only 10%, Poland with 22% and Bulgaria with 27%.

If to compare with the European average, then the innovative enterprises of products and / or processes had a share of 36.8%, and the innovative ones of organization and / or marketing methods a share of 35.9%. Most public funds received innovative product and / or process enterprises from Hungary 32.5%, Latvia 25.3%, Bulgaria 24.8% and Poland 21.4%. In Romania, only 8.3% of enterprises with innovative products and / or processes received a public fund to innovate.

In Republic of Moldova, the main problem of innovations for SMEs is lack of state funding, specialists observed that the smaller is the size of the company, the fewer innovative companies in the total number of enterprises are found, mainly because of limited financial resources. The other barriers in developing innovations are: the low market demand for innovations, the existence of previous innovations, the lack of good ideas for innovations (5.2%) and the low competitiveness on the business market.

Discussion

As a result, of the made analyses we state that SMEs sector as o social economic phenomenon has not become yet a key link in the development of national economy. This conclusion is based on the fact that micro enterprises represents the largest share of companies in the SMEs sector (84.7%), however, their contribution to employment, and to turnover is quite modest. In addition, the largest share of SME_s sector from Moldova is still in the wholesale and retail trade. The innovation capacity of SMEs in the Republic of Moldova is low. As a result, innovation impact on national economy is reduced as well. Moldova has a low share of staff engaged in high technological intensity production. The following reasons determine the low innovative potential of SMEs in the Republic of Moldova: the existing legal framework does not sufficiently encourage innovation activity. There is not any well-established system of direct and indirect financial incentives (for instance tax incentives) aiming to encourage research and development activities of firms and state's low financial capacity to support SMEs.

The legal framework does not require more responsibility from enterprises and costs within the enterprise for achieving the objectives in terms of innovative activities. Thus, the introduction in the legislative acts or regulations of product safety, operational and work safety, environmental protection, and intellectual property right enforcement, provisions on taxes, employment or social affairs led to effects such as stimulating innovation.

In addition, although the Code on science and innovation stipulates that research and development funding should be at least 1% of GDP annually, this provision is not respected and budgetary funding is below this amount. The current legal framework does not stimulate enough innovation activity. Innovation capacity of economic entities in Moldova is very low. Subsequently, the innovation impact on national economy is rather small. Both economic theory and empirical evidence support the idea that innovation plays a vital role in increasing productivity on a sustainable basis. For these reasons, in many countries, there is an active policy on encouraging innovation. Among innovation-targeted policy instruments – patent law regulations, funds for research and development and education, we have to emphasize fiscal policy tools that include tax incentives. In table 5, we present the main problems that SMEs sector is facing and try to identify the best ways for improving them.

Table 5: the main challenges of SMEs sector and ways of improving

Challenges of SMEs sector	Ways of improving
Low efficiency implementation of legislative framework	**In order to create a favorable business environment we recommend**
▪ numerous administrative barriers; ▪ frequent inspections and controls of business sector and high level of taxes; ▪ lack of a consolidated register that would make it possible to analyze activity of all SMEs as well as of patent holders working in the country; ▪ lack of tax facilities exclusively for SMEs. ▪ The legislation requires more responsibility from enterprises and costs within the enterprise for achieving the objectives in terms of innovative activities. Thus, the introduction in the legislative acts or regulations of product safety, operational and work safety,	▪ adjustment of the normative and regulatory framework to meet SMEs needs; ▪ reduction of the number of mandatory documents at starting and closing a business; ▪ set-up tax-control complexity and tax facilities in legislative framework; ▪ reduction of the informational barriers and regulation costs for SMEs.

environmental protection, intellectual property right enforcement, provisions on taxes, employment or social affairs led to effects such as stimulating innovation.	
Limited financial access	**In order to improve SMEs access to finance we recommend**
▪ only 31% from all the credits offered by the bank sector belong to SMEs sector; ▪ about 85% from the total number of the financial application rejected by the bank, were caused by lack of guarantee; ▪ lack of innovative instruments of finance, such as: venture capital or business angels. ▪ lack of state funding for SMEs innovations	▪ support of the national net-work of guaranteed funds for SMEs; ▪ financing start-up in priority sectors; ▪ development of innovative financial schemes for SMEs; ▪ extension and support of Loans Bureau activity.
Low developed competitiveness of SMEs	**In order to develop competitiveness of SMEs we recommend:**
▪ low level of adaption of SMEs to European standards of quality; ▪ low level of elaboration and absorption of innovation; ▪ underdeveloped infrastructure for supporting business.	▪ innovation support and improvement of SMEs access to new technologies; ▪ support to the introduction of quality standards and systems of quality management; ▪ extension and development of business incubators and industrial parks. ▪ apply product, process or marketing innovation strategies
Lack of informative-consulting assistance and the development of the potential activity of entrepreneur	**In order to promote entrepreneurial culture and consolidating managerial performance**
▪ insufficient qualification of personnel, low level of skills and culture of SMEs entrepreneurial spirit; ▪ lack of an informational system dealing with programs of continuing education; ▪ lack of an efficient consulting system in the domain of education and developing business in SMEs sector; ▪ lack of a program about the competitive evaluation in the domain of entrepreneurial activity.	▪ elaboration of a strategy/plan at the national level in the domain of economic education; ▪ formation and development the infrastructure of educational support; ▪ development and consolidation of partnership between educational institutions and business sector; ▪ implementations of the modern methods of education, especially e-learning to promote excess for education in this domain.
Necessity of developing partnership in business	**Development of partnership in business**
▪ the development of partnership in business is at a starting stage, it is focused on ,,public-private" partnership and ,,business to business" partnership.	▪ creation and regulation of activity for business association; ▪ informing the government about the most important problems needs in SMEs sector (organizing round/tables, seminars, work-shops, conferences); ▪ creation and development of clusters, as a base of entrepreneurial partnership.

Conclusions

Small and medium sized enterprises play an extremely important role in modern economies. They create job, enhance competition, contribute to technological change, increase the use of domestic resources and products and are a source of innovation. The importance of small business development involves a comprehensive solution of the following problems:

- activity coordination of all structures of the state support for small business, including at the regional level;

- providing financial support for small business, appropriate to its needs in terms of affordability, volume and timing, which would be achievable by combining efforts of state, banking sector and small businesses alike;
- implementation of a selective approach in provision of state support for small businesses depending on its area of activity by applying appropriate tax, financial measures and public contract system as a priority;
- creation of "growth poles" on the basis of free economic zones, industrial and infrastructure

The innovation activity of companies is a key driver of competitiveness and economic growth. Although the process takes place at a company level through a skilful management, the innovation potential of a firm can be enhanced by appropriate policy measures carried out in a business-friendly environment. Therefore, the identification of the policy options and instruments available to enhance the innovative capabilities of firms is an important component of any strategy to support increased living standards. The innovative activity of SMEs is influenced by the following groups of factors:

- institutions (political environment, regulatory environment, business environment);
- human capital and research (education, tertiary education, research and development);
- infrastructure (ICTs, general infrastructure, ecological sustainability);
- market sophistication (credit, investment, trade and competition);
- business sophistication (knowledge workers, innovation linkages, knowledge absorption).

The future prospects to overcome the lack of an efficient incentive system for encouraging of innovative SMEs in the Republic of Moldova in accordance with the best international practices are as follows:

- adopt the laws on venture funds and create a national venture fund, that might be an alternative source of finance for innovative SMEs;
- develop innovation infrastructure and establish innovation brokerage centres and connect them to specialized international networks, market intellectual property through them.
- develop partnerships between research organizations, universities and economic operators; encourage hiring by firms of researchers in different areas of activity;
- develop public-private partnerships in research;
- focus more on product or process innovation;
- use innovations in logistics such as: the introduction of automated inventory management systems, the digital management of the chain of suppliers, the introduction of electronic public procurement, the unique and automatic identification of the products of the entire chain of suppliers, the reverse logistics concerning all the operations relating to the re-use and return of products and materials, new delivery models, including the use of alternative power vehicles or of multi-modal logistics, the improvement of delivery by re-designing the aspects related to the packaging, weight or density of products.

Today's innovative methods of marketing should incorporate the model of integrated business strategy. Innovative enterprises may introduce or implement innovations that are related to the organization of the enterprise or to marketing its products. These strategies implemented can enable the SMEs to compete and to develop. The advancement in technology has left no option for the SMEs but to adapt to these new innovative practices for prompt and accurate decision-making. If small business wish to survive and grow in today's turbulent environment, they have to make every effort to introduce an innovative approach and creativity.

Acknowledgment

This research was funded by the State Program of Republic of Moldova, Configuration of the innovative business in the context of regional competition" (project cod 20.80009.0807.42).

Abstract

The purpose of the article is to study the problems of legal responsibility for corruption offenses in Ukraine, the distinction between corruption crimes and corruption offenses and the application of appropriate disciplinary liability for their commission in order to improve the anti-corruption legislation of Ukraine. General dialectical method and special theoretical research methods are used in the article. In particular, the dialectical method is used to understand the nature of the types of legal responsibility for corruption offenses; scientific abstraction – defining signs and characteristics of corruption crime as a type of offenses; system analysis – establishing the systemic nature of anti-corruption activities; comparative analysis – determining the correlation between corruption crimes and corruption offenses; statistical methods - used in the analysis of the level of corruption in Ukraine according to the Corruption Perceptions Index. The analysis of the status of corruption and anti-corruption activities in Ukraine showed that the main problems of legal responsibility for corruption offenses are related to insufficient judicial practice, lack of prudent regulatory policy, disadvantages of Ukrainian anti-corruption laws, which needs improvement. Solving these problems is to establish tougher measures of responsibility for corruption, and to predict the criminal responsibility for persons who submit false information in their declarations and the application of disciplinary liability in the form of dismissal for committing a corruption crime and a corruption offense under administrative law. It will reduce the number of offenses related to the submission of declarations with false information and in general reduce the level of corruption in Ukraine.

Keywords: Ukraine, corruption, offense, legal responsibility.

Introduction

Preventing corruption is one of the most current social problems nowadays. Solving this problem is extremely important and difficult for many countries. This fully applies to Ukraine, the countries of the European Union and other countries, where corruption has become a factor that really threatens the national security and constitutional order of states. Corruption negatively affects all spheres of societal life: governance, economics and politics, legal and social. This is one of the main challenges on the way to building a democratic, social and legal state.

The Preamble to the Constitution of Ukraine (Verkhovna Rada of Ukraine, 2014) confirms the European identity of the Ukrainian people and the irreversibility of Ukraine's European and Euro-Atlantic course. Choosing a course on European integration, Ukraine must comply with the requirements of the European Union in the framework of the "Visa Liberalisation Action Plan". Among the demands made by the European Union to Ukraine in the framework of the "Visa Liberalisation Action Plan ", the key issue is fighting against corruption. The Commission through regular progress reports, transmitted to the European Parliament and the Council, has closely monitored the implementation of the Action Plans which are publicly available. Moreover, the progress has been monitored

through regular meetings of senior ranking officials from the European Commission and the partner countries (European Commission, 2017).

Literature Review

Corruption has adverse consequences on income distribution, consumption patterns, investment, the government budget and on economic reforms (Rose-Ackerman, 1997). In the research by Mauro (1998) it was founded that corruption negatively affects all spheres of human life: governance, economics, social and legal spheres and international relations. Corruption is most prevalent where other forms of institutional inefficiency exist, such as political instability, bureaucratic red tape, and weak legislative and judicial systems.

The level of corruption is growing in Ukraine despite the fact that have been implemented in Ukraine in the last few years – a special anti-corruption law has been adopted, public authorities have been established, including the National Anti-Corruption Bureau of Ukraine, the State Bureau of Investigation, High Anti-Corruption Court, the National Agency of Ukraine for Detection, Investigation and Management of Assets Obtained from Corruption and Other Crimes, and other authorities.

Ukraine is perceived by other countries as a corrupt state with an unfavorable investment climate, where corruption has penetrated most relations between the citizens and the government, and has generated a deep public distrust in the state's ability to ensure constitutionally guaranteed human rights and freedoms. According to Transparency International datas, Ukraine ranks 126 out of 180 places in terms of corruption, 30 points out of 100. Since 1995, the Corruption Perceptions Index, (Transparency International's flagship research tool), has become the leading global indicator of corruption in the public sector (Transparency International, 2019).

Table 1: Corruption Perceptions Index of Ukraine, 2012-2019

year	2012	2013	2014	2015	2016	2017	2018	2019
CPI	26	25	26	27	29	30	32	30

Source: Corruption Perceptions Index of Ukraine 2012-2019 by Transparency International

Transparency International believes that the ruling of the Constitutional Court's of Ukraine makes the entire e-declarations system useless, undermines the system of corruption prevention, and threw back Ukraine's anti-corruption reforms by decades. We think that Delia Ferreira Rubio, head of Transparency International, fairly said that the asset declarations registry must be available to the public. Access to information is the key of democracy and an essential step in the fight against corruption. Ukrainians deserve to know how public funds are being spent and have the tools to hold officials accountable" (Transparency International, 2020).

In a research by Gray and Kaufman (1998) the reform of government institutions may include civil service reform; improved budgeting, financial management, and tax administration; and strengthened legal and judicial systems. Such reforms should involve changing government structures and procedures, to put more attention on competition and incentives in the public sector, and strengthening internal and external systems of incentives and counter weights. As a complement to these broader reforms, the transparent implementation of enforcement measures, such as prosecuting some prominent corrupt figures, can also have an impact.

The current stage of development of anti-corruption laws in Ukraine is characterized by radical changes and transformations. Thus, according to the Decision of the Constitutional Court of Ukraine (CCU) №13-r/2020 adopted on October 27, 2020, certain provisions on legal liability for corruption offenses were declared unconstitutional (Constitutional Court of Ukraine, 2020).

Research Results

According to Article 1 of the Law of Ukraine "On Prevention of Corruption" (Verkhovna Rada of Ukraine, 2014) the corruption offense is an act containing signs of corruption, to which, in particular, includes the illegal misuse of authority in order to obtain undue benefits (bribe). The following types of legal responsibility for corruption offenses are applied to guilty persons: criminal, disciplinary, administrative and civil responsibilities.

One of Preventive Measures for the purposes of Inter-American Convention against corruption (United States Congress, 1996) are systems for registering the income, assets and liabilities of those persons who perform public functions in certain posts as specified by law and, where appropriate, for publication of such registrations.

In accordance with the Article 8 of United Nations Convention against corruption (United Nations, 2003) each State Party shall endeavour, where appropriate and in accordance with the fundamental principles of its domestic law, to establish measures and systems requiring public officials to make declarations to appropriate authorities, in particular, regarding, their outside activities, employment, investments, assets and substantial gifts or benefits which may give rise to a conflict of interest with respect to their public official's functions.

According to Article 45 of the Law of Ukraine “On Prevention of Corruption” (Verkhovna Rada of Ukraine, 2014) provides for the submission of declarations of persons authorized to perform the functions of the state government or local self-government. This is one of the measures to prevent violations of financial control requirements by the National Agency for the Prevention of Corruption.

In the research of Messick (2009), mandating that officials divulge information about their finances may reduce corruption in several ways. Disclosure allows a public employee’s wealth to be monitored. If periodic disclosures show an unusual increase in assets or unfamiliar expenditures, the employee can be asked for an explanation. It can strengthen confidence in government by reassuring citizens that conflicts of interests are being policed and public employees’ finances scrutinized.

Nowadays, as analyzed by Tytko and Stepanova (2019), the declaration of assets is a part of the system of financial control since this procedure can be considered as an administrative and legal means of preventing corruption. Foreign experience shows that a declaration can include not only the obligation to declare incomes and expenditures but also the fixing of personal and family members’ private interests.
In the study of OECD (2011) it was determined that corrupt officials often hide their assets under the names of their relatives, their spouses and other individuals. Therefore, it should be possible to monitor the wealth not only of a public official, but also close relatives and household members. This can be achieved through the public officials’ declarations system or through the tax system, or by law enforcement authorities.

The Constitutional Court of Ukraine has the opposite conclusion. Its Decision № 13-r / 2020 declared unconstitutional Article 366-1 of the Criminal Code of Ukraine on bringing a person to criminal responsibility for submitting knowingly false information (Constitutional Court of Ukraine, 2020).

According to Article 366-1 of the Criminal Code of Ukraine (Verkhovna Rada of Ukraine, 2001), the submission of knowingly false information in the declaration is punishable by a fine or imprisonment. Criminal responsibility arises if such information differs from reliable data in the amount of more than 250 subsistence minimums for able-bodied persons.

The decision of the Constitutional Court of Ukraine was based on the Decision №15-rp/2004 adopted on November 2, 2004, according to which the issue of compliance of the punishment with the committed crime is a separate manifestation of justice. The category of justice implies that the punishment for the crime should be commensurate with the crime and the punishment should be in fair proportion to the gravity and circumstances of the crime. That is, the state should use not excessive, but necessary measures for the crime (Constitutional Court of Ukraine, 2004).
It was necessary for the legislature to adopt a law establishing legal responsibility for false declarations. This is because the court must decide to prosecute such a crime. In our opinion, the legislature had two options for behavior. In the first case, a new article had to be added to the Criminal Code of Ukraine, which establishes criminal liability for false declarations. Another alternative way to solve this problem was to establish administrative responsibility in the form of a high penalty for a corruption offense. The Verkhovna Rada of Ukraine adopted a law supplementing with new articles the Code of Ukraine on Administrative Offenses and the Criminal Code of Ukraine on administrative and criminal responsibility for false declaration. If the information in the declaration differs from the reliable ones in the amount of 100 to 500 subsistence minimums, administrative responsibility will be applied. If in the amount of 500 to 4000 subsistence minimums for able-bodied persons - criminal responsibility will be applied. That is, the higher limit has been set for the application of criminal liability in case of false declaration.

In many cases, corruption crimes are separated from non-criminal corruption offenses by an extremely thin line. The boundaries of the corruption offense are very mobile. In some circumstances, a corruption offense may be recognized as an administrative or disciplinary offense, in others - a crime under the Criminal Code of Ukraine.

Lapteakru (1998) mentioned that corruption manifests itself not only as a criminal act, as there are less dangerous types of bribery. He pointed out that the components of corruption are immoral, disciplinary, administrative offenses, civil torts and crimes; but he did not specify which acts each of these types of offenses covers.

The issue of distinguishing between "corruption" and "crime" is important. Shalgunova (1999) believes that corruption is a component of official crime. We partially agree with this wording, but in addition to corruption crimes, there are other crimes for which criminal liability is applied. Most domestic and foreign scientists do not equate these concepts. On the one hand, corruption is a narrower concept than “crime” and covers only a part of crimes related to corruption. On the other hand, corruption is a broader concept than crime, as it covers not only crimes but also administrative and disciplinary offenses.

Thus, individuals will in some cases be held administratively liable and in others prosecuted for the same illegal act, which in turn may serve as a basis for abuse by law enforcement officials. The distinction between these acts in this case is the cost of compensation or the amount of damage caused by unlawful actions of individuals.

In the research by Kolpakov (2003) the importance is in distinguishing between corruption crimes and administrative offenses is to determine the public danger of acts that have indications of corruption. Corruption offenses are socially harmful, and corruption crimes are socially dangerous. However, in the Criminal Code of Ukraine, illegal acts are called corruption offenses. In addition, in the Code of Ukraine on Administrative Offenses, socially harmful acts of corruption are called offenses related to corruption. This situation leads to confusion in the conceptual and categorical apparatus used in the field of corruption. The basic concepts and categories used in the anti-corruption legislation of Ukraine need to be improved.

It is also important to note that in the legislation of Ukraine the problems of labor relations in connection with the commission of a corruption offense remain unresolved. In most cases, a person who has been prosecuted administratively and civilly continues to work for a public authority. Research of legislation on disciplinary responsibility, indicates, that in case of criminal prosecution the employment contract with the guilty person is terminated. This requirement is enshrined in Article 36 of the Labor Code of Ukraine (Verkhovna Rada of Ukraine, 1971). Verdict which comes to the force sentencing an employee to imprisonment a reason for the termination of the employment contract and excludes the possibility of continuing his work.

But bringing to administrative responsibility usually is not a reason for termination of an employment contract. The only exception is if a member of the Commission on Senior Civil Service is brought to administrative responsibility for committing an offense related to corruption (Article 14 of the Law of Ukraine "On Civil Service") (Verkhovna Rada of Ukraine, 2015). Besides, the law stipulates that a person who has been subject to an administrative penalty for an offense related to corruption may not enter the civil service, – within three years from the date a court decision force.

Termination of civil service is possible if a person got a penalty of deprivation of the right to occupy certain positions or engage in certain activities related to the performance of state functions or local government.

In our opinion, changes should be made to the current legislation of Ukraine. It is necessary to establish that the reasons for termination of the employment contract are the entry into force of a court decision to bring a civil servant to administrative or criminal liability for a corruption offense. A civil servant who has committed a corruption offense is not entitled to work in a public authority. This requirement should also apply to local government officials.

Today, there is a problem when a person who is brought to administrative responsibility for a corruption-related offense continues to work in a position in a public authority. Analysis of the reasons for termination of the employment contract related to untimely submission of the declaration of income gives grounds to assert that such a reason is not entirely justified. Which offense has more harmful consequences: submission of a declaration with reliable information a few days later or timely submission of a declaration containing false information? In Article 6 of the Law of Ukraine "On the National Anti-Corruption Bureau of Ukraine», (Verkhovna Rada of Ukraine, 2014) untimely submission of the declaration is a ground for dismissal of the Director of the National Bureau. We believe that filing a declaration that contains false information causes greater social harm than filing a true declaration with a delay. Consequently, the submission of a declaration containing false information causes greater public harm than the late submission of a declaration.

Conclusions and Further Research

Corruption should be considered not only as a legal, but also as a social, political and economical problem of the society and the state. Without a significant reduction in the level of corruption, there can be no significant progress in the economical and political development of the state, the implementation of the rule of law, ensuring the constitutional rights and freedoms of human and citizen.

Corruption includes a set of various offenses, in particular crimes, administrative and disciplinary offenses, which together pose a threat to national security and, - violate fundamental rights and freedoms.

In our opinion, the fight against corruption has two important components: law-making and law-enforcement. The law-making component of the fight against corruption is to improve the legislation, in particular the establishment of criminal liability for submission a false declaration, regardless of the amount of aberration from reliable information; establishment of disciplinary responsibility in the form of firing from a job not only for committing a corruption crime, but also a corruption offense under administrative law; improvement of the conceptual and categorical apparatus used in the legislation of Ukraine.

The law-enforcement component of the fight against corruption is to improve the functioning of the courts. Most corruption cases are closed due to expiration; persons are not prosecuted because the prosecutor has no right to appeal the court decision in an administrative case. Acquittals in criminal cases and widespread use of mitigating circumstances in sentencing are widespread in Ukraine. Only a minority of cases end in criminal prosecution. That is, in addition to eliminating gaps and overcoming conflicts in the legislation of Ukraine, it is necessary to ensure the real functioning of the judicial system. Of course, these components of the fight against corruption and other unresolved problems in the area of prevention of corruption should be the subject of further research.

Therefore, fighting corruption is one of the main problems of our country, which should consider certain courses of European integration, based on international regulations and requirements of the European Union. All public authorities in Ukraine need to act in concert in one direction. The different approach to the application of responsibility for corruption offenses and the understanding of the responsibilities of civil servants to society and the state lead to the fact that Ukraine can go back in the development of the fight against corruption and cancel everything that has been achieved in recent years.

Abstract

Sustainable development aims for a better future for us and future generations. To follow it, the 2030 Agenda for Sustainable Development was elaborated, which proposes, through the 17 objectives, the intervention directions. The 2030 Agenda was adopted by both Romania and the EU, each objective being consenting of a set of indicators. The objective of this paper is the comparative analysis of the most important indicators of SDG 8 Objective Decent work and economic growth in the EU and Romania. They were analyzed in three essential moments of the development of Romania: 2008, the year of accession to the EU, 2013, and present. The research used secondary data. Romania's stated goal is to be a regional leader in implementing sustainable development goals. Based on the results obtained from data available in 2020, a set of recommendations was developed to achieve the proposed target for 2030. The paper also analyzed the sustainable development indicators for the EU and Romania about the new EU 2030 Agenda. Its main indicators are compared with values at the EU level, resulting in relevant recommendations that can be implemented to meet the objectives of the EU 2030 Agenda.

Keywords: sustainable development, EU 2030 Agenda, economic growth

Introduction

The first definition of sustainable development was developed in 1987 through the Brundtland Report. Sustainable development is a way for people to use resources without the planet being left without resources for decades, centuries, or even millennia. This means growing without damaging or harming the environment. The term used by the Brundtland Commission is sustainable development that "meets the needs of the present and also compromises the ability of future generations to meet their own needs" (Brundtland, 1987).

Sustainable development is based on three pillars (Ukaga et al., 2019):

1. Environmental sustainability refers to the ecological component that must be found in every initiative by protecting biodiversity;
2. Economic sustainability or sustainable development in economic terms involves methods of economic diversification. These can be, access to services and environmental protection that are necessary to ensure the success and sustainability of development;
3. Socio-political sustainability presupposes, on the one hand, healthy socio-political relations that allow the development of all states, based on partnership and mutual support.

The principle behind sustainable development is the systematic integration of environmental, social, and economic issues into all aspects of decision-making over generations. The 17 Global Sustainable Development Goals (SDGs) reflect a balanced agenda of economic, social, and environmental goals and objectives. To achieve the SDGs,

countries will need to recognize and appreciate the existence of potential trade-offs and develop ways to manage them.

In 2015, at a meeting of the United Nations General Assembly in New York, a historic document was adopted: the 2030 Agenda for Sustainable Development. Through its 17 goals, this document seeks to achieve a better future not only for us but also for the next generation. Built on the three pillars of sustainable development – economic, social, and environmental – the 2030 Agenda was also adopted by Romania and the European Union. This strategy translates the Agenda to the realities of Romania today.

The Romanian Perspective on Sustainable Development from 2008 to 2018

In Romania, as a member state of the European Union, in 1997 the National Center for Sustainable Development was created, under the auspices of the Romanian Academy, which over time managed to become the most authorized voice in civil society in the field of developing proposals and strategies for development. The purpose of the National Center for Sustainable Development is to identify Romania's sustainable development priorities and achieve them through concrete projects at national and local levels.

The Government of Romania, meeting on November 12, 2008, debated and approved the National Strategy for Sustainable Development for the years 2013–2020–2030. The elaboration of the Strategy is the result of the obligation assumed by Romania as a member state of the European Union according to the objectives agreed at the community level, especially those established in the Accession Treaty, in the Lisbon Strategy for growth and jobs, and the renewed EU Strategy for Sustainable Development since 2006. Following the debate of the project at the national and regional level, with the active involvement of stakeholders and with the conceptual support of the Romanian Academy, the Strategy proposes a vision of Romania's development in the perspective of the next two decades:

- Horizon 2013: Organic incorporation of the principles and practices of sustainable development in all public programs and policies of Romania as a member state of the European Union;
- Horizon 2020: Reaching the current average level of European Union countries at the main indicators of sustainable development;
- Horizon 2030: The significant approximation of Romania to the average level of that year of the member countries of the European Union in terms of sustainable development.

To achieve sustainable development in Romania, and, by extension, to meet the goals of the 2030 Agenda, together with the European Union's commitments regarding the 2030 Agenda, this Strategy is built around the citizen and the needs of future generations. Romania's Sustainable Development Strategy has based on the premise that sustainable development requires a mindset which, once adopted by the citizen, will help create a more equitable society defined by balance and solidarity, and the ability to cope with the changes brought about by current global, regional and national challenges, including a declining population (Deselnicu et al. 2018). The state's concern for its citizens, and the citizens' respect for public institutions, for their peers, for moral values, and cultural and ethnic diversity will lead to a sustainable society.

The 2030 Agenda includes a set of 17 Sustainable Development Goals (SDGs) and an action plan for the next 15 years, to eradicate extreme poverty, combat inequality, injustice and protect the planet by 2030. The 17 Sustainable Development Goals (SDGs) and their related 169 targets, which are at the heart of the UN's 2030 Agenda for Sustainable Development, provide a new policy framework worldwide towards ending all forms of poverty, fighting inequalities, and tackling climate change while ensuring that no one is left behind.

The European Union Perspective on Sustainable Development

The concept of sustainable development in the European Union was introduced into the Strategy for an Enlarged Europe 2006. This strategy was part of a unified and coherent strategic vision with the general objective of continuously improving the quality of life for present and future generations. Its goal was to create sustainable communities capable of managing and using resources efficiently and of exploiting the ecological and social potential of the economy to ensure prosperity, environmental protection, and social cohesion (Freeman, 2010).

On 22 November 2016, the European Commission published “Next Steps for a Sustainable European Future.” This document presents the European Union’s response to the 2030 Agenda, confirming the need to integrate the Sustainable Development Goals into the European policy framework while highlighting the European Commission’s current priorities. The document also presents an evaluation of the Union’s current situation and identifies the most

relevant concerns regarding sustainability (Deselnicu et al., 2017). The European Union declared itself in favor of a sustainable development that will ensure "a life of dignity for all within the Planet's limits that reconciles economic prosperity and efficiency, peaceful societies, social inclusion, and environmental responsibility (Mohieldin, 2017). "The EU Council's conclusions in "A sustainable future for Europe: the EU response to the 2030 Agenda for Sustainable Development," adopted on 20 June 2017, represents the political document adopted by the member states of the EU regarding the implementation of the 2030 Agenda for Sustainable Development. The EU response to the 2030 Agenda is to integrate the 17 SDGs into its public policies to support the global effort to build a sustainable future.

Comparative analysis of Sustainable Development Indicators

In this paper, one of the 17 objectives of sustainable development has been chosen. Romania's progress was analyzed, in relation to the EU average from 2008, the year of Romania's accession to the EU, and 2018.

Decent work and economic growth (SDG 8) recognizes the importance of sustained economic growth and high levels of economic productivity for the creation of well-paid quality jobs and the achievement of global prosperity. SDG 8 calls for providing opportunities for full and productive employment and decent work for all while eradicating forced labor, human trafficking, and child labor and promoting labor rights and safe and secure working environments. The indicator is part of the EU Sustainable Development Goals (SDG) indicator set. It is used to monitor progress towards SDG 8 on decent work and economic growth. SDG 8, among other things, calls for providing opportunities for full and productive employment and decent work for all.

This objective consists of nine indicators grouped in three important directions: sustainable economic growth, employment, decent work. When discussing sustainable economic growth we consider the following indicators:

- Real GDP;
- Investment of GDP;
- Resource Productivity.

Employment is defined by the four indicators that represent the situation and the level of achievement of SDG 8, the indicators that define it are:

- The young people neither in employment nor in education or training (NEET);
- Employment rate;
- Long-term unemployment rate;
- Inactive population due to caring responsibilities.

Decent work, the third pillar on which SDG8 is consolidated, consists of two sustainability indicators:

- People killed in accidents at work;
- In work at-risk-of-poverty rate.

SDG 8 evolution from 2008 to 2018, in Romania & EU level

Economic growth	RO 2008	EU 2008	RO 2013	EU 2013	RO 2018	EU 2018
Real GDP	6.730	25.580	6.760	25.750	8.740	28.280
Investment of GDP	37,29	23,57	24,8	19,5	21,0	20,9
Resource Productivity	0,30	1,50	0,38	1,98	0,40	2,04
Employment						
The young people neither in employment nor in education or training (NEET)	13,2	12,3	19,6	15,9	17,0	12,9
Employment rate	64,4	69,8	64,7	68,4	69,9	73,2

Long-term unemployment rate	2,4	2,8	3,2	5,1	1,8	2,9
Inactive population due to caring responsibilities	16,5	19	28,7	25,5	31,7	27,1
Decent work						
People killed in accidents at work	-	-	5,78	1,91	4,49	1,65
In work at-risk-of-poverty rate	17,4	8,6	14,4	9	15,3	9,5

Authors own work compliant with Eurostat 2020

In recent years, Romania has made progress in this regard, according to the indicators related to SDG 8. However, the data show that most indicators still have a deficit that needs to be recovered. The long-term unemployment rate is declining and is below the European average. This means that fewer unemployed people in Romania cannot find a job for more than 12 months. This indicator reached historic highs in 2018, according to data provided by Eurostat (2020). Romania has also reached a historic percentage. The difference between the EU 27 average and Romania is 3%. These results are very important, being a relevant economic indicator for analysis. As in the case of other indicators, there can be observed large differences between countries. Romania has the highest percentage, followed by Sweden (82.6%), while the lowest percentage is held by Greece (59.7%).

Also, in terms of employment, the rate of young people (aged 15-29) who are not employed and do not attend courses (NEETs) is 17%, 5 percent above the European average. Dual-school vocational training programs, focusing on training young people in line with labor market requirements, could be an extremely useful tool for solving this problem. The transition of young people from education to work is hampered by specific difficulties. As a result, there are relatively low employment rates, a high unemployment rate, and high rates of young people who are not employed and do not attend any education or training (NEET) program. It can be noticed that Romania has a higher percentage within this indicator than the EU 27 average. According to the data, the percentage is decreasing starting with 2015, when a maximum of 21% of the total population analyzed was reached, although, in 2019, the difference between the EU27 and Romania average is 5 percent.

There has been a sharp increase in sustainable economic growth, where both per capita GDP and resource productivity have improved. However, the values of these indicators remain below the European average. There is a major difference in the level of the average indicator in the 27 EU states and Romania's level. Resource productivity varies greatly from one Member State to another. It depends to a large extent on the structure of national economies and the size and structure of their international trade. Usually, open industrial economies consume more resources because they import large quantities of raw materials, which are then exported as finished products. Service-based economies, on the other hand, tend to generate GDP from activities that consume fewer raw materials, such as financial services, tourism, the arts and recreation, healthcare, and public administration. Therefore, service-based savings appear to be more efficient because they consume fewer material resources per euro of production.

Another encouraging aspect is the fact that the percentage of GDP for investments is higher in Romania than the European average. However, an increase is needed to catch up with the West. The government's economic recovery plan is based on a high degree of public investment.

Recommendations to Reach the Proposed Target for 2030

The following set of recommendations was suggested for Romania to reach its proposed target in terms of sustainable development for the year 2030:

- Development of public-private partnership by increasing the number of education classes in the dual system;
- Initiation of basic vocational training programs in correlation with the requirements of the labor market, focusing on young or socially vulnerable segments of the population;
- Elaboration and implementation of a coherent program for the development of tourism, including agrotourism, generator of jobs and considerable income in areas where the employment rate is low;
- The transition to the circular economy by changing the mentality through education, changing consumer behavior, and developing financial mechanisms to support the transition period;

• Reduction of food waste along the entire production-transport-processing-marketing-consumption route, from farm harvesting to final waste disposal;

• Popularization and promotion of sustainable production and consumption models through information campaigns for the general public and efforts to expand these good practices in school and extracurricular educational programs;

• Encourage companies, especially large and transnational companies, to adopt sustainable practices and integrate sustainability information into the reporting cycle.

Decent Work and Economic Growth (SDG 8) in the Context of the Pandemic

If in recent years there is a labor shortage in Romania, the economic crisis generated by the pandemic has led to rising unemployment. The labor market is affected, but the negative effects can be combated by investing in training and retraining. Also, the digital revolution, but also the technological needs to mitigate the effects of climate change will certainly have an impact on the labor market.

National challenges for 2030 include:

• maintaining the pace of economic growth to reduce the gap with other EU countries;

• achieving higher levels of productivity through diversification, technological modernization, and innovation;

• strengthening the capacity of domestic financial institutions to encourage and expand access to banking services.

Results

In this paper, we analyzed the evolution of Romania from the moment of accession to the EU, 2008, until now from the point of view of the sustainability objective Decent work and economic growth (SDG 8), implicitly what new sustainability indicators form it. Following the analysis, it was found that Romania is following a positive trend and continuous improvement of indicators, as is the case at the EU level. The year 2008 shows a very low level compared to the EU average but a sustained increase was observed. The low level of resource productivity and domestic consumption of materials is an effect of the type of Romanian economy, in which the service industry has a much lower share than the European average. In parallel, the positive results and sustained growth are observed in all the sustainability indicators analyzed. Growth is a constant that can be observed in the analyzed decade.

Conclusion

In this paper, following the analysis, it was found that Romania makes sustained progress in each period analyzed, five-year cycle, in terms of the objective of Decent work and economic growth (SDG 8) and each of its indicators. It is observed that the EU trend follows and has a real chance to become a regional leader in the implementation of the 2030 Sustainability Agenda. To become a regional leader in the implementation of the 2030 Sustainability Agenda, it is necessary to involve all actors in achieving the objectives, in this direction adds pandemic context in which solutions. The involvement of every citizen is imperative in the realization of this strategy. It is necessary to form the critical mass, the moment when these principles will be learned by the majority of citizens, to achieve the desired change. This way we can be optimistic in terms of achieving the proposed objectives.

Implementation of Telework in the European Union

Radu MARIN

National University of Political Studies and Public Administration, Bucharest, Romania,
radumarin62@gmail.com

Abstract

The paper aims to analyse, at European level, the evolution of telework implementation over the last two decades. The paper will present documents which are underlying the implementation of telework and which have led, in some of these states, to the insertion in the national laws of the concepts of telework, tele-worker, as well as the regulations governing the conduct of work in this form. The research was conducted only for a few Member States of the European Union, which we considered to be relevant either in terms of economic development, geographical position, cultural values or the population number (Austria, Denmark, France, Germany, Greece, Italy, Poland). We consider this study to be useful for analysing how different states have understood to implement telework, especially in the current conditions created by the COVID-19 pandemic, which has led certain states to reconsider the beneficial effects that telework can bring to the survival and/or development of enterprises in the current economy.

Keywords: Telework, Teleworkers, Labour Agreements

JEL Classification: J41, J81, M54

Introduction

The problem of telework has been the subject of research in numerous empirical studies, has been addressed in numerous papers and has been the theme of many books. Also, the terms telework, teleworkers, as well as the principles that must govern telework, were long topics of discussion between trade unions and employers' organisations. The provisions of some of the framework agreements signed by them were the basis for changes in national legislation on these topics. The high level of interest that telework topic has gained is due to the fact that it can be an important factor in increasing the attraction, motivation and retention of employees, given the decisive contribution it can make to increasing work-life efficiency, flexibility of working hours, reducing costs and commute time. In fact, work-from-home is introduced, from a long time and by many organizations, in the category of employees' rewards. Widespread use of telework in an economy can avoid congestion in large urban centers and reducing pollution. It can be considered a way of working meant to give eased access to the labour market for people belonging to vulnerable social groups, people living in isolated places, to whom such access would be otherwise difficult. On the other hand, as the current pandemic has demonstrated, it can be a means of protecting the health of employees, without causing total disruption of organisations' activity. The reasons that have led to the long hesitations that have existed in the implementation of telework in certain states are based on certain negative effects that it can generate. From the employees' point of view, it may lead to the limitation of professional interactions, isolation in relation to customers, lack of an adequate place to carry out the activity (if it takes place in the home office system). From employers' point of view of, it can be mentioned that they feel that they are losing control of their own employees, they fear that leaks of confidential data and information could occur.

Telework is a form of work that fits very well into the current economy, based on globalisation, digitalisation and the growing need for access to and sharing information. However, it can be said that, at present, there is still no very clear scientific and legislative demarcation between telework and related concepts, such as remote work or telecommuting.

Research Outline

The idea that the goals set at the European Council meeting held in Lisbon on March 23rd-24th 2000 are at the basis of the European legislation regarding telework, it is widely accepted. These objectives also include the implementation of

eEurope Action Plan, considering that the transition to a digital, knowledge-based economy, will be an important factor in terms of growth, competitiveness and job market. Following the objectives set out at this meeting, the European Commission prepared eEurope 2002 Action Plan for the European Council held in Feira on June 19th – 20th 2000. The Action Plan identified the modernisation of the work organisation as one of the challenges that EU is facing. The eEurope 2002 Action Plan for the European Council emphasized that greater flexibility will lead to the technological advantages offered by a flexible work time and work place and that the social partners were urged, for the benefit of both employees and employers, to support flexible work arrangements. (eEurope 2002, p. 15).

One response to this challenge identified in the plan was for the social partners from the Member States to reach to agreements that would, where possible, support greater flexibility in jobs, agreements to be supported by the Member States as well. Telework was given as an example for such flexibility (eEurope 2002, p.16). In order to support this initiative, the social partners signed the Framework Agreement regarding telework in Brussels on July 16th 2002. The signatories were: European Trade Union Confederation (ETUC), Union of Industrial and Employers' Confederations of Europe / European Union of Crafts and Small-Size Enterprises (UNICE/UEAPME) and Centre of Enterprises with Public Participation (ECPE). The agreement defined the concept of telework as being "that form of organising or/and performing work using information technology, in the context of an employment contract/relationship, where work, which could also be performed at the employer's premises, is carried out away from those premises on a regular basis", and the tele-worker was defined as "any person carrying out telework in the context of such a contract". The key points to be addressed were defined given the specific nature of telework: its voluntary nature, employments' conditions, data protection, privacy, equipment, occupational health and security, work organising, teleworkers' training and the collective rights of the teleworkers. It should be noted that the signatories did not considered that it is necessary to transpose the agreement into an European directive. Due to the fact that the agreement had mentioned that the implementation of telework should be carried out within three years of the signing of the agreement, in 2006 the signatory parties issued the report named "Implementation of the European framework agreement on telework" in order to analyze the state of implementation of telework. To the agreement had been invited to join the 15 countries already members at the time of the signing of the agreement, those submitted by the ten countries that had joined in 2004, and those submitted by the countries invited to join, namely Romania and Bulgaria, Bulgaria noting, at the time of the report, that the implementation process had not yet begun and that social actors were debating how to join it.

Findings

Austria

Austria adopted the first collective agreement containing provisions related to telework in the oil and gas industry in the late 1990s. With regard to the European framework agreement, Österreichischer Gewerkschaftsbund (Austrian Trade Union Federation) argued that Austrian regulations cannot be questioned, given that they have a higher level than the minimum standards contained in the European framework agreement (Georg, 2007). However, the provisions of the European framework agreement have been implemented in Austria by introducing telework clauses in the majority of sectorial and industry-wide collective agreements. It should be noted that there are no provisions regarding telework in the Austrians' labour law, since, according to government declarations, teleworkers fully enjoy the rights granted by labour law (voluntary character, equal rights, guaranteeing working conditions, ensuring health and safety at work). The "Report on the implementation of the European social partners' Framework Agreement on Telework" states that, unlike in other countries, in Austria access to the teleworker's home of labour inspectors, health and safety services and the employer can only be made at the request of the teleworker (Commission of the European Communities, Report on the implementation of the European social partners' Framework Agreement on Telework. 2008, p.9). We can note the fact that this last provision brings an addition in relation to European framework agreement.

