Trust creates a climate conducive to information exchange, sharing ideas, and therefore innovation. It can also be a factor that will be crucial for implementing innovations. Research indicates a positive relation between trust and innovation (Barney and Hansen, 1995, Walecka-Jankowska, 2015). Research of Walecka-Jankowska (2011) indicate the highest impact of trust based on identification. It can be noticed that trust based on a deterrent factor and risk calculation results from formal security measures, and therefore limiting the freedom of employees will not be conducive to innovation. Trust based on knowledge and identification allows for faster adaptation to changing conditions, increases flexibility of action, and limits the freedom to a lesser extent. At the same time, it reduces control, which allows the flow of information that is necessary to integrate different points of view and create new ideas. In the literature it is said that trust is the foundation to sustain innovation processes. Its lack discourages innovative activity. (Sankowska, 2011). Some authors believe that the best premise for creating innovation in an enterprise is the level of trust in the organization (Spitzer, 2007). PricewaterhouseCoopers research also shows that trust is the first factor that distinguishes innovators from the least innovative enterprises. (PWC, 2017). Moreover, trust is seen as an element of social capital (Coleman, 1998; Fukuyama, 1995), which influences the more effective implementation of organizational goals by enabling cooperation, decision making, motivating and connecting people (Grudzewski, et al. 2009).

Due to trust, the parties often give up additional security or detailed contracts, which gives greater flexibility of cooperation. Such connections were investigated by S. Herting, who confirmed that there is a statistically significant correlation between trust and organizational innovations. The author of H. Herting and J. Barney suppose that imputed trust is weakly related to innovation. Because trust based on economic calculations is weak (it relies on security measures that have a negative impact on the freedom to cooperate and thus significantly hinder innovation). Only with medium or strong trust is it possible to achieve a competitive advantage of the enterprise. (Barney, Hansen 1995). Enterprises operating at higher levels of inter-organizational trust, characterized by such features as the aforementioned tendency to trust, self-credibility and adherence to informal rules and standards of operation, achieve better results in the field of innovation"(Grudzewski, 2008).

When there is a high degree of trust, employees can be honest, authentic and open. They can count on mutual professional and personal support. They share their ideas and communicate openly. Trust, openness and a sense of security can stimulate nonconformist behavior in which the employee decides to express his opinion directly, or even to question certain assumptions (Lane, 1998; Wilson and Kennedy, 1999). It is possible when he is not afraid of sanctions from the superior. Openness of the management to the initiative and reporting of employees, as well as placing their trust in them, triggers their involvement, and thus creates fertile ground for the creation of unique innovations. A manifestation of the company's openness is also the readiness to absorb information, communicate with the environment, and focus on the customer. " (Wojtczuk-Turek, 2012). P. Sztompka (2005) is of a similar opinion, pointing out that individual cases of aggregate trust lead to increased mobilization, activity and innovation. Organizations that are trusted by their buyers have the opportunity to sell more product categories, and often for a higher price. Introducing radical innovations and a new assortment will be burdened with a lower risk of lack of interest on the part of buyers (Grudzewski, et al. 2009).

Trust within an organization promotes innovation also thanks to the fact that it enables the creation and functioning of organizational structures that favor the emergence and implementation of innovations. K. Bleicher (1991) believes that the trust that is placed in the members of the organization creates an organization of trust that aims precisely at innovation. The opposite is the distrust organization which combats the weaknesses of the individual thanks to a mechanistic-technocratic structure, also exhibiting the characteristics of an ideal bureaucracy. P. Bourdieu and J. D. Wacquant (1992, p. 119) indicate that for trust it is very important to build a permanent network of relations, more or less institutionalized, of mutual knowledge and recognition. P. Sztompka (2007), however, notes that not every network of relationships constitutes social capital. The network imposed by connections in a bureaucratic organization does not create conditions conducive to innovation. This means that only a bottom-up, voluntary and spontaneous network of relationships creates an element of the trust organization, enabling employees to access the resources of other people in the organization. The final hypothesis adopted in the research is: The higher the level of trust in an organization, the higher its innovativeness.

The problem of the relationship between trust and innovation can be expanded not only by focusing on the level of innovation, but also looking at the stages of the innovation process. If we take into account the Tidd and Bessant model (20018), a detailed analysis of the stages can be carried out: information gathering, idea section (opportunities

should also be consistent with the overall strategy of the organization and built in those areas of technical and market competences in which the company operates efficiently), idea implementation (production) and discounting of value, e.g. in the form of market success, increased market share, cost reduction or in the case of social innovation - changing the world. It seems that at each stage, trust based on identification (the strongest one) will be important as it allows ideas to be freely discussed and shared. Especially in the phase of creating and selecting ideas for implementation, because choosing from the numerous technology and market opportunities is extremely important. However, if the organization has not yet achieved the highest level of trust, relying on trust in the knowledge or experience may prove to be sufficient (eg in the information gathering phase). The implementation and production phase, as a more formalized and procedure-based phase, may also be based on weaker levels of trust.

It seems that the higher the level of trust should lead to the higher the level of innovation. However, too high trust level can lead to a soft, effortless behavior - with the increase in mutual trust, innovation increases, but only to a certain point and then decreases. There seems to be an optimal point above or below which creativity is hindered (Bidault, 2010).

Research Results

In order to examine the relation between the types of trust (taken after Lewicki and Bunker, 1995) and the organizational outcomes, key variables were defined: *trust based on calculation*, *trust based on knowledge*, *trust based on identification* (their names mean saturation with features building a given type of trust), as well as detailed variables referring to the organizational innovation level and stages of innovation process (based on Tidd and Bessant model, 2018): gathering information, verification and selection of ideas, testing and production, discounting. The questionnaire study was carried out covering 60 enterprises (they were different in terms of size, industry and ownership structure). The studies are not representative due to the small sample size. They can be treated as pilot studies. In the future, research should include a larger research sample. All variables were measured, basing on the list of statements according to defined types of trust or organizational outcomes and using a Likert scale. The results of Cronbach's α coefficient measurements indicate rather high internal consistency of the scale and reliability of measurement of particular variables (between 0,502 – 0,958).

In order to analyze the relation between types of trust and stages of innovation processes, an analysis was carried out using the Pearson correlation, as the studied variables have normal distribution. The results are presented in table 3.

Table 3: Relation between the types of trust and innovation and stages of innovation process

		Innovation level	**Gathering information**	**Verification and selection of ideas**	**Testing and production**	**Discounting**
Based on identification (5 items)	Pearson's Correlation	**.325***	.238	.310	.105	.127
	bilateral relevance	.011	.067	.016	.423	.334
Based on knowledge (4 items)	Pearson's Correlation	.180	**.355****	.297	.205	.347
	bilateral relevance	.169	.005	.021	.117	.007
Based on deterrent (4 items)	Pearson's Correlation	.219	- .039	.037	- .071	- .157
	bilateral relevance	.092	.764	.781	.591	.232

Source: own work.

Considering trust based on knowledge, conducted analysis confirmed that there is a positive relation only with innovation, although it must be emphasized that the identified correlation is statistically important, but not very strong.

Also according to the trust based on identification the relation between this type of trust and the first stage of innovation process – gathering information is positive and statistically significant (the correlation is moderate).

Conclusion

Organizations must be creative, because it can ensure the distinction and possibility to earn those, who are willing to pay for having a novelty. Moreover organisations must be innovative constantly, as Craig Wynett (from Procter & Gamble) said - What we've done to encourage innovation is make it ordinary. In world rank – innovation is on the top of the list – that is for the first time that innovations is more important than quality. That shows that direction is changing – wind of change is blowing into new direction, quality is not enough to provide competitiveness.

Research presented in the paper is based on the criterion of origin of relationships, which determines the strength and durability of relationships between individual participants in the organization. In this context, the main research problem outlined in this article was the search for the origin-based type of trust (characterizing by specific durability of the relationship), which would be most conducive to building the organizational innovation level, but it also concentrates on stages of innovation process to be more precisely.

The results of the conducted research show the different impact of particular types of trust on the organizational innovation level, and first stage of innovation process – gathering information. What is surprising that no statistically significant correlations were observed for the other stages of the innovation process.

Level of organizational innovation positively correlates with trust based on identification, the strongest and durable trust. Thus, significant trust resulting from a high level of empathy, care, values shared by partners. Another characteristic of this type of trust is the focus on common tasks rather than individual needs. Every employee is concentrate on innovation as a most important and shared goal and value. Trust based on knowledge is positively correlated with the gathering information. This may be due to the fact that the information gathering process itself is based on facts, information and knowledge. So also trust in this part of the innovation process.

There is a need for in-depth research in the above field. Particular attention should be paid to examining the various stages of the innovation process. Further research could also include other typologies of trust.

Abstract

This article aims to present a methodology to analyze how the image of an area is affected by different branding strategies at the level of entrepreneurs. The first methodology aims to stimulate a brand process in which there are sufficient opportunities for an open debate in the process of developing and implementing a local brand. The second methodology refers to the stimulation of an identity-image match in which the image of the place communicates and reflects the identity of the place. It is assumed that each strategy has a positive effect, the reputation of the place, as well as the immediate positive effects by increasing the adoption of the place brand.
The research will be applied structurally by modeling the equation to the data from the local surveys from Podgoria Dealul Mare, in Romania among the professionals working in the field of marketing and branding. The results will follow if the branding of the area will have direct (positive) effects on the reputation of the place. The indirect effect on the reputation of the site mediated by the adoption of the site brand reduces conflicts between stakeholders. The theoretical and managerial implications are discussed.

Keywords: branding, rural areas, sustainable tourism, the attractiveness of the area.

Introduction

Brand issues are a concept that is increasingly applied at different levels, from entities of different sizes, including retail stores, urban or rural shopping centers and why not regions and nations. Scientific research and economic practice in identifying places to be branded has appeared at a multidisciplinary level: history, geography, economics, computer science, etc.

Specialists separate the two notions, namely the branding of the locality / region and the brand of products and services. (Parkerson and Saunders, 2005), tourist destinations (Avraham and Ketter, 2012); (Benedetti et al., 2011), public policy (Kokosalakis et al., 2006) and local government (Anholt, 2008; Lucarelli & Berg, 2011), urban planning (van Assche and Costaglioli, 2012) and local marketing (Dinnie , 2009) (Kotler and Gertner, 2002).

Branding as an emerging discipline has evolved considerably in the last two decades, especially in terms of how it communicates through messages sent to different segments of the public (Braun et al., 2014).

Cite this Article as: Mădălina ȘERBAN, Maria-Magdalena TUREK-RAHOVEANU, Luxița Risnoveanu And Cristian Silviu Simionescu " Study On Creating A Local Branding Process To Increase The Attractiveness Of The Area" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

Through its applications, marketing at the level of governments and tourism organizations has led to more sophisticated applications, including social media (Braun et al., 2014). Marketing has evolved from an approach based on individual promotion to a strategic and holistic vision of place marketing (Ashworth and Voogd, 1994); (Avraham and Ketter, 2012), (Gnoth, 2002), including the concept of local reputation. At the same time, there is evidence that the failures of the global financial crisis of 2008 could have begun in the local branding community (Eisenschitz, 2010), in terms of doubts about the effectiveness of local branding (Medway et al., 2015).

As the concept of "entrepreneurship" became a business-oriented approach to destinations (Hall and Hubbard, 1996), marketing and branding resulted from corporate branding as a result of people's actions, in terms of their perceptions and image (Kavaratzis and Hatch, 2013).

Of course, there are certain limitations regarding the size of the business either at the level of a city or an area, in the sense of improving their business or the presence of retail stores (Steel and Symes, 2005). Specialists appreciate that there are differences between place brand and place management (M. et al., 2011), (Kavaratzis and Ashworth, 2008).

Material and Method

Branding the area - a matter of local government management

Experiences have shown that local authorities cannot brand their own places. First, they lack the resources to apply and experience all the requirements of brand development and communication. Secondly, the local brand depends not only on the actions of local authorities and the way they communicate, but especially on what happens at the level of private companies, social organizations, residents and visitors. Therefore, like most urban policies, place marking is a matter of management in a network of actors, depending on the contribution of stakeholders to local public issues. (Caloffi et al., 2017)).

The literature emphasizes that these processes must be managed to achieve good results (Klijn et al., 2010), (McGuire, 2006) and (Mcguire and Agranoff, 2011), which makes stakeholder management imperative for branding. site Klijn et al., 2010; (Mcguire and Agranoff, 2011).

Another main feature of public administration processes is their complexity. There is often a fundamental uncertainty as to the nature and extent of both the problems involved and their possible solutions.

Reputation of the place: the dependent variable.

The reputation of the place reflects the collective attitude of the people towards something - in this case, a place. Such an attitude allows organizations or places to counteract competition and provides intuitive, relevant and personalized value for target groups (Adesoji, 2011). In the corporate reputation literature, it is argued that reputation is a more stable performance indicator than (brand) image (by Chernatony, 1999), (Fombrun and van Riel, 1997). In this case,
the image concerns only more recent perceptions, while the reputation is made up of several images over time (Fombrun and van Riel, 1997). In other words: "reputation requires increasing the time and consistency of the image" (Markwick, 2000). Reputation is crucial because it is a key factor in people's attitudes and behaviors toward a particular object (Hatch and Schultz, 2002). Summarizing this information in places, we could appreciate that the reputation of a place is the composition of its previous developments, investments, actions, achievements and images of the place (brand). Reputation changes over time, but is generally less volatile than the image of the place. Reputation can be seen as influential on investment decisions, residential location and tourism.

Results and Discussions

The collection of data and variables will be done for the realization of the empirical analysis, using the structural analysis model with data provided from the economic agents that operate around the Pietroasele vineyard. The survey model that will be further developed and sent to professionals and company administrators involved in product marketing and branding in the vicinity of Pietroasele vineyard will be applied.

These places selected by the research team range from small companies in agriculture, trade, services, processors, viticultural organizations, associations. In all cases, the authors collaborated with company professionals to ensure that respondents were effectively involved in marketing and branding. Companies will submit the survey to their members, indicating the website where the survey could be found. This method of surveying the opinion of specialists will be applied to a number of 304 respondents based on email addresses. All respondents who complete only a small part of the survey will be removed from the database. Furthermore, the authors of the survey will ensure that the data set included only one respondent per company or local authority.

Figure 1: Correlations regarding the construction and development of the zonal brand

Source: authors' processing

Tabel 1

Table 1 shows that each question will receive a different answer. The research questions were

1. How did you find out or were you attracted to participate as a producer in the production activities of the area?
2. From your point of view, in what relationship are you with the processor / employer of Pietroasele Resort?
3. As a local producer, how far (km) are you from the processing site? Specify the location.
4. What are the 5 main qualities of the products you sell on the market?
5. What are the 5 main qualities of the wine-growing area in which you operate?
6. From your point of view, how is the grape transported during the harvest period?
7. As a producer / partner / employee, how did you actively contribute to the development of other economic activities in the area?
8. Specify 5 Initiatives, contributions on issues and proposals already expressed
9. A proposal to improve the relationship with the processor in which field would it come from? How could it be improved?

Source: authors' processing

The main correlations between the variables are shown in Figure 1, the correlations between the dependent variable and the five most important independent variables are significant. The correlation will be made between the adoption of the place brand and the conflicts between the stakeholders, but this was not a hypothetical relationship in the conceptual model. Budget development is correlated with the reputation of the place, while media attention is correlated with conflicts between stakeholders.

Table 1 shows that each question has an open answer, respondents can provide qualitative answers. Respondents will be encouraged to provide valuable information on all questions used to successfully assess the answers and will be excluded from the research. The presented methodology will follow the correlations between table 1 and figure 1 starting from the following hypotheses:

H1: An open branding process has a direct positive effect on the reputation of the place. H2: There is a direct and positive construction between the identity of the place and the budget of the area.
H3: There is a direct and positive construction between the identity of the place and the existing workforce in the area.
H4: There is a direct and positive construction between the identity of the place and visibility, models of good practice at regional level.

Conclusions and Proposals

We know that a construction of a local brand is a demanding management process that involves many companies, individuals and legal entities and characterized by cognitive complexity, having views on the brand and the area has different potential. As such, site branding requires strategies that are appropriate for setting up the branding management network. This research will explore the effects of two strategies to deal with the complexity of branding and improving the reputation of the place. In the following research, the results will show a certain strategy content, namely, in creating a realistic brand with an image communication that suits the identity.

The second strategy is actor-centered, namely stakeholder involvement through a series of processes open to the brand. Our hypothesis is that these two strategies will be positive

it affects the reputation of the local brand, not only directly but also indirectly through the increased adoption of the local brand and the reduction of conflicts between stakeholders. Two control variables (eg budget development and media attention) that could have an effect on the reputation of the site were included.

Abstract

Epilepsy monitoring has been one of most recognisable applications of wearable sensors as it can be used to mitigate everyday risks of having seizures. This problem based on statistical data affects children, which from development point of view must be accurately diagnosed and effectively treated. Any exceptions, delays can affect the child's health but especially its development increasing the risk of future conjugate diseases. Described in the paper tool is an attempt to provide a mobile remotely accessible monitoring tool which will alarm, notify and help to report health events which than can be automatically classified as seizures. The algorithms and NERVE tool have been designed not only to identify seizure but also recognise specific four classes of generalised seizures (clonic, tonic, myoclonic, atonic) including evaluation of the intensity of the seizure. This paper discusses the usage of wearable class multi-sensors introducing surface electromyography supplemented with limbs movement and activity evaluation. These data sources need to be selected with regard to not only detection accuracy but also mobility and usability features, which make the measuring process so cumbersome and difficult. To identify a seizure the NERVE tool is using a wireless, attachable, small biomedical sensor capable of autonomous EMG and IMU processing on Arduino platform. Based on the algorithmic signal filtering and evaluation the system identifies, a health treat (an episode) and wirelessly notifies the parent or caregiver. The assistance process allows not only to record the biomedical data but also supplement the episode with video recording and postictal survey describing the health event. Having such detail electronic documentation, epileptologist is capable of identifying the etiology of the disease, proposing a treatment or verifying the efficiency of treatment. The mobile application provides a novel approach in case of child seizures support based also on classification of the seizure based on the survey, which is able to increase the method's accuracy, shorten communication time. This work also demonstrates a quantitative approach to specific physical state evaluation and describes functionality of designed system in the domain of hardware and software components.

Keywords: Epilepsy monitoring, child epilepsy support, mobile system, biomedical sensors, machine learning, seizure

Introduction

Advances in biomedical sensors and popularity of wearable smart devices among users provide new ways of automating medical evaluation processes and supplementing decision tools. Majority of available tools concentrates on data acquisition and simple aggregation, at most providing timeframe characteristics. Moreover most of proposed solutions uses electroencephalography (EEG) as measuring method which is not practical in real-life and day-to-day environment. This work is dedicated to development of a multi-sensor mobile monitoring system capable of identifying specific neurological symptoms during seizures in epilepsy using quantitative signal analysis. For measuring method surface electromyography (sEMG) and accelerometer (ACC) were chosen, as combinations of multiple measuring methods has been shown as most promising in terms of sensitivity and reducing false alarm rate . Other works, such as Empatica

Embrace Wristband and SmartWatch , also use one or more measuring methods different than EEG resulting with high seizure detection rates.

This research aims to provide parents and caregivers with possibility to react in case of infants's seizure occurrence, and to record, describe and document required symptoms of that seizure for post-event analysis and for treatment effectiveness evaluation by developing a multi-sensor mobile tool consisting of custom wearable sensor and mobile application. In general neurologists and epileptologists require detailed information on seizure preictal and postictal phases to correctly diagnose and identify epilepsy etiology. Combination of the data has to capture specific aspects of a disease such as experienced symptoms and biomedical data recorded during detected seizure.

Research Motivation

Based on recent studies the WHO states that: 'Epilepsy is the most common chronic brain disease and affects people of all ages' . Nearly 50 million people worldwide are affected by it and it is estimated that about 70% of them can be treated and live seizure-free if properly diagnosed and treated. The problem is that epilepsy is hard to control and monitor which makes it hard to properly diagnose and treat, and additionally 30% of epileptics cannot be fully cured and they will suffer from one to several seizures a year for the rest of their lives.

It is obvious that the adult population is able to comply with pharmaceutical treatment and monitoring, however children and minors often do not realize the seriousness of the disease and consequences of their noncompliance and bad health habits. The whole burden lies on their parents and caregivers who often fear not knowing when the next seizure will occur.

Although prevalence of epilepsy increases relatively late in human life (after around 60 years), there is a peak at ages 5 – 10 (Figure 1 a), which means that children at that age are one of the high-risk groups for epilepsy. According to US' Centers for Disease Control and Prevention in US there are registered 3M adult and 470k child epileptics , which means that roughly 15% of epileptics are children, 7% to 20% of which suffers from drug-resistant form of epilepsy (as stated by the paper by Xue-Ping). It is clear that children suffering from epilepsy need to be treated as soon as possible – at ages from 5 to 10 the YLD (Years Lived with Disability) value peaks (Figure 1 b) which means that children suffer from epilepsy longer than adults and also die more often, which can be seen in peak of the YLL (Years of Life Lost) value. With proper treatment those statistics can be altered – by using appropriate tools caregivers and doctors can take better care of the children and give them a future.

(a) (b)

Figure 1: Global prevalence of idiopathic epilepsy by age and sex (a); Global years lived with disability (YLDs) and years of life lost (YLLs) rates due to idiopathic epilepsy by age (b)

The need and importance of an advanced epilepsy and seizure monitoring system is undeniable. Our goal realized though NERVE is to create a telemedical tool that not only will alarm caregivers about occurring seizure but also will help doctors with diagnosis and therapy planning by supplementing medical documentation with systematically collected data about the disease and by that will help people in need – not only sick children but also their caregivers.

Available Solutions and Methods

Since epilepsy is one of the most common chronic neurological diseases, the vision of creating a reliable method of detecting and diagnosing seizures attracts many researchers. In this chapter, several of the available methods for testing and detecting epilepsy seizures are summarized and reviewed. The purpose of such an analysis is to demonstrate the variety of approaches and sensors

Table 1: Available methods

Authors, year	Applied Sensors and measuring methods	Detection algorithm classification method	Results
I. Conradsen, 2009	4-hour monitoring with EMG, AMG, ECG, EEG on healthy subjects simulating seizure-like movements	Classification based on RMS	Sensitivity of 98%
Sándor Beniczky, 2013	ACC[15] recordings from patients with GTCS	Generic convulsive seizure detection algorithm	Sensitivity of 91%
Sutrisno Warson Ibrahim, 2017	EEG recordings from ten patients with total of 55 seizure events taken from CHB-MIT database	KNN based classifier	Sensitivity of 94.5%
Rahib Abiyev, 2020	Visual inspection of epileptic abnormalities in EEG	CNN based classifier	Sensitivity of 97.67%
Luis Alfredo Moctezuma, 2020	EEG Channel-Selection	Multi-Objective Optimization based classification	Sensitivity > 96% (depending on number of EEG channels)
Yuanfa Wang, 2017	EEG	DWT and SELM based classification	Sensitivity > 98.1%
Qadri Yazdan, 2016	EEG	MFCC and SVM	Sensitivity of 93%
Charles Ákos Szabó, 2015	sEMG with comparison to EEG recordings from patients with GTCS	Algorithm utilizing Hotelling's T-squared power analysis of compound muscle action potentials	Sensitivity of 95%
Giulia Regalia, 2015	Empatica Embrace Wristband (ACC)	SVM classifier	Sensitivity > 92%

EEG – Electroencephalography
AMG – Acoustic Myography
ECG – Electrocardiogram
EMG – Electromyography
sEMG – Surface Electromyography
ACC – Accelerometer
GTCS – Generalized Tonic–Clonic Seizures
RMS – Root Mean Square
KNN – K-Nearest Neighbors Algorithm
CNN – Convoluted Neural Networks
DWT – Discrete Wavelet Transform
SELM – Sparse Extreme Learning Machine
MFCC – Mel Frequency Cepstral Coefficient
SVM – Support Vector Machine

Multisensor wearable for seizure monitoring

This chapter provides a description of a prototype sensor developed particularly for the NERVE project [16]. It will clarify all the design and functionality required to be fulfilled by the sensor. Collecting sEMG [14] signal requires the use of an

appropriate sensor, there are many devices and chips dedicated for this purpose available on the market, they have different usage and different accuracy classes.

Table 2: Communication standards and their features

Technology	Network	Standards based or Proprietary	Range	Throughput	Energy requirement	Adoption
LoRa	LWPA	Proprietary (Semtech)	High	Low	Low	Moderate
ZigBee	802.15.4	Standards based	Low	Moderate	High	Limited PAN & Home
WiFi	802.11	Standards based	Moderate	High	High	Very High
Bluetooth	Bluetooth	Standards based	Moderate	Low	Moderate	Limited Wearables
Nwave	LWPA	Proprietary (Semtech)	High	Low	Low	High
SigFox	LWPA	Proprietary (SigFox)	High	Low	Low	Moderate
NB-IoT	3GPP/LTE	Standards based	High	Moderate	Low	Increasing
Z-wave	Proprietary	Proprietary (Sigma Design)	Low	Low	Moderate	Very Low Home Automation

The sensor required for the proper use of NERVE system must fulfil specific conditions:

- have rechargeable and durable batteries
- ensure communication with the phone by selected communication standards, e.g. Bluetooth depending on the needs
- guarantee the required accuracy of biomedical data
- have appropriate dimensions to be suitable for children

The requirements are based on specific needs, e.g. what standard of communication will be chosen depends on the age of the child, in case of an infant we can use the Bluetooth standard because the parent is always nearby, but if we talk about preschool age child we should use a standard that will allow for a long-distance range because of mobility of the child, which can for example play outside far enough to make the Bluetooth standard not sufficient. The standard that was used to create the prototype is Bluetooth, for several reasons: the highest number of cases of epilepsy happens in the early childhood which guarantees no problems with range, Bluetooth provides high energy efficiency e.g. BLE v5 has 7 modes, with 3.3V power supply it consumes in active mode 1.8 mA in stand-by mode, 26 mA in sleep mode 300 nA and many facilitations in the implementation like AT command control or UART interface - the simplest interface in terms of control which means a simple implementation. An important advantage is the fact that the Bluetooth module can also have its own microprocessor, which provides greater computing power and consequently, greater effectiveness.

The prototype created for NERVE consists of a main unit with a microprocessor, Bluetooth module and a Li-pol battery input, providing operation and charging of batteries, Li-pol battery of 110 mAh capacity, MPU-9250 module which is a 3-axis accelerometer, gyroscope and magnetometer using the I2C bus and EMG sensor - MyoWare Muscle Sensor.

(a) (b) (c)

Figure 2: Nerve multisensor prototype: view of the prototype (a); scheme (b); dedicated case (c)

The main module was chosen because of its construction, which was designed specifically for mobile sensors that meet most of the assumptions that were set for the sensor, while the battery, module MPU-9250, and MyoWare were selected mainly because of their size.

Table 3: NERVE sensor components and their technical specifications

Sensor	Function provided	Specification	
3. MyoWare Muscle Sensor	capture the sEMG signal	Supply Voltage	+2.9V or +5.7V
		Adjustable Gain Potentiometer	0.01 – 100 kΩ
		Input Impedance	110 GΩ
		Supply Current	9 mA - 14 mA
		Common Mode Rejection Ratio	110
		Input Bias	1 pA
2. Adafruit Feather 32u4 Bluefruit	Provide comunication via bluetooth, charging ability, programmable interface,	MicroControler	ATmega32u4 8MHz with 3.3V logic/power
		Memory	32K of flash and 2K of RAM
		Voltage	3.3V regulator with 500mA peak current output
		Pins	20 GPIO pins 7 x PWM pins 10 x analog inputs
		Charger	Built in 100mA lipoly charger with charging status indicator LED
1. MPU-9250		Supply Ramp Time	0.1 - 100 ms
		Operating Range	-40 - 85 °C
	capture the ACC signal	Sensitivity	333.87 LSB/°C
		Room Temp Offset	0 LSB
		Supply Ramp Time	0.01 – 100 ms

Thanks to this design, we obtained a prototype sensor that fits on the child's arm, which allowed us to carry out tests. Tests of the sensor prototype have been positive. The sEMG signal obtained is qualitatively acceptable - it allows for further signal analysis. The inertial sensor functioned correctly and sent accurate data determining the child's movements. The operation of the Bluetooth module and battery life can be assessed equally well. The reason for constructing an own prototype was the need to design a system of the appropriate size to examine children. Another advantage is the possibility to develop the device's logic - to determine how the data should be collected and transmitted. This solution allowed to optimize the tasks between the sensor and the application.

Figure 3: NERVE multisensor presented during the test phases on children and live demonstrations

Tool for Epilepsy Monitoring

NERVE is a system designed for epilepsy treatment and seizures monitoring composed of custom wearable biomedical multisensory, a mobile app and a central knowledge base. The system's central element – mobile app – provides complete set of functions for disease and treatment monitoring, diagnosis and possibility of assessment of pharmacological therapy effectiveness. This chapter describes the mobile app's functionalities – how they work and how they can aid doctors and patients in epilepsy treatment.

The app continuously checks NERVE sensor's readings and coordinates them with the app's seizure monitoring. As soon as a seizure occurs during monitoring - which means that the application will classify three consecutive time windows as a tonic or a clonic, an alarm procedure will be started. During this procedure, the application, based on the results of the classification, notifies the user what stage of the seizure the patient is currently in. The alarm procedure consists of three steps: preliminary alarm, main alarm and postictal questionnaire. The preliminary alarm (Figure 4 a) lasts for pre-set time and can be deactivated if the muscle activity turns out not to be a seizure. It functions mostly as a fail-safe, giving caregivers time to determine if seizure did occur. The main alarm's (Figure 4 b and c) primary objective is to measure the time span of the occurring seizure but also offers number of functions to help during the seizure, such as possibility to record the seizure and add the recordings to patient's medical documentation (such recording are very helpful for doctors), to call the child's caregivers, and to launch first-aid instructions. To make alarm sequence effective, the sensor is continuously collecting biomedical data and sending it to the app which is visualized by live seizure type identification. After the seizure the app sends collected data to cloud for seizure's intensity and type evaluation, by doing so it supports a medical knowledge expert in the analysis and final diagnosis. At the end the child's caregiver is presented with postictal questionnaire (Figure 4 d) which complements the symptomatology. Each question in the questionnaire relates to the events taking place during and after the seizure and was prepared by neurologists who provided a matrix that maps answers to the questionnaire to several epilepsy types.

Figure 4: NERVE application view of the preliminary alarm (a), the main alarm presenting the results of the seizure stage classification (tonic (b) and clonic (c)), and the postictal questionnaire (d)

NERVE offers a 'medical expert mode' which visualizes all biomedical data transferred to the app (as shown on

Figure ***5***). It provides live sensory analysis screen to visualize different measurements on various charts and diagrams. The app processes live data and classifies sequences of time windows it as one of the seizures phases, for example as tonic (

Figure ***5*** b) or clonic (

Figure ***5*** c).

Figure 5 : NERVE application 'medical expert view' showing aggregated sEMG signal with features: during acquisition and before classification (a), classified as tonic phase – SVM classifier (b), before classification (c), classified as clonic phase (d)

The app also helps in creating a patient's medical documentation by tracking patient's day-to-day routine – events such as taken medicines, eaten food, mood etc. through the app's dedicated screens (**Error! Reference source not found.**). Caregivers plan a day schedule (**Error! Reference source not found.** a) and respond to app's notifications by reporting that child completed planned actions (e.g. ate dinner or took medicines) which are then showed in one-day calendar's view (**Error! Reference source not found.** b) along with recorded seizures. The app correlates seizure frequency with other information it gathered (such as taken medicines) in a form of a histogram (**Error! Reference source not found.** c). This way it can visualize trends in number of seizures in conjunction with medicines that were taken. This summary is designed to help doctor with determining the effectiveness of prescribed pharmacological therapy.

Analytical Method

This paragraph describes all stages and methods of signal processing, which are used to transform the collected data into calculated signal characteristics on the basis of which the reasoning is conducted. The diagram below shows the complete procedure for processing sensory data, from activating the monitoring mode - which activates the sensor and starts collecting data, to the moment when the process can be stopped - i.e. deactivating the monitoring mode.

Figure 7: Activity diagram presenting the process of sensor data flow

Once monitoring modes are started, the sensor will stream the collected data of the sEMG and ACC signals to the application in real time. The data is then filtered as it is important to get the best possible quality as the recognition and assessment of the type of seizure is based on the analysis of these signals. The TEKO method [12], which stand for Teager-Kaiser energy-tracking operator, was used for signal denoising.

$$y_t = x_t^2 - x_{t-1}x_{t+1}$$

where:

y – resultant value
x – value of the point from the data set
t – iterator

This method allows to suppress noise, and make signal even larger. The advantage of this method is low computational complexity, which is important in the case of implementation of applications on mobile devices, due to the universal purpose of the application, it is required to maintain the lowest possible consumption of device resources.

(a) (b)

Figure 8 : The graphs show the results of the TEKO method presents the raw sEMG (a) and ACC (b) signals received from the sensor showing a record of the clonic phase of the seizure; presents sEMG (c) and ACC (d) signals denoised by the TEKO method

The data is streamed to the application in real time, which generates the need to process large amounts of data on the mobile application side, in order to make the algorithm efficient and reliable, a dedicated aggregation method is required. Determining the appropriate size of the time windows allows to identify as many possible variants of the signal during a seizure as possible. This will allow to identify and distinguish the stages of the beginning and the end of a seizure as well as individual trends related to the different phases (tonic, clonic) during their occurrence.

Figure 9: Denoised sEMG signal of a simulated epileptic seizure tonic phase divided into time windows

Subsequently, for each of the time windows, the characteristics [11] of both sEMG and ACC signals are extracted. Based on previous experience, the following set of characteristics was distinguished.

Table 4 : Table (a) provides a list of all characteristics [11] used for classification, table (b) demonstrates examples of characteristic values for time windows of particular types of seizures

Feature full name	Abbr	Feature full name	Abbr
Integrated EMG	**IEMG [mV]**	Difference absolute standard deviation value	**DASDV [mV]**
Mean absolute values	**MAV [mV]**	Variance	**VAR [mV^2]**
Simple square root	**SSI [mV^2]**	Average amplitude change	**AAC [mV]**
Root mean square	**RMS [√mV]**	Zero crossing	**ZC [mV]**
Waveform length	**WL [mV]**	Myopulse percentage	**MYOP [mV]**
LOG indicator	**LOG [mV]**	Slope sign change	**SSC [mV]**
Max value in the frequency domain	**MAXF [u]**	Medium power	**MNP [u]**

Table 5: Average values of signal characteristics for the analyzed epilepsy seizure phases

IEMG_ACC	MAV_ACC	SSI_ACC	VAR_ACC	RMS_ACC	LOG_ACC	WL_ACC	PHASE
90,03	1,17	537,20	7,07	2,10	0,55	126,21	clonic
24,84	0,32	16,16	0,21	0,39	0,22	41,99	tonic

1,64	2,40	54,00	0,49	59,00	51,67	15,74	clonic
0,54	0,66	47,00	0,45	53,00	8,88	2,69	tonic
IEMG_EMG	MAV_EMG	SSI_EMG	VAR_EMG	RMS_EMG	LOG_EMG	WL_EMG	PHASE
75,41	0,98	154,16	2,04	1,41	0,60	137,20	clonic
93,00	1,19	273,09	3,51	1,67	0,54	161,59	tonic
AAC_EMG	DASDV_EMG	ZC_EMG	MYOP_EMG	SSC_EMG	MAXF_EMG	MNP_EMG	PHASE
1,79	2,58	56,00	0,49	58,00	34,81	9,54	clonic
2,06	2,91	48,00	0,42	56,00	40,16	11,68	tonic

The values in the table 4 are calculated as averages of 3 five-second time windows for each of the analyzed phases of the seizure. The tests were conducted on persons simulating the phases of a seizure using the NERVE multisensor.

Following the procedure presented in figure 9, after calculating the characteristics, the time window is classified. Calculated parameters are sent by API to Azure machine learning studio environment, where a given time window is classified, and then the result of the classification is sent back to the application. End users - parent or caregiver is notified about the classification result using the main alarm screen. Picture 6 demonstrates where the application displays the names of identified attack phases. Whereas picture 7 presents the view in medical expert mode, where time window classification results are presented on signal charts.

Recognition and verification of epilepsy seizure

This chapter highlights how to identify the type of seizure and which tools have been used for this purpose. All classifiers necessary for full NERVE functionality are based on Azure machine learning studio environment [13]. The decision to export the inquiry mechanism from the application was made in order to offload the load on the mobile device, taking into account, that the solution uses two complementary classifiers and processes biomedical signals, the computational and memory complexity could have a negative impact on the application and the device. The flow of the reasoning process is illustrated by the diagram below.

Figure 10 : Diagram of the flow of the reasoning process

There are two classifiers in the entire NERVE system; one is responsible for detecting and classifying the type of seizure based on the sensor signals, the other classifies the type of seizure based on a sophisticated questionnaire, which contains a list of symptoms that may occur during individual phases of the attack.

(a) (b)

Figure 11: A matrixes presenting the results of the accuracy of classification (a) of sEMG and ACC signals; (b) the symptoms contained in the post-seizure questionnaire

Table 6: Table indicating parameters of artificial neural networks used as classifiers.

ANN parameters	Signals classifier	Symptoms classifier
Create trainer mode	Single Parameter	Single Parameter
Hidden layer specification	Fully-connected case	Fully-connected case
Number of hidden nodes	100	100
The learning rate	0,1	0,1
Number of learning iteration	100	100
The initial learning weights diameter	0,1	0,1
The type of normalizer	Gaussian normalizer	Do not normalize

Both classifiers utilize the neural network classifiers in Azure machine learning studio in the default configuration. The classification result displayed during a seizure is based on the classification of sEMG and ACC signals, while the final result registered in the calendar is delivered to the user based on the signal and symptoms classification.

Conclusions and Discussion

This paper presents a quantitative approach implemented within NERVE application, and further extensions in form of dedicated non-invasive IoT platform-based NERVE sensor (sEMG, IMU) designed specially to supplemented NERVE mobile application hosting data acquisition, filtering and analysis. NERVE is a comprehensive healthcare assistant tool with time-constraint support for monitoring and auditing drug intake, surveying and sensor test. The application provides a detailed medical history of the child epilepsy supports efficient diagnostics and medical treatment decisions. The approach assumes that seizure symptoms are detected on the basis of electromyography and inertial data which feed seizure detection algorithms, responsible for health event detection and alarms. Demonstrated signal processing algorithms, have been tested mainly on simulated and generated data, preparing next stage of testing. Test procedure examined > 10 various data scenarios to provide a dataset for recognition and identification of motor onset (both focal and generalized) seizures. Electromyography and actigraphy data fusion techniques has contributed to an increase of the correctness of the classification in the process of recognition of movement seizures utilized wearable sensor data. The classification algorithms for simulated seizure data reached – 95% accuracy only for ~300 datasets. Presented method evaluates the intensity of neurological disease symptoms for epileptologii based on the signal features and machine learning techniques. As a further development we will concentrate on moving a part of analytical algorithms towards hardware sensor thus separating components so as to provide recognition of seizures even without NERVE application to making the system more reliable. There is also considered an acquisition of real child patient data sets for clonic and tonic seizures. Moreover, the extension of biomedical signals is planned. Future version of system will utilize the GSR (Galvanic Skin Response) and PPG (photopletysmography) to provide alternative data channels. Analytical method however will be calibrated and connected to multicriterial approach merging various (CNN, ANN, SVM, kNN) classificators.

Abstract

Semantics theories have great relevance in human and business communication. As such, semantics as a subfield of linguistics emphasizes meaning in all spheres of life. In this connection, semantics has gone beyond the remit of the theoretical aspect of linguistics to the realm of providing practical solutions to human life. One of such areas of applicability of semantics is in the domain of international trade where meaning in business interactions can make or mar a business deal. This paper intends to identify the existence of lexical relations in the international trade vocabulary particularly in the Supply Chain Management (SCM) section. A total of twenty terms selected from Supply Chain and Logistics glossary were analysed for their semantic information. In line with the theory of lexical semantics which is concerned primarily with word meaning, definitions for the selected concepts were provided from the glossary. This engendered a link to their sense relations with other words in the supply chain vocabulary. Some of the sense relations which are also tools of analyses include antonymy, hyponymy and synonymy. In the Nigerian context, for example, there is paucity of studies on sense relations and meaning making mechanisms of online linguistic resources in international trade. It is this observation that provides motivation for this study. Thus, this study has implications for the clarity and understanding of SCM terms in international trade.

Keywords: Lexical Semantics, International Trade, Supply Chain Management

Introduction

Semantic studies relates to meaning that can be expressed (Leech 1981). The current research aligns with linguistic meaning which denotes or signifies an expression in a particular language. For instance, linguistic meaning constitutes semantic concepts such as the vocabulary of the language of international trade, as exemplified in the supply chain management sector of the domain. However, this study highlights lexical semantics as a theoretical framework of language use in the business context of international trade. The relevance of semantics in international trade demands a wider and holistic investigation that will highlight its implication in business domains. This thorough investigation calls for the examination of available linguistic resources, such as the glossary of supply chain management. On the long run, an interplay between language and business projects a common platform for flow of communication business communications. Below are some of the existing views to expatiate the concept of lexical semantics.

Stringer (2019) assumes that lexical semantics entails the meaning of words and the semantic relationships between terms and the forms in which word meaning is related to syntactic structure. The essence of lexical semantics is mainly concerned with the meaning of, as well as the ways in which word meaning is related to syntactic structure. Murphy (2016) emphasized that lexical semantics as the study of word meaning is focused on lexical (content)

word. These include nouns, verbs, adjectives, contentful adverbs, prepositions excluding grammatical words. The key concern of Lexical semantics is the definition and meaning of the smallest part of sentences and it is the systematic study of word meanings and how the meanings are structured (Cruse, 2001; Pustejovsky, 2006). As such, language users require the knowledge of words or morphemes which is critical for understanding the lexicon (Malmkjaer, 2010; Geeraerts, 2015). This notion aligns with Kearns (2008) assertion that the term lexical semantics is used in contrast to formal semantics. Formal linguistics highlight explicit mathematical procedures utilized for

CHILUWA "A Study of Lexical Semantics in the Vocabulary of International Trade" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

language interpretation (Chierchia, 2006). In the context of this study, the meanings of words are strictly examined to identify their lexical relations which highlight the information required for knowledge in semantic interpretation (Asher, 1994).

In literature, Aristotle's theory of meaning is observed as the watershed for investigations into word meaning. This connotes that lexical semantics has its origin in the philosophical tradition with Locke, Hume, Reid, Socrates and Parmenides as philosophers who paid close attention to the meaning of words. However, the 19th Century witnessed the rise of the 'philological and psychological' investigation of word meaning with contributions from Breal (1897), Erdnon (1900), Trier (1931) and Stern (1931/1968). These linguists contributed to the nature of meaning by investigating how words acquire meanings; and the relationship between words and their worldly denotations (Pustejovsky, 2006). At present, lexical semanticists are concerned with the description of word meaning and how to account for the variability of meaning from context to context (Cruse, 2001). The domain of lexical semantics comprises vital aspects in the study of meaning in human language and by extension business communication. Lexical semantics as a prominent approach in language study incorporates lexical relations tools as expatiated below.

Key Concepts

Lexical Relations

Lexical Relations is an approach subsumed in lexical semantics, a linguistic theory that investigates word meaning. Lexical relations include antonyms, homonyms, hyponyms, polysemy, meronyms and synonyms (Stringer, 2019).

Antonymy

In lexical semantic relationships, antonymy is unique in that it involves one-to-one relationships rather than one-to-many or many-to-many, as seen in other word relationships (Lynne, Paradis & Willners, 2002). Ogbulogo (2005) asserts that antonymy is usually regarded as semantic opposition. In the view of Palmer (1976:59 cited in Ogbulogo, 2005), it is a word or expression which is opposite in meaning or two words that express opposing concepts. For instance, in the SCM vocabulary, the terms business-to-business (B2B)/business-to-consumer (B2C) express opposition. In English language, for example, the words hot/cold, black/white, sweet/sour, old/new, wet/dry, do uphold the views of Palmer.

In literature, Aarts & McMahon (2008) identifies the main types of antonymy as contrary, complementary, and converse. The contrary antonymy comprises contrasting pairs of adjectives such as hard/soft copy, fast/slow, good/bad. The second type comprises complementary adjectives such as open/close, dead/alive, true/false. Converse antonyms include comparative adjectives which are known to relate by an entailment of the general form. For instance, x is warmer than y is entailed that y is cooler than x. In this connection, antonyms are important in structuring English vocabulary as commonly observed in adjectives though not restricted to it (Jackson & Amvela, 2000).

Homonymy

Homonymy refers to the existence of two or more words having the same spelling or pronunciation but different meanings and origins (Hasa, 2016). A homonymous word has two or more unrelated meanings. For instance, the term bank in used in many senses: as in a river and as in a financial institution (Crossley, Salsbury &McNamara, 2010).

Hyponymy

Fakoya (2004:37)highlights hyponymy as a meaning association between a superordinate term lexeme and two or more terms (hyponyms) indicating more particular instances of the superordinate term. Hyponymy involves the notion of inclusion which is a matter of class membership (Palmer 1981:85; Saeed, 2009). This word relationship is regarded as the inclusive lower terms of a superordinate concept showing that the meaning of one form is included in the meaning of another. This forms a type of hierarchical relationship among words. For instance, the word animal is a super ordinate term with other lower terms such as aquatic animals, domestic animals, and wild animals. It is observed that a hyponym shares a type of relationship with its hypernym. For instance, High Density PolyEthylene (HDPE), PolyEthylene Terephthalate (PET) is co- hyponyms of plastic (their hypernym). Hypernymy is commonly referred to as either a general concept or semantic field or lexical domain (Palmer, 1981 & McGregory 2009). In the SCM sector of international trade, terms such as Global Positioning

System (GPS), plastic and inventory lend themselves to hyponymic analysis as observed later. According to Jackson & Amvela (2000:102), the relation of hyponymy serves to structure large parts of a language vocabulary.

Meronymy

In semantics, a meronym denotes a constituent part or a member of something. For example, mango is a meronym of mango tree (Nordquist, 2019).

Polysemy

Polysemous words are words with more than one related sense. Furthermore, a polysemic term, in contrast to a homonym, has one core meaning with different related senses. For example, the word 'class' has at least six related definitions, including socioeconomic class, a group of students, a course of study, a set of items t hat share similar qualities, a quality league (usually related to sports), and eleg-ance in clothing or conduct (Crossley, Salsbury, & McNamara, 2010). Yule (2010 in Oni, 2020) defines polysemy as one form (written or spoken) with multiple meanings that are related by extension.

Synonymy

Synonymy is the relation of sameness or close similarity of meaning (McGregor, 2009). It is a word which simplifies another by serving as an alternative meaning, therefore, lexemes related in this way are synonyms. Synonyms may sound different but have the same or nearly the same meaning as in the following pairs: smell/odour, pail/bucket, teacher/tutor, power/might, seize/grasp, oats/porridge, noodles/indomie, big/large, meals/covers. There are some observed levels or varieties of synonyms: absolute synonyms, cognitive synonyms and near- synonyms (Kearns, 2008; McGregor, 2009). Absolute synonyms are words that can be substituted one for another in any context without a change of meaning, for instance, anyhow/anyway, everybody/everyone. Cognitive synonyms illustrate differences in style and choice of words among language users, toilet/lavatory/restroom. Near- synonyms comprises plesionyms and cognitive synonyms. According to Cruse (1986 in Aarts &McMahon, 2008), plesionyms are words with slight differences in denotational meaning such as misty and foggy, swamp, fen, bog and marsh.

Synonyms can also belong to different dialects of the same standard language as indicated by (McGregory 2009:137) in the examples: togs, swimmers, cossies and trunks which belong to different dialects of Australian English. Some synonyms at the word level refer to the same thing but differ in the degree of formality. Typical examples include: toilet/lavatory; restroom/convenience. The set of words above shows instances of language used according to social context. In the SCM context, Accessorial Charges/ Accessorial Fee; Accumulation bin/ assembly bin; Accounts Payable/ Accounts Receivable are recognized synonyms.

International Trade

International trade entails the exchange of products and services between countries (Daoui, 2017). Certain factors are responsible for this exchange of capital, goods, and services across international borders or territories. Primarily, every country of the world have a demand for goods and services to satisfy their people, hence the need for exchange of goods and services among nations of the world. In this connection, International trade is an offshoot and a product of international business. International business encompasses all commercial activities that take place to promote the transfer of goods, services, resources, people, ideas, and technologies across national borders. The multifaceted nature of global business includes the transfer of goods from one country to another (exporting, importing, trading), contractual arrangements permitting foreign companies to use products, services and processes from other countries (licensing, franchising), the establishment and operatio n of foreign market sales, manufacturing, research and development and distribution facilities in foreign markets. These varieties of international business create healthy economic development for citizens of nations (Grozdanovska, Jankulovski & Bojkovska, 2017).

The earliest form of international business occurred as a result of surplus farm produce. Specifically, in 3000B.C Sumerian farmers had to exchange their excess grains in a barter system for copper from Sinai Desert traders located several hundred miles away. This international business initiated the earliest international trade which afforded the two countries opportunity to enjoy what they could not produce (Gaspar, Bierman, Kolaari, Arreola-Risa, Hise, & Smith, 2017). The exchange of goods among different countries in global trade is enhanced by the activities of a critical sector highlighted below.

Supply Chain Management

The Supply Chain Management (hereafter SCM), is an important concept in the domain of International trade, which represents a world of service. As observed in literature, SCM has a diversified nature with a broad composition of different concepts: logistics, purchasing, supplies, internet, transportation and haulage. As such, its emergence in the value chain was perceived as a means to meeting the demands of the end consumer in business.

SCM terms form a critical component of the language of international trade. In this era of globalization, uniformity in the language of global trade is critical and non-negotiable for global relevance and business sustainability (Ross, 2013). This investigation is purely borne out of the need for highlighting the meaning relations in the SCM, hence the need for the analysis of SCM terms. As opined by Croxton, Garcia-Dastugue, Sebastian, Lambert, Rogers and Dale (2001). Customer Relationship Management, Cusstomer Service Management and Demand Management are some of the processes that form the core of the SCM. As such, quite a number of intellectual efforts have gone into the explication of SCM, as observed in the many definitions in literature. For instance, The Institute of Supply Chain Management described SCM as "the design and management of seamless value-added processes across organizational boundaries to meet the end customer's real needs. The growth and integration of people and technical capital is essential to the effective integration of the supply chain.

The APICS dictionary defined supply chain as the processes from the initial raw material to the ultimate consumption of the finished product linking across supplier – user companies.

SCM is the design and management of flows of product information and funds throughout the supply chain. As a complete business concept, it coordinates and manages all the activities of supply chain (Sanders, 2012).

As such the meaning of terms, for instance those in SCM is made available in plain language for purposes of clarity in communication and negotiation. In addition, making a head-start in global business demands mutual intelligibility in the language of trade at the global scene. Therefore, a mastering of the English word stock and understanding the SCM for business communications skills remain critical in the emerging informational economy and society. This is the bane of most operators in international trade. In this direction, it is possible to argue that an investigation of lexical semantics in SCM terms will deliver or incorporate meaning making resources to the lexicon of business people and language users. This we believe will have far reaching implications for the Nigerian business environment and for the emerging entrepreneurs in international trade. This relevance is apt for the emerging and trending concept of supply chain management in global trade, especially in a post Covid-19 era.

Data and Methodology

The data for this paper is corpus derived from Supply Chain and Logistics Glossary, a reference resource on supply chain management terms. Another criterion for data selection was based on the credibility and authenticity of the compilers. In actualizing the eligibility test, the background of the glossary compilers was investigated so as to verify the quality of data. It is on this premise that data was selected from the resources of Supply Chain Visions, a renowned and passionate stakeholder in the SCM domain being investigated.

Supply Chain Visions is a private management consulting firm dedicated to assisting companies with supply chain and network strategy, implementation and education. It was founded in 2001, with headquarters in Arlington, VA (https://ng. linkedin.com/company/supply-chain-visions). Their expertise and professionalism with a collaborative approach helps clients create strategic and cost effective schemes that achieves efficiency. From organizing independent producers in Afghanistan into a dynamic business community in a global market, through collaborations with top universities, to leading graduate and executive education, Supply Chain Visions meet client needs exceptionally. This they do by drawing on a deep bench of experts to analyze and execute strategic insights more than other organizations. According to its website, Supply Chain Visions are the experts the experts turn to. Hence, their strategists, planners, logisticians, operators, scientists, trainers, and educators typically have over 25 years of experience that are published across government, business, aerospace, and defense (http://www.supplychainvisions.com).

The data selected comprise of SCM terms that have meaning relations with other words in the sector. Forty terms were purposively selected from the glossary for close examination. In applying lexical semantics analysis to the selected data, some procedures were observed. Following the tradition of lexical semantics, word meaning is paramount. Hence, identification of the words is followed by word meaning which is paramount in lexical semantics. All meanings of the terms are highlighted in the glossary except the term 'soft copy' defined by the researchers. A few exception of any undefined term indicates unavailability in the selected glossary. That is, each of the terms was defined before investigating any type of existing relations among them. Investigations on all the

word relations were carried out in this particular study so as to ascertain their occurrence in the lexical items of the selected glossary. This was followed by a presentation of the identified sense relations among selected lexical items.

The investigation report was to identify lexical relations in the SCM sector of international trade, thereby indicating the interrelatedness among terms in supply chain management and how meaning is derived. The words identified as having relations were displayed on a table for ease of reference. A major objective of the investigation reported here was to find out the preponderant lexical relations in the vocabulary of the SCM in international trade. In this connection, the tools of synonymy, antonymy, hyponymy, meronymy and homonymy were investigated in this context to determine their existence in terms of similarity, oppositeness or nearness, and their relationship with other words as presented below.

Sense Relations in the Supply Chain Management Vocabulary

There are some established forms of lexical relations in the SCM lexicon as presented below. Each of the identified type of meaning relation forms a tool of analysis; which also contributes to vocabulary development in the supply chain sector of the industry. In this regard, the selected terms and their definitions from the glossary are paired with the identified lexical relations. Those observed in this study include antonymy, hyponymy, and synonymy as highlighted below.

Antonymy

Lexical items that have antonymous relations include:

Business -to –Business(B2B) / Business-to-consumer(B2C), Hard copy/Soft Copy, House to House/ Door to Port, Full- container Load/ Less- Than-Container load/ Half container load, First In First Out (FIFO)/ Last In First Out, Extranet/Intranet.

Definitions of the terms in Antonymy

1. Business-to-Business (B2B)/ business-to-consumer (B2C)

b. Business-to-Business (B2B): "Many companies are now focusing on this strategy, and their sites are aimed at businesses (think wholesale) and only other businesses can access or buy products on the site. Internet analysts predict this will be the biggest sector on the Web". This is as opposed to business-to-consumer (B2C). Business-to-Consumer (B2C): "The hundreds of e-commerce Web sites that sell goods directly to consumers are considered as B2C". This distinction is important when comparing web sites that are B2B as the entire business model, strategy, execution, and fulfillment is different.

2. **Hard copy/Soft Copy**
   Hard copy: "computer output printed on paper".

b. Soft copy: an unprinted computer file stored inside a computer.

3. **House to House/ Door to Port**
   House to House: "the through-transport of goods from consignor to consignee".

b. Door to Port: "the through transport service from consignor to port of importation".

4. **Full container load/ Less- Than-Container load/ Half container load**
   Full Container load (FCL): "a term used when goods occupy a whole container".
   b. Less-Than-Container load (LCL): "a term used when goods do not completely occupy an entire container". When many shipper's goods occupy a single container, each shipper's shipment is considered to be LCL.
   Suggested antonym: Half container load.
5. **First In First Out (FIFO)/ Last in First Out**
   First In First Out (FIFO): "In inventory control and financial accounting, this refers to the practice of using stock from inventory on the basis of what was received first and is consumed first".
   b. Antonym: Last In First Out.
6. **Extranet/Intranet**
   Extranet: "A computer term describing a private network (or a secured link on the public Internet) that links separate organizations and uses the same software and protocols as the Internet". It is used for improving supply chain management. For example, extranets are used to provide access to a supply chain partner's internal inventory data which is not available to unrelated parties.

b. Antonym: Intranet

Hyponymy

Some terms were observed have hyponymous relations with other words within the SCM lexicon as indicated below.

1. Code: "A numeric, or alphanumeric, representation of text for exchanging commonly used information". Examples are: commodity codes, carrier codes, bar codes.

Figure 1: Hyponymous relations of code
Source: Researchers

2. Inventory includes raw materials, work-in-progress, finished goods and supplies required for creation of a company's goods and services. The number of units/and or value of the stock of goods held by a company.

A. Active Inventory: "Materials held in a facility, which are intended to be consumed in manufacturing / assembly, or sold in a specified period".
B. Consignment Inventory: "Goods or products that are paid for when they are sold by the reseller, not at the time they are shipped to the reseller". (2) "Goods or products which are owned by the vendor until they are sold to the consumer".
C. Co-Managed Inventory (CMI): "A form of continuous replenishment in which the manufacturer is responsible for replenishment of standard merchandise, while the retailer manages the replenishment of promotional merchandise".
D. Cycle Inventory: "An inventory system where counts are performed continuously, often eliminating the need for an annual overall inventory". It is usually set up so that A items are counted regularly (i.e., every month), B items are counted semi-regularly (every quarter or six months), and C items are counted perhaps only once a year.
E. Vendor-Managed Inventory (VMI): "The practice of retailers making suppliers responsible for determining order size and timing, usually based on receipt of retail POS and inventory data". Its goal is to increase retail inventory turns and reduce stock outs.
F. Wall-to-Wall Inventory: "An inventory management technique in which material enters a plant and is processed through the plant into finished goods without ever having entered a formal stock area".
G. Distributed Inventory: "Inventory that is geographically dispersed. For example, where a company maintains inventory in multiple distribution centers to provide a higher level of customer service".
H. Finished Goods Inventory (FG or FGI): "Products completely manufactured, packaged, stored, and ready for distribution".
I. In-Transit Inventory: "Material moving between two or more locations, usually separated geographically; for example, finished goods being shipped from a plant to a distribution center". In-transit inventory is an easily overlooked component of total supply chain availability.
J. Perpetual Inventory: "An inventory record keeping system where each transaction in and out is recorded and a new balance is computed".
K. Supplier-Owned-Inventory: "A variant of Vendor-Managed Inventory and Consignment Inventory". In this case the supplier not only manages the inventory, but also owns the stock close to or at the customer location until the point of consumption or usage by the customer.
L. Wall-to-Wall Inventory: "An inventory management technique in which material enters a plant and is processed through the plant into finished goods without ever having entered a formal stock area".

Figure 2: Hyponymous relations of inventory

Source: Researchers.

3. Conveyor: "A materials handling device that moves freight from one area to another in a warehouse". Roller conveyors make use of gravity, whereas belt conveyors use motors. Examples include: roller conveyors and belt conveyors.

Figure 3

Source: Researchers

4. Picking: "The operations involved in pulling products from storage areas to complete a customer's order". Among the types of picking are: picking by aisle, picking by source, pick to light, order picking, wave picking.

A. Picking by Aisle: "A method by which pickers pick all needed items in an aisle regardless of the items' ultimate destination; the items must be sorted later".

B. Picking by Source: "A method in which pickers successively pick all items going to a particular destination regardless of the aisle in which each item is located".

C. Pick to Light: "A laser identifies the bin for the next item in the rack; when the picker completes the pick, the bar code is scanned and the system then points the laser at the next bin".

D. Order Picking: "Assembling a customer's order from items in storage".

E. Wave Picking: "A method of selecting and sequencing picking lists to minimize the waiting time of the delivered material". Shipping orders may be picked in waves combined by a common product, common carrier, or destination, and manufacturing orders in waves related to work centers.

Figure 4: Hyponymous relations of Picking.

Synonymy

The under listed lexical items from the glossary were observed to highlight a relationship of close relatedness of similarity in word meaning. Examples of the terms include:

Accessorial Charges/ Accessorial Fee; Accounts Payable/ Accounts Receivable; Accumulation bin/ assembly bin; After-Sale Service/ Field Service; Backlog/back order; Blanket Purchase Order/blanket order; Bullwhip Effect/ Forrester Effect/Whiplash Effect; Call Center/ Customer Interaction Centre; Commodity/ goods; Co-packer/ co-manufacturer; distributor/wholesaler; door-to-door/house to house; End Item/Finished Goods Inventory; Fabricator/manufacturer; Flatbed/haul brite; freight carriers/for-hire carriers; Full container load/ Full Truckload (FTL); gross margin/ gross profit margin; hazardous goods/dangerous goods; Just-in-Time Logistics/Quick Response; Kaizen/continuous process improvement; Key performance indicator/ score card/ dashboard; Private label/store brand, dealer brand; Quality circle/ Small Group Improvement Activity; Landed cost/ total Landed Cost of Net Landed Costs; Subcontracting/outsource; Trailer on a flat car (TOFC)/piggyback; Transparency/visibility; Value chain/supply chain/demand chain; Vendor/ supplier.

Definitions of the Terms in Synonymy

1. Accessorial Charges: “A carrier’s charge for accessorial services such as loading, unloading, pickup, and delivery”. Synonym: Accessorial Fee.
2. Accounts Payable (A/P): “A financial term referring to the amount of transactions which have been accrued but not paid to a vendor”. Synonym: Accounts receivable.
   Accounts receivable (A/R): “On a company's balance sheet, accounts receivable is the amount that customers owe to that company”. Sometimes called trade receivables, they are classified as current assets assuming that they are due within one year. Synonym: Trade receivables.
3. Accumulation Bin: “A place, usually a physical location, used to accumulate all components that go into an assembly before the assembly is sent out to the assembly floor”. Synonymy: Assembly bin.
4. After-Sale Service: “Services provided to the customer after products have been delivered”. This can include repairs, maintenance and/or telephone support. Synonym: Field Service/support.

Field Service/Support – "Field service, customer and field support, technical service, service/call management, returns, warranty tracking".

5. Backlog: "Product ordered by customer but not yet delivered. It is very similar to back order".
   Backorder: "unsatisfied product demand for which customer is willing to wait for
   shipment later, rather than cancel the order". A backorder may cause accounting complications because a vendor typically cannot charge for a product that has not been shipped, in particular if payment is made by credit card.
6. Blanket Purchase Order: "A long-term commitment to a supplier for material against which short-term releases will be generated to satisfy requirements". Oftentimes, blanket orders cover only one item with predetermined delivery dates. Synonyms: Blanket Order, Standing Order.
7. Bullwhip Effect: "It is an observed phenomenon in forecast-driven distribution channels. The oscillating demand magnification upstream a supply chain is reminiscent of a cracking whip". The concept has its roots in J Forrester's Industrial Dynamics (1961) and thus it is also known as the Forrester Effect. Synonyms: Forrester Effect, Whiplash Effect.
8. Call Center: "A facility housing personnel who respond to customer phone queries. These personnel may provide customer service or technical support". Call center services may be in house or outsourced. Synonym: Customer Interaction Center.
9. Co-Packer: "A contract co-packer produces goods and/or services for other companies, usually under the other company's label or name". Co-Packers are more frequently seen in CPG and Foods. Synonym: Co-manufacturer.
10. Distributor: "A business that does not manufacture its own products, but purchases and resells these products. Such a business usually maintains a finished goods inventory". Synonym: wholesaler.
11. Door to Door: "The through-transport of goods from consignor to consignee". Synonym: House to House.
12. End Item: "A product sold as a completed item or repair part; any item subject to a customer order or sales forecast". Synonym: Finished Goods Inventory.
    Finished Goods Inventory (FG or FGI): "Products completely manufactured, packaged, stored, and ready for distribution".
13. Fabricator/manufacturer
    Fabricator: "A manufacturer that turns the product of a raw materials supplier into a larger variety of products". A fabricator may turn steel rods into nuts, bolts, and twist drills, or may turn paper into bags and boxes. Suggested synonym: manufacturer.
14. Flatbed: "A flatbed, also called a haul brite, is a type of trailer on a truck that consists of a floor and no enclosure". Synonym: Haul brite.
15. Freight Carriers: "Companies that haul freight, also called "for-hire" carriers". Methods of transportation include trucking, railroads, airlines, and sea borne shipping. Synonym: for-hire carriers.
    For-hire carriers: "A carrier that provides transportation service to the public on a fee basis".
16. Full Container load (FCL): "A term used when goods occupy a whole container".
    Synonym: Full Truckload (FTL): Same as Full Container load, but in reference to motor carriage instead of containers.
17. Goods: A term associated with more than one definition: 1) "Common term indicating movable property, merchandise, or wares". 2) "All materials which are used to satisfy demands". 3) "Whole or part of the cargo received from the shipper, including any equipment supplied by the shipper".
    Product: "Something that has been or is being produced".
    Commodity: "An item that is traded in commerce". The term usually implies an undifferentiated product competing primarily on price and availability.
18. Gross Margin: "The difference between total revenue and the cost-of-goods sold". Synonym: Gross Profit Margin.
19. Hazardous goods/dangerous goods
    Hazardous goods: "Articles or substances capable of posing a significant risk to health, safety, or property, and that ordinarily require special attention when transported". Synonym: dangerous goods.
20. Just-in-Time Logistics (or Quick Response): "The process of minimizing the times required to source, handle, produce, transport, and deliver products in order to meet customer requirements". Synonym: Quick Response.
21. Kaizen: "A Japanese term for improvement - continuing improvement involving everyone managers and workers. In manufacturing, kaizen relates to finding and eliminating waste in machinery, labor, or production methods". Synonym: Continuous Process Improvement.
    Continuous Process Improvement (CPI): Continuous Process Improvement is a strategic approach for developing a culture of continuous improvement in the areas of reliability, process cycle times, costs in terms of less total resource consumption, quality, and productivity.

22. Key Performance Indicator (KPI): "A measure which is of strategic importance to a company or department". For example, supply chain flexibility metric is Supplier On-Time Delivery Performance which indicates the percentage of orders that fulfilled on or before the original requested date. Synonym: Scorecard.
    Scorecard: "A performance measurement tool used to capture a summary of the key performance indicators (KPIs)/metrics of a company". Metrics dashboards/scorecards should be easy to read and usually have red, yellow, green indicators to flag when the company is not meeting its metrics targets. Synonym: Dashboard.
    Dashboard: "A performance measurement tool used to capture a summary of the key performance indicators/metrics of a company". In addition, scorecards should be reviewed regularly - at least on a monthly basis, and weekly in key functions such as manufacturing and distribution where activities are critical to the success of a company. The dashboards/scorecards philosophy can also be applied to external supply chain partners like suppliers to ensure that their objectives and practices align. Synonym: Scorecard.
23. Landed Cost: "Cost of product plus relevant logistics costs, such as transportation, warehousing, handling". Synonym: Total Landed Cost of Net Landed Costs.
24. Private Label: "Products that are designed, produced, controlled by, and which carry the name of the store or a name owned by the store; also known as a store brand or dealer brand". An example is Wal-Mart's "Sam's Choice" products. Synonyms: Private label/store brand/ dealer brand.
25. Quality Circle/ Small Group Improvement Activity: "In quality management, a small group of people who normally work as a unit and meet frequently to uncover and solve problems concerning the quality of items produced, process capability, or process control". Synonyms: Small Group Improvement Activity.
    Small Group Improvement Activity: "An organizational technique for involving employees in continuous improvement activities". Suggested synonym: Committee of practice
26. Subcontracting/Outsource
    Subcontracting: "Sending production work outside to another manufacturer. This can involve specialized operations such as plating metals or complete functional operations". Synonym: Outsource.
    Outsource: "To utilize a third party provider to perform services previously performed in house". Examples include manufacturing of products and call center/customer support.
27. Trailer on a Flat Car (TOFC)/Piggyback: "A specialized form of containerization in which motor and rail transport coordinate". Synonym: Piggyback.
    Piggyback: Terminology used to describe a truck trailer being transported on a railroad flatcar.
28. Transparency: "The ability to gain access to information without regard to the system's landscape or architecture". An example would be where an online customer could access a vendor's web site to place an order and receive availability information supplied by a third party outsource manufacturer or shipment information from a third party logistics provider. Synonym: Visibility.
    Visibility: "The ability to access or view pertinent data or information as it relates to logistics and the supply chain, regardless of the point in the chain where the data exists".
29. Value chain/Supply chain/Demand chain
    "A series of activities, when combined, define a business process; the series of activities from manufacturers to the retail stores that define the industry supply chain".
    Supply Chain: (1) "Starting with unprocessed raw materials and ending with the final customer using the finished goods, the supply chain links many companies together". (2) "The material and informational interchanges in the logistical process, stretching from acquisition of raw materials to delivery of finished products to the end user". These include all vendors, service providers, and customers are links in the supply chain.
30. Vendor/ Supplier
    Vendor: "The manufacturer or distributor of an item or product line". Synonym: Supplier.

Table 2: Terms in Synonymous Relations

	Terms	Synonyms	Suggested Synonyms
1	Accessorial Charges	Accessorial fees	
2	Accounts Payable (A/P):	Accounts receivable	
3	Accumulation bin/	Assembly bin	
4	After-Sale Service	Field service	Customer service
5	Backlog	Backorder	
6	Blanket Purchase Order	Blanket order	
7	Bullwhip Effect	Forrester effect/whiplash effect	
8	Call Centre	Customer interaction centre	

9	Co-packer	-	co-manufacturer
10	Distributor	Wholesaler	
11	Door-to-door	House to house	
12	End item inventory	Finished goods	
13	Fabricator	-	Manufacturer
14	Flatbed	Haul brite	
15	Freight carriers	For-hire carriers	
16	Full container Load	Full truckload (ftl)	
17	Goods	Product	Commodity
18	Gross margin	Gross profit margin	
19	Hazardous goods	Dangerous goods	
20	Just-in-Time Logistics	Quick Response	
21	Kaizen	continuous Process Improvement	
22	Key performance indicator	Scoreboard/dashboard	
23	Landed Cost	Total Landed Cost of Net Landed Costs	
24	Private label	Store brand, dealer brand	
25	Quality Circle	Small Group Improvement Activity	committee of practice
26	Subcontracting	Outsource	
27	Trailer on a Flat Car (TOFC)	Piggyback	
28	Transparency	Visibility	
29	Value chain	Supply chain/demand chain	
30	Vendor	Supplier

Discussion of Findings

From the above discussions, it is evident that lexical relations (antonymy, hyponymy, synonymy) exist among terms in the SCM vocabulary. However, lexical relations such as homonymy, meronymy and polysemy have not been observed in this study. Table 1 above displays antonyms and hyponyms highlighted in the vocabulary of SCM. A close scrutiny indicates six terms that have antonymous relations with other words and four terms as hyponyms. The antonyms include: Business-to-Business (B2B)/ Business-to-Consumer (B2C); House to House/Door to Port; Full container load (FCL)/Less- Than-Container load (LCL)/ Half container load; First In First Out (FIFO/ Last In First Out; Extranet/Intranet; Hard Copy/Soft Copy. All the pairs of antonyms are derived from a close scrutiny of entries in the glossary. Two exceptions are the terms 'Half container load' and 'soft copy' which are not indicated in the glossary but was derived from the meanings of 'Full container load' and 'hard copy', hence they are suggestions by the researchers. The hyponyms indicated above are Code, Inventory, Conveyor, and Picking. From a close scrutiny of the glossary by the researchers, it was discovered that these key words have components or different types; hence the co-hyponyms highlighted on the table were derived from the glossary.