The Commission of the European Communities report mentioned that the concluded sectorial collective agreements (many of them being concluded before the signing of the European framework agreement) are either of a general nature and refer only to clauses relating to the voluntary nature, the need for a written agreement, or contain more detailed provisions on working time, labour rights, reversibility, training, data protection, prevention of isolation, equipment and costs (Committee of the European Communities, 2008, p.9-10). Telework in the European Union (2010) mentions that the attempt made to amend the Labour Constitution Act for the full implementation of the provisions of the framework agreement failed in 2005 by the opposition of the Austrian Federal Economic Chamber (Wirtschaftskammer Österreich).

Denmark

Larsen (2008) found that, although telework provisions existed in Denmark as early as the 1990s, the European framework agreement was implemented quite slowly in that country. The author considered that this slowness is explained precisely by the fact that there were still collective agreements with their own rules and procedures on telework before 2002. The report "Telework in the European Union", published in 2010 by the European Foundation for the Improvement of living and working conditions, found that in Denmark the implementation of the European framework agreement was done only at sectoral and cross-sectoral level, often these framework agreements being not always able to implement the provisions of the European Framework Agreement. Batina (2012) found that in 2005 the social partners made changes to the existing collective agreement. An explanation of the fact that a framework agreement has not been reached at national level may be that there are several definitions of telework adopted by the social partners (Larsen, 2008):

Danish Employers' Association for the Financial Sector and the Financial Services' Union considered, in 2003, that telework is understood as being work which, after an agreement with the company, is carried out outside the company's premises, such as the employee's home. The agreement does not include work performed at a remote posting and business-related travelling. Telework does not include mobile work such as that carried out by, for instance, sales workers and others who perform work at shifting locations. Potential agreements with these types of employees regarding work at home are, however, included in the agreement (Larsen, 2008).

Ministry of Finance considered, in 2005, that teleworking is work that can be performed remotely from the normal workplace using a personal computer (PC), an electronic communication form or some other similar equipment provided by the employer. The type of work that can be performed by teleworking must be of a repetitive nature in order to be covered by the agreement and can only be undertaken within a proportion of the agreed working hours. The agreement does not include work performed at a remote posting or during business travel. Teleworking does not include mobile work, that is, work performed at shifting locations (Larsen, 2008).

Association of Local Government Employees' Organisations considered, in 1997 and 2005, that teleworking and home-based work are a type of work that is performed remotely from the normal workplace by the use of a PC, an electronic communication form or other form of material which is made available by the employer. Work which is performed as telework and home-based work has to have a regular recurring character to be included by the agreement and can only be used as part of the agreed working hours (Larsen, 2008).

France

On 19 July 2005, the Inter-professional National Agreement - Telework (ASET0551387M) was signed in France. The signatories of the agreement highlight the advantages offered by the application of telework: organisations have the opportunity to modernize their work organisation, and employees gain greater autonomy in the performance of their work tasks and can better integrate their working life with their personal life; telework can ensure the combination of flexibility and job security through the optimal use of information and communication technologies; telework can ensure increased job quality and provide additional opportunities for access and retention of jobs for people with disabilities; telework is a factor of economic development, favor the provision of the right to work and contributes to the fight against leaving certain territories (ASET0551387M, 2005, p.91-92). Telework was defined by the agreement as: "a form of organisation and/or performance of work by the use of information technology in the context of an employment contract and in which work that could also have been carried out in the employer's premises is carried out outside those premises on a regular basis". The teleworker was defined as "any employee of the company who carries out, either from employment or subsequently, telework, as defined, either as defined in the agreement or under conditions adapted to the field, established by an agreement at branch or enterprise level, specifying the categories of employees to whom it applies" (ASET0551387M, 2005, p.92). The agreement stipulated the principles which were to characterise the telework contract: the voluntary nature of the contract, reversibility and insertion, equal rights for the teleworkers in respect with the rights of the employees working within employers' premises, the obligation of teleworkers to take the necessary measures for data protection, the right of the teleworker to have it's personal life with no intrusion from the employer, the employer obligation to provide, install and maintain the work equipment and the teleworker obligation to protect it, the employers' assumption of costs directly related to telework, the obligation of the teleworker to comply with the employers' provisions regarding work related health and safety measures, the right of the teleworker to manage his work schedule, the right of the teleworker to benefit from the same rights related to work training and the same career development opportunities as any other colleague working within the employers' premises and also to have the same collective rights as them.

The provisions of the Inter-professional National Agreement - Telework were subsequently reflected in the provisions of Law No. 387 of 22 March 2012, which supplements the Labour Code.

Germany

The Bundesvereinigung der Deutschen Arbeitgeberverbände (Conference of Employees' Associations of Germany) and Deutscher Gewerkschaftsbund (German Trade Union Federation) adopted, as early as 16 July 2002, a joint declaration, welcoming the signing of the European framework agreement and urging the social partners to design, at sectorial and enterprise level, the needed rules required for the implementation of the principles of the European framework agreement on the German labour market. The social partners attempted to disseminate information from the European framework agreement through a series of communication means (circulars, newsletters) and, in 2003, the German Employees' Association Federation and the German Trade Union Federation organised a transnational conference, which, in addition to presenting information regarding the European framework agreement, had proposed and exchanged views on the application of labour in enterprises.

It should be noted that in the opinion of both German social partners and the German Government, teleworkers were protected by the general legislative framework applicable to all German employees, which is why they did not considered the adoption of legislation regarding telework to be necessary. On the other hand, the social partners considered it is desirable that the approach towards telework issues should be done at the most decentralised level. These were the reasons which led to the fact that, since the signing of the joint declaration and up until now, the issue of telework has generally been regulated only at enterprise level (Commission of the European Communities, 2008, p.16-17).
It should be noted that in the documentary study we undertook we did not identify legislative references to telework in Germany. All the materials we have found in the research undertaken refer to work at home. However, in 1998, Gleiss Lutz Hootz Hirsch, in the article called "Germany: Telework under the German Labour Code", published on the site mondaq.com, considered that "In 2000, more than 5 million Germans will work under conditions considered as telework". The author stated that there is a provision in the Labour Code relating to a specific form of employment, namely that of a home worker (heimarbeiter).

Kraemer (2014), citing a study by Karl Brenke, found that Germany followed the growing trend in home work recorded by European countries in the 1990s and early years of this century. In 2004-2008, however, Germany began to register a negative trend. The author found that in 2012 Germany had returned to the same percentage of workers working from home, i.e. 1.6% who carried out this work predominantly and 4% who carried it out occasionally. The percentage was identical to that recorded by Germany in 1992 and was below the average recorded by E28, Iceland and Switzerland (Kraemer, 2014).

An article published by Economy & Business on 20 October 2020 mentioned that Germany intends to introduce a legal framework for telework. The article also mentions that there are criticisms of the bill, fearing that the introduction of this form of work could lead to a restriction of the collective bargaining power of workers and allow businesses to outsource jobs.

Greece

The first mention of telework appears in Greeks' legislation in the 1st article of Act no. 2369 of 1998, which mentioned telework among the accepted forms of work.

Stamati (2006) and Lampousaki (2008) show that in Greece the implementation of the provisions of the European framework agreement was done by introducing them into the National General Collective Contract (2006-2007). With regard to the 3rd article of the framework agreement, conditions were introduced concerning the written information of the employee on the conditions governing the telework contract, relating to the additional information to be made in writing in relation to the employee's arrondation within the organization, but those conditions were expressed in vague terms (Lampousaki, 2008). The 4th article of the framework agreement stated that teleworkers have the same rights, guaranteed by national law and collective agreements, as workers working at the employer's premises. The document agreed in Greece stipulated that, taking into account the special conditions imposed by telework, there could be additional special collective or individual contracts. The Greek trade unions agreement did not make it compulsory to negotiate with trade unions if the employer wanted to introduce telework. The expression in the document was "to seek opinion". As regards occupational health and safety, it was stipulated that those who are generally required to verify compliance with

national provisions (employer, employees, trade unions, health and safety officers) have the same obligation in the case of telework. The agreement also implemented other provisions of the European framework agreement: non-discrimination, respect for privacy, data protection.

The government appreciated this initiative, seeing it as an opportunity for persons that were part of vulnerable social groups and also for the inhabitants of the Greek islands. Employers' organisations were somehow reticent, due to the fear of decreased possibility of control over employees, the additional investments that will have to be made for the purchase of equipment, possible leaks of confidential data and possible problems related to the provision of training for teleworkers. The trade union organizations, although they had a positive position regarding telework, had questions about the nature of the employment contract. Both trade unions and employers' organisations agreed to introduce a more specific regulatory framework (Lampousaki, 2008).

Law 3846/2010 regulates telework for employers in Greece under the 5th article**,** referring to: the timeframe within which the employer was required to communicate to the employee information relating to the telework contract, the period during which the contract could be requested (claimed of either party), the employer's obligation to bear the costs involved in the telework, the period during which the employer was obliged to draw up the telework contract.

The Legislative Decree of 11 March 2020, issued in order to define the urgent measures that should be undertaken in order to counter the negative effects of the occurrence of the COVID-19 coronavirus and to limit its spread, allowed employers to unilaterally impose the use of telework (using the term of remote work) and “to organise problems arising in connection with it".

Italy

In Italy, the national interconfederal agreement was signed on 9 June 2004 with the aim of implementing the provisions of the European framework agreement. The agreement was signed by the main trade union confederations (Confederazione Generale Italiana del Lavoro, Confederazione Italiana Sindacati Lavoratori and Unione Italiana del Lavoro), as well as by 21 workers' associations from all the sectors. (Maddaloni & Pedersini, 2008). The agreement concerned issues that must regulate telework, thus taking over the principles stipulated in European framework agreement, with some changes (Maddaloni & Pedersini, 2008): voluntary nature, conditions of employment, provision of work equipment, privacy, health and safety, work organisation, provision of training.

It can be noted that, unlike European framework agreement, there was no reference to data protection. In Italy, in the private sector, there were a number of collective agreements at national level which sought to regulate telework, either before the European framework agreement or subsequently, in the light of the rules laid down therein. Thus, the agreement on commercial workers (IT0407108F), workers active in the textile sector, clothing and fashion (IT0405102N), employees of professionals (IT0605029I), employees in the medical field, employees in telecommunications (IT0512305F), in local public transport (IT0412101N) and air transport (Coletto, D., 2008).

Poland

On 30 June 2005, following negotiations, representatives of Poland's largest employers' and trade union organisations agreed on a draft agreement, under which the provisions of the 2002 European framework agreement would be implemented in Polish organisations. Although the agreement contained most of the provisions of the European framework agreement and even had additional provisions and provided detailed explanations on certain issues, it was never formally ratified. This was due to the fact that the signatory parties did not reach agreement on the list of amendments to be requested from the Government in order to transpose it into legislation.

The next step was taken in 2006, when the Ministry of Labour and Social Policy proposed an act to amend the Labour Code, which, after discussions with the social partners, in October 2006, was incorporated into the Labour Code in August 2007. Thus, a new chapter was added to him, comprising 13 articles, under the name "Employment in the form of telework". The definitions of telework and teleworkers were taken in full from the 2002 European framework agreement. Its provisions were also taken over.

The Labour Code has a provision that made telework difficult to apply under the conditions arising from the CoVID-19 pandemic. The following were stipulated: the conditions of an employer applying telework must be determined by an

agreement with the trade union or trade unions to which the employees are affiliated. It was noted that if an agreement with trade unions could not be reached within 30 days, the employer would be able to define the conditions of telework in accordance with the conditions at work, taking into account the conditions already established during the negotiation with the trade unions. It was that provision that produced the introduction into Polish law of the concept of remote work.

On 23 June 2020 the new version of the government act on the anti-crisis measures (Shield 4.0) was signed. In this act, clarifications were made and a number of provisions on remote work were regulated. This act was based on the provisions of the package of laws known as the Anti-Crisis Shield, signed on 31 March 2020. The following aspects were regulated in order to supplement the provisions already covered by the Labour Code: 1. equipment and materials used for remote work were generally provided by the employer, and there was also the possibility for the employee to use his own equipment, but only if the confidentiality and security of the protected information could be ensured; 2. the employee, on the basis of the regulations carried out by the employer, was obliged to keep records of the working time; 3. the employer had the right to give up work at any time in the form of remote work

Spain

The report of the Commission of the European Communities (2008, p.30) found that, in an attempt to align with-the provisions of the European framework agreement, the social partners introduced its essential principles into the Inter-confederal Agreements on Collective Bargaining signed by the main trade unions on 30 January 2003. The signatories stated that they supported the content of the European framework agreement and undertook to support its application by attaching to this end a Spanish translation of the document. The Inter-confederal Agreements on Collective Bargaining signed later in 2005 and 2007 again ruled on the essential principles of telework (voluntary and reversible character, equal rights for teleworkers) and showed the need for the social partners to manage to regulate the issue related to privacy, confidentiality, training, prevention and equipment. These agreements, which are not binding, can only be considered important in the light of the fact that they provided guidance on the signing of sectoral, regional or company-level collective agreements for members of the signatory trade unions.

Compulsory agreements, both based on the text of the European framework agreement, were signed for the chemical industry (2004) and for the daily press sector (2005) in order to regulate telework issues. A number of agreements of a regional and enterprise level were also signed, which signaled the aspects of telework, some of which referred to European framework agreement.

On 22 September 2020 the Royal Decree-Law No.28/2020 on remote working was issued. Within the Royal Decree-Law were defined three types of work (Rodriguez-Escudero, Ruiz de Salazar & Martínez de Luco Ybarra (2020, p.1): distance work, telework ("remote work carried out solely or mostly through computer and telecommunications systems ") and onsite work.

It should be noted that, although it recognised telework as one of the possible types of work, the law referred, in its entirety, only to provisions relating to remote work (in fact, the Royal Decree-Law was issued for the purpose of regulating remote work).

However, we can note that Royal Decree-Law takes over the provisions of the European framework agreement (Aspra & Alonso, 2020). The Decree-Law referred to equal opportunities, equal treatment and non-discrimination for employees who worked in this form, the voluntary and reversible nature of the contract for this form of work organisation, the minimum clauses to be laid down in such a contract, the support of the costs of equipment and the associated operating costs by the employer, the measurement of working time and the possibility of its 'flexibility', recognition of the right to health and safety at work for employees working in this form, recognition of the right to privacy, including recognition of the right of digital disconnection (Rodriguez-Escudero, Ruiz de Salazar & Martínez de Luco Ybarra (2020, p.4), recognition of collective rights.

It should be noted that, prior to this legislative act, in Spains' legislative system, only the provisions of the 13th article, relating to homework contracts, under the Law on the Status of Workers existed. Commission of the European Communities, in the framework of the Report on the Implementation of the Framework Agreement on Telework (2008, p. 31) considered that, by that act, the Spanish governors wanted to implement it solely for the purpose of regulating manual work, which is why it does not align with the realities imposed by telework, although certain elements could have been taken over (the written form to be given to the contract, the salary had to be at least equal to that of a worker in the same occupational category, the determination of the volume of activity, the right of collective representation).

It was necessary the issuance of Royal Decree-Law No.28/2020 for the implementation of one of the provisions of Royal Decree-Law No.8/2020 of 17 March 2020, issued with the aim of taking extraordinary and urgent measures to limit the impact produced by COVID-19. What is noteworthy is that one of the measures deemed necessary by Royal Decree-Law No. 8/2020 was to encourage telework, in this respect considering to be necessary to "establish systems of organisation to enable the continuation of work through alternative mechanisms, in particular telework and companies will have to take appropriate measures, if this is technically possible and reasonable and the effort required for adaptation is proportionate". It was considered that the adoption of these measures should be a priority in relation to the temporary cessation or reduction of activity. Even though in it's content the Royal Decree-Law No.28/2020 make reference only to remote work, it is mentioned the obligation of the employer to provide the equipment and its maintenance. It is also mentioned the right of the employee to digital disconnection. These two provisions, as well as the definition given by the legislative act to teleworking as being "work ----carried out solely or mostly through computer and telecommunications systems", we can consider this act as legislating telework. In support of our interpretation, it is also the fact that the Royal Decree-Law No. 8/2020, which inspired the issuance of this decree-law, spoke of "encouraging telework".

Aaranz Díaz (2008) and the Commission of the European Communities, in the framework of the Report on the Implementation of the Framework Agreement on Telework (2008, p.30) considered that the signing of the Royal Decree on the Regulation of Telework in the General State Administration was an important step in the implementation of telework in Spain. Following the discussion of the draft decree within the Spanish Economic and Social Committee, the draft decree, sketched in the spirit of the European framework agreement, was agreed by the main trade unions (Confedaración Syndicale de Commissiones Obreras, Unión General de Trabajadores, Central Trade Union Independiente y de Funciarios, Confederación Intertradeunionista) in May 2007. The decree did not apply to all public sector workers, which is applicable to civil servants and public employees in the central government system.

Although, until the Royal Decree-Law No.28/2020, telework was regulated in Spain only for the public sector, Batina (2012, p. 3) identifies an increase in the percentage of teleworkers in the total labour force, from 2.81% in 1999 to 8.4% in 2005 (of which 6.9% at least a quarter of working time and 1.5% almost all working time). Meanwhile a permanent increase was recorded, given that in 2002 it was at a value of around 5%, similar values being recorded in Germany and France (Implementation of the European framework agreement on telework, p. 4). However, in the last decade telework has seen a slower growth rate in Spain compared with the European average. Anghel, Cozzolino & Aitor (2020, p. 3), using information provided by Eurostat (Labour Force Survey, 2018), pointed out that, at the moment of the report, Spain was 6% below the European average, recording a telework value of 7.5%, while France reached 20.8% and Germany 11.6%. On the other hand, considering the figures for 2005 reported by Batina (2012, p. 3), figures also found in the report Telework in the European Union published in 2010 by the European Foundation for the Improvement of Living and Working Conditions and the figures relating to 2009 reported by Anghel, Cozzolino & Aitor (2020, p. 4), we can conclude that between 2005-2009 the percentage of teleworkers in Spain decreased from 8.4% to less than 6%.

Discussions

In the research carried out, we identified the specificities of each country with regard to the national implementation of telework and teleworker concepts, the way in which the principles of the European framework agreement, signed on 16 July 2002, in Brussels, were taken over.

We have been able to find that a number of states have taken over the provisions of the European framework agreement in nationals' law, some of which consider that including those provisions the text of a law is sufficient and others amending the Labour Code.

Other states considered that it was not necessary to implement these principles within the framework of national legislation, the principles being taken up and applied on the basis of agreements signed by trade unions at national level, or even on the basis of agreements signed at sectoral, regional or even enterprise level.

There are still states which use only the terms of remote work or even that of work-from- home, considering that employees who carry out this form of work benefit from all the rights granted by nationals' law to the employees who usually work in the employer's premises. That is why it does not consider it necessary to introduce references to telework in national law.

On the other hand, there are states which, although they had implemented the term of telework in national law, decided, following the situation created by the COVID-19 pandemic, that there was the possibility of returning to the title of remote work, considering it more flexible in terms of the possibility of application.

Conclusions

We note that at present there are a multitude of variants in which different EU states have understood to implement the provisions of the European Framework Agreement on Telework, signed on 16 July 2002, in Brussels. This situation can affect the human resources activity and policy of companies operating in several European countries, not being able to adopt a uniform practice regarding telework.

We consider that in this moment it is still necessary to clarify the notions of telework, remote work, work-from-home and adopting a unitary title, given that, in some states, although they have implemented the provisions of the European framework agreement, they have done so under the title of remote work. Work-from home should remain only what was initially, a benefit in the salary package of employees who work in a normal working regime.

The legislation on telework should be a very flexible one, so as to allow the very operative transition from a normal work regime to telework, in order to avoid situations arising in some states at the onset of the COVID-19 pandemic, states where companies have been prevented by national legislation from moving urgently to the telework regime.

Public Financing of Long-Term Care in Poland For the Erderly

Anna KONIECZNA

Department of Finance and Banking, Faculty of Economics, Finance and Management,
University of Szczecin
Szczecin, Poland, anna.konieczna@usz.edu.pl

Abstract

The aim of the article is to analyze the solutions of the Polish system of financing long-term care for the elderly. As part of the literature review, a short summary of the definitions of long-term care is presented, thus introduce its main essence. The diversity of the organization of long-term care services and their financing in Poland is the subject of a broader analysis of the financing of selected services in the scope of the entire health care system and life of society as a nation. The main focus was on the description of the Polish long-term care system, its organizational structure as well as the main principles and sources of financing. On the basis of the analysis of the Polish long-term care system, the issues concerning mainly the provision of benefits, their financing and availability were considered. The main difficulties in the functioning of the system were indicated, such as the lack of systemic legal regulations for all participants of the system, lack of coordination of activities, as well as dispersion of many sources of financing or the tasks of various benefits providers. As a summary was indicated the need for changes in the system, in particular towards the unification of rules and cooperation between entities and participants on many levels. The article presents the directions of changes in long-term care in Poland.

Keywords: Economy, Finance, Healthcare Management, Public Finance, Long-Term Care, Care Benefits.

JEL classification: H51, H53, H55, H75, I13, I18, I38, J11, J14.

Introduction

As a result of demographic processes, caring for an elderly person increases its importance, expanding the group of recipients. Intensively progressing changes in society determine the emerging problem of ensuring appropriate care and access to services. This state of affairs is greatly influenced by the aging of the society, as well as other social changes related to the family model or the departure from the common life of extended families.

Merely providing adequate care for the elderly is a difficult challenge with many problems. Especially when it is to a large extent carried out by the state, which, apart from other important tasks, should provide the widest possible range of services and care for citizens. The multitude of tasks, their multi-aspect nature, as well as the organization of the system itself, make the management of these services complicated, often dispersed between authorities and entities. In Poland, the provision of benefits is divided into three systems, each of which has its own rules of organization and financing.

The diversity of the organization of long-term care services and their financing in Poland is the subject of a broader analysis of the financing of selected services in this area. The aim of the article is to review the solutions of the Polish long-term care financing system and to analyze the difficulties that result from its functioning.

The paper mainly uses the analysis of available data from the most important institutions related to providing long-term care benefits, i.e. The National Health Fund (NFZ), The Social Insurance Institution (ZUS) and Social Assistance Institutions. The studied material mainly focuses on the period 2010-2018 of the analysis (unless newer data was available or was based on data from the author's research work)

The progressive aging of the society increases the concerns about ensuring worthy living conditions for relatives in the elderly age. The growing importance of providing long-term care, often for close family such as parents or grandparents, and the resulting problems became the main motivation to choose this topic for detailed analysis. It is a very actual theme focusing on an important social problem, also in economic and financial terms.

Literature Review

The term long-term care in the literature on the subject quite generally refers, mainly, to the provision of care services to chronically ill people. This is true, despite the cursory description of the basic task of long-term care. Depending on the countries and their systems, there are differences in defining the scope of services provided. The definitions are generally based on similar assumptions and objectives of long-term care and their wording may therefore be comparable. In the literature, interpretations of the concept of long-term care are different, often extensive, but all have the same goal.

The most comprehensive definition is provided by the World Health Organization (WHO), according to which long-term care includes activities designed for people who are unable to provide themselves with long-term care. This also applies to support in the form of informal care by family, friends, and formal care by professional workers in the social and health systems, as well as by volunteers (WHO, 2002). The scope of services includes assistance in maintaining personal hygiene, assistance in everyday life activities, in maintaining the house and its adaptation to the needs of a dependent person. These services can be provided at home, in the local community or in care institutions so as to minimize the effects of loss of independence (both physical and mental) and enable a return to the greatest possible fitness. This definition covers many aspects of this type of benefits, partially overlapping with the one proposed by the OECD. Its extensive form comprehensively covers many issues specifying the nature of the services, which will be the starting point for this work.

Organization of public long-term care in Poland

In Poland, the task of providing long-term care for the elderly rests primarily with the family, but only in certain cases this obligation is taken over by special institutions operating within various systems (Błędowski & Maciejasz, 2008). The task of providing specialized nursing and caring services and services is divided between three social systems:

a) the healthcare system,

b) the social assistance system,

c) the social security system.

Long-term care can be provided as institutional care, by people dealing with professional care (i.e. doctors, nurses, social workers and employees of long-term care facilities) or in the form of home care, by family members, friends, relatives (Kozierkiewicz & Szczerbińska, 2007). Among public entities, each of the above-mentioned social systems provides care benefits, offering their various forms, intended for the elderly, which will be presented below. The health care system provides benefits classified as long-term care on the basis of contracts signed with the National Health Fund (NFZ). The Ministry of Health (MZ) is also responsible for services in this area, of course in cooperation with the National Health Fund. As part of this system, inpatient care is provided in specialized care facilities, such as a nursing and care facility (ZPO) or a care and treatment facility (ZOL), and to some extent also in hospital departments for chronically ill people or geriatric departments. There is a possibility of providing home care by community and family nurses, home nurses, long-term care or palliative care teams. Home care is provided systematically in collaboration with the Primary Healthcare physician (POZ). In the social welfare system, care in the form of stationary benefits is provided in nursing homes (DPS) and day nursing homes (DDPS) mainly to people in a difficult social situation. This task, as well as support in the form of cash benefits, is performed in cooperation with the Social Assistance Centers (OPS), operating at each commune. Thus, these are tasks strictly dependent on the policy of local self-government. The other entities providing support in the field of long-term care include the Social Insurance Institution (ZUS). This entity provides benefits only in cash, in the form of a supplement to old-age and disability pensions.

The number of entities providing residential care services is increasing, which is the result of the increased demand for this type of services (Figure 1). In 2010, there were 827 DPS centers in Poland, while in 2018 there were 876 of them. There are the most of them, because they are located locally, in almost every commune, and provide a wide range of social services, not only for the elderly. In the case of the health care system, the number of ZOL and ZPO entities was gradually increasing. There were more than twice as many geriatric departments in 8 years, to 52 units in 2018. The last three entities are more of a therapeutic profile, hence there are fewer of them than DPS. Their main goal is to provide medical care, which is associated with a more specialized approach.

Fig. 1. Number of entities providing long-term care benefits in Poland in 2010 – 2018

Source: (Central Statistical Office, 2020)

This tendency of increased demand for care services is related to the general aging of the society, which in particular is the result of two factors: the elongation of life and a low fertility rate. The significant influence of social and health factors should also be mentioned. As a result, some medical facilities change their profiles or expand the scope of their services with these services.

Forms of long-term care benefits provided

Within the framework of the three presented social systems, benefits are offered in two forms: in cash or in kind (Table 1) (Więckowska, 2010).

Table 1. Types of long-term care benefits in Poland broken down into individual tasks of social systems

System type	Social insurance system	Social welfare system		Health care system
Benefit	care supplement	• care allowance • special carer's allowance	• care services • specialized care services • benefits in nursing homes (DDP and DDPS)	• benefits at special nursing homes (ZPO and ZOL) • long-term care team • long-term nursing care
Form of aid	**cash benefits**		**benefits in kind**	

Source: own study.

Cash benefits are available under the system:

1. social insurance system, which is paid mainly by ZUS as a care supplement. It is a supplement to old-age and disability benefits. It is granted to a person who has been declared completely incapable of work and independent existence, or has reached 75 years of age.

2. social welfare system, which are provided under the tasks of municipalities by local social welfare centers (OPS) in the form of nursing allowances, or special allowances for carers of adults with disabilities.

a) The nursing allowance is granted to partially cover the expenses resulting from the need to provide care and assistance to another person in connection with their inability to live independently. It is granted to the caregivers of people over 75 and / or severely disabled.

b) special care allowance is granted to the caregivers of persons whose disability arose in adulthood, if they do not take up or resign from employment or other gainful work for the purpose of providing care.

In contrast, non-cash benefits are available in two systems, presented below:

1) social welfare system - they are provided in the form of care services or specialist care services, as well as in-house 24-hour care at the DPS. These types of care benefits are due to a single person who often, due to their age and / or illness, requires the help of other people, and also when the family or relatives are unable to provide such help on their own.

a) care services include physical assistance of home caregivers in meeting everyday life needs, hygienic care, nursing prescribed by a doctor and, if possible, ensuring contacts with the environment;

b) specialized care services are adapted to the specific needs resulting from the type of illness or disability, provided by persons with specialist professional preparation.

c) care services in places of stay, such as Nursing Home (DPS) or Daily Nursing Home (DDPS), provided 24 hours a day or for part of the day. Such assistance applies to people who require care due to age, illness or disability, who are unable to function independently in everyday life, and who cannot be provided with the necessary assistance in the form of semi-stationary care services.

2) health care system - long-term care benefits are provided only in kind. They are usually provided in three forms, which can be provided:

a) in a nursing and care facility (ZPO) or a care and treatment facility (ZOL), most often taking the form of organizational units of Healthcare Institutions or separate, independent entities. They are intended for bedridden and chronically ill people who do not require hospitalization in a hospital, but mainly continuation of treatment and professional care.

b) by a long-term care team - intended mainly for people with respiratory failure. It is a form of care that takes into account specific cases, requiring very specialized support and help from specialists.

c) as part of nursing home long-term care - this assistance is provided individually by a nurse to a patient who does not require inpatient care.

Sources of public funding for long-term care

The principles of publicly financed long-term care in Poland depend on the organizational structure, also broken down into three systems. A budget and insurance model is used, which consists in financing benefits from collected contributions, deducted from the insured's remuneration and supplemented with budget financing. The main sources of financing the public long-term care system in Poland are contributions from health insurance, social insurance and taxes (Figure 2).

Fig. 2. Sources of public funding for long-term care

Source: own study.

In the financing of benefits, each system determines different rules for the payment of benefits. In this respect, and taking into account the criterion of access to services, the healthcare system is the most diverse. The other systems provide cash and in-kind benefits specified in terms of amount, scope and form.

Financing long-term care in the health care system

In the health care system, compulsory health insurance contributions are the main source of financing services contracted by the National Health Fund, i.e. basic health care, hospital treatment, but also nursing and care services. Access to selected long-term care services in the health care system depends on the criterion of having health insurance. Also, this part of financing depends on the patient's income situation, including the disability pensions paid, thus making it dependent on the social insurance system. Health insurance aims to provide benefits to the same extent for all insured persons, regardless of the material status or the type of disease.

The health care system provides services in three forms, presented earlier. They differ in the method of financing on a micro scale, from the perspective of the recipient, mainly in terms of fees charged, their amount and rules. However, as a rule, these benefits are still provided under the existing general health insurance.

In the case of care benefits at ZPO / ZOL, the determination of the costs of nursing and care services provided depends on the distribution of the beneficiaries themselves, based on the health insurance, as well as the rights to retirement and disability benefits. This division is presented in table 2, presenting the principles of financing residential care services in the healthcare system, divided into two parts.

Table 2. Scheme of financing residential care services under the health care system

</table>

Source: own study based on: (National Health Fund, 2020).

Having health insurance determines the provision of care services at ZPO / ZOL. Its absence is tantamount to the need to finance these services on one's own, from the private funds of the patient or family. The costs for the insured person are covered in two parts, one of which depends on the entitlement to health insurance and the other on the entitlement to old-age and disability pensions. The price of the service consists of the following parts:

a) Part I, taking into account the financing of direct nursing and care services. It is financed by the National Health Fund, and its amount depends on the contracts concluded by individual entities (service providers). There are also rate adjustments, depending on the level of care required.

b) Part II (the so-called hotel) covering mainly the costs of accommodation and meals. It is financed entirely by the patient's side, but depends on the patient's financial situation. The monthly fee is set at the amount corresponding to 250% of the lowest old-age pension, but the fee may not be higher than the amount corresponding to 70% of the monthly income of the recipient within the meaning of the provisions on social assistance.

On the other hand, services provided at home by a long-term care team (especially for mechanically ventilated patients) or a nurse in the health care system are also billed at rates per person per day, taking into account correction factors or variable tariffs. When contracting the above-mentioned services, the NFZ differentiates the prices for individual services depending on the region, the NFZ branch, but also the service provider himself. On the basis of annual reports on the implementation of the NFZ financial plans, it is possible to analyze the amount of financing of this type of services within the healthcare system. A collective summary of the costs of nursing and caring benefits against the total cost of healthcare services is presented in figure number 3.

Fig. 3. Costs of long-term care benefits financed by the National Health Fund (NFZ) in 2010-2019 (in PLN thousand)

Source: (National Health Fund, 2020).

In 2019, PLN 1.88 billion was allocated to nursing and care services under long-term care, which represents 2.09% of the total costs of healthcare services. During the analyzed 9 years, these expenses increased from PLN 0.89 billion in 2010, with the share of 1.57% of the costs of health services, which constitutes an increase by 211.14% (i.e. by PLN 987.1 billion). Systematically since 2010, the costs of the NFZ for long-term care services have been increasing, especially since 2016, there has been an intensive increase in costs year on year, i.e. by 9.54% in 2016, to 15.05% in 2019. Earlier years of analysis were not characterized by such a significant cost increase. This increase, especially in recent years, further emphasizes the increased demand for long-term care and thus determines the greater development of the market for long-term care services. The intensive increase in the share of the cost of care services compared to healthcare services confirms that these types of benefits increase their importance and may also play a greater role in the structure of costs of NFZ services in the future.

Financing long-term care in the social welfare system

Mainly, the financing of benefits in social welfare system is carried out at the local level, directly from the budgets of local government units, often with the support of OPS, which manage local, mainly at the municipal level, social assistance tasks. Granting financial support in the form of specific and periodic benefits, as well as the organization and provision of care services is the responsibility of the municipalities, hence the financing of these forms of care rests with individual municipal governments. The stay in nursing homes is payable and the cost is determined by the local government units (commune, poviat or voivodeship) that manage the entity. First, the obligation to pay the payment for stay lies with the resident (the beneficiary), and it is a maximum of 70% of his income. The amount of the fee that the close family is obliged to pay is specified in detail in the act. On the other hand, the commune should cover the difference between the average cost of living in nursing home (DPS) and the fees paid by the resident and his family.

In total, PLN 412.4 million was allocated to cash benefits in 2015. In 2015, nursing benefits were awarded to people aged 75 and over, in the total amount of approximately PLN 50.5 million. On the other hand, PLN 361.9 million was allocated to the carer's allowance in 2015, which is the result of a much higher benefit, but also a larger number of beneficiaries (more than twice the number of benefits granted). Benefits in kind, due to the need for direct contact with the needy and the physical nature of care services, are more costly. The amount of expenditure incurred for this purpose in comparison with cash benefits suggests that it was one of the main forms of assistance in this system. Nationally, the largest part of funds was spent on financing care in nursing homes, amounting to PLN 3.3 billion in 2015. In turn, in 2015, a total of PLN 488.7 million was spent on care services and specialist care services.

Financing long-term care in the social insurance system

The most common payer of benefits in the retirement and disability pension system is ZUS (paying 84% of all payers (GUS, 2016). The only long-term care benefit in the social insurance system is the care supplement, which is an addition to old-age and disability pension. According to data obtained from the headquarters of the Social Insurance Institution, the Department of Statistics and Actuarial Forecasts in Warsaw, expenditure on the payment of nursing supplements varied between voivodeships, and their summary is presented in Table 3.

Table 3. Number of people receiving the care supplement to pensions and the estimated value of their payments by ZUS in 2015

	Number of people downloading the care supplement		Value of the care supplement payments (in PLN)	
	Total	People aged 75 and over	Total	People aged 75 and over
TOTAL	**2 272 420**	**2 062 713**	**5 676 596 057**	**5 152 739 583**

Source: own study based on: (The Social Insurance Institution (ZUS), 2018).

Older people, aged at least 75 years old, accounted for the vast majority of people, ie 90%, to whom the nursing supplement was paid by ZUS. In 2015, it amounted to PLN 208.17 and was paid to approximately 2 million people of this age. Based on the estimated calculations made, the total disbursements could amount to PLN 5.7 billion, of which over PLN 5.1 billion could have been allocated to target recipients at least 75 years old. These are data taking into account the payment of allowances for pensions in general, without distinguishing their breakdowns in detail, but in a collective manner they present information broken down by age.

Research Result

The structure, organization and financing of the Polish long-term care system are elements closely related to the effectiveness of its tasks, which are guided by the overarching goal of satisfying the needs of dependent people. The fact of the existence and functioning of the long-term care system in Poland is a positive aspect, which of course is undeniable. The good side of the system is, above all, providing help and carrying out tasks in this area, but not always to the right, most needy people. Unfortunately, also in this structure of the system there are a number of obstacles, both for beneficiaries and for service providers.

One of the obstacles to the efficient functioning of long-term care in Poland is the lack of systemic regulations and legal obligations for the state, local governments, other public-law institutions, as well as the insured persons and their families to secure the care needs of the future beneficiary. There are no regulations regarding possible penalties and sanctions for persons who do not comply with the obligation. Carrying out the duties towards relatives should be overridingly respected. Unfortunately, it is not practiced because there are no coercive measures, no clear system rules for public entities, service providers and insured persons. Thus, the issue of financing social welfare benefits belongs to local authorities and their limited budget is quite a significant obstacle in ensuring financial resources for this purpose.

Another obstacle is the multitude of possible sources of financing long-term care and other similar services, not only for the elderly. This makes the allocated funds dependent on the decisions of decision-makers. Such freedom in managing resources may be disadvantageous, because it will not take into account the needs of all people equally, but favor only the chosen ones, on undefined terms. The result is that the less important needs, e.g. care for the elderly, may be pushed to the sidelines, as there will always be other, more priority tasks to be financed

In addition, the financing of long-term care, based on several entities and financing sources, introduces chaos and confusion among the multitude of information regarding the various principles of receiving and providing services of a similar nature. This variety and dispersion of financing is additionally made more difficult by the situation of individual dispatchers, which especially concerns expensive stationary services. Depending on the type of benefit, there are various financing problems, which can be caused by:

a) the beneficiary's own resources - are necessary and required to provide assistance. The minimum level of own contribution is indicated in the health care system (contribution depends on the level of income). On the other hand, as part of social assistance in DPS, it is desirable to cover the costs in full, depending on the available financial possibilities, involving mainly private funds.

b) the resources of the family, relatives - partially supplement the financing of long-term care, and sometimes its main source of income. The situation of a person needing help determines the extent to which it is necessary to support relatives, and the lack of it severely limits access to services. Another problem is the family's lack of knowledge and information about the rules and possibilities of receiving long-term care assistance, as well as the lack of awareness of their own rights and obligations.

c) budgets of municipal self-governments - it is a complementary link in the financing of services, which should be the last resort for people with a financial situation that does not allow for the provision of full benefits. Local governments are guided by a certain freedom in managing funds for this purpose, which means that they may or may not often finance benefits. This voluntary nature causes that communes allocate funds to subsidize the stays of poorer residents without rules, without selection criteria, regardless of their other current needs. More populist needs will always be competitive and more important to finance than the problems of elderly and dependent people. This is the main problem of allocating resources and setting priorities. There is also the problem of disproportions between municipalities and their differences in income.

d) NFZ resources, based on the health insurance held, constitute the basic source of financing services in the health system, which are partially supplemented by the patient's own contribution. The amount of funds allocated to long-term care, also for individual service providers, is determined on the basis of autonomous decisions of the payer among many urgent needs. Again, setting priorities makes things more difficult.

e) ZUS resources - supplement the long-term care system, only in the form of cash benefits, which may indirectly affect the receipt of the benefit.

There is also a problem with the financing of long-term care in precisely defining the recipients of services. Just as there are different kinds of benefits and administrators of funds, so are the criteria for the recipients of services themselves. As a rule, they include elderly people, but access to benefits should not be limited by age. The aim of long-term care is to provide assistance to dependent people not only due to their age, but also to those returning after severe injuries or operations requiring convalescence. Thus, the group of recipients is heterogeneous, differentiated depending on the benefit, but nevertheless with a predominant share of older people as beneficiaries. Thus, there are different sources of financing services, different dispatchers, and the addressees may be the same or similar people. The result is that benefits are often overlapping for the same people and ignoring other needy people. The benefit may therefore go to the wrong people, thereby excluding those in real need of support. It is a more complex problem because it results from many reasons, including a person's personal life situation, contact with family, dispersion of beneficiaries in a given area, as well as simple ignorance. A significant problem is also the lack of coordination of the flow of information on the services provided. Inpatient care providers are not required to contact you regarding exchange or patient flow, but often do so on a voluntary basis. There is also no coordination of activities related to the selection of appropriate types of services adapted to the health condition of people. Each of the schemes offers its benefits independently of each other, and the potential beneficiary must determine the type of assistance himself. There is no institution or entity that would verify the demand for services and, on this basis, classify and assign to different types of long-term care. Then, it would be possible to monitor the situation of beneficiaries, their flow and health. This is especially important as long-term care benefits are offered through three systems that should work together for the benefit of those needing assistance.

The lack of coordination also affects cash flow to service providers as well as to their beneficiaries. Tasks in the field of long-term care are assigned to various units (including ministries, local governments, the National Health Fund, the Social Insurance Institution), usually without systemic provision of financial resources that would be specially secured and allocated for this purpose. This means that the increasing needs of an aging society are not always matched by higher expenditures for specific individuals. The aforementioned broadly understood coordination of activities and financing of long-term care would avoid the duplication of benefits. Benefits should be adjusted to the diagnosed needs so that they are best suited to the people applying for them, without the simultaneous overlapping of those that are similar. Harmonizing the operation of long-term care will also enable the necessary action strategies in the field of care services to be identified.

Summary

The review of the system of functioning and financing care needs for elderly people in Poland confirms their rapid growth with the simultaneous organizational dispersion, both institutional and the sources of financing. In addition to the increasing demand for this type of services, the expenditure incurred on long-term care benefits in the health care, social assistance and social security systems is also increasing. Their level is significant. Financing long-term

care requires systemic changes and the introduction of targeted solutions that could guarantee a certain and dedicated source of financing for specifically defined services. Additionally, it seems reasonable to organize and standardize the system of care services for people of senior age.

The main problem of financing and providing long-term care benefits results from the lack of legal regulations and unification of the organizational and institutional side (as is the case, for example, in Germany, although this system is not ideal) or financial (dedicated source of financing) and the lack of coordination of broadly understood long-term care activities. The analysis of the Polish long-term care system shows its insufficiency and inefficiency, as well as the resulting threats in the coming years. Self-financing of self-care by retirees and care for themselves and by their immediate family becomes less and less possible, therefore building an integrated system of financing this sphere of social needs is necessary and should be a challenge in the long run.

Funding

The project was financed within the framework of the program of the Minister of Science and Higher Education in Poland under the name “Regional Excellence Initiative” in the years 2019–2022, project number 001/RID/2018/19.