In Table 2 above, thirty synonyms as derived from the Supply Chain and Logistics Glossary were highlighted. This shows a preponderant occurrence of words with similar meanings in the SCM vocabulary. The second column 'synonyms' indicates words that are observed in the glossary. On the other hand, the last column tagged 'suggested synonym' highlights the original inputs of the researchers where related or similar terms are added to the keywords. In this connection are words such as customer service, co-manufacturer, manufacturer, commodity, community of practice (henceforth CoP). For the purpose of clarity, Communities of practice are groups of individuals who share a concern or a passion for what they do and learn to do it better when they connect regularly. It is a concept in learning theory coined by Anthropologist Jean Lave and Etienne Wenger in 1991 to describe a method of learning otherwise known as apprenticeship as a learning model. Instead of simply acquiring information through a coded source, this includes regular interactions

and sharing of knowledge amongst subject matter experts. In organisations, CoP exist as as learning networks, thematic groups, or tech clubs (Wenger-Trayner &Wenger-Trayner, 2015). For example, a group of fashion designers who meet on weekly basis will definitely discuss trends and challenges in their businesses. Arguably, CoP can also be identified in the General Annual Meetings of accountants, engineers, lawyers and other professions in Nigeria.

Conclusion

The study concludes by affirming that lexical semantics can be applied to the vocabulary of SCM. In specific terms, the semantic functions of lexical relations such as antonymy, hyponymy, polysemy and synonymy can also be identified as a meaning making mechanism whereby meaning can be derived from the interrelatedness of words. This aligns with the views of Oni (2020) that meaning of words may not always be analysed using dictionary or denotative meaning. From the study, it can be observed that words relations can exist beyond what is indicated as available resources of the selected glossary. For consideration is the words 'soft copy' as an antonym of hard copy, and CoP, a suggested synonymy of quality service.

Abstract

According to Carayannis in the editor's note, the knowledge economy emphasizes views on economics, management, law, and political science. Interestingly, this spectrum does not accommodate language and linguistics which should ordinarily provide the basics for any knowledge. For instance, ambiguity a central part of semantics is considered a fundamental issue in language and communication hence the need to situate a robust study on the knowledge economy from a semantic platform. Indeed, from literature, the greatest challenge of the modern society appears to be related to meaning in communication. In the business context for example, observation shows that revisions on International Commercial Terms (INCOTERMS), may lead to misconceptions, and misunderstanding of terms in international trade. Inevitably, it appears that modules of training in entrepreneurship studies in our higher education have not incorporated sufficient complements of language studies; hence this study explores the nature of meaning in the bourgeoning knowledge economy. This reality provides justification for this study. Data drawn from five sectors of international trade comprised a hundred (100) lexical items for 20 graduate and 30 undergraduate students in the Entrepreneurial Development Studies (EDS) class of Covenant University. A questionnaire was used to elicit the respondents understanding of key concepts. Findings revealed that only 146 (24.33%) out of 600 items were interpreted correctly by the undergraduates whereas the postgraduate students had 35.5% of correct elicitations. The methodological framework is the Business Semantics Management by Pieter De Leenheer (2009) that converges stakeholders to fashion out meaning in business interactions.

Keywords: Semantics, Business Semantics Management, Knowledge Economy

Introduction

There is a strong correlation between language and capacity building in the knowledge economy. The basic medium for providing sustainable education is language hence knowledge, skills, literacy is only transferable to learners through the use of language and meaningful communication in every aspect of training. An Understanding of how words create meaning in communication indicates the significance of language in all aspect of human endeavours. As an indispensable tool of communication, language is pivotal in the realization of destinies: it answers to the economy, mental, educational, religious pursuits of man to mention a few.

Human communication is observed as a process of creating meaning between two or more people as much as 'a bridge between diverse people' Scott and Brydon (1997). In a society where the most brilliant men exist without a means of communication, such groups of people wallow in dearth of survival, obscurity, confusion and absence of any meaningful development. Communication is therefore crucial for advancement in life. A prominent aspect of study which highlights meaning and mutual understanding among interlocutors in a specific context of language use is semantics. Very critical to entrepreneurial development and success therefore, is the study of semantics considered a fundamental issue in business communication in the Knowledge Economy.

According to Ross (2018), communication quality focuses on whether the meaning of a message is clear. Notwithstanding, linguistic in capabilities and misunderstanding have been the bane of our populace and

CHILUWA "The Semantics of International Trade in the Knowledge Economy: the Nigerian Example" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

entrepreneurs in their economic pursuits at the global level. When these create vagueness and barriers in meaning, agreements are in conclusive because majority of key concepts in the domains are not understood during communication. Indeed the greatest challenge of the modern society appears to be related to appropriate meaning in communication as exemplified by its magnitudes of losses and litigations in the various transactions of international trade. How can language provide the panacea for global trade in this era of knowledge economy in the Nigeria context?

This paper therefore highlights the role of language for expressive, intelligible, and robust communication, knowledge transfer, clarity of meaning and correct interpretations of concepts in the domains investigated. Such linguistic awareness definitely promotes entrepreneurship, and enhances rapid global relevance for entrepreneurs in international trade. Since a study of lexical resources highlights diverse business terms in the knowledge economy, the issue of misunderstanding and delays for parties in global transactions will be drastically reduced. Therefore, situating a study based on language in the knowledge economy not only discusses meaning and the correct interpretation of information but it significantly contributes to strengthening, and re-shaping the entrepreneurial capacities in Nigerian businesses.

The need for countries to engage in bilateral and multilateral trade transactions for the sales of goods and services creates an international economic order, 'where the developed are self- reliant and the developing countries dependent on them for survival'. However, international trade is observed as the escape route for under-development in the developing countries since the developed ones are viewed as, 'holding the key to rapid economic development' hence economic transactions with them cannot be ignored (Olofin 2001). This trading involves tangible products, (consumables) and intangible products (services) traded on the global market or world economy where prices, supply and demand affect and are affected by global events (Heakal, 2015). In this study, banking, logistics, supply, transportation are services which are intangible products exchanged globally between the nations of the world.

Arising from the above discourse, the overall aim of this paper is to identify and authenticate the lexical resources available in specific domains of international trade mentioned above. In addition, an examination of language in the business context of international trade impacts on knowledge to build capacities for entrepreneurial development in Nigeria. The study begins with a theoretical framework of Business Semantics Management and its role in business communication, a literature review of the scope of semantics, semantics and the professions, semantics and international trade as well as the era of knowledge economy.

The study was concluded with recommendations**,** first to curriculum developers on how to incorporate domains of international trade into academic scheme of work; the need to introduce courses and skills in entrepreneurial development studies (EDS) valuable for export thereby boosting the students' interest. To the students, the need to utilize online resources for entrepreneurial skills would definitely yield dividends. That is, a keen search and 'devotion' beyond their field of study.

The Scope of Semantics

Kim Ballard (2007) posits that semantics is the study of meaning as a crucial component in language and communication study because it deals with meaning which is central to language as a human activity. Linguistics semantics is exclusively concerned with making meanings out of words, phrases, grammatical forms and sentences which are linguistic expressions.

Lobner (2013) asserts that the central objective of semantics is to expose the knowledge of the meaning of words and sentences.

These definitions highlight the import of shared meaning which can be observed at the level of ideas, concepts, individual words, symbols. Moreover, meaning also extends to professional life and everyday living in the society. That is, communication can never be achieved when meaning is elusive and not shared by interlocutors.

Semantics and the Professions

Ogbulogo (2005) asserts that different disciplines, occupations and fields of specialization utilize special terms, concepts and expressions known as registers in their everyday activities.

According to Lunenburg (2010) when communication takes place in an organization within a framework of shared experience, there is benefit that the message sent and received will have a shared- meaning, otherwise efforts in

communicating will be wasted. However, choice of language in business setting will vary depending on the formality and informality of a given situation.

Moore (2013) highlights that for example; successful communication by school administrators is the essence of a productive school organization. School administrators communicate with other people during administrative function and activity, whether in planning and organizing or leading and monitoring, hence the importance of direct or indirect communication. This view aligns with the notion of success being linked to communication in any setting as upheld in this paper.

Ross (2013) highlights that a shared, well-structured business vocabulary provides meaning (semantics), and coherency to business rules and requirements. Therefore, a precise definition for each term should be given explicitly in a business-oriented fashion, free of any IT jargon to communicate business rules effectively in today's ever more knowledge intensive world.

According to Crichton (2018), there is the growing importance of communication as a form of professional expertise that needs to be made visible and developed as a resource for the professionals. This highlights language and communication as significant to professionals, their clients and stakeholders.

Semantics and international trade

The homepage of Scarbrough highlights language as one of the most complex and important tools of global trade. As in any complex and sophisticated business, small changes in wording can have a major impact on all aspects of a business agreement. They further assert that word definitions vary according to industry as observed in global trade. As such for business terminology to be effective, phrases must mean the same thing throughout a particular industry. The position of Scarbrough is accepted as truly semantic since it highlights the import of meaning and lexical resources in international trade.

Melitz and Toubal (2014 in Egger and Lassmann, 2015) provide a significant step towards understanding the bilateral trade effect of common languages. This was based on data from 195 countries with 42 common native and spoken languages. The joint influence of the various aspects of common languages is found to be at least twice as high as that of a common official language. Their findings demonstrate that common spoken languages are particularly important. The ease of communication, indeed, highlights the essence of common languages for bilateral trade.

Methodological Framework

Business Semantics Management (hereinafter BSM) is the collection of activities according to De Leenheer (2009) to put company stakeholders together to collaboratively realize the reconciliation of their diverse metadata; and then the application of the derived company semantics patterns to create semantic alignment between the underlying data structures. He also says,' In BSM, market experts settle on a shared base of business semantics. That is, the meaning of vocabulary and rules used for procedures, data and applications to be communicated and structured. Once again, this happens according to those rules and company objectives. By heterogeneous metadata, he refers to existing and varied business information at the disposal of individual organisations which need to be collated and merged, 'scoped' before being utilized by stakeholders.

Since BSM exposes how business stakeholders negotiate meanings in organising data that pertain to their businesses, emphasis is on communication of information in business. This is achieved through two complementary processes of semantic Reconciliation and Semantic Application Cycles that establish BSM. Below is a diagram from De Leenheer's page that shows the full-cycle business semantics management. This is achieved through two complementary processes of semantic Reconciliation and Semantic Application Cycles that establish BSM.

The Business semantics management is established by two operational cycles each grouping a number of modeling activities. As the first cycle of the BSM approach, Semantic Reconciliation uses the extraction, refinement, articulation and consolidation of fact-types from existing sources, such as natural language definitions, existing metadata, which produces a range of consolidated language-neutral semantic patterns with informal description of meaning (for example, WordNet word senses) useful for the construction of different semantic applications. This first stage aligns with the terms selected from existing glossaries for investigation in the different domains. According to De Leenheer, the Semantic Application as the second cycle of business semantics management entails two activities: select and commit.

This denotes a selection of relevant semantic patterns from established sources of knowledge and resources that are dedicated to a stakeholder's semantic understanding. That is, stakeholders engage in the negotiation of meanings of the common terms they share within organisations in the industry. For instance, in pursuit of building bridges of meaning across diverse international business operators, the International Chamber of Commerce (ICC) created the International Commercial Terms (INCOTERMS) since 1936. The purpose was to provide a set of international rules for the interpretation of the most commonly used trade terms such as DAF: 'Delivered at Frontier'; CPT: Carriage Paid To (named place of destination) among others.

With the use of INCOTERMS, the uncertainties of different interpretations of trade terms, in different countries have been reduced to a considerable degree. (http://www.rhinotrans.com/clients/incoterms/article/2205/). This informs the need for entrepreneurs to engage the methodology of BSM which thrives at making business organisations to excel in business communication and information management, thereby making entrepreneurs masters in their field of endeavours. As such, BSM as a methodology aligns with the ideals of General Semantic Theory (GST) which aims at 'delineating human beings from their weaknesses to make them masters of their own fates' (Korzybski, 1933). This position corroborates De Leenheer (2009) view of 'capture the semantics of a business domain in a way that would enable …….value creation aspects'.

Basically, a 'problematization of the world within which language operates' indicates the existence of communication barriers without a good grasp of common lexical concepts and terminology in any industry. Since language facilitates communication in business, the need for shared meaning among stakeholders in any business context becomes non- negotiable. Hence, to fill this gap in the language of international trade demands an explication of available lexical resources which this study sets out to accomplish. On this premise lies the essence of Business Semantic Management, a methodological approach in business organisations.

The starting point of any BSM is the identification of domains and collection of meta language. Since this work is exploratory for the purpose of right methodology, we intend to draw from existing wordstock domains and to test the extent to which prospective business persons and professionals can identify with these terms.

The Era of Business Semantics Management

De Leenheer (2009) identifies Business Semantics Management as the set of activities which enables business stakeholders to collaboratively realize the reconciliation of their heterogeneous metadata; and consequently the application of the derived business semantics patterns to establish semantic alignment between the underlying data structures. Thus, business experts decide on the meaning of vocabulary used to communicate and coordinate processes, data, and applications in the different corporations based on certain rules and business goals. By heterogeneous metadata, De Leenheer refers to existing and varied business information at the disposal of individual organisations which need to be collated, merged, and 'scoped' before being utilized by stakeholders.

The Knowledge Economy

The knowledge economy is observed to be a dynamic new era where intangible resources such as knowledge, social capital, information and communication technologies are seen as the 21st century drivers of economic growth**.** In this context, there is greater reliance on intellectual prowess and capacities instead of the traditional factors of production (Takeuchi & Shibata, 2006; Carayannis, Popescu, Sipp & Stewart 2006). In a related event, Nonaka & Takeuchi (1995 in Tan & Rao, 2013), argues that the creation of new knowledge extends beyond information processing. Takeuchi et al (2006), highlights certain strategies and interventions that enable the knowledge economy to thrive. These include technology and especially ICT, harmonious policy and institutional environment, a regulatory framework, and an innovative business environment that promotes innovation.

However, the World Bank Knowledge Economy Assessment (KEA) framework cited in Keber (2011) opines that the four pillars of the knowledge economy are economy incentive, innovation, and education and information infrastructure. In line with the views of the World Bank, this study leverages on education and information infrastructure (ICT) as tools for innovation. This informs the choice of our respondents as university students. As such, education is a critical component of the knowledge economy which is non-negotiable for sustainable development in any country. Through education and training policy 'more highly skilled workers' are developed to support innovation and entrepreneurship (Brown, Lauder, & Ashton on behalf of TLRP, 2008).

The involvement of education in economic growth occurs through the creation of new knowledge and the transfer of knowledge and information. That is, schools provide the education necessary for learning and transmission of this new information and technology. In this regard, language therefore remains crucial for literacy, transfer of knowledge and skills to learners in every aspect of teaching and training. In essence, 'the innovators or creators of

new technology' can only be those individuals who have received specialized training in their education (Cavusoglua 2015).

The Knowledge Economy in the Nigerian Context

The Nigerian economy has not maximized the provisions of the knowledge-driven ethos. Faborode (2016), for instance, describes the Nigerian situation as 'a mono-cultural economy. That is, overdependence on the oil mineral at the detrimental productive sectors like agriculture and manufacturing. As hinted by the author, an investment in the manufacturing sector, for instance, in the oil sector and the agro industry will fast track Nigeria's enlistment in the 'globally competitive industrial countries' through high level knowledge activities. Even within the framework of industrialization, a critical factor would be the knowledge-base which would depend on the quality of our education.

It is therefore imperative and in line with Osinbajo (2014) and Faborode (2016) that purpose driven research be conducted in the area of the knowledge economy. This will require leveraging on ICT and advancing the scope of study in core areas such as international trade. It is believed that a good starting point would be the language domain hence, the need for this research. Carayannis, Popescu, Sipp & Stewart (2006) opine that some economic factors such as improved speed and ease of communications and interaction in the productive cycle are created by innovative technologies to reshape the global economic landscape. Therefore, technological learning and information and communication technologies (ICT) are identified as fostering entrepreneurial development (businesses) in the knowledge economy of developing and transitioning economies (Bukht, Rumana, Heeks & Richard, 2018).

As such, the way forward for the Nigerian economy is tied to the development of education at all levels. Indeed, the relevance of higher education for national development should not be compromised as opined by (Osinbajo, 2014; Faborode, 2016). More significantly, the university is reckoned a beacon of hope and centre of excellence for creative innovations, as such a study on the knowledge economy is worth being situated in the university context.

Methodology and Data Collection

The survey method of research was used in collecting data for this study. A face-to-face survey questionnaire was used to elicit information from students of Covenant University as the primary source of information. The research instrument was a customized semantic questionnaire administered by the researchers to a total of 50 students at various locations on the campus. These questionnaires had twenty questions structured on five domains of international trade such as banking, logistics, supply, transport and trade terms each requesting the meaning of twenty concepts in those service areas.

The system of the face-to face- questionnaire presented some unique advantages as each respondent wrote only what he knew about the concepts in each domain investigated. That is, none utilized other reference materials to derive meaning. Moreso, the researchers had the control of identifying the respondents' colleges and level of study. This method gave the researchers uninhibited raw data from the subjects.

Since it was impossible in terms of time constraint and limited resources to collect linguistic data from every student in this academic community, the study opted for a convenience purposive sampling. The undergraduate students drawn from the four colleges of the university had the following distribution. Colleges of Business and Social Sciences (CBSS) and College of Science and Technology (CST) had a distribution of 8 respondents each whereas College of Leadership & Development Studies(CLDS), and College of Engineering (COE) had 7 respondents each, totaling 30 students reflecting their differentials in students population. However, with an equal distribution of 20 postgraduate students, there were five respondents in each of the four colleges where each of them answered 20 questions (1 questionnaire). Hence, this study was restricted to only thirty undergraduate and twenty postgraduate students of Covenant University in Nigeria.

The rationale for using this research design include: to identify the service domain most familiar to the students, and to determine the level of entrepreneurial capacities of EDS students in the knowledge economy. Also, an investigation of the meanings given by the respondents will equally reflect the semantic prowess of students and their level of exposure in the observed language of global trade. Thus, the research design enabled this study to account for the variations in the level of familiarity among students. Data were analysed under three columns: 'Correct', for acceptable meaning, 'No Idea (NI)' for blank spaces, denoting concepts the respondents had no idea of and 'Wrong (W)' for mis-defined terms. However, during tabulation the NI and W labels were compressed for easy calculation of results which were presented in simple percentages.

Domain Selection Rationale

The five domains for this study: banking, logistics, supply, transport and trade terms were purposively selected based on their significance in the transactions of international trade. Banking, logistics, supply, transportation are prominent service domains in global business while trade terms are formulated by the International Chamber of Commerce (ICC) to facilitate communication among members. The banking sector provides the needed financial support to international businesses by providing letters of credit and other financial services for exporters and importers. The banks also act as intermediaries protecting the financial interest of the parties involved to avoid losses in international businesses. Aside business funding, transportation and delivery of commodities are essential services in the system as enabled by the above domains.

International Commercial Terms (INCOTERMS) provide trade terms which are technical lexical resources that facilitate trade transactions among other domains. According to Scarbrough 'In order for business terminology to be successful, phrases must mean the same thing throughout the industry, so INCOTERMS are intended to build a bridge between various industry stakeholders wherever their business operates. For the purpose of assessing lexical resources of those international trade domains, the online sites visited are listed below: https://www.iaspaper.net/incoterms-ddp-up.sc, Glossary of Supply Chain Terms from http://www.inboundlogistics.com/cms/logistics-glossary/.

Data Presentation and Analysis

This section presents the interpretation and analysis of the findings from the data collected in this study. The first section presents the word list used to elicit meaning in two out of the five domains of international trade whereas the next section presents the respondents' test score numerically using simple percentages.

Table 1: Semantics of International Trade: Undergraduates Respondents

DOMAINS OF INTERNATIONAL TRADE	COLLEGES	NO. OF RESPONDENTS/NO OF QUESTIONS		SCORES OF RESPONDENTS		PERCENTAGE OF SCORES

Discussion, Findings, and Recommendation

From the undergraduate respondents' scores, only 146 (24.33%) items were given correct elicitations out of a total of 600 concepts, meaning 454 (75.67%) were wrongly interpreted. A look at the different columns of the domains of international trade presents the following numerical and percentage scores: banking: 47(29.38%) correct meanings against 113 (70.62%) wrongs. Logistics had 10(12.5%) correct meanings against 70 (87.5%) wrongs, Supply had 39(32.5%) correct meanings against 81(67.5%) wrongs, Transportation had 34(21.25%) correct meanings against 126 (78.75%) wrongs, Trade Terms had 16 (20%) correct meanings against 64 (80%) wrongs.

One of the main purposes of investigating language in the domains of international trade is to identify and highlight linguistic meaning of the concepts used within the different domains. When data from the different industry were collated and analysed, the following were observed as findings.

Some of the domains in international trade, for instance, trade terms, logistics, transportation appear too technical for the non-professionals, as shown in the report of scores above. However, most respondents felt more 'at home' with terms in the domain of banking.

A high level of vagueness was exhibited when respondents rely on the surface meaning of the lexical items in the concepts. This increased the range of difficulty encountered by the respondents with regard to the meanings of the terms in each domain. Consequently, respondents were quick to remark that the domains on the questionnaires were unrelated to their field of study. The significance of meaning to the language of international trade upholds the notion of De Leenheer that 'business is only possible when there is an expectation of shared meaning among parties in transactions'.

Thus the results demonstrate that the respondents' acquired proficiency in English cannot salvage the impact of language barriers caused by ignorance in the language of international trade.

Conclusion

From the observations, it would appear that the business climate is scarcely understood by a greater percentage of our sample size. This position can be extrapolated for a wider population bearing in mind that Covenant University is a purpose built institution for leadership, professionalism and entrepreneurship.

Our observations could also suggest that a lot of prospective entrants into the world of entrepreneurship are basically ill-equipped. Thus there is a huge suspicion that Nigeria may not be primed well enough for the knowledge economy.

We consider this research as a catalyst to a more rigorous investigation of the state of affairs. That is why our emphasis has been to point the way forward to more elaborate engagements in the global trade domain.
We now recommend a strong overhaul of our language teaching modules to incorporate aspects of English for business purposes. And in that remodel package, business semantics will find a good place.

Gender-Based Violence and Negative Outcomes in Post-Primary Educational Institutions: Implications for Strategic Leadership Engagements

Abstract

Gender-based violence (GBV) is a 21st century reality across all nations of the world. GBV is observed to present various long and short term negative outcomes in women and girls especially. These outcomes could be educational, social, physical or/and psychological consequences, including low self-esteem. Low self-esteem tends to hamper adolescents' academic motivation and psychological wellbeing. This study investigated the self-esteem outcomes of GBV among adolescent girls in post-primary schools across Lagos, Nigeria. The design adopted for the study was descriptive survey using multistage sampling technique to enlist a total of 588 sexually abused and 576 non-sexually abused female adolescents from three educational districts of Lagos State. The Rosenberg Self-esteem Scale (RSES) and Child Sexual Abuse Questionnaire (CSAQ) were used to obtain data. The results indicate that female adolescents who had experienced GBV in form of sexual abuse reported lower self-esteem levels than their non-sexually abused counterparts. The implications of the findings for strategic leadership engagements at home, school, community and national levels were discussed.

Keywords: Gender-based violence, sexual abuse, self-esteem, secondary school adolescents.

Introduction

Gender-based violence (GBV) is a 21st century reality across all nations of the world. GBV is a brutal human rights violation with no social, racial, economic or geographical boundaries (United Nations Educational, Scientific and Cultural Organization [UNESCO], 2014.). It refers to both acts of violence directed towards persons on gender basis and violence against women and girls in particular (David et al. 2018; United Nations [UN] Women, 2020). GBV encompasses various kinds of violence including child trafficking, female genital mutilation, forced/early marriage, acts of domestic violence, and physical, emotional or psychological as well as sexual violence/abuse (UN Glossary, n.d.; UN Women, 2020). More specifically, in sexual violence research, sexual violence against children and adolescents as a form of GBV is employed as an umbrella term for various kinds of sexual acts, including Child sexual abuse [CSA] (Together for Girls [TFG], 2019; UNICEF, 2020).

Although the true burden of GBV is unknown, the World Health Organization (WHO, 2013) estimates that physical or sexual intimate partner violence or non-partner sexual violence is experienced by at least 33% of women, globally. In Nigeria in particular, the National Demographic Health Survey (NDHS, 2018) reported the 30% of girls and women between ages 15 and 49 had suffered from sexual abuse. In reality, GBV begins at childhood with many survivors of GBV being under the age of 18 (Multiple Indicator Cluster Survey (MICS, 2018). These figures present the reality of the situation of girls in Nigeria and indeed Africa as a whole. The statistics are fuelled by the gender discrimination allowed by African traditional norms and milieu which permits a culture of toxic masculinity. Adverse religious beliefs also contribute to the pervasiveness of GBV in Nigeria (David et al., 2018). Furthermore, the culture of silence built around most African societies, the fear of stigmatization makes most cases of GBV underreported (UN Women, 2020). While GBV also occurs with men and boys, and perpetuated by females, the menace occurs more with women and girls as perpetuated by males (David et al., 2018).

The outcomes of GBV in women and girls often present in different shades of long and short term negative consequences. These outcomes could be educational, social, physical or/and psychological consequences. Educationally, GBV could stand as an obstacle to education and learning (Gesinde, Okunlola & Dada, 2019; UN women, 2020). Socially, GBV victims tend to be withdrawn (W.H.O., 2020) and physically victims could experience unwanted pregnancies and HIV/AIDS (UN Women, 2020). Psychologically, GBV could yield negative outcomes such as anxiety and depression (Ali & Ali, 2014); suicidal ideation (UNICEF, 2017), as well as low self-esteem (Freeman & Temple, 2010; Ali & Ali, 2014; Adigeb & Mbua 2015).

Previous studies had indicated that the major source of human self-esteem is experience (Nigussie, 2014; Henriques & Shivakumara, 2015). This presupposes that negative experiences such as exposure to GBV, including sexual abuse, could have distressing effects on a person's evaluation of his or her self-worth (Henriques and Shivakumara, 2015). A number of studies have established that adolescents, who experience GBV including sexual abuse, tend to show significantly lower levels of self-esteem than their non-abused counterparts (Lamoureaux, Palmieri, Jackson & Hobfoll, 2011; Foster & Hagedorn, 2014; Singh, Parkesar & Nair, 2014). Just like sexual abuse, emotional abuse has also been reported to influence adolescents' self-concept. For instance, Gesinde (2011) reports that seven dimensions of emotional abuse mutually account for 28.0% of the variance in adolescents' self-concept.

In a Swedish research among high school students, Priebe, Hannson and Svedin (2010) conducted a school based study among 1,107 students; the results showed that sexual abuse was highly related to various negative outcomes including poor level of coherence, emotional and behavioural difficulties, as well as low self-esteem. The study revealed that participants who reported a history of sexual abuse had significant correlations with reduced self-esteem. Similarly, an Indian study (Henriques & Shivakumara, 2015) comprising 40 sexually abused and 40 non-sexually abused adolescents, investigated the self-esteem and psychological distress of sexually abused and sexually non-abused adolescents. They found that the self-esteem of the participants differed significantly, with the sexually abused participants having lower self-esteem levels than their non-abused counterparts. Priebe et al. (2010) also found that the more the severity of the abuse, the poorer the psychosocial health of the adolescents.

While low-self-esteem is not the only negative outcome that sexual abuse as a form of GBV presents, a healthy self-esteem is important for a person's overall functionality. Meanwhile in modern day mental health research, self-esteem has been recognised as an important factor in adolescent health and well-being (WHO, 2015; UNICEF 2017); and low self-esteem tends to hamper adolescents' academic motivation and psychological wellbeing (Chinawa et al., 2015). Apart from this, low-self- esteem has also been listed has one of the leading contributors to adolescent suicidal behaviour (WHO, 2017). Self-esteem refers to self-liking, self-respect and a person's perception of his self-worth (Rosenberg, 1965). It is a subjective and personal assessment of a worthiness of a person (Harris & Orth, 2019). Theoretically, the underpinnings of Maslow (1987) present self-esteem as a very important need of not only adolescents, but all human beings.

Sexual abuse as a form of GBV is indeed widespread (UN Women, 2020) and appears to be on the increase (Sodipo et al., 2019). Its negative outcomes on adolescents in educational institutions are also evident (UNESCO, 2014), including low-esteem (UNESCO, 2014; David et al., 2018). These evidences however appear to be more researched among the western and Asian contexts leaving a lacuna within the Nigerian context. Put in another form, published evidences on the relationship of GBV and decreased self-esteem among adolescents appear far-fetched within the Nigerian research space (Okunlola, Odukoya & Gesinde, 2018). This study therefore investigated low-self-esteem as one of the negative outcomes associated with GBV among both sexually abused and non-sexually abused adolescents from post-primary (or secondary) educational institutions in Lagos, Nigeria with the view of comparing which of the groups reported lower self-esteem levels. The study also highlighted the implications of strategic leadership engagements across various levels of leadership.

Methods

This study adopted a survey research design and was conducted within the 2018/2019 school year. The population for the study included all public secondary school female adolescents in Lagos State, South west Nigeria. Out of the six educational districts of the state, only three were randomly selected. A total of 1164 participants, aged 11-19 were selected through a set of multistage sampling protocols. Authorisation for the study was gotten from both the Covenant University Research Ethics Committee and the Lagos State Head of Public Service. Assent and consent were also obtained from participants, school heads and parents of participants below age 18. The participants confidentially completed measures of sexual abuse and self-esteem using the Child Sexual Abuse Questionnaire (CSAQ) and the Rosenberg Self-esteem Scale (RSES) respectively. The CSAQ is a 15-items questionnaire developed by Mohler-Kuo, Landolt, Maier, Meidert, Schonbucher, and Schnyder (2014. Participants were required to answer "yes" or "no" to the items indicating experiences of contact and non-contact forms of sexual abuse. The RSES on the other hand is a 10-items scale developed by Rosenberg (1965) and it follows a 4- point Likert scale form which ranges from strongly

agree (SA) to strongly disagree (SD). To analyse the data obtained, descriptive statistics was performed using the Statistical Package for Social Sciences software (SPSS) version 23.0.

Results

Table I: Comparison of the Level of Self-esteem between Sexually Abused and Non-Sexually Abused Adolescents in the Study

	Sexual Abuse Status			
Self- esteem	**Non- Sexually Abused**		**Sexually Abused**	
	F	**%**	**F**	**%**
High	44	3.8	14	1.2
Moderate	426	36.6	390	33.5
Low	106	9.1	184	15.8
Total	**576**		**588**	

As shown in table 1, slightly more than half of the adolescents (n=588, 50.5%) reported a history of GBV in the form of sexual abuse, while 576 (45.5%) reported they had never experienced sexual abuse. The table also reveals that among the non-sexually abused, 44 (3.8%) reported a high level of self-esteem, whereas, only 14 of the sexually abused participants (1.2%) reported same. Meanwhile 106 non- sexually abused participants (9.1%) reported low levels of self-esteem while among the sexually abused participants, 184 (15.8%). This indicates that sexually abused adolescents experienced lower self-esteem levels than their non-sexually abused counterparts.

Discussion

The findings from this present study reveals that female adolescents from public post-primary educational institutions in Lagos state, who have experienced GBV in the form sexual abuse show lower levels of self-esteem than their non-sexually abused counterparts. This finding confirms previous literature that established decreased self-esteem outcomes among adolescents with various gender-based violence experneices, including sexual abuse. In the study of Duckett (2015), the influence of sexual abuse on the identity development and self-esteem was examined. 208 first-year female undergraduate students were sampled from Illinois State University, USA, and found that sexual abuse was related to decreased self-esteem in the participants. Other studies such as Kim, Park and Park (2017) in Korea and Mutavi, Obondo, Mathai, Kokonya, and Dako-Gyeke (2018) in Kenya, also confirm the findings from this study. Conversely however, Park, Lee and Jun (2017) in their study comparing self-esteem levels of North Korean Adolescent Defectors (NKADs) and South Korean Adolescents (SKAs) who had experienced sexual abuse, discovered that a significant positive relationship between sexual abuse and self-esteem among the NKADs in their study but not with their counterparts from South Korea. This implied that among the NKADs, sexually abused participants reported higher self-esteem. The authors suggested that the outcome might be due to the psychological relief that the NKADs may have experienced, following a relocation from their home countries where their sexual abuse experiences took place and were likely to evaluate themselves in a more positive light. The psychosocial support received by the NKADs may also have influenced the association between the traumatic experiences and self-esteem of the adolescents.

Implications for Strategic Leadership Engagements

Gender Based Violence (GBV) prevention requires strong strategic leadership engagements and interventions, (The United Nations High Commissioner for Refugees [UNHCR], 2011). A menace such as GBV including sexual abuse has truncated the dreams and aspirations of much young adolescence in Nigeria; it has led to marital challenges, loss of job and even death in some instances (Small Arms Survey, 2016). GBV requires strategic efforts from leaders at various organizational levels not only to prevent the problem, but also to make the strategies effective and sustainable. Strategic leadership has been described as that phenomenon which deals with "the possession of unique abilities that allows for the absorption and learning of new information and ideas, and having the adaptive capacity to appropriately respond to the dynamism and complexity of the external environment" (Shoemaker & Krupp, 2015). In responding to gender based violence, it involves application of different strategies to resolving the challenge in our society.

Leadership at various levels such as the government, civil societies, educational institutions, religious institutions and community institutions can play different roles in curbing the peril of gender based violence including sexual abuse. It is a common knowledge that gender based violence including sexual abuse is often perpetuated by individuals, preventing it or dealing with its outcomes requires an all-inclusive approach (Krug, Dahlberg, Mercy, Zwi, & Lozano,

2002) Therefore, leadership across various levels can play a huge role in managing the consequences and outcomes of gender based violence.

- Government – the Government has the responsibility of churning policies, developing legislations and enforcing the framework that creates safe environments for citizens particularly those at risk of gender based violence. There is the need for government to create alertness on the issues of gender based violence including sexual abuse. This will help people to know what to do to prevent it from happening and in case it happens, it will help them to know what to do. The government is also responsible for the training and empowerment of the law enforcement agencies so as to enforce the law adequately and promptly against perpetrators.
- Civil Societies – at the level of civil society leadership, advocacy and lobbying could be a great strategy to ensuring that government measure up to her responsibilities. Civil society organizations have also been known to provide medical care, counselling, skills training, and food for the survivors of gender based violence (UN Women, 2020).
- Educational Institutions – educational institution is one of the social establishments outside of the family and needs to first of all provide a safe environment for children against any form of abuse (UNESCO, 2014). Educational institutions need a clear policy on gender based violence including sexual abuse, which should be displayed conspicuously in the school premises.
- Religious Institutions – Religious institutions and leaders are assumed to be powerful and highly influential. The climate of religious institutions and the posture of religious leaders have the ability to drive attitudinal change and bring profound social change, including regarding GBV. Religious leaders can be intentional in the pursuit of attitudinal change through teaching, training and discipleship. They also can provide spiritual care and support for the survivors of gender based violence through counselling and psychotherapy, assuming they have the capacity and certification to provide such services.
- Community Institutions - community leaders are often respected by their people and as such they command great influence in their communities. Community leadership is one of the oldest institutions in Africa and it has huge influence at the grass root level. Community leaders can therefore push for initiatives that can prevent GBV, Teffo-Menziwa, Mullick, and Dlamini (2010). Community leaders can play significant role in advocating and driving social mobilisation interventions. The social mobilisations can strengthen community and cultural norms, values and social practices that can address gender based violence, Teffo-Menziwa et al. (2010).

Conclusion and Recommendation

This study concludes that gender-based violence, including sexual abuse against female adolescents in post-primary educational institutions results in negative outcomes in the life of victims, including low self-esteem. This is a public health concern that requires urgent attention from not only adolescent caregivers, but also national, community and religious leaders. The findings from this study also have implications for psychological or counselling interventions. Gesinde and Sanu (2015) suggest that seeking professional counselling intercession could resolve problems. The study therefore recommends a strategic leadership thrust, led by the government to re-orientate, educate and engage the Nigerian citizenry towards prevention of GBV as well as prosecute perpetrators. We further recommend that the government should fund counselling interventions for identified sexual abuse victims who may have suffered low self-esteem among other negative outcomes of gender-based violence.

Abstract

During periods of organizational crisis, it is especially important for employees to feel the care and support of the employer, to trust the supervisor and follow him as a leader capable of managing and overcoming crisis situations. The social psychological climate within the work community plays a significant role in maintaining the stability of the enterprise, the formation of which is in the zone of managerial responsibility. A large number of previous studies of leadership are aimed at studying the professionally necessary qualities of leaders, and less attention has been paid to the influence of their personal characteristics on the social psychological climate. To identify causal relationships between the leader's individual characteristics and the social psychological climate within the labour collective forced to work under organizational crisis, the authors used a quali-quantitative approach, including such research methods as a case study, questionnaires and narrative interviews of employees. The presented study was conducted on the basis of a dairy industry enterprise in December 2019 - January 2020 with the participation of 75 employees, who, using the assessment tools proposed by the authors, characterized the adverse factors of the intra-organizational environment, as well as the personal and behavioural features of the enterprise manager. Based on the results of the study, the authors conclude that the employees of the dairy company assess the social psychological climate as unfavourable, and the manager toxic behaviour led to the emergence of a personnel crisis, which reduces the effectiveness of efforts to maintain the enterprise stability.

Keywords: crisis situation, toxicity of the internal organizational environment, social psychological climate, toxic manager.

Introduction

It is well known that one of the most important factors that determine the level of the psychological climate of the work collective is the management staff of the organization: the leaders' personal qualities, style and methods, as well as the authority of the leaders. Therefore, the main attention of researchers of the social psychological climate is often paid to the leader and the study of such characteristics as competence, education level, and work experience and management style. At the same time, less attention is paid to such a factor as the personal qualities of the leader, which determine the quality of his relationship with personnel in the organization.

Most of the research is aimed at determining the professionally significant qualities of a leader (Lysenko, Vazquez, 2019) but the influence of leader's personal characteristics on the social psychological climate in the organization has been studied to a lesser extent. Much attention is paid to the study of management styles that determine a certain course of internal processes in the team.

It should be noted that modern business, due to the high risks associated with globalization, digitalization and the high risk of epidemiological outbreaks, is forced to work in conditions of the VUCA times, characterized by instability and a large number of crisis situations (Kraaijenbrink, 2018, Pesha, Tonkikh, 2020). In times of crisis, it is especially important for a leader to be attentive to the needs of subordinates and to do everything that can be done with no harm for the company and the well-being of employees. Indifference, insensibility, abstraction of the manager from real problems determines his toxicity, aggravating the situation of the crisis, in which the personnel find themselves. While workers expect sympathy, care and confidence in the future from their leaders.

The essence of HR management in a crisis is that employees want to trust their managers (Shook, Lacy, 2020). The basis for building trust is the ability of managers to meet three groups of workers' needs: 1) natural (meeting the needs for safety and protection), 2) mental (meeting the needs for increasing psychological stability) and 3) emotional (meeting the needs for unity and involvement). Thus, in times of crisis, management based on social psychological aspects, such as culture, trust, respect and values, becomes relevant (Fedorova, Dvorakova, et al, 2018).

Naumenko (2002) determines the effectiveness of the control action by the following characteristics: 1) social status, authority of the leader, prestige of the position, etc., 2) personal qualities of a leader - charm, strong-willed, intellectual superiority, wit, self-confidence, attention to others, the capability to captivate, 3) the level of the leader's skills to adequately apply techniques, rules and methods of influencing the control object, taking into account the purpose and specific of communication, 4) the features of the leader's role behaviour. For example, a leader must possess some traits of charm, capable of generating fear and awe in people, 5) the nature of the leader's attitude to his subordinate: benevolent, tactful and helpful; depending on the situation - demanding, strict, principled.

Insufficient attention to the above personal characteristics of the leader leads to the emergence of toxic management in the company. The concept of toxic manager is used to identify an employee in a managerial position who harms the social and psychological well-being of staff, in particular, and the organization as a whole (Fedorova, 2013, Kulkova, 2017, Koropets, 2019). The destructive influence of a toxic manager is the cause of the crisis of the organization's personnel. Such leadership style has a negative impact on employees: it contributes to the emergence of a "distrust syndrome", reduces the level of involvement and motivation of employees, and worsens the social psychological climate in the team.

Moreover, the presence of toxic management directly leads to deterioration in the social psychological well-being of employees and to a decrease in the effectiveness of their activities. For example, Lubit, who studied the phenomenon of toxic management, believes that for effective management of people it is necessary to understand and correctly assess their behaviour (2008). The capability to understand and manage your own and other people's feelings and emotions is called "emotional intelligence". Salouay (1990) and Mayer (1981), studying emotional intelligence, define it as the ability to perceive and understand personality manifestations expressed in emotions, to control emotions through intellectual processes. According to Goleman, emotional intelligence is divided into four parts: 1) the ability to perceive both one's own emotions and those of others, 2) the ability to use emotions in favour of the mind, 3) the ability to understand emotions, 4) the ability to control emotions (1998). Later, a connection was found between the characteristics of emotional intelligence and business performance: leaders, whose emotional intelligence is more developed, manage their teams much better.

On the contrary, the individual qualities of a leader associated with his deformation and the appearance of rigid stereotypes in the personality structure reflect both the wrong perception of the organization and himself as a manager in the organizational structure and the choice of an adequate communication style, which often gives rise to interpersonal conflicts in the “leader –subordinate” dyad. In accordance with Chernikov (2012), the conflict index of the “direct boss – subordinate” dyad exceeds the average conflict level of the "employee – employee" dyad by about 30 times. An assessment of trends in the quality of activity in the “boss – subordinate” dyad shows that the quality of work of a subordinate decreases about three times more often than that of a boss (Tsvetkov, Tanov, 2017).

Contradictions are exacerbated in a crisis, when management activities require mandatory consideration of additional factors that have a negative impact on the leader's personality: the unfavourable influence of the external and internal environment of the organization, great dynamism of the situation, a high level of stress when performing official duties, severe consequences of wrong decisions, physical and mental overload, uncertainty of the situation, tension in the team.

The personal qualities of the leader, influencing the social psychological climate, are assessed, among other things, by the subordinates. The presented article is devoted to the results obtained at a particular Russian milk processing enterprise on the basis of a quali-quantitative approach using a number of research tools.

Methods

In order to identify causal links between the personal characteristics of the leader and the level of the social psychological climate in the work collective, forced to work in context of an organizational crisis, the authors used a quali-quantitative approach, including such research methods as a case study (the object of research is an particular enterprise - production of processed liquid milk), employee questionnaires (provides quantitative assessments) and narrative interviews (provides qualitative assessments).

The presented study was conducted on the basis of the Ural branch of the joint-stock company operating in the Russian dairy industry, in December 2019 – January 2020. The financial problems of the enterprise, associated, among other things, with the stagnation of the Russian dairy market, led to the need for its restructuring with a subsequent reduction in the number of personnel. Over the past year, the following changes have taken place in the personnel policy of the dairy plant: a massive reduction in the number of employees (more than 50 people per month or more than 20% of employees per year), the removal of part of the employees from the company's staff and dismissal due to the transfer of certain works to outsourcing. The restructuring of an enterprise or a certain department affected 62.7% of the staff, and 14.7% of employees faced a forced decrease in working hours.

The total number of workers at the dairy plant at the end of 2019 was 84 people. The study involved 75 employees (89.3%), most of whom have open-ended employment contracts (80%). The structure of respondents by categories of personnel includes: specialists – 32%, manual workers – 21.4%; department heads – 9.3%; line personnel – 37.3%. Most of the respondents are women (55%). More than half of the respondents (53.3%) are 35-50 years old, 36% of the respondents belong to the age group under 35 and 10.7% are over 51 years old.

Based on the previously established fact of general dissatisfaction of the personnel with the management of the plant (namely, the manager of the branch), at the first stage of collecting empirical data, respondents were asked to fill out a questionnaire containing a number of questions aimed at identifying toxic personnel management practices used at the enterprise. Particular attention was paid to judgments regarding the personal and behavioural characteristics of the head of the branch (woman, over 50 years old). At the second stage, on a voluntary basis, was formed a focus group of respondents (12 people), who gave their consent to a narrative interview. During the interview each of them was asked to share their opinion and examples of destructive interaction with the head of the branch. Generalization of the results of questionnaire and narrative surveys, considered in the context of a dairy enterprise in a crisis situation due to the current restructuring processes, will provide data for analysis and determination of the significance of toxic management as one of the factors of crisis in the organization.

Results

The analysis of the results of dairy plant workers survey was carried out by the authors taking into account the gender characteristics of the respondents' perception of the personal and behavioural characteristics of the manager. Fig. 1 shows the distribution of the answers of the interviewed male and female workers as to how they would characterize the head of the branch.

Fig. 1: Distribution of respondents' answers to the question of toxic personal characteristics of the assessed manager, %

Comparison of the aggregate of the answers of men and women shows the presence of both insignificant and significant differences in the assessments. It is obvious that female respondents generally have a more negative assessment of the branch manager, than men have. The difference is especially noticeable in the following cases: 1) a significant majority of women consider the top manager to be "offensive", while almost none of the men indicated this characteristic; 2) 3.9 times more women than men consider a top manager "unethical"; 3) every fourth woman (but not a single man) calls a top manager unreasonable; 4) 5.4 times more women than men indicate the tyrannical character of the top manager.

Similarities and differences in the assessments of the interviewed male and female workers are also observed in the distribution of answers to the question regarding the behavioural characteristics of the assessed manager (Fig. 2).

Fig. 2: Distribution of respondents' answers to the question regarding toxic behavioural characteristics of the assessed leader, %

The most noticeable differences in the assessments of women and men are that slightly less than two-thirds of female respondents believe that the head of a branch imitates work activity, and every fifth indicates that a top manager is abusing power. And only a small number of male respondents have the same opinion.

A more detailed list of behavioural characteristics of a toxic manager was offered to the respondents to select the appropriate, in their opinion, the top manager they were assessing (Table 1).

Table 1: Distribution of respondents' answers to the question about toxic models of interaction in the dyad "boss – subordinate" of the leader they assess, %

Factor	Men	Women
My boss deliberately provides me with false or misleading information	14.7	24.4
My boss lies to me sometimes	2.9	39.0
My boss deliberately withholds information from me that I need to do my work	5.9	61.0
My boss tells me how I should manage my free time	2.9	2.9
My boss humiliates me in front of other employees	5.9	29.3
My boss calls me unflattering names	0.0	14.5
My boss usually thinks I'm the worst and blames me whenever something goes wrong	20.6	85.4
My boss treats me unfairly	44.1	51.2
My boss steals my good ideas or work and claims it for herself	0.0	12.2
My boss expresses his emotions in public by shouting, swearing, or throwing things at me	0.0	22.0
My boss criticizes my personality and personal life, not my work	0.0	14.6
My boss is impolite to me	35.3	73.2
My boss disregards my opinion	2.9	68.3
My boss often blames me for her failures	2.9	2.4
My boss threatens me to get what she wants	70.6	65.8

The table shows a higher level of harshness in the assessment of female respondents in comparison with surveyed men. Gender specificity is manifested here, for example, in the fact that men are little worried about such destructive manifestations in the behaviour of a leader as his dishonesty, hiding information necessary for work, humiliating and emotionally offensive behaviour that she demonstrates in relation to a subordinate. At the same time, men slightly more often than women (70.6% versus 65.8%) point to the fact that the assessed leader uses threats as a motivation tool. A third of the male respondents consider the manager to be impolite, and every fifth notes the accusatory position that the leader most often takes. The women surveyed are in solidarity with men in all of the above assessments, but in addition, two-thirds of them worry that the branch manager does not take their opinion into account.

At the stage of narrative analysis, primary data processing was carried out using the grouping method, and toxicity factors of labour relations were identified (Table 2).

Table 2: Identification of toxic factors in labour relations based on the analysis of narratives of the interviewed dairy company workers

Narrative elements	Toxic factors
– “The leader is completely inadequate, constantly yells for no reason, humiliates. Subtracted [from salary - note. authors] for everything. Always unhappy with everything. The unskilful leader pursues only own interests. Apparently, she only needs money. " – “As a leader, she doesn't cope. She constantly says that we have nothing to think with (no brains). " – “Person - mood. When she is in the good mood, she will thank and praise, but when she is angry, it is better not to approach, hide and be silent, not to say anything across her. " – "In stressful situations, she behaves inappropriately, uses foul language."	Destructive (abusive) behaviour of the leader
– “When I got a job at this plant, at the interview I was told that everything is official, the salary is clear, the benefits. But I worked there for 3 months and still haven't paid for the medical examination costs. " – “When I was applying for a job, they promised that work on holidays and weekends would be paid double. At first everything was great, but now the work	False promises in hiring

schedule has been changed and double payments are almost never paid. "	
– “Our company has low salaries. Now the company is at the stage of a change of administration, and I am glad that I am still working at all. Many are laid off, many leave on their own. They constantly say that all of us at this plant are not eternal, making it clear that we can be fired for no reason. " – "I did not violate law, I have a sick leave officially, but they threaten me that the patience of the managers will burst and they will ask me to go." – "The manager deliberately humiliates, puts spokes in the wheel, as it is necessary to push the employee to quit."	Lack or poor interaction with leader
– “Relationships in the team are tense. We all endure each other, each has his own opinion, and there is no team. " – “There is no team, what kind of relationship can be here? Purely business communication "me to you, and you to me". "	Toxic relationships in collective
– “I have been working as a senior accountant at the company for 3 years. The workplace was identified in the tiny room, there is no direct sunlight, there is no ventilation either. " – "Terrible working conditions." – "The management changed the system of motivation for the worse."	Poor working conditions

It should be noted that in most cases in the story of an individual respondent there is simultaneously an indication of 2-3 toxic factors of labour relations. As can be seen from the table, the most common factor noted by respondents is the destructive (insulting) behaviour of the leader. The next most frequently mentioned factor is the factor of deception in employment, as well as unfriendly relationships in the team.

Thus, the data of the narrative interview supplement the results of a structured survey of dairy plant workers and provide a more complete picture of the conditions under which the personnel of the studied enterprise that going through a crisis period is forced to work and which factors have the most negative impact on the workers well-being.

Conclusion

Based on the results of the study, it can be claimed that the personnel of the dairy plant assess the general social psychological climate as unfavourable. The financial problems of the enterprise led to the need for its restructuring with a subsequent reduction in the number of personnel. The toxic behaviour of the head of the dairy plant branch under study, due to her psychological unsuitability for profession, aggravated the expected deterioration of the social psychological climate in the work collective.

The psychological conditions in which employees find themselves affect the formation of relationships between members of the work collective in the dyads "boss - subordinate" and "colleague – colleague". These conditions can either increase or decrease the level of well-being in the workplace, and the role of the social and psychological climate in the work collective becomes especially important in crisis situations.

The results of the case study show that the branch manager assessed by the respondents can be identified as a toxic manager who generates crisis situations by his behaviour in interaction with subordinates, and, as a consequence, has a negative impact on the performance indicators of both individual employees and the enterprise as a whole. It becomes obvious that the interviewed workers are more concerned about the toxicity of the manager, and not the crisis state of the dairy company. It should be emphasized that the toxicity of the assessed manager led to the emergence of a crisis of the enterprise personnel, which manifests itself in the absence / lack of satisfaction of the social needs of workers. In these conditions, it is difficult for employees to hope for a successful getting out of the enterprise from the crisis, which explains the general pessimistic attitude of the collective.

Sub-Zones in The Euro Area as Optimum Currency Areas

Abstract

Researchers assert that the euro area is not an optimum currency area (OCA). Hence, the currency union is characterized by considerable vulnerability of economies to asymmetric shocks and the ECB's monetary policy is unable to counteract negative consequences of the implementation of the common currency. However, researchers highlight that some of the EU countries could become an optimum currency area. The objective of this study was to verify the assertion put forth by B. Eichengreen and T. Bayoumi, implicating the existence of several groups of countries in the EU (to which two other sub-areas were added: Central Eastern Europe, and Cyprus and Malta) which can be distinguished based on macroeconomic criteria. In line with the assumptions made by economists, the sub-zones could satisfy the criteria devised in the OCA theory, as suggested by the main proponents of this concept, that is the convergence of business cycles, labour mobility, inflation and liberal economy. The research results implicate that the analyzed euro sub-zones do not fully satisfy these criteria. However, three countries, Germany, France and the Netherlands, could create a sub-zone of optimum currency area.

Keywords: the euro, the euro area, optimum currency areas

Introduction

The euro area is an example of a territory endowed with high economic integration. Its formation was among the most significant challenges in the world of modern-day international finances and an extremely important element in European integration. The idea of a European common currency area, ever since it was articulated in the 1950s, has given rise to numerous controversies, stirred by the inclusion of various, sometimes extreme concepts to lay the foundations of the euro area.

One of the most influential ideas in the creation of the eurozone was the theory of optimum currency areas (TOCA). This concept originated and was further developed in 1960-1999, and the founders and main contributors were R. Mundell, R. McKinnon, P. Kenen as well as J.C. Ingram, or J.A. Frankel and A. Rose. Economists considered the idea of creating a common currency (or only of stiffening the exchange rate) in the context of macroeconomic shocks. Although they disagreed about certain details, it was universally claimed that an optimum currency area (OCA) is a region where a floating rate of currency exchange should be foregone because benefits to be gained from a fixed rate of exchange prevailed over threats. The literature emphasizes that the chief benefits from creating an optimum currency area are: declining interest rates, access to greater capital resources and higher market liquidity as a result of the merger of national capital markets as well as stronger macroeconomic stability of less developed countries owing to their access to an area of a stable and reliable currency.

The authors of TOCA strove to define the criteria that should be met by countries intending to adopt a common currency. K. Piłat (2011) mentioned such parameters as: mobility of production means (mainly labour force), elasticity

of prices and salaries, liberal economy, diversification of production, similar preferences regarding inflation and fiscal integration.

Although the European Union member states did not meet the aforementioned TOCA conditions in the 1990s, it was decided to introduce a common currency in an area that actually did not satisfy the theory's assumptions. An assertion was made that monetary integration would contribute to greater economic convergence and economic cooperation. Beside, several initiatives with an aim to support economic convergence of the EU member states were undertaken at the same time. Nevertheless, some twenty years after euro was created, the euro area cannot be deemed as an optimum currency area due to large socio-economic disproportions

Economists continue to ponder which European countries might create an OCA. However, all pertinent analyses are incomplete and provide inconclusive results, which is due to numerous imperfections and inaccuracies of the theory of optimum currency areas, mainly the ambiguity of criteria. Later on, economists either developed some of the theoretical assumptions or presented entirely different opinions thereof (e.g. a dispute about open or closed economy, or discussions about the role of labour mobility in the theory). There is also a contradiction between diversification of production versus specialization and innovative approach. Other imperfections of the theory are: lack of a hierarchy of criteria, and failure to take into consideration several pertinent issues related to modern-day international finances and competitiveness of economies.

Research objective and methodology

Previous analyses made by economists may lead to the conclusion that a solution to structural problems of the eurozone is to create euro sub-zones, which would meet the criteria set by the theory of optimum currency areas. They would most probably be smaller regions with a similar socio-economic situation.

The aim of this study was to verify the assertion put forth by B. Eichengreen and T. Bayoumi, implicating the existence of several groups of countries in the EU (with two more groups distinguishable, such as the states of Central and Eastern Europe, and Cyprus and Malta), which could be distinguished according to macroeconomic criteria. The economists noted that the EU's core countries (Germany, France, Belgium, the Netherlands and Denmark) are characterized by the convergence of macroeconomic shocks, which allows them to implement a shared and effective monetary policy. As assumed by the economists, individual sub-zones would satisfy the criteria of the theory of optimum currency areas suggested by the theory's founders. This assertion has been verified.

To this intent, the key criteria in the OCA theory were considered, that is convergence of business cycles (GDP dynamics), mobility of labour force (a share of emigrants in total population, share of emigrants who decide to leave for a country in the eurozone and in a given sub-zone as well as most important directions of emigration chosen by citizens of every country), inflation (an annual rate of price change), and economic openness (a ratio of export to the GDP, major trade partners). The research results can serve as a basis for further studies on the question whether the designation of several sub-zones in the European common currency would be economically viable in line with the theory of optimum currency areas.

The European Union was divided into a few sub-zones, according to earlier observations and determinations reported by economists, and in line with the socio-economic development of each country, size of national economy and, last but not least, political and economic history. Four groups of countries were identified:

- sub-zone A, with the highest socio-economic development level, identified in the research by B. Eichengreen and B. Tayoumi; four countries belong to this sphere: Germany, France, Belgium, the Netherlands and Denmark.

- sub-zone B, the PIIGS countries – Portugal, Italy, Ireland, Greece and Spain,

- sub-zone C – countries of Central and Eastern Europe: Lithuania, Latvia, Estonia, Poland, the Czech Republic, Slovakia and Hungary,

- sub-zone D – small, insular countries: Cyprus and Malta.

No groups were created for Austria, Finland, Luxemburg, Slovenia, Romania, Croatia and Bulgaria. The exclusion of these states is a consequence of the fact that they had not been considered in earlier analyses and their socio-economic position is completely different from that of the remaining countries.

The time span chosen for the study - from 1998 to 2018 – helped to verify whether the EU countries satisfied the optimization criteria *ex ante* and/or *ex post*.

The methods applied in the study were as follows: critical perusal of scientific sources and statistical analysis. The former method served to describe the evolution of the theory of optimum currency areas, while the latter was applied to check if the above sub-zones fulfilled the criteria defined in the theory of optimum currency areas.

Statistical data originated from official webpages of the World Bank and Trading Economics.

Theory of optimum currency areas

The major part of the concept known as the theory of optimum currency areas (TOCA) provides a set of criteria, referred to as optimization criteria. Researchers have been making efforts to identify the criteria that countries should meet so that the benefits gained from fixing a currency exchange rate would surpass the losses.

R. Mundell was the founder of the theory of optimum currency areas. This Canadian economist (1961) tried to determine the conditions that ought to be met by countries which intended to lock exchange rates between each other. According to that researcher, representing supply-side economics, an optimum currency area (OCA) can be created from regions of a country or from a few countries which are distinguished by high workforce mobility as well as elasticity of prices and wages. R. Mundell concluded that the above were the basic conditions that allowed a given area to restore balance in cases of macroeconomic shocks. A similar definition was later proposed by F.P. Mongelli (2002), who emphasized that an optimum currency area is a region in the geographical sense where either only one currency is used or all currencies have locked currency exchange rates between them. In this study, it was assumed that an optimum currency area is a monetary union which satisfies the criteria set in the optimum currency area theory.

R. McKinnon (1963) identified major benefits from founding an OCA, such as ensuring full employment, balanced international payments, and internal level of prices. This economist initiated a long discussion about the significance of economic openness in a currency union. He concluded that a high level of economic integration should enable absorption of macroeconomic shocks.

P. Kenen (1969) asserted that countries wishing to form an optimal currency area should present a high level of diversification of production. In his opinion, specialization is a perfect element of an OCA, as this allows for greater absorption of macroeconomic shocks than workforce mobility does. Diversification of the production of export goods can spread the risk when a state of imbalance appears. The mentioned economists also highlighted the role of a common budget for a currency union, as another instrument for absorbing macroeconomic shocks.

J.C. Ingram (1972) also suggested that a currency union in Europe should be preceded by fiscal coordination. P. Kenen shared this view. He believed that there should be fiscal solidarity between countries that compose a monetary union. The states entering the union should implement fiscal transfers only when some unfavourable changes happen, e.g. growing unemployment.

A new approach in the TOCA was developed by J.A. Frankel and A. Rose (1997), who agreed that the biggest gains to be achieved are: broader economic international connections, possible increase in specialization and convergence of business cycles. These economists proposed a new look at a currency union, where the states that compose a sphere of a shared currency do not need to meet the TOCA before a shared currency is implemented in all interested countries. Introduction of a new currency in itself can stimulate a rise in convergence between the involved countries.

Sub-zones in the euro area – theoretical background

Most economists agree that the euro area did not meet the criteria of the TOCA. The literature most often mentions such shortcomings as the lack of a budget for the currency union, or low mobility of labour force. These are frequently implicated as significant hurdles to the effectiveness of the European Central Bank. Furthermore, the currency union in

the EU is an organization composed of too many (19) countries, with highly diverse social and economic situation. Some economists (e.g. R. Mundell, B. Eicheengreen and T. Bayoumi, H. Caraveli, W. Bartlett et al. Prica) have pondered whether it could be possible to distinguish some of the EU states in order to form an optimum currency area. R. Mundell is called 'the father of the euro area'. According to this academic, the European currency area back in the 1970s should have comprised Great Britain, France, Italy, Belgium and Luxemburg.

B. Eichengreen and R. Bayoumi (1992), having analyzed degrees of synchronization of supply shocks, divided the European Union into two parts: the core, that is Germany, France, the Netherlands and Denmark, where high correlation appeared, and the periphery, that is Greece, Ireland, Portugal, Spain and the UK, where synchronization was distinctly lower. In consequence, highly developed countries have a better chance to counteract macroeconomic shocks in the future.

A similar division can be found in other scientific references. The core countries are Germany, Austria, Finland, Belgium, the Netherlands and France, while the remaining countries are Italy, Spain, Portugal, Ireland and Greece.

H. Caraveli (2016) mentioned a similar classification of countries, into core ones, with the highest GDP per capita, and peripheral ones. The core countries comprised: Austria, Belgium, Ireland, Luxemburg, the Netherlands, Germany, Finland, France, Italy, Spain (and others, for example Iceland, Norway, Switzerland, Sweden, Denmark, and the UK). The latter group was composed of Cyprus, Malta, Slovenia, the Czech Republic, Greece, Portugal, Slovakia, Lithuania, Latvia, Estonia, Hungary, Poland, Croatia, Romania and Bulgaria. An average GDP per capita in the core countries is twice as high as in the peripheral ones.

W. Bartlett and I. Prica (2016) divided the countries into core and peripheral ones taking into account whether a given country was in the euro area and in the EU. The first group *(Inner Core*) contains Austria, Belgium, Finland, France, Germany and the Netherlands, while the second group (*Outer Peripery*) comprises the Czech Republic, Denmark, Estonia, Lithuania, Poland, Slovakia, Sweden and the UK; the third category (*Inner Periphery*) consists of Cyprus, Greece, Ireland, Italy, Portugal and Spain, and the fourth one (*Outer Periphery*) encompasses the countries outside the euro area, such as Bulgaria, Hungary, Romania, and finally the fifth group (*Super Periphery*) (countries with connections to euro but not EU members) includes Albania, Croatia, Macedonia and Serbia. Now, this publication was issued in 2016 and some countries should now be transferred to other groups, e.g. Estonia, Lithuania and Latvia would now belong to the first group, while Croatia should enter the fourth one.

P. De Grauwe (2003) drew the conclusion that Germany and France together with the Benelux states satisfy the OCA criteria on trade. However, it is worth considering whether the euro area composed of highly developed countries could be named an optimum currency area. The cited researcher arrived at this conclusion only on the basis of studies on the correlation between economic convergence and labour market in every country. De Grauwe mentioned Austria, Ireland, Portugal, Spain and Italy as countries that might co-create an OCA with highly developed countries. However, no detailed analysis is available now to testify whether the above set of countries would meet the OCA requirements.

J. Stiglitz (2017), without mentioning specific countries, has concluded that a solution to the problems in the euro area is to divide this monetary union into several groups. The Nobel Prize winner believes that it would be worthwhile to introduce flexible euro in all countries within the common currency area in the EU.

Sub-zones in the euro area versus optimum currency areas

Business Cycles

The first indicator submitted to the analysis is the GDP annual growth rate in the researched group of countries. An analysis of this indicator over a long time period can indicate convergence of business cycles in the chosen group of countries. Convergence of business cycles would facilitate decreased susceptibility to various macroeconomic shocks. Moreover, convergence of business cycles should contribute to an improved effectiveness of common monetary policy.

Business cycles in the whole European Union are approximate but not identical. They also differ within the distinguished sub-zones (Figure 1-4).

Fig. 1: Business cycles in group A

Source: own study based on World Bank data

Group A displays very similar business cycles. It can be assumed that all these states meet the criterion of convergence of business cycles because their economies are mutually correlated. One might suspect that this was also the case in Western Europe prior to the introduction of euro. All group A countries experienced a similar decrease in the GDP in 2009 (approximately -5% relative to the previous year) as well as a high growth in the GDP in 1999, 2010 and 2016.

Fig. 2: Business cycles in group B

Source: own study based on World Bank data

Larger disproportions in terms of business cycles occur in sub-zone B. A country with a distinctly different course of business cycles than the remainder is Ireland, which stood out with its highest GDP growth over that time period. A much higher increase in the GDP was noted in this country in 2015 (25.16%). Another country with a different business cycle from the other group members is Greece, where a decrease in the GDP during the crisis was demonstrably the biggest. Portugal and Italy have most similar business cycles. These two countries also present a relatively high level of correlation of business cycles with Spain (especially since 2016). It can be assumed that only these countries meet the analyzed OAC criterion.

Group C countries are characterized by similar business cycles. The countries which have adopted euro, i.e. Latvia, Estonia and Lithuania, tended to suffer a greater decline in the GDP in 2009 (-15%), whereas the GPD in Poland increased by a few percent in the same year.

Fig. 3: Business cycles in group C

Source: own study based on World Bank data

In 1998-2011, the business cycles of the two countries in sub-zone D were convergent. In that time period (in 2008), both of these countries adopted euro. Afterwards, there were some notable disproportions in the development of Cyprus and Malta. In 2013, Cyprus suffered the highest decrease in the GDP; in the same year, the GDP of Malta was on the increase. The GDP in both countries was increasing in 2013-2015, to decline slightly afterwards. However, it is difficult to state conclusively whether these two countries satisfy the analyzed criterion.

Fig. 4: Business cycles in group D

Source: own study based on World Bank data

Economic Openness

Economic openness is another significant indicator. It is most often expressed as the share of exports of goods and services in the country's GDP. A monetary union composed of countries with a high degree of economic openness would be more likely to successfully handle macroeconomic shocks.

The European Union member states vary in terms of economic openness. Distinct differences can be noted in all the sub-zones (Table 1).

Table 1: Economic openness in the European Union

Sub-zone	Country Name	1998	2018
A	Belgium	124,71	165,42
	Denmark	71,30	105,24
	France	49,51	64,48
	Germany	51,58	88,67
	Netherlands	112,55	157,65
B	Greece	42,27	72,52
	Italy	45,09	60,51
	Ireland	157,98	211,51
	Portugal	63,83	87,00
	Spain	52,66	67,52
C	Czech Republic	84,69	150,54
	Estonia	157,06	145,00
	Hungary	107,43	165,50
	Latvia	90,81	123,19
	Lithuania	89,65	149,30
	Poland	56,66	107,48
	Slovak Republic	102,07	190,42
D	Malta	223,31	268,77
	Cyprus	134,91	145,34

Source: own study based on World Bank data

Group A shows differentiation with respect to economic openness. The most open countries are Belgium and the Netherlands (over 100%). Countries with a lower degree of economic openness are Denmark, Germany and France, of which the latter country scores the lowest among group A states regarding economic openness. It also has one of the lowest economic openness scores among all EU member states.

Most countries in sub-zone B present similar economic openness recorded in 1998 and 2018. While it was equal 45-63% in 1998 and 60-87% in 2018, the lowest values in both years were noted in Greece, while the highest were ascribed to Portugal. Portugal has a high degree of economic openness, which continues to increase (from 157.98 to 211.51% between 1998 and 2018).

The economic openness in 1998 and in 2018 varied among the countries classified as sub-zone C ones. The demonstrably lowest trade to GDP ratio was observed in Poland (56.66 in 1998 and 107.48% in 2018). In the remaining countries, it reached at least 90% in 1998 and 120% in 2018.

Cyprus and Malta are characterized by a high degree of economic openness (over 100%), although it is much higher in Cyprus than in Malta.

In the light of the above information, it is difficult to determine whether the aforementioned countries satisfy the economic openness criterion. All EU states are open, although it is possible to observe a high degree of diversity with respect to the contribution of exports to the GDP in individual countries and even within some of the sub-zones. For instance, relatively much variation in this indicator can be noted in sub-zone A, but the countries with a lower degree of economic openness (France, Germany) are ones with big economies, whose nominal value of exports exceeds the trade

exchange of the remaining countries. A similar observation can be made in sub-zone C. The lack of reference values makes it even more difficult to identify the countries which should create euro sub-areas.

The adaptation of euro should contribute to an increase in exports and economic openness. Notably, there was an increase in the share of exports in the GDP in all EU member states between 2001 and 2011. However, the European Union countries achieve different nominal values of exports of goods and services (Table 2).

Table 2: Export in the European Union

countries	increase in economic openness in 2001-2011	exports of goods and services (current USD prices, million)	Sub-zone
Cyprus	107,92	18238,67	D
Malta	224,75	21082,89	D
Latvia	413,50	21094,24	C
Estonia	424,08	22820,68	C
Lithuania	487,97	40403,54	C
Greece	136,79	78773,23	B
Slovak Republic	379,15	101764,1	C
Portugal	153,01	104745,7	B
Hungary	250,37	134104	C
Czech Republic	390,99	192222,9	C
Denmark	146,63	197903,5	A
Poland	333,87	325572,7	C
Belgium	148,99	448189	A
Ireland	136,92	467882	B
Spain	149,90	498320,1	B
Italy	105,77	655446,9	B
Netherlands	150,09	770414,9	A
France	109,02	870409,4	A
Germany	172,51	1871808	A

Source: own study based on World Bank data

After the introduction of euro (2001-2011), all European countries recorded a rise in exports. The highest increase was noted in group C, i.e. in Lithuania, Estonia, Latvia, the Czech Republic, Poland and Hungary (250-480%). This growth, however, was caused by the fact that all these economies were becoming more open. Quite a high increase in exports was also noted in the other counties, e.g. in Germany, Portugal and the Netherlands, in Spain, Belgium and Denmark (circa 150%). The smallest increase in trade in 2001-2011 occurred in Italy, Cyprus, France (107-110%) and in Greece and Ireland (136%).

The highest values of exports were noted in 2018 in group A, mainly in Germany, France and the Netherlands (870-187 billion USD), followed by sub-zone B. The peripheral countries are characterized by large values of exported goods and

services in the EU (Italy, Spain – nearly 500 b USD). Much lower values of exports are achieved by Cyprus and Malta (18-21 million USD) as well as Latvia, Estonia, Lithuania and Slovenia (21-46 b USD).

Countries in an optimum currency area should not only feature high economic openness but, even more importantly, are expected to have a large share of trade with partners from the currency union. Nearly all EU countries are characterized by high economic openness towards other European countries (especially towards Germany and the UK), although not necessarily towards other partners from the euro area, and even less so towards other countries from the distinguished euro sub-zones (Table 3). It can be noticed that much of the exports from particular countries reached either the geographically closest countries or the highly developed EU member states.

Table 3: The most important trading partners of the European Union Member States

Sub-zone	Country Name	The most important trading partners of the European Union Member States
A	Belgium	Germany (18%), France (14%), Nethelands (12%), UK (7,7%), USA (6,3%)
	Denmark	Germany (17%), Sweden (12%), Norway (7,2%), United Kingdom (6,9%)
	France	Germany (15%), USA (8,0%), Spain (7,95), Italy (7,6%), Belgium (7,2%)
	Germany	USA (9,1%), France (8,2%), China (7,4%), Nethelands (6,3%), UK (6,0%)
	Netherlands	Germany (22%), Belgium (10%), UK (8,3%), France (8,0%), USA (5,0%)
B	Italy	Germany (12%), France (11%), USA (9,8%), Switzerland (5,6%), USA (5,3%)
	Ireland	USA (31%), UK (11%), Belgium (10%), Germany (9,1%), Netherlands (5,8%)
	Portugal	Spain (26%), France (13%), Germany (12%), UK (6,2%), USA (5,2%)
	Spain	France (16%), Germany (11%), Italy (8,2%), Portugal (7,8%), USA (7,0%)
C	Czech Republic	Germany (32%), Slovak R. (7,6%), Poland (6,0%), France (5,1%), GB (4,5%)
	Estonia	Finland (16%), Sweden (10,0%), Latvia (8,8%), Russia (8,5%), USA (6,9%)
	Hungary	Germany (28%), Italy (5,2%), Slovak R. (5,2%), Romania (5,1%), Austria (4,6%)
	Latvia	Lithuania (17%), Estonia (12%), Russia (9,2%), Germany (7,2%), Sweden (6,6%)
	Lithuania	Russia (14%), Latvia (9,5%), Poland (8,0%), Germany (7,6%), Estonia (5,1%)
	Poland	Germany (28%), Czech R. (6,2%), GB (6,1%), France (5,8%), Italy (4,6%)
	Slovak Republic	Germany (22%), Czech R. (11%), Poland (7,5%), France (7,0%), Hungary (6,3%)
D	Cyprus	Netherlands (15%), Libya (12%), Greece (8,8%), UK (7,0%), Hong Kong (3,0%)
	Malta	Germany (17%), Italy (9,6%), France (9,0%), Japan (5,3%), UK (5,3%)

Source: own study based on Trading Economics data

Significant partners for group A countries are Germany and the USA, and sometimes the Netherlands and Belgium. The most popular trade partners for group B countries are Germany, France, the USA and the UK. Spain also exports its

commodities to Italy and Portugal, while Portugal sends much of its exported goods to Spain. Among group C countries, popular destinations for exports are France, Russia for Lithuania and Latvia, and Poland. The only important trade partner for group D countries is Germany. No large trade exchange was observed between Malta and Cyprus.

In the light of the above, the highest share of exports reaches highly developed countries (Germany, the USA, France, the UK) or neighbour countries (e.g. Russia in the case of sub-zone C countries). Far less often decisions are made to enter export-import relations with countries from the same sub-zone, which leads to the conclusion that sub-zones B and D certainly fail to meet the criterion of high economic openness within a common currency area. In the case of group C, it would be possible to distinguish two sub-groups: the Czech Republic-Slovakia-Poland and Lithuania-Latvia-Estonia.

Inflation

Another criterion is the similarity of inflation rates. Both convergence of inflation and convergence of business cycles make it easier to deal with macroeconomic shocks. The European Union member states have similar, low inflation rates, which in most of these countries tend to decrease (Table 4).

Table 4: Inflation

sub-zone	country	1998	2008	2018
A	Belgium	0,95	4,49	2,05
	Germany	0,91	2,63	1,73
	France	0,65	2,81	1,85
	Netherlands	1,96	2,49	1,70
B	Greece	4,77	4,15	0,63
	Ireland	2,42	4,06	0,49
	Italy	1,96	3,35	1,14
	Portugal	2,57	2,59	0,99
	Spain	1,83	4,08	1,68
C	Czech Republic	10,70	6,36	2,15
	Estonia	8,21	10,36	3,44
	Hungary	14,15	6,04	2,85
	Lithuania	5,07	10,93	2,7
	Poland	11,6	4,16	1,81
	Latvia	4,64	15,4	2,53
	Slovak Republic	6,67	4,6	2,51
D	Malta	2,39	4,26	1,16
	Cyprus	2,23	4,67	1,44

Source: own study based on World Bank data

Group A countries are diverse in terms of inflation, although differences in inflation in particular years are small (especially in 1998). Over the entire time period, inflation in all countries except the Netherlands nearly doubled, and its highest rise was noted during the economic crisis.

Likewise, sub-zone B countries are varied in this respect. Italy and Spain showed relatively similar rates of inflation during the analyzed years. However, inflation in all countries from this sub-zone was on the decrease, which most probably was a consequence of their adaptation of euro. Greece was distinguished by a considerable rise in prices. The growth in prices in this country was the highest in the whole group in 1998 and 2008, while the inflation in this country was relatively low.

Sub-zone C is characterized by the highest diversity in terms of inflation. In 1998, the inflation in these countries oscillated around 4/64 – 14.14%. Some countries (Lithuania, Latvia) with the lowest inflation in 1998 recorded the highest increase in prices during the financial crises. However, the inflation in Central and Eastern European countries can be observed to be increasingly convergent. Most of these countries had similar inflation rates in 2018 (1.74-3.44%).

Sub-zone D countries had similar inflation rates in all analyzed years.

Labour Force Mobility

Mobility of workforce is one of the criteria considered in the theory of optimum currency areas. The European Union presents differences in this scope, and overall has lower labour force mobility than the USA or even the ASEAN countries. International migration expressed as the share of migrants in total population (in 2017) ranges from a few to no more than twenty percent. Sub-zone C comprises countries with large differences in this parameter. Most countries have between 1 to 5% of emigrants in total population, but this percentage goes up to 13-15% in Estonia and Latvia.

Table 5: Share of emigrants in the total population, emigrants to the euro area and sub-zones

Sub-zone	Country name	International migration as percentage of total population	The eurozone	Sub-zone
A	Belgium	11,10	63,86%	52,82%
	Denmark	11,50	21,73%	41,25%
	France	12,20	38,19%	26,33%
	Germany	14,80	30,43%	25,95%
	Netherlands	12,10	40,40%	42,44%
B	Italy	10,00	41,38%	16,43%
	Ireland	16,90	7,82%	57,02%
	Portugal	6,30	49,18%	2,39%
	Spain	12,80	43,18%	15,11%
	Greece	10,90	9,06%	2,05%
C	Czech Republic	4,10	55,50%	51,99%
	Estonia	14,70	33,57%	1,84%
	Hungary	5,20	49,39%	0,57%
	Latvia	13,20	21,97%	0,50%
	Lithuania	4,30	21,14%	18,36%

	Poland	1,70	47,88%	3,78%
	Slovak Republic	3,40	19,62%	7,95%
D	Malta	10,60	4,86%	0
	Cypr	N/A	15,29%	0

Source: own study based on: World Bank, United Nations, International Migration Report data

The share of European emigrants who translocate to countries in the eurozone to the general number of emigrants is highly varied among the analyzed countries. In sub-zone A, Belgian citizens most often chose to emigrate to the euro area countries (63,86%), while the Dutch (40.40%), French (38.19%) and Germans (30.34%) were less likely to migrate and Danes made such decisions least often (21.73%). Among countries classified to group B, the highest percentage of emigrants opting for the eurozone was observed in Portugal, Spain and Italy (49.18%, 43.18% and 41.38%, respectively). Among sub-zone B countries, the popularity of countries that had adopted euro as destinations for emigrants was moderate, and the lowest percentage of emigrants translocating to the euro area was noted in Ireland and Greece (7.82 and 9.06%, respectively).

In group C, the highest share of emigrants who chose the eurozone countries as places of their future residence was recorded in the Czech Republic (55.50%), Hungary (49.39%) and Poland (47.88%). In the remaining countries, this percentage oscillated around 20-35%. A small percentage of emigrants from Malta or Cyprus decided to settle down in a European country that had adopted euro (4.86 and 15.29%, respectively).

Most citizens of European countries who chose to emigrate decided to translocate to the most developed countries (group A states or the USA) or else to the countries where the official languages were English, German or French. The choice of a destination was also dictated by the two countries involved sharing historical past (e.g. Poland-Lithuania, Austria-Germany, or the Czech Republic-Slovakia).

Citizens of the countries categorized as sub-zone A ones decided to emigrate to countries in the same sub-zone or to other highly developed countries, and emigration to sub-zones B, C or D was a far less obvious choice. Citizens of most countries decide to emigrate to Germany (from the Netherlands), Switzerland (from Germany), the USA (from all countries except Belgium and the Netherlands). Emigrants from Scandinavian countries most often emigrate to nearby countries (also the ones on the Scandinavian Peninsula) or to North America. Another popular destination is the United Kingdom (for Germans).

In sub-zone B, popular destinations for emigrants were Germany and France. Italian citizens also migrated to Canada, Portuguese to Switzerland and the USA, while citizens of Spain often moved to the UK. Citizens of countries classified as sub-zone B rarely make decisions to emigrate to countries from the same sub-zone.

Citizens of sub-zone C countries chose to emigrate to highly developed countries, mainly to Germany, the USA, the UK, to Russia and to the countries which are adjacent to their native countries, and the latter tendency gives rise to bilateral migrations: the Czech Republic-Slovakia, Estonia-Finland, Hungary-Austria, Lithuania-Poland. Decisions to migrate to other countries of sub-zone C are made far less often.

In group D, only a few dozen of people a year chose to emigrate within this sub-zone. Citizens of these countries most often left for the UK and Australia, as well as from Cyprus to Greece and from Malta to the USA.

Table 6: The most important directions of emigration of citizens of selected countries

Sub-zone	Country	The most important directions of emigration		
A	Belgium	France (27,77%)	Netherlands (9,87%)	Italy (8,11%)
	Denmark	Sweden (16,16%)	USA (13,01%)	Norway (9,67%)
	France	Spain (9,88%)	Belgium (8,966%)	USA (8,54%)
	Germany	USA (13,63%)	Switzerland (8,47%)	United Kingdom (7,23%)
	Netherlands	Germany (14,83%)	Belgium (14,36%)	Canada (12,82%)
B	Italy	Germany (18,9%)	France (11,76%)	Canada (10,53%)
	Ireland	United Kingdom (51,96%)	USA (16,43%)	Australia (11,29%)
	Portugal	France (32%)	Switzerland (9,83%)	USA (7,81%)
	Spain	France (21,77%)	Germany (11,3%)	United Kingdom (10,85%)
	Greece	Germany (34,85%)	USA (13,55%)	Australia (11,66%)
C	Czech Republic	Germany (19,19%)	Slovak R. (18,12%)	USA (15,4%)
	Estonia	Russia (29,12%)	Finland (22,04%)	USA (5,88%)
	Hungary	Germany (27,28%)	United Kingdom (14,18%)	Austria (9,61%)
	Latvia	United Kingdom (25,65%)	Russia (22,49%)	Germany (7,29%)
	Lithuania	United Kingdom (29,1%)	Russia (10,89%)	Poland (7,29%)
	Poland	Germany (31,06%)	United Kingdom (30,64%)	USA (14,36%)
	Slovak Republic	Czech R. (21,77%)	Germany (11,3%)	United Kingdom (10,85%)
D	Malta	United Kingdom (42,39%)	Greece (11,83%)	Australia (11,32%)
	Cyprus	Australia (40,75%)	United Kingdom (32,32%)	USA (11,31%)

Source: own study based on World Bank data

The share of emigrants who decided to translocate to other countries in their sub-zone was also analyzed. Most countries in sub-zone A are characterized by a high share of emigrants to the sub-zone, although lower percentages, ca 40-60%, were noted in the case of Belgium, Denmark and the Netherlands, while the lowest ones, 25-30%, appeared in the case of France and Germany. In sub-zone B, Italy and Spain represented lower values (15-16.5%) of this indicator than Portugal and Greece. There is much diversity in this regard among sub-zone C countries. 52% of the Czech citizens decided to emigrate to one of the selected Central and Eastern Europe, with Lithuania (18.36%) and Slovakia (7.95%) behind. In the remaining countries within this sub-zone, the share of such migrants is negligible (3.78% at the most). Finally, Malta is not an attractive destination for emigrants from Cyprus and vice versa.

Conclusion

The theory of optimum currency areas indicates the criteria which should be satisfied for the countries that intend to forego a floating currency rate. The OCA theory is imperfect due to several reasons: some criteria are contradictory, the theory lacks any hierarchy of criteria, and there are no appropriate indicators or reference values; all this means that any empirical studies in this field are difficult. As a result, researchers may arrive at completely different conclusions.

A solution to the structural problems experienced in the euro area is to create euro sub-zones. Nevertheless, the assertion that there are a few groups of countries within the EU which would satisfy the OAC criteria, which was accepted in the 1990s, remains valid. Studies completed by B. Eichengreen and T. Bayoumi, as well as the authors' own observations, prove that the core countries present much convergence of macroeconomic shocks, which enables them to implement together an effective monetary policy that could prevent macroeconomic shocks. The accession of some Central and Eastern European countries led to a higher number of sub-zones, characterized by much diversity of socio-economic positions. Thus, the situation is different than 30 years ago.

According to the research results:

1) Sub-zone A is characterized by the highest degree of economic convergence. These countries fulfill all the mentioned criteria.

2) Sub-zone B are countries of the 'old' EU with a lower level of socio-economic development. Spain, Portugal and Italy have convergent business cycles but do not meet the other criteria. The countries which should not be classified in this group are Greece and Ireland.

3) Sub-zone C are countries of Central and Eastern Europe, with some being in the euro area. Two sub-groups could be distinguished in this sub-zone: one composed of the Czech Republic, Slovakia and Poland, and the other comprising Lithuania, Latvia and Estonia. However, these countries do not constitute significant partners to one another. They are characterized by growing economic convergence.

4) Sub-zone D are insular countries, which are not recommended to create a sub-zone of common currency because they are different in the socio-economic situation and do not meet most of the criteria specified by the theory of optimum currency areas.

For most of the countries, a good solution would be to create a currency union with Germany and France. However, both Germany and France most often enter cooperation with highly developed countries (such as the United States of America).

In view of the above considerations, a euro sub-zone that would meet the criteria defined in the theory of OCA could comprise Germany, France, Belgium, the Netherlands and Denmark. A common currency union composed of these countries would be quite resilient to macroeconomic shocks and their common policy might be effective (it would correspond to the so-called 'one size fits all' requirement).

The remaining EU countries should not opt for a fixed currency rate among them, in the sense envisaged in the theory of optimum currency areas.
This study contributes to the national and international debate on monetary integration in Europe. It can also serve as a starting point for further research dedicated to the issue of the creation of euro sub-zones.

Abstract

The article presents the results of the study focused on the elaboration of a method to identify knowledge deficits, particularly from the point of view of a supply chain. The proposed method enables to identify knowledge deficits and makes it possible to determine active actions to improve the level of logistic customer service in a supply chain. The research process consisted of two stages and was aimed primarily at acquiring qualitative information in the field of knowledge processes implemented in logistic processes concerning the execution of make-to-order contracts in a machine-building industry supply chain. The study needed to prepare focused questionnaires for both stages. The first stage was focused on the general determination of knowledge deficits in all logistic processes in an analysed supply chain. The second stage was to characterize and structure identified deficits to get their sources and consequences basing on direct interviews with internal and external experts. The main achieved objective ~~result~~ of the research was the elaboration of a knowledge deficits matrix as an authorial method enabling the identification and evaluation of knowledge deficits in a machine-building industry supply chain. The method, in business practice, enables to determine interconnections between disruptions and knowledge deficits in logistic processes in a supply chain. As a result, it supports managers to undertake actions eliminating or reducing existing problems, and consequently improving the efficiency of logistic processes execution.

Keywords: Knowledge Management, Knowledge Deficits Matrix, Supply Chain.

Introduction

Effective and efficient supply chain management requires adequate coordination of a logistic supply system and a logistic distribution system. The integration of both systems is extremely important for efficient and effective supply chain management, wherein mainly efficient material and information flows are key elements enabling the coordination of these systems. Moreover, a supply chain is a loosely linked system of separate and independently managed units of diverse internal structures. The consequence of the lack of integration in these units is inefficiency, especially as the unsatisfactory level of logistic customer service. The key element is the lack of knowledge which affects the execution of logistic processes in a supply chain. The authors' study was focused on analysing existing knowledge deficits in these processes in Polish machine-building industry. Knowledge deficits are the quantitative and qualitative difference between the required and available knowledge needed to execute processes effectively. The authors have undertaken research in Polish machine-building industry aiming at examining deeply logistic processes in the context of knowledge deficits. The main aim of the study from business and scientific points of view was to elaborate an authorial method enabling the identification and evaluation of knowledge deficits in a machine-building industry supply chain.

The literature review on knowledge management in a supply chain

The supply chain is a functional chain structure linking suppliers, manufacturers, distributors, retailers all the way to end users (Pan et al., 2013). Today, a traditional supply chain is facing important challenges, such as the need to shorten the time to market, minimize production costs and manage products that are increasingly technologically complex (Li and Hu, 2012; del-Rey-Chamorro et al., 2003). Demanding customers, changing demand patterns, short product life cycles, proliferation and individualization of products, rapid product innovations and geographically dispersed locations of buyers and suppliers are important incentives for contemporary supply chain managers (Bhosale & Kant, 2016; p. 141, Fugate et al., 2012). Therefore, it can be concluded that knowledge management is

becoming one of the basic factors, but also a necessary condition for the development of modern supply chains (Li and Hu, 2012).

It is not the intention of the authors to define what is the role of knowledge in the supply chain, it is widely analyzed in many publications, while the literature review conducted by the authors showed that basically knowledge management is mostly considered a tool for supply chain integration. However, due to a different approach to the issue of knowledge management in a supply chain, Table 1 presents a list of selected studies along with the area of knowledge they concern.

Table 1: The List of selected publications in the field of knowledge management in the supply chain

Authors	Subject of study	Research methods
Dyer and Nobeoka (2000, p. 350)	Knowledge Transfer Network	Case study based on 30 interviews with Toyota management and senior management + research on 21 first-tier suppliers (USA + Japan)
Hansen (2002, p. 236)	Sharing knowledge in an international company	Case study of 120 new product development projects in 41 business units of a large electronics company
Bessant et al. (2003, s. 180-181)	Product development projects; Inter-organizational learning	Case study of six industries (semiconductor equipment, oil and gas, computer hardware manufacturing, aviation, chemicals manufacturing); Sharing knowledge on the web; Case study of 42 US Toyota automotive suppliers and US car makers
Wadhwa I Saxena (2006, pp. 28-31)	Knowledge exchange between members of the supply chain; Connecting with supply chain performance	Development of demonstration models to disseminate knowledge sharing concepts; Application of the model to improve supply chain management
Collins et al. (2010, p. 949)	A conceptual overview of the linkages between knowledge management, supply chain, technology investments, and overall business performance	Development of a set of supply chain performance indicators supported by knowledge management technology
Marra, Ho, Edwards (2012, pp. 6103-6110)	Analysis and evaluation of the relationship between knowledge management and supply chain management by analyzing existing theoretical and empirical work.	Desk research based on 58 scientific articles published between 2000 and 2010, coming from the ScienceDirect and ProQuest databases, searched on the basis of the keywords “supply chain management and knowledge management”
Cerchione, Esposito (2016)	A systematic review of the literature on knowledge management in the supply chain to identify the state of the art, highlight research gaps and identify research questions to be addressed.	The literature review divided into two main phases: 1. The publication selection phase (full search by identifying keywords, constructing search strings, selecting databases – Scopus, Web of Science, etc., browsing databases using search strings, selecting publications for detailed analysis);

		2. Phase of descriptive and content-related analysis of selected publications;
Łupicka, Grzybowska (2020, p. 5-6)	Presentation of the role of social capital competences in creating knowledge, as well as cooperation of partners in supply chains or the integration of communication tools and IT systems	Using the SECI model as a model for creating knowledge in complex systems. The results of empirical research showing the ways of acquiring knowledge in these systems are presented

However, it should be emphasized that after analyzing the literature, there are relatively few studies on elements that limit or have a negative impact on the integration of the supply chain. Undoubtedly, such elements are deficits (gaps) in the flow of knowledge, understood as quantitative and qualitative differences between the required and available knowledge in a supply chain.

The concept of knowledge deficits in a supply chain

The concept of knowledge deficit was presented by Wild (Wild et al. 2002) defining the chain of knowledge value, according to the fact that a knowledge value chain consists of four processes:

1. the identification of strategic knowledge for an organization,
2. the determination of knowledge gaps,
3. the fulfilment of a knowledge gap through the creation of new knowledge, buying knowledge, improvement of existing knowledge, the removal of outdated or irrelevant knowledge,
4. the dissemination and application of knowledge.

A knowledge gap is understood by the authors as a quantitative and qualitative difference between the required and available knowledge in an organization. McBriar and others (2003) define the knowledge gap as the difference between the knowledge which an organization needs to achieve its objectives and that one it possesses recruiting the staff with appropriate qualifications or maintaining other forms of knowledge resources.

The authors emphasize that knowledge in the form of a computer archive is not always the same knowledge that organizations are able to retain and use to support business processes. A knowledge gap can refer to acquired and archived knowledge, or can refer to movable knowledge. The company can create knowledge gaps, leading to inactive knowledge (an employee transfer to the position where his knowledge is partly no longer used). and Tseng (2005) identified five different knowledge gaps that may appear during the implementation of knowledge management.

The first knowledge gap is based on bridging the gap between the knowledge required to enhance an enterprise's competitiveness as perceived by top managers, and the knowledge actually required. **The second knowledge gap** is connected with the mismatch between the perception of the top managers and the enactment of the plan for a knowledge management system (it concerns, among others, the situation in which managers admit the need of knowledge acquiring, but they cannot precisely define due to the inability to determine effectively what they need). **Third knowledge gap** is connected with the implementation process of knowledge management in an organization, and it appears because employees may not fully understand what a knowledge management system is or are afraid that their personal value might be negatively affected after sharing their knowledge. Employees' unwillingness to share their own knowledge or their inability to understand exactly a knowledge management system will create a gap between the internalization and externalization processes when implementation occurs. **Fourth knowledge gap** concerns the problem "how to evaluate knowledge". However, although a variety of measures have been proposed, knowledge assets are still difficult to be measured appropriately using the existing accounting systems due to the tacit nature of knowledge and its dynamism. The study presented by Tiwana (Tiwana, 2001) proves that firms usually fail to evaluate the results of knowledge management in order to determine whether or not it meets the expectations. **Fifth knowledge gap** is connected with the essential problem in an organization concerning gaps between the perceptions of top managers and that of employees due to the differences of position, role, and professional knowledge (Nonaka, 1991; Paiva, 2003).

To ease the effects of emerging gaps in knowledge management, companies should visualize operational performance in more detail than the end profitability does by focusing on incentives, control mechanisms, and benchmarking

(Drew, 1997; Stachowicz, Olko, 2015). In addition, it is necessary for the firm to have a well-developed technology that is accessible and easy to leverage knowledge management (Desouza & Evaristo, 2003). Many authors emphasize the great influence of disruptions on the creation of knowledge deficits, particularly in relation to the processes carried out in a supply chain (Hendricks, Singhal, 2005, Hillman, 2006, Ji, Zhu, 2008, Kramarz, Kramarz, 2014; Kleindorfer, 2005, Kull, 2008, Kumar, Du Fresne, Hahler, 2007, Kumar, Jensen, Menge, 2008, Norrman, Sweden, Jansson, 2004). Kramarz M and W (2015) pointed to an increase in the number of participants in a supply chain and network relations which resulted in an increase in the complexity of the entire logistic and production system. Consequently, there appear additional potential sources of disruptions in material flows.

Disruptions were defined by Barroso and others (2008) as as unforeseen or foreseen events that intrude scheduled processes or the stability of an organization. Disruptions are similarly defined by Svensson (2000), Ji G. and Zhu C. (2008), Kleindorfer and others (2005), describing them as unforeseen and unexpected events that intrude a material flow in a supply chain. Disruptions that cause variations in a material flow, in the literature, are classified, among others, according to the criterion of sources of their generation. Mason - Jones and Towill, (1998), and Christopher and Peck (2004) consider four categories of disruption sources: processes in a supply chain (transport, storage, information processes), suppliers, customers, core business activity (planning, organization and control). Other authors, among others Brzóska (2012), Tang (2006) and Ji and Zhu (2008), continuing the problem of risk identification in material flows, consider supply management, demand management, production management, and information management as four areas demanding the strategy of smoothing variations occurring as a result of disruptions. Disruption management (Xia Y., Yand, Golany et al., 2004) is in an unstable environment, which is changed constantly by the unpredictable events, system parameters, availability of resources, new restrictions. This characteristic forces disruption managers to make decisions in real time. Lijun S., Xiangpei H., Yan F., (2008) reported that knowledge representation was the basis of the real-time problem-solving process.

Research Methodology

The research process consisted of two stages and was aimed primarily at acquiring qualitative information concerning the knowledge deficits identification in customer's order in machine-building industry supply chain. The study procedure included two steps:

1. The acquire and analysis of information of knowledge processes in customer's order execution in machine-building industry.
2. The identification of key disruptions in contract execution, to link them to specific knowledge deficits, and finally to develop the method of knowledge deficits identification in logistics customer service processes.

The research required the detailed analyses of selected actors in a machine-building industry supply chain based on research questionnaires, which provided the basis for interviews with representatives of the senior management. The study was conducted in 38 enterprises located in Poland, in Silesian province.

In analysed supply chain the design and technology are usually developed individually for specific customer orders. Projects are generally unique with specific requirements concerning technical planning, production management, expenses scheduling, and accounting methods. Orders repeatability is low or even none. The order execution in this type of environment requires a distinctive support of knowledge management. Within the scope of order execution processes, pre-transaction, transaction and post-transaction elements are very important for the level of a customer service. Pre-transaction elements are associated with preparation processes for customer service. They play a significant role in shaping customers' expectations and affect the perception of a company, as well as the satisfaction with an offer. Transaction elements decide about appropriate and coherent customer's expectations. Post-transaction elements provide customers with the appropriate use of products.

The research model is given in Fig. 1. Based on research assumptions, the main objective of questionnaire survey was to determine the detailed scope of knowledge processes in a customer order execution. The expert method was applied to identify key disruptions in a contract execution process. The team of chosen experts (24 people from 7 enterprises), was presented the preliminary list of potential disruptions, and experts were asked to supplement the list. Disruption factors, collected in this way, were divided into 5 main groups (macroprocesses of a logistics customer service). The list of 35 collected factors was divided as follows (in the brackets there are numbers of factors in each group):

- Contract preparation (5):
    - incorrect setting of contract's conditions,
    - problems with an information flow,
    - too long time of information transmission,

    - inappropriate cooperation with contractors,
    - insufficient access to integrated systems supporting a design process.
- Supply (8):
    - inappropriate cooperation with suppliers,
    - incorrect fulfilment of order forms,
    - default of contract conditions by carriers, logistics operators,
    - materials and components price volatility,
    - default of technical standards and raw materials by suppliers;
    - errors in material requirements planning;
    - incorrect fulfilment of internal order documents;
    - incorrect issuance of warehouse documents.
- Production (9):
    - inappropriate material supply for production in terms of quantity, quality, time, location and costs,
    - qualifications and experience of production workers,
    - mistakes of office workers,
    - misinterpretation of commands,
    - the lack of modern instruments of planning and control,
    - the lack of quick access to production departments' data,
    - long ways of the flow of materials and products,
    - possession of surplus interoperable stocks,
    - shortages of production inputs.
- Distribution (5):
    - damage of products or product parts during delivery to a customer,
    - incorrect data on a transport document,
    - the lack of adequate means of transport,
    - the lack of qualified personnel to implement processes to install the product at a customer,
    - insufficient contact with a customer.
- Supportive processes (8):
    - damage during internal transport,
    - inappropriate material management,
    - shortages of materials,
    - the lack of a material quality control system,
    - damage during storage,
    - shortage of workers,
    - incorrect labels making impossible to identify material, goods, etc.,
    - the lack of adequate packaging.

Figure 1: Research model

Characteristics of a knowledge deficits identification method

The knowledge deficit in logistics processes can be defined as a knowledge gap (total or partial deficit), which reduces the effective implementation of processes in make-to-order contracts. In order to analyse systematically existing knowledge gaps and to take actions to minimize them, it is necessary to develop a method for identification and evaluation of knowledge deficits. To achieve this objective the study has been conducted in two stages.

In 1. stage of the study, the structure of logistics processes in the analysed enterprises was determined. Additionally, knowledge deficits categories were determined taking into account infrastructure, competence and knowledge tools gaps. Questionnaire surveys enabled to determine typical disruptions, their assignment to the specific processes of a logistics customer service and to indicate links between disruptions and knowledge deficits. For each disruption a direct or indirect negative effect was indicated and necessary actions to minimize the deficit.

In 2. stage of the study, the method of knowledge deficits identification was developed. The method allows categorization and evaluation of analysed deficits. As a result, the matrix was elaborated to identify knowledge deficits, which enables to determine the level of negative impact of knowledge deficits on the effectiveness of processes in a make-to-order contract.

The main effect of applying the method of knowledge deficits identification in logistics processes in supply chain is the systematic identification of emerging disruptions, linking them with knowledge deficits and possible actions to reduce these deficits. An important aspect of the proposed method is the matrix which enables to store of codified knowledge of analysed deficits. It results in the ability to transfer this knowledge and to use it repeatedly. The application of the method makes it possible, in a medium term, to identify necessary changes in the configuration of a logistics system and actions to improve knowledge management.

The method of knowledge deficits identification in a machine-building industry supply chain should take into account the following assumptions:

1. The determination of disruptions and associated knowledge deficits requires expert knowledge in the field of a logistics customer service.
2. Disruptions and knowledge deficits should be assigned to 5 main macroprocesses, and then assigned to specific logistics processes or operations.
3. Negative effects of disruptions need to be elaborated, as well as the categorization and evaluation of knowledge deficits that are the source of disruptions. And finally necessary changes should be given to minimize the deficit.
4. The elaboration of the matrix of knowledge deficits identification needs two stages. The first stage (developed by external or internal experts) should include the determination of disruptions, their negative effects, assignment to macroprocesses and logistics processes, and the source of a disruption in the form of a knowledge deficit. The second stage (developed by internal experts) should include categorizing and evaluating knowledge deficits and actions to minimize the negative impact of knowledge deficits.

For the purposes of the study, a disruption in logistics processes in a machine-building enterprise is defined as a disability or an inappropriate intended or unintended action that causes a negative effect lowering logistics customer service, and its source is a knowledge deficit. For example, an problem with the installation of a component in a production process (**a disruption**), which directly or indirectly results in the need to re-order or re-design of a final product, which may lead to a delay in a contract (**a negative effect**) derives from the lack of the precise specification of a component (**a knowledge deficit**). The appropriate identification of a knowledge deficit and its evaluation i.e. the determination of the weight of its negative impact and its incidence allows to take necessary actions to minimize its adverse effects. For this purpose, on the basis of an analogical solution, some elements of the risk measurement card, a project management tool widely used in business practice (Dohn & Gumiński, 2013), can be used.

Identifying which disruptions determine the level of a logistics customer service can be developed with the indication of different logistics service elements. In the process of disruptions identification it is also possible to point to an order execution:

- pre-transaction elements (customer service policy, flexible service system, service procedure),
- transaction elements (order information, expedition of goods and services, the availability of substitutes),
- post-transaction elements (guarantee, complaint, returns and replacement of products and spare parts).

In order to identify knowledge deficits affecting the level of a logistics customer service, the elaboration should be focused on essential elements determining the efficient implementation of knowledge processes. In fact, in terms of consistently appearing disruptions arising directly or indirectly from knowledge deficits as tool or system deficits. For the research purposes, 3 categories of knowledge deficits were determined as follows:

- knowledge deficit in the field of infrastructure (infrastructural knowledge deficit - IKD), which means a deficit in terms of infrastructural elements determining knowledge management that are codified, representing explicit knowledge (e.g. implementation procedures, schedules, processes maps, IT tools),
- knowledge deficit in the competence and experience of personnel (competence knowledge deficit- CKD), is the lack of tacit knowledge,
- knowledge deficit of tools and methods used in knowledge processes (tools knowledge deficit – TKD), which determines the efficiency of knowledge management (the lack of or limited range of procedures and tools for acquiring, storing and updating, transfer, and use of knowledge).

To develop the matrix of knowledge deficits, the assignment of disruptions to macroprocesses and logistics processes or operations should be done. As a result, the knowledge deficits matrix allows to determine what and in what scale is missing of knowledge management in the processes of a logistics customer service in a machine-building company. In turn, it would enable the indication of specific enhancing actions (to minimize knowledge deficits) on the basis of identified disruptions. Any disruption requires to develop:

- the assignment to a logistics customer service macroprocess,
- the assignment to a logistics process or operation,
- the determination of direct / indirect negative effects of a disruption,
- the characteristics of the source of a disruption in the form of a knowledge deficit.

In the next stage, it is important to determine the category of knowledge deficit (infrastructural, competence, or tools deficit), as well as its evaluation i.e. to determine the weight of knowledge deficit, and as a result of a deficit existence,

the incidence of disruption occurrence. Based on the analysis of the impact force of a knowledge deficit within a macroprocess of a logistics customer service, it is possible to propose actions to minimize the negative effects of knowledge deficits.

The disruption can be induced by one, two or even three knowledge deficits categories. It is essential that an expert (or an employee) decides about the category of a knowledge deficit. The impact force of knowledge deficits on the level of a logistics customer service is determined indirectly through the effects of a particular disruption in logistics processes, i.e. the incidence and its validity, as the impact level on an emerging disruption. Both the weight and the impact incidence of a knowledge deficit should be determined in a scale of 1 to 5 (where 1 - very low weight / incidence, 5 - very high weight / incidence). The indicator of **the impact force of knowledge deficit (IFKD)** is the product of the value of knowledge deficit weight and the values of its incidence. In the assessment situation, done by a few experts, the weighted average should be accepted. Descriptively the following scale of the impact force of knowledge deficit was determined as follows:

Table 2: The form of a knowledge deficits identification matrix for a macroprocess "distribution" in a machine-building enterprise

Macroprocesses of a logistics customer service	Id.	Identified disruptions	Logistics customer service processes / operations	Direct /indirect negative impact of a disruption	Description of knowledge deficit	Categorisation and evaluation of knowledge deficits										Proposed enhancing actions
						IKD			CKD			TKD			Total impact	
						weight	incidence	impact	weight	incidence	impact	weight	incidence	impact		
Distribution	1.1.															
	1.2.															
	1.3.															
	1.4.															
	1.5.															
	...															
	The maximal impact force of knowledge deficits for a macroprocess															
	The average impact force of knowledge deficits for a macroprocess															

IKD – infrastructural knowledge deficit

CKD – competence knowledge deficit

TKD – tools knowledge deficit

- if IFKD> = 14, the impact is unacceptable (an absolute indication to take actions to eliminate or minimize knowledge deficits),
- if 6 <IFKD <14, the impact is significant but acceptable (a conditional indication to take actions to eliminate or minimize knowledge deficits),
- if IFKD <= 6, the impact is low (indicating the lack of actions to minimize knowledge deficits).

For a macroprocess it should be determined the maximum and the average impact force of knowledge deficits on the effectiveness of logistics processes, both for each category of knowledge deficits, and totally for all categories. The comparative analysis of the impact force of individual knowledge deficits provides the indication of the most necessary actions to limit negative effects of these deficits, especially those for which the index IFKD has exceeded 14.

The matrix of knowledge deficits identification requires the determination of elementary disruptions in all logistics processes and operations required for a logistics customer service. The form of the matrix of knowledge deficits identification, given in Table 2., enables the identification and evaluation of knowledge deficits in 5 macroprocesses: contract preparation, supply, production, distribution and supportive processes.

The proposed method, i.e. a knowledge deficits identification matrix, has been positively verified in Polish machine-building companies. It was applied in these companies to determine knowledge deficits and consequently to undertake necessary actions to increase logistic processes efficiency.

Conclusions and Discussion

Appropriate storing and using of knowledge is one of key factors determining the level of a logistics customer service in a machine-building enterprise. The proposed method, focused on developing the matrix to identify knowledge deficits in logistic processes, enables to link emerging disruptions in the entire process of make-to-order contract implementation with existing infrastructure, employees competences and tools deficits, which are the direct or indirect sources of these disruptions. The matrix to identify knowledge deficits reflects the impact force of individual deficits, and thus provides a tool for determining necessary actions to eliminate or reduce a negative impact.

The further study should bring in a IT tool supporting the elaboration of a knowledge deficits identification matrix in logistics processes. The tool would facilitate the preparation and implementation of all information necessary to determine the matrix, and on the other hand, would enable averaging and aggregation of knowledge deficits from various experts. And in turn, it would increase the correctness of an analysis, especially at the stage of categorization and evaluation of knowledge deficits. The tool supporting the identification of knowledge deficits would allow further indication of knowledge deficits, which are the sources of various disruptions or problems in the execution of make-to-order contracts.

The above-mentioned IT tool, based on the method elaborated by the authors, would support storing and transferring of knowledge deficits concerning disruptions in logistics processes, and decide on necessary actions to prevent from negative effects of their impact. This should lead to gradual improvement of logistic processes efficiency and consequently the level of a logistics customer service in a machine-building enterprise.

Abstract

Sustainable development constitutes an idea based on three main perspectives: social, environmental and economic. Especially the first two have become more and more important in recent years. The reference of the sustainable development concept is also visible in the logistic processes implemented in distribution networks. However, fulfilment of the sustainable development idea in material flows is conditioned by its implementation by specific economic entities that are the main participants of the network. In relation to that, the authors of the paper considered the influence of cooperation established in distribution network on implementation of the sustainable development concept in the strategies of enterprises participating in the network. On this basis, the aim of the paper was formulated as showing the dependencies between the models of cooperation in distribution networks and maturity of the network in terms of implementation of the sustainable development concept. In the conducted research, the relationships in a chosen distribution network were mapped, two main models of cooperation occurring in the studied network were characterised, and the survey research in the nodes creating the network were performed. The survey research was focused on assessing the awareness of sustainable development and the level of incorporation of the sustainable development pillars in strategies of the entities creating the analysed distribution network. Conducted research allowed to obtain an answer to the question: *does the maturity in terms of the concept of sustainable development of distribution network with participation of the logistic operator depend on the type of the model of cooperation in the network?* The dependencies indicated by the authors became the reason for developing the network maturity model concept in terms of the concept of sustainable development of enterprises that includes specific stages of cooperation in the network.

Keywords: sustainable development, distribution network, cooperation models, network maturity.

Introduction

Współpraca pomiędzy przedsiębiorstwami definiowana jest jako “similar or complementary coordinated actions taken by firms in interdependent relationships to achieve mutual outcomes with expected reciprocation over time” ’Idea podejmowania współpracy w sieciach dystrybucji Idea współpracy pomiędzy przedsiębiorstwami bazuje na trzech głównych elementach: (1) wzajemnego powiązania zachowań współpracujących stron, (2) dobrowolności oraz (3) chęcią osiągnięcia wspólnych celów. Cooperation in distribution networks is directed on ensuring an availability of the products in time and place expected by the clients. It allows to obtain the so called "relational rent", defined as additional benefits possible to achieve by enterprises thanks to established cooperation (Cruijssen, Cools, Dullaert, 2007), among them, the improvement of the level of customer service is indicated (Wang, at al., 2017), as well as the benefits resulting from sharing the information, risk, knowledge and profits (Leitner, Meizer, Prochazka, Sihn, 2011). It is indicated as an important chance of counteracting the negative effects that an uncertainty of the environment creates for the policy makers. At the same time, many researchers emphasise that cooperation in the network creates an environment conducive to increasing the innovation. Complex relationships created between the producers, trading companies and logistic organisations can be indicated on the level of distribution systems. Defining the cooperation as the type of a relationship, the focus is oriented on: (1) interconnection of activities of cooperating parties, (2) voluntary establishment of relationships and (3) willingness to achieve common goals by engaged entities (Mehta et al., 2006).

Three models of cooperation are mentioned in the literature (Kramarz, Twaróg, 2017):

Cite this Article as: Marzena KRAMARZ and Edyta PRZYBYLSKA “Sustainable Development in The Strategies of Organisations Cooperating in Distribution Network” Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

- Simple model of cooperation in which the producers in order to ensure the effectiveness of the trading connections use various forms of motivation based on the stimulus – response principle;
- Model of the long-term partnership in which the producer presents his expectations for the intermediaries. They concern the way of reaching the recipients, level of resources, marketing development, technical counselling, organisation of the logistic processes. Participants share the tasks in the network and determine which works will be implemented together (Muda, 2018). This model is strongly based on trust and coordination of information flows between partners (Wei, Wong, Lai, 2012);
- Model of the distribution programming, that is creating on the producer's initiative a planned and professionally managed, vertically integrated marketing system that combines both the needs of the producer and intermediaries (Meiklejohn, 2017).

Network cooperation conduces to innovations, both in terms of promoting their development and disseminating them (Pittaway, Robertson, Munir, Neely, 2004). However, considerations on the influence of cooperation on innovativeness related to implementation of the sustainable development concept were undertaken in the paper. Therefore, the aim of the paper is to indicate dependencies between the models of cooperation in distribution networks and maturity of the network in terms of implementation of the sustainable development concept.

Sustainable development in cooperation models – theoretical background

Analysing the evolution of cooperation of the partners in the delivery chain, Cordón and Vollmann (2008) have distinguished four basic phases. Phase 1 assumes the beginning of cooperation between the organisations. Enterprises undertake common activities in order to implement strategic goals. Phase 2 is delving into the cost aspect (Total Cost of Ownership). Through the cooperation, organisations try to decrease the total costs of functioning. They assume that such activities will allow to attain competitive advantage. There are more elements of cooperation than competition. In Phase 3, cooperation is still developing, but also stabilising. Partners go beyond the cost criterion. They notice that increasing the costs is only one of the elements of attaining advantage on the market. Bigger attention is being paid to the environmental aspects, sustainable development concept or implementation of innovations. Organisations start to exchange competencies and know-how. The key factor in this aspect is a mutual declaration on maintaining the individuality and respecting intellectual property of the entities (Van Weele, 2014). At this stage, common designing and creating the product takes place. Phase 4 is the process of strategic matching of the enterprises. Reaching this stage is very difficult and complicated. Partners are open to cooperation and share competencies important for them. Common areas include managing the risk, or creating the organisation's value. It is worth pointing out that the transition form the lower to higher phase is possible only when the enterprises decide that they are fully ready for it and all former phases have ended successfully (Cordón, Vollmann, 2008).

Partners analyse the partnership on the basis of criteria that is crucial for them. The duration of a given partnership is most often analysed. Figure 1 presents an adequate path of creating value in the partnership and its measurement (Sulejewicz, 1997).

Fig 1. Model of value creation path

Source: (Simatupang, Sridharan, 2005).

Model of value creation path shows what are the main factors of cooperation, intermediate standards and financial indicators. Analysing the cooperation factors, it can be noticed that sharing the information, decision synchronisation, convergence of incentives and streamlined business processes are the indicators of developing the sustainable development concept in the distribution networks. Indicated intermediate standards should be balanced with the standards in the sustainable development area. Whereas financial standards in the model of value creation path do not include the effects of sustainable development.

Sustainable development requires from the society a change in current thinking and in an approach to the global economy development. Zegar (2003, s. 37) indicated that sustainable development is „a new approach to the philosophy of life, acceptable production techniques, consumption model, use of environmental resources, protection of biodiversity, maximum use of closed cycles for waste accompanying human activities“. Present enterprises more often realise that introducing ecologically justified activities means not only improving the general enterprise image, but also concrete and measurable material benefits. Organisations change their way of perceiving the products or services for the more pro-ecological one. Such activities are treated as creation of the added value to the products or provided services. It can be noticed that all definitions of the sustainable development concept are related to cooperation of the human with natural environment. One of the basic areas, in which the use and implementation of the rules of sustainable development is being advised, is the broadly understood logistics, what is especially difficult in the complex logistic system which are the distribution networks (Sisco, Chorn, Pruzan-Jorgensen, 2010).

As Martins, Anholon, Quelhas, Filho (2019) emphasise, most of the research on the relationship between the sustainable development and the logistics is concentrated on limiting the influence of the logistic activity on the environment. The idea of sustainable development in the logistics is mainly manifested in sustainable orders, sustainable transport, sustainable packaging, sustainable distribution and return logistics, designing and controlling the activities in terms of sustainable delivery chain. However, the basic areas of the logistics that influence the sustainable development most strongly are:

- transport processes - in this term, a special attention should be paid to the sustainable transport development, activities related to the implementation of transports using vehicles that meet the latest exhaust emission standards and the implementation of the full truck loads with the maximum use of the loading area. Sustainable transport system has to meet the transport needs and at the same time not to endanger human health and not to destroy the ecosystem (Balaman, Matopoulos, Wright, Scott, 2018);
- warehouse processes - combining the warehousing process with sustainable development is mainly interfering with the warehouses, their centralisation, location, area optimisation, equipment, applied storing technologies, or use of the picking warehouses. Sustainable warehousing uses a range of technologies and organisational solutions designed in terms of improvement of the processes efficiency, maintaining the quality standards, improvement of the economic effectiveness, as well as decreasing the impact on the environment (Akandere, 2016).
- processes related to managing the packaging and waste (Sadowski, Szołtysek, 2013) - this area combines economic and ecological aspects through applied technology in reverse logistics, as well as designing the packaging. It enters the issue of designing the products with consideration of reverse logistics (ecological cycle of the product's life).

In distribution networks, this challenge is especially faced by logistic companies that are looking for the right balance between the strategic goals and an adverse impact on the natural environment. It seems that keeping the balance between these activities in compliance with the policy of sustainable development may be the key for achieving a desirable competitive advantage. Undoubtedly, a good example of a logistic organisation that combines these two poles is the global logistic operator DB Schenker (2020). The enterprise has introduced, among others, a DB 2020 climate protection programme that assumes limiting the CO_2 emission by 20% in the years 2006-2020, in the land, oceanic and air transport. Moreover, the company has implemented an Integrated System of Managing the Quality, Work Safety and Environment. A package of solutions for the clients, including Emission Reporting Programme, or Ecological Calculator, was also implemented. Another example is the Raben Group (2020), which has the environmental aspects included in its action strategy. Among the main programmes implemented by the enterprise there may be indicated: development of the low-emission fleet, development of the low-emission buildings, neutralisation of the activity's impact on the environment, or the pro-environmental Eco2way campaign. In a research conducted in the United States on a sample of 250 enterprises, it was found that more than a half of them (52%) performs classification of their suppliers on the basis of environmental criteria. Moreover, the remaining 39% of the companies have already undertook the actions in this area. It is worth noticing that most of the analysed companies generate incomes on the level of 1 billion Euro. Therefore, it can be presumed that it is the biggest organisations that concentrate their activities on sustainable development.

The problem of incorporating the sustainable development concept in the strategies of all enterprises cooperating in distribution network seems to be extremely important at the moment. As the research on cohesiveness of the marketing and logistic strategies with the pillars of sustainable development shows, more and more often also the production and trade organisations show understanding for the need to be included in logistic and marketing activities of the sustainable development principles. However, they not always have the knowledge on how to do this. The concept of including the pillars of sustainable development in the logistic and marketing strategy was proposed by Kauf, Kramarz, Sadowski (2019), indicating the importance of their incorporation in the normative, strategic and operational sphere.

Relational abilities in terms of cooperation with all stakeholders are extremely important for the implementation of assumptions indicated by Kauf, Kramarz and Sadowski (2019). As Czakon (2015) indicates, the relational ability is: „the potential of cooperation resulting from former experiences, manifesting as organisational routines, tendency to achieve the goals together and creation of individual organisational entities specialised in supporting the effective cooperation ".- Kauf, Kramarz and Sadowski (2019) emphasise that the concept of sustainable development requires creation of the long-term relationships with suppliers, intermediaries and organisations of the business environment. This concept has to be included in creation and promotion of the products (goal of the marketing) and in the assurance of the products' availability in time and place expected by the customer (goal of the logistics). Creation of the needs and ensuring the availability of the products should include the requirements of environment and society (goal resulting from the concept of sustainable development). In the marketing and logistic planning that incorporates the pillars of sustainable development, it is necessary to include such factors as: reduction of social and environmental costs (including land occupation, noise, accidents, environment pollution).

The need for integrating the activities oriented on sustainable development on the level of cooperating organisations network results from the indicated concept. At the same time, the answer to the following question was searched for in the next stages of research:

Does the maturity in terms of the concept of sustainable development of distribution network with participation of the logistic operator depend on the type of the model of cooperation in the network?

In the conducted research, the relationships in the chosen network were mapped, the models of cooperation were characterised, and the survey research in the nodes creating the network were performed. The survey research was focused on the assessment of sustainable development awareness and the level of incorporation of the sustainable development pillars in strategies of the entities creating analysed network.

Concept of studying the aspects of sustainable development in the strategies of organisations cooperating in distribution networks

The problem of cooperation and the concept of sustainable development was analysed on the basis of a case study of a chosen distribution network. The central logistic link was distinguished in it, which is the enterprise specialised in distribution of the food products in controlled temperatures, as well as in transportation of industrial goods in the country, all European Union and the countries of Eastern Europe. The centrality of the formerly mentioned link is evidenced by organisation of the material flows in the studied distribution network, in which the remaining participants were characterised from the perspective of the connection with central logistic link.

For the reliable implementation of the logistic processes in distribution networks, the central logistic link very often uses external transport companies performing activities on behalf of the logistic operator. Logistic partners work in conjunction with logistic operator, this means that in case of the need of a transport service, those companies meet the need of the operator as first. Analysing relationships between the operator and the shipping companies, bigger bargaining power (or dominating position) belongs to the operator. The dominating position is influenced by owned resources, number of served clients and experience in forwarding work. In case of the studied operator, the number of subcontractors in the form of transport companies is very large. Identification of the relationships between the participants of the distribution network and the directions of flows of the streams of services, finances, information and deliveries occurring in the network allowed to identify the models of cooperation in the studied distribution network.

The conducted research was performed in compliance with adopted model (Fig. 2) and discussed stages. They were conducted at the end of 2019 and at the beginning of 2020.

Fig. 2: Research model

Source: own study.

Stages of conducted research:

- Stage 1 - identification of the cooperation models in the studied distribution network.
- Stage 2 - determining the scope of implementation of the sustainable development concept in the strategies of enterprises cooperating with the logistic operator. The strategies of the enterprise's partners in both cooperation models in terms of including the pillars of sustainable development in them were analysed for this purpose. 20 organisations cooperating with the logistic operator (10 partners from each of the cooperation models) were analysed.
- Stage 3 - evaluation of the actual actions taken by the partners for the sustainable development. The survey questionnaire was developed for the assessment, composed of 13 closed, single-choice questions. They were divided into two different blocks studying the organisations in terms of sustainable development and cooperation models. The survey was conducted once. The questionnaire was sent by e-mail to 20 enterprises (in accordance with the second stage of the study. The direct respondents were the main managers of enterprises (managers of administrative and development units). Enterprises were chosen in terms of their role in the delivery network, these were the companies providing transport services, warehousing services and the customers commissioning the logistics operator to provide the service. Among the enterprises participating in the study, 50% of them execute over 1000 orders in cooperation with the operator. The remaining 50% are the enterprises executing less than 1000 orders per month.
- Stage 4 - conceptualisation of the cooperation model with taking into account the perspective of sustainable development.

Results and Discussion

Simple model of cooperation is the first one observed in the cooperation models network. This model is best seen in the relation logistic operator – external transport company. These companies mutually motivate and drive each other. Receiving the order by the logistic operator often starts the transfer of the order to the transport company. It is worth noticing that cooperation is voluntary, because each of these organisations could function independently. However, cooperation generates specific, measurable benefits. Thanks to cooperation, the enterprises can realise their individual goals more effectively. Of course, it is possible only by meeting certain rules, such as: understanding the idea of cooperation, clear definition of who plays what role in the cooperation model, definition of the scope of each of the participants' duties, trust, efficient communication, coordination of activities.

The second observed cooperation model is the model of a long-term partnership. Logistic operator clearly presents his expectations towards the subcontractors and intermediaries, that is the transport and warehousing companies, in terms of the quality and configuration of the transport service. In the eyes of the client, service is performed by the operator, and so it is important for him that the level of service is satisfying. This results form the fact that he takes a full responsibility for its delivery. In case of not meeting the quality needs, the client will submit claims against the logistic operator. Participants in the observed cooperation model perceive cooperation as very much needed and effective. They care about their own and the partner's good. The key for such state of things is mutual trust. In case of the occurrence of conflicts on the line operator – transport company, they are resolved very quickly due to the will of maintaining a long-term cooperation.

The identification of cooperation models in the studied network was a stage preceding the analysis of the company's partners strategies in both models in terms of including the pillars of sustainable development in them. In compliance with the assumptions indicated in the research model, the research was conducted on the group of 20 organisations cooperating with the logistic operator. In Table 1, the scopes of including the concept of sustainable development in the mission and strategic goals of the companies cooperating in the studied network were indicated. The table includes only those enterprises that incorporate sustainability aspects in their strategies. Remaining studied organisations (not included in the table) do not show the elements of sustainable development in the base strategy.

Table 1: the concept of sustainable development in the base strategies of the distribution network partners

Type of the partner	Coope-ration model	Mission	Strategic goals
Supplier 1	Model 1	Sustainable development	Environmental policy in terms of: carbon footprint, products, packaging, delivery, waste, infrastructure
Supplier 2	Model 1	Sustainable development from the social, environmental and operational point of view. The key value are the workers	Priority: work safety Social responsibility - good practices shared with business partners
Logistic operator (central enterprise)	Model 1 and 2	Care for ecology and safety	Elimination of unnecessary office materials, locating the offices on the Eurocentrum areas, supplying with power and a range of solutions related to alternative and renewable energy sources, full truckload transport.
Transport company 1	Model 1	Care for safety and natural environment	Selective waste collecting storage of hazardous substances and waste on paved and roofed areas in appropriate containers
Transport company 2	Model 2	Social responsibility, where the attention is focused on implementation of the	Supporting local communities, this pillar assumes donations to actions organised at schools, through the

		business projects and development of the company, as well as on supporting the environment in which the organisation operates. Moreover, the attention is paid to engaging in the development of the local communities.	purchase of school products and by supporting the entities and cultural events taking place in the neighbourhood. Minimising the influence on the environment in accordance with the Think Eco Logistics idea, these activities are implemented through the waste collection, its segregation and economical management of the natural resources. Creating the organisational culture that aims at supporting employers by conducting the internal recruitment. Many people that used to occupy the lowest positions, manage the company today.
Transport company 3	Model 2	Social responsibility of the business	Activities supporting the socially responsible business The company undertakes initiatives for education, promotion of the healthy and active lifestyle, or supporting the development of children and youth.
Ware-housing company	Model 1	No reference to the sustainable development	Use of the safe and modern sources of power that use significantly less electricity and the use of cooling methods that are not harmful to the natural environment
Ware-housing company 2	Model 2	Future proof properties, speaking of wisely conducted building investments that are capable of facing the challenges of the modern world. The company cares about using the techniques and practices on the basis of sustainable technologies and materials. Energy solutions are the energetic innovations that constitute the basis of development. From the renewable energy to the intelligent heat networks and ultra-efficient lighting. Data intelligence, that is the use of data potential for the more sustainable character of conducted investments at all stages of a life cycle. The knowledge allows to make more accurate decisions.	70% of the new investments after 2011 received ecological certificates. Moreover, 80% of the warehouses were designed in ecological way.
Client 1	Model 1	Sustainable development, natural environment protection	Development of effective power sources with zero emissions
Client 2	Model 2	Innovations in terms of sustainable development	A plan assuming cooperation with suppliers on the basis of sustainable development principles. Activities in the field of sustainable development include help in the development of the poorest regions of the world,

			providing basic hygiene measures and clean water, sourcing raw materials from sustainable crops (palm oil), supporting small agricultural producers making healthy and ecological food.

Source: own study on the basis of available materials from the enterprises cooperating in the network.

The partners, both in the first and second model of cooperation, spot the importance of aspects related to sustainable development, although with different intensity. In the first model, organisations focus more strongly on the social responsibility of the business, while in the second model - on the factors related to the green delivery chains (environmental factors). In both groups of partners there are organisations that do not mention factors related to the sustainable development neither in the mission nor in the strategic goals – it means that presently this is not the criterion that determines selection of partners for the central enterprise.

At the next stage of the research (survey research), actual activities undertaken by the partner for the sustainable development were evaluated. In the first question, the respondents were to evaluate the form of cooperation with the logistic operator (Table 2).

Table 2: characteristic of the cooperation forms in the studied network

No.	Description of cooperation	Number of indications
1	We recognise ourselves as partners, but we coordinate the actions and planning to a limited extent. It is a short-term cooperation that engages single departments of our organisation.	8
2	When cooperating, we integrate the activities of many departments and functions sharing the processes (e.g. planning, forecasting, stores managing) in the delivery chain in a longer time horizon.	7
3	Strategic partnership We implement common strategy of achieving shared, superior to our own goals through the actions that use the resources and management structures of both autonomous enterprises. The cooperation is long-term.	5

Source: own study.

Among the surveyed enterprises, 40% of them indicated first of the relationship descriptions as the closest one to an actual functioning of the organisation. 35% has chosen the description characterising more personal relationships, the remaining organisations declare the strategic partnership with the logistic operator.

Aspects related to the sustainable development, green delivery chains, or renewable energy sources, are considered in the strategies of 65% of the enterprises. More than a half of the studied organisations do not implement the elements of sustainable development and related actions in their activities. However, functioning in compliance with the sustainable development concept declares 40% of the interviewees. Among the answers provided by the enterprises in terms of ranking the pillars of sustainable development, the indications on economic pillar were dominating. Such answer was indicated by half of the organisations, 20% of the responses were given to the environment and 30% to the social pillar. Therefore, it is the economic pillar that is the most important for the respondents, and in it the respondents assigned the key role to economic stability, profitability and risk management. Among the environmental factors, respondents indicated the importance of the environment protection, preventing pollution, reducing CO_2 emissions and recycling. In the factors defining the social pillar, respondents indicated political stability, Safety at Work and organisational culture.

Characterising the network relationships in the studied distribution network, 50% of the respondents indicated that they include the sustainable development concept in the strategy. At the same time, dominating number of organisations (65%) do not discuss the principles resulting from the sustainable development concept with the partners. Moreover, 65% of the organisations indicated that implementation of the sustainable development principles in potential partner does not influence the conclusion of a business contract. The same percentage of the respondents believes that implementation of the principles resulting from the sustainable development concept does not influence the quality (efficiency) of cooperation.

For the needs of the analysis of the cooperation models in distribution network, respondents defined duration time of the relationship with the central link. The mid-term and long-term relationships, that is from 1 to 3 years and over the 3 years, were dominating in this network. Whereas in assigning the relationship to the level of maturity of the network, the question concerning the trust between the partners (Table 3) and the unity of goals (Table 4) was important.

Table 3: level of trust in the studied network

No.	Answer	Number of indications
1	It is an initial kind of trust based on the calculation of possible benefits and losses that are evaluated in connection with every transaction.	8
2	We have gained experience by working together, we know each other and we have verified the cooperation on the basis of performed transactions, we continue the trust based on the knowledge.	7
3	We understand the needs of our partner and we care for his well-being. We have common goals, identity and values. We put the good of cooperation above our own short-term goals. Trust based on identification.	5

Source: own study.

Among the surveyed enterprises, 40% of them indicated first of the trust level descriptions as the closest one to an actual functioning of the organisation. 35% has chosen the description characterising more personal relationships, the remaining organisations declare the trust based on identification.

Table 4: unity of goals in the studied network

No.	Answer	Number of indications
1	Each of us pursues our own separate goals.	8
2	We pursue the goals together, but we do not put them above the goals of our own organisation.	6
3	The common goals in a long-term perspective are the most important for us and it is them that we concentrate on by putting them above the individual goals.	6

Source: own study.

The respondents answered the question about the compliance of goals in a similar way as to the question in which the level of trust was checked.

Conducted survey research allow for detailed characterisation of the cooperation models with taking into account the unities of goals and inter-organisational trust. In the first model, most of the organisations (80%) indicated that each of them pursues their own, individual goals. Whereas the 20% indicated that the goals are pursued along with the partner and their achievement solidifies the achievement of the individual goals. In this model, the answers concerning trust are in 70% defined by the answer „a“, which means that these organisations are in the first phase of the network relationships. 30% of organisations indicated the answer „b“. The second model of cooperation gathers organisations declaring that the goals of a quasi organisation, which is the cooperation model, are more important than the individual goals (60%). 40% of organisations declares a unity in pursuing the goal of a quasi organisation, however, they do not put these goals above the individual strategic goals. These are the organisations that assess the level of an inter-organisational trust very positively (50% of organisations indicated the answer „b“ and 50% the answer „c“), what places this model of cooperation in the third phase of the network relationships.

The literature and empirical research conducted at this stage, based on a case study of the chosen distribution network, allowed for the conceptualisation of the cooperation model that includes the sustainable development perspective. In relation to the fact that the research concerns a chosen distribution network, it cannot be stated that the obtained results are statistically relevant and representative. However, the dependencies that allow to answer affirmatively to the research question in the studied network were observed: Does the maturity in terms of the concept of sustainable development of distribution network with participation of the logistic operator depend on the type of the model of cooperation in the network? Indicated dependencies became the reason for the development of the network maturity model concept in terms of the concept of sustainable development of enterprises that include the phases of cooperation in the network (Fig. 3).

CSD - concept of sustainable development

Fig 3: The concept of the maturity model considering the pillars of sustainable development of companies

Source: own study.

Certainly, an efficient implementation of sustainable development necessitates wider perspective than of only one organization. Results from the performed analyses, confirming the previous research of other authors, are disturbing. It results from them that during selection of partners one does not take into account environmental or social aspects. Only the economic criteria are predominating. Implementation of the sustainable development concept at the network level requires the achievement of cooperation maturity by the organizations. Only when the partners are ready to deepen the cooperation and already have the sustainable concept pillars implemented in their structures, they start walking together towards further, successive implementation of elements of the sustainable development concept within the whole distribution network. Results of the studies show that models of cooperation between an operator and external companies determine implementation of the sustainable development concept. Most often, the talks concerning implementation of the sustainable development concept take place with multitask organizations of high relationship abilities. Moreover, these are the companies that have shown in the questionnaire the most advanced level of trust and very close consensus of goals. Frequently, the negotiations concerning the concepts of sustainable development are affected by strategic partnership present between the subcontractor and logistic operator.

When implementing the sustainable development concept in the distribution network, proper selection of subcontracting partners, i.e. transporting and warehousing organizations, is critical. The more advanced partnership between the entities the more advanced negotiations and will of the partners to jointly implement the concepts of sustainable development. The results of the studies also show that organizations that adopted the description corresponding to model 2 of the cooperation (advanced or very advanced level of partnership) show more interest in the sustainable development concept than organizations in model 1 (simply model of cooperation) and show the options of cooperation within the scope of mutual implementation of this concept. It is worth mentioning that the interval of a relationship very strongly determines the type of cooperation. It has never happened that organizations being in a relationship less than 1 year achieved at least the 2nd level o cooperation. It is understandable because the development of cooperation in the distribution network necessitates a significant effort from the cooperating organizations related to the exchange of information with a partner and engage even more cells of the organization Short cooperation time does not favour this due to a fear of loss of key information or competences.

Conclusions

The concept of sustainable development shows how important is to care for the natural environment. It also shows the great benefits emerging from correct and reasonable natural resources management. The concept of sustainable development should be considered in three basic pillars related to ecology, economy and society. The sustainable development is shaped by many different factors. It can be noticed that all definitions of the sustainable development concept are related to cooperation of the human with natural environment.

The basic areas of logistics where the sustainable development concept is most popular are the transport processes, warehousing processes and processes related to packages and waste management. Proper cooperation and gradual integration of the partners within the distribution network may allow for achieving the economical, social and environmental benefits.

The main benefits related to implementation of the sustainable development concept in enterprises cooperating in distribution network are: reduction of CO_2 emissions, reduction of other external costs of transport and logistic activities, optimisation of distribution costs, improvement of the company's image. They can be achieved by a number of activities e.g. by consolidation of deliveries and planning the transport in distribution network, minimisation of empty runs, use of an alternative transport (more ecological one), use of returnable packaging, implementation of pro-ecological solutions in warehouses. It has to be emphasised that the mentioned activities are often reflected simultaneously in two or three pillars of the sustainable development, generating benefits of ecological, social or economic nature.

Based on the performed studies it can be stated that: the model of cooperation determines the implementation of the sustainable development concept. Therefore, the obtained results allowed for developing the concept of cooperation model that considers the sustainable development perspectives. The performed analyses are based on a concrete case study - selected distribution network. Because of such an approach, one can point to some dependencies between the factors characterising the cooperation model, such as consensus of goals or the level of trust with an approach to the sustainable development concept. However, at this stage the results of the studies cannot be considered as fully representative. They require further detailed analyses. Because of this, they will be the starting point of detailed research on large study samples and multiple case study composed of different networks of distribution.

Annotation

The article reveals the problems of development and implementation of chaos management as a tool for strategic analysis of trends in the development of social enterprises in the face of uncertainty of the COVID-19 crisis. The urgency and expediency of introducing a new management methodology - chaos management - into the practice of social enterprise management has been substantiated. The methodical features of the use of tools and methods of chaos management in overcoming the COVID-19 crisis by social enterprises have been determined.

Keywords: chaos management, governance, crisis, COVID-19 pandemic, methods, tools, unknown reality, turbulence

Introduction

Social entrepreneurship is an innovative activity, a social brand of a full range of social interactions in various spheres of human activity, including educational, healthcare, etc. The range of its activities is aimed at solving or mitigating social problems of society on the basis of self-sufficiency and sustainable development of the social sphere. (Plotnikova, 2020).

The field of activity of social enterprises affects numerous sectors, such as culture, education, physical education, tourism, social services, employment-related activities, etc. (Gerasikova, 2019).

Social entrepreneurship solves the problems of society, which the state and business structures cannot cope with. It integrates all the most progressive and the best from the public and private sectors, therefore it is the best way (relative to public or commercial approaches) to solve social problems. (Buyanova, 2015).

In the Russian Federation, according to statistics, more than 71.3 million people are employed (Statistika, 2020). The rest are disabled. They need a developed network of social enterprises that provide jobs, implement business projects, etc., in order to be able to realize themselves and not feel superfluous.

The world is currently in a state of global crisis caused by the COVID-19 pandemic. This "plague of the 21st century" has fundamentally changed the world. It has fundamentally changed the place, role and opportunities of social enterprises. (Kramchenko, 2020).

Social enterprises, like all mankind, are faced with a new unknown reality, chaos, where the traditional models of organizing the work of enterprises turn out to be incompetent, where inexorable progress is far from humanism and sometimes very hard to resist.

Traditional management skills and technologies, which have proven themselves in social enterprises, today do not lead to the desired results.

Social enterprises, like all business, live in a situation of total uncertainty, and often in the expectation of collapse.

Nobody is ready to say how and according to what scenario the events will develop. What are the consequences for the business? How to minimize risks?

The time of the COVID-19 crisis has convincingly shown that the modern theory of classical management, built on the principles of predictability, does not correspond to the realities when chaos becomes a global phenomenon.

The current crisis has exacerbated the inconsistency of the organizational and managerial mechanisms for managing sustainable socio-economic development adopted by science and practice, neither in the short, nor in the medium, nor in the long term. The models used in management practice do not meet new realities.

This, of course, requires a serious revision of the theory and methodology of management used in practice today and the development of fundamentally new algorithms, technologies and management methods in situations of total chaos, including in social enterprises.

Chaos management, its management concept of non-standard behavioral strategies will allow business to ensure that the COVID-19 crisis is overcome.

Methods

In the development of social entrepreneurship, situations of chaos constantly arise, which are not possible to take into account either at the initial stages of analysis or when developing their forecasts. At the same time, traditional concepts and research methods of control systems do not allow explaining their turbulence in a state of chaos. Moreover, the use of in modern management well-known and widely used practices of technologies, algorithms and methods leads, as a rule, to the opposite result, practically, negating all efforts to achieve the goal. For the sake of fairness, it should be noted that the existing formal toolkit for studying the main signs of chaos so far remains practically underdeveloped.

In the conditions of the previously unparalleled global total chaos caused by the COVID-19 pandemic, the proposed toolkit for analyzing trends in the development of social enterprises is based not so much on the imperative of the methodological postulates of chaos theory, but on their intuitive understanding and impromptu adaptation.

Chaos-management is the concept of analysis of the state of chaos, the concept of transition to a new order, to a new model of building and functioning of the social enterprise system in the face of uncertainty.

The methodological basis of the concept of controlled chaos is the systemic creative analysis. This methodology is designed to develop non-standard management solutions in the face of uncertainty, including social entrepreneurship, "... both in order to strategic development, and to overcome ever-emerging emergencies and crises, when it is necessary to find and implement fundamentally new ways of survival...". (Savina, A. A. Stepanov, I. A. Stepanov et al., 2016).

Systemic and creative analysis allows making effective decisions in non-standard situations and “synchronizing the state of the controlled organization with the realities of unpredictability and chaos. This effect [...] is achieved through the use of creative potential [...], tools, methods and technologies for making non-standard management decisions. " (Savina, A. A. Stepanov, I. A. Stepanov, 2015).

The methodology of systematic creative analysis ensures the formation of effective management systems in a state of chaos, including in social enterprises. With its help, in the development of management systems in conditions of chaos, urgent problems of social enterprises are solved, such as:

- Determination of specific features of chaos processes inherent in a particular enterprise;
- Identification of problems and shortcomings of the existing system of business process management in social enterprises in the conditions of chaos;

- Substantiation of goals, objectives, technologies and methods of creating a management model of chaos management in relation to the characteristics of social business enterprises. (Morozova, A. Stepanov, I. Stepanov, 2016).

Heuristic (informal), mathematical (formal) and combined methods are used as research methods. At the same time, priority is given to heuristic methods that are most widely used in chaos management in the development of non-standard management decisions, and, in particular, methods such as the method of scripting, the morphological method, the method of collective idea generation, the method for determining the degree of preference, etc. (Stepanov , Savina, Krasyukova et al., 2018).

Results

In the context of the COVID-19 crisis, it is very important to understand its true origins and socio-economic consequences, not only from the standpoint of "what happened", but also "how", and, most importantly, "why"? Today, it is necessary not only to analyze the available information, but, most importantly, to explain and understand through what socio-economic and organizational-management mechanisms this happened, and what served as a trigger for this process.

Picture 1: Corona crisis 2020: socio-economic implications for business
Source: compiled by the author

World governments are taking unprecedented measures to contain the spread of the COVID-19 pandemic. However, the overwhelming majority of the measures taken have significantly changed the usual conditions and the content of work in almost all areas of business. Many businesses have either partially suspended their work or continued to work online.

Restrictive measures resulted in a combination of negative consequences for business: organizational, economic, social, environmental, managerial, etc. (Picture 1).