Abstract

The Information and Communication Technology (ICT) sector has a significant impact in most European Union (EU) member states on their economic development. The aim of this paper is to analyze the impact of the ICT sector in the economic development of some EU member states and the degree of involvement of women in the development of this sector. In the first part of the paper, the productivity of employees in the ICT sector was determined and analyzed. In the second part of the paper, an analysis was made that aimed to determine the degree of women's involvement in the development of the ICT sector. This analysis focused on both the economic and the social side in terms of the accessibility of the ICT sector among women. The investigation shows that the share of women employed in the ICT sector is relatively low in all EU Member States included in the analysis. The results of this paper provide a tool that can be used by decision makers in the ICT sector by capitalizing on the creative potential of women who can work in this sector. As a perspective, the observance of the provisions of the Convention on the Elimination of All Forms of Discrimination against Women (CEDAW) by ensuring equal opportunities in the ICT sector among women should be considered.

Keywords: labor productivity, ICT sector, women's employability.

Introduction

Studies conducted so far show that decisions and the ability to attract women to the labor market are determined by factors that depend on demand and supply. The demand on the labor market is determined by various factors, among which we mention: economic development (Lincove, 2008) and changes in industrial sectors (Kucera and Tejani, 2014) that play an essential role.

Also, the demand is determined by other factors such as: job requirements, the type of activity that the future employee must perform (physical or intellectual work) (Rendall, 2013) , the level of education required for the job, the necessary skills, remuneration (Rendall, 2013, Engelhardt and Prskawetz, 2004).

In 1998 employability was defined as a person's ability to hold a job in accordance with his or her skills, to maintain, to develop a person's professional entrepreneurial ability and to change his or her job (Hillage and Pollard 1998). The Confederation of Business Industries defined the term of employability in 2009 a set of attributes, knowledge and skills that labor market participants should possess to be effective in the workplace. This efficiency will benefit the employer, the employee but also the economy as a whole. ”(Confederation of Business Industries (CBI) 2009). As Frankham concluded in 2016, the notion of employability is constantly changing.

According to the 2004 OECD study, “ICT specialists are defined as persons who have the ability to develop, operate and maintain ICT systems and for whom ICTs constitute the main part of their job” (OECD, 2004). The ICT sector covers a wide range of areas related to computers and digital information. As leading companies in all industries adopt digital technologies, IT professionals have become some of the most in-demand members of the workforce today. Employment in the ICT sector includes professionals from various areas, such as technology production, telecommunications and internet services, software editing and much more.

According to the analyzes carried out in 2015 by the European Commission, a total of 228.7 million employees were registered in the EU. The occupancy rate being 65.6 percent this year. Germany is the EU country with the highest number of employed women (17.9 million) in 2015.

The largest share of employees in the ICT sector is staffed by technical support. Of these in 2019, 82.1% were men compared to only 17.9% women.

ICT brings changes in people's daily lives. The development of this sector has led to people's dependence on ICT, and these effects are visible both socially and economically. Roztocki and Weistroffer (2016).

ICT is increasingly contributing to increasing the quality of life by changing people's behavior and contributing to the development of knowledge. This topic has been addressed in several studies (Lwoga and Sangeda, 2019; Mbuyisa and Leonard, 2017; Thapa and Sæbø, 2014; Zaremohzzabich et al., 2014). that the impact of ICT is particularly critical in developing countries. Other studies have focused on the relationship between ICT and social inclusion, and research shows that certain social groups may be marginalized because they do not have access to the opportunities offered by ICT (Castells,1999).

Thus, access to ICT is a sign of technological progress, which facilitates social welfare (Kenny, 2002; Madon, 2000).

The goal of this paper is to analyze the employability in the information and communication technologies sector, comparing the situation in 5 different EU countries. Throughout this study we can better appreciate the differences and similarities that exist between developed EU countries (Germany and France) and less developed member states (Romania, Bulgaria, Croatia).

The Methodology of The Research

The introduction of new technologies and digitalization, also known like the 'fourth industrial revolution' impacts society by changing the way that people live, work and interact with one another. ICTs has a very important role in the changes arise in methods of production and patterns of employment within the European Union (EU).

In this paper is determined and analyzed the productivity of employees in the ICT sector. The analysis was performed on a group of EU member states. The criteria taken into account in the selection of the 5 EU member states was the level of their development. Thus, two EU member states that are part of the category of developed countries and 3 less developed EU member states were selected (the last three member states that joined the EU): Croatia, Romania and Bulgaria.

The paper also contains an analysis that aimed to determine the degree of women's involvement in the development of the ICT sector.

According to Eurostat data, in 2019, the number of specialists employed in the ICT sector was 7.8 million people, which represents 3.9% of the total workforce. The country with the highest number of experts employed in the ICT sector is Germany with a share of 21.5% of all EU specialists.
In second place is France with 1.1 million specialists employed in ICT, respectively 14.4% of the total.

The analysis was performed starting from the raw data taken from the Eurostat site. Thus, Total employment (resident population concept - LFS), the active population from the 5 EU member states, the total number of people working in the ICT sector were analyzed. Subsequently, the share of women working in the ICT sector was calculated in relation to both the total number of people working in ICT and the total number of the employed population in the 5 EU member states. Based on these analyzes, it was possible to highlight the contribution of women to the development of the ICT sector, respectively their contribution to the economic development of each EU member state analyzed.

Table 1: Percentage of the ICT sector in GDP

GEO/TIME	2014	2015	2016	2017	2018
Bulgaria	4.89	5.05	5.38	5.72	6.1
Germany	4.17	4.23	4.13	4.19	4.4
France	3.83	3.89	4	4.33	4.31
Croatia	4.08	4.2	4.23	4.38	4.45
Romania	3.31	3.36	3.56	3.53	3.74

Data source: Eurostat

As showed in table 1, in the developed countries of the EU the share of the ICT sector in Gross domestic product (GDP), is about 4% (Germany and France) and is relatively constant in the last 5 years. In the former communist countries (Romania, Bulgaria and Croatia) there is an increase in the share of ICT of approximative 12% in the last 5 years. Bulgaria is a leader in this sector. The table shows that on average developed countries have considerably higher per capita GDP and larger populations (see table 5) than less developed countries.

The value added, gross obtained in ICT sector from 2015 to 2018 is presented in table 2.

Table 2: Value added, gross obtaind in the ICT sector (million Euro)

GEO/TIME	2015	2016	2017	2018
Bulgaria	1,991.4	2,252.5	2,584.5	2,966.7
Germany	115,141.4	116,566.9	123,047.9	133,074.6
France	76,534.4	79,871.6	88,597.4	90,480.7
Croatia	1,552.0	1,633.9	1,782.2	1,899.7
Romania	4,726.1	5,429.8	6,000.6	6,911.8

Data source: Eurostat

Germany leads this sector with a value-added gross of 133,074 million Euro in 2018. This value increased with 13% in the past 4 years. Germany is followed by France with 90,000 million Euro. The former communist countries Bulgaria and Croatia have a smaller value added, gross obtained in the ITC sector, of 2966 and 1900 million Euro, respectively. Romania had an astonishing increase in this sector, from 4700 million Euro in 2015, to almost 7000 million Euro in 2018.

The contribution of the ICT sector in gross value added was calculated based on the data provided by Eurostat. Comparing the values in table 2 to the number of people employed in the ICT sector, the productivity of this staff in different countries is obtained. These values are presented in table no.3

Table 3: Labor productivity in the ICT sector (Euro/ person)

GEO/TIME	2015	2016	2017	2018
Bulgaria	22,995.5	24,972.6	27,147.9	29,057.0
Germany	78,557.3	75,638.8	79,084.7	82,013.2
France	84,409.9	82,443.8	87,030.8	85,238.5
Croatia	35,034.3	31,062.0	32,641.7	31,296.4
Romania	29,318.3	32,378.2	32,365.5	36,282.6

From the analysis of these values, it can be seen there is a large discrepancy between productivity in developed EU countries (France, Germany) and former communist countries (Romania, Bulgaria). In the latter, however, there is an important growth rate. Germany and France have a far higher productivity, of approximative 80,000 Euro/person, and this value was kept almost constant from 2015 to 2018. In Bulgaria and Romania, the Value added, gross obtained in ICT/ person in 2015 was 22,000 and 29,000 Euro/person respectively, but by 2018, this value increased by approximative 25%. Croatia on the other hand, had a decrease of 4000 Euro/person from 2015 to 2018.

The number of employees in Central and Eastern Europe has shrunk slightly over the past 25 years. This region now makes up 6.4 per cent of the global employees number.

The data from table no. 4 shows the evolution of the active population in the 5 EU member states subject to analysis. The active population includes both the employed and the number of unemployed.These data were extracted to highlight the share of the employed population in the EU Member States.

Table 4: The evolution of active population aged 15-64 in the analyzed EU member countries (Thousand persons)

GEO/TIME	2015	2016	2017	2018	2019
European Union - 27 countries	206,099	206,987	207,629	207,897	208,458
Bulgaria	3,276	3,200	3,278	3,240	3,276
Germany	41,117	41,932	42,094	42,094	42,427

France	28,435	28,471	28,496	28,628	28,529
Croatia	1,865	1,806	1,807	1,783	1,768
Romania	8,858	8,696	8,812	8,761	8,761

Data source: Eurostat

In 2018 the total number of active citizen in EU was 208,458,000 persons. The number of active citizens per country was fairly constant from 2015 to 2019.

The number of citizens employed in the EU and in the countries studied can be found in table 5. In the European Union, from 208 million active citizen, only 194 million are employed. In Germany, only 2.4% of active population is unemployed, compared with Romania where 3.44% of the active population is unemployed.

Table 5: The evolution of the total number of employees aged 15-64 in the analyzed EU member countries. (Thousand persons)

GEO/TIME	2015	2016	2017	2018	2019
European Union - 27 countries	185,183	187,895	190,542	192,613	194,314
Bulgaria	2,974	2,954	3,073	3,069	3,136
Germany	39,176	40,165	40,482	40,636	41,065
France	25,556	25,671	25,881	26,114	26,177
Croatia	1,559	1,567	1,603	1,630	1,650
Romania	8,235	8,166	8,363	8,382	8,408

Data source: Eurostat

Table 6: Percentage of female employees aged 15-64 of the total employment the analyzed EU member countries.

GEO/TIME	**2015**	**2016**	**2017**	**2018**	**2019**
European Union - 27 countries	45.97	45.97	45.97	46.01	46.08
Bulgaria	47.14	46.89	46.70	46.66	46.62
Germany	46.89	46.78	46.76	46.83	46.90
France	48.44	48.42	48.24	48.35	48.62
Croatia	46.12	46.01	45.85	46.07	45.94
Romania	42.88	42.85	43.29	42.83	42.60

Table 6 shows that in the five EU Member States the percentage of employed women is over 40%. The percentage of employed women did not vary significantly from one year to another in the five countries analyzed. The lowest employment rate among women is in Romania.

The number of employees aged 15-64 in the ICT sector in the analyzed EU member countries is analyses in table 7.

Table 7: The evolution of the total number of employees aged 15-64 in the ICT sector in the analyzed EU member countries. (Thousand persons)

GEO/TIME	2015	2016	2017	2018	2019
European Union - 27 countries	6,553.7	6,914.9	7,179.5	7,580.4	7,858.5
Bulgaria	86.6	90.2	95.2	102.1	101.3
Germany	1,465.7	1,541.1	1,555.9	1,622.6	1,686.9
France	906.7	968.8	1,018.0	1,061.5	1,129.6
Croatia	44.3	52.6	54.6	60.7	55.7
Romania	161.2	167.7	185.4	190.5	197.9

Data source: Eurostat

Analyzing the evolution of the number of specialists employed in the ICT sector, it results that

- in Bugaria, the specialists employed in the ICT sector increased in 2019 by 0.17 percent compared to 2015.
- in Germany, the specialists employed in the ICT sector increased in 2019 by 0.15 percent compared to 2015.
- in France, the specialists employed in the ICT sector increased in 2019 by 0.25 percent compared to 2015.
- in Croatia, the specialists employed in the ICT sector increased in 2019 by 0.26 percent compared to 2015.
- in Romania, the specialists employed in the ICT sector increased in 2019 by 0.23 percent compared to 2015.

The most representative increase in the number of specialists employed in the ICT sector was in Croatia, followed by France and Romania.

Developed Europe has the lowest female representatives in the ITC sector with just 3 per cent of women in this category economically active. Two major trends are clear from tables 7 and 8. First, male labor force participation increased, but at a moderate pace in each of the 5 countries. Second, female labor force participation decreased over the past 5 years despite all the regulations and norms adopted by the UE in order to support women employability across Europe.

Table 8: Percentage of female employees aged 15-64 in the ICT Sector for the analyzed EU member countries.

GEO/TIME	2015	2016	2017	2018	2019
Bulgaria	30.7	28.9	29.0	29.9	28.1
Germany	16.3	16.6	16.6	16.8	16.8
France	15.8	17.6	18.5	19.3	19.6
Croatia	17.2	13.8	14.5	18.2	20.5
Romania	27.3	26.3	25.7	23.7	23.5

In 2019, the percentage of females working in the ICT sector increased in Croatia by 2.3% and in France by 0.3% compared to the previous year. In Germany the percentage of women employed in ICT remained constant and in Romania and Bulgaria it decreased.

Conclusions

Labor productivity in the ICT sector in the last three EU member states that have joined the EU is lower compared to that obtained in other EU member states. This is justified by the fact that these countries are developing.

The share of women working in the ICT sector is low compared to the share of women in the total number of employees.

The results of this paper provide a tool that can be used by decision makers in the ICT sector by capitalizing on the creative potential of women who can work in this sector.

According to the Convention on the Elimination of All Forms of Discrimination against Women (CEDAW), the elimination of forms of discrimination against women must be ensured at the level of each country, ensuring their equal access to the labor market.

Abstract

***Purpose* -** Tourism in Portugal has been growing exponentially in recent years, with a significant impact on the national economy. However, this growth was restricted by the current health crisis, caused by COVID-19. The pandemic has resulted in the confinement of a large part of the world's population; the cancellation of travel; the closure of most establishments, including those involved in the tourism sector; the increase in the unemployment rate; and other tragic repercussions.The objective of the study is to understand the changes made by the sector to defeat this crisis and predict the most significant modifications in the sector and its impact.

***Design/methodology* -** Quantitative research based on a questionnaire survey, which target was the population of employees of tourism enterprises in Portugal. Qualitative research based on data collected in official governments websites, *Turismo de Portugal I.P.* website and national statistical data websites.

***Findings* -** This paper studies the measures implemented by the Portuguese Government and the tourist impact in the economy during the pandemic. It also examines the advantages and disadvantages of the implementation of those measures and how economic recovery is being achieved. From the results of the investigation, it was possible to conclude tourism enterprises generally suffered a considerable impact from the crisis caused by COVID-19. For this reason, they have taken various measures to ensure security conditions for all guests and staff. From the respondents' answers it is possible to perceive the discontent of the workers with the lack of help from the Portuguese Government.

Keywords: Tourism, COVID-19, Crisis, Economic Impact

Introduction

Until 2020, Portugal was in a very favourable position regarding tourism, having a major impact on the Portuguese economy. However, the COVID-19 pandemic has shaken this whole structure, which is now struggling to get back on its feet.

According to Stynes (1997, *as cited in* Ardahaey, 2011, p. 208), tourism has its economic impacts. This way, the most evident are the repercussions in the base areas of this phenomenon: accommodation, catering, transportation, leisure, and commerce. Therefore, the analyse of the tourist activity impact focus, typically, on its benefits, such as intensification of sales, profits, and tax revenues, as well as the development of new jobs.

Analysing the specific case of Portugal, according to Tourism of Portugal IP (2017), the profits achieved in 2016 reassure that this is the largest export activity in the country, being a strategic investment target, since it contributes to economic and social development. Consequently, it is possible to demonstrate the relevance of tourism in the country, through data of World Travel & Tourism Council (WTTC): "In Portugal, where Travel & Tourism accounted for 16.5% of total economy, the sector's GDP grew by 4.2%, outperforming the overall economy GDP growth almost threefold in 2019" (WTTC, 2020).

Although the results, published by Banco de Portugal - consulted in Statistics Portugal (the national institute of statistics in Portugal) - , concerning the Balance Payments in the balance of Travel and Tourism in 2019 (+5.3%)

Cite this Article as: Fernanda FERREIRA, Mónica OLIVEIRA and Mariana MIRANDA "Overcoming the Crisis Caused By COVID-19 And Its Post-Crisis Impact by Tourism in Portugal" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

were less prominent than in 2018 and 2017 (+8.4% and +24.2%, respectively), it is possible to observe that the sector has a great impact on the national economy (INE, 2019).

Over the years, Portugal has been recognized internationally for its quality in tourism. Among the prizes received are: World Travel Awards 2020 – Europe Edition (Portugal was elected, for the fourth consecutive year, the Best Destination in Europe in the 2020 edition of the World Travel Awards); WTTC 2020 (Portugal is the first European country to receive the World Travel & Tourism Council's Safe Travels Label); Recognition SR PRACTICES AND SUSTAINABILITY 2019 (Turismo de Portugal I.P- wins the Community category of the 5th Edition - 2019 of the prize promoted by the Portuguese Association of Business Ethics, with the project "Educating for responsibility" recognizing the actions of social responsibility and sustainability promoted by the network of Tourism Schools of Portugal); World Travel Awards 2019 (Turismo de Portugal I.P.- Best Official Tourism Organisation in the World, for the third consecutive year); 14th Editions of the awards UNWTO 2017 (1st place in the Innovation and Public Policies category with the Tourism Training Talent training project of the Tourism Schools of Portugal); World Golf Awards 2017 (Portugal World and European Golf Destination). (Turismo de Portugal I.P., 2020d)

Thus, with the improvement of transport and the emergence of new emerging markets, tourism remains one of the largest, rapidly growing industries globally. However, its evolution faces several challenges, such as crises and disastrous occurrences, as states Gurtner (2016, as cited in Jurdana et al., 2020).

Considering all the importance of Tourism for Portuguese economy, and the negative impact of COVID-19 pandemic that changed all the optimistic scenario, this article initiates with the state of art about COVID-19 disease, how the Tourism Sector answered to previous pandemics, and predicts the future of tourism, considering different authors and forecasts, that guesses that this pandemic crisis will bring new concepts and strategies and safer experiences. This paper is organized in four main sections: *Introduction* (where is presented the background of the study), *Methodology*, *Results* (divided in *Quantitative Results* and *Qualitative Results*), *Discussion and Conclusion*. In *Discussion and Conclusion*, it is planned to develop an analysis of the strengths and weaknesses of the response to the crisis experienced in the tourism sector and anticipate some of the possible changes that the sector will experience in the coming years. There may be more weaknesses as regards the response from the Portuguese Government than there are strong ones, as we are going through an atypical and never before experienced situation. Thus, the actions taken may not respond so effectively to the problems experienced by the tourism sector.

In this way, it is expected to reach conclusions regarding the changes implemented by tourism enterprises to overcome COVID-19 crisis and to recognize the fluctuations made by the sector to reverse this crisis and forecast the most significant modifications in the sector and its results.

COVID-19 Pandemic

In January 2020, COVID-19 was declared by World Health Organization (WHO) as "Public Health Emergency of international Concern". Between months, the spread of the disease became a pandemic, creating a global sanitary crisis (Khan, 2020). COVID-19 is the infectious disease caused by the coronavirus, SARS-CoV-2 (severe acute respiratory syndrome coronavirus 2). WHO first learned of this new virus from cases in Wuhan, People's Republic of China on 31 December 2019. According to the report of the World Health Organization (WHO as of November 19 2020), the current outbreak of COVID-19, has affected over 55659785 and killed more than 1338769 people in more than 220 countries throughout the world. "The time from exposure to COVID-19 to the moment when symptoms begin is, on average, 5-6 days and can range from 1-14 days. Most people (about 80%) recover from the disease without needing hospital treatment. About 20% of those who get COVID-19 become seriously ill and require oxygen, with 5% becoming critically ill and needing intensive care." (WHO, 2020).

Therefore, people who have been exposed to the virus are advised to stay home, apart from others, for 14 days, in order to prevent the spread of the virus, especially where testing is not easily available. This need for people to be trapped at home and not to move freely, has caused an economic crisis caused by the lack of consumption and travelling.

Since World War II there was never a health calamity with such global impact as COVID-19 pandemic, this is probably the biggest challenge that humankind confronted since then. It has rapidly proliferated across the globe, causing enormous health, economic, environmental, and social challenges to every nation.

The coronavirus outbreak is harshly disturbing the global economy. In general, countries are fighting to slow down the spread of the disease by testing & treating patients, quarantining suspected persons through contact tracing, restricting large gatherings, maintaining complete or partial lock down etc. (Chakraborty and Maity, 2020).

Sequent, Baldwin (2020), argues that both consumers and businesses – in other words, the distinct economic agents – have embraced a mindset of "wait and see". The author states that this is a common behaviour during periods of

uncertainty, as there is less confidence in markets and take risk on economic transactions. This phenomenon is clearly observed by the drastic fall in the number of trips and overnight stays.

Farzanegan et al. (2020) have studied the relationship with the previous records of intercontinental tourism and the number of confirmed cases and deaths related to COVID-19, and they were able to establish a strong connection between these two factors. Although it has be proven that border closure implies an economic recession, the authors affirm that it is an accurate approach to reduce the number of cases. Besides that, in countries that have not suffered a major pandemic impact, this is also a good prevention method, combined with stricter safety and hygiene rules. Political measures have been taken considering the harmful effects of international travel, mainly in destinations with lots of tourist attraction.

Significantly in the tourism and commerce sectors, countries have chosen to sacrifice GDP growth as a method to contain the spread of the disease (Barro, Ursúa and Weng, 2020).

Economy and response to previous pandemics

Analysing the global economic impact to COVID – 19, Céspedes et al. (2020) created a minimalist model of the macroeconomics of a pandemic in which the coronavirus disease drive to a loss of productivity. They defend that the collapse of COVID-19 will be aggravated via an asset price recession and unemployment destruction cycle. According to International Monetary Fund (2020), as surviving businesses start to establish its safe and hygiene systems, their productivity will increase continuously, resulting in the economical emerging. Cheer & Lew (2017, *as cited in* Lew et al., 2020) proposed the model of "the resilience adaptative cycle" which includes four phases of a revolution event: Phase 1: (Re-)Organization (innovation and creativity), Phase 2: Growth (exploiting opportunities that arise from phase 1), Phase 3: Consolidation (establishing fixed institutions and rules for phase 2), Phase 4: Collapse (failure of fixed institutions in phase 3 to adapt to context changes), which results in a return to the Re-organization (phase 1) or, alternatively, the complete dissolution of the system. We are now in Phase 1, where governments are trying to return to the past (this phase will last for two to five (or more) years.

Significantly, Carlsson-Szlezak et al. (2020b, *as cited in* Brodeur et al., 2020), argues that after the past pandemics, such as the 1918 Spanish Influenza, the 1958 Asian Influenza, the 1968 Hong Kong influenza, and the 2002 SARS outbreak, economies adopted a 'V-shaped' readjustment. Nonetheless, the model of economic recovery of COVID-19 is not likely to be this linear. This "V-shaped" economic recovery is a return to what was before the crisis. Other recovery options are "U-shaped", where the economy does not go back to its pre-crisis course, or even "L-shaped", where the economy undergoes a recession, and its recovery is very challenging. The authors stand up for innovation as the way of preventing a developed U-shape. Thus, it may be possible to keep the impact's path as close as possible to the V-shape.

As reported by International Monetary Fund (IMF) in June 2020, global growth is expected at -4.9 percent in 2020, 1.9 percent beneath the World Economic Outlook (WEO) projection released in April 2020. In 2021, global prosperity is estimated at 5.4 percentage points which stands below pre-COVID-19 forecast of January 2020. These costs are much superior than those of past epidemics and also than those of Great Financial Crisis in 2008-09, when the average GDP loss pear year of OECD countries was 3% (Boissay and Rungcharoenkitkul, 2020).

According to Hall & Prayag (2020, *as cited in* Hall et al., 2020), the responsiveness to a pandemic by a destination was classified by disaster levels, what can be related to the analyses of the previous pandemics or disasters, from which it is possible to draw ideas for solving the problem and adapt to the reality experienced.

After analysing different studies about past pandemics, such as Influenza pandemics, SARS, Ebola, H5N1 avian pandemics, Boissay & Rungcharoenkitkul (2020) came to the conclusion that when epidemic have a high percentage of deaths, in a global scale, the economic loss can be directly proportional.

Recalling the economic impact by the Spanish flu, in 1918, (Valle, 2020) states that it may be surpassed by the ongoing crisis, owing to the globalization effect.

The previous epidemic in 2003 – SARS – had a death rate of 9.6% as documented by WHO. So far, SARS outbreak had a greater impact than the actual pandemic.

However, when we examine tourism itself, the previous epidemic in 2003 (SARS) it had a disastrous outcome for tourism industry, being the second worst decline in international tourist arrivals (2.0% in 2003) since WWII just after the Great Recession of 2008-2009. This impact was eased by the independence of Chinese consumers by the tourism industry, unlike the current case (Valle, 2020). Honk Kong, for instance, suffered of a short-term decadency in visits and, consequently, travel, tourism, and trades markets experienced damages. At the time of the recovery of the SARS outbreak, the type of tourists which number increased faster was business travellers and those visiting friends or relatives (VFR tourism). Hong Kong' hotels occupancy rates suffered a decline of 61%, from March to May. However, two months later (July 2003) these rates had return to its normality (71%) (Siu and Wong, 2004).

Additionally, as analysed by the author, with the global financial crisis in 2009, tourist arrivals fell by 4%. However, Chinese consumers started to empower themselves, ending up saving, in a certain way, the Western world. Also, in 2009, emerges the H1N1 influenza virus. Rassy & Smith (2013, *as cited in* Gössling et al., 2020) studied its impacts on tourism in Mexico. In a period of five months, the country lost million worldwide visitors - especially the ones coming out of Europe, which markets took much long to return – ending up losing around US$2.8 billion.

Speakman & Sharpley (2012) affirm that in their research, they came to the conclusion that in Mexican public and private tourism, during the AH1N1 influenza crisis in 2009, these organizations did not have a health crisis management plan to solve the problem.

The impact of a sanitary crisis in tourism growth is visible in the example of Ebola virus outbreak: in 2019, three years after the end of the epidemic, Africa still welcome less than 10% of global tourism receipts. This kind of disasters crashes the competitiveness of tourism region and destination (Maphanga and Henama, 2019).

As underlined by the Secretary-General of the United Nations World Tourism Organization (UNWTO), tourism is within the economic sectors that have been damaged the most (UNWTO, 2020). The tourist activity, known as a very vulnerable industry, has suffered a direct impact from this crisis.

Both Khan (2020) and Ghose (2020) defend that without supply chain regains proper transactions, the tourism sector will not carry on in an accurate approach, once the sector is very "dependent" on different industries.

Moreover, Cahyanto et al. (2016) defend that pandemics can demolish completely the tourist activity, for lack of supply and demand. In the coronavirus crisis it is very remarkable, tourists stop travelling and the supply chain has been broken.

According to McKercher (1999, *as cited in* Speakman & Sharpley, 2012), even though there is some strategic plans for crisis, that companies apply in case it happens, tourism destinations and related organisations don't even make that planning. In addition, theories of risk and crisis management within business organisation are based in a linear perspective that runs through the pre-crisis, during and post-crisis. However, as they are a universally applicable responses, they may succeed in each context, as they may not: each disaster has its variations (in terms of causes, behaviour and consequences) and because of that a "one size fits all" model may not be the appropriate template to answer for "differences in the scale, intensity and impacts of crises, or in the availability skills and resources necessary to respond to them". These complex variations are embraced by a "step-by-step" plan, once tourism outbreaks, most of the times, do not progress as expected. Besides, as said by Speakman & Sharpley (2012), the occurrence can vary in a sudden way and carry a different outcomes in several regions within the same country. That is why "tourism has more generally been described as an inherently non-linear, complex and dynamic system that is well described within the chaos paradigm".

Forecasts for the future of tourism

Further, Lew et al. (2020) e Gössling et al. (2020), believe that 2020's pandemic is contributing to a substantially possible transformation, with a significant and positive impact on the planet in general and on tourism specifically.

Therefore, Khan (2020) states that by taking into account the impact of this unprecedented crisis, on tourism, the sector seems to be lost. It is difficult to foresee "when" and "how" the activity will emerge again and what path it should take. However, according to the author, it is certain that this pandemic is revealing the tourism sector a new direction, as a way of self-innovation, giving priority to "health and safety".

It is believed that, by 2022, the COVID-19 pandemic will be outdated. People will feel safer to travel and the tourist ecosystem will recover, which will make it possible to achieve results close to those recorded in 2018 and 2019. After 2021 is marked by the return of international tourism, it will be 2022 to confirm this trend, registering the values achieved in 2018 and 2019 (IPDT, 2020).

Even though a revolution in the tourism sector is highly difficult to happen, travellers may demand different conditions in tourist complexes and other tourist establishments because of COVID-19. As defended by Gossling et al. (2016, *as cited in* Hall et al., 2020), aftershocks, tourism tends to be resilient and it is necessary that in future collapses (such as the actual pandemic) the tourism industry give importance to environmental factors, like the biodiversity conservation and climate change concerns.

As the past 2008-09 recession shows that the industry went back to its "business as usual" after the crisis, the probability of it happening again, in the present moment, is high. Nepal (2020) argues that "There is a fundamental disconnect between what the UNWTO preaches (sustainability), and what it practices (growth expansion)". There is a necessity of fixing this first and then begin to think about the future of tourism in a global scale. On the other hand, there is the urgency of changing once we will not be able to overcome a crisis like this one in the future.

Nepal (2020), by focusing on adventure tourism industry, affirms that it may have an opportunity to reset and rethink its development in a sustainable and mindful way. This picture can be transposed to global tourism: it should revoke an exponential and disorderly development and invest in a self-sustaining activity that restores itself. Thus, we can value quality over quantity and provide better life quality for communities living off tourism. According to the author, the next generation of tourists is more mindful, environmentally friendly, and sustainability-oriented (as we begin to see in Western Europe, North America, and East Asia).

The slow tourism will mark the future of tourism, which will help the average stay not suffer major decreases. Visitors will seek the opportunity to become part of the destinations, at a pace of travel that allows them to be in contact with the resident community and learn the local culture. As predicted by the Secretary General of WTO, "Mass tourism can come to an end". There will now be a greater demand for experiences that allow the traveller to immerse himself in the local culture. The less massified sites allow you to meet the need to visit and meet new cultures, gastronomies, and traditions, at a slower pace. According to Euromonitor International (Aug'20), 87% of consumers believe it is important to experience other cultures and 94% value real experiences (IPDT, 2020).

Galvani et al. (2020) reveal that COVID-19 may be a consequence of neoliberal globalization and time-space compression, with economic policies sustained by the improvements in telecommunications and transport technologies that have brought humanity closer together. The authors suggest a global consciousness to rethink the post-COVID-19 and the way it may affect tourism activity: “travel and tourism could be a good thing if it intentionally and directly addressed the goal of enabling people to become more aware of, and sensitive to, the planet as a whole entity”.

Ghose (2020) defends the “idea of cleanliness and safety” will be what draws the most attention for tourists, while choosing a place to visit. In addition, Europe’s clean green destinations will be favoured, because nature and the good care of it arouses confidence in the target audience. The author states that contactless booking, less approach with staff members and rigor of cleanliness will be much present in tourism enterprises.
(Valle, 2020) states that ethics will have the same importance as beauty of destinations. Following the thought of Ghose (2020), travellers will benefit places that make environmentally friendly choices and have low-pollution levels. Therefore, governments will have to reinforce environmental measures and social governance.

In agreement with Adam Blake (professor of economics and head of research in the Department of Tourism and hospitality at Bournemouth University in the United Kingdom), population still wants to travel and won’t stop doing it because of the disease; however, people will be much more careful with destination and accommodation choice, they will need to have substantial proof of its the cleanliness and safety (CNN, 2020).

The study of the tourist profile and the market analysis may highlight important behavioural trends for destinations and businesses. The future of tourism will bring or confirm new concepts, namely sustainability. This could be the ideal time to review tourism strategies, preparing for the challenges of the coming years. In the short term, tourists will prioritize safety by choosing slightly more expensive destinations and deals if they can enjoy safer experiences. Moreover, tourists are increasingly seeking to contribute actively to local commerce. Additionally, the truth is that tourism has contributed to the creation and maintenance of jobs, to the preservation and enhancement of resident communities, with emphasis on the discovery of gastronomy, agriculture, handicraft, and culture. Faced with this reality more than ever, destinations must stand alongside local businesses and producers, legislate and support to promote them. Furthermore, the social and environmental awareness of travellers, especially at the level of ecological activism based on the "less is more" philosophy, has been changing patterns of behaviour, particularly at the level of the choice of mode of transport. This will make the travel of tourists focus on alternatives to the plane, which may also increase the average travel stay (IPDT, 2020).

Besides, to engage travellers, governments must be prepared to take advantage of the media to deliver a positive image and get those to feel clean and safe (Ghose, 2020; Martens, Feldesz and Merten, 2016).

According to Ghose (2020), tourism will be one of the first activities to get back up once there is a vaccine to COVID-19. As we already witness, in Europe are emerging travel corridors between “safe” countries – countries that have a lower number of cases – which leads to a development of a giant “travel bubble” in European Union. As a result of these free travel zones, the trade ties between neighbouring countries will be re-established and sectors such as travel, and tourism will be reborn.

Countries will feel severe tension from politics and industry to reopen establishments and kick-start the economy as soon as possible in order to reduce the unemployment rate (the International Monetary Fund (2020b) expects the international economy to suffer a recession of -3 percent in 2020, dreadfuller than the 2008-09 financial crisis). Also to create new jobs and to boost visitor numbers, when it comes to tourism, some destinations will implement low cost operations, neglecting a possible new wave (Hall, Scott and Gössling, 2020).

Liu et al. (2020) argue that the first types of tourism that will begin to be practiced will be VFR tourism (a.k.a. visiting friend and relatives), business tourism and nature tourism. Nonetheless, sports and events tourism and senior tourism will probably be constrained until there is a vaccine. The tourist activity in most countries will be domestically, in such way that are being developed domestic tourism promotion campaigns in order to persuade people to travel locally and promote the economy, while feeling safe and guarded during COVID-19 era.

Methodology

To carry out the investigation, it will be used a mixed methodology.

On one hand, it will be qualitative, being the data obtained from the study of the measures implemented by the Portuguese government, in economy and tourism, consulting official government websites and the Turismo de Portugal I.P. website. On the other hand, it will be quantitative, in that a questionnaire survey is applied to understand the changes made in different tourism enterprises - this will target a sample of the population of employees of tourism enterprises in Portugal. The questionnaire was applied in the summer of 2020 to 138 persons, but only 69 respondents worked in the sector, and were considered valid.

Additionally, to understand the impact of the crisis on tourism in Portugal, websites with statistical data will be consulted, such as INE (Portugal Statistic Institute) and TravelBI by Turismo de Portugal I.P. (knowledge management platform in tourism Portugal). In this way, a comparison will be made between the data presented before, that is, the economic impact of tourism before the pandemic and the data collected during the pandemic.

Results

Quantitative data extracted from Portuguese statistics

To understand the impact of the crisis on tourism in Portugal, sites with statistical data were consulted, as INE (Portugal Statistics Institute) and TravelBI by Turismo de Portugal I.P. (knowledge management platform in tourism Portugal). The data collected were as follows:

Table 1: Guests

		September		August	July	June	May	April	March
		Value	%	%	%	%	%	%	%
Guests		1.4 million	-52,7%	-43,6%	-64,0%	-82,0%	-94,2%	-97,4%	-62,3%
Overnight Stays		3.6 million	-53,4%	-47,1%	-68,1%	-85,2%	-95,3%	-97,0%	-58,7%
	Residents	2.0 million	-8,5%	-68,1%	-64,0%	-85,2%	-85,9%	-93,0%	-57,6%
	Non-residents	1.5 million	-71,9%	-72,4%	-84,5%	-96,2%	-98,4%	-98,6%	-59,2%
Closed Establishments		-	24,0%	22,8%	27,8%	46,3%	70,4%	83,1%	-
Average Stay		2.59 nights	-1,6%	-6,3%	-11,3%	-17,6%	-18,2%	13,7%	10,5%
	Residents	-	8,2%	2,6%	1,6%	1,4%	4,5%	35,5%	11,4%
	Non-residents	-	7,4%	-6,6%	-6,6%	-14,6%	-6,4%	31,3%	9,2%

According to *Table 1*, in September 2020, the tourist accommodation sector is expected to have registered 1.4 million guests and 3.6 million overnight stays, corresponding to variations of -52.7% and -53.4% respectively. The nights spent by residents will have decreased 8.5% reaching 2.0 million, representing 57.2% of the total, while those of non-residents will have decreased 71.9%, standing at 1.5 million. In September, 24.0% of tourist accommodation establishments have been closed or have not registered a movement of guests.

In September, the average stay in tourist accommodation establishments (2.59 nights) was reduced by 1.6%. The average stay of residents increased 8.2% and that of non-residents increased 7.4%.

Table 2: Overnight Stays

		September	August	July	June	May	April
Overnights Stays							
Hotel		-54,9%	-48,9%	-70,4%	-87,6%	-96,8%	-98,1%
	% of the total	79,8%	79,3%	75,9%	69,5%	56,6%	54,6%
Local Accomodation Establishments		-52,5%	-46,6%	-65,5%	-79,2%	-87,7%	-91,4%
	% of the total	14,9%	14,9%	16,0%	20,4%	36,4%	40,4%
Tourism in Rural Areas and Housing		-16,2%	-13,9%	-22,7%	-49,6%	-86,2%	-94,2%
	% of the total	5,4%	6,8%	8,1%	10,1%	7,1%	5,0%
Hostels		-62,0%	-57,4%	-73,1%	-86,8%	-89,9%	-92,7%
	% Local Accomodation	17,8%	17,6%	17,3%	14,9%	1,4%	19,9%
	% Tourist Accomodation Establishments	2,6%	2,6%	2,8%	3,0%	7,1%	8,0%

As stated in *Table 2*, in September, hotel nights (79.8% of the total) decreased 54.9%. Overnight stays in local accommodation establishments (weight of 14.9% of the total) decreased 52.5% and tourism in rural areas and housing (share of 5.4%) fell 16.2. Overnight stays in hostels fell by 62.0% in September, accounting for 17.8% of overnight stays in local accommodation and 2.6% of total overnight stays in tourist accommodation establishments.

Table 3: Regions

		September	August	July	June	May	April	March
Regions		-	-	-	> -70%	> -80%	> -90%	-
Variations in Overnight Stays								
	Alentejo	-20,9%	-15,3%	-26,2%	-48,9%	-84,3%	-92,6%	-

	Archipelago of Azores	-66,3%	-69,1%	-84,7%	-96,9%	-99,7%	-99,9%	-
	Metropolitan Area of Lisbon	-71,8%	-68,6%	-82,5%	-	-	-	-63,7%
Overnight Stays								
	Algarve	40,0%	41,1%	39,1%	31,5%	15,1%	-	-
	North	15,9%	16,4%	17,8%	17,0%	15,2%	-	-
	Centre	13,0%	15,3%	14,9%	17,0%	15,2%	-	-
Residents	Algarve	10,1%	9,9%	-24,5%	-55,6%	-19,4%	-	-
	Alentejo	3,9%	3,9%	-7,1%	-31,6%	-7,6%	-	-
	Centre	-8,3%	1,1%	-24,9%	-	-	-	-61,4%
	North	-13,3%	-1,8%	-25,3%	-	-	-	-59,4%
Non-residents	Alentejo	-62,9%	-57,7%	-63,5%	-85,1%	-	-	-
	Other Regions	> -70%	> -65%	> -75%	> -90%	-	-	-

In *Table 3*, is clear that in September, all regions experienced decreases in overnight stays, with the lowest decreases in Alentejo and Centre. The largest reductions occurred in archipelago of Madeira, archipelago of the Azores and Metropolitan Area of Lisbon. Algarve concentrated 40.0% of overnight stays, followed by the North and the Centre. In September, there have been increases in the number of overnight stays of residents in Algarve, followed by Alentejo, Centre, and North. This month, in terms of nights spent by non-residents, Alentejo experienced a decrease of -62.9%, while the remaining regions showed decreases of more than 70%. In March, also the overnight stays of non-residents decreased in all regions, especially the decreases registered in the Centre, AM Lisbon and North.

According to *Table 4*, in September 2020, tourist accommodation establishments registered 1.4 million guests, which provided 3.6 million overnight stays, reflected in variations of -52.7% and -53.4%, respectively. The domestic market contributed with 2.0 million overnight stays and overnight stays in foreign markets decreased 71.9%, reaching 1.5million. The average stay (2.59 nights) decreased by 1.6%.

In September 2020, the campsites registered 167.4 thousand campers and 565.5 thousand nights, which translated into evolutions of -31.7% and -25.5%, respectively. Both the internal market and the external markets contributed to the decrease in overnight stays. In September residents' nights predominated, representing 80.0% of the total. On the contrary, the nights of non-residents predominated in March, representing 61.9% of the total. The average stay (3.38 nights) increased 9.2% in September.
The summer camps and youth lodges received 14.4 million guests, which provided 30.9 million overnights stays in September, which corresponded to variations of -58.2% and -55.0%, respectively. The nights spent by residents (share of 81.8%) decreased 47.8% and those of non-residents decreased 72.2%. The average stay (2.14 nights) increased 7.5%.

In the first quarter of the year, there was a decrease of 18.0% in total overnight stays, resulting from variations of -11.7% in residents and -20.8% in non-residents. In the first half of the year, there was a decrease of 65.9% in total overnight stays, resulting from variations of -53.0% in residents and -71.1% in non-residents.

Qualitative data obtained from the survey

Hereby we present the results subtracted by the questionnaires replies. From the answers given, the following data were established: Of the 138 respondents, 69 are employed in a tourism enterprise. It was found that 80.9% work in hotel establishments, 7.4% in tourist apartments, 4.4% in housing tourism enterprises, 2.9% in holiday villages, 2.9% in a tourism enterprise in rural areas, and 1.5% in tourist complexes, as presented below.

Table 5: Percentage of employers in the different types of establishments

Types of Establishments	Percentage
Hotel Establishments	80,9%
Tourist Apartments	7,4%
Housing Tourism Enterprises	4,4%
Holiday Villages	2,9%
Tourist Enterprises in Rural Areas	2,9%
Tourist Complexes	1,5%
Total	100%

Of which 33.8% are located in the north of the country, 25.0% in Área Metropolitana de Lisboa, 17.6% in Algarve, 11.8% in the Centre, 4.4% in Alentejo, 4.4% in Região Autónoma da Madeira, and 2.9% in Região Autónoma dos Açores, as we can see in table 6.