Today, the main problems of business, including social, are: shutdown of enterprises; severance of socio-economic and technological ties; breaking down traditional business processes; decrease in profits; lease payments, taxes; credit

stagnation; rising unemployment; falling solvency; large-scale socio-psychological problems, changes in product preferences and demand, etc. (Sheremet, 2020).

In the context of the global COVID-19 crisis, the management and owners of enterprises in the field of social enterprises are faced with the task of not only retaining staff, but also carrying out production and economic activities in these non-standard conditions, which should not only be equal in terms of their socio-economic results, but also surpass them. (Klochkova, 2016).

What's in practice? Neither the modern management system, nor the modern management cadres, nor digitalization, nor management science and education turned out to be able to quickly solve global problems at a high level.

Most enterprises and organizations see financial support in various forms as the main way out of the crisis (money for businesses; deferred loans; distribution of "helicopter money"; introduction of tax holidays, etc.). These are important and necessary, but far from the only ones and perhaps, in the conditions of the current crisis not always priority measures.

In order to use various kinds of support from the state and society, each enterprise must independently decide what will be the effective model of its adaptation to a new unknown reality.

New challenges require significant changes, the search for new strategies and forms of organizing the activities of social enterprises. It is obvious that in the conditions of a total socio-economic crisis, the main strategic goal of business should be to rely on its own capabilities.

In this regard, representatives of social enterprises have many questions:

- How to change strategy and tactics in the chaos of COVID-19, self-reliantly?
- What social-psychological, intellectual, organizational, personnel, behavioral and other intra-organizational capabilities are advisable to use to save business in a situation of total chaos of the COVID-19 crisis?
- In what forms should rapid retraining and advanced training of personnel be carried out in the context of the corona crisis?
- How to motivate and train staff? What new knowledge and skills, rather than outdated, when the competences available today are counterproductive?
- How to combine support measures provided by the government to business with its own understanding and vision of the problems of its preservation and salvation?

The theory and practice of modern chaos management and the tools of strategic analysis will help to answer these and many other questions.

Irreversible processes of transformation of modern socio-economic systems, due to the acceleration of the implementation of the achievements of scientific and technological progress, digitalization, innovation along with intensive processes of expansion of sanctions regimes by the leading scientific and industrial powers, and now the total isolation of the world economy as a consequence of the corona-virus crisis has caused the current stage of socio-economic development as a period of total chaos, uncertainty and unpredictability of development.

The primary task of analyzing the situation of chaos is to determine its main features-characteristics and tools for their study.

The main characteristics of chaos are: turbulence, temporality, delocality and desynchronization.

Turbulence of a socio-economic system is an abrupt mismatch of the elements of its system and the rate of their change, which leads to critical imbalances and is one of its main features. (Kormanovskaya, 2015).

Turbulence manifests itself in the “disordered” state of the socio-economic system, characterized by abrupt unstable fluctuations, changes in the behavior of the system and processes, a rapid change in trends with a sharp increase or decrease in their speed and significant fluctuations in economic characteristics (indicators). As a result, the stability of the functioning of socio-economic systems is disrupted.

Chaos and its state of turbulence characterize the transition of a socio-economic system from an evolutionary to a revolutionary model of development, a transition to revolutionary changes in all elements and relations of the socio-economic system.

As a result of the diagnosis of turbulence as a key sign of chaos, there is an awareness of the contours of a new, unknown structure and content of fundamentally different relations between subjects of social entrepreneurship as an objective prerequisite for maintaining its controllability through the formation of an innovative management system.

Other key features-characteristics of chaos in the system of social enterprises are:

- *Temporality* - a sharp abrupt change in the dynamics of the speed of the turbulence process of systems;
- *Delocality* - blurring of the topos, place and space of systems functioning, in which their former locality ceases to matter;
- *Desynchronization* - discrepancies between the rhythms of the system and the rhythms of its elements, connections and environment in time and space.

We propose a toolkit for analyzing the key features-characteristics of chaos in the activities of social enterprises.

Based on the above methodological message, it is obvious that the basic provisions of controlled chaos from the standpoint of systemic creative analysis are:

- Chaos is one of the most important life cycles of transformation in social enterprises, characterizing their qualitative transition from one state to another;
- Chaos is not an absence of order (disorder, "Brownian motion"), but a new reality that we do not know; the un-deciphered new order that exists in our heads due to the limitedness of our ability to decipher it today;
- Having learned the patterns of behavioral models of chaos, you can use them as an effective management tool in conditions of unpredictability and uncertainty;
- To manage social-economic systems in a situation of chaos, it is necessary to use a management tool - chaos management as management of the state of chaos, the state of transition to a new order, to a new model of building and functioning of the socio-economic system.

Conclusions

Research has shown that chaos management is the management of a state of chaos, a state of transition to a new order, to a new model of building and functioning of social entrepreneurship in the face of uncertainty.

Chaos management as a “technology of destructive creation” can be used as an effective management tool in an environment of unpredictability and total uncertainty.

Management concepts of chaos-management are aimed at solving fundamentally new problems and developing management solutions that can ensure the exit of social entrepreneurship from the state of chaos, and in the future to ensure high rates of its development. Chaos management is the management of an organization to overcome chaos in its socio-economic development. By its content, chaos management is a set of special tools and methods, with the help of which the state of chaos is considered not as an absence of order, disorder or confusion, but as a potential opportunity that opens up new prospects for effective socio-economic development based on the transition to a new model of building and functioning of the organization. (Academic, 2020).

The main objectives of chaos management application are:

- Creating an effective project management system in social enterprises to deal with sudden situations;
- Regular monitoring and preparation of preventive measures to prevent the occurrence of situations of chaos;
- Development of scenarios for the possible development of the situation and the implementation of operational measures to create systems of anti-chaos control based on the analysis and assessment of the reliability of information, the implementation of regular control over the implementation of anti-chaos measures;
- Preparation and implementation of a comprehensive program to overcome the negative consequences of chaos situations. (Stepanov A.A., Stepanov I.A., Savina, 2015).

The analysis of chaos problems in social enterprises using chaos management tools should be carried out in stages:

- *The first stage:* defining the model of the state of chaos in the organization. In the process of analysis, the most characteristic indicators for the enterprise are identified, which allow to assess the state of the chaos processes taking place;
- *Second stage*: identifying transformations of key parameters of the enterprise in a state of chaos. Revealing negative and positive tendencies, as well as parameters of chaos processes. Such an assessment is carried out using the method of express analysis of the current state. In this case, indicators-indicators are used that reflect the signs of chaos processes;
- *Third stage*: identification of production potential opportunities in the process of developing an innovative enterprise development strategy;
- *Fourth stage*: conducting an expert assessment of possible trends and development trends of an enterprise which is in the crisis phase of its development cycle;
- *The fifth stage*: determining the patterns of the formation of business behavioral strategies in a crisis;

- *The sixth stage*: conducting a comparative analysis of the possible parameters of the enterprise development when comparing situations before and after the chaos;

- *The seventh stage*: formation of parameters of the model of the efficiency of enterprise chaos management, its criteria and indicators.

Abstract

The aim of this research was to analyze the key economic drivers of stock market development in Africa. The study used market capitalization as the explained variable to represent stock market development; credit availed to the private sector, external reserves, foreign direct investment, broad money supply, external trade, GDP per capita, inflation and lending rate to represent macroeconomic factors. Eight African countries were used to represent Africa's stock markets- Egypt, Nigeria, South Africa, Morocco, Tunisia, Ghana, Kenya, and Mauritius. The study concludes that broad money supply, credit to the private sector, and GDP per capita were the most important variables that drive African stock markets.

Introduction

The stock market performs critical roles in the economy of nations. Alongside the banks, Pension funds, and the Insurance sector, they constitute the "heart of the financial system" of a country. It provides a mechanism for transforming savings from surplus economic units into financing for economic agents in need of long-term capital. According to the World Exchange Federation (2017), efficient stock markets promotes growth in the economy by encouraging the deployment of financial assets-by putting together people who are in need of long term funds to innovate and expand with people with resources to invest. Another primary role of the stock market is that it provides an avenue for an orderly and seamless transfer of shares of companies among shareholders. The stock market also promotes financial system efficiency by providing competition to other classes of financial instruments like bonds, treasury bills, commercial papers, and certificate of deposits. It provides investment outlay to large institutional investors as well as small retail investors by providing them the opportunity to invest in not only shares, but derivatives, exchange traded products (ETPs), collective or pooled investment schemes like mutual funds, unit trust, and real estate investment trust, as well as stock options and futures.

Stock markets also promotes good governance in business practices (World Federation of Exchanges, 2017). It promotes effective management of companies by providing a framework for corporate governance and thus ensuring that corporate entities are run in the best interest of investors and society in general. It provides companies with the opportunity to tap into the benefits of financial globalization by providing them with diversified foreign portfolio investors. It facilitates growth of companies through mergers, acquisitions, and takeovers there by

providing opportunities to enlarge product lines, improve supply channels, hedge risk, and grow their share of the market. The stock market also provide employment for several individuals in investment banks, issuing houses, stockbroking firms, registrars, fund/asset managers and stock exchanges.

The performance of a nation's equity market reflects the health of its economy; it may help explain the past, understand the present and predict future economic trend. While economic fundamentals influence the performance of equity markets, the later provides a feedback mechanism to policy formulators on the perception of investors on the trend in economic activities. Thus, it is imperative for governments to keep a close eye on activities in the equity market and to build the enabling environment for stock markets to thrive. Stock market development may be visualized from varied standpoints; it refers to increase in the market capitalisation, stock market index, number of listed businesses, level of market liquidity, performance of listed entities, level of participation among local and foreign investors, and reduction in market concentration.

Stock market development is shaped by events in the macroeconomic environment in which it is domiciled. This explains why the most developed and efficient stock markets are found in the most industrialized countries of the world. The biggest stock markets are in the world's leading economies -United States and China with a stock market capitalisation of USD 32.1trn and USD 8.7trn respectively as at the end of 2017 (World Development Indicator, 2018). Apart from having a large economy, these countries are characterized by macroeconomic stability with minimal inflation, moderate interest rate and stable exchange rate; they also have a thriving private sector. Innovations in monetary and fiscal policy, exchange rate, the distribution of income, inflation, trade balances and even crude oil prices have consequences for stock market development. Again, the size of the economy and its structure are also important factors. Limitations on foreign shareholding in stock markets can lead to inadequate market depth and liquidity, especially where there is absence of a large and diverse base of local/domestic investors. International investors need confidence that their funds and income can be repatriated at will. This may however lead to economic problems for the host nation when there is a mass exodus of foreign capital due to exogenous shocks outside the control of the country.

Stock markets also require a sound banking system to support its development as listed companies would perform better in countries where credits are readily available. When credits are readily available; margin lending and security lending activity increases which helps to boost stock market liquidity. The level of financial deepening or participation of the population of a country in financial activities is another factor. Therefore, this work aims to examine the economic issues which account for stock market development in Africa. The work shall be a cross country study with focus on eight African stock markets- South Africa, Nigeria, Egypt, Kenya, Mauritius, Morocco, Tunisia, and Ghana. The rest of this paper is divided into five sessions, session two is the literature review, session three is the empirical literature, session four is the econometric methodology and data, session five is the empirical analysis and end with session 6 which is the conclusion and recommendations.

The Literature Review

Several studies have been carried out by researcher in various countries on the link between economic variables and development in the stock market. Azeez and Obalade (2019) examines the macroeconomic drivers of stock market development in Nigeria. The research was based on the ARDL bound testing technique. The key drivers of stock market development in Nigeria were identified to be a developed banking system, liquidity in the stock market, foreign investment flow and national income. However, inflation which is a proxy for economic instability, and savings rate are not significantly factors that account for stock market development.

Mroua and Trabelsi (2019) probed the link between exchange rates and equity market indices in BRICS nations using the Generalized Method of Moments (GMM) regression technique. The research findings were that changes in exchange rate is a vital factor in explaining both the previous and present volatility of the equity market index in the economy of BRICS countries. Tsaurai (2018) examined the drivers of equity market development in developing stock markets. He made use of the pooled ordinary least squares, the fixed and random effects methodology; the major factors influencing stock market development were found to include economic growth, foreign direct investment, and development of infrastructures. Others were exchange rates, price level (inflation), savings, trade openness, a developed banking system and the levels of liquidity in the market.

Kabuga (2018) examines the connection between fiscal deficit and stock market performance in Eight African Countries. Using the dynamic fixed effects (DFE), granger causality test for panel data, and cointegration, the findings confirm evidence of long run cointegration between budget deficits and stock prices; and that budget deficits depress stock market performance in the short-run, but have a direct relationship with stock market performance in the long run. Agyapong and Badjabeng (2018) examined how foreign direct investment and external debt influence financial sector growth in Africa. Using the generalized method of moment estimation technique,

the results showed that both foreign direct investment and external debt do have a direct relationship with financial sector growth in Africa. Nyasha and Odhiambo (2018) examined the key drivers of equity market development in Brazil. Based on the ARDL Bound test, the research findings were that stock market development in Brazil has a positive and direct relationship with trade openness, exchange rate and a developed banking system both in the long and short run. However, the levels of market liquidity and investment were found to exhibit negative effect on the Brazilian equity market.

Adebowale and Akosile (2018) examines the link between exchange rate, interest rate, and stock market development in Nigeria. Using the OLS regression technique the empirical findings revealed that interest rate had a negative impact and the foreign exchange rate exhibits a positive effect on the growth of the Nigerian equity market. Khan (2017) examined the economic drivers of stock market development in South Asian countries. Using the ARDL bound test technique, the empirical findings was that that Inflation and exchange rate are positively related to stock returns in China, while an inverse relationship was observed between interest rate and the returns on equities. Duy and Hau (2017) investigated the macroeconomic factors that account for stock market index in Vietnam's Stock Exchange. Using the VECM, stock prices in Vietnam were found to be influenced by inflation, exchange rate, supply of money and market prices. Furthermore, increases in the supply of money and the index of market prices enhances the price of equities, while whenever inflation and exchange rate rise, share prices declines.

Jamaludin, Ismail and Manaf (2017) investigated the link between economic variables and equity market returns in ASEAN countries of Singapore, Malaysia, and Indonesia. Using the panel least square regression analysis, inflation and exchange rate were found to influence stock market returns while money supply is not an important factor in explaining stock market return. The study concludes that inflation is inversely related to stock market returns and the effect is greater than that of exchange rate. Rasiah. Habibullah and Hamid (2017) examines the relationship between equity market returns and its key determinants which includes income, inflation, and happiness on selected OECD countries with data ranging from 1973 to 2012. Based on the dynamic heterogenous panel estimation techniques of the Dynamic Fixed Effects (DFE), Mean Group (MG), and Pooled Mean Group (PMG), the empirical findings were that income has a direct effect on the returns on equities, inflation inhibits stock market returns and happiness is not an important factor in explaining stock returns.

Matadeen (2017) explores the economic factors that account for stock market development in 14 Sub-Sahara African nations. Based on the panel vector error correction model, the result indicated that a developed banking sector, economic growth, liquidity in the equity market, the level of investment and stable economic conditions are principal drivers of equity market development in Sub-Sahara Africa. More so, savings was found to have a negative implication for the growth of equity markets for nations in Sub-Sahara Africa. In the short run, economic growth indirectly stimulates stock market development. Ho and Odhiambo (2017) analyzed the macroeconomic determinants of growth in the Hong Kong equity market. They used ARDL bound test, to examine this relationship and the result was that a developed banking system as well as economic growth are directly correlated to equity market development in the long-run; but trade openness and inflation exhibit an inverse relationship with equity market development. The short run empirical results showed that while economic growth has a positive effect; the real interest rate, inflation, and external trade have a negative effect on the development of the stock market. Ho (2017) examines this relationship for Malaysia using the same analytical technique and found that economic performance and openness to trade do have a direct long-term effect, while banking sector development exhibits a negative long-term effect on equity market development. Balogun,
Dahalan and Hassan (2016) studied the effect of market liberalization and financial growth on equity market development in seven Sub-Saharan African nations. Using dynamic heterogenous panel (Pooled Mean Group) estimation technique, the empirical findings was that, on average, stock market liberalization have a positive long-term effect on the economies of the selected nations; more so financial sector growth also has a major positive long-term effect on the growth of stock markets. The macroeconomic determinant of stock market growth in Turkey was examined by Bayar (2016). Using ARDL bound test, the results showed that economic growth and the level of liquidity in the market had positive effects, while inflation had a negative effect on the growth of stock market in Turkey.

Data and Empirical Model

Data

The study employs panel data for eight selected African for the empirical analysis. The countries selected for this study include South Africa, Nigeria, Egypt, Morocco, Tunisia, Ghana, Kenya and Mauritius with data spanning 24 years from 1994 to 2018. The countries were selected based on the strength of their economy as well as to represent the regions in Africa.

Model and estimation Technique

This study adopts the Calderon-Rossell (1990) stock market model. The model expresses some of the economic determinants of the Stock market. The model is specified thus:

$$Y_{it} = \alpha_i + \delta Y_{it-1} + \beta M_{it} + \varepsilon_{it} \quad (1)$$

Where Y represents the market capitalization of the stock exchange; αi represents the unobserved country specific fixed effect; eit is the white noise error term; M is an array of macroeconomic variables comprising per capita GDP, private sector credit, external reserve, inflation, foreign direct investment, lending interest rate, broad money supply, and external trade.

The study further utilizes the mean group (MG) estimator which assumes heterogeneity across panels (both the slopes and the intercepts are permitted to vary across countries). This estimation technique was used in the research of Balogun Dahalan and Hassan (2016); and Rasiah Habibullah and Hamid (2017).

Results and Discussion

Africa's Stock Market Stylised Facts

Table 1: Number of Listed Companies in Stock Exchange

NUMBER OF LISTED COMPANIES IN STOCK EXCHANGE IN 2017					
AFRICA		G- 7		BRIC	
South Africa	294	United States	4336	India	5615
Egypt	252	Japan	3598	China	3485
Nigeria	166	Canada	3278	Brazil	335
Tunisia	81	UK	1858	Rusia	230
Mauritius	74	France	465		
Morocco	73	Germany	450		
Kenya	65	Italy	290		
Ghana	30				

Source: World Development Indicators (2018)

Table 1 is a snapshot of the number of listed companies across stock exchanges in Africa. South Africa tops the table with 294 companies followed by Egypt with a total of 252 companies. Nigeria had a total of 166 in 2017 while the least is Ghana with a total of 30 companies. When compared with those of G7 countries and BRIC countries the table shows that countries like India, United States, Japan, China, Canada and the United Kingdom have listed companies that outnumbers the total number of listed firms in all stock exchanges in Africa.

Table 2: Trend in Number of Listed Companies in Africa

TREND IN NUMBER OF LISTED COMPANIES IN AFRICA								
	1997	2000	2003	2006	2009	2012	2015	2017
Egypt.	654	1075	977	595	312	234	250	252
South Africa	615	604	390	359	353	338	316	294
Nigeria	182	194	206	201	214	189	183	166
Ghana	21	22	25	29	31	29	29	30
Kenya	57	56	47	52	55	60	64	65
Morocco	49	53	52	63	76	76	74	73
Mauritius	30	31	28	62	64	60	71	74
Tunisia	32	44	45	48	52	59	78	81

Source: World Development Indicators (2018)

Table B gives a trend in the number of listed companies across Africa Stock Exchanges. From the table, both South Africa and Egypt recorded significant decline over the period with South Africa recording a significant decline from 615 companies in 1997 to 294 in 2017 and Egypt falling from a high of 654 in 1997 to 252 in 2017. Nigeria recorded a modest fall from 182 in 1997 to 166 in 2017. These declines are largely attributable to delisting of companies that fail to meet listing standards and sometimes voluntary delisting by companies.

Table 3: Market Capitalisation of Stock Exchanges

2017 MARKET CAPITALISATION OF STOCK EXCHANGES (USD'bn)					
AFRICA		G- 7		BRIC	
South Africa	1,231.0	United States	32,121	China	8,711.30
Morocco	67.0	Japan	6,223	India	2,331.60
Egypt	46.5	Canada	2,367	Brazil	954.70
Nigeria	37.2	UK	1,868	Rusia	623.40
Kenya	10.2	France	2,749		
Mauritius	9.7	Germany	2,262		
Tunisia	8.9	Italy	587		
Ghana	3.1				

Source: World Development Indicators (2018)

Table 3 shows the market capitalization of stock exchanges in Africa, compared with the trend in major countries of the world. From the table it shows that South Africa has the most capitalized stock exchange in Africa with a market capitalization more than 85% of the combined market capitalization of all exchanges in Africa.

Table 4: Market Capitalization as Percentage of GDP

2017 MARKET CAPITALISATION AS PERCENTAGE OF GDP					
AFRICA		G- 7		BRIC	
South Africa	352.8	United States	165.7	India	89.6
Mauritius	73.4	Canada	143.2	China	71.2
Morocco	61.1	Japan	127.7	Brazil	46.4
Kenya	24.3	France	106.5	Rusia	39.5
Tunisia	22.3	UK	64.6		
Egypt	19.8	Germany	61.5		
Nigeria	9.9	Italy	27.3		
Ghana	7.8				

Source: World Development Indicators (2018)

Table 4 shows the market capitalization as a proportion of GDP and is called the capitalization ratio which is a relative measure of stock market development. It measures the degree to which the equity market supports growth of the economy. South Africa has the highest market capitalization relative to its national income in Africa with a market capitalization three and half times that of its GDP. Mauritius and Morocco also recoded a relatively good percentage of 73.4% and 61.1% respectively.

Table 5: Stock Market Liquidity in Africa

2017 STOCK MARKET LIQUIDITY (VALUE OF STOCK TRADED IN USD'BN)					
AFRICA		G- 7		BRIC	
South Africa	409.7	United States	39,785.9	China	17,171.6
Egypt	14.4	Italy	5,912.7	India	1,186.0
Morocco	4.2	Japan	5,778.4	Brazil	642.5
Nigeria	4.1	UK	4,402.9	Rusia	145.5
Kenya	0.8	Germany	1,558.6		
Mauritius	0.4	France	1,357.9		
Tunisia	n/a	Canada	1,279.5		
Ghana	n/a				

Source: World Development Indicators (2018)

Table 5 gives a snapshot of the level of liquidity in Africa's stock markets. By liquidity we refer to the annual value of stocks traded in the market. It is a critical variable used by foreign portfolio investors to appraise the ease of disposal of their investment should they decide to sell. South Africa being the most developed market in Africa is also the most liquid with an annual turnover of USD 409.7bn in 2017, though lesser than those of all G7 nations, it performed better than Russia which recorded USD 145.5bn in 2017.

Empirical Result

Table 6 shows the estimated mean group regression results. The results from the mean group estimator indicate that broad money supply is the only important macroeconomic variable affecting stock market development in the long run. Furthermore, broad money supply indicated a positive nexus, which imply the fact that broad money supply is a significant positive driver of the stock market in the long run. All other economic variables were found to be insignificant. In the short run, change in credit to the private sector, broad money, and GDP per capita were found to be significant determining factors explaining stock market development in Africa. However, foreign direct investment, external reserve, inflation, trade openness and lending interest were found to be insignificant.

Table 6: Econometric Results from the Mean Group Estimator

	Mean Group (Long run)	**Mean Group (Short run)**
Dependent variable: Market Capitilisation	Coefficient (Z Score)	Coefficient (Z Score)
Credit to Private Sector	-1.096 (-1.01)	1.242 (2.06) **
FDI	-0.059 (-0.78)	0.009 (0.2)
External Reserves	-0.403 (-0.66)	0.286 (0.4)
M2	3.371 (2.14) **	-3.772 (-2.06) **
Trade Openness	-0.503 (-1.2)	-0.073 (-0.15)
Inflation ***	-0.038 (-0.78)	0.035 (1.5)
GDP Per Capita	-0.075 (-0.05)	3.006 (1.93) **
Lending rate	0.032 (0.57)	0.08 (1.06)
Constant		-15.728 (-1.1)
Error Correction (EC)		-1.131 (-8.52) ***

*Where: *, **, and *** indicate significance at 10 %, ** at 5 % and *** at 1 % respectively. These estimations were done using (xtpmg) approach in Stata. The first set of panels are the long-run results; while the second set of panels are the short-run results Source: Authors' estimations.*

Conclusion and Recommendation

The research examined how macroeconomic factors affect stock market development in Africa. Among these macroeconomic variables were GDP per capita, credit to the private sector, external reserve, inflation, lending interest rate, broad money supply, foreign direct investment, and external trade which were used as explanatory variables, while market capitalisation was used as the dependent variable to capture stock market development in Africa. The study finds that in the long run, only broad money supply significantly drives stock market development, while in the short run, credit to the private sector, broad money, and GDP per capita were found to drive stock market development.

Based on the findings, the study concludes that efforts to develop African stock markets enact policies to encourage credit to the private sector, manage the broad money supply properly and improve the GDP per capita. We therefore recommend that governments of African nations pursue privatization and compulsory listing of public utilities as stock market development is a private sector driven activity. There is also the need to enhance credit to private sector through deliberate intervention funds for private companies, and promotion of sound economic policies that will accelerate economic growth and growth in per-capital income which will enable people to invest more in stocks.

The Process of Origin New Fintech Institutions as A Result of Financial Innovations in Banking Sector

Alicja SZYSZKO

Department of Management and Social Communication, Jagiellonian University, Poland
alicja.szyszko@uj.edu.pl

Abstract

The financial sector is in the process of fundamental transformation caused by the financial crisis, the new regulatory architecture and the technology revolution. The consequence of these shifts is the appearance of fine-tech players in the banking sector. They are increasingly competing with traditional banks, and the offer of innovative digital solutions is a major challenge for them. In the specialist literature, there are different names of the fintechs operating in the banking sector, which are used interchangeably. The aim of the articles is to present the most frequently applied classifications in relation to fintech entities. On the analysis of the literature and case studies, it has been proposed to classify these institutions and to identify their features. The analysis of the prepared case studies allows to verify the research hypothesis: there is no single, universal way of establishment of new, digital banking institutions.

Keywords: Fintech, Challenger Bank, Digital Bank.

Introduction

The global financial crisis of 2007-2009 was a turning point in the financial sector. It triggered a loss of confidence in banks which had been saved by the government from bankruptcy and a shift of customers towards parabanks. In the post-crisis period, the transformations in the financial sector were enhanced by a technological revolution and regulatory amendments. In recent years, the use of digital technologies in the financial sector has increased dynamically and new actors, instruments and tools have emerged. The post-crisis regulatory architecture has responded to these changes. In the European Union, the Payment Services Directive II (PSD2) was implemented in 2018 regarding banks' sharing of their customer data with third-party providers. The openness of the banking market to entities from outside this sector made it essential for banks to adapt to the changing needs and the expectations of customers. As a consequence of these transformations in the financial sector, new financial institutions, known as fintech, began to appear alongside the banks. This term was formed by combining the two words 'financial' and 'technology'.

The term fintech is commonly associated with the use of technology to provide new financial solutions (Arner, Barberis, Buckley, 2017). The second understanding of fitechs refers to new technologies, such as artificial intelligence, blockchain technology, colud computing, robo-advisory (Leong, Sung, 2018). In this sense, the introduction of new technologies enables the improvement of these traditional banks' services. (e.g. credit scoring analysis based additionally on big data). Some researchers also point out that these are the new generation of technology startups which are causing deep transformations in the financial sector (Sia, Soh, Weill, 2016).

The emergence of fintech entities is causing greater competitiveness in the banking sector. Due to the use of sophisticated digital technology, these entities have a significant advantage over traditional banks. Fintech entities base their activities on the digital banking model, using mobile and online access channels. Their operations are focused on understanding and satisfying the customers' expectations, in particular the Millennials. They provide an innovative, personalised products and services, use efficient sales channels, significantly reduce or completely eliminate fees and commissions (Mackenzie 2015). Most of the customer's relationships with the bank have been standardised, their services are simplified and remote provided (KPMG, A new landscape. Challenger banking annual results, 2016). According to the PWC report (Customers in the spotlight. How FinTech is reshaping banking, 2016) customer-oriented activities in fintech represent 80%, while in traditional banks only 53%.

Cite this Article as: Alicja SZYSZKO“ The Process of Origin New Fintech Institutions as A Result of Financial Innovations in Banking Sector” Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

The technological development and the regulatory environment over the last decade have made the fintech entities become a complementary element of the banking system. It is estimated that the number of users of digital banks in the world is around 2.6 billion, and the leading players include European countries, the United States, Singapore, Israel, India and China (FindexAble, The Global Fintech Index 2020, 2019). The major digital banks are: Revolut, N26, Monzo. The success of those companies results from their rapid ability to adapt to changes in the banking sector using modern technology.

Technological development in the financial sector is extensively discussed in both domestic and English language literature. The existing publications can be divided into two main categories. The first group refers to the transformation of the financial sector, which can be analysed from the level of banking, i.e. BankTech (Schwab, Guibaud, 2016), insurance, i.e. InsurTech, or regulation, i.e. RegTech (Rogowski, 2017). he second category of studies concerns the application of new technologies in the product range. These include blockchain technology (Gou, Liang, 2016), artificial intelligence (Vieira, Sehgal, 2018), big data analysis (Hassani, Huang, Silva 2018) cloud computing (Bejju 2014).

The research trends indicated also focus to a large extent on the institutional dimension of the banking sector, which includes financial start-ups. In the literature they are identified as digital banks, challenger banks, neobanks or virtual banks. These terms were originally used interchangeably. With the rapid growth of the number of these institutions, a diversity of names has appeared. The paper attempts to systematise the terms used in reference to new financial institutions established as a result of the technological revolution. The aim of the articles is to describe the process of origin of these institutions and to suggest their classification. For the purpose of the study, the following research questions have been posed:

1. what are the drivers of the transformation in the financial sector?
2. what kind of new fintech institutions established as a technological revolution stand out?
3. what are the characteristics of the new fintech entities?
4. is there one universal process for the origin of these entities?

The research hypothesis, based on the literature studies and research questions posed, is as following: there is no single, universal way to establish new, digital entities in the banking sector.

Literature Review

After the global financial crisis of 2007-2009, the technological revolution brought about changes in the financial sector. Alongside traditional banks, new banks using digital access channels began to emerge. In the literature, these institutions are usually referred to as digital banks, challengers banks or neobanks. In the initial research these terms were used interchangeably. With the deepening of technological transformation in the financial sector and the emergence of new institutions, an approach has been developed that these entities are completely digital, have similar operating principles, are based on digital operating models, but these institutions cannot be considered as the same and the current concepts cannot be used alternatively.

The first type of entities created by the fintech revolution are digital banks. This term refers to institutions based on digital solutions, characterised by simple and fast operation. Customers can access them anywhere and anytime through electronic channels. They offer both classic and new products of the highest quality using digital solutions (PWC, Consumer Digital Banking Survey, 2019). Digital banks have a greater capacity to innovate because they are not limited by the institutional framework, they do not rely solely on third parties (Zhuplev 2018).

The fundamental division applied to new financial institutions includes neobanks and challenger banks. These entities can be classified as digital banks. The literature studies made it possible to list the differences between these institutions. Challenger banks are entities that use innovative digital solutions and thus challenge traditional banking. Most often they hold a banking license, and from an organisational point of view, they are typical fine-tech entities that do not have links with traditional banks. Nowadays, the following entities can be identified: Monzo (after obtaining a licence), N26, MyBank, Starling Bank, Revolut. Neobanks, on the other hand, do not have a banking license, therefore they are not supervised and regulated. Their activities are based on cooperation with traditional banks and provide them with their products and services (Molnár 2018), korzystając using their institutional support and traditional infrastructure. Examples are: Moven, Yolt, Lunarway.

The initial research on Fintech entities included only digital banks, challengers banks and neobanks. Further literature analysis made it possible to divide the challenger banks into three categories (Citi GPS, Bank X. The New New Banks, 2019):

- Standalone challenger banks: these are starups created by fintech companies that use technological solutions to improve retail banking (e.g. Starling Bank, Dozen, Bank Zero).
- Incumbent-led challenger banks: these are digital entities established by traditional banks to improve customer service by investing in technology (e.g. Marcus, New Hong Kong Virtual Bank, DBS Digibank, aiBank, Richard).
- Big-tech-led challanger banks: these are startups formed by technology giants with an extensive big data analysis, which allows for quick customer acquisition (e.g. WeBank, MyBank).

The different classification includes new challenger banks, which are licensed as banks and compete with traditional banking. These are e.g. Monzo, Starling, Revolut. Other categories are neobanks that do not have a licence, e.g. WeBank, Yolt and non-banks that have no connection with traditional banking but are licensed by non-banking entities, e.g. Monese (Cox, 2019). A similar classification also includes new banks, e.g. Monzo, Revolut, N26, neobanks, e.g. Yolt, Moven, and non-banks, e.g. Monese. A new category is beta banks, i.e. digital entities created by traditional banks, e.g. AiBank, Simple (Caicedo, 2019).

This classification is complemented by the PWC report (Who are you calling a 'challenger'? How competition is improving customer choice and driving innovation in the UK banking market, 2017). It identifies the differences between newly established digital banks and traditional banks that use digital access channels and introduces a new category of entities that have been established by the retailers:

- Mid-size ful service banks: these are traditional banks that have moved to digital channels, but still maintain traditional access channels (e.g. cooperative banks or TSB in the UK).
- Specialist banks: these are specialist banks that provide a large network of branches but focus more on call centres, digital channels or third party intermediation (e.g. Secure Trust, Aldermore, Shawbrook).
- Digital only banks: these are banks operating exclusively with digital technology, with innovative technological solutions (e.g. Starling, Monzo, Tandem).
- Non-banks brands: these are entities whose owners are operating outside the financial sector. Most often they are large retailers (Tesco Bank, Sainsbury's Bank, Virgin Money).

All the indicated institutions have similar operating principles and are based on digital operating models. However, these terms cannot be used alternatively for all institutions created as a result of the digital revolution in the financial sector. The basic differences between them result, among others, from the type of founding entity, the profile of the institution's operations, its experience and presence on the market or the possession of a banking licence.

Following the literature studies all fintech institutions can be classified as digital banks and defined as challengers, i.e. using digital access channels and challenging traditional banking. In this group, technological start-ups can be identified as new banks, standalone challenger banks or digital only banks. Another category is neobanks and incumbent-led challenger banks, also known as beta banks. Another category is made up of banks created by technology companies, i.e. big tech banks and retaliers' banks. The last category is made up of non-banks, i.e. entities using licences from non-banking financial institutions.

Research Methods

The researchers' approach includes inductive reasoning. The methodology of scientific research indicates that induction consists in moving from empirical observations to theoretical generalizations, however, conducting observations is closely related to understanding and analysing theoretical knowledge (Lindström, 1998).

The research process has been divided into two stages. The first part of the research included literature studies, which were conducted using the Web of Sience databases. The following keywords were entered: digital banks, neobanks challengers banks, fintech, and then articles were read both in Polish and English from the period 2010-2020. The review of available literature made it possible to check the validity of the research topic and to define in detail the theoretical development of the article. On the basis of the literature research, various proposals for terminology, division and examples of new bank entities created as a result of the technological revolution were detailed.

The second stage of the study is to conduct case studies for selected financial institutions. Six groups of banks have been identified from the literature studies and one example each has been selected and metrics have been developed for them. The case study scheme includes the following data:

- entity name
- country of origin
- year of funding
- type of business
- owner
- type of activity performed by the founding entity
- type of licence
- financial market experience
- availability (countries)

On the analysis of the case studies, the specific features of the individual entities were identified. Then it was proposed to systematise the banking entities created as a result of the technological revolution. At the beginning, only two types of financial institutions were specified: neobanks and new digital banks. Further analysis of the literature made it possible to specify beta banks, non-banks, big tech banks and retailers' banks. In addition, neobanks and new digital banks were classified as one group of bank challengers.

Results and Discussion

In order to identify and qualify new types of digital banks emerging as a result of the technological revolution in the financial sector, case studies of selected entities were conducted. On the ground of the literature studies, six different groups of entities were identified, from which one example was selected. Table 1 presents case studies for the following institutions: Simple, Monese, Yolt, N26, WeBank, Banqi.

Table 1: Case studies for selected fintech institutions.

Entity name	Simple	Monese	Yolt	N26	WeBank	BanQi
Country of origin	USA	UK	UK	Germany	China	Brazil
Year of funding	2013	(2013) 2015	2017	2013	2014	2019
Type of business	Digital bank	Multicurrency mobile banking application	Platform integrating bank accounts (mobile application)	Digital bank (mobile, online)	Digital bank	Mobile bank application
Owner	Bank	Prywat investor, Norris Koppel	ING Ventures	Private investors, subsequent emission (Tencet, Allianz,Valar)	Privat investors, Tencent Holding	Retailers, Via Varejo
Type of activity performed by the funding entity	Banking	Non-banking	Non-banking (investment fund)	Non-banking	Non-banking	Non-banking
Type of licence	Banking licence	Payment institution's licence	Licence of ING Bank N. V.	Banking licence	Banking licence	Mastercard's licence
Financial market experience	Expirience d	Beginners	Beginners	Beginners y	Beginners	Beginners
Availability (countries)	USA	EOG countries	UK, France, Italy	Euro area founders members + Slovakia i Estonia, USA	China	Brazil

Source: Own study based on source materials.

On the ground of case studies prepared for six fintech institutions, some of their characteristics can be identified. The basic differences between them result, among others, from the type of founding entity, the institution's business profile, its position on the market or holding a banking license. These institutions are most often established as

startups of technology companies or large retail chains, whose core business is not related to the financial sector. They enter the market as new players, owing to innovative solutions they acquire customers very quickly, thus increasing competition and forcing traditional banks to adjust themselves. Under great pressure to digitalise services, bank holding companies create their own entities, take over the start-ups that have been created or enter into cooperation with them

Table 2: Classification of fintech institutions according to their features.

Financial market experience	Expirienced	Beginners				
Core business	Banking	Non-banking				
Type of banking licence	Yes, (use a holding company license)	No, (use non-banking financial institutions, e.g. electronic money, licence)	Nie (use a licence of cooperating entities)	yes	Tak (the entity is licensed or partially licensed)	
Owner	Bank	Private investor	Technological startups, private investors		Big tech	Retailers
Type of fintech	Beta bank	Non bank	Neo bank*	New bank	Big tech bank	Retailer bank
Example	AiBank, Simple	Monese	Yolt, Lunarway, Moven	Monzo (po uzyskaniu licencji), N26,MyBank, Starling Bank, Revolut	MyBank, WeBank	BanQi (Via Varejo), Cashi (Walmart), Oney Bank (Auchan)

** may also have its own banking licence*
Source: Own study based on case studies and literature.

On the ground of the case-studies carried out, a systematisation of different categories of digital banks was developed (Table 2). The largest ownership links with the traditional banking sector have beta banks, while other institutions were established by entities from outside the banking sector. Cooperation with the banking sector is characteristic of neo-banks and i.e. new banks, e.g. by using their banking license or providing innovative products and services. The competition with existing banks is focused on non-banks, which use licences of non-banking financial institutions and big tech banks and retailers banks, which have their own licence.

Beta banks represent the new players that are most associated with traditional banks, as they conduct corporate governance. They function as separate entities from traditional banks or as joint ventures. These banks are licensed by the banking holding company to which they belong. In particular, they focus on the Milenials Group and digitally-oriented clients. Thanks to the new digital solutions, they effectively avoid the restrictions characteristic of traditional banks and offer a wide range of banking products and services adapted to specific customer groups.

Non-banks are completely independent of the traditional banking sector. They do not have their own banking licence and do not use the banking licences of their partners. The business is based on the provision of financial services other than banking. Therefore, they benefit from a licence granted to electronic money institutions (e.g. Monese).

Another group are the so-called new banks, which are new participants in the banking market. They were established by start-up companies and therefore do not have any ownership links with the traditional banking sector. These entities most often have a banking licence, and if there is no licence, they use a partner's banking licence.

Big techs' banks were established by large technology companies for which the banking sector is not a core business. They do not have much experience in entering the market, but have a technological advantage over traditional institutions. At large, they gain part of the market, especially customer-oriented ones. Some examples of

these banks include MyBank, which was launched by Alibaba, or WeBank, which was set up by Tencet. These banks have a strong emphasis on efficient, hassle-free customer service and therefore use their data for effective credit risk and working capital management. Technology enterprises called GAFA (Google, Apple, Facebook, Amazon) are more focused on new technologies, applications and data collection and processing (Ruddenklau 2018). They operate in the financial market by offering innovative solutions, such as mobile payments (Google Pay or Apple Pay).

In recent years, large retailers have introduced financial services into their offer. The undertaking of activities which do not coincide with their core business involves reducing the costs of payment services, supporting sales by offering credit services or providing investment and insurance services. Nowadays, retailers increasingly provide financial services independently of other entities according to the DIY (do-it-yurself) model. They are independent financial service providers, creating their own entities that are becoming new players in the financial market (Risso 2010). Banks formed by retailers have their own banking licence. The most important new financial service providers are the retailers such as Walmart and Auchan.

Conclusions

On the basis of the literature research conducted, the variety of classifications of new fintech institutions operating in the banking sector can be indicated. All the analysed companies can be classified as digital banks and bank challengers. Based on the literature and case studies identified six basic groups to which fintech entities can be classified. These are beta banks, non-banks, neobanks, new banks, big tech banks and banks created by retail chains.

There is no single, universal model of establishment for these entities. The largest part of the institutions is formed by companies operating outside the banking sector: technology start-ups, large technology companies or retailers. The examples of such entities are: non-banks, noo-banks, new banks, big tech banks or retailer banks. The establishment of new business is driven to a lesser extent by the banking sector, and these are beta banks. Most of these institutions are licensed as banks, or eventually they will be licensed. Focused on close cooperation with traditional banks are the neobanks, which use a license of the counterparty.. Non-banks do not have their own banking licence, but operate using a licence for non-banking financial institutions.

Technological and Media Platforms: Redefinition of Meanings as Symbolic Power over the Discourse

Jan Kreft

Gdansk University of Technology, Gdansk, Poland
kreftjan@gmail.com

Abstract

Redefining the meanings of such social terms as "likes" and "friends" on Facebook is a popular practice. In terms of consistency, the (auto)-redefinition of the term "platform" is itself particularly important from a media management perspective. The article proposes to consider the redefinition of meanings as a form of wielding non-transparent power over discourse. From this perspective, redefining a meaning is a form of holding symbolic power, i.e. imposing meaning and thus concealing the system of powers existing at its base.
The article is theoretical in its nature and complements the framework that explains how, by redefining and imposing new meanings, media and technology platform managing companies can use a new interpretation of the relationship between the organization and the user and other entities. The aim of the article is to stimulate research on the redefinition of meanings as a form of media management by providing a new theoretical perspective.
Hermeneutics, that provides a framework for looking at the redefinition of meanings, was taken as the theoretical perspective.

Keywords: platforms, symbolic power.

Introduction

In the article, hermeneutics was applied as a research perspective of redefinition of meanings. It provides a convenient framework for looking at the interpretation process and is suitable for studying changes in meanings, and can lead to complementary explanations as to why some firms have a greater potential to redefine meanings.

Although the traditionally interpretational character of hermeneutics concerns written texts, the works of Mats Alvesson and Kaj Sköldberg extend it to activities in general1. This remark needs to be complemented by the philosophical suggestion of Hans Georg that one may only reach the truth of a situation through understanding, as in a case of a translation, and not by an "objective measurement" characteristic for the modern science2.

Considering the nature of the analysis, a particularly significant concept in hermeneutics is that parts of an action or situation can be understood only when placed in context, and vice versa, context can be understood only when these parts are understood.

Hermeneutic reflection requires critical creativity and confrontation of different perspectives as well as putting oneself in the analyzed situation, drawing on intuition and one's own knowledge. It is also important to seek different interpretations in a continuous and active manner, to introduce new information channels and to adopt different perspectives.

The hermeneutic approach opens up to the constant reinterpretation of the surrounding world. Instead of keeping one constant perspective, the idea is to introduce a few perspectives. Rather than deciding on a permanent course, continual adjustments are in the centre of attention. In a word, it suggests the potential of redefining subsequent terms characterizing close social relationships and using these redefinitions in the management process.

The above framework of hermeneutics matches the nature of redefining meanings, because hermeneutics allows directing further research in this matter, especially when it refers to the role of individual actors in the process of interpretation and the market consequences of redefining meanings.

The hermeneutic approach enables a better understanding of how innovative it is to use redefinition of meanings in the management process. The more innovative this non-transparent management factor is, going beyond the traditional connections between a media organization and users, the more innovative is the interpretation of the relationship between a company and the users of its services.

Redefning the meanings

Commonly known are the endeavours to redefine meanings in the environment of the new media and new technologies: the famous "likes" and "friends" of "friends" as well as claimed formation of societies joined the examples of cases when words are stripped of their original meanings and acquire new ones.

Assuming that words provide structure to public discourse, redefining the meaning as the essence of the process of using or even overusing a word and expanding the contexts where the words appear or creating exceptional collocations3.

In the process of redefinition, the meaning changes towards that preferred by the sender4. When the expected and imposed meanings become meanings decoded by the recipients, an effective redefinition takes place.

"Platform" as a semantic camouflage

The redefinition of meanings has fundamental market importance in the case of media and technology corporations that manage platforms. When they define themselves as "technological" and not as "media", it signifies an escape from responsibility for the content that is present on their platforms.

The (auto)-reduction of platforms to a technological and programming entity is consistent with the message sent to users. For example, when Facebook makes efforts to convince others that it does not operate in the business of selecting what the world should read and watch, but in the "business of connecting people and ideas" (this is a classic example of "society rhetoric"), it escapes the responsibility for selecting and recommending media content, and the role of Facebook's algorithms is only to provide users with what they expect, based on data analysis – and this is one of the objectives of this redefinition.

The management of discourses on the essence of the platform concerns, first of all, establishing the criteria according to which new "platform" technologies will be assessed and is aimed at building a protective shield in the public awareness. Some of the issues were included by Tarleton Gillespie in his essay "The Politics of 'Platforms'"[5] noting that there were four semantic territories for shaping the discourse around the "platform": technical (as a computing platform, infrastructure supporting the design and development of operating systems, etc.), architectural (with an emphasis on physical shape – for example, an elevated surface on which people can stand), figurative (as a basis for action, metaphysical reference for opportunity and insight) and political (as a place to speak, a political position, a place open to all)[6].

There is no possibility to point to a discourse that is more important or less important – they affect knowing the essence of a "platform" in a similar way, but knowing is never final, because it is sensitive to the "ethical catastrophes" of platform managers and to the evolution of managing the attention of platform users, to changing trends or, finally, dominant beliefs about their role. Such factors as, for example, the political environment (and its representatives), which is subject to the same discursive treatment as other users, are purposefully not mentioned.

In the environment of digital media and technology, every wave of new solutions, research and investment – from e-commerce, through Internet services, online advertising, to mobile and digital devices – brings those that are re-labelled using the term "platform" pushing its semantic boundary. It is a never-ending management process. This is what happened with user-generated content, blogs, and vlogs, and this is what is happening today – Gillespie published his essay in 2010 – when destructive innovations related to big data, cloud management and the expansion of artificial intelligence appeared.

[3] Warchala J. (2019) Formy perswazji, Wydawnictwo Uniwersytetu Śląskiego, Katowice, p. 269.
[4] Ibidem.
[5] Gillespie, T. (2010), 'The politics of 'platforms', *New media & society* 12(3), 347-364.
[6] Ibidem.

The level of utility of this practice is demonstrated in how handy it becomes in emphasizing the opposition (and superiority) of new media organizations to traditional mass media. The "platform" not only promises the disappearance of gatekeepers and giving voice to those who were not heard before (as passive recipients/consumers not allowed to speak by gatekeepers), but also elevating – which is an outstanding rhetorical procedure – all its users equally.

The greatest benefit of using the term "platform" is the reconciliation of various discourses. The use of the same terminology for all interested parties makes it possible to address amateurs and professional users, advertisers and marketers and other institutional partners; it enables the reconciliation of what seems impossible: supplying advertisers with users' attention on the platform while empowering the latter ones. As Gillespie precisely pointed out the above mentioned practices, under the label of a "platform" one can offer anything[7]. Users receive the promise of egalitarianism, advertisers get the environment to create a brand and launch a product on a market as well as access to users (target groups), while media producers get access to audiences and consumers. Gillespie describes this status as a "figurative platform of opportunity" (empowerment, sales, exchange) that takes into account various activities such as brand creation, popularity, affirmation, but also profit and wealth. In the platform, everyone can thus see (and expect) what is expected and what is suggested to him/her, while losing sight of what is important, and the social proof of rightness in the form of the presence of billions of individual and institutional entities does not facilitate the formulation of varying opinions.

"Platform" has become a word – a contrivance containing a powerful persuasive charge that makes it easier to assume a position at any time, on any topic, towards various groups of interested parties. This is a useful trick, because in legislative works it supports the idea of free competition, and above all, broadly understood neutrality, sometimes demonstrated in the corporate mission records, as in the case of Google. It also makes it easier for platform managers to implement efforts to uphold the competition rules in their role for upholding civil rights[8]. When the corporation managing the "platform" becomes identified with it, in social perception it begins to act as a defender of freedom. The skilfully combined figurative, political and technical aspects make it easier to downplay and use limited liability, the platform then acts as a purely neutral "carrier" environment of social "networks", or possibly an indifferent "medium" providing services to the entire society.

Platforms but not media - redefinition objectives

The fact that Facebook is not a media company, but a neutral (technological) platform is to be proved primarily by the fact that it is not a producer of media content[9]. An equally important argument is the nature of the staff of Facebook and other organizations; Google, for example, is not supposed to be a media company, because it is managed by three scientists. The third argument in favour of the technological character is the lack of human intervention, because it is the algorithms that filter, classify and categorize the content, reflecting in their operation the expectations of the recipients, so it is a process without direct human intervention. This emphasized lack of an active human role in content-related processes is the basic logic behind the perception of media platforms as technology companies. The lack of direct human editorial interventions is to facilitate the further perception of neutrality in the content selection process and clearly differ from editorial practices in the traditional media.

Representatives of the so-called digital platforms argue that they differ from traditional media in the nature of their interaction with their audience, since they have much greater autonomy – the audience members determine which content they will consume, and platforms are merely neutral moderators. Such auto-defining is an expression of the evolution of the organization and takes place on many planes.

In this context, the term "platform" assumes various appearances; it is a labile term, useful in opinion-forming processes. Sometimes it poses as a technical platform, next as a platform of opportunities, perfectly meeting the needs of digital media organizations. It is ambiguous, it allows for shaping the information policy of an organization, but also claiming limited liability for the content posted by users.

In fact, by collecting and analyzing their data, for example, platforms have at their disposal technological solutions for identifying the needs of recipients that are more effective than traditional media. In this sense, more significant application of algorithms (but also greater dependence on them) is to ensure better satisfaction of the needs of users and institutional clients.

In addition, referring to the technological orientation of personnel or management as an argument in favour of non-mediality puts media organizations out of the mainstream of technological advances in the media. The media and the development of technology are often juxtaposed as separate, based on different professional skills. Traditional media, such as workplace or radio, are to perish in history in the process of evolution, along with their propaganda connotations. In opposition to them and on their ruins, technological organizations using the new terminology are to be free from the media burden of social influence, particularly in its pejorative, manipulative contexts.

Such interpretations are accepted, but to a limited extent. For example, the European Commission uses the terms "media platforms" and "media intermediaries" interchangeably to refer to search engines, social networking sites, news sites and video streaming services, information aggregators, payment systems and applications.[10]. There is no definition of media platforms in the academic discourse, but they appear in the concept of Internet gatekeepers controlling information and showing the methods of executing the control[11]. So far, the efforts to clarify the terminology were related primarily to the determination of the scope of responsibilities – this was achieved, among other things, by the separation of the gatekeepers who control the flow of information and the gatekeepers who, as a result of this control, influence participation and reflection in the culture of democracy[12], which enables the identification of the group of dominant corporations sometimes referred to as GAFA (Google, Amazon, Facebook and Apple) from Internet providers.

Facebook, Twitter and many other platforms have been and continue to be referred to as new media/social media. However, the problem of their auto-definition is more and more important due to their growing importance as a source of information in cyberspace[13]. The terminology used to describe Google and Facebook is therefore not only semantic, thus having important social implications. There are also other reasons for the "escape from the mediality". For example, legal protection that neither Google, Facebook, nor other "tech companies" would have had if they had been subject to the US Communications Decency Act and the European e-commerce directive that would have made them liable for spam, just like traditional media publishers.

Arguing that Facebook is obviously a media company, and not a "technological" company, Ian Bogost avoids taking any side of the dispute by pondering, first of all, over what makes the company defined as "technological"[14]. The term "technology" in the high-tech sector is a synthesis for the term of "computer technology". Companies in this sector are involved in developing software, manufacturing hardware, peripherals, providing data processing services, digital advertising, etc., Therefore non-computer companies, for the obvious reason, do not belong to this sector[15]. Verification of this thesis should be sought on NASDAQ, where Google, Facebook, Amazon and many others are listed. They are classified in that stock exchange in accordance with the Industry Classification Benchmark (ICB), a system developed on the London Stock Exchange. "Internet" belongs to "computer software and services" there and the allocation of a company to a sector and sub-sector depends on its largest source of income. Microsoft, for example, is in the "technology, software and computer services" industry because this is the source of the corporation's main revenue. Meanwhile, almost all revenues of Alphabet (Google), Facebook and Twitter come from advertising, which is why they are media organizations. In the case of Alphabet, the problem is more difficult, because it dealt with electric cars, and now, for example, it deals with artificial intelligence and health care (Calico), but the vast majority of its revenues still come from the advertising market.

These comments are important since distribution is a defining feature of the media; it is an element of the media value chain, both in the case of traditional and so-called new media. Creating media content, however, has never been the defining element of an enterprise from the regulatory perspective of the media sector. Therefore, the argument that the creation/possession of media content clearly differentiates the "technological" companies associated with them

from media sector companies reflects a "naive" or insufficient understanding of the media, or intentional attempts to redefine what a "media company" is, motivated by organizational strategies[16].

In the digital media environment, especially confronted with the development of the Internet, the arguments in favour of the "mediality" of Facebook and others are provided by a discussion on communication policies in particular countries, where the policies have been subject to adaptation to changes related to digitization, and where the disputes related primarily to whether the previous regulations could be applied to the Internet, which combined many traditional functions, but also offered new ones. This discussion highlights the importance of what language and what terms are used in the formulation of regulatory policy and the meaning of discourse analysis, as they have an impact on the application of various normative acts.

Redefining "platforms" as wielding symbolic power over discourse

The problem of power is present in numerous studies undertaken from many perspectives offering insight into a fragment of reality. From this perspective, the redefinition of meaning should be considered as a form of exercising symbolic power. It is the power of imposing a meaning, concealing the systems of forces existing at its base and manifesting itself in communication based on rationality[17].

Symbolic power becomes particularly strong when it does not manifest itself, when those who are subject to power are subject to forms and thought patterns (here, imposed by signs and symbols that re-identify "friendship" and "likes") and participate in its construction without perceiving subordination, and they actually make the forms and thought patterns stronger[18].

Therefore, symbolic power takes place where it is not noticed, it is accepted without reflection and the perceived world is obvious, understandable, natural, because the measures applied to it come from this world. Submission then becomes obvious and legitimate and inevitable, and the subordinates favour particular interests. This power is concentrated in the hands of a few members of society and their organizations, symbolic elite that has social, political, cultural and economic capital in their constant conversion.

In the case of platforms, it is consistent with the logic of co-modification, superior when considering the market goals of the platforms, including the new logic of accumulation based on the market benefits of big data analytics[19].

In the analysed context of new technology and media platforms, the symbolic power is in essence exercising power over discourse interpreted within the discourse analysis initiated thirty years ago[20] with its large base of streams and impressive network of notions[21]. In this approach, the analysis initially presented the way in which political power was exercised through language. Later, this trend included advertising, and more broadly speaking, promotion and media discourse, and, further, more areas of exercising symbolic power.

The sources of this reflection, however, should be seen in the critical theory, in the Frankfurt school (discourse can be used by groups of power) and the deliberations of Michel Foucault, from whom the critical analysis of discourse took over the belief that it was a kind of social activity, therefore social activities could be explained through linguistic analysis. Contemporary analysis deals primarily with social inequalities in research into power asymmetry, use, manipulation and structural inequalities through the study of media language, and promotional culture[22]. Importantly, the research programme, which in essence is a critical discourse analysis, is flexible and evolving, which means that such terms as power are defined differently. Norman Fairclough places research on social practices, i.e. forms of activity articulated in order to continue various social fields, institutions and organizations at the centre of this analysis.[23]

[22] Blommaert, J. and Bulcaen, C. (2000) 'Critical discourse analysis', *Annual review of Anthropology* 29(1), 447-466.

[23] Fairclough, N. (1989) op. cit., p 24.

It should be added that in the critical analysis of discourse, the socio-cultural school (Fairclough) or the analysis of discursive phenomena (van Dijk) concern the relationship of power and knowledge. In the post-structural tradition, power becomes a process related to knowledge and discourse, permeates social relations, manifests itself in the actions of actors, which means that there is no social reality without a power relationship[24]. Moreover, it can only be defined in relation to discourse (i.e. language in use), that is in relation to what is not a "reflection of the world" but "violence inflicted on things", therefore discourse is related to power and involves imposing a way of thinking and speaking about reality[25]. Discourse is therefore used to influence people and their perception of the world, and the notion of "hegemony" is used in such an analysis.

As part of the analysis of the relationship between various social spheres and organizations, research is carried out between various orders of discourse, understood as the social structuring of semiotic diversity. Typically, one manner of setting an order one aspect of creating a meaning dominate in the process while others are either marginalized or treated as oppositional.

Summary

"Technological" rhetoric in combination with a pro-social or society-related image is to emphasize the pioneering, unique character of the organizations in question and concentrate on technological competences and take the attention away from social effects. The interpretation claiming that Google and Facebook are media companies would concentrate on their social impact and responsibility, which involves regulatory interventions in the name of protecting the public interest joined with political issues, diversity and competition. Such interventions concerned and still concern television stations, press publications or cable systems and may concern the so-called new media platforms. This would be in line with the logic that, for example, the differentiation of the access of different content creators to the audience should be the overriding social interest protected by the state. In this situation, managers of websites, applications, search engines and social media try to establish such identity that would exclude or limit similar interventions, and the rhetoric of "non-media" has so far effectively influenced the public discussion on the subject.

Abstract

Technology and internet have played a crucial role in most of the organisational activities. The advances in technology are making a huge impact on how we use social media. In this dispensation, the traditional marketing methods have become small segment of the various approaches used for marketing and branding products. Various organisations are continually looking for new ways to reach and communicate with consumers. Some decades back, broadcast (television and radio) and print (newspaper and magazine) advertising were the vital tools of marketing strategies. Hence, this article focuses on the effect of Facebook on the consumer purchasing behaviour of customers. This study has placed substantial value on how social media can be used to shape consumer brand perception and influence customers' purchasing behaviour. This paper employed desk research, known as secondary research, to obtain related information. The researchers obtained articles and literature from the database of Emerald Insight, PubMed, Research gate, Scopus database and Google scholars. This study creates a platform for organisations and PR practitioners to understand how consumers use technology and especially social media (Facebook) in their online shopping process effectively in meeting their needs.

Keywords: Effect, Facebook marketing, Advertising, customers, purchasing behaviour.

Introduction

Almost every part of our personal lives has been invaded by technology and social media is one of the main beneficiaries of its influence. Several studies have tried to demonstrate how social media could help with emerging technologies (Hung & Yuen, 2010; Lim et al., 2015; Amodu, Omojola, Okorie, Adeyeye, & Adesina, 2019). Without doubt, the internet has grown to become a viable platform for business anchorage, a structural foundation for communication that provides interconnectivity for a large percentage of earth dwellers and most important for Nigerians. Importantly, the effect of the internet on commerce and commercial activities cannot be swept aside, especially in the area of marketing. With the aid of social media, marketing as the world previously knew it had undergone a complete facelift. Almost forever gone is the era when the company's had to employ people to distribute flyers or marketing materials by hand to their target audience.

The social media has proven to be equal to the task of safely conveying advertorial tools and public conveyance of product information or company's existence to its publics (Nyekwere, Kur, & Nyekwere, 2013; Nelson, et al., 2013). With the constant innovations and new business models, Facebook keeps churning out, for its continued relevance. In a report by Deloitte, (2015) titled, Facebook's Global Economic Impact, "Facebook-connected more than 1.3billion people… and enabled global economic impact valued at $227 billion."

The number of views marketing campaigns garners via social media advertising is quite intimidating, when compared with traditional marketing. Lee (2013) posits that "this technical revolution during the last decade has drastically revolutionised the traditional marketing approaches and brought marketers to a new era." He further explains that "in the new marketing era, the social media has redefined the relationship marketers have with retailers, channels of distribution, their ultimate consumers, and so forth." Whether any business owner jumps on this fast-growing social

media marketing trend or not is solely their decision to make, but anyone sceptical about the peak this will attain might soon find themselves out of customers and patronage. Social media has given consumers uncountable options of products and services, more than at any other time in the history of humanity.

The shift from traditional modes of marketing and accessing goods and services has led to widespread adoption of online shopping in Nigeria. Though the change has been slow-paced, it is gradually gaining traction. Facebook has become one of the most widely used and renowned social networking sites. Initially, it was created to help connect with family and friends; it has, however, expanded to include the use of the platform as an avenue for promoting businesses and generating customers and revenue for businesses. Consumers now have a wide array of businesses they can patronise, especially from the comfort of their mobile devices. As a result, this study examined the following:

(i) To examine the factors that determine the usage of facebook marketing in the business world;
(ii) To assess the determinants and salient indicators of consumer purchasing behaviour;
(iii) To evaluate the influence of facebook marketing on consumers' purchasing behaviour.

Literature Review

Facebook Marketing

To adequately explicate the concept of Facebook marketing, it is imperative to first define marketing as a standard concept (Kotler & Armstrong, Principles of Marketing, 2010). "Marketing is the action, set of establishments, and techniques for generating, communicating, transmitting, and exchanging offerings that have significance for customers, partners, clients, and society at large" (American Marketing Association, 2017 pig). More often than not, marketing is usually mistaken for buying and selling of products or services. Still, the process of attempting to decipher what can be termed as "valuable offerings" is, in fact, what marketing personifies. To create value consumer needs and wants have to be understood, while consumer interaction and purchasing trends have to analyse. In view of this, the marketer has to be steps ahead of the consumer to enable him to predict their needs beyond what is physical foreseeable and futuristically. Carrillat et al. (2014) indicated that Facebook marketing must be, creative and entertaining to induce the desired outcome on consumers. Stokes (2013) advised marketers of branded experiences for its customers with the purpose of stimulating behavioural reactions.

Consumer Purchasing Behaviour

Consumer behaviour encompasses "all actions related with the purchase, usage and discarding of goods and services, comprising the consumer's mental, emotional and behavioural reactions that support or accompany these activities" (Kardes, Cronley, & Cline, 2011:23). The consumer could be a lone individual or a group of people. Without the consumer, the need for organisation's and marketing strategies in any form would be unnecessary. Consumer behaviour has been of unexpected interest to totals of researchers who have acted to widen the depth of factors that impact consumers who are willing to make purchases. Consumer behaviour is an emotional, mental, and physical indication. The purpose of every consumer is to have their needs satisfied as flawlessly as possible, r.thus the numerous behaviour displayed by them when in quest for satisfaction. In an article by Richarme (2007), analysis on customer's decision-making strategy started about 300 years ago. Over the centuries, impressions and findings about consumers have advanced. Consumer behaviour as distinguished by Solomon, Bamossy, et al. (2010) is the technique through which "individuals or groups select, buy, utilize or dispose of services, product, ideas or experiences to fulfill needs and desires".

Theoretical Justification

The concept of consumer behaviour is an interdisciplinary social science that links rudimental principles from psychology, sociology, social anthropology, economies, ethnography and marketing. Theoretical frameworks aid researchers in examining how attitudes, emotions, and preferences influence purchasing behaviour. It is imperative for organisations (with either large or small number of customers) that engage in marketing and sales activities to have a vast understanding of what customer behaviour encompasses, to get the best out of their customers. To achieve this, the knowledge of human behaviour has to be applied to consumer purchasing behaviour.

Theories of consumer behaviour stand for the normal tract of human behaviour theories (Bernstein, 2018). Specifically, the Engel, Blackwell and Miniard Model was examined. The entry point of this model is needed

recognition which occurs when the consumer recognises an inherent lacuna that has to be filled by something specific. The courage of the need drives the whole cycle from start to finish. If the need was just a whim, the desire to meet it fizzles out after the initial urge. Once a need has been determined, the consumer starts an internal and external search for information aided by brand awareness and brand recall. Ideally, the internal search is usually a quick scan in the consumer's memory to identify alternatives, as indicated in Figure 1.

Figure 1: Engel, Blackwell and Miniard Model

Figure 1: (Blackwell, Miniard, & Engel, 2001)

The internal and external search helps the consumer identify and create a list of existing options of products or services that possess the potential to gratify their needs. Environmental significances such as; personal influences, culture, family, social class, and circumstance (which could be financial, psychological, etc.) influence the consumer's need recognition and purchase decision. The consumer's memory is a poignant point through each of the processes; sort of akin to a car's brain box which monitors and controls engine functions. As depicted in the image, the external information search is influenced by marketing dominated and non-marketing dominated stimuli. During the external search, the consumer passes through five stages; exposure, attention, comprehension, acceptance and retention.

One of the considerations of the consumer at the pre-purchase evaluation of service stage is the amount of satisfaction that will be derived from a purchase. Based on the perceived anticipation of satisfaction, he then goes ahead to purchase. The final purchase decision is influenced by individual differences in the form of; consumer reserves (economic), motivation and involvement, personal influences, knowledge, attributes, and personality, values and lifestyle. The consumer keeps evaluating at every stage of the process, including post-purchase, because it is at this point that the consumer measures the satisfaction derived from the product, compared with his expectations. This ultimately influences the decision to repeat the purchase of that product or never use that product again if he is dissatisfied with his experience. Post consumption evaluation which is a feedback function will result in the consumer deciding that he is satisfied or dissatisfied with his experience. At the same time, divestment indicates that the consumer might discard the product post-consumption.

Methodology

The authors employed desk research, known as secondary research, to obtain related information. The researchers Obtained articles and literature from the database of Emerald Insight, PubMed, Research gate and the Internet. Appropriate information was retrieved from papers indexed in Scopus and Google scholars. The specified articles targeted questions relating to various face book marketing strategies and customer satisfaction behaviour information.

Development of Research Propositions

Factors that determine the usage of facebook marketing in the business world

Extant literature has indicated the various factors that affect Facebook marketing under its Cost per 1,000 Impressions, also known as CPM. Though the list is inexhaustive. It includes:

(i) Target audience**:** Where can your target audience be found? Terkan (2014) exemplifies public restrooms as being choice media for certain types of campaigns to secure unhindered access to a target audience. The target audience answers the question of who should view ads, how to appeal to their emotions, and what to say to them. Age, location, personality trait, income, interests, and needs, amongst various other characteristics are to be considered when determining the target audience, as it gives direction to marketing (Harvey, 2018).

(ii) Schedule and frequency cap of marketing campaigns: This is a pre-specified structure for the number of hours, days, or weeks a campaign should be visible to customers. Frequency cap refers to the maximum number of times an advert will be shown to each individual that is among the target audience.

(iii) Placement: This simply states where an ad will appear. Will they be embedded in videos or as pop-ups while individuals are viewing other posts on their walls?

(iv) Type of creative: The type of creative is used to determine where the ad can be placed. An example is video adverts are usually infused into other video contents.

(v) Budget: Budget is the maximum amount that will be spent on the marketing campaign duration. During festive periods, budgets usually run higher, than off-peak seasons when traffic is much lower.

(vi) Innovative and creative features: Innovation simply put means adopting new methods to achieve an aim. At the same time, creativity requires crafting or envisioning or conceptualising a plan or idea that is entirely new. Creativity is birthed through knowledge, creative thinking and motivation (Adams, 2005). Considering that consumers are bombarded with numerous products and services daily, and spoiled with countless other options if one option fails to meet their expectation. Therefore, marketing campaigns have to be creatively executed. Creativity requires a fresh perspective, a renewed mindset and flexibility in decision making. Fresh insight and perspective can be acquired through observation. Terkan (2014) opines that advertising either thrives or perishes through creative or innovative communiqués.

(vii) Relevancy: Relevancy is a diagnostic measure of the rate at which a marketer's adverts resonates with its target audience, based on the number of impressions it creates. This rate is grouped under either of three rankings: quality ranking, engagement ranking and conversion rate ranking. Results are then further ranked as either above average, average or below average (Robinson, 2019). Perceived relevance positively influences a customer's purchase intentions and continuous patronage.

Determinants of Consumer Buying Behaviour

The determinants of Facebook marketing, as expressed by various authors, include the following:

(i) Brand Awareness:

Every business entity has one goal, which is to maximise sales and make a profit. This goal will only be achieved for businesses that have found a way to create a niche for itself and attract customers who are in need of its market offerings. No matter how attractively packaged a product is and how beneficial service is, it cannot sell itself. If potential customers are ignorant of its existence, it can as well be nonexistent. Brand awareness comes in to bridge the gap between selling in the dark and shooting a brand to the limelight. When a consumer thinks of a product (toothpaste for example), the first brand (which could be Colgate, Close Up, Pepsodent, or Oral B) that comes to his mind is the one he is consciously aware of. Malik et al. (2014) opined that each time a customer willingly patronises the first brand name that pervades his consciousness, it is an indication that this brand has brand awareness. If an organisation's products and services are reputable in the market and have a high acceptance rate, the company can be said to have successfully created brand awareness (Gustafson & Chabot, 2007).

Brand awareness has been positively linked with purchase intentions because the consumer can only buy something he knows exists. Initially, when SLOT Systems introduced its brand of phones into the Nigerian market, it struggled for patronage, because big brands like Samsung, Motorola, Blackberry, and Apple were the rave of the moment. However, with persistent brand awareness creation, many Nigerians now use either a Techno or Infinix phone. Despite being the dominant brand on noodles in Nigeria, Dufil Prima Foods keeps up it's relentless marketing of Indomie to the extent that all other brands of noodles are called Indomie. Indomie is a typical exemplification of brand dominance. The more aware customers are, the more likely there are to purchase and the higher the chances of its acceptance by the market. The advantage Indomie had over the imitation brands was being the first product of its kind in the market. Intensive campaigns that acquaint a higher number people to the message and very frequently expose them to the message are required for success to be achieved with regards to brand awareness (Belch et al., 2009).

Repeated exposure to a brand improves the consumer's ability to recall and recognise the brand (Huang & Sarigollu, 2012). It also helps to maintain awareness creation for new audiences, ensure continued sales and steady ownership percentage of an industry's market share.

Brand awareness is usually measured using four determinants. Firstly, b*rand recognition* which is the degree to which customers can distinguish a brand by its features. Kang (2019) believes that a customer does not need to remember specific brand names but should be able to list the product category when the brand name is stated. Kenton (2018) asserts that a company should use exceptional, emotive and heartwarming narratives that will let customers know the mission of the business. Customers incline to remember brands that they connect with on an emotional level. Secondly, b*rand recall* describes the ability of a consumer to summon up a brand name within its product category, of its own accord with needing any branded paraphernalia to juggle his memory. For example, if a customer hears the word "cornflakes", what specific brand name comes to his mind? Is it Kelloggs, Nasco or Good Morning cornflakes? Typically, a customer can recall no less than two brands, while many can recall as many as seven brand names in a product category (Kang, 2019). Interestingly, awareness of product existence, usage frequency, brand loyalty and circumstance-induced factors are major determinants of the number of brands a consumer can recognise in its product category.