Table 6: Percentage of employers per location

Location	Percentage
North of Portugal	33,8%
Centre	11,8%
Lisbon	25,0%
Alentejo	4,4%
Algarve	17,6%
Madeira	4,4%
Açores	2,9%
Total	100%

Of all the 69 tourism enterprises 54.4% are fully operational, 29.4% are partially operational, 11.8% are closed, and 4.4% are operating as an isolation facility.

Table 7: Percentage of employers per activity

Activity	Percentage
Fully Operational	54,4%
Partially Operational	29,4%
Closed	11,8%
Isolation Facility	4,4%
Total	100%

Additionally, when asked about how COVID-19 affected their activity, 79.4% of the enterprises have been severely affected by COVID-19, 14.7% moderately affected, 4.4% slightly affected and 1.5% not affected.

Table 8: Percentage of employers whose activity was affected by Covid-19

How COVID-19 affected the activity	Percentage
Severely Affected	79,4%
Moderately Affected	14,7%
Slightly Affected	4,4%
Not Affected	1,5%
Total	100%

As regards of employment, most enterprises resorted to lay off (51.8%), 17.0% dismissed staff, 16.1% began teleworking, 10.7% reduced salaries, and 4.5% have not been affected.

Table 9: Percentage of employers whose employement was affected by Covid-19

Employment	Percentage
Lay-off	51,8%
Dismissed staff	17,0%
Telework	16,1%
Reduced Salaries	10,7%
Not affected	4,5%
Total	100%

Inside the tourism enterprises, measures implemented, in addition to the measures imposed by DGS (Directorate General for Health), reduction of items (such as decorative pillows, minibar items, magazines, pamphlets) was the most popular actions among the enterprises with 25.5% of the total, the following is the acrylic screen in reception spaces (24.8%), 20.1% eliminated buffets, 14.8% limited occupancy rates, 12.8% used electrostatic sprayers, and only 2.0% of the enterprises (only hotel establishments) requested the presentation of the COVID-19 test.

Table 10: Percentage of measures implemented in the enterprises, concerning the guests

Measures (for the guests)	Percentage
Reduction of items	25,5%
Acrylic screen	24,8%
Eliminated buffets	20,1%
Limited occupancy	14,8%
Eletrostatic sprayer	12,8%
Requested the COVID-19 test	2,0%
Total	100%

Other measures were implemented, such as ozone disinfection, usage of PPE (Personal Protective Equipment), temperature measure and health questionnaires and traceability of all guests, passers-by, and suppliers.

As a consequence of the crisis caused by COVID-19, 41.9% of the respondents affirm that the tourism enterprise employing them applied cost reduction, 34.3% resorted to vouchers for future stays, 18.1% implemented special rates for certain market segments (this measure was mainly adopted by tourist apartments), and 5.7% did not make any change. In addition to these, the following were applied: promotion in long stays, refund of reservation value, partnerships with local market, and policy of room upgrades.

Table 11: Percentage of measures implemented in the enterprises, considering finantial solutions

Measures (finacial response)	Percentage
Cost Reduction	41,90%
Resorted vouchers for future stays	34,30%
Special rates for certain market segments	18,10%
No changes	5,70%
Total	100%

In terms of use of technology, 47.5% used menus via QR Code, 37.5% made virtual check-in (popular measures between tourist apartments, and also the deposit of access keys in wall vault), 10.0% used smart keys (via app), 5.0% resorted to robots for space disinfection.

Table 12: Percentage of measures implemented in the enterprises, considering technology

Measures (techonology)	Percentage
Menus via QR Code	47,5%
Virtual check-in	37,5%
Smart keys	10,0%
Robots for space disinfection	5,0%
Total	100%

55.9% of the workers believe that the operational performance of the enterprise they work for will be influenced by the crisis caused by COVID-19 for 1 to 2 years; 23.5% for 2 to 5 years; 16.2% for 6 to 12 months; 2.9% for 3 to 6 months; and 1.5% for 5 to 10 years.

Table 13: Percentage of employers that believe that COVID 19 will affect the operational performance per period of time

Operational Performance Affected	Percentage
3 to 6 months	2,9%
6 to 12 months	16,2%
1 to 2 years	55,9%
2 to 5 years	23,5%
5 to 10 years	1,5%
Total	100%

Considering the economic situation of the enterprise, 80% affirm that is not good, 80% are not satisfied with governments assistance, and most of the respondents feel the need of more support from the government.

Political Measures

In Portugal, to foster economic recovery, the Government implemented tax and contribution measures, and labour and employment measures, which are part of the Economic and Social Stabilisation Programme. These include the following: deferral of tax obligations - flexible Value Added Tax (VAT) and Personal Income Tax (IRS) and Corporate Income Tax (IRC) payments scheme to be completed in the second quarter of 2020; beneficiaries IRC obligations, VAT payments and IRS withholding taxes; deferred payment scheme for social contributions - the Government has approved a deferred payment scheme for social contributions payable by employers and self-employed persons; simplified lay-off access regime; under the simplified system of access to the lay-off, employers may have social security support for workers working for them during the period of the containment measures. (Turismo de Portugal I.P., 2020b, 2020c)

The Portuguese Government in conjunction with Turismo de Portugal I.P. provided measures to support employment and business in the field of tourism. These are divided into three major groups:

- Economic and Social Stabilisation Programme: additional measure to support businesses

This is a programme with a time horizon until the end of 2020, which is based on four axes: maintenance of employment and the progressive resumption of economic activity; social support and support for people's income; support for businesses; and institutional adaptation.
The plan covers a COVID-19 economic support line: enterprises (micro and small enterprises with SME certification) and entrepreneurs in individual name without organized accountability. In monetary terms, the aid will be maxim per company: €50 000 (micro-enterprises); €250 000 (small enterprises) - with a guarantee of up to 90% of the outstanding principal.
The OpenCall202020 of Turismo Fundos is also part of this programme: Turismo Fundos makes available to companies the liquidity available in the real estate investment funds it manages, allowing access to a financial instrument characterised by the sale and subsequent long-term lease of a property, with respect to the right to repurchase it.

- Finance: Lines of credit for companies and measures for start-ups

The programme covers:
- a Tourism Micro-Business Support Line COVID-19, which is a financing line aimed at tourism micro-enterprises that demonstrate a reduced capacity to react to the strong contraction in demand that has taken place. The loan value is €750 per month for each existing job in the company on 29 February 2020, multiplied by a three-month period of up to €20 000.
- an Economic Support Line COVID-19, which is divided into Catering and similar support (Suspended) – total budget of €600 million; Support Tourism Enterprises (including tourism enterprises and tourist accommodation) (Suspended) – total budget of €900 million; Support for Travel Agencies, Tourist Entertainment, Event Organisation and similar (Closes) – total allocation of €200 million.
- Start-ups will be supported primarily with liquidity injections by the government, given their importance as a driver of innovation and job creation.

Be more flexible: obligation vis-à-vis Turismo de Portugal I.P., CSF III, NSRF, Portugal 2020, moratoriums on credits, specific scheme for the relationship between companies in the sector concerning reservations of

accommodation services located in Portugal. Flexibility measures have been implemented concerning:
- Fulfilment of obligations towards Turismo de Portugal I.P.- in all support schemes financed by Turismo de Portugal's own revenues (General Financing Scheme, Supply Qualification Support Line, Value Programme).

- Fulfilment of obligations under the CSF III, NSRF and Portugal 2020
- Credit moratoria – the Government establishes a moratorium on lending to financial institutions; this measure is intended to support families and businesses in an adverse context of a sharp drop in income.
- Relations between travel agencies and tourism, tour operators and tourism enterprises and local accommodation establishments – booking of accommodation services situated in Portugal, in the form of non-repayment of amounts paid, made by travel agencies and tourism or tour operators, Portuguese or international operating in Portugal, which are not carried out or are cancelled as a matter of fact in connection with the declaration of a state of emergency issued in the country of origin or in Portugal or the closure of borders attributable to the COVID-19 pandemic, confer on those operators, exceptionally and temporarily, the credit claim of the unused amount.

All these forms of support have certain conditions which must be met if they are to be granted (Turismo de Portugal I.P., 2020a)**.**

Turismo de Portugal I.P. also implemented a programme to encourage consumption Visit Portugal: The "Visit Portugal" Consumer Incentive Programme translates into an incentive to consumption, through the application of a discount in the marketing of tourism products and services, in equal shares, in a shared public/private commitment model. The Program is an initiative of the Government, coordinated by Tourism of Portugal, and developed in conjunction with the internal tourism campaign managed by Tourism of Portugal, which aims to contribute to enhance its reach (with an endowment of € 50 million) (Turismo de Portugal I.P., 2020e).

Discussion and Conclusion

Concerning the analysis of the statistical data, it is possible to compare the data relating to the pre-COVID-19 with those during to the economic crisis.

With the pandemic, the number of guests, the average stay, the number of overnights stays and the regions with the highest number of tourists, for example, have decreased dramatically and will certainly take a long time to return to the numbers of 2018 and 2019. As foreseen by IPDT (2020), only in 2022 will it be possible to achieve these figures again.

Consequently, Portugal's economy is suffering a great shake-up, also due to the crisis that tourism is currently overcoming - as this sector had a great weight in the national GDP.

When analysing the measures implemented by the Portuguese government, we can verify that they all culminate in a "V-shaped" economic recovery, since it is clear the attempt to return to the situation before COVID-19. This recovery represents an acute rise back to a prior point after an abrupt decline. It is probably too early to be sure, but it seems that the government is doing everything in its power to ensure that this kind of economic recovery is achieved. It will only be clear a year or two after the end of the economic crisis caused by COVID-19. Although the government is doing its utmost to ensure that economic recovery proceeds in a "V-shaped" recovery, the emergence of new waves can affect this recovery in a negative way, delaying the resumption of the number of tourists from 2018 and 2019.

Regarding the aid to the tourism sector, the effort made by the Portuguese Government is remarkable. However, all the measures implemented, with the aim of supporting businesses and families dependent on this industry, have many conditions that must be put in place to provide this support. Many companies, for example, did not have access to the support measures because they did not have their tax status regularised or because they did not apply for aid within the stipulated deadlines. Having, thus, many tourism enterprises resorted to the reduction of wages and the dismissal of staff.

Considering the analysis of questionnaire replies, it is possible to conclude that the tourism enterprises employing the respondents have taken precautions regarding the hygiene and safety of the establishment, implementing measures other than those imposed by the government. Besides that, it is possible to confirm that most of the companies have been affected by this crisis.

Despite the response of the Portuguese government to the crisis caused by COVID-19, the discontent of the workers is evident. The idea is reinforced by the information taken from the survey: 80% of employees are unhappy with this assistance. Several respondents suggested the injection of money into the non-refundable ventures by the government to ensure their functioning and avoid high unemployment rates.

Workers believe that the future of tourist will be based on technological innovation and sustainability. Some think this crisis will lead to the rupture of the sector and to the precariousness in the sector, to redirect market segments (business professionals and students from other countries and regions), to empower the luxury tourism and rural tourism, to invest on quality over quantity, to promote local consumption, to restructure the method of management of the enterprises.

It is possible that tourism enterprises will feel the impact of the pandemic much more (in fact, a partial breakdown of the sector may occur), since, with the emergence of new waves and the imposition of new measures by the Portuguese government, the numbers of tourists and overnight stays will remain stagnant at low levels.

Therefore, given that the future is uncertain, we are facing a second wave (but possibly a third or fourth wave will arrive), it is rather difficult to predict what might happen to the economy and the tourism sector. The predictions are that in 2022 we will resume the 2018 and 2019 numbers, however with the emergence of a new wave these may change. It is true that tourism is undergoing a great change, with the aim of adapting to the new reality, a change that will most likely remain in the tourist reality. Tourism in Portugal will hardly have the same impact as before the pandemic, at least not in the way it was practiced before the crisis.

Abstract

Tax potential for any state is the source of its revenues as well as expenditures. In the global pandemic there is a trend in reduction of state revenues with a significant increase in expenditure obligations, both in the social sphere and in the real sector of the economy in order to support business. The issues related to solving medical problems, which also require substantial funding come to the foreground. This determines the urgency of the problem of stimulating the tax potential.
The purpose of the study is to assess the sources of formation of tax potential in the pandemic. Based on the analysis of official statistical information, trends in the dynamics of tax potential were identified, and a comparative assessment of monthly tax revenues over several years was carried out. The trend of reduction of the real volume of tax revenues for each tax is revealed.

Keywords: Budget System, Tax Potential, Revenues, Taxes, Economic Instability, Pandemic

Introduction

Certainly the main source of state budget revenues is tax revenues. Tax potential plays a key role in it. Despite the fact that there are a lot of scientific publications about tax potential of both Russian and foreign authors, there is still no single interpretation of this concept.

Moreover, in the context of a global pandemic, when government expenditures increase significantly, the problem of finding sources of income for the budgets of all states becomes most urgent. This is due to the fact that a large amount of funding is allocated to medical and social services for the population, pharmaceutical research and the introduction of medical technologies. Business support programs in the most affected and related industries also require significant expenditures.

Accordingly, solving the problem of budget deficit comes to the fore in theoretical and practical research in the context of the new reality. Thus, the analysis of the sources of the formation of tax potential, the possibilities of its expansion becomes a priority task for any state. At the same time there is a dilemma to keep the business while creating a stable tax base for the budgetary system.

Existing approaches to the analysis of tax potential contribute to the formation of certain myths associated with the sources of its growth. The external factors often have a negative impact that can change the structure of the tax potential. The article considers this problem.

Literature Review

Tax potential as an economic category is considered in the writings of the Russian and foreign authors. There are many approaches to its definition. In the Russian Federation the tax potential at the legislative level was indicated in 2004 in the Budget Code in Article 138 in order to determine the level of estimated fiscal capacity of municipal districts. At the same time the peculiar feature is that the tax potential at the legislative level is synonymous with the tax base of the corresponding territory: a region, a municipal district, a rural settlement, etc.

Well-known studies of such authors as J. Stamp (1922), L. Alfirman (2003), H. Rao (1993), C. Pessino and R. Fenochietto (2010) investigate the issues of tax potential in various aspects. In the scientific literature tax potential is usually considered both in the broad and narrow sense. Such authors as Gorskiy I.V. (1999), Roshchupkina V.V. (2007), Saakyan R.A. (2007), Mayburov I.A. (2013), Shemyakina M.S. (2013) define tax potential as the total amount of taxable resources of territories, i.e. give an expanded interpretation of this economic category. In the narrow, practical sense tax potential is considered in the writings of Vasilieva M.V. (2004), Prokopenko R.A. (2007), Simonov V.V., Sulakshin S.S., Podporina I.V., Pogorelko M.U. (2008) and others.

In the broad sense “tax potential” is the total amount of taxable resources of the territory. In the narrow, practical sense "tax potential" is the maximum possible amount of taxes and levies calculated in the current legislation (2004).

Tax potential is considered from different aspects: according to qualitative and quantitative characteristics, according to temporal and territorial characteristics, based on various approaches (institutional, resource, reproduction and effective ones). All this shows how alternative the methods for the quantitative determination of tax potential are.

At the same time in our study we consider tax potential as tax revenues of the state going into the budget system under the current legislation and under the current economic conditions.

Research Question

As the tax potential is the main source of income for the budgetary system it is necessary to take into account the specifics of its formation on the territory of the Russian Federation. The specifics is formed on the basis of sources of income which in general can be represented as oil and gas and non-oil and gas ones. This is due to the specifics of the economic potential of the Russian Federation and the focus on the sale of natural resources as income sources.

However in recent years the issues related to the need to focus on the increasing role of specifically non-oil and gas revenues have been actively discussed. This is confirmed by statistical data, which clearly illustrate that since 2015 the situation has changed and the role of non-oil and gas revenues has increased (Figure 1).

Figure 1: The structure of oil and gas and non-oil and gas revenues of the Russian Federation, billion of roubles (Ministry of Finance of the Russian Federation, 2020)

At the same we suppose that this circumstance is to a greater extent associated with economic turbulence caused by political processes, which is also confirmed by the actual data on the dynamics of Russia's foreign trade (Figure 2). In parallel with these processes there is also a significant drop in oil prices, which also does not contribute to the growth of oil and gas revenues.

Figure 2: Dynamics of Russia's foreign trade, billion of dollars (Ru-Stat, 2020)

Proceeding from the fact that mineral products occupy the first place in the structure of foreign trade (Figure 3), the decrease in oil and gas revenues was primarily influenced by the fall in demand due to the ongoing geopolitical processes.

Figure 3: Structure of the Russian export, % (Ru-Stat, 2020)

The statistical data clearly show that during the period under consideration there is a reduction in the share of mineral products in the total structure of export. Moreover, if we compare the data for August 2019 and August 2020, we can see that there was a decrease of almost 50% in the export of mineral products from 18.6 to 9.25 billion dollars. These processes also have an impact on tax potential.

It is obvious that in context of the global pandemic there was a fall in demand for oil, since the volume of cargo and passenger traffic decreased. The main sources of tax potential associated with the import of goods are: VAT (value

added tax), excise taxes and import duties. Moreover, the main source of tax potential is VAT primarily because of the size of the tax rate (Figure 4).

Figure 4: Dynamics and structure of tax potential for imported goods, billion of roubles (Ministry of Finance of the Russian Federation, 2020)

Despite the annual increase in tax rates on excise taxes, their receipts only since 2017 are significant for the revenues of the federal budget of the Russian Federation. However, they are still significantly lower than VAT which also shows an insignificant import of excisable goods. The monthly dynamics of VAT collection for 2015 - 9 months in 2020 is shown in Figure 5.

Figure 5: Monthly dynamics of VAT collection on imported goods, billion of roubles (Ministry of Finance of the Russian Federation, 2020)

The closure of borders in 2020 directly influenced VAT receipts in the budgetary system of the Russian Federation. If in 2015–2019 there was an increase in VAT collection, then in 2020 the situation is changing. The VAT receipts from imported goods in January, February, April, July and August are below the level of the same period in 2019, and in May 2020, the collection rate fell below the level of the same period in 2018.

In 2020 "Machinery, equipment and facilities" (31%), "Chemical products" (13%) were mainly imported. In the structure of imports by country China is in first place (22%), Germany is in second place (11%). Moreover, 43.4% of goods were supplied in 2020 to Moscow, 11.7% - to the Moscow region, 9.5% - to St. Petersburg, the rest of the

subjects of the Russian Federation accounted for 49.7% of imported goods, the largest receipts were carried out in the Kaliningrad (3%), Kaluga (2.5%) regions and Krasnodar Territory (2%). This is due to the structure of the economic potential of these regions.

The main taxes associated with domestic production at the federal level are VAT, corporate income tax and excise taxes (Figure 6). Despite the fact that the corporate income tax rate is 20%, its role in the federal budget is less significant as only 2% goes to the federal level, and 18% remains in the regional budgets. A substantial growth in income tax revenues in 2017 was due to the fact that contributions to the federal budget were increased by 1% and amounted to 3% however this is a temporary measure due to economic turbulence.

A peculiar feature of the tax potential for excise taxes is that the annual increase in tax rates does not lead to an increase in budget system revenues, but on the contrary reduces the demand for excisable goods sold through retail chains, while the role of the shadow sector of the economy increases (for example, the production of alcohol-containing products in home conditions).

Figure 6: Dynamics and structure of tax potential for domestic production, billion of roubles (Ministry of Finance of the Russian Federation, 2020)

The most significant value in the structure of tax potential for domestic production at the federal level belongs to VAT (the entire amount collected is fully transferred to the federal budget). A significant increase in its collection rate in 2019 was due to an increase in the tax rate from 18 to 20%. At the same time, the monthly dynamics of its collection has the same trends (Figure 7).

Figure 7: Monthly dynamics of VAT collection, billion of roubles (Ministry of Finance of the Russian Federation, 2020)

The global pandemic has shown significant impact for VAT receipts to the federal budget from domestic production since April 2020, this fact is due to a decrease in demand in the domestic market caused by a significant drop in household income, an increase in unemployment and the restriction in the activities of economic entities. The global pandemic has directly or indirectly affected almost all industries. This also naturally affected the tax potential of the budget system.

All enterprises and organizations are forced to increase their costs significantly for compliance with preventive measures and disinfection of premises. A number of enterprises in the real sector of the economy were forced to suspend their activities in the conditions of self-isolation, the onset of the second wave of the pandemic also limits the sources of profit for economic entities significantly. Consequently, on the one hand, a decrease in the volume of profits of economic entities in a pandemic, and on the other hand, an increase in the volume of expenditures contributes to a decrease in tax revenues to the budgetary system on corporate income tax. Also, tax incentives provided to enterprises, for example, in the form of a tax deferral, naturally minimize the collection of corporate income tax (Figure 8).

Figure 8: Monthly dynamics of corporate income tax collection, billion of roubles (Ministry of Finance of the Russian Federation, 2020)

The peak of collection of corporate income tax, as well as VAT, fell on March 2020, as it was partly due to the rush demand of the population for essential goods and the desire to spend making purchases planned for the future in anticipation of inflationary processes. The population's fear of losing their savings led to an increase in demand for durable goods, including real estate. As noted above, the annual increase in tax rates on excise taxes does not lead to an increase in their collection (Figure 9).

Figure 9: Monthly dynamics of collection of excise taxes, billion of roubles (Ministry of Finance of the Russian Federation, 2020)

Even an increase in demand in the pandemic for alcohol-based disinfectant products does not contribute to an increase in revenues from this revenue source. The statistical data given above indicate that the tax potential in the context of the pandemic received a negative impetus as a result of the March – April lockout, however, the trend of its formation in the future indicates a recovery.

Discussion and Results

Consequently the first myth associated with the fact that non-oil and gas revenues are increasing solely due to the growth of the national economy is not confirmed by the statistical data since there is no significant increase in tax potential, rather the growth of its indicators is influenced by inflationary factors that cause the increase in price, and as a result the increase in tax revenues to the budget system. The second myth associated with the fact that in the context of the global pandemic there is a significant drop in tax potential is not confirmed by the statistical data as well.

Tax incentives provided to enterprises from the most affected sectors, at the time of their operation reduce the tax potential but in general this is not so critical for the revenues of the budget system. The decrease in the collection of tax revenues is often more negatively affected by the annual increase in tax rates.

The development of any branch of the economy in the context of the “new reality” requires a revision of the existing economic mechanisms. The situation is aggravated by the presence of the interregional differentiation, the significant volume of the “shadow sector of the economy” and a large territory of the Russian Federation.

In order to mitigate the impact of the crisis on the regions, the federal support alone will not be enough. Some thoughtful actions of the regional authorities (especially their interest) are needed to support the economy, to create jobs, to launch new industries, and provide real support for businesses, especially small businesses as well. It is necessary to resolve the issues related to the reduction of the shadow sector of the economy, and specifically at the regional level, to think over the tools for its legalization, taking into account the regional specific features of its conduct.

In fact it is necessary to look for individual growth points for each region that will make it possible to level out the impact of the coronavirus pandemic. And this can be done only on the basis of the economic potential of each constituent entity of the Russian Federation, there cannot be one universal recipe for all regions, as their interregional differentiation is too strong.

The issue to be discussed is one for each region: the interest of regional authorities, the adequacy of the decisions made, trust in the authorities and the desire of the population to help in overcoming the consequences of the pandemic, the activity of citizens. The solution to this problem is possible only from the comprehensive perspective. The consequences are too serious, both for each region and for the whole country as a whole.

It is necessary to understand that the crisis will not end immediately, business will gradually and very slowly gain momentum, and the fulfillment of the state's social obligations to the population cannot be postponed until later. Pensions, benefits, scholarships must be paid on time, schools and kindergartens, clinics and hospitals must work. This requires tax revenues. But any inept actions of the authorities may not increase but on the contrary reduce them.

Therefore, before launching any program to eliminate and overcome the consequences of the coronavirus pandemic it is necessary to assess its consequences, both for the budget and for business and the population, forecasting must be quite accurate (unlike the practice of recent decades). Of course an adjustment in implementation process is possible but it does not have to be global. It is necessary to clearly understand the final results and the ways to achieve them otherwise a positive result is hardly possible.

Thus, the structure of tax potential directly depends on the structure of economic potential. Considering that the Russian Federation consists of 85 subjects, and the interregional differentiation of their economic potential is quite significant it is the economic potential that affects the formation of both the tax base and the tax potential, the need to stimulate the development of economic potential in the regions is a priority task of the state at the present time.

The incentive mechanism in a pandemic should not include only the financial support for business, it is necessary to use the full range of direct and indirect tools, including consideration of the possibility of transforming the legislative framework for functioning of business, not in terms of tightening it, but in order to stimulate the formation of growth points capable to take the national economy out of the crisis.

Abstract

Lately, with the availability of huge amounts of data over the internet, it becomes difficult and necessary need to get information vastly and accurately in order to extract the related information . we need a good mechanism automatic text summarization becomes a useful technique for generating the summary from single or multiple documents related to the users query the operation of text summarization is condensing the original text into a shorter form this paper focus on extractive text summarization for summarizing text using neural networks which is trained on a set of features extracted from sentences that should be included in the summary of the text.

Keywords: Automatic text summarization – extractive text summarization**-** Features-neural network.

Introduction

Automatic summarization is the process of shortening a set of data computationally to create a subset that represents the most important or relevant information within the original content. In addition to text, images and videos can as well be summarized [Allahyari, M., Pouriyeh, S., Assefi, M., Safaei, S., Trippe, E.D., Gutierrez, J.B. and Kochut, K., 2017]. Here we focus on Text summarization which is the process of locating the most informative sentences in a document. There are two common methods to automatic summarization: extraction and abstraction. Firstly extraction-based summarization here, content is extracted from the original data, but the extracted content is not modified in any way. Examples of extracted signification involve key-phrases that can be used to "tag" or index a text document, or key sentences (including headings) that collectively cover an abstract, and representative images or video segments, as stated above. [Shimpikar, S. and Govilkar, S., 2017]For text, extraction is hassling to the method of skimming, where the summary (if available), headings and subheadings, figures, the first and last paragraphs of a section, and optionally the first and last sentences in a paragraph are read before one chooses to read the entire document in detail. Secondly abstraction-based summarization this has been applied mainly for text. [Abdelaleem, N.M., Kader, H.A. and Salem, R., 2019]Abstractive methods build an inner semantic impersonation of the main content [Bhargava, R., Sharma, Y. and Sharma, G., 2016], and then use this representation to make a summary that is nearer to what a human may express. Abstraction can convert the extracted text by paraphrasing partition of the original document, in order to intensify a text more robustly than extraction [Nallapati, R., Zhou, B., Gulcehre, C. and Xiang, B., 2016]. However, such conversion is computationally much more challenging than extraction, including both natural language processing and often a deep understanding of the area of the main text in states where the main document relates to a specific field of knowledge.[García-Hernández, R.A. and Ledeneva, Y., 2009] "Paraphrasing" is even more complicated to apply to image and video, which is why most summarization systems are extractive. Approaches aimed at higher summarization goodness depend on joint software and human endeavor.[Allahyari, M. and Kochut, K., 2015] In Machine Aided Human Summarization, extractive techniques highlight elect crypt for implication (to which the human adds or removes text). In Human Aided Machine Summarization, a human post-processes software output, in the same way that one formulate the output of automatic translation by Google Translate. There are two types of extractive summarization tasks count on

Cite this Article as: Nadeen M ABDELALEEM , Hatem M ABDAL KADER, Rashed K SALEM andDiaa SALAMA ABD ELMINAAM"Extractive Text Summarization Using Neural Network" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

what the summarization program concentrate on. The first one is generic summarization, which focuses on gaining of a generic summary or abstract of the collection (whatever these are documents, or sets of images, or videos etc.). The second is query relevant summarization, sometimes called query-based summarization, which summarizes objects particular to a query. Summarization systems are qualified for creating jointly query relevant text summaries and generic machine-generated summaries depending on user requirements. An example of a summarization issue is document summarization that try to automatically produce an abstract from a given document. Occasionally one might be interested in generating a summary from an individual source document, while others can utilize several source documents (for example, a collection of articles on the same topic)[Allahyari, M. and Kochut, K., 2016]. This problem is called multi-document summarization. A related application is summarizing news articles. Imagine a system, which automatically pulls with each other news articles on a given topic (from the web), [Allahyari, M. and Kochut, K., 2016] and briefly represents the latest news as a summary. Summarization algorithms trying to locate subsets of objects like set of sentences [Allahyari, M. and Kochut, K., 2016], or a set of images, that include information of the whole collection. This is also called the core-set. These algorithms paradigm notions like variety, coverage, information and representativeness of the summary. Query based summarization mechanisms, additionally model for relevance of the summary with the query [Meena, Y.K. and Gopalani, D., 2015].Artificial neural networks (ANN) or connectionist systems are computing systems ambiguously inspired by the biological neural networks that comprise animal brains. Such systems "learn" to comprise tasks by considering examples, generally without being programmed with task-specific rules. For example, in image recognition, they might impart to recognize images that include cats by analyzing example images that have been manually labeled as "cat" or "no cat" and utilizing the results to identify cats in other images. They do this without any prior knowledge of cats, for example, that they have fur, tails, whiskers and cat-like faces. Instead, they automatically produce recognizing characteristics from the examples that they process. An ANN is based on a group of linked units or nodes called artificial neurons, which loosely model the neurons in a biological brain. Each connection, like the synapses in a biological brain, can transfer a signal to other neurons. An artificial neuron that receives a signal then processes it and can signal neurons connected to it [Allahyari, M., Pouriyeh, S., Assefi, M., Safaei, S., Trippe, E.D., Gutierrez, J.B. and Kochut, K., 2017] .In ANN implementations, the "signal" at a connection is a real number, and the output of each neuron is calculated by some nonlinear function of the sum of its inputs. The connections are called edges .Neurons and edges usually have a weight that adjusts as learning proceeds. The weight increases or decreases the intensity of the signal at a connection. Neurons may have a threshold such that a signal is sent only if the aggregate signal passes that threshold. Typically, neurons are aggregated into layers. Various layers can carry out various transformations on their inputs. Signals move from the first layer (the input layer), to the latter layer (the output layer), probably after traversing the layers several times.

The ANN way's primary purpose was to resolve problems in the same way that a human brain would. However, over time, attention moved to implementing particular tasks, leading to deviations from biology. ANNs have been used on a diversity of tasks, involving computer vision, speech recognition, machine translation , social network filtering, playing board and video games, medical diagnosis and even in activities that have traditionally been considered as reserved to humans, like painting [Sarda, A.T. and Kulkarni, A.R., 2015].

Supervised learning utilized a set of paired inputs and desired outputs. The learning task is to produce the desired output for each input. In this case, the cost function is related to eliminating incorrect deductions. A commonly used cost is the mean-squared error, which tries to minimize the average squared error between the network's output and the desired output. Tasks proper for supervised learning are pattern recognition (also known as classification) and regression (also recognized as to function approximation). Supervised learning is also usable for sequential data (e.g., handwriting, speech, and gesture recognition). This can be considered learning with a "teacher", in the form of a function that supplies continuous feedback on the quality of solutions obtained thus far [Fang, C., Mu, D., Deng, Z. and Wu, Z., 2017]. In unsupervised learning, input data is presented along with the cost function, some function of the data {\displaystyle \textstyle x} and the network's output. The cost function is linked with the task (the model domain) and any a priori suppositions (the implicit characteristic of the model, its parameters, and the spotted variables). As a petty example, suppose the model {\displaystyle \textstyle f(x)=a} where {\displaystyle \textstyle a}a constant is and the cost{\displaystyle \textstyle C=E[(x-f(x))^{2}]}. Reducing this cost produces a value of {\displaystyle \textstyle a} that is equal to the mean of the data. The cost function can be much more complicated. Its form depends on the application: for example, in compression, it could be related to the mutual information between {\displaystyle \textstyle x} and {\displaystyle \textstyle f(x)}, whereas in statistical modeling, it could be related to the posterior probability of the model that present the data (note that in both of those examples those quantities would be maximized rather than minimized). Tasks that fall within the

pattern of unsupervised learning are in public estimation issues, the applications include clustering, the estimation of statistical distributions, compression and filtering.

This work is relative to our work that using features for extractive text summarization. Recurrent Neural Network (RNN) based sequence paradigm for extractive summarization of documents and presentations realizes performance superior or comparable to state-of-the-art.[Nallapati, R., Zhai, F. and Zhou, B., 2016.] "SummaRuNNer: A Recurrent Neural Network Based Sequence Model for Extractive Summarization of Documents" .propose an extractive technique for text summarization by using feature terms for calculating the relevance measure of sentences and extract the sentences of highest ranks[Gowri, K. and Chezian, R.M., 2018] "Optimization of Text Summarization Based on Feature Selection and Classification". Ramesh Nallapati introduced a model for abstractive text summarization using Attentional Encoder-Decoder Recurrent Neural Networks and show that they achieve state-of-the-art performance on two different corpora.[Nallapati, R., Zhou, B., Gulcehre, C. and Xiang, B., 2016] "Abstractive Text Summarization using Sequence-to-sequence RNNs and Beyond". another approach for extractive, query-focused, single document summarization of medical text. The research utilizes an aggregation of target-sentence-specific and target-sentence-independent statistics drawn from a bulk specialized for summarization in the medical domain [Sarker, A., Mollá, D. and P Also Ramesh Nallapati aris, C., 2013].Also, Ramesh Nallapati cast text summarization as a sequence-to-sequence problem and Apply the attentional encoder-decoder RNN that has been shown to be successful For Machine Translation [Nallapati, R., Xiang, B. and Zhou, B., 2016.] "Sequence-To-Sequence RNNs For Text Summarization. "

Abstractive Sentence Summarization produces a shorter edition of a given sentence while seeking to preserve its concepts. We introduce a conditional recurrent neural network (RNN), which generates a summary of an input sentence.[Chopra, S., Auli, M. and Rush, A.M., 2016] "Abstractive Sentence Summarization with Attentive Recurrent Neural Networks".

The paper covers a review of the growth and improvement in Automatic Text Summarization techniques on implementing Evolutionary Algorithms techniques. We propose a broad set of features that considers additional features in the fitness function.[Meena, Y.K. and Gopalani, D., 2015] Evolutionary Algorithms for Extractive Automatic Text Summarization Yogesh Kumar Meenaa,*, Dinesh Gopalanib. S.A.Babara and Pallavi D.Patilb.focuses on the Fuzzy logic Extraction technique for text summarization and the semantic method of text summarization using Latent Semantic Analysis [Babar, S.A. and Patil, P.D., 2015][Allahyari, M. and Kochut, K., 2016,].

Neural Network

Multilayer Perceptron (MLP)

It is a class of feedforward artificial neural network (ANN). Multilayer Perceptron (MLP) is used obscure, sometimes widely to refer to any feedforward ANN, occasionally precisely to refer to networks composed of multiple layers of perceptrons (with threshold activation); Multilayer perceptrons are sometimes colloquially called "vanilla" neural networks, especially when they have a single hidden layer. An MLP composed of at least three layers of nodes: an input layer, a hidden layer, and an output layer. Unless the input nodes, each node is a neuron that utilizes a nonlinear activation function. MLP utilizes a supervised learning technique called backpropagation for training. Its multiple layers and nonlinear activation differentiate MLP from a linear perceptron. It can distinguish data that is not linearly separable. The MLP consists of three or more layers (an input and an output layer with one or more hidden layers) of nonlinearly-activating nodes. Since MLPs are connected, every node in one layer connects with a particular weight {\displaystyle w_{ij}} to each node in the next layer.

The term "multilayer perceptron" does not mention an individual perception that has multiple layers. Instead, it includes many perceptrons that are orderly into layers. An alternative is the "multilayer perceptron network". Furthermore, MLP "perceptrons" are not perceptrons in the strictest possible sense. True perceptrons are officially

an unusual case of artificial neurons that use a threshold activation function such as the Heaviside step function. MLP perceptrons can employ arbitrary activation functions. A true perceptron carries out binary classification (either this or that), an MLP neuron is loose to either execute classification or regression, depending on its activation function. The expression of "multilayer perceptron" later was applied regardless of the nature of the nodes/layers, consisting of arbitrarily known artificial neurons, not perceptrons particularly. This translation averts the loosening of the definition of "perceptron" to mean an artificial neuron in general. MLPs are valuable in research to resolve issues stochastically, which often permits approximate solutions for too complex problems like fitness approximation.

MLPs are universal function approximators, so they can be used to create mathematical models by regression analysis. As classification is a specific case of regression when the response variable is categorical, MLPs create perfect classifier algorithms. MLPs were a widespread machine learning solution in the 1980s, discovering applications in several domains such as speech recognition, image recognition, and machine translation software, but subsequently faced robust opposition from much simpler support vector machines. Concerned in backpropagation networks returned due to the victories of deep learning.

Probabilistic Neural Network (PNN)

Is a feedforward neural network, which is vastly used in classification and pattern recognition problems . In a PNN, the operations are organized into a multilayered feedforward network with four layers: An input layer, Pattern layer, Summation layer, and Output layer **Input layer,** every neuron in the input layer symbolize a predictor variable. In categorical variables, *N-1* neurons are used when there is *N* number of categories. It measures the extent of the values by subtracting the median and dividing by the interquartile range. Then the input neurons feed the values to all neurons in the hidden layer **Pattern layer** this layer includes single neuron for each case in the training data set. It keeps the values of the predictor variables for the case along with the goal value. A hidden neuron counts the Euclidean distance of the test case from the neuron's center point and then stratify the radial basis function kernel function using the sigma values. **Summation layer** For PNN there is one pattern neuron for each category of the goal variable. The factual target category for all the training cases is kept with each hidden neuron; the weighted value coming out of a hidden neuron is fed only to the pattern neuron equivalent to the hidden neuron's category. The pattern neurons collect the values for the class they represent. **Output layer** the output layer compares the weighted votes for each target category cumulated in the pattern layer and utilizes the largest vote to prophesy the target category.

Some Advantages of PNN rather than MLP. Its much faster and more precise, relatively insensitive to outliers, producing accurately predicted target probability scores, and PNNs approach Bayes optimal classification.

The main drawbacks of PNN are slower than multilayer perceptron networks at classifying new cases. And need more memory space to store the model.

Applications based on PNN

- In modelling structural deterioration of storm water pipes.
- Is method to gastric endoscope samples diagnosis based on FTIR spectroscopy .
- Used in resolving Different Pattern Classification Problems.
- Implement of PNN to population pharmacokinetics.
- Probabilistic Neural Networks to the Class Prediction of Leukemia and Embryonal Tumor of Central Nervous System.
- Ship Identification Using Probabilistic Neural Networks.
- Based sensor configuration management in a wireless *ad hoc* network.
- Probabilistic Neural Network in character recognizing.
- Remote-sensing Image Classification.

a. *Time Delay Neural Network (TDNN)*

is a multilayer artificial neural network architecture that aims to firstly classify patterns with shift-invariance, and secondly model context at each layer of the network .The Time Delay Neural Network, like other neural networks, operates with multiple interconnected layers of perceptrons , and is implemented as a feedforward neural network. All neurons (at each layer) of a TDNN receive inputs from the outputs of neurons at the layer below but with two differences:

1. Unlike regular Multilayer perceptrons, all units in a TDNN, at each layer, obtain inputs from a contextual window of outputs from the layer below.. Higher layers have more expansive context windows than lower layers and thus generally model coarser levels of abstraction.

2. Shift-invariance is achieved by explicitly removing position dependence during backpropagation training. This is done by making a time-shifted replica of a network across the dimension of invariance.

Applications based on TDNN

1. Speech recognition
2. Large vocabulary speech recognition
3. Speaker independence
4. Video analysis
5. Image recognition
6. Common libraries (s.a.) Matlab: The neural network toolbox has explicit functionality designed to produce a time delay neural network give the step size of time delays and an optional training function.

Features

Each document is converted into a list of sentences. Each sentence is represented **as** a vector [f1, f2,…, f8] composed of 8 features. Table 1: eight features of a document [Sarda, A.T. and Kulkarni, A.R., 2015].

Table 1: list of features and corresponding description

Feature	Description
F1	Paragraph follows title
F2	Paragraph location in document
F3	Sentence location in paragraph
F4	First sentence in paragraph
F5	Sentence length
F6	Number of thematic words in the sentence
F7	Number of title words in the sentence
F8	Numerical data feature

The proposed algorithm extract eight features represented as follow: Feature *f1* Paragraph follows title, which detect location of paragraph herein first paragraph that follows title. Feature *f2* Paragraph location in document, which finds location of paragraph among all paragraph present in document. Feature *f3* Sentence location in paragraph, which finds sentence location among all sentences from paragraph and decides rank for sentences as per their position. Feature *f4* first sentence in paragraph which decide sentence score and rank by its position in paragraph in this case first sentence in paragraph. Feature *f5,* sentence length, is useful for finding out long and short sentences such as dateline and names commonly found in different articles. We also anticipate that short sentences are unlikely to be included in summaries. Feature *f 6*, the number of thematic words, which point out the number of thematic words in the sentence, relative to the maximum possible words According to the theme of article. Feature *f7* Number of title words in the sentences, which indicates the number of title words in the sentence, relative to the maximum possible. Feature *f8* Numerical data feature is used find numerical data in sentences to find more feasible sentence for summary.

Data set

first dataset with eight features

Our data set about 80000 row which is divided into about 60% used for the training the data set on classification of MLP multilayer perceptron ,about 15% taken for cross validation which is another set-aside data set that is used during the training process to help prevent the neural network model from overspecializing on the training data. So while the neural network is training, and about 25% for the testing the neural network .the software also uses the cross validation data to test the network simultaneously to stop the neural network training before it starts becoming too specialized on the training data.

Neural Network Training

First Dataset

The first phase of the process involves training the neural networks to learn the types of sentences that should be included in the summary. This is accomplished by training the network with sentences in several test paragraphs where each sentence is identified as to whether it should be included in the summary or not. This is done by a human reader. The **neural** network learns the patterns inherent in sentences that should be included in the summary and those that should not be included. This training done by using three methods MLP , PNN and TDNN that discussed previously

We use a three-layered feed forward neural network, number of epochs is 1000 epochs and the cross validation termination after 100 epochs .the following figure show the relation between no of epoch vs the MSE

Fig. 3: MSE vs. Epoch using MLP classification

Results

first dataset

The end results is an easy to understand report displaying a confusion matrix of the results as well as some general statistics about the performance of the model on the out of sample data. The confusion matrix is read from the top left and goes diagonally to the right displaying the correct predictions. So for this particular training run we classified 600 in summary and 5 not in summary correctly with 22 not in summary and 11 in summary misclassified.