Thirdly, Top-of-mind awareness describes the position of a brand on a consumer's mind, such that that brand is the first that comes to fore in its category or class. Such a brand is frequently referred to as the most remembered brand name (Farris, Bendle, Pfeifer, & Reibstein, 2010)**.** In Nigeria, Milo and Bournvita are the most popular brands of beverages. Still, they are consumers who are favourably loyal to either of the brands and will never consider purchasing the other brand. Having a top-of-mind brand eliminates waste of time and enables quick decision making when confronted with an array of options. The final determinant is b**rand dominance.** Aaker (1996) stated that brand dominance is when a consumer can only recall specific brand names in a category. In such instances, when a brand becomes synonymous with its category, the brand is said to have become genetic. An example is a sellotape which in actuality is a brand of cellulose-based adhesive tape.

(ii) Lead Generation:

Lead generation is the process through which an organisation gathers a catalogue of potential customers whose interest was roused after becoming aware of its existence and what it offers. The initial contact could have been after viewing an e-mail, blog content, targeted advert, promotion, product or service. The customer indicates that interest by whatever medium the organisation makes available, which could be an email or a chat box that encourages the prospective customer to leave their contact details for further information from the company. In summary, it states the prospect's intention to buy. "Lead generation involves technique that characterizes the marketing procedure of involvement and capturing of attention in a product or service which is intended for creating sales plans and as an outcome entreating new clients" (Swieczak & Lukowski, 2016:106).

Lead generation positions the business in the minds of people and fulfils a triple role of audience engagement, brand awareness and attraction of prospects. An upgrade to lead generation would be the conversion of leads to sales. Scott (2013) identified "direct marketing, email, banner, search engine marketing, and social media advertising,, trade show and coold calling" as the lead-generating tactics that yield the most remarkable results. Despite the indication of interest or intention, Riano (2017) stipulates that leads need to be nurtured. Lead nurturing, according to Mawhinney (2018), is the deliberate act of engaging a specific group of people by supplying relevant information in an attempt to push them from prospects to paying/buying customers. The bottom-line of each lead generated is its potential to become a sale.

(iii) Audience Engagement

The audience here can be interchangeably replaced with customers and potential customers. Audience engagement is an attempt by a brand to connect to customers on an emotional level by creating interactive channels such as a Facebook page or other social media pages. Pennington (2012) defineíol pms business engagement as a business communication link between an external individual or group who have a vested interest (a consumer) and an organisation through different channels of communication. Before the advent of social media, companies used experiential marketing as a medium to connect with customers. However, it was more transactional, in that it targeted increase in sales than it was engaging. Television, radio, newspapers, etc, were formerly used to secure consumer engagement; now, customer engagement can occur online on platforms like Facebook. The customer's commitment to a brand as embodied by its website or other computer entities that act as a go-between must be designed to communicate instrument and experiential value from the brand (Mollen & Wilson, 2010). Figure 2 indicated that audience engagement could come in the form of a like, a share, a comment, amongst others; all that matters is that customers are involved, and their attention is unrelenting.

Figure 2: a cycle of chain reactions for Audience Engagement

Source: (Kahil Insights, 2016)

As shown in Figure 2, customer engagement starts with creating content which is then distributed on social media platforms that the company is registered on like Facebook, Twitter, or Instagram; it could also be a website or a blog. Visitors (audience/prospective and existing customers) view the content and engage by reacting, sharing or leaving a comment or as the case might be, indicating an interest in the product or service being offered. These visitors convert to leads, and as stated earlier, leads are potential buyers. These leads then convert to sales and satisfied customers share their experiences with their contacts, and then the cycle begins all over again. Engagement is misunderstood in business as an event rather than a position of being (O'Dell, 2015). This means that engagement with the customer should be a continuous process and put at the top of every business's agenda. In an interview by Chaffey (2017), Richard Sedley defines customer engagement as "repeated exchanges that enhance the psychological, emotional, or physical interest a customer maintains in a brand." For customers to take necessary action in initiating and keeping up with engagement, an organisation must be able to understand its consumers and give them reasons to take action with its marketing message. For there to be continuity or repetition of interactions, the value must be created, offered and exchanged and interactions should be relational.

4. Attractive Adverts

The objective of advertising is to stimulate consumers consciousness of the availability of a product or service through paid media. Advertisement is rooted in the Latin word "advertise", which means "to offer public information or to proclaim publicly". American Marketing Association, define advertising as "any form of non-personal production or promotion of ideas, goods or services, by an identified sponsor." Sponsor in this regard would be the organisation. What is said in advertising is more important than how you say it; ads must be objective. Tell the truth in a fascinating way; breakdown big ideas into simple ideas; keep promises do not use "highfalutin language" in advertising (Ogilvy, 1963:2012). It must communicate what exactly it intends to. Duffett (2014) suggested that adverts should be composed in an interactive and exciting manner to generate appeal. Therefore organisations must ensure that social media is a component of is "marketing communication strategy" to actualise its ultimate potential (Bass, 2017). Bass concludes that "the end objective is to establish strong, immersive experiences that retain consumers tuning in and seeking for more." Extant studies (Bass, 2017; Swieczak & Lukowski, 2016; Duffett, 2014) have identified the various objectives of advertising which includes:

- It is used to generate sales, increase sales and grow sales revenue.
- It aids in stimulating the desire for repeat possession.
- It helps to project the image of an organisation to its intended audience.
- It stimulates market demand.
- It promotes brand awareness and supports lead generation.
- It acts as a call to action.

Types of Advertisement Media

i. Print media
    - Newspapers

- Banners
- Magazines
- Billboard
- Direct mail
- Coupons

ii. Electronic media
- Television
- Radio
- Cinema
- Internet
- Mobile

5. Environmental Factors

The environmental factors are made up of the social, economic, personal, cultural and psychological factors.

- Social Factors: Social factors are traditions, vules and customs established in the society or community the consumer lives. Every community is made up of several individuals who exist within family units. Though the family is always related by blood, each person is distinct in the preferences, choices, wants and needs. The family plays a role in developing a child's purchasing behaviour, as the child observes his parents in action. An adult would likely have an affinity for brands he grew up using.
- Economic Factors: These comprise personal income, family income, consumer credit, income expectations, liquid assets and assets. Each of these is a source of disposable income and influence how much an individual spends to purchase a good or service. Others include inflation, recession, etc.
- Personal Factors: These are factors that are consumer-specific and vary from one person to the other. They are age, occupation, lifestyle and income. For instance, the products a pregnant woman purchases will differ from those of a nursing mother.
- Cultural Factors: This refers to culture (the beliefs, customs and practices of a group of people) and social class. A consumer in the upper social class will tend towards purchasing luxury products, while those in the lower class will majorly make purchases that meet their needs.
- Psychological Factors: Perception, motivation, learning, attitudes and belief are psychological factors that affect consumer purchasing behaviour.

Salient Indicators of Consumer Purchasing Behaviour

These include:

(i) Buying Decision

The human life is faced with a plethora of choices that often require the need to make decisions at each stage. Buying decision process is used by consumers pre-purchase, during purchase and post-purchase. Buying decision explains the set of decisions that a consumer makes while buying (Hoyer et al. 2010). The stages of buying decision, as stated by Kotler (2002) includes:

- Problem/Need Recognition: The customer realises a need that has to be met and pegs it down to the specifics.
- Information Search: The consumer then searches for the product that can meet the recognised need and how to access it. Usually, more than one product is identified within a brand category.
- Evaluation of Alternatives: The consumer evaluates the product alternatives and decides which would be most suitable. Preference comes to play at this stage.
- Purchase Decision: After the consumer has concluded an evaluation of available options, the intention to buy would have taken root and then he goes ahead to buy if all conditions are favourable with regards to price, taste, et cetera.
- Post Purchase Behavior - After the purchase, the consumer measures the extent to which he/she got value from the product choice that was settled for and might also wonder if another product would be offered more benefits.

(ii) Repeat Purchase

Customer repeat purchase is a consumer's decision to buy a product or engage the services of a service provider, as well as a definition of the extent to which this will go (Beránek, Nýdl, & Remeš, 2015). Repeat purchase is an indication that value was gotten from a product or service. All repeat purchase decisions are based on prior experience and satisfaction was derived. Satisfaction is that feeling of fulfilment a consumer gets from having made a purchase

that met a need suitably. Several factors such as benefits, price, quality and alternatives also influence repeat purchase. Brand awareness plays an important role, even in instances of repeat purchase (Hoyer & Brown, 1990; Macdonald & Sharp, 2000). A consumer normally decides to go through a repeat purchase when he/she is generally fulfilled with the brand and is in the final phase of post-purchase behaviour of the consumer buying process" (Kotler & Armstrong, 2016).

(iii) Continuous Patronage
Continuous patronage is a depiction of a customer's loyalty to a brand. Continuous patronage for a high involvement product is an indicator of brand loyalty; whereas repeated patronage for a low involvement product implies habitual purchase behaviour (Sadavisian, Rajakumar, & Rajinikanth, 2011).

Influence of Facebook Marketing on Consumer Buying Behaviour

Having garnered a mammoth size membership of over 2.4 billion people, Facebook is inarguably the largest social media network, and many businesses are discovering just how influential it has become in the online marketplace. The advent of social media opened up a medium of interaction through which individuals interconnect, and businesses connect with customers. Social media is a faction of internet-based applications that enable the production and exchange of user-generated content (Kaplan & Haenlein, 2010). Lu, Zhao, & Wang (2010) assert that online communities on social media have made new structures available to businesses, while Gruzd, Wellman, & Takhteyev (2011) suggest that social media has eliminated the regimental need for physical meetings. Facebook allows users to connect in several ways and gives businesses the ability to project their business to their target market. Facebook allows users to share information; generate content, post photos, videos and pretty much do whatever they wish, as long as they do not violate Facebook policies. In a study conducted by Simmonds (2012) and commissioned by Facebook, it was discovered that at that time, 71% of marketers who were surveyed believed companies could gain competitive advantage by leveraging social media.

Conclusion

The impact of social media marketing, (Facebook) on consumer purchasing behaviour yield unified submission that brand awareness, lead generation, audience engagement and attractive adverts have effects on consumer purchasing behaviour. Marketers should exploit all the benefit of facebook for branded experiences for its audience to elicit behavioural responses from them. Organisations that are wise in combining strategic approaches to the use of social network platforms (Facebook) are most feasible to be successful in reaching, building, and sustaining a customer base relationship. Factors that influence brand perception and behaviour to purchase, entail trends like the economic and personal issue, social and cultural factors. Irrespective of these factors, the organisation should consider device strategies for managing their online customers. Organisations in Nigeria are gradually tuning in with the inherent benefits of online marketing strategies, and consumers are loosening up enough to influence purchase and interact.

Suggestions for further studies

The present study used desk research to source literature on Facebook marketing and customer behaviour future research can use survey quantitative (questionnaire) or qualitative (interview) to collect data. Accordingly, mixed-methods approach (i.e. use of quantitative (questionnaire) and qualitative (interview and focused group) can be used to give more insight into the probable impact of Facebook marketing on customer buying behaviour.

Abstract

This pilot study examines the citizens' awareness of the influence of network marketing communication on their usage of herbal medications. Research locations are two African countries; namely, Nigeria and Zambia. In Africa, many people, especially those living in rural countryside, prefer the use of healing herb when faced with health challenges. They assume that herbal medicines are innocuous, active and valuable. However, the reverse is the case in city-centres where documented reports of active use of herbal medications are few. This study was conducted at the same time in Lagos, Nigeria and Lusaka, Zambia to fill this gap. The two cities are metropolitan with fast-growing industrial hubs, dense population, and having high representative margins of the different groups across the countries. A semi-structured questionnaire was administered on 230 respondents in Lagos and Lusaka using the purposive sampling technique. Results show that there is a high awareness of network marketing communication of herbal medications in both countries; although it is stronger in Nigeria than Zambia. Usage of herbal medications in both countries is above par. Similarly, the respondents do not believe that marketing communicators have marginally influenced the citizens to use herbal medications. This study invites collaborations from other parts of Africa and the world at large.

Keywords: Network Marketing, Marketing Communication, Herbal Medications, Citizens, Nigeria, Zambia

Introduction

Subject area	Marketing Communication
More specific subject areas	Herbal Medication Marketing
Study execution	A survey using a questionnaire instrument.
Study format	Quantitative methodology
Experimental factors	This is an investigational study involving 230 consumers of herbal products in Lagos, Nigeria and Lusaka, Zambia. Study objectives include examining the influence of network marketing communicators of herbal medications on the citizens in Lagos and Lusaka. Descriptive tables indicate the initial results.
Experimental features	Data on citizens' awareness of network marketing communication and its influence on the patronage of herbal medication products appear in this preliminary study.
Preliminary study locations	Lagos, Nigeria and Lusaka, Zambia.
Data accessibility	Authentic data is available to match with similar studies in Africa and the rest of the world.

Value of Study

1. This study provides the prototype for similar studies in different parts of the world, especially African countries.
2. Preliminary findings of this research are prospective background data for future researches on network marketing communication and herbal medications.

Experimental Design, Materials and Methods

This study generated the data for future use. Two hundred and thirty cosmopolitan citizens of Nigeria and Zambia filled the questionnaire designed for this study. However, 223 copies of the questionnaire returned properly filled. The respondents were selected through a random sampling technique. Initial results of the study are shown in the Tables below.

Preliminary Study Results

Descriptive statistics was adopted in this research to indicate mean scores in the data presentation. Frequency distribution tables show the position of each item in the questionnaire. The study used Statistical Package for Social Sciences (SPSS/PASW) software, version 25.

Table 1: Descriptive of individuals' awareness of network marketing communication of herbal medications

			Country		
			Nigeria	**Zambia**	**Total**
Are you aware of network marketing communication of herbal medications?	Yes	Count	112	92	204
		% of Total	50.2%	41.3%	91.5%
	No	Count	6	5	11
		% of Total	2.7%	2.2%	4.9%
	Not sure	Count	7	1	8
		% of Total	3.1%	0.4%	3.6%
Total		Count	125	98	223
		% of Total	56.1%	43.9%	100.0%

Table 1 shows that majority (91.5%) of the respondents are aware of network marketing communication of herbal medications. This result speaks equally for both countries in the affirmative.

Table 2: Descriptive of individuals' usage of any herbal product

			Country		
			Nigeria	**Zambia**	**Total**
Have you ever used any herbal product?	Yes	Count	112	93	205
		% of Total	50.2%	41.7%	91.9%
	No	Count	6	5	11
		% of Total	2.7%	2.2%	4.9%
	Not sure	Count	7	0	7
		% of Total	3.1%	0.0%	3.1%
Total		Count	125	98	223
		% of Total	56.1%	43.9%	100.0%

The descriptive result of Table 2 shows that a vast majority (91.9%) of the respondents have used herbal products at one time or another. The result reflects similarly in Nigeria and Zambia. However, few (3.1%) of the Nigerian respondents were not sure of herbal product consumption in the past, while no one was unsure in Zambia.

Table 3: Descriptive of citizens' awareness of network marketing communication of herbal medications

			Country		
			Nigeria	Zambia	Total
Most of the people are aware about network marketing communication of herbal medications	Strongly agree	Count	28	41	69
		% of Total	12.6%	18.4%	30.9%
	Agree	Count	54	26	80
		% of Total	24.2%	11.7%	35.9%
	Not sure	Count	35	16	51
		% of Total	15.7%	7.2%	22.9%
	Disagree	Count	7	7	14
		% of Total	3.1%	3.1%	6.3%
	Strongly disagree	Count	1	8	9
		% of Total	0.4%	3.6%	4.0%
Total		Count	125	98	223
		% of Total	56.1%	43.9%	100.0%

The descriptive result in Table 3 indicates that the respondents vastly agree that most people in Nigeria and Zambia are aware of network marketing communication of herbal medications. Although more respondents in Nigeria are unsure of this assertion, the low level of disagreement with the statement is common to both countries.

Table 4: Descriptive of network marketing communicators' influence on people to consume herbal medications

			Country		
			Nigeria	Zambia	Total
Marketing communicators of herbal medications have influenced people to consume herbal medications.	Strongly agree	Count	27	28	55
		% of Total	12.1%	12.6%	24.7%
	Agree	Count	38	26	64
		% of Total	17.0%	11.7%	28.7%
	Not sure	Count	45	25	70
		% of Total	20.2%	11.2%	31.4%
	Disagree	Count	11	11	22
		% of Total	4.9%	4.9%	9.9%
	Strongly disagree	Count	4	8	12
		% of Total	1.8%	3.6%	5.4%
Total		Count	125	98	223
		% of Total	56.1%	43.9%	100.0%

Table 4 shows the agreement among the respondents that marketing communicators have non-marginal influence on the citizens' consumption of herbal medications. However, while majority (20.2%) of Nigerians are not sure, most (12.6%) of their Zambian counterparts strongly agree on the influence of herbal medication usage by network marketing communication.

Conclusion

This preliminary result shows high awareness of network marketing communication of herbal products among the citizens of Nigeria and Zambia. Specifically, the citizens consume herbal products with the preponderant influence of network marketing communication in both countries. Although there are cases where Nigerians are unsure of ever using herbal products, Zambians are not in doubt. The tentative conclusion is that from the perspective of the citizens, network marketing communication of herbal products has the potential to be firmly rooted in Nigeria and Zambia.

Abstract

Consumption of herbs is increasing in various parts of the world. However, in many African countries, public perception of hereditary consumption of herbs is yet unclear especially as regards to marketing communication. In Nigeria and Zambia for example, tradition, religion, level of education, economy, healthcare needs and other factors influence hereditary consumption in general terms. Nonetheless, misconceptions still surround the hereditary consumption of herbs specifically relating to marketing communication activities. Quantitative survey design using the questionnaire instrument was deployed. Two hundred and twenty-three out of 230 copies of the questionnaire successfully returned from respondents who were selected through a multi-stage sampling technique. Tentative findings show that hereditary consumption and marketing communication have less than average influence on the uptake of herbs by Nigerians and Zambians. Local and global stakeholders in African herbal medicine will find this study's results beneficial for further investigation.

Keywords: Hereditary Consumption, Herbs, Marketing Communication, Nigeria, Zambia.

Introduction

Subject area		Marketing Communication
More specific subject areas		Consumer Psychology and Consumer Relations
Study execution		A survey using a questionnaire instrument.
Study format		Quantitative methodology
Experimental factors		As a comparable study, 230 hundred copies of questionnaire were drawn up and divided into two to elicit public responses from two targeted areas in Nigeria and Zambia. The respondents were selected through a multi-stage technique. The semi-structured questionnaires were administered by the researcher and other research assistants to get responses from the respondents. Study objectives include examining public perception of hereditary consumption patterns of herbal remedies through marketing communication in Nigeria and Zambia. Preliminary results are included in tables.
Experimental features		Data on public perception of hereditary consumption patterns of herbal remedies through marketing communication in Nigeria and Zambia is included in the initial study.
Preliminary study location		Nigeria, Zambia
Data accessibility		Original data is available to compare with similar investigations anywhere in the world

Value of Study

Hereditary consumption of herbal product involves the practice of consuming remedies as did the forbears. This study is significant as follows:

Experimental Design, Materials and Methods

Quantitative survey design was applied in executing this study as work-in-progress. Data was generated from a questionnaire designed for all time use. Two hundred and thirty copies of the questionnaire were dispatched, proportionate to the two countries' population. However, 223 responses were generated from correctly-filled forms. The respondents were selected through a multi-stage sampling technique. Tables below show part of the primary results of the study.

Preliminary Study Results

As shown in the data presentation below, this study implemented descriptive statistics to designate mean marks. Each item's position in the questionnaire is represented through frequency distribution tables show below. Statistical Package for Social Sciences (SPSS/PASW) software, version 25 was used.

Table 1: Frequency of herbal consumption

			Country		
			Nigeria	Zambia	Total
How often do you consume herbs?	Once a year	Count	43	33	76
		% of Total	19.3%	14.8%	34.1%
	Twice a month	Count	36	23	59
		% of Total	16.1%	10.3%	26.5%
	Once a week	Count	23	21	44
		% of Total	10.3%	9.4%	19.7%
	Once a day	Count	23	21	44
		% of Total	10.3%	9.4%	19.7%
Total		Count	125	98	223
		% of Total	56.1%	43.9%	100.0%

Table 1 indicates the daily herbal consumption is slightly higher in Nigeria (10.3%) than in Zambia (9.4%). The weekly consumption 10.3% in Nigeria and 9.4% in Zambia. Twice a month for Nigeria is 16.1% and Zambia is

10.3%. Once a year for Nigeria (19.3 per cent) and Zambia 14.8%. Overall, once-a-year consumption is the highest common frequency in both countries.

Table 2: Consumption of herbs by grandparents and parents

			Country		
			Nigeria	**Zambia**	**Total**
Did your grandparents and parents consume herbs?	Not sure	Count	11	20	31
		% of Total	4.9%	9.0%	13.9%
	No	Count	14	11	25
		% of Total	6.3%	4.9%	11.2%
	Yes	Count	100	67	167
		% of Total	44.8%	30.0%	74.9%
Total		Count	125	98	223
		% of Total	56.1%	43.9%	100.0%

An overwhelming (74.9%) number of the respondents affirm that their parents and grandparents consumed herbs. Consumption of herbs by grandparents and parents is also higher in Nigeria by 44.8% and 30.0% in Zambia. In Nigeria 6.3% and 4.9% in Zambia respectively indicted their forebears did not consume herbs. Nigeria (4.9%)and Zambia (9.0%) were not certain their parents consumed herbs**.**

Table 3: Hereditary consumption of herbs

			Country		
			Nigeria	**Zambia**	**Total**
Do you consume herbs as your parents did?	Not sure	Count	10	21	31
		% of Total	4.5%	9.4%	13.9%
	No	Count	68	43	111
		% of Total	30.5%	19.3%	49.8%
	Yes	Count	47	34	81
		% of Total	21.1%	15.2%	36.3%
Total		Count	125	98	223
		% of Total	56.1%	43.9%	100.0%

Majority (49%) of the respondents in both countries do not consume herbs as their parents. Table 3 shows further that the hereditary consumption of herbs is high by 21.1% in Nigeria and 15.2% in Zambia.

Those who said did not consume herbs as parents were 30.5% in Nigeria and 19.3% Zambia. 4.5% and 9.4% respectively indicated were not sure of hereditary consumption. This means that though hereditary consumption of herbs is visible, it is not highly prevalent.

Table 4: Marketers' communication influence of hereditary consumption of herbs

			Country		
			Nigeria	**Zambia**	**Total**
Did marketers' communication efforts influence you to consume herbs like your parents?	Not sure	Count	11	15	26
		% of Total	4.9%	6.7%	11.7%
	No	Count	69	47	116
		% of Total	30.9%	21.1%	52.0%
	Yes	Count	45	36	81
		% of Total	20.2%	16.1%	36.3%
Total		Count	125	98	223
		% of Total	56.1%	43.9%	100.0%

Table 4 shows that marketers' communication have not succeeded in influencing the respondents to consume herbs like their parents and grandparents. However, marketers' communication influence of hereditary consumption of

herbs is higher in Nigeria representing 20.2% and 16.1% in Zambia. Majority (30.9%) of Nigerians and (21.1%) Zambians indicted that they were not influenced by marketers' communication while 4.9% and 6.7% respectively were not sure of marketers' communication influence.

Conclusion

The findings show some patterns in the consumption of herbs in Nigeria and Zambia. Generally, the respondents consumed less herbs than their forbears, suggesting that hereditary consumption is low among the people. Similarly, the people are not able to consume herbs like their parents and grandparents in spite of the acknowledged communication activities of marketers. These findings are interesting for practitioners of African traditional medicine, orthodox healthcare practitioners, researchers, herbal marketers and the World Health organisation (WHO), among others.

Abstract

Deviant behaviours among secondary school students has remained a global concern. It is on the increase and is affecting the educational sector across the nation as it is capable of disrupting teaching and learning process in schools. This study investigated the teachers and students' perceptions of the influence of deviant behaviours on academic performance of senior secondary school students in main land educational district IV of Lagos State. The population was 3,101 participants made up of 290 teachers and 2811 students. Descriptive research design was adopted for the study and simple random sampling was employed to selected 300 participants. The instrument used for the study was "Influence of Deviant Behaviours on Academic Performance of Students (IDBAPS)". The instrument has a test-retest reliability coefficient of 0.91. Collected data were analyzed using mean and standard deviations and t-test to test the null hypotheses at 0. 05 level of significance. The result of the findings revealed that deviant behaviours influence students' academic performance. There was no significant difference in the perception of male and female teachers on the influence of deviant behaviours on the academic performance of students but there was no significant difference in junior and senior teachers' perception of the influence of deviant behaviours on students, academic performance. There was significant difference in male and female students' perceptions of the influence of deviant behaviours on academic performance. Based on the findings, it was recommended that schools should have functional professional counsellors to minimize deviant behaviours.

Keywords: Perceptions, Teachers, Deviant Behaviour, Academic Performance.

Introduction

Deviant behaviours are on the increase globally (Hanimoglu, 2018) and if not arrested, will lead to more serious problems. Deviant behaviour is any behaviour that is contrary to the dominant norms of the society. This departure from social norms is especially more amongst peer groups both at home and in schools. It simply means to deviate from the laid down rules, regulations, norms and value in schools, home community and society at large. Ali, Dada, Isiaka and Salmon (2014) discovered that deviant behaviours were high among secondary school students in Lagos, State.

NWADINOBI "Teachers' and Students' Perception on Influence of Deviant Behaviours On Academic Performance of Secondary School Students in Lagos State" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

There is however no universal definition of deviant behaviour as several authors view it differently. Ayomide & Omotosho (2017) sees deviant behaviour as an act of indiscipline or behaviour disorder which served as a major or great source of some social vices in Nigeria society which are of great concern to the parents, government and teachers. Deviant behaviour is a behaviour that violates laid down rules and regulations of any given organizations or group (Adeusi, Gesinde & Adekeye, 2015; Diche, 2016; Idris, 2016; Bolu-Steve, 2017). Deviant behaviours occur in schools as a result of poor environment, bad peer group, poor school materials such as textbooks and seats, children from broken homes and poor family background, school phobia and parenting styles (Chikwature, Oyedele & Ganayi; 2016). Thibaut (2017), opines that neglectful parenting style which is characterised by lack of care and warmth triggers deviancy among students who use it as protective reactions. According to Asiyai (2019), deviant behaviours in urban secondary schools include assault, not being punctual to school, cheating in examinations, noise making, fighting, indecent appearances, aggressive acts, sexual perversion and truancy. Cheating in examinations and noise making occur most in rural secondary schools.

Deviant behaviours have a long – term effects on the individuals themselves, the family and society in general (Adeusi, Gesinde, Alao, Adejumo & Adekeye, 2015). Asiyai (2019) revealed that deviant behaviour disrupts learning thereby leading to poor academic performance, lateness to school, noise making among deviants can lead to punishments like flogging or missing first lessons. Name-calling used for deviants may make them create phobia for school, low self-esteem and dropping out of school. Bhagavi and Cairio 2017) reported also that deviant behaviours hinder students from learning, thereby leading poor academic performance and abscondment from school. Afe (2017) state that deviant behaviour results from indiscipline which works against effective teaching and learning as well as production of quality school graduates. Afe further stated that there are some other factors which are responsible for them as well such as excessive videogames (Onyemaka, Igbokwe, Adekeye & Agbu, 2017).

Adolescence period is a very turbulent period in child development and most secondary school students are adolescent. According to Nkhata & Mwale (2016), Secondary school students are within a period of growth known as adolescence, a period which falls in between childhood and adulthood. During the period of adolescent, they exhibit unstable emotions like mood swings, challenge authorities, break rules, exhibit anti- social behaviours more than either children or adults (Damron – Bell, 2001). Adolescents participate in problematic behaviours in schools such as fighting, bullying, stealing, truancy, being unruly to authority and many more of such deviant behaviours usually affect their families, academics, social and personal functions. The 21st century schools are characterized by moral value decadence where the students lack love and care in alarming proportion.

Mayo & Siahi (2015) posited that in education academic performance can be measured through students' academic achievement. Academic achievement is the manifestation of skills or knowledge gained in the school subjects (Busari, 2000). Deviant behavoiurs are often exhibited by secondary school students because majority of them are adolescents who want to risk behaviours like sexual activities, smoking, stealing, bullying, examination malpractices, abortion, rape, cultism, loitering, lateness and rudeness (Maiyo & Siali (2015). Unless deviant behaviours in public secondary schools are arrested and managed, it is likely to spill over into the community and society with severe consequences for future national development. Education is the bedrock of every nation and so parents, educational stakeholders are aware that students need sound education to survive in the era where there is unemployment, inflation, scarcity of food. If students engage in deviant behaviours which can affect their academic performance and better future, the essence of their being in school will be therefore defeated. Academic performance according to Bashir & Matto (2012) is the measure of how much knowledge the individual has acquired from school or institution. Also, that academic performance is an important issue in the society as highest levels of abilities attract more economical and social rewards. Furthermore, they reported that students who achieve high academic performance attend all classes, turn in assignments on time, take notes in class, pay attention in class, do not cheat in class while low performing students miss classes, come late to school, submit assignments late, do not take notes in class, have poor time managements. From this report, it follows that students who refuse to carry out the accepted steps to learning, perform poorly in their examination. These are said to exhibit deviant behaviour. At school, adolescents get affected in one way or the other as they socialized either positively or negatively by their fellow students and teachers (Nkhata & Mwale,2016). They further stated that cases of deviant behaviour among adolescents are rampart.

Several studies have been done all over the world with findings showing the prevalence of various forms of deviant behaviour. There is high prevalence of truancy, bullying, fighting, lateness, lying in secondary schools and society (Adekeye, Alao, Chenube et al., 2016; Okorie, 2012). Afe (2017) observed that substance abuse is on the increase among Nigeria youths and this poses a threat to the objective of education in Nigerian schools. He also discovered in his studies that indiscipline work against effective teaching / learning and production of quality graduates. Morris (2016) reported that good order is essential in a school if children are to be able to fulfill their learning potentials. Poor and disruptive behaviour in the classroom reduce children's abilities to concentrate and absorb information. These children and cause immense stress for teachers. However not much have been done on the influence of many collective variables on deviant behaviours on academic performance among secondary school students. Therefore,

this study sets to investigate teachers and students' perceptions on the influence of deviant behaviours on academic performance of secondary school students in main land Educational District (IV) of Lagos State.

Statement of the Problem

Controlling students behaviours in schools especially in Lagos state is one of the biggest challenges being faced by school authorities. Deviant behaviours constitute serious menace to students' academic performance The menace of deviant behaviours has a negative effect on the fulfillment of the adolescent as they grow into adulthood. It also exposes them to even more bigger crimes which may destroy them completely in future. Nkhata & Mwale (2016) shows that cases of deviant behaviour among adolescents are still rampant. Students violate different schools rules and regulations as a result of deviant behaviour which may include among others, coming late to school, truancy, jumping walls to leave school compound, drug abuse, coming to school with dangerous weapons to fight, assault and insult of teachers, disobedience, smoking, vandalizing of school properties, not participating in compulsory school programmes, sexual deviant acts such as those that takes place in classroom toilets, libraries and hidden areas of the school compound, examination malpractices of different kinds and bringing objects not allowed in school like wrist watches, pens, belts, shoe bags, artificial nails and hair attachments among others. If these behaviours are not checked, they will disrupt teaching and learning processes. The innocent and good student may be corrupted. The school may turn into breeding grounds for hooligans and criminals instead of turning out creative well-educated graduates that will accelerate nations economic development. Researchers have reported deviant behaviour as an act of indiscipline and a social problem which is wide spread among secondary school students. Afe (2017) asserted that deviant behaviours result in indiscipline which work against effective teaching and learning as well as in turning out quality school graduates. Therefore, if these deviant behaviours are not given adequate attention by the stakeholders, the educational system of the nation will be heading to chaos. Again, if it is not curbed, it will increase delinquency / indiscipline which invariably affect the students' academic performance. Thus, this study examines teachers and students' perception of influence of deviant behaviour on academic performance of secondary school students in Lagos State, Nigeria and suggest ways of tackling the problem.

Objectives of the Study

The objectives of this study are to investigate teachers' and students' perception of influence of deviant behaviours on academic performance of secondary school students and to also proffer solutions on how to curb the incidence of deviant behaviours in school adolescents.

Research Questions

1. What are teachers' and students' perception of the influence of deviant behaviours on academic performance of secondary school students?
2. What are the differences in male and female teachers/ students' perceptions of the influence of deviant behaviour on academic performance of secondary school students?
3. To what extent do teachers teaching experience affect their perceptions of the influence of deviant behaviours on academic performance of secondary school students?

Hypotheses

To guide this study, three hypotheses were stated and tested at 0.05 level of significance.

H_1: There is no significant difference between junior and senior teachers' perceptions of the influence of deviant behaviours on academic performance of secondary school students.

H_2: There is no significant difference between male and female teachers' perceptions of influence deviant behaviours on academic performance of secondary school students.

H_3: There is no significant difference between male and female students' perceptions of the influence of deviant behaviours on academic performance of secondary school students.

Significance of the Study

This study will reveal the influence of different aspects of deviant behaviour on students' academic performance. The results of the findings and recommendation will help in minimizing deviance in schools and promote academic performance. School management will take both preventive and treatment measures to stop deviance in schools. Parents of deviant students who have discovered some of the reasons of their children's poor academic performance

would increase the supervision of their children's behaviours, conduct at school and academic activities as well as correct and encourage them whenever the need arises. The ministries and boards in charge of education would use the information to improve discipline and methods to achieve optimal academic performance among students. This study also provides a suitable platform for other researchers to work on.

Methodology

Research Design

The descriptive survey design was used for this study

Population of the Study

The population for this study was all male and female teachers in ten public secondary schools and all senior secondary school (SS II) students in mainland Educational District (IV) of Lagos state. The population comprises of 290 teachers (135 male & 155 females) and 2811 students (1495 males & 1316 females).

Sample and Sampling Techniques

The sample for this study comprised of 300 participants made of 50 (males and female) teachers and 250 (male and female) students. This selection was based on simple random technique 10 teachers and 50 students were selected from the sampled schools. 20 (40%) teachers who have less than 5 years teaching experience are termed junior teachers while 30 (60%) teachers who have taught for more than 5 years are termed senior teachers and the students aged between 13 and 18 years. The mean age was 15 years.

Research Instrument

The instrument for data collection was a researcher designed questionnaire titled. Influence of Deviant Behaviour on Secondary School Students' Academic Performance (IDBSAP). The instrument was divided into two sections the first section requires respondents to supply demographic information such as teacher's sex, years of experience and age of students. The second section deals with 20 items that elicit information on influence of different deviant behaviours as perceived by teacher and students. The respondents indicated their response using four-point Likert – types rating scales of strongly Agreed (SA) Agree (A), Strongly Disagree (SD) and Disagree (D)

Validity of Instrument

Influence of Deviant Behaviours on Secondary School Students' Academic Performance Questionnaire was subjected to face and content validity by experts in department of psychology, covenant university, Ota – Ogun State.

Reliability of the Instrument

The reliability of the instrument was determined using Cronbach Alpha value to ensure that the constructs are constituent across items. It yielded a value of 0.91 which was considered high.

Data Collection Procedure

The researcher got access to the schools with permission of the school administrators. Questionnaire were administered collectively in classrooms in the exclusive presence of the researcher and researcher assistants. All participants took part on a voluntary basis. They were informed that the questionnaire was anonymous and is strictly confidential.

Data Analysis

The data was collected, coded and analyzed using the statistical package for the school sciences (SPSS) version 20. Descriptive statistics were used to analyze the distribution responses of each item while independent t-test was used to test null hypotheses at 0.05 significant level.

Results

Data analysis

Table 1: Mean Ratings of Teachers and Students Perceptions of the Influence of Deviant Behaviours on Students Academic Performance

Items	N	SA	A	D	SD	Mean	Standard Deviation	Remark	Rank
Perpetrator of bullying may not perform well in schools	300	57	196	38	9	3.00	0.0662	Agreed	15
Victims of bullying may not do well in tests/ examinations	300	78	156	50	16	2.99	0.807	Agreed	17
Use of substance abuse can cause the Vitim to perform poor in tests / examination	300	119	171	9	1	3.36	0.575	Agreed	8
Students who do not do homework / assignment may fail their exanimation	300	145	97	47	11	3.25	0.862	Agreed	10
Skipping classes can result to poor performance or failure.	300	167	130	3	-	3.55	0.518	Agreed	12
Students are unable to honour their study time table perform below in their examination	300	48	186	22	44	2.78	0.909	Agreed	10
Students who do not revise materials taught frequently may not recall thereby performing below expectation in their examination	300	117	153	29	1	3.28	0.662	Agreed	8
Frequent lateness may lead to poor academic achievement	300	77	195	26	2	3.16	0.589	Agreed	13
Constant noisemaking by students may lead to poor performance.	300	67	156	59	18	2.90	0818	Agreed	18
Truancy may not lead to academic excellence.	300	172	78	28	12	3.39	0.792	Agreed	5
Cultism may lead to failure in studies	300	170	93	23	14	3.40	0.822	Agreed	4
Rudeness can affect academic performance	300	81	161	40	18	31.01	0.834	Agreed	14
Alcoholism may cause the victim to perform poorly in tests/ examination	300	153	126	4	17	3.38	0.778	Agreed	6
Theft may disrupt effective learning process	300	113	143	28	16	3.18	0.089	Agreed	12
Sexual perversions may lead to poor academic achievement	300	142	145	2	11	3.38	0.729	Agreed	7
Teenage pregnancies may lead to poor academic achievement	300	228	67	1	4	3.72	0.573	Agreed	1
Violence may cause the victim to perform poor in test/ examination	300	97	171	10	22	3.14	0.795	Agreed	14
Fights may lead to examination failure	300	47	162	56	35	2.74	0.862	Agreed	20
Abortion can lead to examination	300	143	105	35	17	3.25	0.873	Agreed	11
Examination malpractices can lead to poor academic achievement	300	176	107	4	13	3.49	0.734	Agreed	3
GRAND MEAN						**3.2175**			

Result in Table 1 showed that all respondents have mean score value between 2.74 and 3/72 for all the items. There mean score values are greater than 2.5 which is the criterion mean score value of the studies. This shows that all the respondents agreed that deviant behaviours influence students' academic performance.

Hypotheses Testing

H_o1: There will be no significant difference between junior and senior secondary teachers' perceptions of the influence of deviant behaviour on academic performance of secondary school students

Table 2: Independent t– test of the mean response of junior and senior teachers' perceptions of the influence of deviant behaviours on students' academic performance.

	Teacher's experience						95% C: for Mean Difference		
	Junior			Senior					
Variable	M	SD	n	M	SD	n	t	df	sig(2tailed)
	52.5	5.66	18	60.93	6.66	30	-4.482	48	.000

P<05.

Table 2 shows the result of an independent t-test conducted to compare the junior and senior teachers' perceptions of the influence of deviant behaviours on students' academic performance. There was significant difference in score for junior teachers (M-52.5, SD = 5.66) and senior teachers (M=60.93, D = 6.66); t)46) = 4.482, P = 0.000, two tailed).

Ho2: There will be no significant difference between male and female teachers' perceptions of the influence of deviant behaviour academic performance of secondary school students

Table 3: Independent t-test and descriptive statistics of the means score of male and female teachers' perception of the influence of deviant behaviours on academic performance of students.

	Teacher's experience						95% C: for Mean Difference		
	Male			Female					
Variable	M	SD	n	M	SD	n	t	df	sig(2tailed)
	57.71	8.28	31	58.32	5.81	19	.279	48	.78

P<05.

Table 3 shows the result of an independent t-test conducted to compare the male and female teachers' perceptions of the influence of deviant behaviours on students' academic performance of students. There was no significant difference in score for male teachers (M-57.71, SD = 8.28) and female teachers (M=58.32, 5.81); t (48) = .279, P = .78

Ho3: There will be no significant difference between male and female students' perceptions of the influence of deviant behaviours academic performance of secondary school students

Table 4: Independent t-test and descriptive statistics of the means score of male and female students' perception of the influence of deviant behaviours on academic performance of students.

	Students' Gender						95% C: for Mean Difference		
	Male			Female					
Variable	M	SD	n	M	SD	n	t	df	sig(2tailed)
	60.80	6.19	117	65.90	5.15	133	5.97	248	0.000

P<05.

An independent sample t-test was conducted to compare the male and female students' perceptions of the influence of deviant behaviours. There was a significant difference in the scores for male (M-60.8, SD = 8.19) and female (M=65.9, SD, = 5,15) participants; t (5.97) = 248, P = 0.00.

Discussion of Findings

The mean score values of all the respondents in this study are between 2.74 and 3.72 for all the items. This shows that all respondents agreed that deviant behaviours influence students' academic performance. Table 1: Show the highest respondents mean score of 3.72 that is linked with teenage pregnancy as a predictor of academic performance.

The mean score value of 3.48 which was the third highest agreed that examination malpractices could lead to poor academic achievement. This has the support of Ukpepi & Enukoha (2012) who reported that there is a significant relationship between pupils' perceptions of examination malpractice and academic performance in primary schools.

Table 2 shows that there was significant difference in scores for junior and senior teachers' perceptions of the influence of deviant behaviours in students' academic performance. The P – value of 0.000 which is less than 0.05 (95% confidence intervals) depicted this. Senior teachers have a higher mean score value of 60.93 compared to junior teachers with the mean score value of 52.5. The longer years of encounter and experience with students could have led the senior teachers to assess the influence of deviant behaviours on students' academic behaviours differently from junior teachers. In table 3: The p-value of 0.78 is greater than 0.05 (95% confidence interval). This implies that there is no statistically significant difference in the perceptions of male and female teachers on the influence of deviant behaviours on students' academic performance.

Table 4 shows that gender has no significant impact on the perceptions of the influence of deviant behaviours on the academic performance of students. This is evidence in the p-value of 0.000 which is less than 0.05 (95%) confidence intervals implying the rejection of the hypothesis that states that there is no significant difference in the perceptions of male and female students' on the influence of deviant behaviours an academic performance of students. The mean value of 65.90 of female students is however more than 60.80 of male counterpart.

This may be because females are more sensitive to deviant behaviours than males. The students' perceptions on the influence of deviant behaviour on academic performance is high and it was observed that deviant behaviour may lead to school dropout. This collaborates with the result of the study of Fayomobo & Aremu (2000) which show that drug abuse leads to reduce academic achievement or even halts one's entire academic process. Chikwature, Oyede & Ganyani (2016) in their study opined that deviance behaviour causes poor concentration during teaching. The result is in line with that of Smink & Reimer (2005) who found out that absenteeism within public school has reached a crisis point and it has been linked to school dropout.

Conclusion

Based on the findings, the presence of deviant behaviours in schools affect students' academic performance. Teachers with longer years of teaching experience and female teachers seem to perceive the influence of deviant behaviours on academic performance more than teachers with fewer years of teaching experience. Students' perception of the influence of deviant behaviour on students' academic performance are not gender based. It is evidence that deviant behaviour has a long-term effect on the individuals themselves, the family and society in general. Deviant behaviours in schools can therefore make the students not to acquire personal skills for self-development and fulfillment as well as for the development in the society since it affects their academic performance and can also lead to school drop outs.

Implications for Counselling

Effective counselling services should be established in schools. Counsellors and educational psychologists should provide right information to school adolescents on how to form good study habits and desist from negative effects of deviant behaviours. The accuracy of the information given, will help them to make right decisions and through counselling, discipline can be installed in secondary schools. Adolescents should be counselled on the values associated with behaviours that conform to the law so that they can adhere to such values. Hence counsellors can assist in curbing deviant behaviour problems in schools through counselling and other psychological approaches.

Recommendations

Based on the findings of the study, the following recommendations were made:

1. Parents should provide parental care to their children as well and monitor them in order to dictate the early incidents of deviant behaviour in them and take necessary actions in conjunction with the school administrators to address it.
2. School administrators should state clearly the rules and regulations of the school to the students as soon as they enter the school during orientation programme and punish any deviant behaviour act.
3. There is greater need for school authorities and administrators to increase the relationship between parents, teachers and other organizations. Interest in the welfare of students and regular meeting should be held to ensure that specific plans of actions concerning disciplinary matters and its management on deviant behaviour are formulated and implemented by the parents, counsellors, school administrators.

Abstract

Urban green is fast diminishing in the dense cities resulting in a multitude of socio cultural and environmental problems. Urban ecology is the direct victim to the diminishing greens contributing to some extent towards global warming. Green roof concept as it has the potentialities to reduce the adverse ecological effect of the buildings by providing bio-physical diversity benefits, food, temperature and rainfall runoff regulation, wildlife habitat, as well as aesthetic and recreational opportunities. The aim of this paper is to analyze the benefits of implementing green roofs for the building, for the city and also for the society. In the same time the main errors encounter in the designing and construction stage of the green roofs are presented.

Keywords*:* Green Roof, Sustainable Development, Urban Development.

Introduction

Nowadays, more than ever peoples are aware of the importance of protecting the nature and the living environment, and thus this are topics of interest for many countries. Cities expand their peripheries to accommodate more and more peoples attracted by the higher urban living standards than rural living standards. In a recent report of the United Nations, urbanization is forecasted to attain 83% by 2030 in developed countries (UN, 2019). A series of environmental issues arise from this, on a global scale, the most common one is the increased greenhouse gas emissions.

This worldwide urbanization led to an increase demand for new buildings, water, land, and energy. According to United Nations Environmental Program, the construction and maintenance of buildings account for about 40% of the global primary energy requirement and buildings account for 33% of the global greenhouse gas emissions (De Fino *et al.*, 2017). Therefore, the building sector is of particular interest in the reduction of energy use, in order to limit global warming and mitigate the impacts of climate change (Cascone and Sciuto, 2018).

In this context it arise the need to design sustainable buildings and urban spaces by considering the effect of building envelope technologies. Implementing various sustainable approaches (Maier, 2018c) and designing more environmentally friendly components for buildings leads to the realization of low-energy buildings. In addition, roofs are important components of buildings (Maier and Marusciac, 2011), accounting for nearly 20–25% of the overall urban surface area. Therefore, efficiently designed and integrated green roofs have great potential to affect the building and urban environments, replacing the lost green spaces and habitats in modern cities. Specifically, green roofs are engineered roofing systems, planted with different kind of plants on the top of a growth medium (Cascone, 2019).

A roof garden is actually very different from a green roof, although the two terms are often and incorrectly used interchangeably. A roof garden is an area that is generally used for recreation, entertaining, and as an additional outdoor living space for the building's resident(s). It may include planters, plants, dining and lounging furniture, outdoor structures such as pergolas and sheds, and automated irrigation and lighting systems. A green roof is usually constructed to cover a large area in the most economical and efficient means possible with an emphasis on improving the insulation and /or improve the overall energy efficiency within a building. Green roof concept can be most effective in urban areas where the lack of green-open spaces is a common phenomenon. The purpose of this paper is to identify the main benefits of the green roofs and to highlight the challenges of executing this structures.

Cite this Article as: Andreea MAIER and Ioan ASCHILEAN "Green Roofs - A Solution for the Sustainable Development of Urban Space" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

Benefits of Green Roofs

The results of increasing the innovation interest in the construction sector (Maier, 2019) can be seen also in the new ways to respond to the environmental issues. As a response to this issues engineers and architects began to look at ways to bring more nature in the urban environment. In the same time the each organization need to came up with solutions to sustainable development (Maier, 2018a) of the society (López-González *et al.*, 2020). In this context green roofs gain great attention because of their ecological advantages comparing to other build elements. The main obvious advantages of green roofs refer to improvement of energy performance, the urban microclimate conditions and the eater retention.

The advantages of green roofs are better felt in summer time conditions. Green roofs are in a continuous development, creating new innovative products or process (Maier, 2018b). The first advantage observed, in summer time conditions, is related to the increased thermal resistance and dissipation of the solar radiations. This is felt both at the building level and also at the outside temperature. The advantages of the green roofs can be observed also in the winter time when green roofs can store heat from solar radiations and reduces the heat loses through the roof part of the building (Cheng *et al.*, 2020). At freezing ambient air conditions, the process of water freezing further improves the energy efficiency of green roofs (Arkar *et al.*, 2019). Considering the multiple benefits of the green roofs we decide to analyse the benefits from three main category of beneficiaries (figure 1.)

Figure 1: The main benefits of green roofs from building, city and social point of view (author proposal)

When speaking of **Benefits for the Building** one of the benefit is related to the *prolonging the service life of roofing material*. Green roofs protect roofing membranes from extreme temperature fluctuations, the negative impact of ultraviolet radiation and other physical damages. It is estimated that Green roof extends the life of the existing roof fabric by up to 70%. Protection of roof membrane resulting in a longer material lifespan, decreased maintenance and savings in replacement cost (Cascone and Sciuto, 2018).

Another benefit from the category of benefits to the building is that a green roof can *control irrigation and storm water runoff*. The plants capture and hold rainwater. Water is stored in the growing media released to the atmosphere through evaporation and evapotranspiration. Green roofs, in summer, depending on the plants and depth of the growing medium, retain about 70-90% of the precipitation that falls on them, and in winter retain between 25-40% (De Fino *et al.*, 2017). The next benefit felt at the building level is the *energy conservation*. In summer, green roof planting shades the building from solar radiation and through the process of evapotranspiration cools the air reducing the temperature. Reduced energy consumption can cut cooling cost up to 50% and heating by 25% (De Fino *et al.*, 2017).

Improving the Aesthetic Environment is other benefit from the building benefits category. Green roofs contribute significantly towards the aesthetic appeal of urban roof-scape. Green roofs can integrate a building with its natural surroundings, besides offering opportunities for growing a wide range of aesthetically pleasing and vigorous, native

plant species on a large and small scale buildings and structures. The last benefit from this category is r*educing sound reflection and transmission*. Green roofs can be designed to insulate for sound. The growing medium tends to block lower sound frequencies and the plants block higher frequencies. Tests show that green roof with 12 cm substrate layer can reduce 40 decibels and that of 20 cm can reduce sound by 46-50 decibels.

In the category of **benefits for the city** we can identify the effect of green roof over the *improvement of the water quality*. Green roofs help reduce storm water runoff and also moderate the temperature of the water besides acting as natural filters (absorbs metals and pollutants) for runoff water. Other benefit can be felt also on the i*mprovement of the air quality*. Green roofs filter fine, airborne particulates as the air passes over the plants. They trap up to 85% particulates on the surface areas of the greenery. Plants also absorb gaseous pollutants through photosynthesis (De Fino *et al.*, 2017). *Creating Wildlife Habitat* is another benefit from the benefits for the city category. Green roofs are valuable in conserving and restoring endangered habitats and vegetation types. A greater diversity of plant species tends to support a greater diversity of animal species (Cascone and Sciuto, 2018). Green roofs can also h*elp to mitigate urban heat island effect.* Cities of concrete and tarmac retain heat and create 'urban heat islands', as much as 5^0C warmer than surrounding suburbs. Plants through transpiration directly cool the air and can reduce surface roof temperatures by as much as 40^0C. In the end the city can benefit from the green roofs because it *reduces the greenhouse gas emissions*. Buildings are responsible for almost half (48%) of all energy consumption and greenhouse gas emissions and consume 76% of all power plant-generated electricity.

Green roofs can bring **social benefits** also. In this category we can identify *aesthetics,* planting gardens, both at ground level and in the sky, alters both the sensible and psychological climate for the better. *Health and horticulture therapy, t*he variety of sounds, smells, colors and movement provided by plants, can add significantly to human health and wellbeing (Fotopoulou *et al.*, 2018). Other benefit can refer to *improved safety*, a garden on the roof is often considered safer than a garden at grade, because access to the roof is often restricted to building tenants, there is less likelihood of assault or vandalism. *Recreation* is another benefit for the society. Green roof compensates the lack of green open space in many urban areas. Studies show that leisure activities in natural settings such as gardens and parks help people to cope with stress and in meeting other non-stress-related needs. Finally the last benefits from this category is referring to *fire resistance*. Green roof can help slow the spread of a fire to and from the building through the roof, particularly when the growing medium is saturated (Cascone, 2019).

Challenges of green roofs constructions

Considering the multiple benefits of the green roof, it can be stated that the initial investment can be amortized over time, but in order to benefit from these benefits it is important that the roofs are built correctly and efficiently. When green roofs are not proper build not only that they will not offer benefits or the building owners but the cost of repairing them can have a serious impact on the budget (Zhang, He and Dewancker, 2020). There are situations when green roofs occasionally fail to behave like they were design and thus a series of issues arise for the roofs and also for the building. The most common failure include leaks in the roof structure, dying of plants, soil erosion or slope instability (Opatowski, 2018).

In this section of the paper we perform an analysis of the most common green roof failures and how to prevent them. In the analysis process we focus on highlighting the best practices and lessons that can be learned from each potential failure of the green roof system. In this way solution can be offered to the owners, the designers or maintenance staff, solutions that can help to anticipate and overcome any challenges regarding the green roofs.

Choosing the right roofing system is one of the most important aspect to consider regardless of the green roof type. A less maintenance roof with an extensive system having shallower layer or a higher maintenance roof, an intensive system, with deeper soil must be chosen also according to the roofing system (Kumar and Kaushik, 2005). Among the main failure problems identify in the literature we can find:

Damaging the plant life. This is the most visible failure of the green roofs, thus the green part of the roof is transforming in a brown color and the advantages of plants on the roof are lost. The common solution to this problem is to correctly balance the growing medium, the soil layer, with the plants regime of maintenance and water (Teotónio *et al.*, 2020). This means that it is important to respect the correct soil depth, the porosity, the irrigation and the drainage recommendations. In most of the cases green roofs are installed on terrace roofs, with little or no slope. In cases where the green roof is installed on sloping roofs erosion problems can appear. In this case it is important to minimize soil slippage and anchor trees.

Problems on the drainage system. Even if most green roofs seems to be flat roofs, the reality is that in many cases this is not true, the roofs are having a lot of highs and lows. The existence of plants is strictly related to the presence of water and, especially in summer conditions, there is the need for irrigations. In this sense a good drainage system is essential. The water drainage issues must be resolved before installing planting medium and the plants themselves

(Nardini, Andri and Crasso, 2012). There is a common belief that the presence of the soil and plants will absorb all the water and no drainage is needed. This is obvious a big mistake and failure in ensuring the proper drainage system will cause a lot of structural problems for the building. In the same time too much water is bad or the plants. According to (Opatowski, 2018) the best way to prevent ponding is to create a 1:60 slope on flat roofs.

Problems of erosion and uplifting. These are particularly problematic at corners and edges of the roof especially on higher ones. A solution is to include a band of pebbles or paving at the edge and retain trims at the eaves(Green roofing failures: Root causes, 2008). Making sure that vegetation is sectioned and contained by edges of pebbles or gravel paving will allow good drainage of water without taking soil and plants with it. Often these "pathways" double as access for the maintenance staff, so they may already be included in the design (Opatowski, 2018).

Problems of uneven distribution in dead load on the roofing structure. From structural point of view choosing a green roof system will increase the dead load acting on the roof structure. In calculus the dead load is considered to be a uniformly distributed load on the entire structure, thus each of the roof structural element is carrying out a specific equal load. The reality is that depending on the contractor skills and equipment an uneven distribution of the green roof layers can occur. This variations along with live loads acting on the roof can cause local structural failure. Thus it is important that for each job site a proper load distribution should be ensured, from the designing phase and this must be checked in the execution phase. The roof structure must be design so as to resist additional forces on a roof and the possibility of rain-saturated soils. In the execution phase and in the exportation phase must be adapted solutions not to allow concentrated loads are not created by piling up soil or materials.

Problems with the plant and soil selection. The survival of the green roof is determined by correct plant and soil selection. Sedums (similar to succulents) are often selected because they can survive in a variety of climates and require a growing medium that is dry and has low amounts of organic matter (VanWoert *et al.*, 2005). But depending on the needs of your specific project, you may require shrubs or flowers to make the roof more ornamental. If this is the case, make sure you work closely with your contractor to make sure they are knowledgeable of what does best in your local climate. That means using native plants and native soil (although soil left over from the construction site may not necessarily be the best choice). If the architect or contractors are not familiar with soil and plant selection for the local region, hire a horticulturist (Opatowski, 2018). In designing phase of green roofs, the choosing of the plants should be done by a good collaboration between the designer and provider of the roof system.

Problems from improper plant handling. The effect of improper plant handling techniques can causes a series of problems for the green roofs. The green roof contractor should have a working knowledge of plant handling and establishment techniques. A green roof is a living building component, and the plants must be stored and handled with care to ensure their viability. Landscaping is a key trade for the successful installation of a green roof, and landscape contractors have the knowledge and experience with plant material to ensure that the green roof is properly installed and to ensure that precautionary measures are in place to respond to variable climactic conditions. Recognizing the need for this expertise, many roofing contractors who are serious about integrating green roofs into their business models have developed green roof divisions that focus on plant handling, installation, and maintenance (Challenges to Green Roof Construction, 2006).

Problems with moisture penetration. Water has a phenomenal capacity to track through construction. Establishing the point of water entry from manifestation inside the building can be challenging. Before remote testing – such as thermal imaging, electronic leak detection or radio frequency testing – can be attempted, the plants and growing medium may have to be removed. The simplest solution may be to re-roof from scratch. According to (Green roofing failures: Root causes, 2008) waterproofing failures may be caused by:

- Plant root disruption. The effect of rhizomes such as couch grass or Japanese Knotweed may need to be tested separately. Ensure the waterproofing layer is resistant to root growth or incorporate a root resistant membrane
- Poor detailing at junctions, penetrations and edges. If at all possible, avoid penetrations or concentrate them in one area. Keep the roof design simple and minimize junction variations. All junctions should be planned in three dimensions to give installers a clear guide for what is expected. At upstands the waterproofing layer should finish at least 150 mm above the finished roof surface. Allow for drainage at the base of facades.
- Failure of waterproofing upstand. To maintain longevity of the waterproofing membrane, incorporate protection from direct sun exposure.
- Inadequate slope. Flat roofs will result in ponding unless there is at least a 1:60 slope.

Over-watering and over-fertilizing. Over-watering and over-fertilizing typically occur when the cause of plant loss is not apparent. The symptoms of over-watering are very similar to the symptoms of under-watering, and the same is true for over fertilization, therefore, they are easy to misdiagnose. Over-watering can be corrected by cutting off supplemental water. Over-fertilizing can be ameliorated in some cases by adding other amendments to balance nutrient ratios available to plants. It does take time for nutrient levels to stabilize, and additional maintenance may be

required during this time. Laboratory testing of growth medium samples should be conducted before beginning a nutrient amendment course (Challenges to Green Roof Construction, 2006).

Green roofs are also accused of such disadvantages as leakage, condensation of water in the thermal insulation layer, or moulding of their bottom surface. These are not disadvantages, but rather the results of errors made during the design or construction of the cover. The specificity of green roofs, the fact that they constitute a type of water storage, causes that even the slightest deviations result in big losses. Thoughtful design and professional and careful construction ensure the reliable use of such roofs.

Conclusions

In today's society the role of nature is extremely important. Especially in urban areas, innovative technologies that can help to bring more natural elements are becoming more and more successful. One of the most popular solution is choosing green roofs for buildings. Green roofs are also used as a response to the increase requirements of sustainability and biodiversity as well as decreasing the energy consumption, green gas generation and urban heat island in the cities.

Initially they only constituted protection against unfavorable weather conditions, but over time humans began to notice more and more value and possibilities of using this kind of roof cover. Their properties are studied by many researchers. Numerous studies and experiments allow us to confirm the advantages of green roofs. Not only do they protect from heat or cold, but they also have a major impact on improving the living conditions and functioning of the human body, which is not unimportant to one's health. They allow for leisure, recreation and contact with nature even in tightly-built cities. They protect against their bustle and reduce pollution. Green roofs create a good microclimate and, in addition, neutralize the effect of urban heat islands. Green roofs are not only very useful for the environment, they also have many aesthetic qualities. They improve the appearance of cities, give a chance to beautify the ugly, unused roofs of many buildings.

Importance of Stakeholder Management for Sustainable Construction Industry

Andreea MAIER
Technical University of Cluj - Napoca, Romania, andreeaelenamaier@gmail.com

Ioan ASCHILEAN
Technical University of Cluj - Napoca, Romania, aschileanioan@gmail.com

Abstract

Increasing client expectations, high demands related to construction time and cost, and the growing complexity of construction methods have made the building industry dynamic and multifaceted. The internal and external participants on the construction project are recognized as stakeholders, they are actively involved in the project, and the execution of the project can affect positively or negatively their interests. The aim of this paper is to analyze the process used to identify construction stakeholders, the factors used to manage their needs, their expectations and the implications of mismanaging them in the development of sustainable construction projects. To improve the process of stakeholder management in the constructions projects we proposed a set of eleven steps. By adopting the principles of stakeholder management organizations will satisfy better their constituent needs and balance their interests, which in the end will increase the sustainability of the construction industry overall.

Keywords*:* stakeholder, stakeholder management, construction sector, construction industry, construction projects, management in construction

Introduction

The construction industry is one of the industries that are considered as non-sustainable, mainly due to its high energy consumption and greenhouse gas emissions. In the current social and economic context, where people are becoming increasingly aware of the importance of protecting the environment, the researchers are focusing also on finding ways to improve the sustainability of the construction industry(Maier, 2018b). In the scientific literature we can find approaches regarding promoting green technologies or green innovation of the construction methods reduction of greenhouse gases, reuse of materials and so on. However the subjects needed to be address and resolved are far away from covering the entire spectrum of the construction industry. In this paper we want to approach the subject of stakeholders and their influence on the sustainability of the construction projects.

The construction industry is diverse because construction professionals come together from different backgrounds, with varied training and experience to deliver common project goals. Construction companies must develop plans to survive in the competitive environment filled with client demands, and be competent in identifying those client requirements for contractors that aim for higher quality services (Maier, 2019). Construction projects are complex projects and they involve many stakeholders from different areas of expertise. In addition, the construction industry has many branches, and as such, it encompasses a lot of information about any one construction project. This is information that is very important to a project, and can be the basic foundation for decision-making, procurement and collaboration(Tahir *et al.*, 2018).

A series of researchers, as (Newcombe 2003) have studied the stakeholders importance in the construction projects (Olander, 2007). However, the construction industry has a poor record of stakeholder management during the past decades owing to the complexity and uncertainty of projects (Takim, 2009). If we look at the current project managers we can see that they need to take into consideration also the cultural, organizational and social environments surrounding the project. Understanding such project environment includes identification of project stakeholders and their ability to affect successful outcome of the project

The effective management of project stakeholders is considered as an important key to project success (Jergeas et al., 2000). If stakeholders are not managed effectively, the probability of successful project completion is reduced due to conflicts between stakeholders. Ineffective stakeholder management can also result in dissatisfaction with project outcomes and adverse disruption to budget and schedule. Besides, future works between project team and internal

stakeholders may become more difficult and the community, as external stakeholders, may have negative reaction to the project (Chinyio and Olomolaiye, 2010).

The aim of this paper is to analyze the process used to identify construction stakeholders, the factors used to manage their needs and expectations, and the implications of mismanaging their needs and expectations in the development of sustainable construction projects. These internal and external participants are recognized as stakeholders who are actively involved in the project, or whose interests may be positively or negatively affected as a result of project execution.

Theoretical perspectives and implications of stakeholder management

The concept of stakeholder management is accepted as theory, especially in the academic environment. Stakeholder management theory evolved from business management and aims to describe, understand, analyze and manage stakeholders. The first recorded idea regarding stakeholders appear in 1963 at the Stanford Research Institute and means "*those groups without whose support the organization would cease to exist*". In a famous article Freeman and Reed define stakeholders as "*those groups who have a stake in the action of the corporation*" (Freeman & Reed, 1984)

The stakeholder theory evolves from private sector, and from the need to understand the organization and its environment (Mitchell, Agle and Wood, 1997). Stakeholder theory is considered to be a theory of organizational management and ethics. Stakeholder management involves managing relationships in order to motivate stakeholders to behave in ways that support the objectives of a company. The theory posits that businesses, causes, interests and pressure groups have to manage their relationships with those external entities that can influence the achievement of their goals (Maloney, 2006). Stakeholder management is about creating the most positive environment in which a project can be developed (Vogwell, 2003).

Stakeholder Management is about relationships between an organization and their interested groups or stakeholders (Pampliega, 2013). The impact of these relationships can have a positive or negative influence on the success of the project. Therefore the purpose is to find ways of managing the stakeholders in order to minimize the negative impacts and make sure that there are no obstacles in the way of a successful project (Chinyio and Olomolaiye, 2010).

Stakeholder management does not just focus on single stakeholders, but accounts for all stakeholder influence on one another in complex interactions of multiple, and potentially interdependent stakeholders (Beringer, Jonas and Gemunden, 2012). Complexity is the main source of uncertainty and risk in projects, and it affects project performance if participants fail to address this issue from the beginning (Takim, 2009). These participants can be viewed as stakeholders. In any organization a series of management systems can be implemented to achieve the sustainability goals (Maier, 2018a). The complexity of the projects requires systematic approaches and appropriate project management skills to manage stakeholders to achieve the best value for project performance (Mok, Shen and Yang, 2015).

From the original work at the Stanford Institute, the stakeholder notion has diverged into four main research themes: corporate planning, systems theory, corporate social responsibility and organization theory (Freeman, 2010). To unite these themes, Freeman (1984) introduced a strategic management process—a stakeholder approach that has been widely acknowledged as a milestone in the evolution of stakeholder management research, where stakeholders are defined as a party 'who can affect or is affected by the achievement of the organization objectives (Nguyen, Mohamed and Panuwatwanich, 2018) .

Stakeholder management involves identifying and classifying stakeholders, thus facilitating both initial and subsequent engagement with them in a timely, planned and coordinated manner. This engagement involves identifying different categories of stakeholders; gathering information about them; identifying their missions in a project; determining their strengths and weaknesses; identifying their strategies; predicting their behavior and developing and implementing a strategy for managing these stakeholders (Cleland, 2002).

Stakeholders in the construction industry

Identification of stakeholders is the first task in developing projects and without identification of stakeholders probably the project will not be thought successful. In the construction industry, it is especially important to identify stakeholders and understand the roles they play in a project delivery. "*It is not about knowing how to read an architectural or structural drawing or having money to go into real estate and property development that makes one a builder or an engineer, it is all about having the required skill and academic discipline to marry the profession*" (Osuizugbo and Ojelabi, 2020)

In general, the construction projects are difficult and persons involved in this activity needs many different skills. Like any complex work the construction project is a step process that involve the engagement of considerable founds. Ensuring the sustainability of the process can be achieved by quality and innovation (Maier, 2018c) and thus through the entire process there are multiple works that need to be done: planning, designing, logistics and engagement of

people responsible for the performance of the investment. When dealing with the workers evolved in the project each person must have experience, applicable knowledge, occupational background, and, in most cases, adequate professional licenses (Bizon-Górecka and Górecki, 2018). When dealing with the managing personnel each of them must have additional skills, like creativity, innovation, psychological notions and so on. All of this additional skills must be combined with schedule development, planning, organizing and coordinating actions of other people (Bizon-Górecka and Górecki, 2018).

The most common effect of ignoring the specific stakeholders on project execution, is that it can extend the project execution time and in the end it increases the project costs. These two main aspects, of time and money, are the most important issues in construction. Thus the success of a construction project is not related only to the quality standards but is also about respecting the time and the budget of the project (Tahir *et al.*, 2018).

Construction projects by differing nature have organizations and individuals actively involved in the project, or whose interest may be negatively or positively affected by the outcome of the project. Every construction stakeholder, in any project, has specific functions and objectives to the project. According to Vaux (2014), every project begins with the stakeholders working towards a quality, profitable and successful project, but most times conflict emerges to undermine those goals. In fact, construction stakeholders can contribute to the failure or success of a construction project. This challenge can be reduced if construction stakeholders increase their effectiveness, efficiency and choice decisions on projects (Vaux, 2014).

Traditionally, the main participants in a construction project coalition are the client, the architect and the contractor. The interactions and interrelationships between these participants largely determine the overall performance of a construction project, and have the crucial responsibility for delivering a project to successful completion. However, looking upstream and downstream in the construction project life cycle, there are multiple attributes that contribute to the success of a project, and these are influenced by a variety of decisions made by various individuals, bodies and organizations (Figure 1).

The researchers Chinyio and Akintoye (2008) identify as the main construction stakeholders the engineers, builders, architects, contractors, owners, suppliers and subcontractors (Chinyio and Akintoye, 2008). Stakeholders can be divided into *internal and external* (Atkin and Skitmore, 2008). According to Atkin and Skitmore (2008), internal stakeholders such as employees, owners, suppliers and customers, are those directly involved in an organization's decision-making process while external stakeholders like local authorities, local community, neighbors and general public, are those affected by the organization's activities in a significant way.

From the paper of Smith (2000) we can identify in the category of internal construction stakeholders the sponsors, the owners, the team members together with their unions and families, the management level with the functional management and direct management, and functional departments of the organizations like the engineering, marketing, human resources or accounting departments. At the border between internal and external stakeholders we can identify the vendors or suppliers and the customers as clients and inactive accounts. From the category of the external stakeholders we can have the media such as radio, TV, internet of newspapers; the community as the citizens from the construction locations, the boards and clubs or special interest groups; the competitors of the organization and in the end the public administration, the government through regulations, legislations, legal systems, courts, and political parties.

Figure 1: The main stakeholders involved in a construction project (Smith, 2000).

Others researchers pointed out that even if in each particular construction projects are involved different kinds of stakeholders we can have the same two main category, internal and externals. The researchers (Chinyio and Olomolaiye, 2010) grouped the stakeholders into five main groups: *clients, consultants, contractors, external public parties and external private parties*. Clients, consultants and contractors can be grouped together as internal stakeholders, while the remaining parties are considered external stakeholders.

The stakeholders in a construction project are by no means isolated from one another (Figure 2). They are closely interrelated through formal or informal ties during the implementation of a project. The internal stakeholders are linked via legal contracts or direct, while the external stakeholders will also affect or be affected by the construction product through indirect ties. Although the external stakeholders are not decision-makers in the project, they still have a link to the project and can influence the project in a number of ways.

Clients, *consultants* and *contractors* generally have official communication channels, as they are closely interrelated through legal contract ties. In the **initial stage**, the client normally employs consultants to prepare a marketing report in order to understand the existing economic situation and the *customers*' expectations of the site. The client will also seek comments from *general practice surveyors* regarding the purchase of land from the *government*, after describing the client's requirements to the government. If necessary, a *private client* may seek advice from *financial institutions* on a development project. P*ublic clients* may not have any financial difficulties, but, in recent years, they have also placed an emphasis on the need for the support of the *community* and *local residents*.