Fig 26. Analyzing Test Data Results Using TDNN

Conclusion

In this paper we presented a technique for summarizing text exactly extractive text summarization by training supervised neural networks to determine the features that should be included in the text and so the sentences that will be taken in the summary depending on the results of training and the performance each network in training, as previously shown we use two different data set with different number of features and training both of them on MLP,PNN ,TDNN .and then we concluded that the dataset with eight features gives results better than the other one especially with MLP technique. the future work will depend on developing a new technique that combine the selected sentences to give a meaningful text for human reader also developing a new technique for extracting more features from the text.

Abstract

The article deals with the problematic issues of legal assurance of food quality and safety from the point of view of its significance for ensuring the right of citizens to health protection. The authors note that the quality and safety of food products and the legal mechanism for ensuring them is a necessary element of protecting the health of citizens and a condition for achieving food security in the country. Analyzing the regulatory framework in the field of food quality and safety, the authors conclude that it does not fully protect the interests of public health, and therefore does not adequately contribute to ensuring food and national security of the country. Among the shortcomings of the current legal mechanism for ensuring the quality and safety of food products, the authors highlight: the half-hearted nature of this mechanism (legal regulation focuses on ensuring product safety), the content uncertainty of the basic concepts («food quality», «food safety»), declarative provisions in the field of food quality assurance and the lack of clear quality criteria.

Keywords: right to health protection, quality and safety of food products, national security, health, legal assurance of quality and safety, legal regulation, food security, public health.

Introduction

It is obvious that the well-being and sustainable development of a state directly depends on the quality of the human potential of its citizens. In recent years, the concept of «human potential» has become firmly established in economic and legal science and is defined by a whole set of characteristics, such as the level of education of the population, indicators of public health and demography, features of mentality, etc.

It is the human potential of the country's population that ultimately determines the level and prospects of its socio-economic and technological development, the ability of a nation to resist external influences in the form of military aggression, natural disasters, etc.

Despite the breadth of the concept of «human potential» and its multidimensional nature as a phenomenon, its basis in any case is the health of citizens, since it is health that creates the necessary physical opportunities for employment, it is a necessary prerequisite for the realization of creative and educational abilities of a person, etc. Nothing else but health primarily determines the quality of life, the improvement of which is declared a strategic national priority in the Russian Federation (Decree of the President of the Russian Federation of 21.01.2020 №20), which is important for ensuring the national security of the country.

The food security Doctrine is intended to improve the quality of life of Russian citizens by providing sufficient food supplies, as well as by ensuring the quality and safety of food products. This seems natural, given the huge importance of the quality characteristics of food products for the health of citizens and in General for ensuring food security, which in turn is one of the main directions of ensuring national security of the country. It should be noted that the Russian legal doctrine has long considered the quality and safety of food as an integral part of food security.

It is in this aspect that it appears in the works of N. M. Aliyeva (Alieva N. M., 2018), H. U. Belkharoev (Belkharoev H. U., 2018), E.V. Vorontsova, A.L.Vorontsov (Vorontsov, A.L., Vorontsova E.V,2016) (Vorontsova E.V., Vorontsov A.L.,2018), M. L. Makarevich (Makarevich M. L., 2015), O. V. Rakhmatullina, T. S. Chernovol (Rakhmatullina O. V., Chernovol T. S., 2017), O. A. Semenova (Semenova O. A., 2020) and O. V. Tarkhanov (Tarkhanov O. V., 2016). This position was also accepted by the leadership of the Russian state, which found its legal confirmation in the fact that providing the population with high-quality and safe food products is declared the national interest of the state in the field of food security. At the same time existing in Russia a real legal mechanisms to ensure the quality and safety of food products, in our opinion, far from perfect and is unable to adequately protect the interests of citizens in the field of health and do not achieve the status of food security as one of the goals of state policy in the sphere of ensuring the national security of the country.

All this actualizes our scientific analysis of the issues of legal regulation of food quality and safety.

Materials and Methods

The author's research was based on the General principles of science, objectivity, and the principle of taking into account different points of view. The method of analysis, logical reasoning, comparison, and the formal legal method were used as specific research methods.

Results and Discussion

In a modern democratic society, a person has a certain set of rights that determine, on the one hand, his belonging to this society, and, on the other hand, his autonomous position. The most important of these rights acquire an integral character and are enshrined in the Constitution of the country, which imposes on the state the obligation to unconditionally observe and protect them. However, not all constitutional rights are equivalent in their impact on human life. The right to health protection occupies a special place in the system of constitutional rights. This is because of the great value of this subjective right to preserve key social benefits, what is health, and the specifics of the legal mechanism of ensuring the right to health, involving regulation of a very wide range of social relations. Of course, such broad legal regulation cannot be carried out only within the framework of constitutional law. In the field of health protection, legal regulation is cross-sectoral, but this is also due to the constitutional status of the right to health protection, which a priori required its detail in industry legislation.

The most important prerequisite for human health is high-quality and safe food. It is estimated that 85% of harmful substances a person receives together with food and water (The decree of the RF Government from 29.06.2016 №1364-R), which determines the development of a number of chronic diseases that significantly affect public health indicators. In addition, food can be a source and carrier of deadly infections, which is confirmed by periodic outbreaks of various kinds of epidemics, the epicenter of which was the sphere of food turnover. Thus, the quality and safety of food products is a practical tool for preserving and strengthening the health of citizens. Accordingly, legal assurance of food quality and safety is an integral part of the integral mechanism for ensuring the constitutional right to health protection. At the same time, the quality and safety of food consumed by Russian citizens raises reasonable concerns. Moreover, basic government document on national security – national security Strategy of the Russian Federation – the decline in the quality of consumer goods (and food are the main ones) called the threat to strategic national priority – improvement of the quality of life of Russian citizens (The decree of the President of the Russian Federation from 31.12.2015 №683), which suggests that human health is a crucial component of quality of life, because it (the condition) largely determines the possibility of realization of his aspirations, rights and freedoms etc.

The importance of quality characteristics of food is also indicated in Federal law №323-FZ of 21.11.2011 «On the basics of public health protection in the Russian Federation»: health protection is provided through the production and sale of high-quality and safe food products (Federal law №323-FZ of 21.11.2011). However, according to the authors of this article, it is in terms of implementing the constitutional right to health protection that the legally established mechanism for ensuring the quality and safety of food products is the least perfect.

In support of this thesis, let us first turn to the Doctrine of food security of the Russian Federation (Decree of the President of the Russian Federation of 21.01.2020 №20), since providing the population with high-quality and safe food products is generally considered to be a necessary condition for achieving food security in the country. The definition of food security enshrined in the Doctrine guarantees physical and economic accessibility for every citizen of food products that meet mandatory requirements (this is its main characteristic-author's note) in turn, mandatory requirements are contained in technical regulations for a particular product and are regulated by legislation on technical regulation, primarily Federal law №184-FZ of 27.12.2002 «On technical regulation» (Federal law №184-FZ of 27.12.2002). However, the fact is that only requirements for product safety became mandatory with the adoption of the above-mentioned law. As for product quality indicators, any standards, state

standards, etc. have become voluntary. Currently, no one can oblige the manufacturer (except himself) to adhere to any specific components in the product and their quantitative ratio. Thus, the current mechanism for ensuring the quality and safety of food in Russia is based on unconditional compliance with the only legal criterion – the food product in circulation must be safe under normal conditions of its use, i.e. its use under the necessary conditions of storage, processing, etc. should not pose a danger to human life and health. And this is the root of a huge problem, because a safe product does not mean a healthy product, and it is the usefulness of a particular product that very often determines the need for its use as food.

For example, let's take baby food produced by food concerns, the consumption of which is determined exclusively by the quality characteristics of these products, which a priori must contain a certain amount of substances necessary for the child's body. Let's assume that certain baby food products do not contain the declared vitamins and trace elements in their composition, or contain them in insufficient quantities. This in itself does not make them dangerous, but it does not mean that these baby food products are not capable of harming the child's health. Moreover, the harm of such products is obvious, since, while consuming them, the child does not receive the proper amount of substances necessary for him in the first months of life, which can cause a delay in his physical and mental development.

The situation may become even more threatening when using safe, but also useless medications, as well as when eating foods that do not meet the declared characteristics - people suffering from certain chronic diseases (pancreatitis, diabetes, etc.).

At the level of legal regulation, the emergence of such threats to the health of citizens contributes, among other things, to the content uncertainty of some fundamental concepts, including the concepts of quality and safety contained in Russian legislation. Thus, in Federal law №29-FZ of 02.01.2000 «On the quality and safety of food products» (Federal law №29-FZ of 02.01.2000), the concept of food quality is formulated as «a set of characteristics of food products that can meet human needs for food under normal conditions of their use». As you can see, the meaning of this definition boils down to the fact that any food product that can satisfy the feeling of hunger can (should) be recognized as a quality product. Otherwise, how can we interpret the expression «able to meet human needs in food»?

In our opinion, the above definition is very general, it does not contain any indication of the usefulness of food products, the significance of their characteristics for human health. In a situation of such conceptual uncertainty, it is quite natural that it is in the field of food quality assurance that the legal mechanism is the least specific, and therefore the least effective.

As for the definition of food safety, in our opinion, it is also not entirely successful. In the Federal law «On the quality and safety of food products» (Federal law №29-FZ of 02.01.2000) mentioned above, the definition of safety is as follows: «a state of reasonable confidence that food products under normal conditions of use are not harmful and do not pose a risk to the health of present and future generations». The problem is that the «state of reasonable confidence» is a very subjective concept, due to the peculiarities of personal perception. In turn, our perception of something can be affected by a variety of factors-advertising, lack of necessary information, etc.

A better definition of food safety is contained in the technical regulations of the Customs Union (The decision of the Customs Union Commission on 09.12.2011 №880), where the main safety criterion is "the absence of unacceptable health risks". It seems to us that this criterion is much more suitable for the purposes of law enforcement practice in the field of ensuring the quality and safety of food products.

Returning to the last question, we note once again that the main problem on the way to realizing the right of Russian citizens to quality food is the non-mandatory nature of the requirements for their quality. Nothing in this sense has changed with the adoption of the new Federal law №162-FZ of 29.06.2015«On standardization in the Russian Federation» (Federal law №162-FZ of 29.06.2015). Within the framework of the current legal regulation system, the application of standards remains strictly voluntary. For the sake of objectivity, we note that the Strategy adopted in 2016 to improve the quality of food products in the Russian Federation until 2030 (The decree of the RF Government from 29.06.2016 №1364-R) provides for the establishment of mandatory requirements for the quality of food products. But this is only a long-term (program) goal of the legislative activity of the Russian state, which requires a large amount of work to achieve it.

Thus, the current system of legal (technical) regulation of food quality and safety issues does not allow citizens to properly exercise their rights in relation to the quality of consumed products, including those declared in the Law of the Russian Federation of 07.02.1992 №2300-1 «On consumer protection» (Law of the Russian Federation of 07.02.1992 №2300-1) and the Federal law of 02.01.2000 №9-FZ «On the quality and safety of food products» (Federal law of 02.01.2000 №9-FZ), etc. However, the main problem, in our opinion, is that imperfect legal

regulation in this area of relations hinders the implementation of the constitutional right to health protection, which is a fundamental right of every person and citizen, providing one of the most significant social benefits. In this regard, the national security of the Russian Federation is also under threat.

Conclusion

Our brief analysis of the problems of legal assurance of food quality and safety in the Russian Federation allowed us to draw the following conclusions:

- the problem of ensuring the quality and safety of food products is perceived in Russia in the context of ensuring the country's food security, i.e. as a problem of significant importance for national development and national security. The strategic program documents of the Russian state indicate the importance of high-quality and safe food products for improving the quality of life of the population, strengthening their health and increasing their life expectancy. At the same time, it is in the aspect of implementing the right of citizens to health protection that the practical mechanism for ensuring the quality and safety of food products is the least perfect. This was largely due to the need to unify and harmonize national food safety standards with international standards in this area, as well as the membership of the Russian Federation in the EAEU and the WTO, whose regulatory rules are mandatory only for product safety requirements;

- the current system of legal regulation in Russia in the field of ensuring the quality and safety of food products, in fact, ignores the issues of ensuring its quality, focusing entirely on ensuring the safety of products. This situation creates significant threats to the health of citizens, since even a safe food product, as shown in the article, can cause harm to human health if it is systematically consumed. According to the authors, the current legal mechanism for ensuring the quality and safety of food products is not able to fully ensure the interests of citizens in the field of their health, and also does not adequately contribute to ensuring food and national security of the country;

- the Russian legislator needs to step up work on creating effective industry mechanisms for ensuring the quality of food products, since at present everything is limited to declarative statements and software installations that do not lead to the creation of a regulatory framework that guarantees the quality of food products. But if there are no legal guarantees of the quality of food consumed, then there are no guarantees for the health of citizens.

Abstract

The article examines the activities of the control and supervisory bodies of the Russian Federation to ensure the quality and safety of food products and to prevent the production and circulation of counterfeit and counterfeit products. Analyzing the available data, including those presented in the official reports of the Federal Service for Surveillance on Consumer Rights Protection and Human Wellbeing, the authors conclude that food safety monitoring carried out by this federal service underlies the optimization of the nutrition structure, which, according to According to Russian experts, it is necessary to increase the expected healthy life expectancy of the population and reduce its mortality. In general, it is noted that the control and supervisory activities of state bodies in the field of ensuring the quality and safety of food products are characterized by a noticeable increase in the number of laboratory and instrumental studies with the involvement of third-party experts and expert organizations. The article indicates the most falsified types of food products on the Russian consumer market, highlights the most relevant directions in the structure of laboratory tests of food products for their compliance with safety requirements carried out by state control and supervision authorities.

Keywords: quality and safety of food products, control and supervision activities of state bodies, national security, public health, counterfeit, counterfeit, monitoring of food safety.

Introduction

The widespread distribution of low-quality, including falsified and counterfeit food products is, perhaps, the main harmful factor in the Russian consumer market. In terms of its negative impact, this factor poses the greatest threat, since it affects the fundamental good for each of us - our health. Given this circumstance, counteraction to the production and circulation of low-quality, including counterfeit and falsified food products takes on the character of an important state task, on the successful implementation of which the welfare of society and the possibility of its successful (sustainable) development depend.

The problem of the presence of counterfeit and counterfeit products on the food market occurs in many countries of the world, but in the Russian Federation this problem has become truly enormous, which at certain stages of development of our state began to pose a real threat to national security, taking into account the specifics and traditions of food consumption, as well as peculiarities of food supply of some regions (for example, regions of the Far North).

The problem of the spread of food counterfeit and counterfeit products in our country began to acquire negative dynamics since the beginning of the 90s. XX century, when the ongoing socio-economic reforms opened the way for the development of private entrepreneurship in the field of food production, which in the absence of proper control by state bodies and total disregard for compliance with legal norms led to the emergence of large "shadow" structures engaged in the production of counterfeit products and fake of famous brands. It should be noted that the

Cite this Article as: Elena V. VORONTSOVA and Andrey L. VORONTSOV "Organizational and Legal Counteraction to The Production and Entry into Circulation of Low-Quality, Including Counterfeit and Falsified Food Products: Analysis of The Practice of State Control and Supervision Bodies" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

Russian consumer of those years, brought up in the traditions of the Soviet period, was very inexperienced in choosing a product. This greatly facilitated the circulation of counterfeit and counterfeit food products, especially under the trademarks of foreign brands, which poured into the Russian food market after decades of food shortages. In addition, the impoverishment of a significant part of the population and the deterioration of the financial situation of enterprises have become a powerful incentive for the development of the production of counterfeit and counterfeit products in Russia. The low solvency of Russian citizens forced them to purchase the cheapest foodstuffs, in turn, the lack of working capital from enterprises pushed them to replace certain ingredients in their products with cheaper ones, which entailed the widespread use of various kinds of additives, substitutes, etc.

The above food production practice has become persistent. Even the change in the general socio-economic situation in the country by the second half of the 2000s. did not change this negative trend in the food market - the production of falsified and counterfeit products remained steadily high. The main reasons that contributed to this development of events were the huge profits of food manufacturers, for whom the production of counterfeit was very profitable in the conditions of the "softness" of Russian legislation and the lack of the necessary material and technical base for state control and supervision bodies to identify technological tricks (life hacks) of enterprises - manufacturers, including their use in unlimited quantities of agricultural chemistry, antibiotics, etc. This actualized the need to improve the management mechanism of the national food supply system, which has been repeatedly insisted on by leading Russian experts. (Ananiev M.A. (2015), Ananiev M.A. (2016), Ananiev M.A. (2019)).

As for counterfeit products, in the last 6 years the volume of products recognized as counterfeit has increased due to the ban on the import of food products from the EU and the USA introduced by the Russian Federation. Not wanting to comply with the ban, some European suppliers and their partners in Russia have established the supply of counterfeit products under the brand name of goods produced in the Republic of Belarus.

Realizing the threat to public health, and therefore the threat to national security, which arose in connection with the widespread distribution of counterfeit and counterfeit products, the Russian Federation was forced to start developing and implementing comprehensive measures aimed at improving the quality of food products in order to ensure adequate nutrition of the population and increase quality and duration of his life. As part of the measures implemented by the state, great importance was attached to monitoring food safety, carried out by the bodies of the Federal Service for Supervision of Consumer Rights Protection and Human Welfare (Rospotrebnadzor).

An analysis of the practical activities of these bodies allowed us to identify trends in the food market related to its quality and safety.

Materials and Methods

The author's research was based on the General principles of science, objectivity, and the principle of taking into account different points of view. The method of analysis, logical reasoning, comparison, and the formal legal method were used as specific research methods.

Results and Discussion

In a number of program documents of the Russian state, in particular, in the Order of the Government of the Russian Federation dated June 29, 2016 No. 1364-r "On approval of the Strategy for improving the quality of food products in the Russian Federation until 2030" (Order of the Government of the Russian Federation of June 29, 2016 No. 1364-r) and the Decree of the President of the Russian Federation dated May 7, 2018 No. 204 "On national goals and strategic objectives of the development of the Russian Federation for the period up to 2024" (Decree of the President of the Russian Federation of May 7, 2018 No. 204), the tasks were set to increase the expected healthy life expectancy of the population and reduce its mortality. Obviously, setting such tasks, the Russian Federation sought to improve the main indicators characterizing the level of social well-being of citizens, among which public health indicators play a leading role.

One of the mechanisms for the implementation of the tasks is based on the optimization of the nutritional structure, which, according to Russian experts, can reduce the risks caused by an insufficient amount of essential microelements in the diet of Russians, as well as an excess of carbohydrates and saturated fats. In addition, in the professional community, it is with the change in the structure of the population's nutrition that they associate the possibilities of reducing the consumption of nutrients that are critical for health and have a negative impact.

In order to identify the most risky groups of goods that pose the greatest threat to the health of Russian citizens, the Russian Federation is constantly monitoring the safety of food products and food raw materials. First of all, products and raw materials are tested for compliance with sanitary and epidemiological requirements for sanitary-chemical and microbiological indicators. This type of state control and supervisory activity is of a large-scale

nature. So, in 2019, 2.165 million samples of food products from Russian and foreign manufacturers were taken for the above studies. At the same time, 332840 samples were examined for compliance of food products with safety requirements in terms of sanitary and chemical indicators, and 1259836 samples were examined for its compliance with microbiological indicators (On the state of sanitary and epidemiological well-being of the population in the Russian Federation in 2019: State report). As you can see, the main attention in carrying out these monitoring studies was paid to microbiological safety indicators, which is natural, since these indicators have long been a weak point ("weak link") in the system of safety indicators of the Russian food market.

If we analyze the data obtained in the course of these studies, then we can state that in 2019, compared to the previous year, the share of food samples that do not meet safety requirements for microbiological indicators decreased in a number of food groups that were previously the object of close attention of controllers. organs. Among them: confectionery, soft drinks, juices, alcoholic beverages, culinary products, fish and fish products. At the same time, for some groups of goods, an increase in the percentage of samples that do not meet safety requirements according to the specified criterion can be noted. These groups of goods include: meat and meat products, milk and dairy products. Moreover, an increase in the number of samples that do not meet safety requirements (sanitary and epidemiological requirements) in terms of microbiological indicators can be recorded both in Russian-made products and in imported food products (On the state of sanitary and epidemiological well-being of the population in the Russian Federation in 2019: State report). However, the greatest concern is caused by the increase in non-compliance with sanitary and epidemiological requirements for products, noted in baby food products - from 1.09% in 2018 to 1.30% in 2019. It should be noted that this negative growth was recorded in products for baby food produced exclusively at Russian enterprises. In our opinion, this indicates the need to strengthen control over the quality of products for baby food at the stage of its production.

A separate area of monitoring food products and raw materials for their production is the study of samples for the presence of nitrates. In this regard, it should be noted that in 2019 only 8% of samples of fruits and vegetables, fruit, wine, grain, meat and fat and oil products were identified undeclared pesticides (the rest of the identified pesticides belonged to the category of standardized and their content did not exceed the established requirements). This may indicate the effectiveness of measures taken by the state to control the use of pesticides and other agrochemistry in agriculture.

A very urgent problem for the Russian food market is the uncontrolled use of antibiotics in food production. For a long time, this problem was aggravated by the lack of sufficient equipment in the Russian Federation to detect antibiotic residues in manufactured food products. This led to the fact that, for example, 18 antibiotics approved for use in production were controlled only according to their manufacturer's declaration.

Realizing the threats to the health of citizens arising from this, especially in connection with the actualization of the issues of the formation of resistance to antibiotics, the Russian state in 2018-2019. additionally equipped 11 testing laboratories of hygiene and epidemiology centers in the constituent entities of the Russian Federation (as part of the creation of a network of reference laboratory bases) with modern high-tech and highly informative equipment, which makes it possible to analyze for the presence of antibiotic residues in food, including undeclared. This made it possible to carry out the most reliable laboratory studies in this area in all constituent entities of the Russian Federation.

Among antibiotics and antimicrobial drugs, traces of which are most often found in food, the first place is occupied by chloramphenicol - 40.8% of the identified samples; the second place belongs to tetracycline and its derivatives - 28.6%; in third place - bacitracin - 16.7%. It is noteworthy that most often antibiotics were found in products belonging to the category of "essential products" - these are meat and meat products, as well as milk and products based on it (with the exception of cheese). Unfortunately, residual amounts of antibiotics used in the production were found in baby food products (On the state of sanitary and epidemiological well-being of the population in the Russian Federation in 2019: State report). The number of such products, according to official data, is minimal - 0.50% of the number of samples examined (On the state of sanitary and epidemiological well-being of the population in the Russian Federation in 2019: State report), nevertheless, the detection of such cases, in our opinion, should alert the regulatory authorities, since it indicates the absence of food production areas that are completely "closed" from threats associated with use of antibiotics.

Equipping specialized laboratory centers with the latest equipment made it possible to carry out examinations of food products that were not previously used in the practice of state control and supervision bodies. Thus, in the Russian Federation, for the first time, the method of enzyme immunoassay began to be widely used, as well as methods of gas and liquid chromatography-mass spectrometry based on a triple quadrupole, which significantly increased the possibilities of detecting substances undeclared by the manufacturer, including antibiotics, antimicrobial drugs, pesticides, environmental pollutants. and others. As a result of the modernization of the equipment of Russian laboratories, it became possible to identify about 100 names of antibiotics and antimicrobial

drugs, the residual amount of which may be in food products entering the Russian market. In addition, the latest equipment supplied to the laboratories of the Russian centers of hygiene and epidemiology makes it possible to identify potentially hazardous organic compounds in food products in a very wide range (the library of mass spectra is currently about 350 thousand organic compounds).

An independent direction of research in the field of food quality and safety is the isolation of antibiotic-resistant bacteria. Russian laboratories during 2017-2019. 119 antibiotic-resistant bacterial isolates isolated from food products were examined (On the state of sanitary and epidemiological well-being of the population in the Russian Federation in 2019: State report). Thorough genomic studies of the isolated bacteria were carried out, as well as an analysis of antibiotic-resistant bacterial pathogens. The main task was to identify isolates, their typing, identification of antibiotic resistance genes and phylogenetic analysis.

According to the Rospotrebnadzor of the Russian Federation, the data obtained as a result of the conducted studies on the molecular genetic characteristics of food isolates, the genetic determinants of their resistance to antibiotics, as well as their virulence, can serve as predictors of the evolution of resistance. The presence of one or another resistance gene is also important for epidemiological studies and the compilation of a general pool of resistance genes circulating in the population (On the state of sanitary and epidemiological well-being of the population in the Russian Federation in 2019: State report). On our own behalf, we add that in the Russian Federation these studies will continue until 2022 in accordance with the Order of the Government of the Russian Federation dated December 21, 2019 No. 3116-r (Order of the Government of the Russian Federation of December 21, 2019 No. 3116-R).

In general, it should be noted that a noticeable increase in the number of laboratory and instrumental studies is characteristic of the control and supervisory activities of state bodies in the field of food quality and safety. In addition, government agencies began to involve outside experts and expert organizations much more often in their control activities. This practice made it possible to raise the level of objectivity of conducted research and increased the effectiveness of the control and supervisory activities of state bodies.

As for countering the circulation of counterfeit food products, an analysis of the data provided by Rospotrebnadzor of the Russian Federation allows us to conclude that counterfeit products are most often found in dairy products and cheeses, as well as in alcoholic beverages. These food groups have been problematic for many years. And although the situation on the markets of dairy and alcoholic products in terms of their compliance with the mandatory requirements has noticeably improved recently, nevertheless, control over these groups of goods is a subject of special attention of state bodies. Measures aimed at not suppressing the turnover of counterfeit dairy products, as well as measures to control the turnover of “cheese-like type” products, were given special attention in the List of Orders of the President of the Russian Federation No. Pr-529 dated March 30, 2018 (The list of instructions of the President of the Russian Federation dated March 30, 2018 No. PR-529). As part of the implementation of these measures, the Federal Service for Supervision of Consumer Rights Protection and Human Welfare is currently carrying out large-scale monitoring of the wholesale and retail trade of "cheese-like" products, including chain enterprises, using laboratory research. In order to exchange information on the supply of these products to the territory of Russia, including the exchange of information about its consignees, interagency interaction with the Federal Customs Service of Russia and Rosselkhoznadzor is carried out.

Note that 5.9% of all the samples taken did not meet the established requirements (in 2018 - 9%) (Consumer Rights Protection in the Russian Federation in 2019: State Report). In terms of identification indicators, the percentage of samples that do not meet the established requirements is slightly higher - 9.2%.

As for counterfeit dairy products, 346 tons of such products were withdrawn from sale in 2019. In a number of cases, government agencies were forced to suspend or withdraw declarations of conformity. The total amount of fines imposed was 105 million rubles (quite a lot for Russia, taking into account the relatively low size of the fine for such violations). It should be noted that an important role in the fight against counterfeiting of dairy products is played by citizens' appeals to state bodies with claims for their quality. According to a sociological survey conducted by us in the Kursk region, 36 out of 100 interviewed respondents expressed certain complaints about the quality of dairy (milk-containing) products.

It should be noted that in the Russian Federation, since 2019, certain types of dairy products are marked with identification means. Such a measure is being carried out as an experiment and, in the opinion of the Russian authorities, it can contribute to the suppression of illegal circulation of products of these commodity groups.

As for alcoholic counterfeit and counterfeit products, one of the most effective measures allowing the Russian authorities (competent authorities) to successfully counteract its production and circulation is the pre-trial seizure of illegal technological equipment, the products themselves, raw materials, and vehicles. At the same time, the volume

of counterfeit alcohol withdrawn from circulation amounted to 23.2 million liters in 2019 (Consumer Rights Protection in the Russian Federation in 2019: State Report).

In order to improve state regulation of the alcoholic beverages market, the Russian Federation adopted a number of regulatory legal acts in 2019, including the Federal Law of December 27, 2019 No. 481-FZ "On Amendments to Certain Legislative Acts of the Russian Federation" (Federal Law of December 27, 2019 No. 481-FZ), which strengthened control for the production and use of a pharmaceutical substance of ethyl alcohol (ethanol) and alcohol-containing medicines.

In the field of counteracting the import and circulation of food products on the territory of the Russian Federation prohibited for import in accordance with the decree of the President of the Russian Federation on counter-sanction economic measures (Decree of the President of the Russian Federation of August 6, 2014 No. 560), Rospotrebnadzor sanitary and quarantine control was strengthened at checkpoints across the state border of the Russian Federation. For the entire period of the establishment of bans and restrictions on the import of products from the EU countries and others (since 2014), the employees of Rospotrebnadzor, according to official data, were not allowed to import into the Russian Federation about 2.9 thousand tons of counterfeit products (Consumer Rights Protection in the Russian Federation in 2019: State Report). At the same time, on the territory of the Russian Federation during the same period, more than a thousand tons of products prohibited for import were withdrawn from circulation. A simple comparison of these figures suggests that a significant part of the sanctioned food products still ends up on the Russian consumer market.

Conclusion

Our study of the practical activities of state control and supervision bodies in the field of ensuring the quality and safety of food products and countering the spread of counterfeit and counterfeit products in the Russian food market allowed us to draw the following conclusions:

- optimization of the dietary structure is recognized in the Russian Federation as the most important direction in the implementation of tasks to increase the expected healthy life expectancy and reduce the mortality rate of the population, proclaimed in the program documents of the Russian state. This optimization assumes a system of measures aimed, among other things, at improving the quality and safety of food products;

- one of the main tools for ensuring the quality and safety of food products and the main evidence in the detection, prevention and suppression of offenses in this area is currently laboratory control, along with the involvement of experts and expert organizations. This laboratory control is carried out in the Russian Federation within the framework of continuous monitoring of the quality and safety of food products and food raw materials;

- in the structure of laboratory tests of food products carried out by the state control and supervision authorities for their compliance with safety requirements for sanitary-chemical and microbiological indicators, the most relevant areas can be distinguished: the study of samples for the presence of nitrates (this is due to the vigorous activity of the state to control the use of pesticides and other agricultural chemistry in agriculture), the identification of residual amounts of antibiotics and antimicrobial drugs (this is due to the uncontrolled, and therefore - excessive use of these substances in the production of food raw materials and products), the isolation of antibiotic-resistant bacterial isolates (which is extremely important in conditions of the formation of population resistance to antibiotics against the background of emerging global pandemics), identification of falsified and counterfeit food products;

- Analysis of data from Russian state control and supervision authorities suggests that the most falsified groups of food products are milk and dairy products, including cheeses, and alcohol. However, the measures taken by the state to prevent the production and circulation of counterfeit and counterfeit products, including measures aimed at identifying such products by laboratory analysis, lead to a decrease in the amount of counterfeit and counterfeit products on the Russian food market. In recent years, in the Russian Federation, there has been a steady trend towards a decrease in potentially dangerous food products, both domestic and imported, detected in circulation.

Improving Military Supply Chains in Polish Contingents Carrying Tasks Abroad

Dariusz GRALA

War Studies University, Faculty of Management and Command, Warsaw, Poland,
d.grala@akademia.mil.pl

Abstract

The article concerns the issue of logistic support organization regarding military and civilian contingents taking part in modern multinational crisis response operations carried out outside the country. The author's comments are focused on supplying the contingent directed to perform tasks outside the country's borders within the framework of crisis response operations, peace mission or humanitarian aid.

The aim of the publication is to identify the disruptions that may occur in the process of supplying contingents carrying out tasks outside the country and to propose solutions that can limit the effects of their occurrence.

The article contains the results of own research and the author's experience from participation in multinational operations.

Keywords: Management, Risk, Logistics, Supply Chain.

Introduction

In the age of globalisation, each country is responsible for shaping the global security system. In order to preserve world peace and provide humanitarian aid to countries in need, states participate in the initiatives of the United Nations, the European Union and the North Atlantic Treaty Organisation. One of them is military and civil-military operations within the framework of broadly understood crisis response or peace missions.

In order to carry out missions (operations), contingents are created, consisting of various civil and military personnel: specialists, doctors, emergency services, logistics. To ensure the security of mission personnel, these are usually military contingents, with combat and logistical capabilities adequate to the conditions of operation. For example, the Polish Armed Forces currently maintain several military contingents in various parts of the world. They operate at a considerable distance from national supply bases, in different organizational, geographic and military conditions. The proper organization of the logistic system, especially the supply subsystem, is to ensure an effective supply chain of the means of supply to the contingent in order to ensure its functioning and the execution of its mandate tasks. Continuity of supply is also one of the basic factors determining the security of soldiers and civilian employees of the contingent. There is a potential risk of disruption in the process of supplying the contingent, which should be assessed and solutions need to be developed to ensure supply.

The purpose of this publication is to identify disruptions that may occur in the process of providing supply to the contingents carrying out tasks outside the country and to propose solutions aimed at minimising the consequences of their occurrence.

The first part of the article presents the general characteristics of the system of supplying the military contingent carrying out tasks outside the country. Next, possible disruptions to the supply provided to the military contingent, which occurred in the previous military operations, were identified. The final part of the publication presents the procedure of risk planning in the supplying process and a proposal of minimising the disruptions when providing supplies to the military contingent.

General characteristics of the military contingent supply system

A military contingent is a military unit separated from the armed forces, which performs tasks outside the country.

Cite this Article as: Dariusz GRALA "Improving Military Supply Chains in Polish Contingents Carrying Tasks Abroad" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

According to the doctrinal documents, the state sending the military contingent to take part in an operation is responsible for its comprehensive equipment and preparation as well as for organising its logistic support during the operation. Tasks in this area can be executed with the use of: national support system, host nation support, support by the leading state in the field of logistics (Lgistic lead nation), support by a state with an expertise in the field of logistics (Logistic role specialist nation), support by multinational logistics, support by external contractors, support by NATO agencies responsible for supporting the activities of the allied forces, support by other states in the implementation of international agreements, combination of several of the above mentioned methods (Doktryna 2019, p. 34, AJP-4B 2018, p. 1-3). The experience so far shows that in practice Polish military contingents were usually provided with supplies on the basis of three basic channels, i.e.: the national supply system, the multinational supply system and civil contractors.

The national supply system consists in organised deliveries of means of supply from the home country (sending troops to operations). The basic body supplying subunits of the contingent, i.e. military units, is the logistic unit known as the National Support Element, commonly known as National Support Element (NSE). This element is separated from one of the logistic units in the country and then relocated, along with a certain amount of supply reserves to the operation area (Zasady 2010, p. 5). The contingent subdivisions report their needs to the NSE, which sends them further in the form of aggregate needs to the logistics unit in the country responsible for supplying the contingent. The logistic unit in the country is supplied by the military supply base or engages in purchases on the domestic market. There is also a possibility of local purchases by the NSE in the area of operations. Deliveries from the country are usually made by air bridge cyclically or on ad hoc basis in case of urgent needs. At the beginning of the new contingent, due to the large amount of equipment and materials, sea transport is used. The national channel is in most cases the primary channel for providing supply to the contingent. Depending on the conditions of a particular contingent, it includes supplies of: food, military rations, medical supplies, individual soldier's equipment, spare parts for state-owned equipment, specialised propellants and lubricants, ammunition.

The multinational supply system consists in receiving supplies from other countries' contingents within the framework of signed bilateral and multilateral agreements, support provided by logistics agencies, e.g. NSPA (NATO Support and Procurement Agency) or contractors for civil operations, e.g. those working for the UN. If a multinational logistic unit (e.g. JLSG – Joint Logistics Support Group) operates in the area of operations, then it has joint multinational resources, which can be used by contingents (AJP-4.6 (C), 2018). In many cases, properly organised multinational logistics support can be an effective and economically more advantageous solution compared to the national channel (AJP 4 (B), 2018, p. 1-4). Depending on the nature of the operation and the international organisations participating in it, as part of multinational support, the Polish Military Contingent (PMC, PL: PKW) received water for consumption purposes (bottled), water for sanitation, food, MRE (Meal Ready to Eat) food rations, leased technical equipment and spare parts, individual equipment of soldiers, personal hygiene equipment, fuel, construction and fortification materials, housing containers with equipment, explosives.

Civilian contractors are both large corporations providing services to the benefit of the forces participating in the operation under a long-term contract, supplying food, construction materials, food and sanitary water, as well as small local companies and stores where the supplies are provided to the contingent on an ad hoc basis in the event of disruption of national supplies or suddenly emerging needs. Often local contractors were able to deliver faster than a national or coalition (multinational) system. Contractors supplied water, food, consumables and even fuel. Medicines were also purchased on the local market in exceptional situations (e.g. for parasites in Chad) [Grala 2011].

These three channels were used in almost each of the contingents under investigation to varying degrees and levels of services provided, depending on the operational and economic conditions in the area. The organization of the supply system is a contingent-specific choice from among the available sources of supply, taking into account not only the economic benefits, but also the risk of disturbing the continuity of supply to the contingent.

Methodology and sample

The article uses research conducted by means of a diagnostic survey using a questionnaire sheet and an expert interview sheet. The survey was conducted among the personnel of units and institutions that were involved in the processes of logistic support of Polish military contingents taking part in multinational missions and operations abroad. A total of 145 people took part in the survey, of which 109 sheets were qualified for the research. A very important criterion for the selection of respondents, from the perspective of the conducted research, was participation in missions abroad (Fig. 1).

Fig. 1: Characteristics of respondents in terms of participation in particular missions abroad

Source: Own study.

Among the respondents there were people who implemented logistic support and those who used it. The large variety of missions in which the respondents took part made it possible to gather opinions on the implementation of supply tasks in specific operational, organisational and geographical conditions.

In order to collect opinions and verify the surveys, expert interviews were conducted among people who were involved in planning and implementing the supplies delivered to the contingents. These persons had experience in logistical management positions in national and international structures.

In order to enrich the article, reference was also made to the results of P. Bentkowski, who conducted a survey in another period and on a different research sample.

Identification of Disruptions in The Continuity of Providing Supplies to Contingents

Disruptions to the continuity of supply provided to the contingent result from the risks that accompany each activity and are inherent in the functioning of any system. The threat to the functioning of the system (in the described case of the supply system) is potentially all human actions or their omissions and actions of higher forces, which directly affect this system and may cause significant losses as a result of the disruptions (Dębicka, Jałowiec 2016, p. 38).

The studies carried out so far indicate that there were supply disruptions in the existing contingents. In a nutshell, supply disruptions can be divided into two groups. The first one is internal disruptions, which include all the risks associated with logistics activities, which we can identify, calculate and to some extent influence through appropriate organisational solutions, development of operating procedures and training of personnel. Supply disruptions in this group are mainly due to human errors, inaccurate information about resource data, quantity or assortment errors in demand, misinterpreted needs, and late suppliers. Limiting internal disruptions will mainly consist in applying good practices, selecting qualified and experienced personnel, increasing supervision and control, organising additional training.

When analysing the results of research in the field of supplying PMC, it should be recognised that the experience gained during the organisation of subsequent contingents resulted in good preparation of procedures and personnel for executing logistic tasks. Table 1. presents the results of the research on the difficulties arising in the process of supplying the VIIth change in the Polish military contingent in Afghanistan (PKW ISAF) (Bentkowski 2016, p. 106). It should be stated that there are few threats affecting its proper course. The defined problems concern mainly the extended time of delivery of supplies. This problem is conditioned by many factors, including the limited transport capacity of the armed forces of the country sending the contingent.

Table 1: Summary results of the RSC method of research on the issues related to the supply provided to subdivisions and PKW ISAF cells

Problem under investigation	Research result
Non-compliance of the demand with the received goods	69
Supply not delivered on time	- 5
Order waiting time is too long	- 38
Failure to receive the ordered assortment	40
Receiving too few goods	56
Delivery of supplies to the wrong place	147
Low quality of the received assortment	86
Goods are defective or damaged	104
Destroyed packaging and part of the required assortment	88
Goods expired or with too short a shelf life	125
Transport difficulties in moving supplies	37
Non-compliance of the goods with the transport documentation	124
Doubling the ordered demand	130
Receiving a substitute for the ordered goods of low quality, unsuitable for use	131
Too long storage of goods in warehouses	35
Difficulties in the exchange of information with the Economy Branch or other supply unit	98

Source: study on the basis of P. Bentkowski, System zaopatrywania polskiego kontyngentu wojskowego w operacji International Security Assistance Force, PhD thesis, ASzWoj, Warsaw 2016, p. 107.

The remaining problems listed in the table did not constitute a serious obstacle to proper functioning of the examined contingent. In the case of organising the system of supplying subsequent contingents, they should be considered as factors that may occur and disrupt the supply chain.

The second group of disruptions to the continuity of supply of the contingent is related to external factors, independent of the organiser of the supply system (contingent logistic security system). Such factors are difficult to predict and thus present a challenge when it comes to prevention. In this case the focus should be on minimising the effects of the disruption. External factors that may occur in the process of providing supplies the contingent may be related to the impact of the opponent (attacks on logistic convoys or supply depots), atmospheric factors (very high or very low temperature, storms, gales, floods), economic or political factors (currency fluctuations, economic sanctions, strikes), thefts, terrorist attacks and many others. These disruptions should be taken into account when organising supplies to the contingent.

The research conducted so far (Grala 2015, Bendkowski 2016) and personal experience from service in the Polish military contingents show that external disruptions in the process of providing supplies to the contingent occurred quite often.

Table 2: External disruptions in the process of providing supplies to the contingent

Type of disruptions	Description	Reasons	Actions taken
Water shortages	The local contractor supplying water for sanitary purposes to PMC Chad supplied half of the water in comparison to the quota agreed in the contract, and sometimes failed to deliver it.	Water shortages in wells.	During the rainy season, the water is produced by the contingent using a filtering device and its storage.
	Damage to water storage tanks in the base in Iraq	Artillery attack	Water from other bases was transported for the time of fault removal.
	The contractors did not deliver bottled water on time. The deliveries were incomplete.	Technical condition of the contractor's vehicles. Difficult road conditions in rainy weather.	Arrangement of water supply from the home country.
Food shortages	Local contractors in Chad have delivered defrosted food to PMC from UN warehouses several times	Poor technical condition of refrigeration equipment on contractor's cars	Nutrition with individual rations of MREs (Meal Ready to Eat). Change of a contractor.
	Lack of meat supply, for about 2 months	European company supplying food to the UN mission in Chad did not deliver for 2 months due to lack of quality certificate	Nutrition with individual rations of MRE
	Food transported by ship in a refrigerated container has defrosted	Failure of the electrical installation of the refrigerated container	Food was delivered by air transport.
	Fresh food deliveries were stopped	Increased threat of attacks on supply convoys	Frozen and canned products were used to prepare meals;
Shortages of medical supplies	In PMC Chad, there were no appropriate medications due to mass infections with gastrointestinal parasites	No such parasite infections were expected to occur.	Medicines were therefore purchased on the local market.
Shortages of technical equipment	No ammunition for the newly introduced rifles was delivered.	Delay in domestic purchases	Ammunition was obtained from the allies

Source: Own study

The most frequent supply disruptions concerned cooperation with civil contractors, especially the local ones. The reasons were very different: strikes, an attempt to raise service rates, technical problems of the means of transport, the rainy season, threats of enemy actions, corruption. In addition, it should be emphasised that the possibilities of the contingent to supervise the execution of the contract by the contractors were very limited. Some of the disruptions directly affected the functioning of the contingent and the implementation of the mandate tasks, as well as the safety and health of personnel. Lack of water in desert conditions swiftly affected the sanitary and hygienic condition of the

contingent, while food restrictions resulted in the inability to diversify meals and maintain a balanced diet. The logistics services had to look for alternative sources of supply, make purchases, organise air transport. Many of these activities were associated with additional costs.