Figure 2: The interconnections between external and internal stakeholders in construction industry

In the **pre-design stage** of a construction project, clients normally employ a group of consultants as internal stakeholders to further investigate the project. In order to ensure that a project will be constructed and operated in a functionally, technically and financially feasible manner, a group of *internal stakeholders* such as the *project manager*, the *architect*, the *engineers* and the *quantity surveyor* have to work together on a feasibility study

During the **design stage**, clients and project *consultants* have to work hand-in-hand to ensure that the design is satisfactory. During the **tendering stage**, there are close interactions between *clients*, *consultants* and *tenderers*. In the **construction stage**, a contractor has to carry out the work on site, working to the Contract Documents. A *construction team*, including the *main contractor*, the *sub-contractors* and *suppliers*, should be formed at this stage. In the **completion and operation stage**, the project has to be handed over to the *client*. The *contractor* will have to deal with *government agencies* to obtain certain permissions. The *project manager* must coordinate his or her work with *other designers*, *surveyors* and contractors to ensure that all the terms of the contract are fulfilled.

Framework for construction stakeholder management

Stakeholders go beyond the people and organizations that populate projects. According to (Gare and Feldman, 2009), it is a common view that stakeholder groups in community development projects are trying to influence the design, implementation, monitoring and evaluation of community development projects. When this happens, it often results in conflicts and disagreements. Many projects with good technical and economic planning have failed because of conflicting interests of stakeholders. Stakeholders end up fighting each other, resulting in many projects failing to achieve their specific objectives, or in worst-case scenarios abandoned midway.

Due to the unique and complex nature with different parties, conflict is inescapable in most construction projects. These complexities and unsure nature of construction projects need effective stakeholder management approaches to contain conflicting stakeholder interests and to build coexistence among construction and ensure attainment of overall organizational goal. Even if an organization has implemented an integrated management systems (Maier, 2018d) this not imply that the problem of stakeholder managed is resolved. According to Beringer et al. (2013), stakeholder management is considered, from both a professional and an academic standpoint, to be extremely important for achieving success in projects. For these authors, the stakeholders have a dual relationship with the performance of the project, because their actions can influence the project, but, on the other hand, the results of the project may affect their interests (Pacagnella Júnior *et al.*, 2015).

From a practical point of view, stakeholder management allows the project leaders to create factors that lead to the effective participation of stakeholders in the project and consequently allow the leaders to reap the benefits of the engagement of the stakeholders with regard to obtaining resources and using their influence (Purvis et al., 2014). The management approaches involve creating an effective framework for the prevention of conflict in construction projects (Figure 3). The essentials of every construction project are its ability to meet up with the stipulated deadline and schedules without any constraint on quality delivery. During the development stages of a project, a stakeholder management strategy should be developed (Yang *et al.*, 2009).

Figure 3: The framework for stakeholder management in the construction industry

The proposed framework for managing the stakeholders in the construction industry involves an 11 steps approach. The first step is to clearly **define the project mission.** Before every activity of stakeholder management, the project manager should have a better understanding of the tasks and objectives at a particular stage of the project lifecycle, including the issues of cost, schedule, budget, etc. The next step is to **understand the area of the interest for stakeholders.** There are various stakeholders' interests due to the complex nature of construction projects. Freeman et al. (2010) believe that identifying stakeholder interests is an important task to assess stakeholders, and they listed stakeholders' interests including product safety, integrity of financial reporting new product services, and financial returns. The third step is to **explore the stakeholder needs and constrains in the project**. During the project process, all the needs of stakeholders should be assessed "so that a satisfactory and realistic solution to the problem being addressed is obtained"(Yang *et al.*, 2009).

The next step is to **assess the stakeholder behavior**. The capacity and willingness of stakeholders to threaten or cooperate with project teams should be measured during stakeholder management process**. Analyzing the conflicts and coalitions among stakeholders** is an important step for stakeholder management. Other step involves **compromising conflicts.** Since there are various conflicts among stakeholders, compromising these conflicts become important for project managers to make decisions (Freeman 1984). In the same idea the next step is to **promote a good relationships** among stakeholders, which is vital for successful delivery of projects and meeting stakeholder expectations. The next step is to **formulate appropriate strategies**, these means that it is very important to know how the project management team treats different stakeholders.

Predicting stakeholders' reactions is also an important factor when managers make decisions about strategies to deal with stockholders. The next issue to address is to **analyze the change of stakeholders**. The concepts of the change and dynamics of stakeholders were acknowledged by Freeman (1984). According to him, in reality stakeholders and their influence change over time, and this depends on the strategic issue under consideration. In the final place, but not having less importance, is the **ensuring of effective communications** between stakeholders. Communication is essential for maintaining the support and commitment of all stakeholders. Effective, regular, and planned communication with all members of the project community is necessary for project success

Conclusions

The construction industry has been criticized as a non-sustainable industry due to its low productivity but high resource consumption. However, there has not yet been an effective tool to monitor and achieve the expected sustainability for construction projects from stakeholders' viewpoints. The overall importance of stakeholder management has been studied and highlighted by both researchers and practitioners

If key stakeholders are not satisfied, at least to a minimal degree, by their standards, it will only be natural that an organization budget and operations will be cut, which will lead to redundancies and abandoned initiatives. Organizations that adopt stakeholder management principles probably better satisfy their constituent needs and balance their interests, which results in higher capacity of goal achievement.

Carefully developed positive and mutually supportive stakeholder relationships that encourage trust and stimulate collaboration by reducing conflict and suspicion can help avoid time delays and increased costs, whose reduction would be beneficial to the normal business of profit generation. In summary, it is necessary for the stakeholders to manage construction projects throughout the development and construction processes due to the dynamic nature of society, the complex nature of construction work and the interplay of multi-stakeholders.

Abstract

The aim of this article is to present planned empirical study which will take place in 2021 in the area of Poland for small and medium sized enterprises (SME) which consider or are during implementation or plan to implement Industry 4.0 solutions. Authors are going to conduct anonymous survey where the greatest focus will be on the evaluation of the implementation factors such as driving forces, barriers and chances for I4.0 implementation on Polish markets.
As a practical aspect of presented survey authors planned to obtain coherent and comprehensive information related to each implementation factors in order to share that knowledge with organizations which plan to implement I4.0 solutions and would like to prepare their daily activities and project assumptions for all barriers, chances, challenges and risks which are connected with technology changes in their organization.

Keywords: Industry 4.0, solutions, barriers, chances, driving forces

Introduction

The concept of Industry 4.0 means a new paradigm of modern manufacturing. This phenomenon requires continuous innovation processes and technological development from each enterprise – as mentioned by: Durana et al (2019), Mittal et al (2019) or Müller & Voigt (2018). As well as understanding the concept of I4.0, it is important to discuss factors that may encourage companies to move towards this approach, what was the subject of research of Michna & Kmieciak (2020). Ongoing changes on a global level have led to a networked society, affecting both business and private life. They have also resulted in a number of changes for manufacturing companies pointed by Horváth & Szabó (2019). Each of that changes or improvements require proper implementation process which could be driven by a project management process.

In general, for a project to be successful, is has to be delivered on time, within budget, and conform to the client's requirements; requirements analysis is mainly related to determine the needs and conditions to be met for a successful project, taking into account also the possible risks and of course, understand customer's needs and expectations as said by Karamistsos et al (2010).

Current literature examines the research areas of the I4.0 from different perspectives. For this elaboration two aspects are the most important – I4.0 solutions types and technology changes and their implementation factors, in particular driving forces, barriers and chances. Under umbrella of I4.0 Stentoft et al (2019) stating in total 12 technologies. Those are: 1) big data and analytics, 2) autonomous robots, 3) simulations, 4) horizontal and vertical system integration, 5) internet of things -IoT, 6) cyber-security, 7) the cloud, 8) additive manufacturing, 9) augmented reality, 10) artificial intelligence, 11) mobile technologies, 12) RFID and RTLS technologies.

Each solution could be independently implemented as a separate project for the organization. In order to be in line with time, budget and requirements as stated by Karamistsos et al (2010) organizations should become aware of

Planned Research of SME" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

driving forces which motivate them to change and implement above I4.0 solutions stated by Stentoft et al (2019) mentioned different types of factors.

As a first should be reviewed determinants which influence on willingness to implement I4.0. Base of recent research made by Michna & Kmieciak (2020) in polish small and medium sized organizations proof that open-mindedness culture, knowledge-sharing, and financial performance in the organizations have a positive impact on willingness to implement solutions of I4.0. Others as pointed by Horváth & Szabó (2019) or Stentoft et al (2019) are dividing factors into certains cathegories. First one related to human resources area like: increasing labor shortages, needs for reducing human work and allocating workforce to other areas. Second one – financial resources and profitability mostly in case of cost reduction in all areas: human, operations and inventory. As a third one authors pointing all managerial factors as: market competition and trends, increasing pressure and customer requirements, new business model innovation together with demands for greater control and needs for continuous monitoring of company performance. Last from the factor's group - productivity, efficiency technological and process integration and cooperation has been recalled. Here errors reduction, lead times improvement and reliable operation has been pointed as well a direct driving forces for enterprises transformation. Base of survey made by Stentoft et al (2019) stating as a main driver: legislation and standards changes, strategy of the organization with cost reduction needs, customer requirements changes, time-to–market improvements and fact that competitors practice I4.0. In relations to work force lack of qualified employees also was mentioned.

Implementation of I4.0 is also connected with certain barriers which shall be defined, analyzed and taken into account during risk assessment performance. Muller (2019) and Moeuf et al (2020) indicate human factors (employee acceptance, lack of competencies and know-how, lack of cooperation among departments, lack of top management support, unclear benefits for employees) data factors (as a data access and protection, lack of capacities, availability and usable data) and others factors (like organizational structure, dependency from machines or too cost driven approach, lack of expertise and a short-term strategy mindset). On the opposite side of barriers, we have chances factors detailed by Li et al (2019), Müller et al (2020) and Müller et al (2018) where they indicate as a chances: mass customization with larger variety of products, interconnection by digital means in real time, process optimization, complexity and flexibility of manufacturing systems, competitiveness growth by better capabilities to meet individual customer's demands, integration of data and new business models.

Planned Empirical Study Scope

Determining implementation of I4.0 solution as a specific project to be managed by enterprises multiple areas shall be taken into consideration. Starting with review of driving factors for process change, verification of actual situation and available resources, barriers which needs to be overtaken, definition of desired target achievement, challenges before and during implementation such as financial aspects, duration possibilities, knowledge and experience of created team and leader, also taking into account opportunities, chances and risks which I4.0 solution will bring to the organization.

Empirical study planned by the authors will be conducted in 2021 via anonymous survey for small and medium sized organization in the area of Poland. Independently of industry type and activities areas questionnaire for survey will be prepared base of three blocks presented on the figure 1 below.

First block – Planning Phase represents all activities which organizations must perform on the stage of decision taking and general planning. In case of the time axis first block is focused on activities before direct implementation. In this area survey questions will be directed into definition of driving forces which convincing single enterprise to consider and / or implement solution of I4.0. It is also a place for questions regarding available help solutions which could be sourced from inside of organization, meaning: internal process, internal guidance, procedures, systems or individual projects directly coordinated by organization itself. External help in the area of law, standards changes, government programs lead by Country, Region or Districts will also be a part of planned survey questionnaire. That unit will be finalized by specified barriers which organizations are facing before implementation phase of I4.0 projects.

Second blocks represent Implementation Activities with main focus on challenges, which are part of a daily project implementation activities. Challenges in implementation phase could be understood as a barrier which block organization to go out from planning phase and prevent step in into next implementation levels. By this group of questions authors plan to receive information which are the biggest challenges for organization during implementation phase. Knowledge about that gives significant lessons learned for other organization which are still in planning phase and base of their internal risk analysis they consider challenges as a blocking points or even strong barriers. Second block of question will be connected with direct list of I4.0 portfolio solutions. By those questions authors assumption is to get information about planned, implemented or desired, by specific enterprises, solution of I4.0 available on the market and in actual technology status.

Last block of questionnaire will be covered by the questions linked with achieved Results. Main focus will be directed into opportunities which I4.0 solutions, tool or methods would potentially and are giving to the verified companies. Considering opportunities authors would not forget about second axis of archived results meaning risks which is linked with I4.0 implementation as well.

Fig.1: Industry 4.0 project implementation factors. Source: Author's own elaboration

Conclusions

Planned research, as a assumption, is intended to clarify and structuralize information in theoretical and practical field. As a desired output in the theoretical area authors shall be able to answer below questions:

- what are the driving forces for organization to implement I 4.0,
- which kind of help solutions organization have from inside (company organization) and outside (society, government, law, associations etc.),
- which kind of barriers shall be overtaken before implementation phase,
- which kind of industry 4.0 solutions are preferably chosen by polish organizations,
- which kind of challenges organization must face during implementation phase,
- which kind of results are desired,
- which kind of opportunities organization will have after successful implementation,
- which kind of risks implementation will bring to organization and its employees, processes, technology etc.

As a practical aspect of presented survey authors pointing direct knowledge sharing and lessons learned which could be used for organization and employees who plan to implement I4.0 solutions and would like to prepare their daily activities and project assumptions for all barriers, chances, challenges and risks which are connected with technology changes in their organization.

Abstract

For the last ten years it has been emphasised that the importance of regions competitiveness depends on identification and development of smart specialisations. According to assumptions identification of smart specialisations allows to focus the investments in research, development and innovation (RDI) on the areas with the greatest innovative and competitive potential in the given region, that is the areas which may be most advantageous to the region and its economy. Regional smart specialisation strategies are integrated economic transformation programmes which build on region's strengths, its competitive advantages and potential for excellence. The strategies focus on selected prioritised areas of development which match regional conditions, thus allowing to achieve competitive advantage in the given area.

The economic area of materials production and processing in the Silesian Voivodeship has had its history but the challenges related innovative development in that area have become of key importance.

The purpose of this paper is to present the potential and market challenges of the materials manufacturing and processing specialisation, as one of the technological areas being developed in the Silesian Voivodeship. This technological area has been identified as a result of the measures taken as part of regional development. This will form the basis for presenting the assumptions of new European Union polices and national and regional strategies as well as the evaluation of the potential and strategic challenges of the analysed specialisation area.

Keywords: regional development, smart specialisations, materials production and processing.

Introduction

Smart specialisation strategy is the key element of EU policy towards regions and its purpose is to make sure that every region develops its own methods of coming out of recession and to guarantee long-term development of a region and thus – of the entire EU. The measures taken on the level of the EU as well as states and regions have combined smart specialisation strategies with innovation strategies (Procesy, 2017). Smart specialisation consists in identification of extraordinary features and assets of every state and region, in emphasising competitive advantage of every region and focusing regional partners and resources around the vision of their future oriented at achievements. It also means reinforcement of regional innovation systems, optimisation of knowledge flow and spreading of the advantages arising from innovation within the entire regional economy. Smart specialisation is of key importance to real effectiveness of research and investment in the area of creation, absorption and diffusion of innovation (Program, 2019).

Analyses carried out in regions indicate that specialisation areas are internally very diverse and from today's perspective not all previously identified subareas have shown appropriate potential that would allow to consider them, at the moment, as smart specialisations which means that the list needs to be verified. The niches identified in technological areas for establishment of new undertakings or for development of existing ones indicate that some smart specialisation areas in the Silesian Voivodeship display significant growth potential which can be used, through appropriate support policy, for further development of the region (Strategia, 2020) These smart specialisations include

Cite this Article as: Lilla KNOP and Marek KRANNICH ""Challenges for The Technological Area of Materials Production and Processing in The Context of Smart Specializations Development"" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

the technological area of materials production and processing. The companies from the materials processing sector are not only particularly exposed to the impact of turbulent environment in which they operate but also are facing new competitive challenges, intensified changes in demand and sensitivity to economic cycles associated with other sectors (such as construction, civil engineering, automotive industry, food industry, health care, etc.).

Regions have been implementing smart specialisation strategies for a couple of years now and their experience in this field gives them a basis for carrying carry out monitoring and taking verification measures. Regions in Poland apply different solutions to monitor and verify regional smart specialisations. Poland and one of the regions which has made an attempt to verify smart specialisations are an example here. The said approach relies on an extensive regional policy based on the national regional development strategy, region development strategy, technology development programme and innovative-region strategy. This has allowed to select another specialisation, that is production and processing of materials, as one of the so-called emerging industries.The purpose of this paper is to present the potential and market challenges of the materials production and processing specialisation in the Silesian Voivodeship. The research has been based on the analyses of strategic documents concerning regional development on the European, national and regional level and also on the evaluation of economic, social, scientific and innovative potential and challenges. Analyses were carried out based on selected technological subgroups, that is: metallic products, ceramic products and polymers.

Theoretical background

Theories of regional development are continuously evolving due to the necessity of taking into account new phenomena which have a significant impact not only on the economic space and economic activity location processes but also on centralisation and decentralisation of manufacturing (Nowińska-Łaźniewska, 2004). The smart specialisation concept is one of those theories and it was proposed by D. Foray and B. Van Ark in 2007 (Foray and Van Ark, 2007). It should be added here that the term “smart” is not a new concept since it has been used with respect to development, especially regional development, in such phrasings as: smart city (Florida, 2003; 20; Komninos, 2002; Giffinger 2007; Glaeser and Berry, 2006; Murray, Minevich and Abdoullaev, 2003; Silva, Khan, and Han, 2018) or smart grid (Coll-Mayor, Paget and Lightner, 2007; Giri and Avila-Rosales, 2009) and also with respect to organisations, e.g. smart organization (Deiser, 2009).

In the beginning the work on smart specialisations focused on the search for the solutions that would increase engagement of science and R&D in the processes of creating and implementing innovation. They considered smart specialisation as an “attempt to create a holistic (comprehensive) perception of the notion of specialisations in the area of science and technology in knowledge based economy” (Nowińska-Łaźniewska, 2009). By combining cohesion policy analysed in the F. Barca’s report (Barca, 2009), which emphasised the necessity to formulate priorities and work out better coordination, with sectorial approach to regional development proposed by P. McCan and R. Ortega (McCann and Ortega-Argilés, 2011) the “Knowledge for Growth” Expert Group developed assumptions of smart specialization. The key idea of this concept is “entrepreneurial discovery” (Foray D. et al, 2012) according to which smart specialisation means “entrepreneurial process of identifying the science and technology areas the specialisation in which might be of advantage to the specific region”. It is emphasised that smart specialisation should be a bottom-up process (hence the term: “entrepreneurial” process – regional organisations (enterprises, science entities, research and development entities and other) should point out orientation of investment, research and development themselves and definitions of smart specialisation strategies cannot be imposed (Foray, David and Hall, 2009). At the moment it is assumed that regions, in order to effectively use the funds invested into science, research and development, should rather strive for reaching appropriate status in the regional “market” than break up their investments into the areas where they would still remain catching up regions (Foray, 2009). Smart specialisation assumes close relationship between research and development activity, human capital development (employees’ qualifications and skills) and economic specificity of regions and countries. Identification and selection of the areas of the greatest potential which may ensure competitive advantage to business entities and regions (subregions) is of key importance. As a result smart specialisation strategy should consist in entrepreneurial (bottom-up) establishment of economic priorities in the RDI area and in focusing investments in the areas which ensure increase of the value added of economy and its competitiveness in foreign markets (Foray and Goenaga, 2013).

It should be kept in mind, however, that smart specialisations: do not necessarily need to be centred around one branch of industry – horizontal solutions are promoted; regional specialisations should give rise not only to innovative products but also organisational, marketing, service and social innovations; they should be based not only on general technologies but also on application of those technologies in one or more areas which are of importance to the region (e.g. not “nanotechnology” but “nanotechnology in cosmetics”). It would be hard, however, to consider the concept of specialisation as something totally new since economists have been interested in it for centuries.

With respect to regional development the following theories may be identified: H. Innes's staples theory according to which regional development is driven by the creation of gradual specialisation (Innes, 1956); flexible production theory which also emphasises the role of specialisation (McCann and Ortega-Argilés, 2011); A. Marshall's industrial district theory (Marshall, 2012; M.E. Porter's cluster theory (Porter, 1997 and Porter, 1990); endogenic development strategy (Friedman, 1986). Furthermore, application of smart specialisations had been preceded by the application of the methods based on the evaluation of regions' competitiveness, including, for example: competitiveness pyramid (Lengyel, 2004 and Lengyel, 2013), competitiveness hat (Martin, 2005), competitiveness tree or Porter's model (Porter, 1997 and Porter, 1990).

Nowadays smart specialisation is a pioneering approach enabling an integrated economic transformation agenda via research and innovation anchored in territories. It allows the identification and the development of competitive advantages by concentrating efforts and resources on the discovery of innovation niches. Smart Specialisation advocates the conjugation of the economic, innovative and scientific potential of a territory and aims to address societal challenges (Prieto, Demblans and Martínez, 2019).

The presented smart specialisation concept will be the basis for evaluation of potential of the technological area selected in the course of smart specialisation verification. It was based on expanding the smart specialisation concept by adding two key approaches: entrepreneurial discovery process and identification of technological areas (D'Adda, Iacobucci and Palloni, 2020). The process of entrepreneurial discovery combines future strengths of field- and knowledge-based regional economy and consists in a bottom-up approach to identification of specialisation areas (Asheim, 2019). In the second approach regions need to identify technological areas and not sectors of industry. In short, we are looking for the specialisations which describe the problem and technological areas and not sectors of economy. Aiming at technological areas and not specific branches of industry allows us to expect an increase in innovativeness and diversification of products by creating and implementing new technologies (Asheim, 2019; D'Adda, Iacobucci and Palloni, 2020; Janik, Ryszko and Szafraniec, 2020).

Methodology on studies

The research was based on the analysis of secondary data, expert analyses prepared by area specialists and the workshops which verify evaluation of region's challenges and potential in the area of materials production and processing. The research process is presented in figure 2.

The Silesian Voivodeship is a region in the south of Poland neighbouring the Opolskie, Łódzkie, Świętokrzyskie and Lesser Poland Voivodeships and bordering the Czech Republic and Slovakia in the south. The area of the region is 12,333 km2, that is 3.9% of Poland's total area, which means they are in the 14th position among all regions of Poland, before the Świętokrzyskie and Opolskie Voivodeships. The Silesian Voivodeship is the most urbanised region of Poland (urban population of 76.7%) with the highest population density in Poland (368 people/km2, whilst the national average is 123 people/km2). Rural areas of the Voivodeship, on the other hand, which make up 69.3% of the region's area, were inhabited by 1.05 million people (23.3% of the total population of the Voivodeship).The Silesian Province has 4.5 million residents which makes up 11.8% of the total population of Poland. From the point of view of population the Silesian Voivodeship ranks second in Poland after the Masovia Voivodeship (14%). Approximately 42.4% of the Gross Value Added generated in the Silesian Voivodeship comes from the industrial and construction sector.

Figure 2: Research methodology.

Source: Own study.
EU, national and regional documents analysis

Apart from having analysed the source documents listed above, the authors of this paper have co-participated in the drawing up and evaluation of a dozen or so expert opinions concerning materials processing. The concept of the research approach focused on matching the analysis and challenges of technological areas (the so called "rising industries") in the Silesian Voivodeship with the Upper Silesia development strategies defined by authorities of the Silesian Region.

The entire approach to the analysis of technological challenges in materials processing must be consistent with the following objectives adopted in the Strategy for the Development of the Silesian Voivodeship – Śląskie 2030 (Strategia, 2020).

- Strategic objective: Silesian Voivodeship as the region of responsible economic transformation
  Operational objectives:
- Diversification of the economic structure and economy 4.0 development, including support for automation processes, increase in flexibility and digitalisation of production in companies and increasing the competence of current and future human resources in the industry.
- Support for creation of new companies and development of the existing ones, including start-ups, based on the region's potential and using the technologies developed in the region, in particular in the areas of regional and intelligent specialisations and creative industries.
  The proposed analytical approach is also consistent with the model of regional development, as regards the substantial aspect of support for the Silesian Voivodeship, proposed in the National Strategy of Regional Development for 2030, the strategic assumption of which is the following: "territorially sustainable development – concentration of support on the economically weaker areas and providing an impetus for their development and their integration with broader surroundings", in the system of adopted topical concentration: "continuation of the measures which support the increase of competitiveness of Polish regions on the European level (the largest infrastructural projects, support for the development of technologies and innovation, enterprises, human resources) implemented in the territory of the entire country with the increasing share of other sources of financing managed on the European and national level"

The methodology proposed in the report entitled "Processes of entrepreneurial discovery in the context of innovative development of the Silesian Voivodeship until 2020" and related to the relationships between science, economy and technologies allows to abandon, in the process of entrepreneurial discovery, the traditional sector approach and attempt to determine key technological areas on which Technology Development Programmes might be based, including a documented condition of technological potential, and in compliance with the provisions of the National Strategy of Regional Development and Development Strategy for the Silesian Voivodeship – Śląskie 2030. From the point of view of application it might be assumed that:

- The area of support from the regional level should go beyond the scope of precisely defined area of specialisation.

- In selection of specialisation areas quiet signals and relations existing in economy should be taken into account more than previously.

A deepened analysis of strategic regional, national and international documents has allowed to make a list of technologies and technology development directions which have an impact on the shape of technological areas.

Presentation the challenges and potential in the previous and new specialisation areas of the region

The selected technological area in the intelligent specialisation of the Silesian Voivodeship indicates that specialisation's capabilities and potential for development. New challenges and experience as well as the knowledge about that area allows to classify them as emerging industries. The technological area of "materials production and processing" is treated as the one which is facing new challenges and opportunities but is based on bottom-up initiatives and long-standing experience. This paper focuses on a singled out direction of technology development, that is production of metallic, ceramic and polymer goods.

To make the most of the great technological potential of materials production and processing it is important not only to overcome technical barriers but also the social and economic ones and also to improve the mechanisms of financing of scientific and development research in Poland. The major identified megatrends in materials processing include: automation of processes and introduction of information technology into processes as well as increase in the share of recycled raw materials.

Large scale of use of innovative metal, polymer and ceramic materials is emphasised here. This applies for example to the technology of energy production and storage, electronic equipment, sensors, intelligent coatings and membranes, composites for aviation, 3D printing or medical products. Metallic products such as steel, aluminium and copper are the materials which are most often used in construction, automotive and energy sectors. Development of polymer plastics is related to the development of the sectors of packaging, medicine, electronics and electrotechnology, transport and communication, machine equipment and machine parts, household, cosmetics, furniture and construction. Ceramic products are broadly used in chemical, environmental protection, power, machinery and household appliance industries.

The major trends identified in the Technology Development Programme for the Silesian Voivodeship with respect to the materials processing area include:

- Development of the foundations for functioning and implementation of circular economy
- Implementation of IT systems for supporting production management
- Robotisation and automation of production processes
- Orientation at an increase in the creation and implementation of all kinds of innovation
- Energy saving in the area of production, distribution and use (also of materials)
- Increase in demand for materials (in particular metallic materials and polymers).
- Increase in labour costs in materials processing

The Silesian Voivodeship is the region in which the largest in Poland steel manufacturer – According to the Polish Steel Association (HIPH) market conditions in the steel industry deteriorated in 2019 when compared to 2018 (Polish Steel Industry, 2020). Significant decrease in the construction industry growth has become a market challenge - it indicated that the stage of finalising many infrastructural investments related to EU funds was approaching. Insignificant increases in machinery, automotive and household appliances industries also fit into this downward trend. The lower growth in steel consuming sectors resulted in a significant drop in the real consumption of steel by over one million tons.

At the beginning of 2020 it seemed that stabilisation would soon occur. At the beginning of 2020 the economic situation was favourable to the companies operating in the steel sector – order portfolios were almost full. However, the crisis related to the Cov-SARS 2 pandemic has seriously revised, downward, the forecasts for the steel market in Europe. Until the end of the first half of the year there were no grounds for stopping steel production in Poland whilst demand, though seriously weakened, still gave a chance for keeping up production, in particular in the construction industry which has never been so severely affected by any market stagnation. The pandemic decrease, however, overlapped with a new market challenge – maintaining the costs of production while keeping in mind the anticipated growth of energy prices.

According to the data for 2018 the total demand for plastic materials amounted in EU and in Norway and Switzerland to 51.4 million tons. The greatest demand for plastic has been in the packaging market (40.7%). The construction segment and the automotive segment also have a significant share in the consumption of plastic in Europe (19.6% and 9.8%, respectively) (Branża, 2019).

Two-dimensional portfolio analysis carried out as part of the Technology Development Programme for the Silesian Voivodeship consisted in analysing interdependencies between the development potential of the given technological line and its importance for the Silesian Voivodeship. It positions technologies and technological groups based on their technical, organisational and intellectual potential in the region, thus leading the way to the discussion about its possible reinforcement and shows importance of the region from the point of view of accomplishment of Voivodeship's strategic objectives, and in particular development and promotion of innovation. Ceramic materials have been classified as least important in the the category of potential/importance for the Silesian Voivodeship of the prepared matrix. Their usefulness for the Voivodeship as well as their potential have been unambiguously classified as “low/little”. This means that there will be no chance for this technological line to be supported in the upcoming years. Metallic materials have been classified as the technological line most predestined for development. They fall into the following categories: “great importance for the Silesian Voivodeship” and “high development potential”. You can clearly see that in the materials processing area this technological line should be reinforced through coordinated measures such as implementation of innovation, active support in entering foreign markets and maximum use of internal sources of competitive advantage, in particular the ability to reduce costs. The technological line of polymers is characterised by “low development potential” and “high importance for the Silesian Voivodeship”. In practice it means putting emphasis on maintaining the current market position, developing and reinforcing cost advantages and focusing on maintaining brand image of current manufacturers in the increasingly competitive market. Another stage of analyses was related to the evaluation of technology and groups of technologies using the criteria related to the interdependencies among them. Selected experts carried out an analysis of the relations between identified key technologies through the prism of the process of generation and absorption of knowledge, skills and competence useful for creation and implementation of technical innovations into the business sphere and based on that they classified technologies into two groups – knot technologies and island technologies. Knot technologies are those closely dependent on the development of other technologies in the region or conditioning the development of other technologies in the Silesian Voivodeship, whereas island technologies are not related to any other technologies of the region and do not condition development of other technologies in the Silesian Voivodeship. Metallic materials and polymer plastics were classified into knot technologies, whilst ceramic products into the group of island technologies. Due to their presence in global value chains knot technologies provide pro-innovative solutions to the entrepreneurs located in the territory of the Silesian Voivodeship, including large entities operating internationally. The next stage of the experts’ work consisted in dividing technologies into two groups based on their impact on region's development, where the first group, that is the endogenous technologies, may be used for development of new products and services which make the region stand out and allow it to be competitive in global markets, whilst the second group, exogenous technologies from outside the region, will have an impact on the region's growth. Polymers and ceramic materials have been classified as exogenous technologies whilst metallic products as endogenous ones. In the case of exogenous technologies it is necessary to develop experimental and test infrastructure in order to ensure their development in the region and link them to the technologies which already exist in the region. This will translate into further increase in competitiveness and innovativeness of the region. Continuous globalisation of economy and development of transnational corporations which use local potential also drive the growth of innovativeness. Such enterprises play a dominant role in creation and diffusion of innovation. In the case of the technological area analysed by authors the process of applying open innovations has varying dynamics and requires a systemic support, in particular development of the methods and tools that would increase trust between the actors in the innovation ecosystem, as well as support for commercialisation of new technological solutions implemented based on the paradigm of open innovations.

Evaluation of the challenges and potential in the area of materials production and processing

You can see that in the distribution of the SWOT analysis carried out by experts with respect to the analysed technological area of “materials production and processing” long-standing experience and tradition, good relations with customers and understanding of their needs and expectations bring significant advantage. The factors which limit development include capital intensity and high energy consumption in production, high fixed costs, necessity for make investments which require high expenditures and little use of external innovations. It is related to the fluctuation of highly qualified personnel and shortages of human resources. The elements which give opportunity for development include the continuously growing demand for innovative materials, robotisation and automation of processes and financial support for development provided by parent groups of companies. High demand for pro-ecological solutions increases the chances for obtaining EU funds and for development of multidirectional cooperation. Threats include growing competition, including from Asiatic countries, as well as unstable prices of components and raw materials.

On the second stage of evaluation technologies were analysed from the point of view of the interdependence criterion. As a result of the analyses technologies were positioned with respect to the strategic initiatives which determine the policy of supporting their development by indicating one of their for orientations (Program Rozwoju Technologii Województwa Śląskiego, 2019):

- Orientation I – orientation at "Leadership through diversification" – endogenous technologies with high level of interdependence with other key technologies of the region.
- Orientation II – orientation at "Leadership through perfection" – endogenous technologies with low level of interdependence with other key technologies of the region.
- Orientation III – orientation at "Technological acquisition for diversification" – exogenous technologies with high level of interdependence with other technologies and high pressure on their use for increase in attractiveness of innovative products in the region.
- Orientation IV – orientation at "Technological acquisition for perfection" – exogenous technologies with low level of interdependence with other technologies and, at the same time, high pressure on their use for increase in attractiveness of innovative products in the region

Ceramic products have been classified into the "Technological acquisition for perfection" orientation, polymers – into "Technological acquisition for diversification" whilst metallic products – into "Leadership through diversification".

Conclusions

At the moment, on the eve of 2021, market challenges in the area of materials processing have a totally different dynamics than two years ago. Unstable impact of the surroundings, inability to formulate verifiable scenarios of the course of events in the surroundings, difficulties in taking investment decisions as well as radical fluctuations in business cycles of many national economies result in a necessity to shorten the time axis of business forecasting and, at the same time, to create many alternative decision making paths while more and less closely related stakeholders continuously undergo some turbulent processes. The primary challenges in the technological area of materials processing may also occur through implementation of post-pandemic market activities, such as learning from partners, internalisation of partner's abilities and resources, knowledge sharing and creation, growth of an enterprise and its greater share in the market, risk and costs sharing in the R&D area, securing against radical innovations with a large-scale executive uncertainty, increasing entry barriers and because of creation of the economies of scale.

The key conditions which determine development approaches in the nearest dozen or so years, synthetically include the following characteristics of economic, innovate, ecological and social processes:

1. Economic conditions:
    - economic effects of the coronavirus pandemic and the resulting rapidly changing business cycles by sector
    - increasing globalisation of economy's internationalisation
    - development of circular economy (including recycling of metals and polymers)
    - development of cooperation networks
    - financial engineering with the use of aid funds, in the view of 2021-2028 financing, for realisation of pro-ecological and energy-saving investments
    - possible increase in demand in selected market sectors after pandemic
2. Innovative conditions:
    - growing competition
    - new models of business with the ability to implement innovations and rules of sustainable development
    - customer value chain extension (development of processing and service)
    - development of ecological innovation and its orientation towards implementation in enterprises
3. Ecological conditions:
    - necessity for radical reduction of gas and dust emissions in production processes
    - increasing importance of regional, national and EU pro-ecological policy
    - increasing energy-saving properties of technologies used, due to the necessity for competitive adaptation to radical costs reduction among the manufacturers operating outside the European Union
4. Social conditions:
    - continuously growing social anxiety resulting from perturbations in the labour market, caused by closing of state economy during the coronavirus pandemic
    - growing demand for improvement of employees' pays, working conditions and personal life
    - growing social awareness of the necessity for environmental protection
    - social behaviour oriented at pro-ecological and energy-saving efforts of industry and of the industrial environment
    - development of the specialisations that would allow for stability in jobs

It seems that in order to define the right development paths of the technological area of "materials processing" it is necessary to implement the recommendations included in the Technology Development Programme for the Silesian Voivodeship (2019-2030), and in particular (Program Rozwoju Technologii Województwa Śląskiego, 2019):

- Intensification of the work on modification and development of regional statistics to collect the data which allow quantification and reliable evaluation of the technological and innovative potential of the region.
- Further development of annual reports on the condition of technological areas together with the results of the entrepreneurial discovery process combined with the structuring of the scope and manner in which results are presented.
- Implementation, as part of the operational programmes for the Silesian Voivodeship, of the directions included in the Technology Development Programme for the Silesian Voivodeship, as well as identified areas of technological specialisations as a criterion for awarding financial support.
- Monitoring and forecasting technological development based on the continuous process of entrepreneurial discovery and foresight implementation the purpose of which is to identify the factors which determine strategic development directions and scenarios of conditions for development of prioritised technologies.

Abstract

The demand for work-life balance by employees have increased in organizations. Therefore, work life balance must be effectively managed by organization to have competitive advantage over their competitors due to fast pace of economic development. This study therefore identifies the determinants of work-life balance that influence employee performance in organization a study of Lagos state ministry of works and infrastructure. The study sought to determine the influence of flexible work arrangement, wellness programs, family responsibility on employee engagement, employee commitment and employee task performance respectively. For the study, two theories were used, the study adopted survey research design. The population size is 450 employees with sample size of 212 respondents which was determined using Taro Yamen formula. The study employed the use of stratified random sampling technique and structured questionnaire was used for data collection. The data obtained was analyzed using statistical package for social science (SPSS) while linear regression and Pearson correlation were adopted for analysis. the result showed that flexible work environment and wellness programs has effect on employee engagement and employee commitment respectively while there is strong relationship between family responsibility and employee task performance. The study therefore recommends that organization should support flexible-work arrangement, wellness programs and family responsibility to its employees for increased performance. However, organizations and decision makers should endeavor to include determinants of work-life balance such as flexible-work arrangement or wellness programs in their policies so as to improve employee performance which will have positive effect on organizational productivity.

Keywords: commitment, efficiency, employee engagement, performance

Introduction

All organizations are confronted with the challenge of guiding the strengths of their employees to the mission of attaining the goals and objectives of the firm. In order to achieve this, organizations must develop ways to influence and control the attitudes of their employees so as to maximize their contributions (Benn, Edward, and Williams, 2014). Employee performance accounts for one of the most important management aids adopted in this process. This stems from the belief that a person's performance in a work role is enhanced by having distinctive purposes, comments about their performance and complemented by a suitable compensation system. Employee performance is vital in any firm (Elnaga, and Imran, 2013), however, it has always been a main concern in the management of the organization and seeking useful techniques to encourage employees in accomplishing and delivering higher job performance as well as increasing competition among organizations which is one of the aims of every business environment (Inuwa, 2016). Therefore, studies have shown that employee performance is a key element in ascertain organizational growth and productivity.

Human resource is considered to be the most important asset in any business-oriented environment that help in the day to day activities and functions of a firm (Mudah, Rafiki & Harahap 2014). Likewise, Oluwafemi (2010) affirmed that the level of effectiveness and efficiency of organization depends on how valuable and resourceful the workers in the organization are. Employer's ability to figure out worker's contentment in relations to schedules and daily duties will greatly have an impact on worker's output and performance. In contemporary business world, the performance of employee is a crucial factor in the accomplishment of organizational objectives (Anitha, 2014). Thus, organizations must find various means of encouraging their staffs so they can contribute immensely their invaluable quota to the growth of the organization (Osibanjo, Waribo, Akintayo, Adeniji, and Fadeyi, 2019). Every plan and strategy must be centered on improving the performance of their employee. Inadequate work life balance has become a universal concern that influences organizational productivity as well as employee's welfare and performance (Osabiya, 2015). Employees in government owned organizations are constantly confronted with balancing their personal life and work role. The continual challenge of shuttling between the demand at home and work has increased the relevance of employees over the past decades (Mwangi, Boinett, Tumwet, and Bowen, 2016). This is as a result of change in the place of work and population determinants e.g. lengthy hours of work, numbers of women in labor force, use of complex communication method that does not allows instant contact within the work environment, an aging population etc. An organization thus needs to attract and conserve valuable employees in this very viable labour force. Therefore, one of the encouraging factors that can ensure the achievement of individual and organizational objectives is the introduction of work-life remunerations and policies in organizations (Dousin, Collins, and Kaur Kler, 2019).

However, work life imbalance can have an adverse impact on the employee's mental health, physical health and performance as a whole (Haar, Russo, Suñe, and Ollier-Malaterre, 2014). Work life imbalance affects the employer in such a way that it constricts the operation of its staffs thereby affecting organizational productivity (Ola 2019). Thus, there is an urgent need for organizations to be informed about actions that must be taken so as to successfully implement the management of work life balance strategies. Hence, this research study focuses on evaluating the determinants of work life balance and its influence on the employees' performance using Lagos state ministry of works and infrastructure as a case study.

Objectives of the Study

The aim of this research work is to critically examine the determinants of work life balance and its influence on employees' performance in an organization: a study of Lagos State Ministry of Works and Infrastructure, Alausa, Lagos, Nigeria. The specific objectives include to:

- evaluate the effect of flexible work arrangement on employee engagement in an organization.
- examine the impact of employee's wellness program on employee commitment in an organization.
- examine the relationship of family responsibilities on employee task performance in an organization.

Research Hypotheses

The following null hypotheses will be tested within the framework of this research work;

- There is no significant relationship between flexible work arrangement and employee engagement in an organization.
- There is no significant relationship between employees' wellness program and employee commitment in an organization.
- There is no significant relationship between family responsibilities and employee task performance in an organization.

Review of literature

Due to changes that often occur in the place of work, there is need to level up work life and non-work life of a worker. This concept is intended to enhance work precision and career stability. According to Paryani (2014) work life balance and stress are interconnected ideas. Biron & Burke (2014) opined that the concept should involve training program and proper time utilization as though, there are penalties attached to it such as work stress and melancholy. Similarly, Delecta (2011) described work life fit to be the combination of work fulfillment and excellent performance with minimal dispute. According to Oludayo, Gberevbie, Popoola & Omonijo (2015) described work life balance practices in terms of the challenges faced by employees and these include flexible work arrangement, leave policies, dependent care schemes and wellness programs.

Mungania (2017) described flexible work arrangement to be replacement of the normal work activity that allows staffs to choose the time and place so far, their responsibilities are met. This usually depends on the policies adopted by the management of the organization in enhancing worker's flexibility in terms of time and place where tasks can be performed (Mungania, Waiganjo & Kihoro, 2016). The common flexible work programs include flexi-time, job sharing, constricted work weeks, flexible shift work, part-time work flexible holidays, telecommute, controlled schedule of meetings (Mwangi, Theuri & Sang, 2018).

According to Mujtaba and Cavico (2013) wellness programs in organization surfaced as a significant matter for employers. Taylor and Don (2010) described health maintenance programs as method used for maintaining sound health status within the organization rather than amelioration of poor health. Wellness programs include athletic activities, psychological and spiritual development practices and are of benefit to the organization as they enhance employee performance thereby boosting overall productivity of the organization (Mungania, Waiganjo, & Kihoro, 2016).

According to Amazue (2013) individuals or workers who have children or elderly ones to take care sometimes risk their job by decreasing hours to be spent on work so as to cater for their family necessities. Subsequently, parenthood experiences which form an important family responsibility play an important role on how they work and balance up with their family life with little or no consequences for both men and women (Kelly, Moen, & Tranby, 2011).

Thus, it is crucial for employers to uphold work life balance practices in order to obey the statutory preconditions that grant working parents the right to flexible work arrangement, employee wellness programs and family responsibility Ojo, Salau, and Falola (2014). This will promote equal privileges within the organization as employees with family responsibilities are not deprived and are guaranteed an easy accessibility to be rewarded for work performed and job privileges. Failure to uphold work life balance practices has an adverse effect not only on the performance of employees and value of service delivery but also on their families (Quo & Zhao, 2012).

Employee performance

The achievement of a worker has continually been a crucial issue to the management of any organization (Kelidbari, Dizgah, and Yusefi, 2011). Consequently, staff's performance is a vital structure of the workplace thus, must be critically examined by the management so as to ensure successful work environment. According to Ahmad and Khurram (2011) employee achievement represents the general conviction of personnel about their behavior as well as efforts geared towards achievement of organizational objectives. Ahmad and Shahzad (2011) is of the opinion that apparent employee achievement encompasses the entire view of the personnel of organization on how they behave and participate or involve in attaining organizational objectives and proceeds to state that reward programs, performance appraisal and promotional measures are factors that determines the degree to which they perform. Likewise, Anitha (2014) describes employee performance as a measure of the employee's output that is linked with the achievement of organizational productivity and further stated that work condition, management, team and co-employee's relationship, compensation programs, codes and conducts as well as employee's appointment are the major determinants of employee performance.

An outstanding performance of an employee is essential to the workplace this is because organizational success depends on employee's creativity, innovation and dedication. Out of all these aforementioned resources, manpower is the most important. Manpower performs a significant role in tasks accomplishment. In order to improve employee performance, organizations must identify ways to ensure that employees are engaged, committed as well as workers' competency in performing their responsibilities.

According to Anitha (2014) employee engagement is the main factor that determines the success and sustainability of an organization especially where the cost of labor accounts for the larger part of the total operational cost of the organization. Bhuvanaiah and Raya (2014) posited that employers and managements of organizations need to devise strategic plans that would enable them achieve high yield while minimizing costs. Thus, employers and managements of organizations must consider investing in the interaction between workers and their work environ as it minimizes cost and enhances employee's effectiveness which therefore improves the growth of the organization.

Employee commitment on the other hand is a vital work behavior (Nongo & Ikyanyon, 2012). The level of employee commitment focuses on a number of factors such as employee contentment and organization's reward system. Thus, the complexity in and significance of understanding employee commitment makes it an important aspect of management duty.
Employee becomes committed to an organization due to various reasons. Thus, commitment exits in different forms depending on the context. Three-dimensional framework of commitment has been established by scholars based on employee's perspective (Johnson, Chang, & Yang, 2010).

They include;

- Affective commitment: This is a positive emotional bond connecting the employee as well as the organization. Here, a strong, productive relationship exists between the employee and their employer thus, making the employee to be willing to stay.
- Continuance Commitment: This is a form of controversial relationship that exists between staffs and business owners. Here, the workers feel unsettled but cannot leave as leaving would cost him a lot. This can be due to some financial implications or benefits that would be forfeited if he leaves. Such an employee stays with the organization because he or she is tied in
- Normative commitment: refers to an obligatory relationship in the workplace. Here, the personnel feel indebted to where they work and perform the duties for which he's been employed for.
- The significance of differentiating between these frameworks is that they have distinctive effects on employee attitude and this attitude has impact on the employee performance.

Theoretical Framework

This section equips other theories to understand the existence between work-life balance practices and employee performance in an organization. Two theories were adopted as a guide for this study, they include; component theory and spill over theory.

Component theory

Component theory highlights balance as a direct formative latent construct meaning that work life balance is comprised of information that presage stability and gives interpretations (Mungania, 2017). According to Baral and Bhargava (2010), professional life synergy includes stability in work hour, engagement balance and satisfaction balance. Stability in work hour means assigning equal hour for work, while involvement balance means equality in the mental effort inputted to work and satisfaction balance can be explained as the fulfillment derived in performing a given task and family responsibilities. Professional life balance includes work life dispute and work enrichment. The advantage of this theory is that one can use different work life practices that will ensure balance in the workplace. As a result, employees will be able to identify different ways in which they meet up with their responsibilities (Mungania, 2017).

Spillover theory

This theory explains that there is relationship in what transpire within the work environment and family settings (Md-Sidin, Sambasivan & Ismail, 2010). It identifies the tendency of the employee to transfer the feelings, abilities, passion and behavior they get at work into their non-work life (Md-Sidin et al., 2010). This theory may have harmful and helpful impact on the workforce. The harmful effect of it can be in form of work stress while the positive impact helps to develop employee performance. From a business perspective, positive spill over theory can directly affect the financial status of the organization. For example, positive spill over can lead to increased productivity, it can as well increase customer satisfaction, employee loyalty and vice versa.

The importance of this model to the study is that organizations institutions should have a helpful work life balance method that will encourage employee to improve on their performance or encourage them in accomplishing laid down goals.

Methodology

This research employed the use of descriptive design because it allows researchers gather detailed information and permit gathering of primary data on the factors that determine work life balance (independent variable) and its influence on employee performance (dependent variable) from Lagos State Ministry of Works and Infrastructure staffs

In this study, the population is made up of the entire staff of The Lagos State Ministry of Works and Infrastructure, Alausa, Lagos State Nigeria. As at the time of this research work the ministry had a total number of 450 employees which range from the low-level staff to the top managerial staff of different departments, based on the information given by the records department. The sample size of 212 employees was determined using Taro Yamen formula. The primary data collected through the administered questionnaire were gathered, classified, and evaluated with the use of Statistical Package for Social Sciences (SPSS).

Results and Discussion

The demographic information for the survey is illustrated in table 1. This therefore shows that the information gathered is adequate enough for the purpose of the research objective.

Table 1 Socio demographic information

S/N			Frequency	Percent
1	Gender	Male	75	41.2
		Female	107	58.8
		Total	182	100
2.	Age	21-30	49	26.9
		31-40	121	66.5
		41-50	12	6.6
		Total	182	100
3	Educational qualification	SSCE	4	2.2
		NCE/OND	10	5.5
		BSc/HND	110	60.4
		Postgraduate	58	31.9
		Total	182	100
4.	Marital Status	Single	73	40.1
		Married	109	59.9
		Total	182	100
5.	Dependent	None	56	30.8
		Parent	86	47.3
		Siblings	40	22.0
		Total	182	100
6	Position in organization	Top level	50	27.5
		Middle level	113	62.1
		Low level	19	10.4
		Total	182	100
7	Years of service	Less than 10 years	149	81.5
		10-20 years	21	11.5
		20 above	12	6.6
		Total	182	100
8	Time Spent at work	Both	34	18.7
		Day	147	80,8
		Night	1	.5
		Total	182	100
9	Hours of work	5-9 Hours	136	74.7
		10-12 Hours	46	25.3
		Total	182	100

Hypotheses Testing

In this study, three (3) hypotheses were identified and analyzed with the use of regression analysis and correlation. In regression analysis, when the significant (sig) value is less than 0.05 for 95% confidence level or less than 0.01 for 99% confidence level we accept the alternative hypothesis and reject the null hypothesis and vice versa.

- Hypothesis one

Ho Flexible work arrangement has no significant effect on employee engagement
Regression was used to test hypothesis one because it determines the cause and effect of independent variable (flexible work arrangement) on dependent variable (employee engagement)

Table 2: Regression Analysis

Model Summary	R	R^2	Adj. R^2	Std. Error of the Estimate				
	.258[a]	.066	.061	.81179				
ANOVA	Model	Sum of Squares	Df	Mean Square	F	Sig.		
	Regression	8.445	1	8.445	12.815	.000[b]		
	Residual	118.621	180	.526				
	Total	127.066	181					
Coefficients[a]		Unstandardized Coefficients		Standardized Coefficients			95.0% Confidence Interval for B	
	Model	B	Std. Error	Beta	T	Sig.	Lower Bound	Upper Bound
	(Constant)	1.576	.168		9.378	.000	1.244	1.907
	Flexible-work arrangement	.217	.061	.258	3.580	.000	.097	.336

a. Dependent Variable: Employee Engagement

b. Predictors: (Constant), Flexible Work Arrangement

Interpretation

From table 2, the Model Summary shows how much variance in the dependent variable (Employee Engagement) is explained by the model (Flexible work Environment). In this case, the R square value is 0.066 expressed in a percentage 6.6% of the variance with Flexible work environment and adjusted R square of 0.061. Also, the ANOVA table in 2 reveals the test of the statistical implication of the outcome. The ANOVA table tests the null hypothesis to determine if it is statistically substantial. From the results, the model in this table is statistically substantial (F=12.815, p=0.000). Hence, the alternative hypothesis is accepted because our p-value is less than 0.05 significant level while null hypothesis is rejected. The coefficient table depicts that a one unit increase in Flexible Work Environment (independent variable) leads to a 0.217 unit increase in Employee Engagement (dependent variable) with other variables held constant.

Decision**:** The alternate hypothesis which states flexible work arrangement has effect on employee engagement was accepted while the null hypothesis was rejected.

Hypothesis Two
H_0 Employee wellness programs have no effect on employee commitment

Table 3: Regression Analysis

Model Summary	R	R2	Adj. R^2	Std. Error of the Estimate				
	.477[a]	.227	.223	.79799				
ANOVA	Model	Sum of Squares	Df	Mean Square	F	Sig.		
	Regression	33.679	1	33.679	52.888	.000[b]		
	Residual	114.623	180	.637				
	Total	148.302	181					
Coefficients [a]		Unstand ardized Coeffi cients		Standardized Coefficients			95.0% Confidence Interval for B	
	Model	B	Std. Error	Beta	T	Sig.	Lower Bound	Upper Bound
	(Constant)	.955	.151		6.310	.000	.656	1.253
	Recognition Strategy	.421	.058	.477	7.272	.000	.307	.535

a. *Dependent Variable: Employee Commitment.*
b. *Predictors: (Constant), Employee Wellness Programs.*

Interpretation

From table 4.4.2, model summary shows how much variance in the dependent variable (Employee Commitment) is explained by the model (Employee wellness program). In this case, the R square value is 0.227 expressed in a percentage 22.7% of the variance with Employee wellness program and adjusted R square of 0.223. Likewise, ANOVA reveals the test of the statistical implication of the outcome. The ANOVA table tests the null hypothesis to determine if it is statistically substantial. From the results, the model in this table is statistically substantial (F=52.888, p=0.000). Hence, the alternative hypothesis is accepted because our p-value is less than 0.05 significant level while null hypothesis is rejected. The coefficient table reveals that one unit increase in Employee wellness program (independent variable) leads to a 0.421 unit increase in Employee Commitment (dependent variable) with other variables held constant.

Decision: The alternate hypothesis which state employee wellness programs has significant effect on employee performance was accepted while the null hypothesis was rejected.

- Hypothesis Three

H_0 Family responsibility has no significant relationship on employee task performance.

Correlation analysis was used of this hypothesis because it deals with the degree of relationship between independent and dependent variables.

Table 4: Correlation Analysis

		Family_respons ibility	**Employee_task _performance**
Family_responsibility	Pearson Correlation	1	.522**
	Sig. (2-tailed)		.000
	N	182	182
Employee_task_performan	Pearson Correlation	.522**	1
	Sig. (2-tailed) ce	.000	
	N	182	182

Interpretation

From the tables above, it shows that there is moderately positive relationship between family responsibility and Employee task performance with a Pearson correlation coefficient of r=0.522. Meaning that family responsibility affects employee task performance.

Decision**:** The alternate hypothesis was accepted which states family responsibility has significant relationship with employee task performance while the null hypothesis was rejected.

Summary, conclusion and recommendation

Summary

The main objective of this study was to ascertain the factors that influence work-life balance on employee performance in Lagos State Ministry of works and Infrastructure. The result of the findings in hypothesis one shows that flexible work arrangement has significant effect on employee engagement. This however conforms to the findings of Christopher (2014) that employees who have the opportunity to harmonize their work itinerary with their personal needs display positive characters not only in their individual life but also in their work life. The study indicated that flexible work arrangement provides employees with the opportunity to prioritize the effort they input to work at the appropriate time.

The result of the findings in hypothesis two **table 3** shows that wellness programs have effect on employee commitment. This also conforms to the result of Carlson (2014) that top managers in organizations should adopt wellness programs and genuinely show concern about the welfare of their employees. It is therefore apparent from the foregoing discussions how important wellness programs are to an organization as they ensure that employees are healthy and motivated.

The result from the third hypothesis **table 4** shows that there is moderate positive relationship between family responsibility and employee task performance. Family responsibilities comprise of derivatives that can increase the level of effectiveness by creating rooms for personal life, child care, dependent care and spending adequate time with family. Family responsibilities also stimulate social growth by ordering time and responsibility productively.

Conclusion

The study centers on determinants of work-life balance that influence employee performance a study of Lagos State Ministry of Works and Infrastructure. Considering what has been discussed from previous chapters, it is important to note that for employees to have work-life synergy, there is need for organization to put into considerations factors like flexible work arrangement employee wellness programs, and family responsibility which implies that if all the determinants mentioned above are not put in place, there would be reduction in employee engagement, commitment as well as employee task performance. Therefore, it is safe to say that the above factors or determinants have influence on employee performance.

Recommendations

In order to improve employee performance, the following recommendation should be put in to consideration

- The results from the findings show that work-balance has a positive influence on employee performance. Therefore, there is a need for organizations to continually review their policies and ensure that flexible work arrangement, employee wellness programs, and family responsibility are considered to improve employee performance.
- Secondly, managers should show support to their subordinates by ensuring that they have a good rapport with them and also treat them with respect. By so doing, employees show more dedication to their work.
- Thirdly, fitness programs, and health counseling must be organized regularly. By so doing, their level of satisfaction will increase, this would lead to increased performance.
- Organizations should ensure that training and career development programs are organized for new and existing employees. This in a way will make employees to be more engaged and also boast their confidence in doing their work.
- Organizations need to reschedule working hours and ensure that employees do not work overtime because this might lead to stress and affect their productivity.
- Organizations should provide financial and non-financial benefits to employees in order to engage them towards performing a given responsibility.

Abstract

The survival and relevance of an organisation hang on its achievement of set purpose and aspirations. Conflict can be destructive but in some other times constructive. However, if managed properly, it can have a constructive impact on employee contentment and performance. The main purpose of this research is to critically analyse the effects of conflict management taxonomy on employee performance in manufacturing industries. The manufacturing industry selected for this study is the Nestle Nigeria Plc, located at Agbara Industrial Estate, Ota, Nigeria. Descriptive survey design involving quantitative method was used for this research study to obtain data through sample selection and analysis. The data was collected over a period of 7 days. The survey started on the 5th of March and the last day was 12th of March, 2020. The data collected through the administered questionnaire was subjected to sorting and analysis. Data analysis was conducted using Statistical Package for Social Sciences (SPSS).
Three hundred and thirty-eight (338) copies of questionnaires were administered via the random sampling technique to Nestle Nigeria Plc workers., a total of two hundred and eighty-six (286) questionnaire copies were correctly collected and adequately completed, reflecting an 84.6 percent input ratio. For the analysis of results, descriptive statistics were used; linear regression analysis was also used to test all hypotheses. The findings from this study revealed that compromise, accommodation, competition and collaboration conflict management styles are significant predictors of employee engagement, commitment, task performance and productivity respectively as measures of employee performance.

Keywords: Conflict management, employee performance, Employee Commitment, Collaboration

Introduction

The survival and relevance of an organisation hang on its achievement of set purpose and aspirations. This entails the effectiveness of its material contribution with the human factor being very important (Nwaeke and Obiekwe, 2017). Nevertheless, the human factors needed to aid this achievement frequently involve in disagreement over issues like interest, opinions, and management styles amid others. This intransigent effect due to apparent mismatches is term conflict. Consequently, all organisations are faced with the challenge of guiding the strengths of their employees to the mission of attaining the goals and objectives of the firm. In order to achieve this, organisations must develop ways

to influence and control the attitudes of their employees so as to maximize their contributions (Benn, Edward, and Williams, 2014). Employee performance accounts for one of the most important management aid adopted in this process. Employee performance is vital in any firm (Elnaga, and Imran, 2013), however, it has constantly remained a main concern in organisational administration and employing active ways to manage conflicts within the organization will help inspire workers to achieve and deliver better job performance and improve the productivity of the company. (Inuwa, 2016). It is therefore believed that conflict is significant to employee performance and organizational productivity.

Employees are considered as the most important business assets that aid the day to day happenings and functions of an organization (Inunwa, 2017). Likewise, Oluwafemi (2010) believed that the organization's level of productivity and effectiveness depends on how productive and successful the organization's employees are. The ability of managers to consider the happiness of workers as it relates to schedules and everyday duties can have a direct effect on employee engagement and efficiency.

Industrial conflict is said to have started as soon as the employer-employee relationship surfaces in the course of organisational development (Malkhandi, 2018). In contemporary business world, the performance of employee is a crucial factor in the accomplishment of organisational objectives (Anitha, 2014). Thus, organizations must find various means of encouraging their staffs so they can contribute immensely their invaluable quota to the growth of the organisation. Every plan and strategy must be centered on improving the performance of their employee.

Conflict in most organizations in Nigeria has become so recurrent and alarming that it has hindered their development. This is as a result of the inability of the board of these industries to properly and effectively manage conflict that arises within the organization. This inability mostly results to high rate of strike, harmful opposition between and among employees within an organization, disrupt at place of work, truancy, lack of production, slow work, suppression of information and a host of others that are being executed by employees in an organization. Against this background, this research seeks to evaluate the effect of compromise conflict management technique on employee engagement. To study the effect of accommodation conflict management technique on employee commitment, it seeks to determine how trying to soothe the other person's feelings in order to preserve relationship affects how employees are passionate about their work. To identify the effect of competition conflict management technique on employee task performance, this research seeks to examine how being firm in pursuing one's side of the issue during conflict affect how workers get work done well at the least possible cost in good time. Lastly, to appraise the effect of collaboration conflict management technique on employee productivity, this research seeks to evaluate how bringing all concerns out in the open during conflict in order to resolve issues in the best possible way affect how employees are able to meet their daily targets.

Objectives of The Study

The main purpose of this research is to critically examine the effects of conflict management taxonomy on employee performance, a case of Nestle Nigeria Plc, Agbara Industrial Estate, Ota, Nigeria. In specific terms, the objectives of this research include;

- To evaluate the effect of compromise on employee's engagement.
- To examine the effect of accommodation on employee's commitment.
- To identify the effect of competition on employee's task performance.
- To appraise the effect of collaboration on employee's productivity.

Research Hypothesis

The following will be tested within the framework of this research work;

- H0: A significant relationship exists between compromise and commitment of employees.

H1: No substantial relationship exists between compromise and commitment of employees.

- H0: The relationship between accommodation and employee engagement is significant.

H1: The relationship between accommodation and employee engagement is not important.

- H0: A major relationship exists between competition and the success of the role of the employee.

H1: There is no important association between rivalry and the efficiency of employee tasks.

- H0: A major relationship exists between teamwork and the productivity of employees.

H1: No substantial relationship exists between teamwork and the productivity of employees.

Review of Literature

The word 'conflict' comes from the Latin 'confligere', the literal translation of which is 'to bend together or to tense'. It's a tension situation where people who rely on each other seek to achieve incompatible goals or execute different action plans (Kreyenberg, 2010).

The concept of conflict has so many prospective ideas and viewpoints; nevertheless, the whole ideological perspective of conflict is due to disagreement (Akume and Abdullahi, 2015). Conflict is perceived to be an aftermath of conduct which is an inherent part of human life (Ojo and Abolade, 2014). It occurs whenever the activity of one group is envisaged as suppressing or clashing with the objectives, aspirations or activities of another group. It may emerge from a few industrial experiences such as incompatible objectives, divergent standards and beliefs, unconstructive emotions, disparity in the interpretation of facts, or disagreement over shared resources. As earlier described, conflict tends to be related with pessimistic attributes and circumstances which results to incompetence, ineptitude or dysfunctional consequences. Sometimes, it can really fuel innovative problem solving skills and enhance the circumstance for all groups involved.

Industrial conflict has been described in numerous ways by various authors. Chukwuemeka, Ugwu, Enugu, and Igwegbe (2018) define industrial conflict as any controversy between employees and managers over a violation of terms of agreement. In as much as employees and employer heed to the terms of contract, it is certain there will be peace and harmony within the organization. Disputes resulting from violation of terms of job agreement have been recognized as one of the cause of industrial conflicts.

Abolade (2015) industrial conflict is as a result of the difference in interests and emerges from contrasting behaviours. At the entity, group or organizational level, it can happen. In the absence of common interests in organisations, conflict is thus likely to occur.

Conflict management means preventing unnecessary conflicts after noticing their early signs, before focusing on handling current conflicts constructively or maybe even facilitating and fostering beneficial conflicts (Kreyenberg, 2010). Conflict management in an organization is a process of minimizing the adverse effect of conflict and increasing the positive aspect of conflict so as to enhance and improve the performance of the employees and the productivity of the organization at large (Rahim, 2015). This is the achieved by devising effective approaches and procedures to manage these conflicts. Thus, conflict management does not essentially mean avoidance of conflict but the reduction of unproductive confrontations. This is the idea all organizations employ in order to handle effectively inevitable grudges and disagreements consistently occurring within the work environs and this helps them to make the right decision.

According to Inuwa (2016) performance is closely related to output's quality and quantity, output's timeliness, job's presence and attendance, level of efficiency and effectiveness in the completion of task. Employee performance refers to an outstanding execution of job duties by an employee or group of employees as addressed and determined by the management of the organization to an established benchmark while systematically and logically making use of the available resources within a dynamic environment. An outstanding performance of an employee is essential to the organization as the success of an organization is dependent on the employee's creativity, innovation and dedication. All organizations are set up with clear and definite goals and objectives to accomplish. These goals can only be accomplished by employing resources such as manpower, machines, materials and money. Out of all these aforementioned resources, manpower is the most important. Manpower performs a significant role in tasks accomplishment. Consequently, there has been a drastic change in the business environment due to uncontrollable environmental factors which are beyond the control of the management of organizations.

According to Longe (2015) it is convenient when the subject of the controversy is more significant to the other party. Accommodation technique entails sacrifice and concession which are often employed to satisfy the opponent in order to sustain peace and harmony within the work environment. Often times, this is used later for commendation as the party who made the sacrifice earns social credit. This technique however, does not permit the expression of individual views. People or employees who engage in accommodation strategy unavoidably hold back their grievances and resentment.

Competition involves the use of challenge or contest as a way of settling disputes most especially when the resources available for employees are limited for example when there are few job positions to be filled through promotion. In this case, one party will use better ability and intellect to surge the other party (Rahim, 2015).

This technique involves each of the parties yielding or gives up valuable thing so as to settle the dispute. This results to a no-win, no-lose situation. It leads to "no winner, no loser." It requires adjusting so as to reach an agreement (Rahim, 2015). Compromise attempts to settle dispute by trying to satisfy at least some of the grievances of both parties thus, leading to a compromised result.

According to Longe (2015) all the parties involved in the dispute openly and honestly express all their concerns, angers are cooled and solutions deliberated. Collaboration strategy functions perfectly well once it is vital to resolve a shared problem and often results to a win-win situation. It completely deals with the demands and concerns of the conflicting parties and reaches a mutual resolution.

According to Anitha (2017) employee engagement is the major factor that defines an organization's effectiveness and sustainability especially where the cost of labour accounts for the larger part of the total operational cost of the organization.

Employee commitment is vital work behaviour (Nongo & Ikyanyon, 2012). The level of employee commitment depends on a number of factors such as employee contentment, organization's reward system etc. Thus, the complexity in and significance of understanding employee commitment makes it an important aspect of management duty.

Employee task performance is an organizational outcome (Osei, and Ackah, 2015). To achieve this outcome, employees need to recognize and convert this idea into a motivating factor of achievement, consequently, employees should be provided with necessary material inputs to make them accomplish this.

According to Rohan and Madhumita (2012) employee productivity is the economic degree of amount produced per unit of effort of an employee in an organization.

Theoretical Framework

A theory is a body of reasoned supposition submitted to offer explanations to ideas, issues or hypothetical propositions. In view of this, it is pertinent to attempt a theoretical exploration as to the incidence of conflict management especially within the Nigerian environment. In doing so, this study borrows from the Marxist theories of industrial relations and expectancy theory.

Marxist (conflict) theory

The conflict theory as suggested by Karl Marx claims that because of competition for the scarce resources available, society is in a state of persistent and permanent conflict. It maintains that social order is maintained instead of agreement and agreement through superiority and authority. (Richmond, 2010). Those with affluence and authority always make effort to preserve it by any means possible mostly by suppressing the deprived and weak ones in the society. Therefore, the underlying foundation of the philosophy of conflict theory is that persons and groups of individuals work together within a society to maximize their own benefits. (Dobre, 2013).

Expectancy Theory

Expectancy theory focused on subjective precedents that engage in motivation and human interaction (Barba-Sánchez and Atienza-Sahuquillo, 2017). That is, the theory of expectation is a logical motivational philosophy based on the idea that there is a relationship between the work effort of people, the success of people in achieving this effort, and the benefits of people from their effort and performance. Specifically, people tend to be motivated when there is an assurance that their strong effort leads to good performance and good performance results to good rewards. Expectancy theory was first developed by Victor Vroom with a direct focus on organizational setting and Porter and Lawler, and others, later extended and polished it (De Simone, 2015).

Empirical Review

Several studies have looked at the effect of conflict resolution strategies on the efficiency and productivity rates of workers. Even several of these studies from their study obtained similar findings. Eunice, Jacqueline, Buyeke, Wafula and Musyoki, (2014) Examined the impact of interpersonal conflict on organizational performance, a case study of some selected hotels in the city of Kisii. The research work followed both descriptive survey and explanatory study methods, using 368 staff of specifically selected hotels. Data obtained using concise and inferential statistics is analysed. Consequently, multiple regressions were used to test the hypotheses. Results from the data analysis revealed that interpersonal conflict strategies, relationship conflict and task conflict have an important effect on organizational performance, while interpersonal conflict results have no important effect on organizational performance, respectively.

Wamocha, Nasongo and Injendi (2012) "The idea of "conflict management" in their study entitled "Intervention steps for conflict management in secondary school boarding in the western province of Kenya was indicated as a method or way of settling disagreements among two or extra people involve. The significance of the outcomes in this research work was that it provides the administrators of secondary schools with more knowledge and understanding on the mediation methods in handling conflict especially in boarding high schools. Consequently, the findings of this study

will be used to inform policy-makers, school boards, administrators, staff and students on the correct classification of a penalty for conflict management (Wamocha et al., 2019).

Obasan (2011) The impact of conflict management on employee performance was analyzed, using the branch of First Bank Nigeria Plc Lagos as a case study. To check the sense of answer, the study used a pupil distribution and use of purposeful sampling technique to pick the bank of choice randomly. 50 respondents who spread over all First Bank of Nigeria plc (Lagos Branch) were administered a self-design questionnaire. staff cadres. The study indicated that the organization 's major causes of conflict contribute to beliefs and value problems and subsequently, employees with high morale often performs their tasks excellently well when conflict is effectively managed. Thus, there is a strong connection between conflict resolution and success of employees.

Agwu (2013) With the Julius Berger Nigeria Plc case study, Bonny Island, researcher explored the connection between conflict management and employee efficiency. The study work followed a descriptive research design using 50 nominated survey respondents comprising of 25 managers and 25 non-managers of Julius Berger Nigeria Plc, Bonny Island. Much of this research work involves using cross-sectional survey research design to produce the key data needed. For the analysis of the collected data, descriptive and inferential statistics were used. The outcomes of the study revealed that there is a substantial connection between the understanding of the efficacy of conflict resolution approaches by managerial and non-managerial employees.

Methodology

Research Plan

Descriptive survey design involving quantitative method was used for this research study to obtain data through sample selection and analysis. This research plan assisted the researcher in data gathering, presentation and interpretation for the purpose of explanation**.**

Study Population

The study population refers to all the workers of Nestle Nigeria Plc, Agbara Industrial Estate, Ota and the entire population is 2,200 employees (Nestle Nigeria Plc Annual report and account, 2017).

Sample Size Determination

The computed sample size for this study is three hundred and thirty-eight (338) employees from a study population of two thousand two hundred (2200) employees using Taro Yamane formulae for sample size calculation (Taro Yamane, 1967). This study used a 5% error margin (confidence interval) and 95% confidence level in the evaluation for its sample size

Data Analysis

Data obtained by questionnaire from the respondents were collected and analysed using the Social Science Statistical Package (SPSS) as provided below.

Result and Discussion

This segment shows the personal information of the respondents based on the data collected and analysed showing their distribution as regards age, gender, marital status, educational status, position in the organization, as well as years worked in the organization.

SN			Frequency	Percentage
1	Gender	Male	162	56.6
		Female	124	43.4
		Total	100	100
2	Age	21-30	72	25.2
		31-40	83	29.0
		41-50	96	33.6
		51above	35	12.2
		Total	286	100
3	Educational Status	O'level	57	19.9
		NCE/OND	91	31.8
		HND/BSC	113	39.5
		Postgraduate Degree	25	8.8
		Total	286	100
4	Marital Status	Single	93	32.5
		Married	151	52.8
		Widow/Widower	33	11.5
		Divorced	9	3.2
		Total	286	100
5	Job Status	Senior Staff	34	11.9
		Junior Staff	107	37.4
		Contract Staff	89	31.1
		Casual Staff	56	19.6
		Total	286	100
6	Length of years	Less than 10 year	42	23.1
		11-20years	79	43.4
		21years above	61	33.5
		Total	286	100

Hypothesis Testing

Four (4) hypotheses were proposed and proven using regression analysis. In regression analysis, the alternative hypothesis is accepted and null hypothesis is rejected when the significant (sig) value is less than 0.05 for 95% confidence level or less than 0.01 for 99% confidence level and vice versa.

Hypothesis 1
Compromise has no significant effect on employee engagement.

Model Summary		R	R^2	Adj. R^2	Std.Error of the Estimate			
	1	.144[a]	.207	.173	.464292085			
Anova		Model	Sum of Squares	Df	Mean Square	F	Sig	
		Regression Residual Total	1.29697 61.22188 62.51885	1 284 285	1.29697 .21557	6.0165	.00148	
Coefficients[a]			Unstandardized Coefficients	Standardized Coefficients			95.0% Confidence Interval for B	
	Model	B	Std. Error	Beta	T	Sig.		
	(Constant) Employee Engagement	2.985 0.136	0.204 0.055	.136	14.622 2.453	0.000		

a. *Regress: Employee Engagement*
b. *Regressor: (Constant), Compromise*

Interpretation

The result presented in the Table above indicates that there is a significant association at R=0.144 between Compromise and Employee engagement. Also, from the Table above, R2 = 0.207, thus, the implication of this value is that compromise accounts for 20.7% change in employment engagement, hence, having a considerable impact on employee engagement. Mean Square Regression (1.29697) and Mean Square Residual (0.21557), to obtain F= 6.0165. The implication of this value is that the model used in this study is statistically significantly (sig= .00148). Thus, Compromise is a strong covariate of employee engagement at F (1,284) = 6.0165. From the ANOVA results, the level of significance for all parameters are less than 0.01, thus, the alternative hypothesis is accepted and the null hypothesis is rejected. Hence, Compromise has a significant effect on employee engagement.

Hypothesis 2

Accommodation has no significant effect on employee commitment

Model Summary		R	R^2	Adj.R^2	Std Error of the Estimate		
	1	.793[a]	.629	.278	.61839464		
Anova		Model	Sum of Square	Df	Mean Square	F	Sig
		Regression Residual Total	6.87318 108.60501 115.47819	1 248 258	6.87318 .382412	17.973	.0018
Coefficients			Unstandardized Coefficients	Standardized Coefficients			95% Confidence Interval for B
	Model	B	Std. Error	Beta	T	Sig	
	(Constant) Employee Commitment	3.875 0.733	0.197 0.055	.733	19.674 -1.341	0.000	

a. Regress: Employee Commitment
b. Regressor: (Constant), Accommodation

Interpretation

The result presented in the Table above indicates that there is a significant association at R=0.793 between Accommodation and Employee commitment. Also, from the Table above, R2 = 0.629, thus, the implication of this value is that accommodation accounts for 62.9% change in employment commitment, hence, having a considerable impact on employee commitment. The F-value is calculated from division of Mean Square Regression (6.87318) and Mean Square Residual (0.382412), to obtain F= 17.973. The implication of this value is that the model used in this study is statistically significantly (sig= .0018). Thus, Accommodation is a strong covariate of employee commitment at F (1,284) = 17.973. From the ANOVA results, the level of significance for all parameters are less than 0.01, thus, the alternative hypothesis is accepted and the null hypothesis is rejected. Hence, Accommodation has a significant effect on employee commitment.

HYPOTHESIS 3

Competition has no significant effect on employee task performance.

Model Summary		R	R^2	Adj.R^2	Std.Error of the Estimate		
	1	.573[a]	.328	.226	.253870668		
Anova		Model	Sum of Square	DF	Mean of Square	F	Sig
		Regression Residual Total	0.60306 18.30380 18.90686	1 284 285	0.60306 .06445	9.35702	.00033
Coefficients			Unstandardized Coefficients	Standardized Coefficients			95% Confidence Interval for B
	Model	B	Std .Error	Beta	T	Sig	
	(Constant) Employee Task Performance	4.458 0.192	0.073 0.020	.192	60.778 -0.967	0.000	

Intrepretation

The result presented in the Table above indicates that there is a significant association at R=0.573 between Competition and Employee task performance. Also, from the Table

above, R2 = 0.328, thus, the implication of this value is that competition accounts for 32.8% change in employment task performance, hence, having a considerable impact on employee task performance. The F-value is calculated from division of Mean Square Regression (0.60306) and Mean Square Residual (0.06445), to obtain F= 9.35702. The implication of this value is that the model used in this study is statistically significantly (sig= .00033). Thus, Competition is a strong covariate of employee task performance at F (1,284) = 9.35702. From the ANOVA results, the level of significance for all parameters are less than 0.01, thus, the alternative hypothesis is accepted and the null hypothesis is rejected. Hence, Competition has a significant effect on employee task performance.

Hypothesis 4

Collaboration has no significant effect on employee productivity

Model of Summary		R	R2	Adj.R	Std.Error of the Estimate		
	1	.208[a]	.431	.431	.309710954		
Anova		Model	Sum of Square	DF	Mean of Square	F	Sig
		Regression Residual Total	1.17584 27.24128 28.41712	1 284 285	1.17584 .09592	12.25855	.00072
Coefficients			Unstandardized Coefficients	Standardized Coefficients			95% Cofidence Interval for B
	Model	B	Std.Error	Beta	T	Sig	
	(Constant) Employee Productivity	4.312 0.265	0.120 0.034	.265	35.994 -0.350	0.000	

Intrepretation

The result presented in the Table above indicates that there is a significant association at R=0.208 between Collaboration and Employee productivity. Also, from the Table above, R2 = 0.431, thus, the implication of this value is that collaboration accounts for 43.1% change in employee productivity, hence, having a considerable impact on employee productivity. The F-value presented is calculated from division of Mean Square Regression (1.17584) and Mean Square Residual (0.09592), to obtain F= 12.25855. The implication of this value is that the model used in this study is statistically significantly (sig= .00072). Thus, Collaboration is a strong covariate of employee productivity at F (1,284) = 12.25855. From the ANOVA, the level of significance for all parameters are less than 0.01, thus, the alternative hypothesis is accepted and the null hypothesis is rejected. Hence, Collaboration has a significant effect on employee productivity.

Conclusion/Recommendation

The findings of this research have demonstrated the significant role of conflict management approaches and thus encourage organizations to adopt these approaches as they motivate employees towards achieving the goals of the organization. Also, this study expressed the need to create awareness on conflict management styles within organizations as they are crucial in ensuring the achievement of the organization's objectives. The results of this study recommend that organizations should cautiously design a suitable approach in the adoption of conflict management practices so that they complement one another in making sure that the goal of both the organization and employees is accomplished.

Finally, this study recommends that management or policy makers in organizations should evaluate and make policies that support conflict management practices thus, ensuring that employees are adequately motivated on the job. Also, appraisal of conflict management practices in terms of how they contribute to the achievement of organization's objective and employees' performance should be ensured. This will in turn increase worker's morale leading to a competitive advantage over greater commitment levels, employee engagement, task productivity levels and better performance.

Acknowledgement

The authors wish to express their profound gratitude to Covenant University Centre for Research, Innovation and Discovery(CURID) for the financial support and assistant to publish this study.

Abstract

This study examined online newspapers reportage of COVID-19 in Nigeria during the lockdown period with a focus on the frequency, depth of coverage, story format and news sources. For epidemic/pandemic disease control, knowledge is critical. For the population, public health crises like COVID-19 and the ensuing lockdown instituted a challenging time, especially towards the identification of valid updates on the local and international situation, as well as avoiding rumours and conspiracy theories. Two widely read newspapers were content analysed within the month of April. However, it was observed that the coverage of COVID-19 stories was not frequently reported in both newspapers. Punch reported seventeen (17) while the Nation only reported nine (9) for the whole of April. Also, the coverage was not in-depth, as most reported stories were short and mostly straight news. It was also observed that the media cited more of the government officials, the society, and the Nigeria Centre for Disease Control (NCDC). Most common topics were coverage of cases in Nigeria, death rates, closures of businesses, risk of COVID-19 to essential health workers and worries about Nigeria's preparedness. However, there were few or no stories on sensitising the public about the virus. The online newspapers should capitalise more on educating the people on the best practices to take in curbing the spread of the virus. The Agenda Setting Theory propounded by Marshall McCombs and Shaw, as well as the Technological Determinism Theory by Thorsten Veblen, were the foundation theories for this study.

Keywords: Online Newspapers, COVID-19, Awareness and prevention, Lockdown.

Introduction

COVID-19 is an infectious disease caused by the novel Coronavirus now called severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2; previously called 2019-nCoV) (Cennimo, 2020). It was first identified amid an outbreak of respiratory illness cases in Wuhan City, Hubei Province, China in December 2019. Wuhan is Central China's most populous city, with a population of about 11 million (Li, 2020). All Covid-19 cases discovered were related to Huainan Seafood in Wuhan Wholesale market, which trades in fish and livestock species, including bats, snakes, and marmots (Sohrabi et al., 2020). Since its outbreak, more than 1 million people worldwide have died from the virus, including Nigeria. However, over 26 million people were reported to have recovered from the virus, with over 7 million active cases as of October 6, 2020 (Worldometer, 2020). This is the third severe Coronavirus outbreak in less than 20 years, following SARS in 2002-2003 and Mers in 2012 (Yang et al., 2020).In January 2020, the World Health Organization declared the COVID-19 outbreak a global health emergency (WHO, 2020).

Unfortunately, on February 27, 2020, the first case of Covid-19 was confirmed in Lagos, the commercial capital of Nigeria, with a population of 21 million. The index case came from Milan, Italy, then the fourth high-incidence country (371 cases) and entered the country on February 25, 2020, via Lagos Airport. Where there was nothing serious on the ground from suspected places with acute infections to check or monitor new entrants into the world. The man who worked at Lafarge Cement Corporation, a multi-billion-dollar multinational, went to a meeting at the company's factory in Ewekoro, Ogun State, an adjacent form to Lagos. The case was identified at the Lafarge medical centre in Ewekoro when he declared ill, was sent for testing, and confirmed he had the Covid-19 virus (NCDC, 2020). After that, more cases were discovered.

There were over 4000 reported cases of Covid-19 and 150 deaths as of May 11, 2020, in Nigeria, which is the most populated Nation on the continent with an estimated population of 200 million (NCDC, 2020). This informed the government's decision to impose a compulsory an initial two weeks lockdown in the three high-risk states (Lagos, Ogun, and Abuja) in April 2020 as part of the measures to reduce the spread of the virus (CNBC Africa, 2020) which was later extended by an additional two week period (Nairametrics & Olisah, 2020). During this period, many people sought the media for information on the best practices to adopt to stay safe (Anwar et al., 2020).

Mass media are recognised as a powerful force that shapes how we experience the world and ourselves (Ivan et al., 2020). Media are one category of several technologies developed to accelerate, smoothen, and make information accessible betimes or on-demand. The role of mass media, including Television, Radio, Print and recently Social media, in the curbing of past pandemics (Ebenso & Otu, 2020), has remained influential. Knowledge has also been disseminated through these media on positive public health measures such as social distancing, hand washing, respiratory hygiene, and government strategies in combating outbreaks (Mustapha et al., 2020). The pervasiveness of the Internet and the degree to which it relies on specific facets of human life especially during the pandemic make it hard to believe that the Internet only became available to the public commercially in the 1980s (Amodu et al., 2019).

In December 2019, in Wuhan Province, China, the coronavirus outbreak created an explosion of health problems and crises for different media outlets to cover, including newspapers. Since its inception, the spread of the pandemic may have genuinely engaged newspaper organisations in a news rivalry. The media, including the newspaper organisations, may have embarked on a reporting spree since the outbreak to keep the public fully aware of the prevalence, deaths, and preventive measures (Adegbija et al., 2013).

Now, regardless of the impact of the global pandemic which affected many businesses including the media industry, they must carry out their role as the "Fourth Estate of the Realm" and the "watchdog of culture" in liberal theory, suggesting that the media exist as an instrument of information sourcing and distribution, promotion of education, surveillance, social enlightenment, and mobilisation. Such roles distinguish the media as an essential one. The conventional Newspaper business model, underpinned by advertisement and distribution, may have collapsed from the shock of the unprecedented epidemic/pandemic (Ajasa & Okere, 2019). One of the conclusions from the results of (Cribb et al., 2020) released in April 2020, demonstrated that the Coronavirus epidemic had forced publishers in America to move quickly to minimise print-related expenditures and shift their business models to news and information channels that are more digitally based. In Nigeria, however, Punch newspapers, one of the largest publications in the Nation, decreased the number of pages of its print media from 62 to 32, while attempting to place more focus on its web arm (Odutola, 2020).

For epidemic/pandemic disease control, knowledge is critical. Panic in the population is caused by the inaccurate transmission of information (Ahmad & Murad, 2020). For individuals and families, public health crises like COVID-19 lockdown was a challenging time (Mustapha et al., 2020). The identification, evaluation, and response to rumours, stigma, and conspiracy theories and their effect on public health in real-time are a challenge for novel epidemic and pandemic diseases.

Social media functions as a two-edged sword despite the Nigerian situation as it allows people to be privy to data without impediments. This same method, however, has been used to misinform the population and circulate unverifiable and misleading messages to people. Online newspapers have been described as one of the most vital outlets among the public to track disinformation and debunk rumours, stigma, and conspiracy theories (Obi-Ani et al., 2020).

As a type of mass media, newspaper play a significant role in educating people about current events in various sectors of life, keeping them up-to-date with recent events (Kilgo et al., 2019), and in particular about this COVID-19 pandemic during the COVID-19 lockdown, and how to stay healthy and how best to respond to it. If newspapers are unable to deliver the correct information, individuals may take actions that may be harmful to their wellbeing, and this may impact the public (Chowdhury & Halder, 2016). Studies analysing media coverage of COVID-19 lockdown are scarce, to the best of our understanding. This paper is one of the first to research the quality of the COVID-19 outbreak coverage in Nigerian newspapers during the lockdown.

The latest research aims to display media coverage of Nigeria's COVID-19 pandemic. It also helps to assess whether media attention increases awareness and educates the masses about the preventive steps to be taken. In Nigeria, the focus was on two widely read newspapers: The Nation and Punch. The following objectives and questions guide this study:

1. To ascertain the depth of COVID-19 content that the sampled online newspapers published during the COVID-19 lockdown.

2. To evaluate the consistency with which online news published updates on COVID-19 in the sampled newspapers.

3. To examine the story format used by the sampled newspapers in the coverage of the COVID-19 outbreak in Nigeria.

4. To find out the dominant news sources engaged by the sampled newspapers in the reporting of the COVID-19 outbreak.

Literature Review

Agenda Setting Theory was propounded by Marshall McCombs and Shaw in 1972 (McCombs & Shaw, 1972). The theory believes that there is a substantial correlation between media coverage and the rating of public concerns by people. The theory provides a connection between the rate at which the media and the importance report a story that individuals place on such a story. This shows that the media dictate which issues society should consider being more relevant. This is achieved by reporting frequency, prominence given to the reports by headline display, images, newspaper layout, magazines, graphics, or timing. During the COVID-19 lockdown, people depended on the media as their source for information.

Technological Determinism Theory by Thorsten Veblen in 1967. The theoretical framework used in this study is the Technological Determinism theory. This theory postulates that technology dictates how the future of society will be (Bimber, 1990). Thorsten Veblen coined the term 'technological determinism', and this revolves around the idea that technology defines the nature of its community (Brette, 2003). During the lockdown, a lot of businesses focused more online because of the movement restriction in place which also affected the sale of printed newspapers thus causing most newspaper organisations to place more focus online especially during the period of lockdown (Odutola, 2020).

Technological determinism is primarily used as the concept of a critic, used to refute such classes of theoretical and empirical statements. According to (Bimber, 1990), Marx's literature reveals contradictory claims regarding technology's role in social change. Most of the topic can be due to uncertainty about what 'Technological Determinism' entails. There are many approaches to this concept:' Standard-Based Accounts' interpret Technological Determinism as a mostly cultural phenomenon;' Unintended Consequences Accounts' interpret it in terms of the technical enterprise's unforeseen social outcomes.

One of the issues with technological determinism is that it leaves no space for human choice or interference and, in addition, relieves us of responsibility for the technologies that we produce and use. If technologies are built beyond collective interests, therefore the application and consequences of these technologies have very few choices for employees, residents, and others (Hackett et al., 2008). This serves the needs of those responsible, irrespective of whether they are consumer goods or power stations, for creating new technologies.

According to (Smith et al., 1994), a sense of technology's power as a crucial agent of change has a prominent place in the culture of modernity. It belongs to the body of the widely shared tacit knowledge that is more likely to be acquired by direct experience than by the transmittal of clear ideas. If the technology takes an inexorable course, then technological determinism helps all of us to disclaim responsibility for and mock the technological decisions we make individually and collectively. Technological determinism is a useful and influential viewpoint, more productively interpreted as referring to arguments that put a greater focus on the autonomous and social-shaping patterns of technology (Dafoe, 2015).

Methodology

A quantitative content analysis research design (CA) in online newspaper reporting was used to study the COVID-19 lockdown scourge in Nigeria. Two widely read Nigerian newspapers available online were selected for this study. The Vanguard and Punch are the newspapers. These newspapers were chosen due to their national reach and readership. Furthermore, since they are popular in the west (Ogun and Lagos), they were selected. The coverage deadline was April 2020. This time was chosen because the first lockdown was introduced by Ogun, Lagos and Abuja in Nigeria, which was later extended to its second phase by another two weeks to curb the spread of the virus. For the sample size, two widely read newspapers in Nigeria: Punch and The Nation.

Sampling Technique

On the newspaper website, an online search was carried out using keywords such as “COVID-19”, “COVID-19 outbreak”, “COVID-19 lockdown”, “COVID-19 prevention”, and “COVID-19 knowledge”. Thirty-three articles consisting of articles in ‘news’, ‘editorials’, ‘feature’, and ‘opinion’ were retrieved by the total quest. For inclusion, articles required to report on COVID-19 in Nigeria were included; therefore, articles on the reporting of COVID-19 in other countries were not included. Furthermore, papers that merely listed coronavirus in the body were also omitted. Using these parameters, seven papers were omitted, leaving a final list of 26 articles for review.

Unit of Analysis

The unit of analysis for this study were news stories on COVID-19 found under the sections; news, editorials, features and opinion.

Depth of Coverage and Frequency

To realise the depth of coverage, the word counts were noted and classified as long, short or medium for each article. For instance, 400-word news stories were deemed long, while 200-399-word stories were deemed medium, and 1-199-word stories were deemed short. This categorisation refers to previous studies (Apuke & Tunca, 2020). Also, to determine the frequency, the research checked and selected the number of articles of COVID-19 outbreak in Nigeria during the lockdown.

FIG 1. ARTICLES SELECTION FLOW CHART (analyzed from Punch & Nation Online newspaper April 2020)

The researcher downloaded 33 articles on COVID-19. 5 were excluded for containing COVID-19 stories in different countries. Two were further excluded for not having adequate information on COVID-19. 26 articles were analysed. Twenty-four of the articles were news, while one was an opinion and the other a feature.

Results

RQ1. What is the level of consistency of published news updates on COVID-19 outbreak in the online newspapers during the lockdown?

Table I.

Table I: Frequency of COVID-19 coverage in April 2020

Newspaper	No. of stories covered	Frequency (%)
Punch	17	65.4
Nation	9	34.6
Total	26	100

The conclusion from this content analysis study revealed that newspapers were not ready for the lockdown because of the inconsistency in the reportage of news stories online, as revealed in table I. Furthermore, the researcher discovered that the stories were few or far between. The result shows that neither of them published one story each day in 28 days. This reason could be because they were unprepared and had not fully recovered from the shock of the pandemic. Also, the number of stories published from both newspapers demonstrated that the public had insufficient information about the COVID-19 outbreak in Nigeria during the period of lockdown. The public was less enlightened on precautionary measures to take to curb the spread of the virus. However, knowledge is crucial in the struggle to curb epidemic/pandemic. Inaccurate or intentional misinformation could lead to panic. This is not a patent mitigator in the campaign to adequately inform the public on staying safe and healthy during such seasons.

RQ2. What is the level of depth of coverage of the COVID-19 outbreak published in the online newspapers during the lockdown?

Table II.

Table II. Depth of words in the articles								
Newspaper	400 and above (long) (%)		200–399 (medium) (%)		1–199 (short) (%)		Combined total (%)	
Punch	3	(75)	11	(64.7)	3	(60)	17	(65.4)
Nation	1	(25)	6	(35.3)	2	(40)	9	(34.6)
Total	4	100	17	100	5	100	26	(100%)

As revealed in table II, the depth of content in both newspapers under investigation is a matter of concern because very few of their stories provided the detailed public information on COVID-19, awareness, and prevention. This categorisation is consistent with prior research (Apuke & Tunca, 2019). The Punch and the Nation newspaper are among the most widely read newspapers in Nigeria, and one would expect from them comprehensive and credible information about the virus and most importantly during the lockdown period when the movement was restricted. People who could not get the printed newspaper to buy or read because of the lockdown would have wanted to get updated news about the virus online. Since sufficient information on the virus was unavailable to the readers on the Punch and the Nation newspaper online, readers may have sought for information from other sources that may not be credible or reliable and which could have an adverse effect on their health. The lack of in-depth information in the newspaper articles could be because journalists are under pressure to produce content rapidly in the contemporary digital news environment (Veen & Thomas, 2020).

RQ3. What is the story format used in the coverage of the COVID-19 outbreak in Nigeria during the lockdown?

Table III.

Table III Story Format						
Newspaper	News (%)		Opinion (%)		Feature (%)	
Punch	15	(62.5)	1	(100)	1	(100)
Nation	9	(37.5)	-	-	-	
Total	24	100	1	100	1	100

Table III shows a significant variation in story format. The News story format was dominantly used by both newspapers, The Punch (62.6%) and the Nation newspaper (37.5%). However, a trivial number of feature and opinion also constituted a source of the Punch and the Nation newspaper. This study result in table III is also consistent with similar research that analysed the reportage of COVID-19 outbreak in Nigerian newspapers (Apuke & Omar, 2020). We, therefore, maintain that Nigerian newspapers use more straight news because they are more concerned with delivering the information on COVID-19 first-hand to the public.

RQ4. What are the dominant news sources of COVID-19 outbreak in the sampled newspapers during the lockdown?

Table IV.

Table IV Sources Cited						
	Punch (%)		Nation (%)		Combined Total	
Other Government Officials	7	(41.2)	4	(44.4)	11	(42.3)
Society (citizens, corporate bodies/agencies, business and so on)	6	(35.3)	2	(22.2)	8	(30.8)
NCDC	3	(17.6)	1	(11.1)	4	(15.4)
Health Officials	-	-	1	(11.9)	1	(3.8)
Newspaper reporters/editorials	1	(5.9)	1	(11.9)	2	(7.7)
Total	17	100	9	100	26	100

Table IV sought to determine the sources of media reports on COVID-19 pandemic in Nigeria. The researchers aim is to discover the most sources cited across the sampled newspapers. The results revealed variation in the usage of sources. The highest source cited in the two newspapers was by other government officials (42.3%) followed by the society (30.8%), NCDC (15.4%), Newspaper reports (7.7%) and the least sources came from Health officials (3.8%), this was a striking aspect of the result as only a few sources came from the health officers during the period of lockdown. In these critical health circumstances, such as the latest coronavirus pandemic, one of the vital resources of the mass media are from the health officials.

Discussion

Based on the interview given by nairametrics in May, as cited in (Odutola, 2020), It was revealed that the Punch and the Nation newspapers did not make any financial or business profit during the lockdown period. This result is consistent with the study by Obadofin (2020). The pandemic was unprecedented as most of the newspaper organisations were unprepared for the sudden economic downturn that resulted in a massive loss in April 2020 (Mustapha et al., 2020). For this purpose, some newspaper organisations have had to lay off their staff and cut down on their newspaper pages to cushion the effect of the pandemic. The reason they suffered significant loss during this lockdown could be because they relied heavily on the adverts from the printed version of the newspaper; this conclusion is consistent with Osunrinde, (2020) findings. According to the Nairametrics, for Punch, one of the reputable and widely read newspapers in Nigeria, they explored the option of slashing pages of their dailies from 62 to 32 pages. In the case of the Nation, findings revealed that the medium served over 100 staff across the department's letters of disengagement. The Nation also slashed salaries of staff earning over N60,000 by 50% (Odutola, 2020).

Concerning the frequency of coverage, we found out that the media reported 26 stories (Punch, 22 and the Nation, 9) on COVID-19 outbreak in Nigeria in April 2020. However, this outcome is contrary to a research by (Apuke & Omar, 2020) which found out that Daily Sun, Daily Trust, Vanguard, and Leadership newspaper had many published stories on COVID-19 during the period under review. This study also discovered that the story format used for more than half of the information is that of the straight news format, which is consistent the researcher's result. We, therefore, maintain that Nigerian newspapers use more straight news because they are more concerned with delivering the information on COVID-19 first-hand to the public.

Additionally, previous research has shown that the source of news plays a vital role in assigning significance to some aspects of the issue (Dwivedi et al., 2020). From this viewpoint, we have found that news from the Government officials (42.3%), the society (30.8%) accompanied by the NCDC (15.4 %) was the primary source cited. Furthermore, the news source attributed to these stories were applaudable because the sources were valid. However, the information contained little or no recommendations on what steps citizens can take to prevent contracting or spreading the virus within the context of Nigeria since they were getting sources from NCDC, the federal government and the ministry of health. A possible reason for referencing the NCDC more in the newspapers could be the fact that they are accountable for handling infectious diseases in Nigeria. However, news from the ministry of health and newspaper reporters or editorials have been sparingly cited. Besides, we noted that newspaper reporters/ editors themselves were the least cited sources. This outcome is somewhat different from that of Asaolu et al., (2016), who found that the most widely quoted sources in the coverage of the Ebola crisis in Nigeria were reporters/editors and medical experts. We argue that because a large number of the stories quoted government officials, such as ministers, senators, House of Representative Members and presidential spokespersons, there are possibilities that politics could influence true coverage of the COVID-19 outbreak in Nigeria. Adesoji (2006) stressed that due to its active

involvement with partisan politics, the Nigerian media had been found lacking. The media regulatory authority should therefore be more sensitive to media coverage and representation by further controlling media acts (Itabiyi et al., 2019), especially in the reporting of stories on sensitive issues.

Limitation of the Study

This research focused only on COVID-19's online newspaper reports. The month of April, which was the time when the government implemented the lockdown as part of efforts to curb the epidemic's spread.

Conclusion

We conclude that online newspapers in Nigeria paid little attention to the COVID-19 outbreak during the lockdown period, as demonstrated in the frequency of reporting, the news stories were not detailed therefore lacked depth and also most stories were straight news. The conclusion to the issue of the COVID-19 outbreak from this content analysis study revealed that newspapers were not ready for the lockdown because of the inconsistency in the reportage of news stories. We contend that the Nigerian online newspaper did not do enough in creating awareness of the outbreak during the lockdown period. Furthermore, the news sources attributed to these stories were applaudable because the sources were valid. However, the stories contained little or no recommendations on what steps citizens can take to prevent contracting or spreading the virus within the context of Nigeria since they were getting sources from NCDC, the federal government and the ministry of health. Public health crises like COVID-19 and the ensuing lockdown instituted a challenging time, especially towards the identification of valid updates on the local and international situation. However, for epidemic/pandemic control, knowledge is crucial in the struggle to curb epidemic/pandemic, and panic caused to inaccurate or intentional misinformation is a patent mitigator in the campaign to adequately inform the public on staying safe and healthy during such seasons

Recommendation

Online newspapers are recommended as preferable information sources at such times among the public to not only stay informed, but also track disinformation, rumours, and conspiracy theories. This paper is one of the first to research the coverage quality of the COVID-19 outbreak in Nigerian online newspapers during the lockdown period in April 2020. This could be done by increasing their emphasis on educating the public about the pandemic mode of infection and transmission, symptoms, risk, face mask use, hand washing with hand sanitizer and social distancing. To inform and educate Nigerians about the pandemic, they should provide opinions and editorials, as well as include a thorough overview of the measures to be taken to curb the spread of the virus.

Abstract

The construction of a modern tyre, due to its durability and resistance to external factors, is very complicated. The tread is undoubtedly the most important element of a tyre. Its design and thickness have an impact on driving comfort. Lack of driver's reaction to the signals and alerts coming from the monitoring system exposes the company to losses in the form of too early tyres being worn out, increased combustion and even damage to the axle or transported goods. Therefore, it was advisable to develop a continuous monitoring system enabling pressure and temperature measurements with a frequency adjusted to the vehicle's driving course, and enabling the reduction of data stream for the management of vehicle operation procedures, e.g. by controlling the drivers' decision-making process. The purpose of paper is to determine the impact of installing the developed system of continuous monitoring of tyre performance values on the tread wear of truck tyres. With the installation of a performance monitoring system on a tyre it is possible to react quickly and make decisions about the condition of the tyre (e.g. regrooving or replacing the tyre). The paper presents data on the abrasive tread wear of tyres in vehicles with and without a system. Statistical calculations have also been made - statistical tests of the significance of differences in tread wear.

Keywords: Tread Wear, Tire, Monitoring, Pressure.

Introduction

The construction of a modern tyre, due to its durability and resistance to external factors, is very complicated. The tread is undoubtedly the most important element of a tyre. Its design and thickness have an impact on driving comfort. The tread is made of a rubber layer of variable thickness. It consists of a front, shoulder and side parts, In study by Chomka et al. (2012).

Due to the structure of the tread pattern, a distinction is made between summer, winter, off-road and universal tyres. Tyres should be selected according to their needs and purpose. Tyres for long-distance, regional, mixed or other applications have different, often divergent characteristics. In addition to the type of tread, the most important thing to choose is to match the right tyre size to the vehicle. Poor tyre selection can result in malfunctioning ABS, ESP and other electronic systems calibrated to a specific tyre size. Identical tyres should be fitted on one axle. Authors as: Polasik et al. (2017), Schlie and Yip (2000), Meyer (2006) have indicated that, is particularly important as different types of tyres may have different traction parameters. The main factor which significantly weakens the tyre is the improper use of the tyre. Many drivers at the wrong time (usually too late) change tires for season-related tires (summer and winter tires). Using a tyre designed to be used at a different time of the year contributes significantly to excessive tire wear In study by Mukherjee (2014). Therefore, Toretta et al. (2015) mentioned that, the service life of a tyre (its service life) will be determined both by its structure and by the appropriate tyre operation adjusted to the conditions and driving course.

Cite this Article as: Bożena SZCZUCKA-LASOTA, Joanna KAMIŃSKA, Iwona KRZYŻEWSKA and Krzysztof WILCZYŃSKI " Impact of The Installed Tire Pressure Monitoring System (TPMS) In Heavy Transport Vehicles on Tread Wear Height in Tires." Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

An unresolved problem in the car fleet of transport companies is the inability to immediately check whether the driver reacted properly to the monitoring signal. One of the tasks of drivers is to react to the emerging alerts as well as to track the tread height in tires, In connection with authors: Chomka et al. (2012), Polasik et al. (2017), Schlie and Yip (2000), Oduro et al. (2013), Meyer (2006), Mukherjee (2014), Toretta et al. (2015), Skarbek-Żabkin and Kamińska (2015). Lack of driver's reaction to the signals and alerts coming from the monitoring system exposes the company to losses in the form of too early tyres being worn out, increased combustion and even damage to the axle or transported goods. Therefore, it was advisable to develop a continuous monitoring system enabling pressure and temperature measurements with a frequency adjusted to the vehicle's driving course, and enabling the reduction of data stream for the management of vehicle operation procedures, e.g. by controlling the drivers' decision-making process. The installed system of continuous monitoring of tyre operating parameters allows for the sudden detection of tyre pressure drops and sudden temperature increases. In addition, it will enable the generation of alarms and alerts, which allows for immediate response and decisions on corrective actions in the tyre life process. The system indirectly reduces fuel consumption and waste in the form of used tyres as well as tyre tread wear and improves the passive safety of trucks.

The purpose of paper is to determine the impact of installing the developed system of continuous monitoring of tyre performance values on the tread wear of truck tyres. With the installation of a performance monitoring system on a tyre it is possible to react quickly and make decisions about the condition of the tyre (e.g. regrooving or replacing the tyre). The paper presents data on the abrasive tread wear of tyres in vehicles with and without a system. Statistical calculations have also been made - statistical tests of the significance of differences in tread wear.

Material and Methods

Of all the vehicles available in the company's fleet, 10 sets consisting of 6x2 three-axle trucks and MegaTele trailers were selected for the basic tests, as it was found that, for these sets, the operating conditions of the vehicles would be the closest to each other in terms of length of journey, weight of goods transported, etc. In addition, these sets are the most used vehicles in the company investigated. A monitoring system has been installed in five sets of vehicles. The performance monitoring system has been developed specifically for use in fleets of vehicles to meet challenges such as: quick response to changes in tyre pressure and temperature parameters to increase passive vehicle safety. It was assumed that an immediate response to changes in the monitored parameters will enable the proper use of the tyres, contributing to a reduction in operating costs (maintenance, excessive tread wear, fuel consumption). It was validated and verified.

The vehicles (truck + trailer) are identified by the letters A to E (for monitored vehicles) and A_N to E_N (for non-monitored vehicles). The test material are tyres. For the purpose of the test, new tyres (from Michelin) have been purchased and fitted to all vehicles tested. The truck tyres used for transport in the vehicle fleet of the company tested vary in size:

- 22.5 inches used for trucks,
- 17.5 inches used for trailers.

During the tests, undamaged tyres were not replaced or converted to a different axle-layout. These tyres were only inflated, and some of them were regrooved. The tyres for each vehicle were marked using the marking system adopted in Figure 1 (Fig 1.).

Example recording: vehicle A - 1D tyre - means the tyre D in the first axle of vehicle A.

In the surveyed company, tread depth measurements are made with a manual laser scanner. The manual laser scanner (Fig 2.) measures the height of the tyre's tread by scanning the entire tread surface, giving an average result based on point measurements. This result is affected by a measurement error of 0.1 mm.

Fig 1. Model of tires symbol (own study)

Fig 2. Handheld laser scanner to measure tread height (own study)

Tread height measurements were carried out in the same way for all tyres of both monitored and unmonitored vehicles with the monitoring system.

The tread height was measured with a handheld laser scanner with an accuracy of 0.1 mm. Measurements were made both in selected vehicles of the company's car fleet without an installed system and in those with a system of

continuous monitoring of pressure and temperature in the tyres. Each time the vehicle descended to the transport base, the tread height of the tyres was measured. When a value equal to or less than 4 mm was obtained for at least two tyres, the tread was regrooved. The tread was extented (regrooved) in all tyres except the tyres on the first axle of the truck, as this is not in accordance with the applicable legislation.

Result

Analysis of measurement results for vehicles without a monitoring system installed

The tables (Tables 1-4.) show the tread height measurements in selected vehicles without monitoring system. Tire tread height for a three-axle trucks with 6×2 drive B_N vehicle took place in July, while for C_N vehicle the tread had to be regrooved already in June. The highest abrasive wear of the tread was recorded for the third axle of the vehicles (Tables 1-2). This axle is the most stressed in the analyzed trucks.

Table 1: Measurement of the tread height [mm] of vehicle tyres B_N (own study)

Vehicle B_N	Measuring tread height [mm] per month:						
tire symbol	December	February	April	June	July	Extension	September
1A	13	12	12	11	10	10	10
1D	12	12	12	11	10	10	10
2A	11	11	10	10	8	8	7
2D	11	11	10	10	7	8	7
3A	12	9	8	8	7	8	7
3B	14	7	6	6	6	8	8
3C	14	7	7	6	4	6	5
3D	14	7	6	6	4	6	5

Table 2: Measurement of the tread height [mm] of C_N vehicle tyres (own study)

Vehicle C_N	Measuring tread height [mm] per month:						
tire symbol	December	February	April	June	Extension	July	September
1A	11	10	10	10	10	10	10
1D	11	10	10	10	10	10	9
2A	10	10	9	9	9	8	7
2D	10	10	10	7	8	7	6
3A	12	7	7	5	7	6	5
3B	12	7	5	4	6	6	5
3C	11	5	5	3	5	5	4
3D	11	7	6	5	7	7	6

Similar results were obtained for the remaining vehicles. In order to facilitate the interpretation of the results, diagrams were prepared (Fig 3.). The column diagram showing the measurements of the tread height during the successive months of tyre operation for a truck (B_N vehicle) clearly shows the changes in tread height, indicating the abrasive wear of the tyres during operation.

For the most heavily loaded third axle of the analyzed vehicle, changes in tread height from 1 to even 7 mm between consecutive months were recorded. The tread height in the third axle of the vehicles changed by up to 50%

during the winter months. The biggest difference was observed between the initial value (14 mm - new tyre) and the measured value after 7 months of operation (4 mm), which represents tread wear of more than 70% of the initial value. With these measurement values, the treads of the vehicle's tyres on axles 2 and 3 were regrooved. The data obtained for the other vehicles were analysed in a similar way. An example of a C_N vehicle is shown in Figure 4 (Fig 4.).

Fig 3: Measurement of the tread height in the subsequent months for a truck tractor (vehicle B_N); black columns indicate the tread extension (own study)

Fig 4. Measurement of the tread height in the subsequent months for a truck tractor (C_N vehicle); black columns indicate the tread extension (own study)

In this case, the recorded results of tread height measurements after 7 months of operation represented about 33% of the initial value for tyres fitted on the third axle of the vehicle. The recorded value of tread height measurements of the tyre at the same level in subsequent months (e.g. for tyre 1A the measurement result in the months December-June was 10 mm – Fig 4.) does not prove the lack of abrasive wear of the analysed materials. Abrasive wear occurs and the results obtained only indicate that no measurable tread wear was recorded during the month of vehicle operation.

The research also analysed the tread height measurements of Mega Tele trailers. Diagrams were drawn up on the basis of the obtained measurement results (example – Table 3).

Table 3. Measurement of the tread height [mm] of vehicle tyres A_N (own study)

Vehicle A_N	Measuring tread height [mm] per month:					
tire symbol	December	February	April	June	July	September
1A	12	12	11	9	7	7
1B	13	12	7	6	6	5
1C	13	11	9	7	6	6
1D	11	11	10	9	7	6
2A	12	11	9	7	7	7
2B	11	10	9	9	9	8
2C	11	8	7	7	6	5
2D	11	8	7	7	5	5
3A	12	11	11	10	8	6
3B	12	11	10	10	8	6
3C	12	9	9	8	7	7
3D	11	10	10	8	8	8

Based on the results of the measurements, it can be concluded that in a Mega Tele trailer, the tread height was between 5 and 8 mm in September, i.e. after 10 months of operation. The recorded tread height in September compared to December last year was around 50 -73% of the initial value, which means that there was 27-50% tread wear on the tyres (Fig 5).

The highest abrasive wear of the tread was observed in the wheels of a trailer's third axle, which is associated with a heavy load on the trailer. On the other hand, the slowest process of abrasive wear of the tyre tread was observed in the tyres of the first and secondo axle of the trailer.

Fig 5. Measurement of the tread height in the subsequent months of tyre operation for a trailer (vehicle A_N) (own study)

The differences between the individual tread height measurements were up to 4 mm for tyres operating in the first axle of the vehicle, 6 mm for tyres operating in the second axle and 5-7 mm for tyres operating in the third axle of the vehicle (Table 4.).

Table 4: Measurement of the tread height [mm] of MegaTele trailer E_N (own study)

3D	12	12	10	10	7	7

Fig. 6: Measurement of the tread height in the subsequent months of tyre operation for a trailer (vehicle E_N) (own study)

The highest abrasive tread wear in the tyres was observed in these vehicles for tyres running on the second and third axle of a trailer (example – Fig 6.). After ten months of operation, the maximum level of abrasive wear of the tread height of 56% (initial height) was recorded. The slowest abrasive wear of the tread was recorded in the tyres of the first axle of the trailer.

Analysis of measurement results for vehicles with monitoring system installed

Tread height measurements were taken after each vehicle's descent to the transport base. The data obtained indicate that the abrasive wear of the tread is lower in these vehicles compared to non-monitored ones (comparison of the results from Tables 1 and 2 respectively with the statements presented in Tables 5 and 6). It can be concluded that the relatively low abrasive tread wear of the tyres of monitored vehicles is primarily influenced by the decision-making process. Properly responding to changes in tyre pressure and alerts sent out by the installed monitoring system, as well as the ability to control the driver whether he has taken appropriate measures to achieve the tyre pressure equalization, has made it possible to maintain the tyre pressure in the range 0.8 - 1.1 MPa.

Table 5: Measurement of the tread height [mm] of tractor vehicle A (own study)

Vehicle A	Measuring tread height [mm] per month:					
tire symbol	**December**	**February**	**April**	**June**	**July**	**September**
1A	10	10	10	10	10	10

3B	9	9	9	9	9	9
3C	9	9	9	9	8	7
3D	9	9	9	9	9	9

Tables 6: Measurement of the tread height [mm] of truck vehicle D (own study)

Vehicle D	Measuring tread height [mm] per month:					
tire symbol	**December**	**February**	**April**	**June**	**July**	**September**
1A	12	12	12	12	11	11
1D	11	11	11	11	10	10
2A	11	11	10	9	9	9
2D	11	11	11	10	10	10
3A	10	10	10	10	10	10
3B	11	11	10	10	10	10
3C	9	9	9	8	8	8
3D	9	9	9	9	9	8

In turn, ensuring the correct tyre pressure has contributed to achieving the right operating conditions for the tyres, in line with the manufacturers' recommendations, which has led to a longer service life of the tyre material. The recorded abrasive wear of the tread is therefore lower compared to vehicles without a monitoring system supporting the decision-making process. In the truck of vehicle A, the values of the tread height after 10 months of operation were 7 to 10 mm respectively (Fig 7.).

Fig. 7: Measurement of the tread height in the subsequent months of tyre operation for a truck (vehicle A) (own study)

The difference between successive measurements was a maximum of 1 mm, which represented 6.67 % of the abrasive wear of the tread. During the entire test period it was not necessary to cut the tread of the tyres. The slowest process of abrasive wear of the tread was observed in the tyres of the first axle of a truck.

Analogous results were obtained for trucks of vehicle B, C, D and E. Tread height values ranged from 7 to 12 mm (Fig 8.). The recorded value of measuring the tyre tread height at the same level in subsequent months for a given tyre only indicates a slow, long lasting process of abrasive wear of the analysed materials during operation.

As with vehicle A, the difference between successive measurements was 1 mm, representing 6.67% of the tyre's optimum tread height, and the largest difference between successive measurements was 2 mm, representing 13.34% of the tyre's optimum tread height (Fig 9).

Fig. 8: Measurement of the tread height in the subsequent months of tyre operation for a truck (vehicle D) (own elaboration)

In the case of these vehicles, a positive impact of the monitoring and decision making system on the state of the tyre quality was also observed, with no need to cut the tread during the entire test period in any of the kits analysed.

In trailers of vehicles monitored from A to E, the tread height after 10 months of operation ranged from 8 to 11 mm (Tables 7 and 8).

Table 7: Measurement of the tread height [mm] of MegaTele vehicle B trailer (own study)

Vehicle B	Measuring tread height [mm] per month:					
tire symbol	**December**	**February**	**April**	**June**	**July**	**September**
1A	10	10	10	10	10	10
1B	10	10	9	9	9	9
1C	9	9	9	9	9	9
1D	9	9	9	9	9	9
2A	11	11	11	11	10	10
2B	11	11	11	11	11	11

3C	9	9	9	9	9	9
3D	9	9	9	9	9	8

Fig. 9: Measurement of the tread height in the subsequent months of tyre operation for a trailer (vehicle C) (own study)

Fig. 10: Measurement of the tread height in the subsequent months of tyre operation for a Mega Tele trailer (vehicle B) (own study)

The tyres of axles 1 and 3 of trailers were used the most, which was observed Turing registration of tread height measurements (Fig 10.). The middle axles (2) of trailers were characterized by the highest values of tread height, which may indicate uneven distribution of loads on the trailer.

On the basis of the data presented and their analysis, it can be concluded that the tread wear is much slower in the trucks of the vehicles to be monitored than in the trucks of vehicles without a monitoring system installed. The recorded tread wear of tyres in heavy transport vehicles with monitoring was between 6.67 and 13.34%, while in the same period (after 10 months of operation), it was as high as 50-70% in vehicles without monitoring. In trucks for these vehicles, regrooving had to be done.

Therefore, it can be concluded that maintaining the tire pressure at the appropriate level recommended by the manufacturers results in longer tire life and lower tread wear, which is consistent with the results of the authors'

research: Kulikowski et al (2014), Oduro et al. (2015) and in Regulation (EC) No 661/2009. Additionally, the literature shows that lower tread wear translates into to increase vehicle traction. Therefore, continuous monitoring of the tyre pressure with an accuracy of 0.01 MPa, it allowed procedures to be initiated to correct the incompatible parameters, which contributed to lower tread wear and thus improved vehicle traction. Thus, the validity of the test hypotheses was demonstrated.

Concluding, it should be stressed that the relatively low abrasive wear of the tread of the tyres of monitored vehicles is primarily influenced by the decision-making process. The quick and immediate reaction to changes in tyre pressure makes it possible to ensure a proper tyre life process. It can be concluded that the newly developed system installed is an effective tool to make the right decision on the alignment of monitored parameters during vehicle operation. In addition, it should be noted that the alerts sent by the installed monitoring system to both the driver and the dispatcher have resulted in drivers not ignoring the alerts. Dual control of their decisions has eliminated the cases of delayed driver's reaction to an emerging alert. Maintaining the correct tyre pressure during vehicle operation has resulted in longer service life and reduced abrasive wear compared to tyres used in trucks without a continuous monitoring system to support the decision-making process.

Statistical tests for the significance of differences in tread wear

Statistical tests were carried out on the significance of the differences between tread wear in vehicles with and without monitoring. The tread wear of tyres on the wheels of trucks and trailers was considered separately. Due to the highly differentiated initial tread height, wear during the month expressed in [mm] was determined. Cases in which the recorded tread height in the following month was higher than in the previous month were considered as measurement errors and removed. Four such cases were noted. Measurements after regrooving were not taken into account due to the heterogeneity of the data sequence resulting from the combination of values before and after regrooving. After the regrooving operation, the tyre tread wears much faster and the regrooving was only carried out on car tyres without monitoring. The table presents basic statistics on the monthly tread wear values and the *N-test* size (Table 9).

Tab. 9. Statistical parameters (own study)

Variable	N	Average	Median	Min.	Max.	Lower Quartile	Upper Quartile	Std dev.
truck with monitoring	220	0,15	0,0	0,00	2,0	0,00	0,0	0,39
truck without monitoring	116	0,80	0,5	0,00	7,0	0,00	1,0	1,20
trailer with monitoring	330	0,10	0,0	0,00	2,0	0,00	0,0	0,30
trailer without monitoring	252	1,00	1,0	0,00	7,0	0,00	1,0	1,13

The differentiation of monthly consumption values is also presented in the box diagram (Fig 11.).

Fig. 11: Box diagram of statistical parameters (own study)

Significantly greater variation and higher tread values are visible for car tyres without monitoring. For both truck and trailer tyres with monitoring, the third quartile is equal to zero, which means that at least 75% of the measurements show no measurable tread wear during the month of operation. Tires without monitoring were wearing faster and tread was as high as 7 mm for both truck and trailer tires. In order to objectively assess the significance of the differences in tread wear between tyres with and without installed monitoring system, a t-test of equality for independent variables was conducted. The tread on the wheels of trucks and trailers was compared separately. Each time a zero hypothesis of equal average tread values was made with an alternative hypothesis of their differences. A variance compatibility test was also carried out for each pair of variables. The results of statistical tests are presented in Table 10.

Table 10: Student's t test (own study)

Variables	The value of the statistics t	p-value	decision	Quote F variance	decision
Trucks with/without monitoring	-7,33	0,00	Reject H_0 They differ	9,31	Different variants
Trailers with/without monitoring	-13,88	0,00	Reject H_0 They differ	12,91	Different variants

In each case, test t indicated a rejection of the zero hypothesis in favour of an alternative hypothesis indicating a statistically significant difference of α=0.05 between the wear of the tread without monitoring and with it. The F-value of variance indicated that also the variation measured by the variance is statistically significantly different.

The analysis confirms the effectiveness and legitimacy of monitoring in terms of reducing tread wear and thus increasing tyre life and reducing costs for tyre replacement.

Conclusion

The installed system of continuous monitoring of tyre performance allows for the sudden detection of drops in tyre performance. In addition, it has enabled the generation of alarms and notifications, allowing immediate reactions and decisions on corrective actions to be taken in the process of tyre operation. The system has indirectly reduced waste in the form of used tyres, as well as the wear and tear of tyres and improved the passive safety of heavy transport vehicles.

The following conclusions were drawn during the research:

1. Tyre tread wear was reported to be between 7 and 13% for vehicles equipped with a monitoring system, while for the same period (after 10 months of operation), it was as high as 50-70% for vehicles without monitoring,
2. in trucks of vehicles without monitoring, a regrooving should have been done. In trucks of monitored vehicles, such a necessity has not been noted,
3.the statistical analysis carried out confirms the effectiveness and legitimacy of monitoring in terms of reducing tread wear and, consequently, increasing the durability of tyres and reducing the costs of replacing them.

On the basis of the studies and observations carried out, it can be considered that making decisions on the basis of the measurement results obtained from the monitoring system makes it possible to reduce the company's costs related to the operation of its tyres through lower tread wear and less frequent tyre replacement.

Abstract

Purpose – The purpose of this paper is to solve the problem of validation of the market rental rate for specialised movable and immovable property.
Design/methodology/approach – It uses the method of iterative calculations in the framework of the cost approach.
Findings – The paper presents a step-by-step algorithm for the implementation of the method of assessing the market rental payment for specialised property of the enterprise in underdeveloped market, where there are no proposals for renting of such objects. It allows to develop a methodology for assessing market rental rate. To determine the rental rate of surplus and non-core property, it is necessary firstly to calculate the market value of such property, and then at a known value of the object and the market rate of return on capital to choose rental payment that will allow recouping capital investments and ensuring regular income. In the construction of cash flows of the rental business, tax payments and management costs are taken into account.
Practical implications – The obtained value of the rate of return on equity for cash flow can be used in the calculation of the current value of cash flows of rental income.
Originality/value – The paper clarifies the market rental payment for specialised property of the enterprise received using the cost approach. The paper calculated the discount rate on the models of the CAPM and the WACC and received rental income for the transfer of specialised property for rent.

Keywords: Asset valuation, Specialised assets, Market value of the rent, Rental payment

Introduction

In the post-crisis period, when the company's cash flows slow down the growth rate, the management of surplus and non-core assets will help to maintain the competitive position of the company in the market, and in the most successful cases, to bring an increase in the market value of the equity. Excess and non-core property, as a rule, requires maintenance costs (including tax payments) and is not involved in the generation of income of the enterprise. The lease of such property will allow the company to cover the necessary operating costs and increase the non-operating profit of the company. To offer this property for rent, the owner will be required to assign a market-based rental rate.

The scientific novelty of this research is in presentation of a model for the implementation of the method of assessing the market rental payment for surplus and non-core property of the enterprise, developing a methodology for determining the market rental payment.

The paper solves the problem of justification of the market rental payment using the method of iterative calculations in the framework of the cost approach. The proposed step-by-step algorithm for determining the rental income is suitable for defining of the market rental payment for specialised assets of the company in an underdeveloped market.

The paper deals with specialised assets that are a business forming unit (part of the property complex) at industrial enterprises of chemical, coal, oil and gas industries. Specialised assets are defined in paragraph 14 of the FSO No. 10 (2015) as “a set of technologically related objects that are not presented on the market as an independent object and have a significant value only as part of the business”. Here is an example of an aggregated list of specialised

production assets on the balance sheet of three organisations in Russia (for example of the chemical industry) (see Fig. 1).

Source: Data of public joint stock companies of chemical industry.

Fig. 1: The structure of assets of chemical enterprises.

It can be seen on the diagram (Fig. 1) that about 70 % of the initial balance cost is contained in machines, chemical equipment and pumps, another 20 % is contained in real estate (buildings, facilities and tanks). It should be noted that specialised property does not have an independent utility for continued use. The use of specialised property as a part of the entire production complex determines the usefulness of such assets. The rented objects can have an independent utility only in liquidation proceedings. However, the authors in the framework of this paper do not consider such situation.

Literature Review

The chosen research topic extends the Value Based Management (VBM) approach, since the company increases cash flows by leasing surplus specialised property. The principles and methods of VBM are widely used in many corporations in different countries. The works of the founders of two consulting companies (Stewart, 1991; Rappaport, 1999) were main catalyst for the development of the VBM approach. In these works, an attempt is made to rethink the main role of hired managers of the company, which, according to the authors' opinion, is to create and increase the value of the company in the interests of its owners. Recognition of this purpose means the need for the next review of corporate strategic guidelines, as well as criteria for assessing the efficiency of the assets in-use that are at the disposal and control of company's managers (Izmaylov and Kobzev, 2019).

Surplus assets without management outflow the company's cash, while the option of leasing such assets will solve this problem.

Works (Damodaran, 1996; Damodaran, 2002) raise the issue of increasing the cost of equity through the management of excess assets. Such assets may generate additional rental income. However, author does not consider the issue of setting a market rental rate for such assets of the enterprise.

Ozerov and Pupentsova (2015) give an algorithm for calculating the rental rate of the real estate. This algorithm is applicable to commercial real estate objects in the established rental market.

Pupentsova and Livintsova (2018) propose an algorithm for determining the market rental rate of the commercial real estate in a developed market with a sufficient number of analogous objects.

In the Federal valuation standard (FSO No. 10, 2015), it is proposed to apply the methods of the cost approach to assess specialised property.

In the methodology of Gazprom, PJSC (Yatsenko, 2012), when determining the rental payment of excess property, only the lessor's costs and the rate of profit are taken as the basis. Moreover, the rate of profit is justified by federal and domestic norms of the enterprise.

In the works of the above-mentioned authors, not enough attention is paid to the procedure of assessment of the rental income from the specialised assets in an underdeveloped market.

It should be noted that the issue of assigning market rental payment for such specialised assets, despite its relevance, is not disclosed in the normative documents on property valuation and in the works of the authors (Bakhvalov et al., 2015; Rhaiem et al., 2007; Bukharin et al., 2011; Pupentsova, 2012; Shabrova et al., 2017; Kozlov et al., 2017; Fitz-Gibbon, 2018; Konowalczuk, 2018; Grigoryev and Kozin, 2006).

Jansen van Vuuren (2016) argues that the profits method, specifically a discounted cash flow (DCF) based profits method, should be the preferred method of valuation when valuing specialised property than the cost approach in taking into account systematic and unsystematic risk.

A Description of The Methodology

The specialised assets of an enterprise are limited to a specific type of functional use and have a closed, non-competitive, passive or asymmetric market, or none at all. When evaluating such assets, a limited set of approaches, methods and valuation techniques can be applied. They often require modification or revision.

According to the valuation methodology, the market property rental rate is determined by the methods of comparative, cost and income approaches. In practice, the most commonly used comparative approach is based on information about similar transactions (offers to rent transactions), which implies the existence of a well-developed market. If there are no data on the rental rates typical for the lease of specialised non-core and excess property of the enterprise, the comparative approach is not applicable.

From the point of view of the cost approach when determining the rental rate, the lessor intends to ensure the return of capital and income on capital invested in the creation of the object. To determine the rental rate, it is necessary "at the first step to assess the market value of the rented object by the methods of the cost approach (of course, taking into account the profit of the developer's project and the value losses due to wear and obsolescence). If the new owner has purchased an object for use as a financial asset, then as a property owner he will accept the evaluation of the object by the method of comparative analysis of transactions. For a typical lessor, it is advisable to determine the market value at this first step using both cost-based and comparative approaches. At the second step, the appraiser finds the potential total income and rental rate at the known value of the object and the market rate of return on capital" (Ozerov and Pupentsova, 2015, pp. 291-292).

To determine the market rental rate by using the income approach, it is necessary to determine the maximum allowable for the tenant "the value of the rental rate, based on his ideas about the permissible value of the expected business income, which he would consider possible to give for the use and ownership of the rented property extracting these revenues. Here the annual income from the business of a typical tenant is necessary to distribute between all types of factors of production, isolating the amount "generated" by the rented specialised property, that is, determining the "additional productivity" of improvements on the residual principle. This amount ("additional productivity") will determine the amount of market rental rate of a typical tenant for the use of the object during the relevant period" (Ozerov and Pupentsova, 2015, p. 292). As a rule, the income approach is not used for determining the market rental rate, since the allocation of the total amount of income and expenses of the part that is directly related to the estimated specialised asset is associated with a large error.

Let us consider the algorithm for calculating the market value of rental rate for specialised property, including real estate and technological equipment, which is excessive for business. The implementation of the algorithm includes iterative calculations, that is, multiple calculations on the argument x (rental rate). The *iterative process* of solving the equation $f(x) = 0$ consists in a sequential refinement of some initial approximation of x_0. The sequence of approximate values of the root: $x_1, \ldots, x_n$, is a result of iterations. If these values with an increase in the number of n iterations approach the exact value of the root x^* (that is $\lim_{x\to\infty} x_k \to x^*$), it is said that the iterative process of the solution converges, otherwise, it diverges (Bakhvalov et al., 2015, p. 326). Calculation steps will be considered further:

1. First of all, the full cost of the expenses of reproduction (replacement) of rented specialised production assets must be calculated in order to determine the market value of the rental rate of specialised objects. Next, the presence or absence of external wear should be identified. The value of the costs of creating the entire production complex needs to be determined.

The cost of reproduction (replacement) of leased specialised assets is determined by the methods of comparative and / or cost approaches. Physical and functional wear is assumed to be zero, since, most often, under rent agreements, all expenses associated with the payment of current and capital repairs are paid by the tenant independently. The reproduction costs are adjusted by the amount of external wear, if any.

2. The discount rate (the rate of return on capital) is determined. As a rule, the rate of return of rental cash flows will be lower than the rate assessed for the enterprise industry due to a lower risk premium and a different capital structure from the business.

3. The value of rental income is entered in the initial approximation of x_0.

4. The amount of operating expenses (at least, property tax and management expenses) is calculated.

5. The cash flow is constructed for the assigned approximate rental income.

6. The capitalisation ratio is determined for the reversion and the value of the reversion.

7. The current value of cash flows is calculated.

8. An iterative calculation of rental income is made, in which the present value of cash flows is equal to the market value of the specialised property of the enterprise.

Results and Discussions

Based on the experience of assessing the assets of enterprises, the revalued value of non-current assets may exceed its book value several times. The owner needs to compensate for the return of capital on the reproduction of assets, so the use of book value as a basis for determining the amount of rental payment for specialised property is not acceptable. First, it is necessary to calculate the full cost of the reproduction or replacement of rented specialised production assets due to determine the market value of the rental payment of specialised objects. Next, the presence or absence of external wear should be identified. It is necessary to determine the value of the cost of creating the entire production complex. The methodology of determining the cost of reproduction (replacement) with use of comparative and cost approaches, as well as methods for identifying and calculating the amount of external wear are not considered in the current study. Detailed approaches and methods of assessing the market value of assets can be found in any methodological publication on the valuation of assets, for example, in (Ozerov and Pupentsova, 2015; Bakhvalov et al., 2015; Damodaran, 1996 & 2002; Rhaiem et al., 2007; Bukharin et al., 2011; Pupentsova, 2012; Yaskevich, 2005; Zelenski, 2008; Grijalva et al., 2018; Sharov & Schneiderman, 2015; Giglio et al., 2015; Gloukhov et al., 2014; Bril et al., 2018).

The discount rate is determined for the invested capital according to the WACC (weighted average cost of capital) model (Damodaran, 1996 & 2002; Rhaiem et al., 2007; Bukharin et al., 2011; Pupentsova, 2012; Magni, 2015):

$$Y_o = M \cdot Y_m + Ye_{rur} \cdot (1 - M), \tag{1}$$

where

Y_O – the weighted average rate of return on invested capital;
Y_m – the rate of return on borrowed capital;
M – the share of borrowed capital;
Ye_{rur} – the rouble rate of return on equity.

The rate of return on equity is determined by the modified CAPM model (capital assets price model). The algorithm for calculating the rate of return on equity is given in (Bukharin et al., 2011; Pupentsova, 2012; Bakhramov and Gloukhov, 2011):

$$Ye_{\$} = Y_{rf} + \beta \cdot (Y_{\max} - Y_{rf}) + S_1 + S_2 + S_3, \tag{2}$$

where
$Ye_{\$}$ – investor's expected rate of return on equity;
Y_{rf} – the risk-free yield (in the US);
β – the beta-ratio;
$(Y_{max} - Y_{rf})$ – the market premium for equity risk (in the US);
S_1 – the premium for country risk (for example, Russia compared with the US);
S_2 – the premium for a small capitalisation;
S_3 – the premium for the specific risk of the assessed company.

Despite the fact that a large share of the property falls on specialised equipment, the size of the beta-ratio (β) is chosen for the "Real Estate (Operations & Services)" industry. Such choice is because when renting equipment the industry (chemical, coal, oil, etc.) risks are minimised and become the most similar to the risks when renting real estate.

The specific risk is assumed to be 0 %, since the object of the study is the property complex, which has no specific risks.

The transition to the rouble norm is carried out, taking into account the assumption that the excess of the absolute value of the rouble cost of capital (Ye_{rur}) over the US dollar ($Ye_{\$}$) is equal to the excess of the yield of Russian government long-term bonds denominated in roubles (R_{rur}) over the yield of Eurobonds ($R_{\$}$), and is made according to the formula:

$$Ye_{rur} = \frac{(1+R_{rur})\cdot(1+Ye_{\$})}{(1+R_{\$})} - 1. \quad (3)$$

The cost of borrowed capital is determined at the level of interest rates on loans issued by banks to non-financial organisations for a period of more than three years.

The initial data for calculating the rate of return on equity are given in Table 1.

Table 1: Parameters for calculating the discount rate on the CAPM model (January 2019)

Name of indicator	Target value	Definition base / Source	Reference to a source
The risk-free yield – Y_{rf}	2.92%	30-year US Treasury bonds yield, %	Economic Time Series Page[1]
The market premium for equity risk – $(Y_{max} - Y_{rf})$	3.26%	Excess of the yield of shares of public companies over the yield on US Treasury bonds for the period from 1928 to 2017	Damodaran, A.[2]
The beta-ratio without financial leverage – β	0.90	Damodaran industry (US): Real Estate (Operations & Services)	Damodaran, A.[3]
The country risk premium – S_1	3.47%	The long-term credit rating of Russia established by international rating agencies is used	Damodaran, A.[4]

[2] Damodaran, A. Analytical materials on the main market indicators. [Online]. Available: URL: http://pages.stern.nyu.edu/~adamodar/pc/datasets/histretSP.xls (accessed 05.05.2019).

[3] Damodaran, A. Analytical materials on the main market indicators. [Online]. Available: URL: http://pages.stern.nyu.edu/~adamodar/New_Home_Page/datafile/Betas.html (accessed 05.05.2019).

[4] Damodaran, A. Analytical materials on the main market indicators. [Online]. Available: URL: http://pages.stern.nyu.edu/~adamodar/New_Home_Page/datafile/ctryprem.html (accessed 07.04.2019).

Name of indicator	Target value	Definition base / Source	Reference to a source
The small capitalization premium – S_2	1.75%	The difference between the average return on investments in the US stock market and the average return on investments in the company's business with a particular capitalization	Valuation Edition 2018 Yearbook[5]
The yield of Russian government long-term bonds denominated in rubles – R_{rur}	8.75%	OFZ-46020 repayment 06.02.2036, Ticker: RU000A0GN9A7	Markets now[6]
The yield of Eurobonds denominated in dollars – $R_{\$}$	4.86%	Eurobonds of the Russian Federation 2042 repayment 04.04.2042, Ticker: XS0767473852	Markets now[7]

The transition from the beta-ratio excluding financial leverage to the beta-ratio taking into account the financial leverage is not performed, as the cash flows of the model are built before taxation. The rate of return for the currency cash flow on the CAPM model, calculated before tax, will be:

$$Ye_{\$} = 2.92\% + 0.90 \times 3.26\% + 3.47\% + 1.75\% = 11.07\%.$$

Then, the rouble rate of return on equity on the CAPM model for cash flow calculated before taxation will be equal to:

$$Ye_{\text{rur}} = (1 + 11.07\%) \times (1 + 8.75\%) / (1 + 4.86\%) = 15.2\%.$$

The following input parameters are accepted for the WACC investment rate:
– the cost of borrowed capital is determined on the basis of interest rates on loans for more than 3 years issued in roubles. According to the Central Bank of the Russian Federation it is equal to 8.63 % (Banking Bulletin, 2019);

– the target capital structure for the Real Estate (Operations & Services) industry according to (Damodaran, 2019[4]) is 65.34 %. As mentioned above, the choice is due to the fact that when renting the risks of the industry (chemical, coal, oil, etc.) are minimized, and become most similar to the risks of renting real estate. Then the optimal share of the debt capital for the selected industry corresponds to 39.52 %.

Thus, the rate of return on invested capital under the WACC model for pre-tax cash flow, as a weighted average of the capital structure, is:

$$Yo = 15.2\% \times (1 - 39.52\%) + 8.63\% \times 39.52\% = 12.6\%.$$

It should be noted that in Russia the above discussed models are often used in real estate and specialised property appraisal practice. But, taking into account the opinion of the authors (French, 2004; French and Gabrielli, 2018) that at present the CAPM and WACC models are not widely used in practice in European countries for property valuation, the obtained result will be confirmed by the opinion of professional experts. This paper authors recommend specialists of the Committee for Appraisal Activity of the Association of Banks of the North-West (Russia) as experts.

Recommended specialists annually, within the framework of the project for collecting opinions of banks, issue a survey of the opinion of specialists from the collateral divisions of seven banks.

According to the survey results (2018), experts of the Committee for Appraisal Activity of the Association of Banks of the North-West recommend using the discount rate for the real estate market and specialized equipment at the level of 11-16 %. Further the average value of the discount rate for the valued property will be determined. To do this, from the expert opinion on the recommended rates, the segments that are most suitable for the valued property are selected and the average value for the groups is calculated (see Table 2).

[5] Stocks, Bonds, Bills and Inflation, SBBI. [Online]. Valuation Edition 2018 Yearbook. Available: URL: https://duffandphelps.onfastspring.com/books (accessed 22.04.2019).

[6] Bonds. Markets now. [Online]. Available: URL: www.quotenet.com (accessed 22.04.2019).

Table 2: Recommended discount rate by property segments

Segment	Lower limit	Upper limit	Average value
Office property (class C, detached buildings)	11%	14%	12%
Warehouse property (class C, detached buildings)	11%	15%	13%
Industrial and warehouse real estate, detached buildings, complexes	12%	15%	12%
Special purpose equipment	13%	24%	16%
Standard equipment	8%	14%	10%
Mean	11%	16%	12,6%

Source: Committee for Appraisal Activity of the Association of Banks of the North-West, 2018.

Thus, the result of the discount rate, determined by modelling according to formulas (1) and (2), is confirmed by experts' opinion based on the survey of highly professional experts in the field of appraisal, collateral and financing. Further, for the calculations, the authors choose the discount rate determined by the WACC model and confirmed by experts' opinion at the level of 12.6 %.

Operating expenses of an enterprise that leases specialised property include property tax and management costs. In the framework of the study, an assumption is introduced that under the terms of the lease agreement the tenant carries out the current and major repairs. Therefore, the repair costs are not taken into account in the construction of cash flows.

Property tax according to the Tax code of the Russian Federation is 2.2 % of the average annual value of the property (Article 380 of the Tax code of the Russian Federation).

Management costs are usually determined by the level of expenses of management companies, which for real estate are from 5 % to 25 % of the revenue. Large values of management costs are associated with the need for advertising, searching for tenants and the organisation of public services.

To calculate the depreciation, weighted average period of economic life (WAL) is determined according to the formula (Pupentsova et al., 2017):

$$WAL = \frac{\sum_{i=1}^{t}(TRC_i \times Pel_i)}{\sum_{i=1}^{t} TRC_i}, \quad (4)$$

where

TRC – the total cost of reproduction or replacement of property and equipment;
t – the number of property and equipment;
Pel – the period of the economic life of the property.

Thus, in Table 3, the weighted average economic life of the leased property is 30 years. Then the annual depreciation rate for the analysed group of assets is 1/30.

Table 3: The calculation of the weighted average economic life (chemical industry enterprise)

Type of property and equipment	Share by costs of reproduction, %	Depreciation of property and equipment, %	The period of the economic life, year	WAL, year
Total	100%			
Reinvested property, including:	65%	45%	30	17
reinvested short-lived	*4%*	*50%*	*10*	*5*
reinvested long-lived	*96%*	*45%*	*31*	*17*
Nonreinvested property	35%			

Source: own study.

The next step, the amount of rent is entered in the first approximation, for example, 10 % of the market value of the leased objects. Cash flows for the entire forecast period are calculated. An annual increase in rental payment at the level of inflation is planned to lay in the lease agreement. Inflation is accepted according to data of the Ministry of economic development of the Russian Federation (Forecast of social and economic development 2019).

The present value of cash flows is calculated by the formula:

$$Vo = \sum_{j=1}^{n} \frac{Io_j}{(1+Yo)^j} + \frac{Vo_n}{(1+Yo)^n}, \quad (5)$$

Where

Io_j – the cash flow of the *j*-th forecast period;
Vo_n – the property value at the end of the forecast period (reversion value);
Yo – the discount rate determined by the WACC model;
n – the forecast period, years.

Gordon's model is used to calculate the reversion (Bukharin et al., 2011; Pupentsova, 2012; Shabrova et al., 2017; Giglio et al., 2015; Michaletz & Artemenkov, 2018). The value of the property at the end of the forecast period is determined by the ratio of cash flow in the *n*+1 period to the capitalisation ratio, which is equal to the difference between the discount rate and the growth rate of cash flows in the post-forecast period (Ozerov et al., 2018).