Risk Planning Procedure in The Supply Process

Since it is difficult to predict what external factors may disrupt the continuity of the supplies provision to the contingent, and what is the probability of their occurrence and their consequences, it can be assumed that there is a risk of disruption. According to the theory, risk management consists in recognising the risk, its evaluation in terms of probability of occurrence and its impact on logistic activity, and then introducing actions reducing the probability of the problem occurrence and minimising losses related to the negative event in case of its occurrence (Kasperek. 2006, p. 117). After determining the main risk factors, managers have the opportunity to determine risk management mechanisms, e.g. the use of preventive tools and solutions targeted at the identified ones the risk factors through which a potential release of risk is prevented or their consequences the edition is limited (Khachaturyan 2020, p. 143). Building a risk knowledge base is also of great importance, especially for subsequent logistic projects (subsequent contingents or subsequent changes of operations). The effect of proper risk management is to minimise the risk of disruptions or limit the effects of a given event.

Fig. 2: Planning procedure for the reduction of disruptions to PMC supply continuity

Source: own study based on M. Kasperek, Planowanie i organizacja projektów logistycznych, Wyd. Akademii Ekonomicznej w Katowicach, Katowice 2006, p. 117.

The presented planning procedure for reducing supply disruptions (Fig. 2) (Kasperek 2008, p. 117). should be applied separately for each newly organised contingent. It should take into account political, organisational, operational, geographical, field and atmospheric conditions, and even cultural and religious ones. It should be noted that planning to reduce supply disruptions concerns not only new contingents, but also subsequent changes to the same operation (mission), where existing conditions may change, especially when the operation concerns a politically unstable region. Moreover, often in tropical conditions, due to the rainy season, there is a completely different weather occurring in the individual changes, affecting the pass ability of roads and thus the time of supply or availability of water. When planning to reduce supply disruptions, it is very important to use the experience and lessons learned from previous operations, as well as to obtain information from other countries or international organisations that have previously sent contingents to a given region of the world.

Suggestions for Minimising the Impact of Disruptions in Provisions of Supplies to The Contingents

According to the collected opinions, there were quite frequent disruptions in the process of supplying the contingents. Logistics services repeatedly had to react very quickly to the disruptions and to reach for alternative sources of supply.

If the contractor failed, the national channels were used to meet the immediate needs. At other times, shortages of supplies from the country were compensated by purchases on the local market. The services of the allies were also used many times. Problems with water supplies in Chad were solved by collecting, during the rainy season, purified water obtained from natural reservoirs. The experience gained and the lessons learned from the operations to date are an extremely important source of knowledge to be used in planning the system for supplying future contingents.

While organising the contingent supply system, one should first of all remember the principle of flexibility of logistic support, which says that the logistic system must be able to react quickly to dynamic changes in the operational situation (*Bi-SC Joint Operational Guidelines for Logistics*, 2013, s. 2-1). At the same time the system should be effective. The key factors influencing the efficiency of the contingent supply system are (Jałowiec, 2020, p. 108):

- level of training of logistic staff;
- determination of the volume of stocks held in the area of contingent operation and in the home country or in the unit responsible for multinational logistic support of operations;
- developing forecasts for the consumption of supplies and plans for their replenishment;
- availability of alternative sources of supply.

It should be emphasised that the efficiency, i.e. the degree of achievement of the target in relation to the incurred expenditures, cannot be expressed only in the economic dimension, but should refer to the operational, allies-related and even economic dimension (Jałowiec, Grala, 2020 p. 975).

Referring to the previously presented disruptions of the supply processes, when planning the logistic support of the contingent, it is necessary to identify alternative sources of supply, such as:

- host state aid;
- purchases on the local market;
- contract with a civil contractor;
- maintaining increased stocks in the contingent;
- maintaining stocks in the home country;
- use of multinational logistics options.

It will not always be possible to use all the listed options. In the missions covered by the research, the support of the host country was very limited. Purchases on the local market and cooperation with contractors often did not meet quality expectations. Therefore, it is always necessary to determine the amount of resources, separately for a given assortment, which should be maintained for a certain period of time, ensuring self-sufficiency of the contingent.

In a modern multinational operation, an important issue in organising a contingent supply system is to determine the scope of national responsibility in relation to the multinational logistics option. The research shows that the respondents have great confidence in multinational logistics, which can be entrusted with the implementation of supply tasks (Fig. 3).

Fig. 3: Results of research on the division of supply tasks between national and multinational logistics

Source: Own study.

The stocks specified for a given assortment can be kept in the national warehouses of the contingent or, if possible, in multinational logistics databases (Fig. 4).

Fig. 4: Proposal of dividing stocks– of supply means between national and multinational logistics

Source: Own study.

Since maintaining stocks in the mission area is associated with high costs and it is not always possible deliveries from the home country must be assumed in predictions. To this end, it is necessary to define the standards and gather stocks or sign contracts with suppliers. The rapid movement of materials into the contingent also requires prior planning of the air bridge.

Conclusions

Providing supplies to the contingent carrying out tasks abroad is a big challenge for the logistic system of operations both on a national and multinational scale. Due to long distances strategic air or sea transport is required. Because of the limited transport capacity, the Polish Armed Forces use civilian contractors and utilise the allies' transport aviation on the basis of signed agreements. Such solution is economically advantageous for our country, however, it is connected with the risk of disruptions in supplies provided to the contingents, occurring independently of the logistic system of the Polish Armed Forces.

When organising the logistic support of the contingent, the available supply options should be considered, taking into account NATO logistic principles, in particular the principle of efficiency and flexibility. Regardless of the choice of national, multinational or civilian sources, the possibility of supply continuity disruption should be taken into account. Proper planning of the associated risks allows for maintaining the continuity of the supply chain, which will ensure the functioning of the contingent and the fulfilment of the mandate tasks.

The aim of the publication was to identify the disruptions that may occur in the process of supplying contingents carrying out tasks outside the country and to propose solutions that could minimise the effects of their occurrence.

Due to the adopted restrictions in the material, reference was made only to those areas of supply that were most frequent in the Polish military contingents assigned to the operations conducted so far. The research to date shows that the rich experience from the participation in missions and operations conducted so far outside the country may be a source of knowledge about the risk of disruptions in the continuity of supplies provided to the contingents. To solve the research problem and achieve the goal of the research the risk planning procedure modified for the needs of the supply process was applied. According to the author, the proposed procedure of planning the risk of disruption of the continuity of supply could be helpful in the planning process of supply system of contingents in future multinational operations.

This publication does not exhaust the issues of improving supply chains in military contingents contingents. Further research should aim to develop a complete database on the risk of continuity disruptions of supplies provided to the contingents and then to develop risk assessment sheet for a given supply option with alternatives.

Abstract

Tthe idea of human rights and the concept of human security is essential to human dignity. Human dignity is a complex notion involving philosophers, lawyers, anthropologists who operate within different social and political contexts, and who pursue diverse, often conflicting, interests and goals.
The idea of human dignity and the concept of human security has played an key role in several social and political movements in the past century. Currently one can notice that human dignity plays a vital role in the development of human rights and human security adjudication. When analyzing human dignity used in judicial interpretations, we can find several definitions of it. One the one hand, some judges use human dignity as the basis for human rights. On the other hand, dignity is used to express the idea of a collection of human rights and human security.

Keywords: Human Dignity, Human Rights, Human Security, Dignity, Human Rights Adjudication

Introduction

Dignity referred to in both international and regional documents indicates the critical role it plays in human rights policy and arouses interest in various environments. It has always been a thought-provoking element that animated, united, and stimulated the minds. Dignity is a space of unity, equality, and an assembly. In a sense, it is a linguistic symbol that represents different viewpoints, justifying a specific agreement, both social and political, on a seemingly typical area of human rights.

While dignity1 plays a key role in human rights systems, it is yet to be completely defined and agreed upon its fundamental precepts. Without engaging the historical aspect of interpolation of dignity regarding documents related to human rights, it can be stated that since World War II, dignity has become a central axis of discussion between law and politics, and law and society. 'Dignity revolution' as indicated by J. Thot, began after World War II by the announcement of the Universal Declaration of Human Rights, and it was based on the fact that all rights that belong to man are derived from dignity. In the Preamble we read that:

'recognizing the inherent dignity and the equal and inalienable rights of all members of the human community is the foundation of freedom, justice, and world peace'.2

The turn of the 20th and 21st century initiated a kind of dignity revolution in the perspective of bioethical issues related to the topic of reproductive rights, the legal subjectivity of nasciturus, euthanasia laws as well as genetic

manipulations.3 Dignity aspires to the axiological and normative center of the human rights protection system and is used by lawyers around the world as an element of legal argumentation.

The Philosophical Context

The inspiration for reflection round dignity derives from philosophy. Jean-Paul Sartre claimed that true human dignity could only be adequately captured within existentialism.4 In his work, J.P. Sartre pointed to freedom as a kind of human absoluteness – the freedom to which one is destined.5 In Sartre's view, this means that freedom – paradoxically – is a necessary choice. Man must choose freedom, but also everything else, which is not freedom. Such a way of thinking about the man and the world develops ethical reflection not so much in the direction of freedom, as freedom makes this primary prism through which he looks at the world. As a result, freedom somehow forces people to make endless choices, those of oneself and others. In this light, man is also considered to be the creator of dignity – dignity being the essence of his existence.6

In turn, Jacques Maritain recognized the distinction between the individual and the personality. By identifying the two dimensions of human existence, he pointed out that the human being functions in two considerably different spaces that complent each other. In the text Human Person and Society,7 he mentions ancient, medieval and modern philosophers, and concludes convincingly that a human being is suspended between the two spheres: a material one that does not actually refer to an authentic personality, but rather material conditions and a type of shadow of personality, as well as a spiritual sphere that refers to the personality itself. So, if a human as an individual may be considered interpreted as a material being, then a human as a person becomes oneself himself only when he turns to the spiritual dimension of his being, which consequently gives him the possibility of transcending himself. Maritain notes that the complete human being enters a given society and somehow blends with others, but he always remains one individual and remains oneself himself. What follows is that, for instance, the good of the whole (society) is something superior to the good of a particular person, to the private good. However, these 'common goods' must be equitably distributed among each member of the community. In other words, the good of the whole must be beneficial to individuals and should be divided between them due to their rights and dignity.8 In conclusion, Jacques Maritain and Jean Paul Sartre, who seemingly represented opposite philosophical spectrums, agreed that and also revealed to the contemporary human rights researchers the fact that human dignity is the right means of creating authentic social relations.

In the light of the above reflections, one can ask to what extent, what we call 'dignity' is responsible for the process to what extent dignity is responsible for human development? From a psychological point of view, we know that low self-esteem means a low level of personal growth. To the contrary, a poorly developed sense of personal dignity keeps an individual at a primitive level of development. Many psychological tests prove it. In Poland, Polish profesor Kazimierz Dąbrowski, among others, examined this issue in his theory of positive disintegration.9 According to him, the sense of dignity stimulates the development of a person and contributes to his learning and becoming, and gives specific developmental power to every sphere of a personal being. It can also be a measure of personal development.When dignity is examined from this point of view, the source of dignity crisis is revealed to us.

Nowadays, more and more is being said and written about dignity. However, dignity is less protected, and as a consequences there is no space to fully and adequately experience it.10 Psychologists and philosophers indicate that the contemporary human loses the primary sense of dignity, because he has lost the sense of his self, the sense of development and the sense of reaching a higher level of his experiences. Although he desires greatness and holiness, he remains at the level of primitive impulses and desires. Dignity, as a concept which is commonly used,

.

and as a philosophical and ethical category of the 21st century, occupies a relatively high position. It is applied in life, especially in situations where ethical and moral dilemmas are present, and also in legal cases. For these reasons, a systematic reflection on the question of dignity seems necessary. As Ryszard Kozłowski points out, 'when observing and analyzing the functioning of a particular person in social life, and especially in uncertain and difficult situations in the moral, ideological and religious sense, one notices a clear crisis of experience of dignity. On the one hand, a while a lot has been done for a human being , on the other hand, there is a dramatic divergence from a human being; people remain deaf to his call for basic material and cultural goods. That is why a topic defining the philosophical and cultural contexts of the crisis of human dignity was raised'.11

Systemic philosophical reflection toward human dignity offers a number of precise tools to diagnose contemporary culture. Following the original concepts of man and defining the axiological environment of his existence, one can notice these sensitive points in which the man betrays himself and betrays others and therefore betrays his dignity. Cultural contexts of the dignity crisis are much more difficult to overcome. The cultural backgrounds of the crisis of dignity are more challenging to study. The problem is that even the researcher is immersed in a specific culture or a particular style of thinking. Nevertheless, humans are not doomed to failure. We assume that posing a question about dignity, the greatness of the human, the value of his life, death and illness is a brave move, even if it does not bring ready-made solutions. If this approach to some extent has stimulated the minds, it has already fulfilled its role.12

Despite the above ruminations, however, we are aware that it is still up to the researchers to specify the term of dignity, which is referenced by numerous documents relating to human rights. An even more significant discrepancy arises between dignity presented in research papers and their jurisdictional interpretation. Jurisdiction is the space that reflects the directions of perception of human dignity, thereby demonstrating how firmly it is present in social and political debates.

Today, we are witnessing some 'cult of dignity'. One can risk the claim that the concept of human dignity has never been so ubiquitous in everyday speech, or so deeply rooted in political, social and legal discourse. The idea of dignity, as already indicated in the beginning, is a feature of contemporary legal argumentation. When examining the problem of dignity from this perspective, one can ask what role human dignity plays in human rights. Is dignity the foundation of human rights or is it one of his rights? A few more questions inspire this reflection: Does dignity belong to anyone and is it inseparably connected with us, or is it granted based on some distinction or exclusivity? Do other rights or even attitudes, such as empathy and concern, result from dignity? Or perhaps is dignity just an empty slogan, motivating to heroic positions, deprived of the rationality of actions carried out on the moral, ethical and discretionary level? 13 Is dignity a right that everyone is entitled to, or is it an individual value that requires protection? Is placing dignity in the center of the human's axiological system the same as putting it on the pedestal of legal systems?

Although it is impossible to delineate all the areas and a manner of the judicial interpretation of dignity (because an in-depth analysis would significantly exceed the scope of this article), this rich and extremely valuable judicature allows outlining the problem synthetically.

Dignity As The Foundation Of Human Rights And The Ground Of Human Security

Dignity as a human right means that all people have specific rights because of their dignity. In fact, there is not enough space for the debate here about what rights matter and what dignity is. This trend took shape in the 80s of the last century, mainly, under the influence of the teachings of the philosopher Joel Feinberg and was spread out primarily in the jurisdictions of the universal law system. The judicature was based on the principle: 'Dignity for people can simply be expressed in respecting their rights. [...] Dignity neither explains nor complicates things, it tends to coincide with human rights, and therefore there is little debate about what it is, what its laws are or how they should be interpreted'.14

Dignity as a fundamental human right finds application in the interpretation of ethical and moral principles related, among others, to the issues of respecting dignity and autonomy of the patient, on which grounds even the principle of informed consent in the USA has appeared. It did not concern only people applying for medical experiments but referred to Human Rights informed consent also included all types of therapy. Judicature invoked the Patient's Bill

[11] Ryszard Kozłowski, 'Personalne konteksty kryzysu poczucia godności' in *Primum philosophari. Opuscula Antonio Siemianowski dedicata* (Poznań 2016) 403.

.
[14] Joel Feinberg, 'The Nature, and Value of Right' (1970) 243, Journal Value Inquiry 252.

of Rights, citing natural laws and inherent dignity, proclaiming that the patient, due to his dignity and autonomy, has the right 'to obtain from his doctor the information necessary to give informed consent before initiating any procedure or treatment, [...] and to refuse the treatment to the extent permitted by law and to obtain information about the medical consequences of the treatment'.15 For instance, one can recall Salgo vs. Leland Stanford Jr. University Board of Trustees. In this case, the court ruled that, apart from the formal nature of the consent of the patient, there was also an aspect of the patient's awareness and dignity, who consented to the treatment. Such a position is also noticeable in Poland. As for the right to respect for dignity, the Supreme Court stated that personal dignity 'relates to the sphere of personality that is embodied in self-esteem as a human being and the expectation of respect from other people'.16 Such attitudes result precisely from the recognition of dignity as the foundation of human rights. Therefore, the doctor's relationship with the patient should be filled with care, empathy, trust and the recognition of the patient as the subject of the healing process, not the object. For instance, the ruling of the Supreme Court in a judgment of June 21, 1976 stated that 'causing the personality threat condition in a minor by a doctor’s diagnosis regarding patient’s illness due to a conduct contrary to the principles of social coexistence, relating to the protection of human personality, his dignity, and the position in the society, can be considered as a causal relationship of the minor’s suicide, if there are no convincing grounds for combining suicide with the victim's psychological abnormalities'.17

The principle of respecting the dignity and recognizing it as the fundamental human right is reflected in Polish legislation under Art. 30 of the Constitution of the Republic of Poland,18 which reads: 'The inherent and inalienable dignity of man is the source of freedom and human and civil rights. It is inviolable, and its respect and protection is the responsibility of public authorities'.19 The language interpretation of the regulation mentioned above is expressed in the legal obligation to respect and protect dignity. The basis of such values is the recognition of dignity as a human right.

Dignity as The Synonym of Human Rights

The International Court of Justice expressed the above statement. Initially, the judges of the Tribunal applied the word dignity to the dignity of the function rather than to dignity in the prism of human rights. However, in the 1960s, along with racist conflicts in South Africa, the process of displaying dignity in the justification for respect for humanity and equality of all people began. For instance, Judge Tanak's opinion on matters related to South Africa South Africa Cases, i.e., Ethiopia v. South Africa; Liberia v. South Africa. Judge Tanaka stated that 'all people are equal before the law and have equal opportunities regardless of religion, race, language, gender, social groups, etc. As people, they have dignity, which should be recognized equally for all people. It is the principle of equality which is one of the fundamental human rights and freedoms that are universal. [...] disregarding fundamental rights is expressed as the humiliation of personalitie’s dignity'.20

Also, the advisory opinion to the above case of 21 June 197121, ICJ Rep 16, in § 77 states that 'it is not a coincidence that Article 1 of the Universal Declaration of Human Rights is a fundamental principle or a maxim saying that ‘all people are born free and equal in dignity and rights. ’The majority of rights and freedoms derive from this first principle. Of all human rights, the right to equality is by far the most important. It is also a law that has been recognized for the longest time as a natural law'22.

Today, dignity as a synonym of human rights is reflected in many disputes regarding the rights of sexual minorities. Freedom and equality in dignity resonate especially in the judicial interpretation of cases regarding disrespect for

homosexual relationships and non-discrimination against people with different sexual orientation in the workplace.23 Such case-law practices are common both internationally and in the strictly regional sphere.24

Interpretation Through The Prism of Dignity

The presented method of analysis corresponds to the recognition of dignity as the foundation of human rights; nevertheless, in this case, dignity is interpreted rather as an expression of the unique value in itself, on which human rights are built. Dignity's primary role in the first place is to help define a list of specifications of laws. However, this list is not closed, and the general rule may change. In other words, the general principle creates a minimum interpretation to help further present the catalog of rights generated by the principle. All laws should be interpreted through the prism of dignity. This approach is initially visible in the interpretations of the European Commission and the Court of Auditors, where cases were examined regarding, in particular, the prohibition of torture and inhuman treatment under Art. 3 of the European Convention for the Protection of Human Rights (ECHR)25 through the prism of dignity. The foundation of issued decisions was human dignity.

In turn, the European Court of Human Rights for the first time referred to human dignity in the case of Tyrer v. the United Kingdom26, in which corporal punishment was questioned. In this case, it was argued that corporal punishment contradicts humanity and cannot be subject to justice. The ECtHR stated that the verdict, adjudging a corporal punishment, is contrary to art. 3 of ECHR, and above all, violated all the principles and purposes on which the article was based which is, 'to protect, namely the dignity of the person and the physical integrity'.27

This verdict has become a reference to all matters relating to the right to a fair trial. It was considered an ethical and moral imperative not use corporal punishment under any circumstances, not only in case of using torture28 (such as Bock v. Germany29). Also, through the prism of dignity, the European Court of Justice considered cases of racial discrimination, establishing a position that all its manifestations interfere with human dignity.30

Dignity As The Foundation For All Rights Protected By Legal Acts

Since 1993, after the Treaty of Lisbon, such trend has been present in the judicature of the European Court of Human Rights. The court recognizes human dignity as the foundation for all the rights protected by the Convention for the Protection of Human Rights and Fundamental Freedoms. Human dignity is the cornerstone of the European integration and has become the foundation of the axiological order of united Europe. The European Union which so far has been focused on the community of material goods, points out to the dignity of the human, which above all material values, is the priority on which the entire community will be based.

Human dignity in the Court's judicature has also been included as a general principle of the European Community law, resulting simultaneously from the common constitutional traditions of the Member States. Member States accept the rule that the individual country must respect not only physical well-being, welfare, but above all, the dignity of its citizens, moral integrity and sense of identity. The legal order of the Member States is undeniable; it strives to ensure respect for human dignity as a general rule of law. As L. Bosek notes, the ECtHR's case judicature does not analyze the general concept of human dignity; it only examines its violation in the context of specific cases.31

[31] Por. Lech Bosek, *Gwarancje godności ludzkiej i ich wpływ na polskie prawo cywilne* (Warszawa 2012); Human rights outline the way of thinking about a human. A human who, regardless of his limitations, is always the subject and not the object of his rights. A human, whose life is the highest good, and who is a subject to proper legal protection. Unfortunately, on a daily basis, reality gives us many examples relating to injustice, iniquities, disrespect for the highest goods and values lived by a human.

This approach to dignity is shown in the case of Pretty v. the United Kingdom32, in which the appellant objected to a violation of Article 2, art. 3 and art. 8 of the Convention for the Protection of Human Rights and Fundamental Freedoms.33 The Court did not find any violation of any of the provisions of the Convention referred to by the appellant. It stated, however, that art. 2 para. 1 sentence 1 obliges the state not only to refrain from the intentional and unlawful elimination of life, but also is committed to take all the steps to protect the lives of individuals who remain under its jurisdiction. The court often stressed that the state is obliged to protect life, while emphasizing that there was no room for another interpretation of art. 2, which could indicate a different right from the protected one, i.e., the right to euthanasia. The Court indicated that a right to die and a right to assisted suicide respected by public authorities could not be derived from art. 2.34 This opinion was also reflected in the recommendation of the Parliamentary Assembly of the Council of Europe on Protection of human rights and dignity of dying in the terminal state.35

The Court further stressed that the complaint Pretty v. the United Kingdom indicates that art. 3 and with art. 2 of the Convention is a guarantee of the most fundamental values of a democratic society. Nevertheless, what is relevant to the article, is that the Court confirmed that all choices related to the survival of the appellant's last days should belong to her, as indicated by the very essence of the Convention. Respect for human dignity and freedom is the foundation on which the document is based. Thus, in the Court's opinion, interference could have occurred in the applicant's private life, and therefore in the whole area protected by the Convention. Such statements, however, did not become grounds for finding that there had been a violation of Art. 8 of the Convention.

Dignity can be also seen as a right or an obligation with specific content, not just as a foundation for human rights, or a collection of human rights specifications. The European Court of Justice (ECJ) has ruled in this direction, pointing to dignity as an autonomy while respecting the right to privacy. In the Coleman v. Attridge law case, the court stated that the right to dignity includes the right to personal freedom, in which free, intimate human choices are expressed, without any interference of the state. 'Dignity plays an important role in recognizing and respecting the autonomous choices of a person, and in recognizing that people can control and regulate their actions unless they harm others'.36

The ECJ stated that personal autonomy has been and still is an inseparable, distinct and vital part of dignity.37 It pointed out that human choices may differ, but they are always rooted in dignity as a real law, which also includes other values. This statement shows that every human being is an autonomous entity, and that dignity enables him to develop personally.38

[33] Convention on the Protection of Human Rights and Fundamental Freedoms (Journal of Laws of 1993, No. 61, item 284, as amended).

[34] The right to life resulting from art. 2 of the European Convention on Human Rights is a special provision. The right to life is first and foremost an integral part of the fundamental human rights and systems. It provides for legal protection of life, which cannot be waived. Although it is not absolute, manslaughter is within the limits provided for in the article, if it occurs as a result of the absolutely necessary use of force in the cases foreseen in art. 2 paragraph 2 of the Convention. It should be mentioned that it is a closed catalog and it is subject to strict interpretation. The Court stressed many times that the scope of art. 2 of the Convention primarily serves the protection of life, which means that the scope of this protection is not only that the state does not deliberately deprive the state of life, but the state's duty is to take appropriate action to protect the lives of individuals under its jurisdiction. Compare the judgment of the ECHR of 27 September 1995, No. 18984/91, *McCann and others v. The United Kingdom*; Taking one's life will not be considered contrary to Article 2 of the ECHR.
The above provisions are aimed at preventing situations in which unregulated and arbitrary actions of state officials cause deprivation of human life. The privileges that the relevant public services have under national legislation, must be compatible with a system of adequate and effective safeguards to protect against the abuse of power and, consequently, against life-threatening events that could have been avoided'. [38] In a similar manner, the Supreme Court of Canada spoke in the case of the *Canadian Society Law v Canada* (Minister of Employment and Immigration); The decision of the Supreme Court of Canada of 25 March 1999,

Dignity as a right to subjective treatment is used by courts for the death penalty. In the complaint of *Gregg v. Georgia* [39], the US court stated that it is not possible to divide people who, although are human, are treated as non-human, 'as objects that we play with and then throw away. [...] even the worst offender remains a human with common human dignity'.[40]

Conclusion

The concept of dignity was initially present in theology and philosophy. In philosophy, there are many known and analyzed ideas, thanks to which we learn more about a human and his life; his life as a person, as an individual, as a member of the human community, nation and a state. Homer, Plato, and Aristotle have already analyzed Human's phenomenon; it was studied by medieval and modern philosophers, and nowadays, it is one of the leading topics of social and political discourse. In the literature of the subject, there are many valuable answers to the fundamental question of 'who the human being is'; at the same time, we note that the categories such as dignity are included in the reflection on the essence of human and his nature. It must be stated that today, it is impossible to speak about a human acceptably, bypassing the social and axiological dimension of his existence. We also will not get a full answer to the question “who I am” when we dismiss a profound reflection on the essence of dignity. Every human feels unique and special; he thinks that he has his dignity. In modern times, the interest in dignity has found its place as an element of legal argumentation. Laws are derived from dignity which indicates that a human is autonomous, and should be treated with respect, has the right to freedom, and to humane treatment. This approach collerate with the dogmatic reflection of the concept of human security, as the Z. Brodecki said "that concept the new concept of human security should assume that the concept of (internal and external) security is a legal phenomenon that requires analysis: an interdisciplinary approach in the "market-culture-law" system on a "country-continent-world" scale; developing an optimal decision due to for the purpose of the action, taking into account the relationship between purposefulness, security and justice; building decision alternatives based on the examination of the facts; the use of pragmatic patterns that are not a manifestation of conformism"

The outline of the problem based on juridical interpretation of dignity shows that 'human beings constantly demand that others recognize their dignity as individuals or other religious, ethnic or racial groups. The struggle for recognition is not an economic struggle – we do not covet money here, but we only want other people to show us respect, which we believe we deserve'.41 Dignity is, therefore, inseparably connected with every human being, regardless of his social, material or national status. It is deeply rooted 'in the entelechy of perfect humanity. The dignity of the human constitutes an ontological quality and a constitutive quality of being'.42 Judges have repeatedly shown that dignity of every human being is a special type of dignity because it stems from life.

Judicial interpretation of dignity shows that dignity stems from life, and thus a person as a human is, first of all, turned towards other people, towards the world, and participates in the lives of other people and things. Because all beings engage in the same experience, they are all equal and have their dignity so that no one can be a tool, or a means for anyone. But since human is a person, and someone special, who enjoys his dignity, position towards others, and who can serve others, he then may be a gift for another person. Being a gift does not annihilate either his dignity or the dignity of the other person, as long as everyone enjoys their way of loving life. In this way, dignity has become a specific criterion in the implementation and protection of human rights and human security concept. Judicature indicates that it is a critical category, both axiological and practical, which has its source in fundamental values and rights. Dignity has become the cornerstone of intercultural agreement on fundamental values, rights, and freedoms in the regional and international arena. It is a principle for determining whether a particular law is fair because a fair law protects the dignity, and its any violation is contrary to the inherent dignity.43

The notion of dignity appears in the transnational44 and transcultural space, reaching a minimal consensus which is used as a specific 'endowment of human existence; every human being in a significant, equal and inseparable way,

regardless of race, religion, age, nationality and other special attributes is entitled to dignity. It is not obtained based on individual achievements or qualifications, nor is it lost as a result of disqualifying circumstances, such as a crime. Therefore, the justice system [...] is obliged to respect human dignity (also in the case of a criminal) and to avoid (for example, by imposing a prison sentence) the measures that may humiliate him or violate his physical or psychological integrity and consequently violate his human dignity'.45 At the same time, there is a considerable discrepancy in the perception of dignity itself, and there is still no answer to why some rights derive from dignity (e.g., inclusion, gender based violance). The reason for it may be sought in situations and circumstances in which we refer to the concept of dignity. Dignity along with its attributes of inviolability and inalienability is a permanent and unchangeable element of legal, social, political as well as axiological order.46

Resumen

La ilusión de que las TIC podían ser la llave para resolver gran parte de los problemas educativos y para dar un rápido impulso a la calidad de la enseñanza se ha ido desvaneciendo ante los grandes retos pendientes y la dificultad de modificar la organización de las escuelas y la forma de enseñar de los profesores. Sin embargo, nuevas reflexiones, modelos e iniciativas están surgiendo y permiten albergar renovadas expectativas.
En la actualidad el uso de la TIC en el aula es el objetivo de estudio de la presente investigación es un aspecto importante para la enseñanza aprendizaje ya que esto nos facilita para que los estudiantes puedan tener un aprendizaje significativo, siempre y cuando esté de acuerdo a una planificación adecuada para las diferentes áreas que se van a dar, la metodología de estudio es la de campo ya que se evidencio los problemas que tiene la educación en las instituciones educativas. Los resultados que se obtuvieron es que la incorporación de las TIC a la educación exige pensar previamente cuáles son los objetivos y los retos de la educación y determinar posteriormente de qué manera y en qué condiciones la presencia de las TIC en las escuelas contribuye a ellos. Lo primero y más importante es determinar el sentido de las TIC en la educación y cuál es el modelo pedagógico con el que se puede contribuir de forma más directa a mejorar la calidad y la equidad educativa. Por ello se concluye que es imprescindible establecer la relación de las TIC con el desarrollo en los alumnos de su capacidad para aprender a aprender, para buscar información de forma selectiva, para tener una posición crítica ante la información disponible en la red.

Palabras claves: Capacidades cognoscitivas, fuentes de enseñanza, profesores, alumnos, tecnología, nuevas metodologías de enseñanza.

Abstract

The illusion that ICT could be the key to solving a large part of educational problems and to give a quick boost to the quality of education has been fading in the face of the great pending challenges and the difficulty of modifying the organization of schools and schools.
The teachers' way of teaching. However, new reflections, models, and initiatives are emerging and allow for renewed expectations.
At present, the use of ICT in the classroom is the study objective of this research, it is an important aspect for teaching-learning since this facilitates us so that students can have meaningful learning, as long as it is in accordance with

Cite this Article as: Juan Carlos Chancusig Chisag, Augusto Hidalgo Sánchez, Julio Castañeda Carranza, Ricardo Gómez Arce, Javier Gamboa Cruzado and Luís Soto Soto "Las Tic En La Educacion" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

adequate planning for the different areas that are going to be given, the study methodology is that of the field since the problems that education has in educational institutions were evidenced. The results obtained are that the incorporation of ICTs into education requires thinking in advance about the objectives and challenges of education and subsequently determining how and under what conditions the presence of ICTs in schools contributes to them. The first and most important thing is to determine the meaning of ICT in education and what is the pedagogical model with which it can contribute more directly to improve educational quality and equity. For this reason, it is concluded that it is essential to establish the relationship of ICT with the development in students of their ability to learn, to search for information selectively, to have a critical position before the information available on the Internet.

Introducción

En el presente trabajo se trata de buscar todas las habilidades valoradas a través de los diferentes ítems que forman parte de una tic para poder fomentar en cada una de las aulas con los alumnos y así tener una educación que pueden agruparse en torno a cuatro apartados generales con el uso y conocimiento del ordenador y sus periféricos, la instalación y configuración de programas; el segundo grupo de competencias hace alusión a aspectos relacionados con Internet comunicación, información, colaboración en tercer lugar, nos encontramos un grupo de ítems que miden competencias referidas al trabajo con documentos de texto, el tratamiento de la información mediante bases de datos y hojas de cálculo, la creación y edición de imágenes, sonido, multimedia; y por último, en el cuarto grupo se recogen una serie de ítems relacionados con el uso de las diferentes herramientas disponibles en la de este estudio se contó con una muestra invitada correspondiente a los alumnos de tercer curso de cuatro de las seis especialidades de Educación Primaria, de Lenguas Extranjeras, de Educación especial y de Educación Musical

La educación, debe adaptarse a cada individuo, pues presenta diversas habilidades, destrezas y capacidades cognoscitivas para aprender, las TIC han transformado los parámetros de obtención de información por medio de las tecnologías de la comunicación como son Diario, Radio y Televisión. Las TIC en la educación ayudan a solventar la brecha generacional entre alumnos y profesores utilizando recursos como pizarras interactivas, aulas virtuales en tiempo real, salas de discusión, foros, cuestionarios, esquemas, recursos audiovisuales, bibliografía digitalizada, documentos colaborativos en línea, portafolios, juegos didácticos, entre otros.

En la actualidad las TIC es una nueva metodología que los docentes pueden utilizar para el desarrollo de la enseñanza aprendizaje de los alumnos dejando así atrás la educación tradicional, con el paso del tiempo los docentes tienen que capacitarse para utilizar de una manera correcta las TIC. Para tener una mejor utilización de las TIC en educación debemos tener una planificación para evitar la improvisación, obtener Objetivos Específicos y alcanzables, así podremos tener mejores resultados.

Las TIC en la educación nos permite la creación de ambientes educativos cómodos pero desafiantes, en los que el alumno debe asumir un mayor grado de responsabilidad, su participación debe ser activa, fomenta la interdisciplinariedad y el trabajo en equipo, así como la alfabetización por medios digitales y audiovisuales. Al docente le ayuda a tener una mayor disponibilidad de recursos y fuentes para la enseñanza, además de dar una mayor posibilidad para abarcar diferentes estilos de enseñanza e innovación en el ámbito educativo, que llevan a un proceso de actualización profesional.

(Barrio, 2018)La innovación de la tecnología es una estrategia que a facilitado que los docentes conviertan las clases tradicionales en clases donde el estudiante se sienta motivado y pueda expresar sus ideas sin problemas, como docentes, debemos pensar en el futuro de nuestros alumnos y prepararlos. De esta forma, podrán dar respuesta a todas aquellas nuevas exigencias y demandas del entorno laboral.

Objetivo General De La Investigación

Identificar de qué manera los docentes se capacitan para el manejo de las Tic, la utilización, la innovación, y la integración de las Tic en el proceso de enseñanza aprendizaje, mediante encuestas realizadas para los docentes, obteniendo datos nuevos de investigaciones ya elaboradas por otros autores.

Objetivo Esécifico

- Despegar y fortalecer hábitos de valores de la responsabilidad, tolerancia y respeto al uso adecuado de los medios tecnológicos.
- Disminuir el mal uso de los medios tecnológicos creando espacios de participación en las instituciones con el acceso a una información clara y precisa dando beneficio a docentes y alumnos.

- Analizar los datos obtenidos de las encuestas realizadas en los centros de desarrollo infantil.

Contenido Científico

Historia De Las Tic En La Educación

Los avances de las telecomunicaciones ayudaron a la innovación del tic con la creación de nuevos materiales audiovisuales y multimedia cada vez más integrados.

> (unesco)Para la UNESCO la nueva tecnología cumple un papel muy importante, ya que puede facilitar el acceso universal a la educación, apoya en un mejor desarrollo a la vida profesional del docente, mejora la calidad de la enseñanza aprendizaje en las instituciones educativas siempre y cuando se la utilice de una manera adecuada para poder lograr resultados exitosos.

La sociedad industrial ha descrito y desarrollo un modelo de educación basado en las necesidades laborales y en la estructura de la industria, la sociedad del conocimiento requiere nuevos modelos para adecuar la formación a las necesidades de la sociedad que gracias a las Tic presentan un panorama distinto a la manera de actuar, de relacionarse y de aprender que conocíamos hasta ahora.

En los años 70s los avances de la informática permiten la utilización de computadoras en la educación, en los 80s se estableció una fusión de computación y comunicaciones creando el origen de las Tic, siendo así en la actualidad una parte fundamental para la educación.

¿Que Son Las Tic En La Educación?

Las TIC son parte de los cambios a nivel económico, social y tecnológico que se están produciendo en la sociedad actual, y las instituciones educativas no pueden mantenerse al margen. Deben adaptarse a las características individuales y a las necesidades propias del alumnado, para así aportar mayor flexibilización en las trayectorias académicas y facilitar al máximo el desarrollo de sus potencialidades.

El aprendizaje significativo surge cuando el alumno, como constructor de su propio conocimiento, relaciona los conceptos a aprender y les da un sentido a partir de la estructura conceptual que ya posee. Dicho de otro modo, construye nuevos conocimientos a partir de los conocimientos que ha adquirido anteriormente. Este puede ser por descubrimiento especialmente cuando trabajamos con las TICs, o receptivo. Pero además construye su propio conocimiento porque quiere y está interesado en ello.

El aprendizaje significativo a veces se construye al relacionar los conceptos nuevos con los conceptos que ya posee y otras al relacionar los conceptos nuevos con la experiencia que ya se tiene. El aprendizaje significativo se da cuando las tareas están relacionadas de manera congruente y el sujeto decide aprenderlas. Las metodologías activas constituyen una forma interesante de presentación del conocimiento y una respuesta a las preguntas de qué, cómo, cuándo y dónde enseñar.

> La sociedad vive un proceso de cambio acelerado que está afectando no solo a la forma en que la comunidad se ha organizado hasta ahora, sino también al sistema educativo. En pocos años se producen transformaciones que, en épocas pretéritas, requirieron varios años, incluso siglos. Un gran cambio que afectó a la historia de la humanidad fue la aparición de la lectoescritura, que significó aprender a vivir de acuerdo con las exigencias del proceso de alfabetización: “aprender a leer”, “leer para aprender”, “leer para estudiar e investigar”; en consecuencia, “leer para vivir” (J, 2014)

Particularidades del uso de las TIC

En la actualidad, muchos maestros y maestras solicitan y quieren contar con recursos informáticos y con Internet para su docencia, dando respuesta a los retos que les plantean estos nuevos canales de información. Sin embargo, la incorporación de las TIC a la enseñanza no sólo supone la dotación de ordenadores e infraestructuras de acceso a Internet, sino que su objetivo fundamental es: integrar las TIC en los procesos de enseñanza-aprendizaje, en la gestión de los centros y en las relaciones de participación de la comunidad educativa, para mejorar la calidad de la enseñanza. Los profesores tienen la posibilidad de generar contenidos educativos en línea con los intereses o las particularidades de cada alumno, pudiendo adaptarse a grupos reducidos o incluso a un estudiante individual. Además, el docente ha de adquirir un nuevo rol y nuevos conocimientos, desde conocer adecuadamente la red y sus posibilidades hasta como utilizarla en el aula y enseñar a sus alumnos sus beneficios y desventajas.

El profesorado manifiesta que el uso de las TIC tiene beneficios muy positivos para la comunidad escolar, su alta implicación con las TIC ha mejorado su satisfacción personal, el rendimiento en su trabajo y la relación con el alumnado, debido a la amplia gama de posibilidades que ofrecen. Adaptarse a estas nuevas tecnologías es un proceso que se está llevando a cabo lentamente, pero que está permitiendo a muchos docentes mejorar la calidad de la enseñanza.

> (González, 2017) La formación del docente es muy fundamental para la nueva generación ya que al pasar el tiempo nuevas cosas surgen y el docente debe conocer un poco de todo por otro lado debemos comprender que existe un solo mundo, dos generaciones con el propósito de desarrollar un mundo más armonioso y de sobrevivencia, donde la tecnología sea un instrumento de desarrollo y no de destrucción, pero esto se puede solucionar reconociendo que este espacio de vida es para que los conocimientos de las dos generaciones se complementen.

Son muchos los usos que se les pueden dar a las TIC en el aula, por ejemplo los docentes tienen la posibilidad de crear contenidos en línea, actualizados y acordes a los intereses de cada momento y de cada alumno, siendo estos totalmente adaptables a cada grupo o a cada alumno en particular.

Las TIC están ayudando a mejorar la interacción del alumno con las clases, pasando de tener un rol pasivo a uno mucho más dinámico, activo y responsable.

Pero no sólo está cambiando el medio con el que se imparten las enseñanzas, también se están viendo modificados los procedimientos y métodos para impartir clases. Se desarrollan nuevos modelos de enseñanza/aprendizaje como el aula invertida, el aprendizaje basado en proyectos, entre otros.

También facilita que las familias se involucren en la educación de sus hijos, ofreciendo la posibilidad, a los centros educativos, de tener un contacto más directo con ellas.

En el ámbito educativo el uso de las TIC no se debe limitar a transmitir sólo conocimientos, aunque estos sean necesarios; además, debe procurar capacitar en determinadas destrezas la necesidad de formar en una actitud sanamente crítica ante las TIC. Con esto, queremos saber distinguir en qué nos ayudan y en qué nos limitan, para poder actuar en consecuencia. Este proceso debe estar presente y darse de manera integrada en la familia, en la escuela y en la sociedad.

Alumnado y TIC

En nuestra sociedad los niños/as asumen con total normalidad la presencia de las tecnologías en la sociedad. Conviven con ellas y las adoptan sin dificultad para su uso cotidiano. En este sentido los docentes debemos propiciar una educación acorde con nuestro tiempo realizando nuevas propuestas didácticas e introduciendo las herramientas necesarias para este fin.

Actualmente el uso de las tecnologías de la información y la comunicación constituye un objeto de preocupación, debate y reflexión para muchos autores, tanto a nivel nacional como internacional. Pero dicha preocupación aún no se ha traducido en un intento sistemático y organizado de realizar actividades pertinentes en favor de un uso adecuado de las tecnologías.

> (José A. Ferreyra) Por tanto las tic son una herramienta de apoyo, uno de los retos más importantes de los profesionales de la educación debe centrarse, sin lugar a duda, en el estudio de la relación que los alumnos/as establecen con las TIC.

Es necesario conocer y comprender en profundidad cómo las utilizan, para qué y con qué frecuencia lo hacen, así como la importancia que tienen en su vida cotidiana. También es interesante conocer cómo estás tecnologías mediatizan sus relaciones interpersonales con padres, madres, profesorado, etcétera.

Dentro del contexto social, los alumnos/as mantienen una estrecha relación con las tecnologías de la información y la comunicación debido a que se han convertido en una poderosa herramienta que les facilita información, comunicación y potencia el desarrollo de habilidades y nuevas formas de construcción del conocimiento.

Las TIC como el ordenador, Internet y el teléfono móvil, han propiciado acelerados e innovadores cambios en nuestra sociedad, principalmente, porque poseen un carácter de interactividad. Las personas, a través de su uso, pueden interactuar con otras personas o medios mientras nos ofrecen posibilidades que anteriormente eran desconocidas.

De lo que se trata con el uso de estas tecnologías dentro del aula, no es, transmitir una información determinada, sino de enseñar a aprender a lo largo de toda la vida. Los centros educativos tienen que preparar a sus alumnos/as para, no solo acceder a la información, sino también saber “crear” conocimiento basado en dicha información. Deben saber

seleccionar, valorar, criticar, desechar y utilizar adecuadamente dicha información a la que tienen acceso desde sus puestos escolares.

Las TIC se pueden analizar y clasificar en distintitos tipos. Desde nuestra perspectiva consideramos tres tipos de usos esenciales:

- Lúdico y de Ocio.
- Comunicación e Información.
- Educativo

Características de las Tic en la educación

- permiten reducir costos
- reducir tiempos
- mayor expansión en cuanto a ubicación geográfica
- variabilidad en los modelos educativos virtuales
- mayor acceso a la información.
- aprendizaje sincrónico y asincrónico
- Son de carácter innovador y creativo, pues dan acceso ha nuevas formas de comunicación.
- Tienen mayor influencia y beneficia en mayor proporción al área educativa ya que la hace más accesible y dinámica.
- Son considerados temas de debate público y político, pues su utilización implica un futuro prometedor.
- Se relacionan con mayor frecuencia con el uso de la Internet y la informática.
- Afectan a numerosos ámbitos de las ciencias humanas como la sociología, la teoría de las organizaciones o la gestión.

Herramientas de las Tic en la educación

- **Flexibilidad:** tanto el alumno como el profesor pueden decidir el uso del material informático o dispositivo electrónico que se adapta a sus necesidades para realizar una tarea en concreto.
- **Versatilidad:** con las herramientas digitales te permite realizar diferentes tareas o actividades en diferentes formatos, como por ejemplo, la producción, edición o transformación de un vídeo.
- **Interactividad:** con el uso de las herramientas digitales, los alumnos pueden interactuar y descubrir una serie de contenidos que les facilite el logro en la consecución de las tareas.
- **Conectividad:** los alumnos pueden comunicarse, compartir e intercambiar información por medio del uso de redes sociales o de plataformas virtuales en las cuales pueden aportar y ofrecer sus puntos de vista referidos a un tema en específico.

> (Sanchez, 2014) Según María de Rus Guerrero Sánchez el desarrollo del alumno es muy fundamental, y con la ayuda de las Tic podemos de una manera más factible enseñar a los alumnos, mientras que a los docentes nos ayuda a que el trabajo sea más eficiente al momento de enseñar.

¿Qué tipos de TIC existen?

- **Redes:** la telefonía fija, la banda ancha, la telefonía móvil, las redes de televisión o las redes en el hogar son algunas de las redes de TIC.
- **Terminales:** existen varios dispositivos o terminales que forman parte de las TIC. Estos son el ordenador, el navegador de Internet, los sistemas operativos para ordenadores, los teléfonos móviles, los televisores, los reproductores portátiles de audio y video o las consolas de juego.
- **Servicios en las TIC:** las TIC ofrecen varios servicios a los consumidores. Los más importantes son el correo electrónico, la búsqueda de información, la banca online, el audio y música, la televisión y el cine, el comercio electrónico, e-administración y e-gobierno, la e-sanidad, la educación, los videojuegos y los servicios móviles.

Ventajas de las Tic

- **Motivación.** el alumno/a se encontrará más motivado utilizando las herramientas tics puesto que le permite aprender la materia de forma más atractiva, amena, divertida, investigando de una forma sencilla.
- **Interés.** el interés por la materia es algo que a los docentes nos puede costar más de la cuenta dependiendo simplemente por el título de la misma, y a través de las tic aumenta el interés del alumnado indiferentemente de la materia.

- **Interactividad.** el alumno puede interactuar, se puede comunicar, puede intercambiar experiencias con otros compañeros del aula, del centro o bien de otros centros educativos enriqueciendo en gran medida su aprendizaje. los estudios revelan que la interactividad favorece un proceso de enseñanza y aprendizaje más dinámico y didáctico. la actitud del usuario frente a la interactividad estimula la reflexión, el cálculo de consecuencias y provoca una mayor actividad cognitiva.
- **Cooperación.** los tics posibilitan la realización de experiencias, trabajos o proyectos en común. es más fácil trabajar juntos, aprender juntos, e incluso enseñar juntos, si hablamos del papel de los docentes. no nos referimos sólo al alumnado, también el docente puede colaborar con otros docentes, utilizar recursos que han funcionado bien en determinadas áreas de las que el alumno/a será el principal beneficiario. se genera un mayor compañerismo y colaboración entre los alumnos/as.
- **Iniciativa y creatividad.** el desarrollo de la iniciativa del alumno, el desarrollo de su imaginación y el aprendizaje por sí mismo.
- **Comunicación.** se fomenta la relación entre alumnos/as y profesores, lejos de la educación tradicional en la cual el alumno/a tenía un papel pasivo. la comunicación ya no es tan formal, tan directa sino mucho más abierta y naturalmente muy necesaria. mayor comunicación entre profesores y alumnos/as (a través de correo electrónico, chats, foros) en donde se pueden compartir ideas, resolver dudas, etc.
- **Autonomía.** con la llegada de las TIC´s y la ayuda de internet el alumno/a dispone de infinito número de canales y de gran cantidad de información. puede ser más autónomo para buscar dicha información, aunque en principio necesite aprender a utilizarla y seleccionarla. esta labor es muy importante y la deberá enseñar el docente. los alumnos aprenden a tomar decisiones por sí mismos.
- **Continúa actividad intelectual**. con el uso del tic el alumno/a tiene que estar pensando continuamente.
- **Alfabetización digital y audiovisual.** se favorece el proceso de adquisición de los conocimientos necesarios para conocer y utilizar adecuadamente las tic

Las TIC se utilizan como herramientas e instrumentos del proceso de enseñanza aprendizaje, tanto por parte del profesor como por el alumnado, sobre todo en lo que atañe a la búsqueda y presentación de información, pero las TIC pueden aportar algo más al sistema educativo.

Uno de los colectivos que se ve especialmente beneficiado por la aplicación de las TIC en la educación es el de las personas con discapacidad y es que, si el desarrollo tecnológico no tiene en cuenta las necesidades de este sector, se pueden dar nuevas formas de exclusión social.

Las personas ciegas o deficientes visuales tienen, como es obvio, serios problemas de accesibilidad a las TIC. Dicha dificultad se suple con los llamados «revisores de pantalla» que permiten interpretar la pantalla a través de una línea Braille añadida al teclado y un sistema de voz.

En caso de que no haya ceguera sino deficiencia visual, la solución radica en el tamaño de las fuentes, colores, contrastes, resolución de pantalla, etc.

El caso de los sordos es algo distinto, aunque si bien podría pensarse que al tener facultades visuales no deberían tener problemas para leer y escribir de forma correcta, la realidad es que muchos de ellos presentan problemas de lectura y escritura. El remedio en este caso consiste en establecer un vocabulario y una estructura de navegación sencilla. Adicionalmente, es necesario que los contenidos en audio vayan acompañados de subtítulos o descripciones textuales.

Además, la disponibilidad de las TIC en la escuela es una valiosa herramienta y constituye un componente esencial para evitar que los grupos económicamente desfavorecidos y las minorías se encuentren cada vez más aislados y alineados con respecto a las familias que tienen acceso a las TIC en sus hogares. Un acceso restringido a las nuevas tecnologías supondría un riesgo de exclusión social.

(Sunkel, 2010) la perspectiva del desarrollo con las tic concibe la tecnología como un medio a favor de un desarrollo humano y social más inclusivo y pone como elementos centrales de la transición hacia las sociedad de información.
En definitiva, podemos señalar que: las TIC aplicadas al proceso de enseñanza-aprendizaje aportan un carácter innovador y creativo, ya que dan acceso a nuevas formas de comunicación; tienen una mayor influencia y beneficia en mayor proporción al área educativa, ya que la hace más dinámica y accesible; se relacionan con el uso de Internet y la informática; está abierta a todas las personas (ricos, pobres, discapacitados,) y afectan a diversos ámbitos de las ciencias humanas.

Algunas de las principales funciones que cumplen las TIC en la educación:

- Como medio de expresión: para realizar presentaciones, dibujos, escribir, etc.

- Canal de comunicación presencial. Los alumnos/as pueden participar más en clase. Pero, también es un canal de comunicación virtual, en el caso de mensajería, foros, web log, wikis, etc. que facilita los trabajos en colaboración, intercambios, tutorías, etc.
- Instrumento para procesar información.
- Fuente abierta de información.
- Instrumento para la gestión administrativa o tutorial facilitando el trabajo de los tutores y gestores del centro.
- Herramienta de diagnóstico, evaluación, rehabilitación…
- Medio didáctico: guía el aprendizaje, informa, entrena, motiva.
- Generador de nuevos escenarios formativos donde se multiplican los entornos y las oportunidades de aprendizaje.
- Medio lúdico para el desarrollo cognitivo.
- Suelen resultar motivadoras, ya que utilizan recursos multimedia como videos, imágenes, sonido, interactividad… Y la motivación es uno de los motores del aprendizaje.
- Pueden facilitar la labor docente con más recursos para el tratamiento de la diversidad y mayores facilidades para el seguimiento y evaluación.
- Permiten la realización de nuevas actividades de aprendizaje de alto potencial didáctico.

(Torres, 2017)" La educación a distancia se combina con la tecnología ayudando en si a docentes y alumnos a trabajar de una mejor manera, incrementando la motivación del alumno para que pueda realizar investigaciones por medio de bibliotecas virtuales.

Desventajas

- **Generan mayores distracciones:** En el mundo de las TIC tienes tal cantidad de información y de alternativas que es muy fácil distraerse, aumenta por tanto el grado de dispersión
- **Altos niveles de adicción:** Cuando hablábamos antes de aprender a utilizar las TIC y de concienciarse sobre ellas, nos referíamos entre otros a aprender a controlar nivel de adicción que estas generan, sobre todo en los perfiles más jóvenes
- **Mayor pérdida de tiempo:** Muy relacionada con el primer punto de atención de este listado
- **Genera aislamiento:** El uso abusivo de las TIC genera un menor contacto, en el mundo físico, entre personas, lo cual supone un hándicap para el crecimiento de la persona. También conlleva la no realización de otras actividades necesarias, como por ejemplo el deporte
- **Filtrado de la información:** Mucha de la información que encuentras en los medios digitales es falsa o incompleta. Hay que saber contrastar el contenido y buscar fuentes de información fiables
- **Ciberbullying o acoso a través de las redes**: Sin duda un tema muy controvertido y de rabiosa actualidad y uno de los mayores riesgos que suponen las TIC. La falta de contacto físico con otras personas provoca la pérdida de asertividad y puede derivar en este tipo de actuaciones. Igualmente, la posibilidad de crear perfiles falsos y ocultar la identidad en las redes, pueden provocar situaciones de riesgo para las personas en las redes
- **Falta de privacidad**: Este tema está también muy relacionado con el anterior, estamos muy expuestos debido a la cantidad de información personal que compartimos en las redes, esto puede derivar en convertirnos en el blanco de persecución de acosadores. Por suerte, cada vez más se trabaja en mejorar la privacidad en las herramientas, pero sin duda, también es necesaria una tarea de concienciación de que no es necesario, es más, puede llegar a ser contraproducente, compartir cierto tipo de información a través de las redes.

Metodologia

Para la siguiente investigación se utilizó la metodología de investigación de campo por lo que implica una combinación del método de observación del estudiante, encuestas y análisis. A través de las prácticas pre-profesionales que se efectúo en los CDI se pudo realizar las encuestas y la observación, con esto se pudo obtener datos nuevos al mismo tiempo se procedió a realizar el análisis crítico de cada pregunta respondida por los docentes del centro de desarrollo infantil obteniendo resultados satisfactorios.

Técnica: Encuesta y Observación

Población: 8 docentes

Resultados de investigación aplicadas por medio de encuestas a las docentes del centro de desarrollo infantil "Ignacio Flores".

1.- ¿Se ha capacitado en el manejo de las TIC para laborar como docentes?

Tabla N° 1: Se ha capacitado en el manejo de las TIC

Alternativas	frecuencia	Porcentaje %
si	2	25%
no	6	75%
TOTAL	8	100%

***Fuente**: Centro de desarrollo infantil "Ignacio Flores"*

Grafico N°1: Se ha capacitado en el manejo de las TIC

Grafica N°2: Se ha capacitado en el manejo de las TIC

***Fuente:** CDI" Ignacio Flores"*

Análisis

De acuerdo a esta pregunta un 75% de las docentes encuestadas respondieron que no se han capacitado en el manejo de las tic, mientras que un 25% respondieron que si se han capacitado para el manejo de las Tic.

Interpretación

La inclusión de las Tic en la educación es una preocupación inminente en cualquier institución, puesto que requiere que los alumnos estén preparados para usar medios tecnológicos durante el proceso de enseñanza aprendizaje.

¿Usted ha asistido a talleres de actualización de conocimientos de manejo de aulas virtuales?

Tabla N°2: Talleres de actualización de conocimientos

Alternativas	Número	Porcentaje %
Si	2	25%
No	6	75%
TOTAL	8	100%

***Fuente**: Centro de desarrollo infantil "Ignacio Flores"*

Grafico N°1: Talleres de actualización de conocimientos

Grafico N°2: Talleres de actualización de conocimientos

***Fuente:** CDI" Ignacio Flores"*

Análisis

De acuerdo a esta pregunta, el 25% de los docentes encuestados respondieron que si han asistido a talleres de actualización de conocimientos y un 75% de los docentes encuestados respondieron que no han asistido a los talleres para la actualización de conocimientos.

Interpretación

Los talleres de las Tic son muy importantes para poder apoyar los objetivos que tiene el docente al momento de enseñar a los estudiantes, una manera de mejorar como docentes es tomar conciencia de nuestro rol, en este siglo tomar conciencia de nuestro ser, sentir, pensar y hacer.

¿Qué herramientas tecnológicas utiliza en el proceso de enseñanza aprendizaje?

Tabla N° 3: qué herramientas tecnológicas utiliza

Alternativas	Número	Porcentaje %
Laptop	1	13%
Celular	5	63%
Tablet	0	0%
Televisión	2	25%
Proyector de datos	0	0%
Smart	0	0%
Ninguna	0	0%
TOTAL	8	100%

***Fuente**: Centro de desarrollo infantil "Ignacio Flores"*

Grafico N°1: qué herramientas tecnológicas utiliza

Grafico N°2: qué herramientas tecnológicas utiliza

***Fuente:** CDI" Ignacio Flores"*

Análisis

De acuerdo a esta pregunta un 13% de docentes respondieron que utilizan como herramienta la laptop, un 63% de docentes utiliza como herramienta el celular, un 25% de docentes utilizan como herramienta la televisión mientras que un 0% no utiliza la Tablet, Smart, proyector de datos.

Interpretación

El uso de las herramientas tecnológicas en el aula permite agregar valor a los procesos educativos, lo que implica conocer que se está haciendo bien y mal, estas herramientas nos permiten que los estudiantes tengan un aprendizaje colaborativo y significativo, además de ayudarnos en el ahorro de tiempo durante el proceso de enseñanza aprendizaje.

¿Conoce Usted Si En Ministerio De Educación Ha Implementado En La Institución Educativa O CDI Computadoras Para El Proceso De Enseñanza Aprendizaje?

Tabla N° 4: Implementa en la institución educativa o CDI computadoras

implementa en la institución educativa o CDI computadoras		
Alternativas	Número	Porcentaje %
Si	0	0%
No	8	100%
TOTAL	8	100%

***Fuente**: Centro de desarrollo infantil "Ignacio Flores"*

Grafico N°1: Implementa en la institución educativa o CDI computadoras

Grafico N°2: Implementa en la institución educativa o CDI computadoras

Fuente: *CDI" Ignacio Flores"*

Análisis

De acuerdo a esta pregunta un 100% de docentes responden que no implementan el uso de la computadora en el proceso de enseñanza aprendizaje.

Interpretación

El implemento de computadoras en las instituciones son muy importantes ya que el alfabetismo en la computación es una habilidad esencial en el mundo moderno , donde las actitudes tecnológicas son más vitales para tener éxitos en la vida, los niños expuestos a computadoras en las escuelas primarias tienen la oportunidad de obtener aptitudes tempranas en la vida.

¿Para Enseñar A Sus Estudiantes Utiliza Las TIC Como Recurso Tecnológico?

Tabla N° 5: Utilización de las Tic como recurso tecnológico

Alternativas	**Número**	**Porcentaje %**
Si	0	0%
No	8	100%
TOTAL	8	100%

Fuente*: Centro de desarrollo infantil "Ignacio Flores"*

Grafico N°1: Utilización de las Tic como recurso tecnológico

Grafica N°2: Utilización de las Tic como recurso tecnológico

Fuente: *CDI" Ignacio Flores"*

Análisis

De acuerdo a esta pregunta el 100% de docentes no utiliza las Tic como un recurso tecnológico al momento de enseñar.

Interpretación

La utilización de las tic favorecen la interacción docentes- estudiantes, es de gran importancia porque a través de la interacción entre docente- alumno se convierte en una educación virtual y adecuada permitiendo que los estudiantes tengan una flexibilidad en el acceso y manejo de la información.

¿Usted Está Interesado En Innovar Sus Clases Utilizando Recursos Tecnológicos?

Tabla N°6: Innovar sus clases utilizando recursos tecnológicos

Alternativas	Número	Porcentaje %
Si	2	25%
No	6	75%
TOTAL	8	100%

Fuente*: Centro de desarrollo infantil "Ignacio Flores"*

Grafico N°1: Innovar sus clases utilizando recursos tecnológicos

Grafico N°2: Innovar sus clases utilizando recursos tecnológicos

Fuente: *CDI" Ignacio Flores"*

Análisis Y Discusión

De acuerdo a esta pregunta el 75% de docentes no utiliza los recursos tecnológicos para innovar su clase y el 25% de docentes si utilizan los recursos tecnológicos para innovar sus clases.

Interpretación

Utilizar las TIC en el aula implica adaptar el sistema educativo a una sociedad cambiante y a unas necesidades específicas, los docentes deben ser capaces de manejar de forma adecuada y pedagógica las tics y combinar las metodologías tradicionales con formas innovadoras de enseñanza.

¿Hace Que Tiempo Ha Asistido A Clases De Capacitación Sobre Las TIC?

Tabla N° 7: Asistido a clases de capacitación sobre las TIC

Alternativas	Número	Porcentaje %
1 a 3	8	100%
3 a 5	0	0%
5 a 7	0	0%
7 a 9	0	0%
TOTAL	8	100%

Elaborado por: *Estudiantes de la carrera de educación inicial de la Universidad Técnica de Cotopaxi*
Fuente*: Centro de desarrollo infantil "Ignacio Flores"*

Grafico N°1: Asistido a clases de capacitación sobre las TIC

Grafico N°2: Asistido a clases de capacitación sobre las TIC

Fuente: *CDI" Ignacio Flores"*

Análisis

De acuerdo a esta pregunta, de 1 a 3 años el 100% de docentes han asistido a clases de capacitación de las TIC, mientras que de 3 a 9 años no han asistido

Interpretación

Las tic, son la innovación educativa del momento y permiten a los docentes y alumnos cambios determinantes en el quehacer diario del aula y en el proceso de enseñanza aprendizaje de los mismos.

¿Las TIC Pueden Ser Utilizadas Por Los Docentes En Las Diferentes Áreas De Estudio?

Tabla N° 8: Las TIC pueden ser utilizadas por los docentes

Alternativas	Número	Porcentaje %
Si	8	100%
No	0	0%
TOTAL	8	100%

Fuente*: Centro de desarrollo infantil "Ignacio Flores"*

Grafico N°1: Las TIC pueden ser utilizadas por los docentes

Grafica N°2: Las TIC pueden ser utilizadas por los docentes

Fuente: *CDI" Ignacio Flores"*

Análisis

De acuerdo a esta pregunta un 100% de docentes responden que las Tic si pueden utilizar los docentes.

Interpretación

La incorporación de las TIC en la sociedad y en especial en el ámbito de la educación ha ido adquiriendo una creciente importancia y ha ido evolucionando a lo largo de estos últimos años, tanto que la utilización de estas tecnologías en el aula pasará de ser una posibilidad a erigirse como una necesidad y como una herramienta de trabajo básica para el profesorado y el alumnado.

Los Recursos Tecnológicos Los Utiliza Para:

Tabla N° 9: Los recursos tecnológicos los utiliza para

Alternativas	Número	Porcentaje %
Investigar	3	38%
Realizar las actividades laborales	1	13%
Realizar actividades personales	4	50%
TOTAL	8	100%

Fuente*: Centro de desarrollo infantil "Ignacio Flores"*

Grafico N°1: Las TIC pueden ser utilizadas por los docentes

Grafica N°2: Las TIC pueden ser utilizadas por los docentes

Fuente: *CDI" Ignacio Flores"*

Análisis

De acuerdo a esta pregunta el 50% de docentes utilizan los recursos tecnológicos para actividades personales, el 38% de docentes utilizan los recursos tecnológicos para investigar, y el 13% lo utilizan para actividades laborales

Interpretación

Un recurso tecnológico es un medio que se vale de la tecnología para cumplir con su propósito. Pueden ser tangibles o intangibles. Los recursos tecnológicos sirven para optimizar procesos, tiempos, recursos humanos, agilizando el trabajo y tiempos de respuesta

¿las dificultades para incorporar las tic en su trabajo se debe a?

Tabla N° 10: Las dificultades para incorporar las TIC

Alternativas	Número	Porcentaje %
Falta de preparación	1	13%
Falta de tiempo	4	50%
Falta de herramientas tecnología en la institución	3	38%
Ninguno	0	0%
TOTAL	8	100%

Fuente*: Centro de desarrollo infantil "Ignacio Flores"*

Grafico N° 1: Las dificultades para incorporar las TIC

Grafica N°2: Las dificultades para incorporar las TIC

Fuente: CDI" Ignacio Flores"

Análisis

De acuerdo a esta pregunta el 50% de docentes tienen una dificultad para incorporar las TIC por falta tiempo, el 38% de docentes tienen dificultad para incorporar las TIC por falta de herramientas y el 13% tienen dificultad por falta de preparación.

Interpretación

La utilización de las TIC se dificulta por el bajo nivel de preparación del profesor utilizando las nuevas tecnologías y el material de información disponible, la mala planificación y la falta de espacio y tiempo dificultan la utilización de estas herramientas.

Conclusiones

- Como hemos podido ver a lo largo de este artículo es evidente que las TIC han tenido, tienen y seguirán teniendo una enorme repercusión en la sociedad y en el ámbito educativo.
- Las ventajas que han tenido las TIC en el proceso educativo es que la gran mayoría de docentes aplican las TIC en la secundaria la cual queremos fomentar el uso adecuado de las TIC desde la primaria.
- En el centro de desarrollo infantil" Ignacio Flores" no se aplica los medios tecnológicos en el ámbito educativo correctamente.

Abstract

The crop structure of a farm designates its field of activity and, in the case of developing a strategy, it is a component of it, influencing in many aspects the results that will be obtained. Due to its complexity, determined by the multitude of components, the relationships between it and the impact it generates on the economy of agricultural holdings, the culture structure has a special decision charge. In this context, the structure can be viewed as a combination of options, of ways in which the unit is to function. It is absolutely necessary for the process of establishing a culture structure to take into account the relationships of biological, technological and economic nature, whose contents can lead to either a complex structure of production (diversification) or the imposition of narrowing the profile of the production activity (specialization). The following indicators are followed in research: structure of cultures (2015-2018); cultivated area (2015-2018) and total production, prices and total revenues (2015-2018). The conclusion of the research is that choosing an optimal crop structure, it starts from the soil and climate conditions that characterize the agricultural unit, following on one hand, putting them into value, and on the other hand satisfying the requirements of the plants towards these factors, which influences the level of production. Extensive and intensive agriculture determines the organization of different production structures, with particularities that influence the economic results on the farm level.
Practicing culture structure is a natural consequence of the plant biology, especially population’s need for food (population growth and product demand).

Keywords: Agriculture, Culture Structure, Culture Share.

Introduction

The rural development of Romania experienced a complex evolution after the change of the political regime in 1990, being influenced by the national policies regarding the field of land funds and the retrocession by the former

owners. The fragmentation of agricultural lands, due to the wrong system of reallocation of the Romanian farmers' lands, affected the performance of the national agricultural production and favoured the sale of the Romanian land to foreign investors (Iancu and Stanciu, 2017).

Direct payment schemes to be granted as support mechanisms for agricultural producers, are the following in Romania: Single payment scheme on the agricultural area; Transitional national aid - ANT; Redistributive payment; Payment for climate-friendly agricultural practices; Payment for young farmers; Coupled support scheme; Simplified scheme for small farmers. Payment schemes should be revealed in the impact study.

Since, in general, crops have varied production cycles and that environmental factors know a certain distribution over time, some of the crops, respectively, the varieties, "catch" better conditions. For example, given that, in certain areas, rainfall is concentrated during May-June and early July, early varieties of maize give better results than late ones, which, although having higher efficiency, are affected by drought at the end of the period, production per hectare being decreased (Stanciu, 2017a, b).

The same can be done in the case of field vegetables, in order to counteract the negative effects of late spring frosts and mists that come too early in the fall. In principle, the determination of the production structure of the agricultural holding must take into account the criteria of the technical and economic optimum (Florea et al, 2019). In connection with the transition to the market economy, it is deeply necessary to investigate the economic efficiency of the production and to introduce corrections in the modification of the specialization of enterprises. Schin, Virlanuta and Stanciu (2017), showed that the association of agricultural producers, in various forms, can be a solution for the improvement of technological flows for the agricultural feedstock production, for the processing and selling of food products. As far as agricultural associations from Romania are concerned, there are significant discrepancies between counties and between the crop and animal production sectors. At a national level, there is a moderate concentration degree of producer organisations.

This is done through structural changes in the production process, as well as in the potential of resources for which large investments are usually required. The selection of crops must be made according to the profitability ensured by selling the products that depend on the level of the resources of the companies. Selecting the most profitable crops and determining the profit obtained by combining them is a relatively slow process and a specific research problem.

An analysis of the structure of the main agricultural crops in Romania (table 1), in 2018 compared to the year 2014, shows that:

- grains decreased by 4.14%, from 5,484 thousand ha in 2014 to 5257.20 thousand ha in 2018;
- legumes registered an increase of 170.59% in 2018 compared to the year 2014, especially due to the increase of the cultivated areas with pea beans, an increase with 233.89% in 2018 compared to the year 2014;
- oilseed plants registered an increase with 18.40%, influenced by the growth with 92.25% in the culture of rapeseed.

Regarding the share of the crop groups from the total cultivated area it can be observed the following:

- cereals registered a decrease in share, from 66.44% in 2014 to 62.09% in 2018, decrease influenced by the share decrease of the areas cultivated with maize from 32.66% to 28.82%;
- legumes registered an increase in share, from 0.60% in 2014 to 1.58% in 2018, influenced by the share increase of cultivated areas with peas from 0.44% to 1.42%;
- the oilseed plants registered an increase of the share, from 18.57% in 2014 to 21.44% in 2018, growth influenced by the increase of the surfaces of all crops. (table 1).

Table 1: Share of the main crops from the total agricultural area in Romania (2014 – 2018)

Culture groups / Culture	years		(+/-) compared to 2014 (%)	% (compared to the total cultivated area)	
	2014	2018		2014	2018
Total cultivated area (Thousands of ha), of which:	**8254.40**	**8466.70**	**2.57**		**100.00**

Source: data processed according to the Statistical Yearbook of Romania 2014 and 2018.

Analysing the data presented in Table 2 it is noted that, regarding the structure of the main agricultural crops in Galati County, in 2018 the evolution was different from the evolution to the national level, thus:

- cereals showed a decrease of 16.82%, from 283,976 ha in 2014 to 269,848 ha in 2018;
- legumes registered an increase of 446,47% in 2018 compared to 2014, being influenced by the growth of the cultivated areas with peas with 798.09%;
- oilseed plants showed an increase of 14,43%, growth influenced by the increase with 6,39% of the sunflower culture.

Table 2: Share of main crops from the total agricultural area in Galati County (2014 – 2018)

Culture groups / Culture	**Years**		**(+/-)comp. to 2014%**	**% compared to total agr. area 2014**	**%compared to total cultivated area 2018**
	2014	**2018**

Source: data processed according to the Reports of Statistical Office of Galati County,

Regarding the share of the crop groups from the total cultivated area, in Galati County, it can be observed that:

- grains have decreased in share, from 67,11% in 2014 to 58,75% in 2018, being influenced by the decrease of the share of the wheat cultivated areas from 19,33% to 16,15%;
- leguminous showed an increase of the share, from 0,64% in 2014 to 3,70% in 2018 influenced by the increase of the peas cultivated area from 0,37% to 3,49%;

- oilseed plants registered an increase of the share, from 24,24% in 2014 to 29,19% in 2019.

Considering the structure of the main crops in the total agricultural area used in Galati County, it is required an analysis of it viewed in a rational rotation, recommended for the South Eastern part of Romania (table 3).

Table 3: The share of main crops from the total agricultural area within a rational rotation, in the plain area

Culture groups/Culture	Crop system	
	Irrigated (%)	**Not irrigated (%)**
Maize	33 - 35	25 - 27
Wheat	10 - 12	12 - 16
Barley	6 - 8	11 - 14

Soybean	8 - 9	5 - 7
Sunflower	5 - 6	8 - 10
Oilseed plants - total	**13 - 15**	**13 - 17**
Beetroot	4 - 5	3 - 4
Other plants for industrialization - total	**4-5**	**3-4**
Fodder plants	**14-15**	**15-18**

Source: CEEX PROJECT no, 732 " The technical-economic and management practical guide - Vegetable production"

From the data presented in Table 2 and Table 3, the following conclusions can be formulated:

In Galati County:

- the share of cereals in the crop structure represented 67,11% in 2014 and 58,75% in 2018, which shows a structure above the recommended share;
- the share of leguminous plants in crop structure represented 0,64% in 2014 and 3,70% in the 2018;
- the share of oilseed plants in crop structure represented 24,24% in 2014 and 29,19% in 2018, a structure above the recommended share.

Case study on PFA Pecheanu Cornel

The Authorized Physical Person (PFA) is the form of organization of the economic activity performed by an entrepreneur in Romania equivalent to a self-employed individual in UK or USA.

The Authorized Physical Person (PFA) PECHEANU CORNEL was founded in 2006 and operates on the basis of the Romanian commercial law, with headquarters in Namoloasa village, Galați County, having an agricultural area of 908,69 ha in 2018, located on the territory of the same locality. The area of arable land owned and used by PFA PECHEANU CORNEL between 2015-2018 has shown a structure of crops presented in table 4 in which it is noticed that cultures of wheat, barley, maize and sunflower are predominant. The land is leased from the rightful owners, based on lease agreements, according to Law no. 16/1994.

The land area currently used has low agricultural potential, the area being disadvantaged due to specific natural conditions, as provided by the National Rural Development Plan 2014-2020, allowing moderate agricultural productions.

The agricultural holding has no possibilities to irrigate the crops, even if in that area has been conducted, before 1989, a project for an irrigation system, abandoned in 1991. From the data presented in table 4 it is noticed that the land area of the agricultural holding, all arable land, has increased during the years 2016, 2017 and 2018, towards the year 2015, with 199.74ha, 223.94 ha and 62.84ha, reaching from 422.17ha in 2015 to 908.69ha in 2018.

Table 4: Crop structure for PFA PECHEANU CORNEL, between 2015 and 2018

Source: data processed according to PFA PECHEANU CORNEL's records.

The analysis highlights the fact that, during the period 2015-2018, the culture structure has modified, in the sense that certain crops (soybean, rapeseed, peas) are no longer cultivated, but new crops appeared (barley, oats, sorghum). Surface increases are recorded for the autumn wheat crops, maize, sunflower and fodder plants (between 236% for barley and 14,87% for fodder plants). Considering that in the structure of crops a predominant place is occupied by cereals, it can be concluded that the farm is a "cereal type" farm. The following indicators are followed in research: Structure of cultures (2015-2018); The cultivated area, 2015-2018; Total production, prices and total revenues 2015-2018.

The results for the economic activity of agricultural holding PFA PECHEANU CORNEL are presented in tables 5, 6, 7 and 8. The total amount of the obtained products has increased from one year to another as a result of the increase of the cultivated area, but the average production per hectare depended on the climatic conditions.

Table 5: Total production, prices and total income, on crops, realized by PFA PECHEANU CORNEL in 2015

Culture	Area (ha)	Average production (kg/ha)	Quantity (tons)	Average price (RON/ha)	Total revenue (thousand RON)	Income (RON/ha)

Source: data processed according to PFA PECHEANU CORNEL's records.

In 2015, due to drought, yields obtained have been far below the average of the years 2015-2018, and the total income has been influenced by the average sales price, which has been above the average price for the years 2015-2018. In 2016, by comparison to the year 2017, the total income realized by the farm were with 48,54% higher, due to the influence of the average productions as well as the average selling price.

Table 7: Total production, prices and total income, on crops, realized by PFA PECHEANU CORNEL in 2017

Culture	Area (Ha)	Average production (kg/ha)	Quantity (tons)	Average price (RON/ha)	Total revenue (thousand RON)	Income (RON/ha)

Source: data processed according to PFA PECHEANU CORNEL's records.

For some crops, the income per hectare had a significant increase, as it is the case of the sunflower crop, where the income increased by 257.22%, compared to the year 2015 and the case of fodder plants, which increased by 131.47% towards the year 2015. In 2017 compared to the year 2018, the total income registered a decrease by 26.13%, as a result of the change of the crop structure, of the sale prices and of the lower yields compared to the year 2018. In 2018, compared to the year 2017, the total income on the farm increased by 37.75%, as a result of the increase of the used area, but also as an effect of changing the structure of crops, the average selling price and the higher yields.

Table 8: Total production, prices and total income, on crops, realized by PFA PECHEANU CORNEL in 2018

Conclusions

The structure of cultures, which has a very important role in how it is manifested and in terms of the results it generates, is influenced by natural, economic, technical and technological factors, etc. Taking into account this role, it is necessary to choose and to optimally proportion the different cultures that enter the structure and, implicitly, in the production system.

An optimal culture structure must satisfy several demands in a simultaneous relationship:

- to offer products that, from a quantitative and qualitative point of view, respond to the demand, highlight and protect the natural conditions and other factors of production;
- to allow the organization of culture rotation and to ensure maximum profit for the entrepreneur.

As a result, the option for one structure of cultures or another structure of cultures is a complex process, which is required to be grounded considering both technical and economic knowledge and appropriate methods.
It is rightly appreciated that these conditions manifest themselves as major restrictions, which almost certainly limits the choice of structure, also with a restrictive role intervenes the market of the respective products.

BotTROP: A Botnets Detection Method Based on Identification of Synchronous Actions

Hubert OSTAP
Military University of Technology, Warsaw, Poland, hubert.ostap@wat.edu.pl

Ryszard ANTKIEWICZ
Military University of Technology, Warsaw, Poland, ryszard.antkiewicz@wat.edu.pl

Abstract

The aim of this paper is to present a method of detecting botnets based on identification of their synchronous actions. There are a lot of botnets implementations and there are a lot of methods of their detection. Usually, those methods are only effective against specific groups of botnets which are using for example IRC, HTTP or P2P protocols to communicate with their Command&Control. Presented method, called BotTROP, utilizes clustering and classification methods to detect synchronous action among corporate network traffic to detect malicious activity such as a botnet of any type. Furthermore, the effectiveness of the presented method was verified in numerous experiments where simulated and real-life network traffic was used.

Keywords: Botnet, Security, Detection, Botnet Detection, Botnet Mitigation.

Introduction

Nowadays, there are a lot of different types of Internet threats such as DOS (Denial of Service), ransomware, phishing campaigns. Some of them are more dangerous, others are better organized but most of them are profit-oriented which makes them difficult to detect and mitigate. One of the biggest Internet threats are botntes (Plohmann et al. 2011) (Gralla 2019) and RATs (Harel 2019). They consist of infected machines controlled from a C2 (Command&Control). Rightful owners don't realize that their devices are infected and used to conduct malicious actions. The number of different types of botnets that have been implemented is truly impressive (Garcia et al. 2014). They use different infection and communication methods. The most popular are based on P2P, HTTP/HTTPS and IRC protocols. They are used for sending and receiving commands from their owner called a botmaster. Another difference between botnets is their architecture. Most of them are centralized with only one C2, more sophisticated are decentralized with a group of C2 based on P2P protocol (Silva et al. 2013). Another type of botnet is based on hybrid architecture. This specific model is used only by few known botnets where decentralized architecture is used to spread domain addresses of the C2s and centralized is used to receive reverse-tcp connections (Chanda 2014) (Wang et al. 2010). During the last several years one has been able to observe an increasing number of new kind of botnets which are based on social networks.

Due to a huge number of described internets threats, there are also a lot of methods of their detection. Unfortunately, most of them are bound by a specific protocol or architecture and are useful only against specific botnets. Others are effective only when a monitoring agent is installed on every host. This approach is also problematic especially for an organization that possess a huge number of devices that should be secured.

This paper presents an improved and developed method for botnet detection which is based on previous research (Ostap et. al 2017). Furthermore, it includes a description of its implementation and extensive research on its effectiveness and quality. It is able to detect botnets that use any kind of architecture, protocol or social networks for communication (Ostap et al. 2018) purpose with their C2. Moreover, to mitigate botnet activity it is not necessary to install any monitoring agent on every host in the monitored network. Network traffic is analysed at the interface between the internal and the public network.

The article is organized as follows. Section 2 contains a description of the novel classification approach for botnet detection methods and an overview of some research works in this field. Section 3 contains a detailed description and

the main concept of the BotTROP algorithm. In the next section we present a case study including the methodology to reach our objectives, description of the dataset and an interpretation of the results. Section 5 presents performance, evaluation and comparison of some previous solutions. The final section contains a conclusion of our paper and some future work.

An overview of botnet detection methods

Over the years an impressive number of different botnets have been discovered in the wild. It was the root cause of implementing a huge number of defense method by researchers all over the world. So far, few authors have also proposed a classification of botnet detection methods (Feily et al. 2009) (Nallanthighal et al. 2012) (Strayer et al. 2007) (Garcia et al. 2014) (Silva et al. 2013). The first mentioned publication presented by Maryam Feily, Alireza Shahrestani and Sureswaran Ramadass is based on well known and clearly defined classification criteria. The second classification contains a wide spectrum of botnet detection methods based on their architecture. Next publication proposed by Tim Strayer, David Lapsely, Robert Walsh and Carl Livadas contains information about detection method based on botnet network behavior. From our perspective the most valuable classifications are presented by Garcia et al. (2014) and Silva et al. (2013). Taking those two propositions into consideration, we create a scheme that contains attributes of detecting method on which classification may be based and present it in the following subsection.

A Novel Classification Method

Figure no.1 presents a classification of the criteria/attributes based on which botnets detection methods could be described. It is necessary to point out that not all criteria have to be linked with each method but only some of them. The main reason why a new approach to classifying botnet detection methods was taken is the complexity of current methods. Today it is not sufficient to operate only with a classification of detection methods because now they have to implement more than one technique to be effective. Furthermore, the presented classification of attributes is also helpful to describe even the first botnet detection methods which used very simple techniques. Using the presented classification approach, it is possible to compare different botnets detection methods using well known comparison algorithms.

First attribute is called *Data Extraction and Analysis* and contains two values *Host-Based Analysis* and *Network-based Analysis*. The first one requires monitoring agent on every device in a network (at least those used by users). The main goal is to localize malicious files or actions (registry modification, file extraction etc.) After a successful identification of the malicious software different approaches could be taken. One of the most common is to create a signature of such a file and upgrade *Host and Network Based Intrusion Prevention* and *Detection Systems*. Another one is to start the reverse-engineering (RE) process to find out more details about the implementation and techniques used by particular malware. This process is very time-consuming and not every organization is able to implement it. One of the methods based on this criterion was proposed by Stinson et al. (2007). The approach implemented by the authors is to monitor individual machines to find any suspicious and unusual behaviour such as larger CPU usage or interaction with suspicious files. Another method from this group was proposed by Liu et al. (2008). Their method called BotTracer monitors system-level activities to detect unusual actions. Mehedy Masud proposed a method where the main approach is to monitor multiple logs in the host file system. He assumes that bots respond faster than users and this feature could be spotted and compared in log time stamps (Masud et al. 2008).

Fig. 1: An overview of the classificaton criteria for botnet detection method.

There are also situations where methods with implemented *Host-based Analysis* value of *Data Extraction & Analysis* attribute are used only when a malicious action is identified by methods with implemented *Network-Based Analysis*. In this approach a monitoring agent is not necessary, a detailed analysis of the infected machine is conducted after identifying its malicious network traffic to the C2.

The second value of the first attribute is called *Network-based Analysis* and is the most commonly implemented approach by the researchers so far. Methods with this value only need access to the analysed network without any necessity of installing a monitoring agent on every device in it. This is the main reason why they are mostly used nowadays (Silva et al. 2013). They owe their popularity to the simplicity of use. Most of them do not require any additional hardware; furthermore, no modification in the network structure is needed. *Network-based* method could be used in any part of the botnet life cycle. Their main advantage is the possibility to mitigate even unknown botnets, which have not been used for any malicious action so far.

The second attribute *Detection Techniques* contains values such as: *Anomalies detection, Signatures Detection and Others*. Methods with implemented one or more values that belong to this attribute are focused on characterization of the network flow. Next attribute is *Detection Algorithms*. Its values are used in each botnet detection method. For the needs of the presented classification, they are grouped based on their main approach. The next attribute *Network Flow Analysis* consists of two values: *Passive Network Flow Analysis* which allows only to observe network flow to localize potential bots and *Active Network Flow Analysis* which also provides methods to modify the network flow. It allows to localize infected devices by changing the content of the captured packet and send it to the suspicious destination or source IP address. The fifth attribute is linked with the protocol being analysed. The last attribute *Suspicious file analysis* represents the methods which are focused on the suspicious file identification and analysis. The values from this group are linked with the final approach how the method make the final decision. The first value describes a

Dynamic method which includes opening and running potentially malicious file in a secure environment and Static which allows only to identify different attributes without running the files.

Nowadays most of the newly implemented methods are network based with modern data-mining algorithms to discover anomalies in the network flow (Silva et al. 2013) using passive network flow analysis algorithm against one or more protocols. According to this we are mostly focused on the research based on methods that have implemented such values of presented attributes.

For the sake of clarity below we classify some botnets detection methods based on scheme described above. The method proposed by Gu et al. (2008) called BotSniffer has implemented *Network Based Analysis* to detect *Anomalies using Clustering* methods. This algorithm, due to *Passive Network Analysis* does not require any interaction with the network or devices. Another representative with the same features was proposed by Binkley et al. (2006). Their approach is to detect bots by analysing an IRC commands and messages. The only difference between those two methods is the protocol, the first one is tcp-based and the second one is effective only against botnets based on IRC communication.

Another presented group consist of attributes as follows: Network-Based Analysis, Signature Analysis, Clustering, Passive Network Flow Analysis and Multiprotocol. The method called BotMiner is one of the representatives (Gu et al. 2008). This approach combines results from two monitors; the first one utilizes Snort (Roesch 1999) to identify malicious actions and the second one is responsible for network monitoring.

Method proposed by Gu et al. (2009) is also based on the attribute Network-Based Analysis Method which ties to identify Anomalies using Classification with the Active Network Flow Analysis approach against only IRC based botnets. The idea behind this method is to inject modified packets that will probe the internal devices if a bot or a human is managing the other side of the communication channel.

Another method strictly correlated with the clustering approach is called BotGAD (Choi et al. 2009; 2012). It is also based on Network-Based Analysis and Analysis of the Anomalies using only Passive interaction with the network flow. The main goal of BotGAD is to detect group activity which may denote the communication process between infected machines and a C2. The group activity (synchronous activity) is a widespread phenomenon widespread among bots, crawlers, and other tools developed to conduct actions simultaneously and automatically. Such tools, unlike humans, tend to communicate with the target in a highly synchronized fashion. BotGAD focuses on finding such actions by analyzing Domain Name System queries in the network flow.

The algorithm implemented by Göbel et al. (2007) is a representative of the group with attributes as follows Network-Based Analysis, Analysis of Signature, Classification and Passive Network Flow Analysis and is only effective against IRC network flow. This method tries to localize suspicious IRC servers, unusual ports for IRC communication and suspicious usernames by inspecting network traffic. A detection method that utilizes Heuristic approach was proposed by Barthakur et al. (2012). It also linked with Network-Based Analysis for spotting any anomalies in P2P protocol by passively monitoring the network flow. For the network classification Support Vector Machine (SVM) is used. The method is based on the observation that legal P2P traffic has significant differences in comparison with malicious P2P network traffic.

The representative of the Hybrid-Based Analysis was proposed by Almutairi et al. (2020). Authors utilize techniques from Host-Based Analysis such as a monitoring agent and Network-Based Analysis in one approach. Their algorithm called HANABot works at the host level and network level and focuses on HTTP, IRC, IP fluxing and P2P network traffic to detect infected machines.

Table 1 contains all the methods described above, classified using the proposed scheme of the classification criteria. It is possible to describe every botnet detection method using a previously described vector of attributes values.

Summary of botnet detection methods review

Nowadays, the biggest group of detection methods is Passive Net- work Analysis and in general data mining. They are easy to implement in a specified network. The process of analysing does not require Deep Packet Inspection (DPI) and any additional physical access to the potentially infected devices. This is the main reason why they are most frequently implemented nowadays. They owe their popularity to the simplicity of use. In most cases they do not require any additional hardware; Furthermore, no modification in the structure of the network is needed. After suspicious communication, as well as the identification of the devise that generated that traffic, analysis commences where host-based methods are used to discover for example other C2 servers. They could also be adopted in any part of a botnet life cycle, but their main advantage is the possibility to detect even unknown botnets in creation or maintenance phases, which have not been used for any attack so far. There is a subgroup of especially effective methods which are based on detecting synchronous action. High efficiency of such methods is based on the assumption that botnets must work synchronously in order to achieve their goals. To conduct a successful SPAM campaign or a DDoS attack, it requires the Botmaster to use as many bots as possible. During the research, it was observed that synchronous activity occurs not only during the attack phase but also during the creation and management phases of the Botnet. This fact allows us to detect the threat before the first attack, which is a big improvement compared to the already known methods. BotGAD (Choi et al. 2009; 2012) is a representative of this group. It is an interesting method but has a few disadvantages. First of all, it allows to analyse only the DNS protocol while looking for malicious activity. It is also vital to specify a proper time-window parameter, which is very problematic especially when we are dealing with an unknown botnet. This paper presents the method called BotTROP which is based on BotGAD and it is free of its disadvantages and restrictions.

BotTROP: A Method for Detecting Botnets

The main goal of this section is to describe the BotTROP algorithm and its main concept. To improve the description a graphical representation was also prepared.

The main concept of the method

BotTROP is able to identify infected PCs called bots in a network infrastructure of any organization. We assume, that bots communicate with C2 servers outside the organization in similar moments. This feature of botnet is named synchronous activity or group activity (Choi et al. 2012). BotTROP at first, records all public IP addresses (destination IP), which were destination of the connections generated by nodes (source IPs) using specified protocols. Next, for a fixed destination IP and communication protocol, BotTROP uses a clustering method for grouping all the moments, when packets from source IPs were sent to the analysed destination IP. During the next step similarity of identified groups of moments is calculated. High value of similarity factor means that the groups being analysed contain very similar source IPs and they are connecting with a destination IP in a similar moment (i.e. in a synchronous way). This fact indicates that an identified group of source IPs (internal nodes of organization) could be bots of some botnet, and destination IP is the C2 server of that botnet.

To make a decision if analysed network traffic is synchronized it is possible to calculate average cosine similarity for every cluster, but it is very time-consuming. To increase the speed of the calculation the Sequential Probability Ratio Test (SPRT) is used (Gu et al. 2008) (Jung et al. 2004). All the steps described above are done for all recorded public IP addresses (destination IP) and all analysed protocols separately. The exception are those destination IPs which belong to the same organization for example: Twitter, Facebook, Amazon AWS etc. They could be used by the same botmaster for the communication purposes with infected PCs. In such a situation the destination IP is changed because those organizations use a load balancer for network optimization. This method is used by botnets based on social networks. To use BotTROP it is necessary to collect all the public addresses of the services because they could be changed during the monitoring time. For example, clients can connect to different IPs in the Twitter range during every communication process. Missing one of them could lead to false positives. Furthermore, separate Twitter IP addresses could be used by different source IPs. Only by combining them into one group (owner of IP range like Twitter) could lead to the detection of malicious activity. It is not possible to detect synchronous activity only with one source IP, in such situation this traffic would be admitted as legal. Presented method is effective against all of the protocols used during network connectivity of any type. Details of BotTROP method are presented in the next section.

The algorithm

To simplify the presentation, it is assumed that the following form of algorithm is a study of the existence of a botnet for a fixed address or group of destination addresses and a fixed communication protocol. In order to describe the method, we define the following denotations:

- $SIP = \{1,2, \dots, I_s\}$ – the set of IP source ordered numbers.
- $T(i) = \left(t_r(i)_{r \in ST(i)}\right)$ for $i \in SIP$, where $t_r(i)$ – the moment, when computer with i-th IP source address was connected with the destination address in r-th session.
- $ST(i) = \{1,2, \dots, I_T(i)\}$ – set of the ordered numbers of moments, when i-th IP source address was connected to the destination address.
- IC_{max} – the number of connections generated by the most active source IP address.
- $\bar{C} = \{1,2, \dots, I_T(i)\}$ – set of ordered numbers of subsequent connections of the most active source IP address.
- Cl – the set of ordered numbers of IP source, which take part in synchronous action.

To increase the speed of the BotTROP algorithm, clusters with only one moment of communication are removed (cluster filtering). Furthermore, source IPs that are exhibiting low activity are also removed (source IP filtering). Test shows that cleaned data sets help to reduce the number of false positives and false negatives classifications. Cluster and source IP filtering are separate algorithms that are also included in the final BotTROP implementation.

For the needs of the Sequential Probability Ratio Testing (SPRT) method we determine values for the parameters: *thr,* θ_0, θ_1, *a, b.* Detailed discussion of this problem is presented by Ostap et al. (2018). Shortly speaking we assume that:

- thr - threshold of similarity between following clusters, where analysed source IPs were connecting to the same destination IP. From research presented by Ostap et al. (2017) results that thr could take value not less than 0.5.
- we consider the hypotheses:
  - H_0 – the analysed source IPs do not belong to the botnet,
  - H_1 – the analysed source IPs belong to the botnet.

$IC_{max} := \max_{i \in SIP} I_T(i)$ and $I_{max} = arg \max_{i \in SIP} I_T(i)$
$SourceIPFiltering()$
forall $c \in \overline{C}$ **do**
  $CreateSet(cluster) : C(c)$;
  $C(c) := \{I_{max}\}$;
end
; /* Source IP Clustering process */
forall $i \in SIP$ **do**
  forall $r \in ST(i)$ **do**
    $C(m) := C(m) \cup \{i\}$ where:
    $m : \left|t_r(i) - t_m(I_{max})\right| = \min_{n \in Cl} \left|t_r(i) - t_n(I_{max})\right|$
  end
end
$ClusterFiltering()$
; /* The process of verification if analyzed network flow is synchronous */
$Cl := \{I_{max}\}$;
$\overline{S}_{cos} = 0$;
forall $c \in \overline{C} \setminus \{IC_{max}\}$ **do**
  $S_{cos}(c) = \frac{\left|C(c) \cap C(c+1)\right|}{\sqrt{\left|C(c)\right|} \cdot \sqrt{\left|C(c+1)\right|}}$
  $\overline{S}_{cos} := \overline{S}_{cos} + S_{cos}(c)$;
  $Cl := Cl \cup C\{c\}$;
  $\overline{S}_{cos} := \frac{\overline{S}_{cos}}{IC_{max}-1}$;
  $Y_c = \begin{cases} 1 & \text{if } S_{cos}(c) \geq thr \\ 0 & \text{if } S_{cos}(c) < thr \end{cases}$
  $\Lambda_c := \frac{\theta_1^{K_c} \cdot (1-\theta_1)^{c-K_c}}{\theta_0^{K_c} \cdot (1-\theta_0)^{c-K_c}}$, where:
  $K_c = \sum_{n=1}^{c} Y_n$
  if $\Lambda_c > b$ **then**
    $break$; /* Traffic is synchronous */
  end
  else if $\Lambda_c < a$ **then**
    $break$; /* Traffic is not synchronous */
  end
  else
    $continue$
  end
end
if *(SPRT was not able to take a decision)* **then**
  $\overline{S}_{cos} := \frac{\overline{S}_{cos}}{IC_{max}-1}$;
  if $\overline{S}_{cos} \geq thr$ **then**
    $break$; /* Traffic is synchronous */
  end
  else if $\overline{S}_{cos} < thr$ **then**
    $break$; /* Traffic is not synchronous */
  end
  else
    $continue$
  end
end

- We are using following notations:
  - $\theta_0 = P\{Y_r = 1|H_0\}$
  - $\theta_1 = P\{Y_r = 1|H_1\}$
- α - the maximal value of false positive rate (the type I error rate or significance level)

- β - the maximal value of false negative rate (the rate of the type II error)

It means:

- $P\{rejection\ H_0|\theta_0\} \leq \alpha$
- $P\{rejection\ H_0|\theta_1\} \leq \beta$

Values of α and β are determined by the analyst. In our analysis we assume that α = 0.05 and β = 0.1. Furthermore, parameters a and b of SPRT method are determined as follows:

$$\alpha = \frac{\beta}{1-\alpha}\,;\, \beta = \frac{1-\beta}{\alpha}$$

The interpretation of the algorithm steps

The Figures below present the preparation for the clustering process of the one destination IP (organization IP range). All the source IPs which were connecting to the analysed destination IP are on the vertical axis and moments when the connection took place are on the horizontal axis. The crosses represent the moments when every source IP sent an initialization packet (SYN) to the analysed destination IP.

All information necessary for the clustering process can be gathered with any kind of network sniffer such as tcpdump or wireshark. At first initial number of clusters is calculated (IC_{max}). It is equal to the highest number of connections from source IPs to the analyzed destination IP. The most active source IP denoted as I_{max}. Figure 2 presents the process of the calculation of the initial number of clusters.

Fig. 2: The calculation process of the initial number of clusters.

The most active IP is denoted with an oval and based on its connection number the same number of clusters will be created. During the next step, all connection moments of every source IP are compared with the connection time of the IP on which clusters were created and assigned to the cluster whose connection time is most similar.

To increase the speed of the algorithm we delete low active source IPs (source IP filtering) and clusters with only one moment of communication (clusters filtering) to reduce the data bulk. They also improve results and decrease false

positives and false-negatives classifications. The source IPs filtering method distinguishes xlegal and malicious traffic by using the K-means clustering method. Figure [3] presents the filtering process.

Fig. 3. Cluster filtering process.

When clusters are prepared, Sequential Probability Ratio Test (SPRT) is used to determine if the analysed traffic is synchronous or asynchronous. Based on groups activity, presented method can detect even an unknown botnet and it is able to identify not only communication between C2 and an infected host but also working activity such as SPAM and DOS attacks.

Case Study

In order to verify the properties of the BoTROP method, extensive research was conducted. Its aim was to verify the ability to detect new, previously unknown botnets and to compare the quality of the method with other methods in this category (Network-based, Passive analysis, detection of anomalies with implemented clustering/clustering techniques). The comparison also took into account the limitations of the methods due to the communication protocols used by botnets.

The Measurement Method

The tests were performed using two groups of data:

- Real-life network data such as:
  - Computer networks traffic of the Military University of Technology in Warsaw, Poland.
  - Traffic generated by real-life malware and registered in the Czech Technical University in Prague during a project The Malware Capture Facility Project (MCFP).
  - Network traffic generated by Powershell Empire and Twit-terBot.
  - Network traffic generated by a botnet simulator and legal network traffic simulator.
- Network-traffic generated by legal and botnet traffic simulators.

The first group of data was used to verify BotTROP's ability to detect previously unknown botnets. The second group was used to verify the quality of the BotTROP method and to compare this method with the method of the same category - BotGAD. In both cases BotTROP correctly classified mentioned traffic as malicious and was able to distinguish it from legal network flow. The figure 4 presents the simplified scheme of the experiment. The results gathered from the test with MCFP project were presented by Ostap et al. (2018) as well as the experiment with Powershell Empire and TwitterBots. Furthermore, the implementation and the environment of the TwitterBot and Powershell Empire was also included in the mentioned publication.

Fig. 4. The simplified scheme of the experiment.

All data sets, listed above, were mixed together and examined by BotTROP and BotGAD simultaneously as shown in the picture below. To compare the results with third party mitigation techniques, all results were verified using services listed below:

- VirusTotal - an internet service that allows you to scan in- dividual files and present the results of finding out possible infections with malware.
- HybridAnalysis – free malware analysis services established by Payload Security. These services allow to submit potentially malicious files and analyse them using static and dynamic methods. All results are presented to the user.
- Google Safe Browsing – it is a blacklist service powered by Google that contains information about malware or phishing content. Browsers such as Firefox, Chrome, Safari use this service for checking pages against potential threats before displaying malicious content to the user.

The dissertation of Ostap (2020) presents a full description of the experiment and its results. Due to the limited number of pages, this paper contains only the most important results of the studies.

Description of the dataset

The data set used for this research was captured from the real life network used in previously mentioned Polish university. It contains only all outgoing SYN-packets from the internal network to the destination IPs. This type of packets represent the willingness of the source IP to connect to the destination IP and according to the Mohammadi et al. (2019) and Khurum et al. (2019), SYN packets are sufficient to make a final decision if connections are made synchronously or not. By limiting the number of captured network traffic, the algorithm is able to serve final results much faster.

The packets were captured using port mirroring on the last router before the router of the ISP (Internet Service Provider). Due to security reasons packets were also captured before the main firewall. The process of monitoring and gathering network traffic took 2 weeks. During this period of time, we also launched Powershell Empire commonly used by Red Teams and APT actors like FIN7, APT10, APT29 (Cimpanu 2019). The C2 of this project was established on the VPS with public IP outside the private network and client software was installed on the several PCs in one of the classrooms. One of the most valuable features of PSE is the opportunity to choose jitter - the parameter that allows to randomize connection delays between the client and PSE C2. The main goal of including Powershell Empire in this research was to present that even changing the jitter parameter BotTROP is still able to detect synchronous action. The captured network traffic contains also all packets generated for the need of the Powershell Empire botnet. This open-source project was used only for 2 days due to security reasons. Table [2] describes captured network traffic in more details.

Table 2: The details about the network traffic from MUT.

Parameter	Value
Number of all packets	135 M
Number of PSE packets	58 437
File size	11 GB
No. of unique destination IP	98 117

Results of the experiment and interpretation thereof

Final results contains 49 (including PSE C2) destination IP addresses that where used by source IPs in a synchronous manner which was pointed by the SPRT method and their cosine similarity factor was greater than 0.5. Results are presented in table [3]. The thir- teen destination IPs were also labeled as malicious by third-party vendors (VirusTotal, HybridAnalysis and GoogleSafeBrosing). To avoid legal consequences only those IP are publicly accessible, oth- ers, not detected by other malware detection system, are presented with labels.

The columns of the table [3] with final results have the following meaning:

- IP - destination IP address that was used in a synchronous manner
- BotTROP ACS - contains Average Cosine Similarity. This factor is calculated as follows: cosine similarity factor is measured for each day separately, then the value is averaged after all days.
- SPRT - the number of days when the network flow was iden- tified as synchronous by the SPRT method (network was monitored for 14 days. It is typical for universities that the number of working PC is smaller during the weekends, more- over the number is also smaller during the nights. This is the main reason why synchronous activity is equal 0 during weekends.
- BotGAD - for comparing purposes, this column contains average cosine similarity calculated by the BotGAD method.
- Third-party vendors - the number of identified unique malicious software/campaigns linked to the analyzed des- tination IP. Rows where IP is labeled as "MS" means that it was used to host malicious site.

Table 3: The final results

No	IP	BotTROP (ACS)	SPRT per day	BotGAD	Third party vendors
1	Hidden-IP-1	0.98737	14/14	0.00047	0

All 49 destination IPs were labeled by BotTROP due to synchronous communication pattern. PCs with source IPs sending packets to them in a synchronous manner. The protocol used for communication purpose in most cases was HTTP(port 80) and HTTPS (port 443). There were also 3 IPs (165.227.63.195, Hidden- IP-28, Hidden-IP-27) where an unknown protocol was used on port 81. HTTP(80) and HTTP(443) are commonly used by attackers due to the fact that administrators don't block this port as it is needed to connect with the Internet. Moreover, visual representation of the analyzed network traffic in Figures [7][8][9] reveals equal delays between clusters and malicious symptoms such as network flow grouping. The thirteen destination IPs addresses presented in Table [3] (rows:2,6,19,21,23,26,27,29,30,35,37,40,46) are also recognized as malicious by third party services mentioned above and two of them are labeled as phishing sites. What is worth underlining is the fact that only about 30% of all identified IPs are detected as malicious by third-party services(HybridAnalysis, VirusTotal, GoogleSafeBrowsing). The SPRT method was able to identify the whole PSE traffic for all 2 days (because of the security reason Powershell Empire was running only for 2 days).

BotGAD was able to identify only 3 destination IPs which are used in a synchronous maner under the same circumstances as BotTROP. It is also worth underlining that BotGAD was not able to detect Powershell Empire C2. It may be caused by a wrong time-window parameter setting. Based on the presented results we can tell that the effectiveness of the BotTROP method does not depend on the time-window parameter.

Due to the fact that BotTROP was able to identify synchronous network communication to 13 well known malicious IPs and 36 (including PSE C2) to unknown destination IPs, it could be con- firmed that the presented method has the ability to detect unknown synchronous communication. It is also worth mentioning that some of the detected IPs could belong to well known vendors for example as a download center of updates for Windows or a new Antivirus signatures center. Communication for such purposes could be also synchronous. To avoid such false-positives it is necessary to include a kind of white-list that will be fitted to the needs of a particular internal network. From our point of view it is necessary to treat IPs detected by BotTROP as potentially malicious and require fur- ther action if they belong to well know organizations. There are examples where a botnet was using Twitter servers as its C2. In the future also Youtube or Instagram could be used in malicious ways. Due to this reason all IPs that belong to services where users are able to add some content in it should be treated as potential threats, of course if network traffic generated to them is synchronous.

To compare the functionality of BotTROP and BotGAD, accu- racy function and false-positive rate function have been calculated based on the false-positives, false-negatives, true-positives and true- negatives indicators. The comparison was prepared for BotTROP and BotGAD with four different time-window parameters.

The diagram presented in Figure [5] compares accuracy for the value of threshold between 0 and 1. Threshold means a minimal value of cosine similarity factor, above which compared methods treat analyzed traffic as synchronous (BotTROP and BotGAD with different Time Window parameters).

Fig. 5: Accuracy function for all the analyzed methods.

Fig. 6: The false-positive rate for all the analyzed methods.

It is shown that the BotTROP method is the most accurate method for botnet detection from all the tested methods. Its accuracy is equal to 1 for thresholds from 0.53 to 0.73. The minimal value of threshold where FPR and FNR are equal to 0 for BotTROP is also an optimal solution. BotGAD with a 60s. time window is also very accurate but only when the threshold is between 0 and 0.57. Because of this threshold this method is unusable in real life. Based on the picture below, one can say that accuracy of the BotGAD-1800 is efficient, however its accuracy comes from the very long Time Window parameter where a lot of traffic is combined. All of the above makes the BotGAD method very vulnerable to FPR.

False-positive rate presented in Figure [6] reveals that high values for BotGAD (especially for time-window =1800) in the whole range of threshold variability, reduce the prognostic capabilities of this method. Moreover, this figure also proves that the BotTROP method has very low false-positive rate when threshold is above 0.5.

Detailed view of the one of the malicious IPs

The following subsection contains a detailed presentation of one of the malicious IPs identified by BotTROP. During the survey Author- sPublications software implementation of the BotTROP algorithm was made. The implementation include the following functionali- ties:

- analysis of accumulated traffic using BoTROP method,
- additionally, for the comparison purpose, method BotGAD was also implemented,
- graphical representation of the results obtained,
- comparison of the results with three commercial solutions for malicious motion detection.

Presentation is made using the BotTROP software used during experiment. The public IP 172.217.16.46 was also identified by third- party software as malicious. Hybrid-Analysis lists 185 different malicious activities that were linked with this public IP. This address was also used as a malicious site and the drop zone for trojans based on JAVA. BotTROP identified synchronous activity for 11 days out of 14 days of monitoring time. Cosine similarity was quite high, it was equal 0.62157. The number of internal devices that were connecting to this C2 amounted to 240. All graphics comes from the software implemented for the needs of the BotTROP algorithm. Figure [7] presents a graphical representation of the network traffic to this domain, this graph is also helpful for an analyst in making a final decision because it is easy to spot group activity in similar moments.

Fig. 7: The network flow directed to the IP 172.217.16.464.

The horizontal axis denotes times of connection and the verti- cal one contains the source IP addresses. Red dots represent the connection time that belongs to the most active source IP. Blue dots denote a connection to the selected destination IP from an IP addresses that belongs to the analyzed network. The white lines represent borders between subsequent days.

Cosine similarity factor for each day separately is shown in Figure [8]. The horizontal axis shows days and the vertical axis average cosine similarity. Blue dots denote that network traffic was labeled as legal by the SPRT algorithm, the red one means that the traffic was synchronous that day.

Fig. 8: The cosine Similarity factor per day for 172.217.16.46.

Average cosine similarity stays on a high level most of days in- cluding the SPRT results. This graph underlines that this particular destination IP was used in a synchronous manner.

A graphical representation for the cosine similarity factor be- tween the following clusters is presented in Figure [9]. There are situations where neighboring clusters differ a lot between each other. The horizontal axis denotes subsequent clusters and vertical one value between them. It can be spotted that most of similarities' values are higher than 0.7, which may indicate malicious activity. As we can seen a high level of cosine similarity is mostly equal for the whole monitoring time. Those three graphical representations prove that this public IP was also used in a synchronous manner.

Fig. 9: The cosine Similarity for the following clusters for IP 172.217.16.46.

The summary

There a lot of different botnet detection methods but most of them are not efficient against unknown threats, moreover most of them are able to detect a botnet based only on a specified protocol. The algorithm described in this dissertation is an attempt to change this situation and make networks more secure. BotTROP, just like BotGAD, identifies not only well-known botnets (which was proved in experiments with Powershell Empire, Neris and others) but also unknown threats (for example TwitterBot based on social networks, which was implemented for the needs of the survey [AuthorsPub-lication]). It also improves detection of synchronous activity via different protocol.

The aim of the presented experiment was to verify the ability of the BotTROP method to detect known and unknown botnets and to analyze any communication protocol. We also evaluate the quality of the BotTROP method and compare it with the quality of the BotGAD method – the results are presented in table [3]. All the results prove that BotTROP is a very efficient method for botnet detection of any kind, no matter the protocol or architec- ture. It is very important to underline that the role of the BotTROP method is to identify synchronous activity which in most cases takes place in malicious network flow. Implementing a white list where synchronous activity is also spotted, for example during system upgrades can help to decrease the number of false nega- tives and false positives rate. Presented results also reveal that the BotGAD method is very dependent on the time window parameter, which is one of its biggest disadvantages. This makes the method unusable against unknown botnets because it is necessary to set up a relevant parameter for communication sessions with its C2. The BotTROP method is independent of Time Window parameters and can be used efficiently even against unknown - malicious or legal - network traffic, which in turn makes it possible to identify an unknown botnet. It is possible to use the BotTROP method in a production environment without any modification but there are a lot of improvements that are going to be made in the nearest future, for example on-line monitoring with graphical representation.

In order to use BotTROP in a working network, it is only neces- sary to provide its traffic for analysis. Currently work is underway on the possibility of an on-line analysis without the need to collect the analyzed network traffic. Afterwards, all the collected network traffic is analyzed by the BotTROP algorithm, and the administrator has the possibility to verify the cosine similarity for each destina- tion address and a preview of which hypothesis was adopted by the SPRT method.

The experiment helps us to observe that there are situations in which legal users generate synchronous traffic, for example to Facebook or Twitter servers during very important events such as football world championships or significant political events. All posts and comments written during such events are generated with high intensity, therefore this kind of network traffic is recognized as a synchronous action. Despite this, even in such situations cosine similarity factor never exceeds level of 0.5. During the research even more intense legal network traffic never exceeded 0.5.

Abstract

The public health crisis is also a socio-economic crisis, showing deep inequalities between people in different areas of life. It particularly highlighted the weakness of health and social security systems. What's more, the COVID-19 pandemic has shown that the virus is cross-border and we are all treated equally regardless of gender, race or religion. The priority is global, international solidarity as a sine qua non for an effective response to the threats generated by the pandemic. The COVID-19 pandemic has shown that the Council Of Europe (CE) goes far beyond the area of merely providing an abstract European constitutional identity and alerting when Member States seem to depart from it significantly. The activities of the CE also include promoting the convergence of legal systems relating to respect for human rights, which at the same time set another key goal, namely, the direction towards the implementation of human rights standards e.g. in medicine and other sphere.

Keywords: Human Rights, Council Of Europe, Health Care Crisis, European Convention On Human Rights, WHO

Introduction

The public health crisis is also a socio-economic crisis, showing deep inequalities between people in different areas of life. It particularly highlighted the weakness of health and social security systems. What's more, the COVID-19 pandemic has shown that the virus is cross-border and we are all treated equally regardless of gender, race or religion. The priority is global, international solidarity as a sine qua non for an effective response to the threats generated by the pandemic.

As we note, health care systems relating to both the public and private sectors have found themselves in an unprecedented situation since the emergence of the epidemiological threat related to the Covid-19 coronavirus in Europe. The situation is so specific that although the discussions on medical ethics, public health ethics, medical law and health protection law differed in many respects, they have recently faced similar problems. In the aforementioned areas, not only is the problem of maintaining public confidence in one's actions and implemented policies noticeable, but also strictly systemic aspects of legal inconsistency in a given matter have been exposed, which makes the health care system highly unstable.

The crisis has become global in this context. The inefficiency of the health service intensifies growing fears and increased suspicion of patients towards actions in the field of state health policy.

Losses of public confidence generating the fears and concerns of the "risk society" have traditionally focused in particular on the threats of medicine and genetic technologies in the bioethical sphere. In the current situation with which we are dealing, anxiety relates to the possibility of losing control over access to health care, obtaining certain medical services, and even complete lack of access for patients belonging to the so-called difficult cases.

Moreover, fear is generated from both sides, including doctors who point out that in an epidemiological emergency there may be more cases of medical errors and adverse events. On the part of patients, in the face of

Cite this Article as: Daria Bieńkowska " The Metter of Human Rights in The Contemporary Health Care Pandemic Crisis: Council of Europe's Human Rights Standards" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

the paralysis of not only the health care system, but also the justice system, postponing court hearings (in this case concerning medical errors), difficulties arise in asserting the protection of their rights. It is right to ask questions about solutions to critical issues that will be shown by the tools to break the deadlock.

The Importance of Human Rights

Human rights in this context are of key importance as they place man, his life and dignity in the center of attention. They become an effective tool for shaping appropriate solutions in the fight against the crisis, based on respect for the most important rights and values for human beings, while respecting the principle of sustainable society, development and respect for peace. The international community of ius commune of human rights in the fight against the crisis is based on three objectives: ie 1. to strengthen the dynamic effect of the response to an immediate global threat to health; 2. to mitigate the impact of the crisis on people's lives; 3 avoid escalation and not aggravate existing problems[1].

.

When observing the pandemic situation in which one can notice human rights disregard (such as those relating to the Covid-19 pandemic), there is a well-founded fear that the nation-state is not a space for the protection of human rights. Of course, at the level of assumptions and positive law, it can be assumed that nation-states with exposed democratic principles respect human rights in their assumptions. At the same time, we are aware that positive law does not keep pace with the changing reality and the most important in terms of respect for human rights, policy of application and enforcement of human rights law are the institutions that apply the law, developing certain standards in the field of human rights in the medical sphere of interest to us.

The COVID-19 pandemic has shown that the Council Of Europe (CE) goes far beyond the area of merely providing an abstract European constitutional identity and alerting when Member States seem to depart from it significantly. The activities of the CE also include promoting the convergence of legal systems relating to respect for human rights, which at the same time set another key goal, namely, the direction towards the implementation of human rights standards in medicine, and in other sphere. The CE as the largest pan-European Human Rights Organization with its human rights standard laid down in the ECHR.

On April 7, 2020, the Secretary General of the CE (hereinafter referred to as SGRE), Marija Pejčinović Burić, handed over to all 47 Member States an information document on respect for human rights, democracy and the rule of law during the pandemic COVID-192. The SGRE document indicated that the specified in Article 2, 3, of the ECHR - The right to life and the prohibition of torture and inhuman or degrading treatment or punishment are among the most fundamental provisions of the European Convention on Human Rights. Importantly, the articulated rights and freedoms are not derogatory. In other words, the rights and freedoms are protected at all times and in any situation, even in the event of a threat such as the COVID-19 pandemic. The Council of Europe recalls that under all circumstances, Strasbourg's fundamental standards for the protection of human rights and freedoms must be kept in mind.

The right to life, resulting from Art. 2 of the European Convention on Human Rights is a provision of special importance. The right to life is first and foremost an integral part of fundamental human rights and the systems upon which they stand. It provides for the legal protection of life, which cannot be waived. Although it is not absolute, the deprivation of life falls within the limits provided for in the article, if it occurs as a result of the absolutely necessary use of force in the cases provided for in article 2 clause 2 of the Convention. It should be noted that this is a closed catalog and it is subject to strict interpretation. the state's obligation to protect life. According to Art. 2 of the Convention, in connection with the general obligation of the state under Art. 1 of the Convention „to ensure to everyone subject to [his] jurisdiction the rights and freedoms set out in (...) the Convention”3 implicitly lays down requirements relating to the right to a fair trial, the right to an effective and official investigation in whenever there is a reasonable suspicion that the person died as a result of doubtful circumstances. By undertaking the exegesis of Art. 2 of the Convention indicates premises which quantify the effectiveness of an investigation. The basic principle in this respect is to entrust the investigation to persons who demonstrate responsibility, independence and impartiality with regard to law and practice (Schabas, 2015).

Another principle is the measure of the effectiveness of an ongoing investigation. Successful in this case means that the investigations in question led to the identification and punishment of the guilty. „It is the authorities that must take the reasonable steps at their disposal to preserve evidence relating to the incident, including, but not limited to, eyewitness and forensic evidence. The conclusions of the investigation must be based on a thorough, objective and impartial analysis of all relevant elements. Any deficiency in the investigation that undermines its ability to ascertain the circumstances of the case or the person responsible compromises the required measure of effectiveness”4.

Moreover, the Tribunal points out that whenever the state fails to provide its citizens with proper protection of the right to life under Art. 2 of the Convention, it can be said that the protection granted by national law to citizens is only a theoretical declaration. The state under Art. 2 of the Convention, the obligation is to take effective action immediately, in order to quickly recognize and consider the case without undue delay. In the issue under consideration, it draws attention to the fact that, by interpreting individual judicata, the Tribunal indicates that the procedural obligation imposed on the state with regard to the effectiveness of the investigation and resulting from 2 of the Convention became an independent obligation.

In the light of the analyzed matter, it is necessary to focus on the wording of the first sentence of Article 2 § 1 of the Convention, according to which the state is bound by an order not only to refrain from deliberately and unlawfully taking life, but also to take all appropriate steps to protect the lives of people within their jurisdiction. Thus, both Article 2 of the Convention and the Court's case-law underline the fundamental obligations of the State to safeguard the fundamental right to life by establishing effective criminal provisions to stop the commission of crimes against the person. The practical dimension of these obligations boils down to organizing appropriate judicial institutions to prevent, fight and punish perpetrators who have violated the above provisions. It also extends to identifying the circumstances in which public officials will be required to take preventive operational measures to protect a person whose life is threatened by the criminal acts of another (Schabas, 2015).

Moreover, in its jurisprudence, the European Court of Human Rights has repeatedly emphasized that the state has a positive obligation to protect persons covered by state care against terminal diseases and the suffering resulting from tchem5. For example, reference should be made to the judgment of the ECHR of October 23, 2018, in which the Court ruled on the complaint of Turkish citizen Elvan Alkan, pointing out that medical negligence constitutes a violation of human rights, in this case Art. 8 of the European Convention for the Protection of Human Rights and Fundamental Freedoms (ECHR). This ruling confirms that the ECHR is a living instrument primarily used to implement the pursuit of one's rights by an individual, which is part of the process of judging human rights, which means that „the possibility of pursuing an individual's rights in court has become their constitutive element" (Bodnar, 2019). The judgment draws attention to the constantly expanding scope of Art. 8 of the Convention.

By analyzing the jurisprudence practice in the context of medical negligence in the most complaints in this scope were assessed by Tribunal, in the regime of Art. 2 of the Convention (i.e. the right to life) or Art. 3 of the Convention (i.e. prohibition of torture and degrading treatment). The ruling in question is against this peculiar novelty, as the jurisprudence of the Tribunal indicates that violations art. 8 of the Convention referred mainly to the situation of obligations states to introduce regulations imposing an obligation on doctors informing patients about the effects of the medical intervention they had enable patients to make informed consent to the proposed service medical. When examining the present complaint, the Court decided that it had at its disposal Art. 8 of the Convention includes the length of proceedings in a situation where the applicant subjected to unjustified physical and existential suffering (Bieńkowska, 2020; Alwan, Burges, Ashworth, Beale, Bhadelia, Bogaert et al).

At the same time, the Tribunal indicated that, in accordance with settled case law, it was physical the integrity of the person undoubtedly falls within the concept of "private life"

within the meaning of Art. 8 § 1 of the Convention. Private life is the broadest and most

diversified sphere subject to protection in the context of the analyzed Art. 8 of the Convention. It is understood as the freedom of the individual to shape his life relating to independence in one's choices and autonomy in making decision14. In turn, personal autonomy is the cornerstone „The grounds for interpreting the guarantees contained in Art. 8 of the Convention" (Nowicki, 2005, p. 160), which results in the recognition of independence by right. Undoubtedly, this is an imperative to respect human dignity, it was binding the institutional and source guarantee of human subjectivity. It is peculiar the legal and ethical imperative that every human being is someone, not something. Such a broad understanding by the Strasbourg jurisprudence of "private life" it involves providing the individual with some basic sphere of privacy (autonomy), protected - as far as possible in modern society - against public or private outside interference (Schabas, 2015). At the same time it returns attention to the fact that the Tribunal reiterates that the obligations arising from Art. 8 in the large to a degree coincide with the obligations contained in Art. 2 of the convention.

Prohibition of torture and inhuman treatment

In the context of the prohibition of torture and inhuman treatment, it should be noted that each of the Member States bound by the obligations arising from the Convention is obliged to treat persons deprived of their liberty with dignity, which is also related to the fact that individual states must provide persons deprived of their liberty an appropriate level of medical care. It should be noted that in accordance with Art. 3 of the ECHR, the prohibition of torture is contrary to human nature and the above-mentioned human dignity. This article is absolute, which means that actions by state authorities that may be perceived as torture and inhuman treatment are not justified under the Convention.

For this reason, due to the pandemic situation, the European Committee for the Prevention of Torture (CPT), on March 20, 2020, issued a Declaration on the principles relating to the treatment of persons deprived of their liberty in the context of the COVID-19pandemic[6].

The CPT reads that currently, in the COVID-19 pandemic situation, the CE and individual Member States face the challenges of creating appropriate conditions based on human rights standards in detention facilities. Consequently, the CPT of the Declaration has outlined guidelines that apply to the relevant authorities responsible for persons deprived of their liberty.

In these guidelines, it was indicated above all that the focus should be on ensuring the highest level of safety for inmates by taking all possible measures to protect health. In addition, it is recommended that you follow the WHO guidelines to combat the COVID-19 pandemic. WHO among others, highlights the importance of integrating a human rights based approach in response to COVID-19. It provides key considerations in relation to addressing stigma and discrimination, prevention of violence against women, support for vulnerable populations; and restrictive measures and shortages of supplies and equipment. It also highlights human rights obligations with regards to global cooperation to address COVID-197. Thus, the recommendations issued by specific health care institutions in a given country should be followed, which should be in line with international standards.

In addition, the CPT Guidelines state that staff who deal with detainees should be provided with adequate support, both mentally and physically, in relation to health care provided by Covid -19. The Committee further concluded that it must be ensured that any restrictive measures taken to prevent the spread of COVID-19 to persons deprived of their liberty have a legal basis and are necessary, proportionate, guaranteeing human dignity and of a limited duration; provide such persons, in a language they understand, with comprehensive information on the procedures undertaken, and make concerted efforts to extend the use of alternative measures to imprisonment - especially in overpopulation situations; make greater use of alternatives to pre-trial detention, conversion, early release and suspended sentence; verifying the need for patients in psychiatric hospitals located there without their consent; dismissal of residents of social welfare homes and refrain, as far as possible, from detaining migrants[8].

It should be noted that among those deprived of liberty there are also vulnerable groups or risk groups. Such groups include, first of all, the elderly and people with pre-existing diseases, therefore they should be provided with increased protection and attention due to their health condition. Correlations of these guidelines can be found in the WHO recommendations mentioned above, which read as follows „The threat and experience of COVID-19 occurs differently for different groups. According to current guidance, the health risk from COVID-19 to older adults and people with certain pre-existing conditions is considered to be greater than that of the general population. Nowadays even within these vulnerable groups there are differences that would benefit from a human rights lens. People of all ages, however may have greater vulnerabilities to COVID-19 depending on their living arrangements, financial instability and lack of specific safeguards impacting their risk of infection, such as persons with disabilities, people who are homeless, refugees, migrants, and prisoners. COVID-19 has revealed a unique ecology of sickness based on social determinants of health, which requires attention. These groups are among the world's most marginalized and stigmatized. The Universal Declaration of Human Rights states, <<All human beings are born free and equal in dignity and rights>>, and it is the dignity and rights of those most vulnerable that requires additional attention in COVID-19 response"[9].

Above all, it is recommended that all states of the Council of Europe respect the fundamental rights of those who are deprived of their liberty during a pandemic. At the same time, it should be remembered that people deprived of their liberty must be properly treated, as these are groups exposed to all kinds of violence. Consequently, CPT points out that always and under all circumstances fully comply with the basic safeguards against mistreatment of persons under the supervision of law enforcement officers (access to a lawyer, access to a doctor, notification

of arrest), with the necessary additional precautions, such as, for example, mandatory protective masks, and guarantee uninterrupted access to independent monitoring bodies (national preventive mechanisms, CPT) all places of detention, including places where people under quarantine are present[10].

Conclusions

The COVID-19 pandemic has highlighted the problems with respecting human rights not only in Europe but also around the world. For this reason, the initiatives taken in the form of the Guidelines of the Council of Europe remind us that only in the spirit of solidarity and sensitivity to other people is it possible to secure fundamental human rights. Human rights standards can serve as a tool to meet the challenges, opportunities and needs in the fight against COVID-19. First of all, in the spirit of respect for life and dignity for every human being, the actions of decision-makers in the prevention and fight against the virus should be aimed at reconstructing human relationships, mutual trust, and ultimately achieving global stability.