Since the market rent is determined on the basis of the condition that the invested capital should not only pay off, but also bring a regular income, the resulting current value of cash flows is reduced to the market value of the lease objects by selecting the market rental payment by iterative calculations. Table 4 shows an example of calculation of cost of rental payment of the specialised assets based on the assumption that the cost of reproduction or replacement is equal to 100 million c. u. (1 c. u. = 1 Euro), the average percentage of depreciation is equal to 1/30 (*Pel* = 30 years), the rate of return is 12.6 %. The rate of return includes inflation and is adopted constant for the entire forecast period. Management costs are taken at 5 %. The average annual growth of cash flows for the last 2 years of the forecast period was 5 %. This level is adopted for the post-forecast period.

Table 4: The calculation of the market rent by an iterative calculation

Indicator	Data at the valuation date	1	2	3	4	5	6	7	8	9	10	Post-forecast
The value of the asset, million c. u.	100	97	93	90	87	83	80	77	73	70	67	63
Depreciation, million c. u. per year	3.3	3.3	3.3	3.3	3.3	3.3	3.3	3.3	3.3	3.3	3.3	3.3
Inflation, %	4.27	5.0	4.2	4.2	4.2	4.1	4.1	4.1	4.0	4.0	4.0	4.0
Rental income, million c. u. per year	*9.2*	*9.7*	*10.1*	*10.5*	*11.0*	*11.4*	*11.9*	*12.4*	*12.9*	*13.4*	*13.9*	*14.5*
The estimated property tax, million c. u. per year	–	2.2	2.1	2.0	1.9	1.9	1.8	1.7	1.7	1.6	1.5	1.4
Management costs, million c. u. per year	–	0.5	0.5	0.5	0.6	0.6	0.6	0.6	0.6	0.7	0.7	0.7
Total costs, million c. u. per year	–	2.7	2.6	2.5	2.5	2.5	2.4	2.3	2.3	2.3	2.2	2.1

Indicator	Data at the valuation date	1	2	3	4	5	6	7	8	9	10	Post-forecast
The operating income, million c. u. per year	–	7.0	7.5	8.0	8.5	8.9	9.5	10.1	10.6	11.1	11.7	12.4
Cash flow growth, %									55.42	55.32	55.22	55.14
Reversion, million c. u.											168	
Present value of the net operating income, million c. u.	48.6											
The present value of the reversion, million c. u.	51.4											
The present value of the asset, million c. u.	100											
Descent	0											

Source: own study.

Thus, with a rental payment of 9.2 million c. u. on the valuation date given at the rate of profit, the value of cash flows becomes equal to the estimated on the valuation date cost of leased property, which is equal to 100 million c. u. Therefore, provided that if "the invested capital should not only return, but also bring a regular expected income" (Ozerov & Pupentsova, 2015; Ozerov et al., 2018), then the market rental payment for specialised property will be 9.2 million c. u.

Conclusion

The step-by-step algorithm for determining the rental income for defining of the market rental payment for specialised assets of the company was proposed.

The simplicity of use of the developed algorithm for calculating the rental payment for the considered property will allow company's managers to offer an economically reasonable result. The logic of the calculation is clear and understandable to managers at all levels. The rental rate is selected depending on the market value of such property, the rate of return on capital and the payback period of capital investments. Tax payments and management costs should be taken into account when building cash flows for the rental business.

The result of the rental payment is sensitive to the rate of return on capital. Therefore, this paper focuses on the justification of the discount rate. The authors note that the discount rate is modelled for the Real Estate (Operations & Services) market. Such a choice is due to the fact that when renting specialised property, the risks of the industry are minimized and become most similar to the risks when renting the real estate.

In addition, within the framework of the paper, the discount rate has been determined by using the models of the CAPM and WACC for the Real Estate (Operations & Services) industry as of February 2019:

– the rouble rate of return on equity on the model of the CAPM for cash flow calculated before taxation was 15.2 %;

– the rate of return on invested capital on the WACC model was obtained at the level of 12.6 %.

The resulting value of the rate of return on equity for cash flow in roubles can be used to calculate the current value of cash flows of the rental income.

Future directions for further research are related to the construction of a model taking into account risk analysis and the application of the simulation method.

Abstract

Selecting a database engine for governmental electronic services provided by different institutions has a direct impact on the performance. This paper compiled a ranking of the most used databases in the Portuguese town halls in the year 2019. For each DBMS, this study evaluates the IT department satisfaction, focusing on the following technical dimensions: customer support, global evaluation, licensing costs, documentation, ease of use, maintenance, performance, and security. Additionally, are identified the motives that lead to the selection of each DBMS. To gather information, 308 Portuguese city halls, were inquired, 104 answered (33,7%), allowing a confidence level of 95% with an error over the answers of 8%. The resulting DBMS ranking, the 2019 most used database engines in Portuguese city halls, is as follows (from the most relevant to the least): SQL Server Express, Informix, MySQL, SQL Server (pro version), Access, and Postgres.

Keywords: Survey, Database, Data Analysis, E-Government, Information Systems, Local Government.

Introduction

Recently, all public services work on top of electronic platforms. Most of these platforms have a front-end (where available services are available to the general target audience), back-office (where services are configured and managed), and one or more databases. Information stored inside the databases is intensively used to provide all kind of services to general citizens [28]. Therefore, the acquisition and implementation of a database management system (DBMS), should be carefully planned since it will have a significant real impact on the information availability. As the internet evolves, and consequently the cloud computing, the databases must cope with the large volumes of data efficiently, requiring performance for both read and write operations [11]. Abadi, Boncz [1], mention in their study that, the performance of the database systems is directly related with the efficiency of the system to store data, and in the ability to move them to the CPU registers for processing. In all sectors, the databases have a critical role, especially in business, electronic commerce, engineering, healthcare, genetics, education, library science and others [6]. Sharing the before mentioned point of view, Abramova, Bernardino [3], consider the databases the organization's vital point. The selection and decision of a database must obey to strict approaches, methodologies and rules, which abide organizational growth without harming performance. Even though when data is structured, its size is small, and databases operate relatively well. The increase of data volume requires, performance tuning and maintenance by specialized technicians, for instance, normalization and indexation [25].

This paper presents a study of the most used databases in the Portuguese public town halls, having into account the main reasons to select the adopted databases. Conclusions in this study consisted of several quizzes sent to the IT managers responsible for the IT town halls, aiming to find more about how and why they used their databases. Presented results allow to study the quality factors and pondered reasons to acquire a database management system, in the scope of the Portuguese government. Additionally, it allows concluding what the most adopted database management systems are.

This document contains five sections. Section 2 presents the state-of-the-art review. Section 3, describes how the quiz was performed, organized, and distributed to obtain answers regarding the motivations to select and use specific

databases software. Section 4 shows the obtained results. Finally, in Section 5 conclusions are drawn, followed by the introduction of future work guidelines.

State of the art

Information systems comprehend several organizational activities which concern data; these activities include acquire data; storage; recover; manipulation; transmit information to other users [14]. Almost all information system includes data storage, which is done internally using databases, relational or non-relational. These databases present themselves as essential for managing modern society's information [3].

According to Silberschatz, Korth [21], database management systems differ significantly from storage systems and from programming environments. A DBMS consists of a collection of programs and services, that allow the user to insert, update, delete and query the stored data, therefore, making it easier to maintain and access the data [18]. It is essential to underline that relational databases were created as a technology to store structured data as tables., allowing to perform queries using SQL (Structured Query Language) [7]. For the authors, Viscusi, Batini [28], each DBMS represents a logical data schema, divided into classes where each relates between them. At the same time, the authors mention that relational databases within governmental institutions are constantly in use. Not only central government but also at local municipalities, electronic stores, sensors, city halls, mobile devices. For all cases where databases fit, vast amounts of data are being produced with different data-rates [8]. As proof of the importance of databases, in a study dated from 1989, the number of estimated databases in the world was already five million [9]. The most known and utilized database model is the relational, developed in 1969 by E. F. Codd, working as a researcher at IBM, the model assumes a set of theory and predicate logic [12]. Despite the familiarization with relational databases, in the last decades, many NoSQL databases were adopted in many large organizations [16]. According to [17], NoSQL databases were developed around 2000 to deal with the limitations of traditional SQL databases, especially concerning scalability, replication and the storage of non-structured data. For the author Vaish [27], NoSQL is the terminology for the database class that does not follow the same principles of relation databases, concerning ACID (Atomicity, Consistency, Isolation e Durability) properties. NoSQL is equipped to manage with scalability vs speed for enterprises such as google, facebook, yahoo, Twitter. When comparing NoSQL with traditional relational databases, NoSQL databases are projected to store data with simple structures, or like the object-oriented programming languages [24]. In studies carried by Bassil [5], the author tested and compared the database engines SQL Server, Oracle, IBM DB2, MySQL and the MS Access. In this comparative study, the author concludes that IBM DB2 shows a better performance, despite consuming more memory. At the same time, MS Access uses less CPU. These conclusions are supported by other authors, Sing, Sharma [22], that also tested query performance.

The 2019 ranking "DB-engines" identifies 330 database engines. By this ranking, in 2018 and 2019, the six most popular databases are Oracle, MySQL, SQL Server, PostgreSQL, MongoDB, and IBM DB2. Note that, in this top 6, there are six relational databases, and only one non-relational (MongoDB). The selection of a database engine has direct implications on the daily performance and organization of both enterprises and research [29]. The authors Abbasi, Sa [2], in the context of smart cities, consider the performance of database engines, test, and suggest the use of Cassandra, which is a NoSQL oriented engine. Another author, Liu and Luo [13] use PostgreSQL in their project, eGovMon, in the field of eGovernment, justifying the choice with the resources that PostgreSQL provides for data warehousing. Then authors Sourouni, Lampathaki [23] use SQL Server to implement ontology is oriented to represent concept relations in the domain of eGovernment and the development of associated services. Authors claim that the decision relies on performance and scalability.

In turn, Signore, Chesi [20], based on the eGovernment project CiTel, Oracle DBMS was the choice. Baraka and Madoukh [4], do not mention which DBMS engine is used to improve the Palestinian eGovernment but suggest that the SOA oriented model surpasses the actual in-place model in performance, interoperability, flexibility, and management. Authors Tsai, Choi [26], for the implementation of a GIS web-based project, decide to use Oracle or SQL Server for licensing reasons, aiming to reuse the organization DBMS's licences and optimize costs. The decision on which database to use is not consensual; it is not possible to say which is good or bad without first analyzing the context. The DBMS should be chosen very carefully, due to his cost and importance for the entire surrounding systems [19]. Based on all factors, this paper presents a study that allows assessing the most used DBMS's in the Portuguese government, having into account the specificity of the city town halls.

Survey/Quiz

Based on a survey, the central objective of this study is to identify the most used DBMS's by the Portuguese city town halls. From Marconi and Lakatos [15], a questionnaire is an instrument for collecting data with the resource to a set of ordered questions. This author points the negative aspect that questions answers are in written format, without the presence of the interviewer. By Gil [10], the survey is a technique based on a set of cross-questions to an individual with the aim to garter information regarding knowledge, beliefs, feelings, values, interests, expectations, aspirations, fears, behaviour, and others.

This study comprehends 308 Portuguese governmental city halls which were selected, aiming to maximize the number of answers, and obtain a clear picture of the reality.

The questionnaire was sent by email to all Portuguese city halls (On May 15, 2019), directed to the encharged of the department of Information Systems, and the limit date to reply to the questionnaire was until 2019, June 10.

The questionnaire questions are designed using the application "survey do Zoho". Based on the state-of-the-art literature, the questions are performed to the users.

- First page contains key sociodemographic questions. After validating that the inquired belongs to a city hall, it is essential to understand the number of inhabitants influences the: amount of provided services; technological resources; the number of IT workers.
- Next question is to understand the number of IT workers in the organizational IT department. The dimension of the IT department directly relates to the capacity to define, chose and identify work policies, data selection, and where to store it.
- - Other question aims to gather generic characteristics of DBMS's that participants value. By presenting to the user a set of possible features, participants can answer by selecting the most relevant ones. Table 1, , resumes the list of state-of-the-art DBMS most relevant features. Note that, an open field is also available, "others" so that participants can include new features.

After the generic database characteristics are select, participants must identify which DBMS they have in the governmental institution where they are associated. The list with possible databases to select is set accounting thirty most used databases present in the db-engines.com (2018). Anyway, to include all database engines, the user can add additional database engines. According to DBMS's identified by the user as being the most used in their organization, two further questions are performed individually.

- First (Q1): "What are the characteristics did you take into account to select/install/use the DBMS in the organization?"

Table 1: Database characteristics

Technical support	Key-value oriented	Support for transactions
Recovery in case of disaster/crash	Graph oriented	Support for the cloud
Compatibility with other softwares	Map-Reduce oriented	Support for ACID operations (Atomic, Consistency, Isolation e Durability)
Price	Memory oriented	Support for functions
Scalability	NoSQL oriented	Support for indexation
Available as a cloud service	Object oriented	Support for PL/SQL
Easy to install	Support for XML	Support for procedures
Easy to use	Performance	Support for SQL
Existing licensing	Global ranking	Support for triggers
Opensource	Required computational resources	Others

- Second (Q2): "How do you evaluate the DBMS that is currently in use in the organization?"

The Q1 reuses the listed databases shown in Table 1, with two extra options: “Used by a web-based software”; and “Used by an Enterprise Resource Planning (ERP) software”. These options exist to include specific databases software requirements, such as ERP software’s.

Q2 evaluates individually the installation and utilization of each DBMS in use. This evaluation uses the Likert scale with five positions. Considered dimensions for the Likert range include technical assistance; global evaluation; price; documentation; usage easiness; maintenance; performance; and security. Additionally, it is also provided with an open option for users to include new dimensions and observations.

After acquiring all the necessary data for the proposed study, with SPSS software data was imported for analysis.

Results

Obtained data for this result analysis, results from a quiz to 308 Portuguese town halls, from which 104 (33,7%) replied, allowing a trust level of 95% with an error of 8%. This sample is considered a valid reality representation of the DBMS’s utilization over the Portuguese central government institutions.

From the example, 11% of participants have a graduation, 18% have certification, 3% have higher education, 19% have a BSc, 15% have an MSc, and 3% have a PhD. Note that IT departments are gradually hiring better professionals with more academic formation. Moreover, most of the regional city councils have an average of 3 technicians. Finally, results show that larger cities have more significant IT departments. However, most of the participants show to have less than 50 thousand inhabitants (Table 2).

Regarding the results to the question “what are the most valued characteristics in a DBMS”, 67% of the participants selected “recovery in case of disaster/crash”. This identifies the importance and value that information plays in an organization.

Second most relevant characteristic is the “technical support” with 58.3% of the

Table 2: Number of answers by city hall size

More than 200.000	4
Between 150.001 and 199.999	5
Between 100.000 and 150.000	5
Between 50.001 and 99.999	16
Less than 50.000	74

answers. This choice demonstrates that public services consider the availability of their services as important. At the same time, because public services do not deal directly with the problems, having a good support service available in case of trouble is a critical factor.

Understandably, the performance is the third most relevant characteristic with 57.5% (the response time is directly related to users satisfaction). Compatibility and scalability, both with 50% of the votes. The price is the sixth identified characteristic, with 49% of the inquired selection. Pleasantly, it is good to know that public institutions consider the cost of the tools.

On the other side of the choices, characteristics such as NoSQL oriented, Global ranking, and memory oriented, are the less selected options, with respectively, 0.9%, 1.8%, 1.8%.

Table 3 shows all results, with a variance of 87.72, and a standard deviation of 9.26.

Table 3: Most valued characteristics in a DBMS

Characteristic	Frequency of times it is selected	Relative Frequency (%)	Variance	Standard Deviation
Recovery in case of disaster/crash	73	70,19%	0,209	0,457
Technical support	63	60,58%	0,239	0,489
Performance	62	59,62%	0,241	0,491
Compatibility with other software	54	51,92%	0,250	0,500
Scalability	54	51,92%	0,250	0,500
Price	53	50,96%	0,250	0,500
Support for SQL	53	50,96%	0,250	0,500
Easy to use	45	43,27%	0,245	0,495
Existent licensing	32	30,77%	0,213	0,462
Easy to install	30	28,85%	0,205	0,453
Open-source	27	25,96%	0,192	0,438
Required computational resources	21	20,19%	0,161	0,401
Support for transactions	17	16,35%	0,137	0,370
Support for PL/SQL	16	15,38%	0,130	0,361
Support for triggers	16	15,38%	0,130	0,361
Support for indexation	13	12,50%	0,109	0,331
Support for procedures	13	12,50%	0,109	0,331
Support for functions	10	9,62%	0,087	0,295
Support for XML	10	9,62%	0,087	0,295
Object oriented	8	7,69%	0,071	0,266
Support for ACID operations	8	7,69%	0,071	0,266
Support for the cloud	7	6,73%	0,063	0,251
Available as a cloud service	4	3,85%	0,037	0,192
Memory oriented	2	1,92%	0,019	0,137
Global ranking	2	1,92%	0,019	0,137
NoSQL oriented	1	0,96%	0,010	0,098

Regarding the databases, Table 4 shows the list of the most used databases. Gathered results present a variance of 39.67 and a standard deviation of 6.3. In general, the preferred database engine in this study is the SQLServer Express, which is present in 68.2% of the Portuguese town halls. Other results metrics show that participants evaluate the SQLServer Express in 3.51 points in a total of 5. Important to highlight that the "price" is characteristic with more relevance, showing an average of 4.17 points in 5. With average, 3.4 points in 5, are the characteristics of performance and security. Performance and Technical Support have an evaluation of 3.5 points in 5. Performance and technical support have 3.5 points in 5. Characteristics, easy to use, and documentation, are evaluated with 3.7 points in 5. In general, the features considered more relevance in this study, when choosing the SQLServer Express are the price, easy to install, easy to use, easy to, and integrate with an ERP software.

This study second most used DBMS is IBM Informix, which is present in 65.4% of the inquired users. Technical assistance and security have 4.01 points in 5. Informix global evaluation is 3.94 points in 5, followed by the performance with 3.85 points in 5. Licensing price, easiness to use, maintenance, and performance stand between 3

and 4 points (in a total of 5). Note that, most Informix users select this database based on ERP software, widely used among the town halls, which requires this DBMS. Already mentioned before, technical assistance and licensing are essential factors when pondering a DBMS section. Third BMS in the list is MySQL with 61% of the votes. Regarding the price for licencing, it has punctuation of 4.14 points in 5. Easiness to use, maintenance and performance, 3.9 points in 5. Despite having proper punctuation, the worst detected characteristic with 3.22 points in 5, is the technical assistance.

The fourth DBMS in the list is the SQL Server (commercial version) with 56.7% of the votes. Although characteristics are very similar to the express version, the price has worse punctuation. On the other hand, technical assistance improves. The identified requirement to use this DBMS is the dependability of web-based software.

Surprisingly, MS access is the fifth-ranked database, with 44.2% of participants preference. This position is due to the easiness to install and use. At last, in the fifth position is PostgreSQL with 37.5% of the votes.

Less used DBMS are ActionVector, ElasticSearch, Redis, SQLanyWhere, PostGIS and Disan. These last engines are used only by one town hall (Table 4 resumes the findings).

Table 4: Most used databases in Portuguese town halls in 2018

Databases	Frequency of times it is selected	Relative Frequency (%)	Variance	Standard Deviation
SQLServer Express	71	68,27%	0,217	0,465
Informix	68	65,38%	0,226	0,476
MySQL	64	61,54%	0,237	0,487
SQLServer – Empresarial Version	59	56,73%	0,245	0,495
Access	46	44,23%	0,247	0,497
Postgres	39	37,50%	0,234	0,484
Libreoffice	20	19,23%	0,155	0,394
Oracle	16	15,38%	0,130	0,361
MariaDB	14	13,46%	0,116	0,341
db2 - IBM	13	12,50%	0,109	0,331
Sqllite	7	6,73%	0,063	0,251
MongoDB,	4	3,85%	0,037	0,192
MS azure database	3	2,88%	0,028	0,167
Outra DB	2	1,92%	0,019	0,137
ActianVector vectorwise	1	0,96%	0,010	0,098
ElasticSearch	1	0,96%	0,010	0,098
Redis	1	0,96%	0,010	0,098
Sqlanywhere	1	0,96%	0,010	0,098
PostGis	1	0,96%	0,010	0,098
Disam	1	0,96%	0,010	0,098

Conclusions

This research work reflects an initial study that intends to identify the most used DBMS by the Portuguese government in the city town halls. Simultaneously, it is also recognized the reasons which lead to such selection/implementation, as well as the satisfaction level of each participant in the study.

In this study, based a set of questions, sent to 308 Portuguese town halls by email, 104 valid answers were collected, from which the ranking in this study results. Each database system is evaluated regarding, satisfaction, technical

assistance, globally, price, documentation, easiness to use, maintenance, performance, security, and performance. In simultaneous, the characteristics that justify the inquired participants were also collected.

The raking of the most used DBMSs presents in Table 4 show that, the DBMS with more votes are, SQL Server Express, Informix, MySQL, SQL Server (commercial version), Access, and PostgreSQL. The less-used databases, last in rank, are DiSAM, PostGIS, Redis, and ElastichSearch. In general, it is possible to conclude that the database administrators across studied institutions, value the Technical Assistance, Security and Performance, as critical aspects.

Additionally, it is also visible that because of software requirements such as ERP's, specific DBMS's are required to be installed, obligating the municipalities o use/integrate such databases, Informix and SQL Server are examples of such cases.

Future Work

As future work, this study is going to be extended to understand the reasons that make users choose and acquire DBMS's. Inline of this study completeness, the quiz will be repeated annually, to understand the evolution of the Portuguese local government. Moreover, based on gathered information, this study aims to help IT departments in the acquisition and selection of a DBMS.

Abstract

Foreign direct investment (FDI) towards developing nations is eventually intended to help host countries attain sustainable economic growth. As such, the recipient country ultimately achieves poverty reduction and improved human development. Over the past decades, the justification for increasing foreign direct investment to developing and under developing countries have constantly grabbed the attention among scholars and researchers. However, despite inflow of FDI towards the Sub Sharan African (SSA) countries, economic growth is still inconsistent in these regions. And even though foreign direct investment in Chad has grown in the recent years, the country still faces development constraints. This study aims to assess the effect of FDI on economic growth in Chad using time series data collected from the World Bank from 1980 to 2019. The autoregressive distributed lag (ARDL) and error correction (ECM) models were estimated among the variables. Hence, both the long run and short run dynamics regression estimates revealed that FDI has a significant effect on economic growth in Chad within the period. Nonetheless, there is a strong sign of convergence towards long run equilibrium as the speed of adjustment is significantly high at -122.7133%. The findings explain evidence of a uni-directional causality (one-way) running from FDI to economic growth. Furthermore, the paper recommended that both public and private foreign investors should invest in specific needs and exhaust every prudential step in making sure the inflow of FDI is efficiently used for the target aimed to boost the overall economic growth of the country especially by enhancing infrastructure, openness, and inflation target.

Keywords*:* Foreign direct investment, Economic growth, ARDL, ECM, Republic of Chad.

Introduction

Economic growth is referred to as the increase in the output per capita of an economy (Ivic, 2015) whereby, an increase in per capita output under the growth of GDP not only increases the total volume of production, but a

Cite this Article as: Ganama MOUSTAPHA GUEME, Maimunah Binti ALI, Khalil KAYA, Hissein ARABY NOUR and Khadar Ahmed DIRIE "The Causality Effect of Foreign Direct Investment on Economic Growth in Sub Saharan Africa: An Empirical Evidence from Chad Using ARDL Approach" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

simultaneous increase in the total population as well. Therefore, capital output will also increase over time to maintain the same growth rate (Gueme et al., 2020). On the other hand, foreign direct investment (FDI) often to the physical investments and purchases made by a company in a foreign country, typically by opening plants and buying buildings, machines, factories and other equipment in the foreign country (Altzinger & Bellak, 1999). As such, FDI can be classified in two categories namely direct and indirect (Varghese, 2015). These types of direct investments generate much more benefits since they are generally considered as long-term investments and help strengthen the economy of the foreign country. While the indirect investments include the equity instruments such as stocks, and also debt instruments such as bonds (Altzinger & Bellak, 1999; Kalotay, 2012). More often, FDI is undertaken by multinational firms and it is undeniable that foreign direct investment is a major catalyst to development towards increased growth (Carbonell & Werner, 2018). Moreover, it is also an integral part of an open and effective international economic system (Patmawati & Maimunah, 2013).

Most of the flows of FDI originate from OECD countries with developed countries contributing to advancing this itinerary. Considering the importance of FDI to the implementation of less developing countries' economies, it is primordial to understand its contribution and significance towards the economic growth of both developing and under developing countries. Since these countries play a role in facilitating developing countries to access the international markets as well as the technology (Fahad, 2014; Adegboye, 2017; Ma *et al*., 2018). However, unlike developed economies, developing countries and other poor countries with limited resources such as Chad must still dependent on foreign intervention. It has been known for decades that Foreign direct investment (FDI) is undeniably recognized as a catalyst for stimulating growth, especially in many developing countries that have limited capacity to promote domestic investment and finance long-term development (Gichamo, 2012; Senkuku & Gharleghi, 2015; Kadiatou, 2017). Decades of economic stagnation and declining standard of livings have turned the Sub-Saharan Africa among the world's poorest region in the globe.

Beside, economic growth is often failing to reach those who are more in need along different social dimensions (UNCTAD, 2019; The Global Fund, 2018) as FDI is an important channel for the transfer of technology between countries, due to the fact that it promotes international trade through access to foreign markets, A number of empirical studies have mainly focused on the relationship between economic growth and foreign direct investment (for e.g. Masry, 2015; Loots & Kabundi, 2017; Carbonell & Werner, 2018). In order to investigate the effect of FDI on economic growth in Sub Sahara African (SSA) countries by selecting GDP per capita as the dependent variable, a panel data of 32 SSA countries during 2008 to 2014 were collected using static panel regression techniques. The dynamic panel estimates were employed to assess the causal relationship between population size and the effect of the 2009 European debt crisis. As such, the implications of foreign direct investment towards economic growth remains a topic of great concern among researchers (Nations Encyclopedia, 2019).

Although FDI in Chad has increased significantly over the years, it is yet to be visible due to its concentration towards the non-primary sector of the economic growth of the country (agriculture). And because agriculture is the primary sector of the economic growth of the country, the huge concentration of FDI in other sectors made it difficult to boost up the economy. On the other hand, the services sector has lately attracted telecommunications and banking sectors where the country's main investors are Nigeria, France, the United Kingdom and South Korea (Nordea Trade, 2019). furthermore, the value of announced greenfield FDI projects in Chad increased by 319% during 2014. Nevertheless, Chad's ranking in the "where to invest in Africa Report" dropped from 33 in 2014 to 34 in 2015 due to a deteriorating operating environment. With poor rankings in the "Ease of Doing Business Survey" in 2015, the consumer price index (CPI) are ranging at 3% and 12% (Nations Encyclopedia, 2019).
Therefore, does FDI significantly affect economic growth in SSA countries and especially in Chad?

It is no doubt to consider there is countless extensive literature about the role of FDI for developing economies. More often, foreign direct investment increases the stock of capital of a country and generates public revenue through taxation, but the main channels for FDI are to improve economic growth. For example, the evaluation of the SSA (Sub Saharan African) countries has shown that agriculture has a big share in the GDP (with the majority of the population working in the primary sector), however agricultural FDI remain extremely low and it only accounts for 2% to 3% of the total FDI volume (Dike, 2018).

Additionally, the theoretical arguments on the contribution of FDI to host economies have been extensively articulated, with the overall benefits broadly categorized into the direct and indirect macroeconomic effects (Haller, 2012). The direct effects of macroeconomic factors of foreign direct investment occur when there is increase in the investment level of the host economy. For instance, the increase in tax revenues can generate government spending, creating employment and increasing foreign exchange receipts. Furthermore, the indirect effects or micro level in regard to FDI contribute to the long-term growth and development which occur through technology spillovers to the domestic firms (Fagan et al.,2016; Abd Rahman Ahmad et al., 2019). More particularly, it has been proven that FDI can accelerate growth through increases in total factor productivity, and thus overall efficiency of resource use in the

host countries (Kargbo & Dunne, 2017). Therefore, the main aim of this paper is to investigate the effects of foreign direct investment on economic growth in Chad using the ARDL, and ECM approaches as well as the causal effects of the variables.

Literature Review

The Effect of Foreign Direct Investment on Economic growth

To confirm the source of growth in Ghana, Antwi et al (2013) proved that foreign direct investment (FDI) has been a vital source of growth by bringing in the capital investment, technology, and management knowledge needed for the country's growth. As such, these finding embrace practical implications for policy makers and investors as well (Oshodi, 2018). Besides, in order to assess FDI inflows as a percentage of GDP (FDI ratio) and economic growth (GDP growth rate) in Tanzania, a study conducted by Senkuku & Gharleghi, (2015) tested the cause-and-effect relationship between variables selected for period from 1970 to 2007. The study employed the granger causality test procedure which refers to an innovative econometric methodology and more effective for testing the direction of causality between variables. The results based on the Granger causality criterion clearly shown that there exist a bilateral or bidirectional causality between FDI inflows and economic growth. This means that FDI stimulates growth and that growth stimulates FDI, which shows that in Tanzania foreign direct investment inflows have led to economic growth and that GDP growth has attracted inflows of FDI (Senkuku & Gharleghi, 2015).

Adegbite & Ayadi (2011) conducted a similar study in Nigeria in order to obtain the best unbiased linear estimators, the study used several econometric tests based on the model using ordinary least squares (OLS) regression analysis and yielded the best linear non-linear estimators. The results of the study confirmed the beneficial role (relationship) between FDI and growth. However, Adegbite & Ayadi (2011) found that the role of FDI on growth could be limited by human capital. The study concluded that if FDI promotes economic growth, then more attention is needed for infrastructure development. Since Sebnem *et al* (2006) confirmed that other local conditions such as human capital and market structure are among the important factors that have effect of FDI on economic growth. On the other hand, Koyuncu & Ünver (2016) have proven that population growth and inflation do not have statistically significant effect on FDI. It is essential to ensure a sound macroeconomic environment and to develop human capital to boost productivity and FDI flows (Adegbite & Ayadi, 2011). In the meantime, Sayek et al. (2006) suggested that holding the extent of foreign presence constant often allow the financially well- developed economies to experience growth rate situated at almost the double of those economies as compared to those with poor financial markets. And secondly, they (Sayek et al., 2006) also suggested that increase in the share of FDI or relative productivity of the foreign firm leads to higher additional growth in financially developed economies as compared to those in poor countries. Similarly, another study conducted in Australia by Pandya & Sisombat (2017) using the regression analysis between FDI and different measures of growth found that FDI inflows are considered to be a vital source of economic growth and it play an immense role in growth regarding the gross domestic product (GDP), infrastructure improvement, employment creation, trade performance and export. On the other hand, the mining and quarrying sector have been identified as an attractive sector which contributed to 7% of the GDP of the country' s large amount of capital invested and employing intensive labour. The findings provide insight from the critical information to Australian policy decision makers to sort an informed decision with regard to attracting investment sectors and policies in encouraging foreign investors to invest in the country.

Similarly, Jugurnath, Chuckun, & Fauzel (2016) have investigated the effect of FDI on economic growth in Europe and have found that despite its negative impact on economic growth, the inclusion of the 2009 Euro zone crisis did not diverge the results based on static random effects. Which shows that the contribution of FDI is observed to be relatively higher than domestic investment despite its negative effect (Jugurnath, Chuckun & Fauzel, 2016). For instance, Sebnem et al. (2006) stipulated that financial markets usually allow the inverse relationship between foreign and domestic firms to turn into FDI spillovers since the effect is not significant. Overall, both results from Adegbite & Ayadi (2011); and Chuckun, & Fauzel (2016) suggested that FDI does have a positive and significant relationship with economic growth and therefore consistent with literature with respect to developing countries. Moreover, the relationship between FDI and economic growth in Spain with data collected from 1984 to 2010 show that there is no evidence for FDI towards stimulating economic growth in Spain (Carbonell & Werner, 2018).

From the review, there exist a relationship between FDI and economic growth from various dimensions. And then, the nature of the relationship is either negative of positive. The studies show that for the Sub Saharan Africa (SSA) region, most of the finding have negative effect between FDI and economic growth due to the absence of proper application of the factors affecting economic growth which led to a lower FDI.

Data and Methodology

A systematic way of systematically solving a research problem can be done through methodology. By doing so, methodology allows us to achieve the answer to the main objective of the research. As earlier pointed out, the current study sought to investigate the effect of foreign direct investment on economic growth of Chad. Thus, quantitative methodology was employed in this study in which annual time series data were collected from 1980 to 2019. The data are being estimated using the autoregressive distributed lag model (ARDL) and the Granger causality test. The Augmented Dickey-Fuller method was used to test the unit root of the variables whether at first difference or at level (I (0) or I (1). Next, the bound test for cointegration was employed to determine whether there is a long run relationship between the variables according to Pesaran *et al* (2001).

The process of using ARDL includes lag determination, the bound-test for cointegration including the long-run and short-run estimation of the variables' coefficients. Many recent studies have shown that the ARDL approach to cointegration is more reliable than other approaches such as Engle and Granger (1987), Johansen (1988), Johansen and Juselius (1990); Gregory and Hansen (1996). One of the reasons that favour the ARDL approach is that it is applicable irrespective of whether the regressors are integrated of the same order or not. Thus, the ARDL model boycott the problems resulting from non-stationary time series data at different level (Pesaran *et al.*, 1996; Pesaran *et al*., 2001). Which means under the ARDL method, both the long run and short run coefficients in the model are estimated simultaneously. And from there, the model can be developed and utilised for cointegration test even if all the variables are not stationary after the first difference at I (1) or at level at I (0); as long as none is integrated at the second difference at I(2). Therefore, the necessary condition is that some variables are integrated at I (1) and or at I(0) but none at I(2). ARDL model can be developed when this condition is met (Ugwuanyi et al., 2017). Thus, the description of the variables in this study are illustrated in Table 1.

Table 1: Data description

Variable description	Unit of Measurement	Source
GDPG growth (GDPG)	Gross Domestic Product growth (annual %)	World Bank Development Indicators
Foreign direct investment Inflows (FDI)	FDI net inflows (% of GDP)	
Gross capital formation (GCF)	Gross capital formation (% of GDP)	
Inflation (INF)	Inflation, consumer prices (annual %)	
Openness (OP)	Trade Openness (%GDP)	

Economists have used both theory and empirical research to explain economic growth. As a result, economic growth is measured as a percentage increase in real gross domestic product (GDP) (Fouthe & Ndedi, 2017). The variables in this study are presented in Table 1 where, real GDP growth is used as the dependent variable and FDI inflow as the independent variable. While gross capital formation, inflation, and openness are employed as the control variables in the model. The data on FDI inflows and real GDP growth as well as the control variables come from the World Development Indicators and measured as the net FDI inflows of investment and GDP Growth prior to literature (Sun, 2002; Mengistu & Adams, 2007; Antwi & Poku, 2013; Blonigen, 2019).

Theoretical Framework

The economic theory of development shows many ways in which FDI could contribute to the growth of the real income of the host country. First, the classical and neoclassical theories of capital movements or foreign investment reveal the restrictive constraint of national savings through the inflow of foreign capital. More specifically, international capital flows involve a flow of investment funds from countries where capital is relatively abundant for countries and where capital is relatively scarce (Fouthe and Ndedi, 2017). For example, the evidence from the statistical analysis of Jugurnath et al (2016) suggested that cumulative FDI had a significant positive effect on economic growth. More specifically, in the long run, Dike (2018) confirmed the existence of a long-term relationship between FDI inflows and economic growth. Apart from this, FDI often plays a unique role in job creation (employment) and modernization of host countries. Indeed, many countries, especially developing countries, view FDI as an important element of their economic development strategy (Samuel, 2009) including economic growth. According to Ricardo's classic theory of growth, an increase in capital and labor would lead to growth in output. In

the Harrod Domar growth model, the change in the capital stock (investment) and the additional capital / output ratio (ICOR) determine the growth of national income (GNI). For a given ICOR, an increase in investment will result in an increase in output. For example, Adams (2009) found that FDI had a significant positive effect on economic growth and overall, FDI tend to improve and encourage domestic investment.

Conceptual framework and hypothesis development

Literature particularly for developing countries have shown that the flow of FDI is moving towards a country especially where rapid economic growth has been recorded. For example, when FDI contributes significantly to economic growth, faster economic growth attracts more FDI. Because it increases the confidence of foreign investors in the economy, which further pushes the rate of growth (Blonigen, 2019; Owusu-Antwi et al., 2013). However, in the least developed countries like Chad, studies have shown that FDI is in fact tracking, rather than a form of initial growth or at least a promise of growth (Sun, 2002). Therefore, the proposed framework has blended and modified the existing economic theories to effectively fit the role of FDI towards economic growth.

The following hypotheses are established to examine the various relationships between foreign direct investment factors and economic growth factors in the Republic of Chad.

H_1: Foreign direct investment has a significant influence towards economic growth in the Republic of Chad.

H_{1a}: There is a significant relationship between FDI inflow and GDP Growth in Chad.
H_{1b}: There exist a directional causality between FDI and GDP growth in Chad.

Model Specification

In an econometric model, the relationship between economic variables is not precise. Firstly, the theory and assumptions must be consistent with the available data and the problem specification. Secondly, it is essential to make statistical inferences from a particular dataset (estimation and test models); and lastly, draw appropriate conclusions, including forecasts and policy implications, from the estimated model (Ogunyinka & Tang, 2013; Wakyereza, 2017). The role of foreign direct investment and economic growth by Osano & Koine (2016) in Kenya have shown an evidence of a strong relationship between foreign direct investment variables and economic growth. Tus, the applied model for this paper follows the primary linear model which attempted to ascertain if FDI inflow is effective in improving economic growth then, the single linear regression equation is modified from Acquah (2016); as follow;

$$EG_t = \alpha + \beta FDI_t + e_t \quad (1)$$

More specifically, Equation (1) will be modified to reflect the peculiarity of the study and the selected variables. The long run model is therefore expressed as;

$$GDPG_t = \alpha + \beta FDI_t + e_t \quad (2)$$

Where t indicates the country and time (year); α is the constant number (the intercept) ≠ 0; FDI represents the FDI inflow; EG represents economic growth; GDPG defines GDP growth; e_t is the error term; and β represent the parameter estimates. Hence, equation (1) will be modified to reflect the peculiarity of the study and variables selected. The ARDL model with error correction parameter and short-run dynamic model can be derived from equation (2) and presented as;

$$\Delta y_t = \alpha_0 + \sum_{i=1}^{p} \beta_i \Delta y_{t-i} + \sum_{i=1}^{p} \delta_i \Delta x_{t-i} + \sum_{i=1}^{p} \varepsilon_i \Delta z_{t-i} + \lambda_1 y_{t-1} + \lambda_2 x_{t-1} + \lambda_3 Z_{t-1} + u_t \quad (3)$$

The first part of the equation with β, δ, and ε represents the short run dynamics of the model. The second part including λs represents the long run relationship. The null hypothesis in the equation is $\lambda_1 + \lambda_2 + \lambda_3 = 0$, which means non-existence of long run relationship; and Δ represents the first differing operator.

The error correction model (ECM) illustrated in the equation (4) and (5) integrates the short-run dynamics together with the long-run equilibrium without losing long-run information, since ECM illustrates the speed of adjustment towards the long-run equilibrium from the short-run after the shock. The error correction models for Y_t, and X_t are as follows:

$$\Delta Y_t = \mu_Y + \alpha_Y \varepsilon_{t-1} + \sum_{h=1}^{I} \alpha_{1h} \Delta Y_{t-h} + \sum_{h=1}^{I} b_{1h} \Delta X_{t-h} + u_{Yt} \quad (4)$$

$$\Delta X_t = \mu_X + \alpha_X \varepsilon_{t-1} + \sum_{h=1}^{I} \alpha_{2h} \Delta Y_{t-h} + \sum_{h=1}^{I} b_{2h} \Delta X_{t-h} + u_{Xt} \quad (5)$$

Where, μ_{Yt} and μ_{Xt} are stationary with noise processes for some number of lags l and the coefficients in the cointegration equation give the estimated long-run relationship among the variables and coefficients on the ECM describe how deviations from that long-run relationship affect the changes on them in next period.

Likewise, causality among the variables are to be employed for the direction of granger causality between FDI, and economic growth. The necessary condition to perform the causality test is that if the bound test for cointegration revealed that the series are cointegrated then the study will employ the error correction model estimation for the equation (6) in the model as follow;

$$EG_t = \sum_{i=1}^{n} \alpha_i FDI_{t-i} + \sum_{j=1}^{n} \beta_j EG_{t-j} + u_{1t} \quad (6)$$

Thus, the results of the study are presented below in order to achieve the objective of the study.

Results and Discussion

Trend Analysis

Figure 2 below illustrates the trend analysis for Chad between the year 2000 to 2019 shows that between these periods, the economic growth in Chad is fluctuating. Whereby, the country experience high growth rate from 2003 to 2006 where it starts to dramatically decline and slightly raise; then kinky shaped curve until 2019. Seemingly, FDI in Chad has experienced a systematic increase from 2000 and sharply started to decline between year 2005 to 2006. Which then experienced a sharp fluctuation until 2018 then experience a slight increase from mid-2018.

Figure 2: Trend Analysis of FDI and Economic growth of Chad

Hence, between 1961 to 2018, the average value of economic growth in Chad varied between 3.48 % to -21.44% in 1979. With a maximum of 33.63 % average value in 2004 after the country become an oil producer (African Development Bank Group, 2019). According to the African Development Bank Group (2019) the average growth rate of Chad is approximately 2 to 3 % a year. Hence, a significant and strong growth rate of an economy should consistently grow in minimum at nearly 5 % a year or more in a year, which can imply a substantial rate of economic growth. The Group also suggested that a 7 to 8 % of economic growth rate is extraordinary which means the country is performing well. However in Chad, the scenario is totally different and still at low growth rate (African

Development Bank Group, 2019). As a result, poverty continues to afflict a large proportion of the population (Khalil Kaya et al., 2020).

Since oil production has been the largest target of foreign direct investment in Chad and since 2003, the petroleum sector has dominated the economic activities of the country. Nevertheless, the majority of the population are dependent on livestock breeding and agriculture as the major and important economic activities and sector of employment. As such, the government has prioritized these sectors in order to diversify the economy and to maximize non-petroleum tax receipts due to the decrease and fluctuations in the overall global oil prices (Nour & Rahman, 2017). Which have led to low oil revenues (which account for over 70 percent of government revenue) (Nour, 2015). Though Chad net FDI inflows fluctuated substantially in recent years, it tended to increase through 1999 - 2018 period ending at 662 million US dollars in 2018. For instance, in 2018, net FDI inflows was 662 million US dollars and during that period, the average value was 3.74 percent with a minimum of -4.85 percent in 2014; and a maximum value of 46.49 percent in 2002. The latest value from 2018 is 5.87 percent (World Bank, 2019). According to the World Bank (2019); and Nour (2015), foreign direct investment in Chad in 1995 was only $7 million, or 0.6% of GDP, but from 1997 to 2000, the range was $15 million to $16 million.

Descriptive Statistic Results

The skewness and kurtosis of each of these variables from the normal distribution, the probability is the probability that a Jarque-Bera statistic exceeds (in absolute value) the observed value under the null hypothesis. Whereby a small probability leads to the rejection of the null hypothesis of a normal distribution. The results of the descriptive statistics are illustrated in Table 2.

Table 2: Descriptive statistics

	GDPG	FDI	GCF	INF	OP
Mean	6.71	7.57	19.9	3.60	61.80
Median	4.22	4.05	20.7	3.51	53.80
Maximum	33.63	46.49	60.2	41.72	126.4
Minimum	-6.26	-4.85	2.73	-13.0	20.1
Std. Dev.	8.96	12.64	13.1	9.77	21.86
Skewness	1.38	1.88	0.99	1.58	0.65
Kurtosis	5.36	6.01	4.13	7.72	3.26
Jarque-Bera	10.44	18.31	8.40	48.37	2.91
Probability	0.005	0.0001	0.01	0.00	0.23
Sum	127.42	143.79	775	129.4	2471
Sum Sq. Dev.	1445.8	2876.6	6530	3339	18628

Note: Symbols are used to represent variables for convenience (i.e. GDPG, FDI, GCF, INF, OP are GDP growth, FDI Inflow, Gross capital formation, Inflation, Openness respectively).

Therefore, the probability value of the descriptive test results from Table 2 show that GDPG, and FDI values are less than 5% (< 5%) and are significant, which imply the data are not normally distributed for these variables. While among the control variables, only the p-value of openness was not significant and implies normal distribution.

Unit Root Test results

Table 3 results show that FDI, GDPG, and INF are stationary at first difference I(1). While GCF, and OP are stationary at level I (0) with trend and intercept at 1% and 5% significance levels.

Table 3: Unit Root Test Results

		Level			**1rst Difference**		**Results**
Variables		ADF		ADF			
	Constant	Trend & Constant	No trend & intercept	Constant	Trend & Constant	No trend & intercept	
GDPG	-5.604	-5.529	-1.856**	-2.823**	-1.739	-5.737	I(1)
FDI	-3.808	-3.789***	-4.755	-4.565**	-4.502*	-3.238	I(1)
OP	-1.519**	-2.017**	0.072**	-5.397**	-9.277	-2.873**	I(0)
GCF	-2.751**	-3.571***	-0.571**	-5.288	-5.304	-5330	I(0)
INF	-6.373	-6.270*	-5.856	-6.43***	-6.399	-6.549**	I(1)

*Notes: ***, **, * denotes rejection of the null hypothesis of a unit root at the 1%, 5%, and 10% significance level. No asterisk indicates that the series is non-stationary*

In addition, since some variables are stationary at I(0) and others at the I(1), and others are both of each of the specified models, is it therefore appropriate to employ the bound test for cointegration relationship between FDI and economic growth in Chad. Therefore, the ARDL representation of the equation (3), (4), and (5) are formulated as follow:

$$\Delta GDPG_t = \alpha_0 + \sum_{i=1}^{n} \beta_{1i}\, \Delta GDPG_{t-i} + \sum_{i=1}^{n} \beta_{2i}\, \Delta FDI_{t-i} + \sum_{i=1}^{n} \beta_{3_i}\, \Delta GCF_{t-i} + \sum_{i=1}^{n} \beta_{4_i}\, \Delta INF_{t-i} + \sum_{i=1}^{n} \beta_{5_i}\, \Delta OP_{t-i} + \lambda_1 GDPG_{t-1} + \lambda_2 FDI_{t-1} + \lambda_3 GCF_{t-1} + \lambda_4 INF_{t-1} + \lambda_5 OP_{t-1} + u_t \quad (7)$$

The first part with the difference (Δ) sign represents the ECM (error correction model) for the short run representation; while the second part with the lambda (λ) sign represent the ARDL long run relationship part. Hence, before carrying out the co-integration test, it is very important to choose an appropriate lag length for the specified models.

Lag Length Criteria

Several criteria can determine the optimal lag length such as the Likelihood Ratio (LR) test, Akaike Information Criterion (AIC), Schwartz Bayesian Criterion (SBC), Final Prediction Error (FPE), and Hannan Quinn criterion (HQC). The study firstly focusses on the optimum lag length selection which entails the Vector Auto Regression (VAR) model by building the models and taking into consideration the dynamic time series properties.

Table 4: Lag Determination criteria

Lag	LogL	LR	FPE	AIC	SC	HQ
0	-127.3245	NA	13893.35	15.2147	15.3127	15.2243
1	-115.0959	20.1413	5314.986	14.2466	14.5406	14.2758
2	-105.3531	13.7544*	2782.223*	13.5716*	14.0611*	13.6197*

The results from Table 4 shows that the numbers in * indicates lag order selected by the criterion employ the vector autoregressive (VAR) based on the Akaike information criterion (AIC) for both the FDI and GDPG selected lag (2,2) for the model since AIC indicates the smallest value (13.5716). Thus, the relationship between FDI inflow and GDP growth using the ARDL model using Lag (1,1) as best suited for the consistency of the results for both the long run and short run models.

Bound Test Results

The ARDL cointegration approach was developed by Pesaran and Shin (1999) and Pesaran *et al* (2001). This test was carried out on the models to examine the existence of a long run relationship between the specified variables with the aid of the previously selected lag length.

Table 5: ARDL Bound test for cointegration

F-Bounds Test		Null Hypothesis: No levels relationship		
Test Statistic	Value	Significance	I(0)	I(1)
F-statistic	4.87113	10%	3.02	3.51
		5%	3.62	4.16
		2.5%	4.18	4.79
		1%	4.94	5.58

The dependent variable from the result is unrestricted constant and no trend. F statistic value = 4.87113 which is greater than (>) the upper bound I(1) and the lower bound I(0) at both 5%, and 10% levels of significance. Therefore, there is co integration between the variables and the null hypothesis of no long run relationship is rejected. Hence, the next step consists to determine the long run and short run relationship models of the variables.

Long Run Estimation

After establishing that the series in the models move together in the long run, an ARDL (1, 0, 1, 0, 0) was chosen for the FDI and economic growth model in order to achieve the objective this the study. The results of the estimated coefficients in Table 6, along with the F-statistic for GDPG and FDI equation model show the variations of the selected independent variables explained certain changes of the dependent variable. Furthermore, the inclusion of the control variables (e.g.: gross capital formation, inflation, openness) in the model help to explain more clearly the occurrence of changes and effect of FDI to GDP growth.

Table 6: ARDL Long run estimation

Variables	**Coefficients**	**T-statistics**
GDPG(-1)	0.054733	(0.330613)
FDI	0.322211	(1.567083)**
GCF	-0.589652	(-2.176759)**
GCF(-1)	0.585898	(2.840158)***
INF	0.353197	(2.432647)**
OP	0.051525	(0.446822)
C	-0.818306	(-0.173005)

Note: *, ** and *** denote statistical significance at 10, 5 and 1 percent respectively. Symbols are used to represent variables for convenience (i.e. GDPG, FDI, GCF, INF, OP are GDP growth, FDI Inflow, Gross capital formation, Inflation, Openness respectively). Figures in parentheses beside the coefficient values are the t-statistic values.

The estimated outputs suggest that foreign direct investment inflow FDI (-1) coefficient is statistically significant (p-value< 5%) at the 5 % level of significance. Interestingly, FDI (-1) positively affect GDPG, thus FDI promotes economic growth. And a unit change in FDI leads to 32.22% increase in economic growth (GDPG). In addition, among the control variables the first lag of gross capital formation as a proxy of physical infrastructure (GCF) is positive and significant at 1 percent level. The results show that when gross capital formation (CCF) increases by 1%, GDPG tend to decrease by nearly 58.96%. When openness increases by 1 percent, GDPG tend to increase by 5.125 percent. It implies that an increase in infrastructure encourage openness to FDI which tend affect economic growth. Further statistical test from the control variables (inflation rate) reveal a strong positive evidence of INF on GDPG at 5 percent level. A unit increase in inflation has led to 35.32 increase in economic volatility which prevent growth. Hence, this higher and significant inflation rate indicates a volatile climate of investment that will eventually inhibit real growth. Therefore, infrastructure (GCF) has a significant positive effect on economic growth which means that improved infrastructure will allow the increase in inflow of FDI in the country. Nevertheless, if infrastructure is negative but significant it means that the country level of infrastructure needs expansion in order to attract investors. Therefore, since infrastructure is not enhanced in Chad in the long run, openness (OP) has not significant effect on economic growth (GDPG).

Short Run Estimation

Table 7 display the error correction model representation for the selected ARDL (1,1,1,2,0,1,0,1) for the short run representation of FDI and economic growth model (4.1).

Table 7: Short run estimation ARDL (1,1,1,2,0,1,0,1)

Variable	Coefficient	t-statistics
Δ (GDPG(-1))	0.211490	(1.380421)
Δ (FDI(-1))	-0.732466	(-3.866563)***
Δ (GCF(-1))	0.799185	(3.954409)***
Δ (GCF(-2))	0.296049	(1.724984)
Δ (INF)	0.364926	(4.316050)***
Δ (INF(-1))	0.039223	(0.372003)
Δ (OP)	-0.002368	(-0.035267)
C	-0.623083	(-0.650510)
ECM (-1)	-1.227133	(-5.397273)***

Note: *, ** and *** denote statistical significance at 10, 5 and 1 percent respectively. Symbols are used to represent variables for convenience (i.e. GDPG, FDI, GCF, INF, OP are GDP growth, FDI Inflow, Gross capital formation, Inflation, Openness respectively). Figures in parentheses beside the coefficient values are the t-statistic values.

The outcome obtained for the ECM estimation for FDI and economic growth revealed that almost all the independent variables have been proven to be significant and adjusting variables for the short run equilibrium of the dependent variable (GDPG). Among all the variables, foreign direct investment inflow (FDI (-1)), gross capital formation (GCF(-1)), and inflation rate (INF) turned out to be significant; whereas openness (OP) is insignificant. However, the insignificance of openness has a negative effect on GDPG and a unit increase in OP lead to a decrease in GDPG by -0.2368% which is make FDI to have a negative significant effect on GDPG by a decline of -73.2466. Interestingly in the short run, 1% increase in GCF (-1) significantly increases GDPG by 79.9185%; 1% increase in INF significantly increases GDPG by 36.4926% in relation to economic instability which imply the significant influence of the economic activities by the explanatory variables in the short run model. Furthermore, the error correction term (ECT) coefficient (-1.227) has a negative sign and highly significant, reflecting the joint significance of the long run coefficients indicating a high speed of adjustment to disequilibrium in the short run at -122.7133%. Next, the Granger causality test is employed in the following section in order to find which variable causes the other to change.

Granger Causality Result

The result of the Pairwise Granger causality test among the variables is employed to examine the direction of causality between FDI and economic growth are presented in the Table 8.

Table 8: Pairwise Granger Causality result among the variables

Null Hypothesis	P-value at level of significance (F-test)	Results
FDI does not granger cause GDPG	12.2937***	rejected
FDI does not granger cause GDPPG	11.0561***	rejected

Note: 10%, 5% and 1% level of significance are represented by *, ** and *** respectively. Null Hypothesis: there is no Granger Causality.

The results reveal that there is evidence of causality running from foreign direct investment inflow (FDI) and economic. Thus, the outcome of the direction of causality show that there exists a uni-directional causality (one-way) between FDI to economic growth but it does not go the other way. As such, the findings indicate that FDI is dominant and have huge impact on the economic growth in Chad. It means when FDI inflow is significant and boost the economy, then implying that GDP growth tend to considerably grow as a result of the importance and the high influence of FDI to Chad which then improve infrastructure, openness and stabilizing inflation rate.

Diagnostic Tests Result

Several diagnostic tests were conducted to determine the suitability of the ARDL and the ECM models in this study in order to determine the relationship between the variables are presented in the following Table 9.

Table 9: Diagnostic test results

Tests	Statistics	Probability
a. Jarque-Bera (normality test):	1.9273	0.3815
b. Breusch-Godfrey Serial Correlation LM test:		
F statistics	0.4429	0.6475
Obs R-squared	1.2609	0.5324
c. Heteroskedasticity test Breusch-Pagan-Godfrey:		
F statistics	1.053942	0.4247
Obs R-squared	8.574903	0.3794

Notes: 1. denote the respective model (4.1) of the study.

The diagnostic test results show that since the p-values of the dependent and independent variables are greater than 5% level which means not significant, indicate that the model does not suffer from serial correlation, no heteroscedasticity and the error term is normally distributed.

Similarly, the residual stability from the Cumulative Sum (CUSUM) and Cumulative Sum of Squares (CUSUM of squares) test are displayed in the Figure 3.

Figure 3: Model Stability diagnostic test

The results of both CUSUM and CUSUMQ of OLS recursive residuals clearly demonstrate a steady state of the specified ARDL model in the study at both long and short run levels. Since the residuals denoted in the blue line lie between the lower and upper critical boundaries at 5 percent, therefore, the long run coefficient of the repressors is stable and thus the results suggest that the estimated parameters of the respective models specified are generally steady over the study period. Furthermore, the next section discusses the findings of the study in relation to literature.

Discussions

The results show that FDI inflow has a significant long run and short run effect on the economic growth in Chad. Hence, in the long run, the relationship is significant and positive, while in the short run, the relationship is negative and significant. Similarly, the control variables have a significant effect on economic growth in both long run and short run, except for openness. More specifically, the result revealed that in the long run, gross capital formation (in line with Ndambiri *et al.*, 2012), inflation (GCF, INF) have a significant positive effect on economic growth; and openness (OP) has a positive (in the long run) and negative (in the short run) effect on economic growth. Therefore, the findings are in line with the study conducted by Otto & Ukpere (2014); Jugurnath *et al* (2016); Saini *et al* (2016); Loots & Kabundi (2017); Carbonell & Werner (2018); Masipa (2018); Dkhili & Dhiab (2018); Baiashvili & Gattini (2020) which suggested that cumulative FDI had a significant positive effect on economic growth as a result of the beneficial role of FDI to stimulate growth.

Mbogela (2019) conducted a study for 49 African countries using cointegration and granger causality where the empirical results revealed that FDI flows, openness and gross capital formation shown to have a significant effect on economic growth in the selected African countries. Besides, Blonigen (2019) confirmed that when FDI contributes significantly to economic growth, faster economic growth attracts more FDI inflow thus FDI encourage domestic. As such, prominent finding from studies in the Sub Saharan Africa (SSA) regions including Chad have revealed that most of the finding have negative effect for FDI on economic growth due to the absence of proper application of the factors affecting economic growth which led to a lower FDI. Besides, other local conditions such as human capital and market structure are among the important factors for the effect of FDI on economic growth, although Koyuncu & Ünver (2016) have proven that population growth and inflation do not have statistically significant effect on FDI.

On the contrary to this study, finding by Jugurnath, Chuckun & Fauzel (2016) confirmed that there is no significant effect of foreign direct investment in the Euro zone although the contribution of FDI is relatively higher than domestic investment (Jugurnath, Chuckun & Fauzel, 2016). Moreover, in Spain, the study conducted by Carbonell & Werner (2018) has shown no evidence of FDI towards stimulating economic growth. Therefore, FDI can significantly influence economic growth in developing countries than in the developed countries and the findings thus support the hypothesis H_{1a}.

The results of the hypothesis H_{1b} of this study was achieved and partially support the hypothesis. The findings explain that there is evidence of causality from foreign direct investment inflow (FDI) to economic growth. And it shows the existence of a uni-directional causality (one-way) between FDI to economic growth but it does not go the other way. As such, the findings indicate that FDI is dominant and have huge impact on the economic growth in Chad. It means that when FDI inflow is significant and boost the economy, then GDP growth tend to considerably grow as a result of the importance and the high influence of FDI to Chad which then improve infrastructure, openness and stabilizing inflation rate. In line with this study, Mbogela (2019) confirmed the existence of the unidirectional causality between FDI and economic growth which highlight the importance of FDI to stimulate growth. The study thus suggested that the export and investment would be more advantageous for the growth of African countries if it would increase real incomes and economic structural transformation of these countries. However, a contradiction was found where Vo *et al* (2019) employed the Granger causality test and the system generalized method of moments (GMM) found a bidirectional causality between economic growth and foreign investment in the middle income countries. In addition to the comparison on the contrary from previous studies conducted, the results of the causality test of this study is partially supported from the study conducted by Senkuku & Gharleghi (2015) who found evidence of a bilateral causality between FDI inflows and economic growth. This means that FDI stimulates growth and that growth stimulates FDI in Tanzania which led to economic growth and GDP growth in Tanzania has attracted inflows of FDI.

Therefore, the outcome of this paper thus suggests that an improvement in trade openness and a strong infrastructure will lead to more significant economic growth; while inflation rate needs to be monitored in order to achieve the inflation target of the country's treasury bank and reduce instability in the economic climate. Dike (2018) argued that agricultural FDI only account for 2% to 3% which can contribute less to the GDP or economic growth of these countries including Chad. In addition, since agriculture is the primary sector of income of poor countries such as Chad, foreign investors are encouraged to invest more in the agriculture sector and mild or less amount towards industrialization for the moment.

Limitation, Conclusion and Recommendations

This study has investigated the effects of FDI on economic growth in Chad. The study collected time series data from the World Bank database dated between 1980 and 2019. The data were analyzed using the autoregressive distributed lag (ARDL) techniques to estimate the long run and short run models and the error correction representation, as well as the pairwise Granger causality test. In the long run, the ARDL estimation for FDI and economic growth analysis revealed a strong evidence that the individual dimensions of foreign direct investment including the control variables (GCF, INF, OP) indicators have a significant effect on economic growth in Chad and are also revealed to be the important factors in explaining economic growth in Chad. While in the short run, the effect is significant but negative.

The results of this study evocate the need for the government as well as the policy makers to enhance openness, infrastructure, and inflation by improving the skill labors so that the country is able to attract more investment (FDI) and improve the overall economic growth of the country. In addition, strategies that can enhance economic growth should be developed. First, because FDI and GDP growth were retarded by technical inefficiencies, mismanagement and miss guidance which indicate that a robust policy should be developed. Second, government should also encourage local contribution than foreign involvement as a sole aim of step in the direction to improve efficiency and boost foreign investor's confidence.

This paper hence highlights some limitations firstly in terms of the limited availability of FDI inflow data per sector of investment. The data per sector of investment were only available prior to three-year period instead of 1980 to 2019. Therefore, the data would not be as useful and meaningful for each sector in the analysis which combine all sectors as inflow of FDI. In addition, from the literature, there have been very little studies conducted in the same area equally to the current research which make it difficult to have more information about the existing researches conducted in Chad. Moreover, using a time series dataset would allow the researcher to identify and estimate the effects that are simply not detectable in either pure cross-sectional or pure time-series data across countries.

Direction of future research should then focus on a wide range of every state of Chad or at least from every region (in rural and urban) in order to clearly identify and specify the effects and determinants of economic growth accordingly. In addition, more variables like market integration, natural resources intensity and specific human capital factors may also be point of focus. Therefore, future studies should have to investigate specific impact of FDI (a particular sector) on economic growth performance (by investigating featured variables) to see the effects and significance of these variables.

Abstract

In the face of the production of discourses-practices on the "phenomenon of habitability in the street" in Bogotá, to think of a Media Observatory is an academic commitment to build contextual knowledge, taking into account that "the observatories are born of the first conviction that the power that the media has today in our democratic societies does not correspond to an exercise that is always responsible for its mission. The media, like any other actor, also makes mistakes" (Herrera, 2006, p. 3). However, beyond judging the media, we will attempt to analyze how the media builds discourses around street living and how it reinforces institutional ideas to justify decisions or measures in the face of policies, programs and projects designed to benefit those who live on the street. The proposal is constituted from the method of discourse analysis and the mixed approach to research.

Keywords: Street habitation, media, university social responsibility, discourse analysis.

Introduction

Colombian society as a group of people and organizations that share a territory, common interests, specific objectives of well-being and growth, carried out within a defined order, where each one fulfills functions; subject to clear authority, laws and norms of conduct, requires that its Institutions of Higher Education - IES -, transcend doing in their communities with respect to generating competencies with their teaching, learning and research processes; to become observers of the national reality to support their ethical and responsible development, applied in the economic, political, legal, technological, cultural, ecological and of course social aspects. In this last and special way, the IES must with their activities of social responsibility, transcend from only applying and supporting with their knowledge the multiple disciplines of thought in business sectors and specific regions to become the constructive social critical conscience of a society to which invitations must be given to reflect and act appropriately, when problematic situations are found that affect their members. This vision is more relevant in Colombia, a country that does not have the resources and even in some cases the sufficient political and ethical will to solve its innumerable problems, even more so if it is from vulnerable populations that do not have visibility. Even the 697 IES (Ministry of National Education, 2019) of the country, may have university observatories, but very few materialize it on the management of the media informing on the street inhabitants (Acuña, 2020); In this way, there is a gap on the possible media observatories in front of the street habitability in Bogotá; situation that the VII census of its inhabitants, "found 9538 people in this condition, especially located in three localities: Los Mártires, Santa Fe and Kennedy" (Bogotá Secretary of Social Integration, 2018).

Research Question

How does UNIMINUTO contribute to the analysis of the media in the face of the phenomenon of street living and contribute to the transformation of some social representations in the towns of Los Mártires, Santa Fe and Kennedy?

State of the art

In 2013, with the enactment of Law 1641, "which establishes the guidelines for the formulation of social public policy for street inhabitants", the institutional measures for addressing this problem in Colombia are indicated. However, it is important to clarify that in Bogotá the different district governments, through their development plans, began to include the problem in 1995. Of special importance are Decree 136 of 2005 and Agreement 366 of 2009, which begin to establish measures to provide integral attention to the street population, to define the district entities responsible for carrying out these processes, and to establish the main public policy guidelines for attention, inclusion and improvement of the quality of life of the street inhabitant (Sánchez, 2015).

The official figures of street dwellers in Bogotá established the presence of 4,515 people in the 1997 Census of Homeless People and 7,817 in the II Census of Street Inhabitants in 1999. Two analyses can be made in this regard, firstly, the change in the population's nomination, and secondly, a significant increase in the population in just two years, immediately following the intervention and eviction of the area known as El Cartucho, to make way for the Third Millennium Park. In 1998 the "Program of Attention to the Street Inhabitants" was created: Vida libre, a lo bien por la vida" was created in 1998, which advances its action through Projects 7151 "Attention to the street inhabitant" and 7159 "Street outreach brigades" in the framework of the Development Plan. The operation is developed by the Administrative Department of Social Welfare - DABS together with NGOs that attend to the drug-dependent population" (SDIS, 2015).

In this way, the already mentioned Law 1641 of 2013 arises, which "aims to establish the general guidelines for the formulation of social public policy for street dwellers aimed at guaranteeing, promoting, protecting and restoring the rights of these people, in order to achieve their comprehensive care, rehabilitation and social inclusion". There, the Public Policy is defined as "... a set of principles, guidelines, strategies, mechanisms and tools that will guide the actions of the Colombian State in the search to guarantee, promote, protect and reestablish the rights of the people living on the streets, with the purpose of achieving their rehabilitation and social inclusion

Within the framework of this same law, the Forum "Habitability in the Streets: Human Dignity, Citizenship and Coexistence" was held in September 2014, organized by the District Secretary for Social Integration through the Sub-Directorate for Adults and the Ministry of Health and Social Protection, with the aim of jointly building alternative solutions to this problem. This space was replicated in other cities in the country such as Medellin, Barranquilla, Cali and Bucaramanga in search of unifying proposals at the national level for the formulation of social public policy for the street dweller, in addition to identifying social support networks and visualizing actions to promote coexistence.

Theoretical Framework

The media play an important role in the construction and consolidation of social imaginaries through the reiteration of representations of street inhabitants. Although there was an effort in the documentary genre to show the life stories of former street dwellers on television, some patterns such as poverty, consumption, domestic violence and marginality were not able to be overcome or adapted in a dignified way so that these lives would be recognized as possible lives. And when they tried to show "overcoming", they sought to vindicate the work of the institutions in favor of this population, taking away from them again the capacity of agency for decision making as opposed to following or leaving the streets and leaving aside certain group practices for the organization of daily experiences (García, 2014).

Therefore, an active role of the media in prevention is required when analyzing how some documentary and fiction productions can contribute to mitigate certain risks in children, adolescents and youth. Collecting communication inputs and putting them at the service of the communities, as well as contributing to the monitoring and generation of knowledge in the face of the phenomenon is a task that we as a university must undertake (SDIS, 2015). For example, few reports showed police abuse or mistreatment of street inhabitants, who were forced to attend and stay in shelters against their will (CPAT and Parces, 2017).

Methodology

The study is proposed from the method of Discourse Analysis (DA), providing a mixed approach to research, which allows the use of quantitative methods in one phase, and qualitative methods in another (Pereira, 2011). Considering the postulates of Sayago (2014), who states that it is common to resort to DA as a form of analysis for two reasons: "a) because the object of study asks for it, or b) because we decide to carry out a work of discourse analysis and, then, we start from the choice of the technique of analysis and, then, we choose a topic that fits the possibilities that this technique opens to us" (p. 4). During the process, databases are built for the processing of qualitative and quantitative information. The following instruments are being used: Public policy analysis matrix, interviews, surveys, database with the 2016-2019 media corpus, Strategic Communication Plan for the design of multimedia content. Likewise, the interviews conducted by District officials and the surveys of the inhabitants of the three selected locations, in the neighborhoods most impacted by the presence of CHC, as well as the academic community of UNIMINUTO will allow the analysis of university social responsibility.

Acknowledgment

The team of researchers involved in the bet for the observatory of means around the habitability in street in Bogota, thanks the support and management of the Corporación Universitaria Minuto de Dios - UNIMINUTO for the development of the proposal and the achievement of the proposed objectives.

Abstract

The article attempts to assess the current state of non-financial reporting, or rather the practices applied by companies fulfilling the statutory obligation in the first two years. The main aim of the article is to examine the current practices in Poland in the field of non-financial reporting and to attempt to evaluate them. Taking the above into account, the Authors decided that the purpose of the article is to answer two research questions: 1) Based on what good practices, companies prepare their non-financial reports, taking into account various industries? 2) What are the trends of non-financial reporting in Poland in the analysed years? A total of 94 companies were examined. The results obtained indicate that the form of disclosures made is very different. The research used research methods and techniques, including: methods of induction and deduction, analysis and synthesis, critical analysis of domestic and foreign literature on the subject, the method of comparative analysis and content analysis. Previous studies in this field did not cover the 2017 and 2018 reporting period, i.e. the first two years after the change of guidelines. Therefore, the obtained results allow to determine the level of preparation of the analysed companies, belonging to various sectors, to new reporting obligations and indicate the current trends in the field of applied practices. The authors clearly indicated, as a result of the conducted research, the need to introduce a uniform framework for the disclosure of non-financial information.

Keywords: non-financial reporting, standards, good practices in Poland, EU Non-Financial Reporting Directive (NFRD)

Introduction

Nowadays, financial statements are only one of the sources that present information on a company at times when information plays a critical role and the area of non-financial reporting becomes fundamental. For capital owners, financial statements data are no longer sufficient . A growing number of companies have started to implement and incorporate principles into their activities (Bauer, Baran, 2015; Jurkiewicz, Wójcik-Jurkiewicz, 2014; Zimoń, 2016; Łojek, 2020; Bauer, 2018). This activity consists of publishing, apart from standard financial statements, also social reports. As a result, a need has arisen to revise the existing reporting of businesses and to create reporting on social responsibility (Lulek, 2014; Sadowska, Lulek, 2020; Wójcik-Jurkiewicz, Sadowska, 2018; Berniak-Woźny, Wójcik-Jurkiewicz and Sroka, 2018). As J. Fijałkowska points out, the accounting system requires new solutions for accounting and communication of companies' achievements, as the approach related to non-financial reporting is increasingly being implemented by businesses (Fijałkowska, 2012, p. 146).

Therefore, the results obtained make it possible to determine the degree of preparation of the analysed companies from different sectors for new reporting obligations or indicate existing trends in this respect. The authors determined, as a result of the conducted research, the need to establish one standard in this area, binding for all public companies. An analysis of domestic and foreign subject literature has also been performed which emphasized the multidimensionality of actions taken by companies in this respect.

Non-financial Reporting in the light of legislative changes: Literature Review

The significance of non-financial reporting has increased in recent years, which has contributed to the emergence of new challenges and expectations regarding the quality of information, especially in the domain of legal regulations in this area and the manner in which it is reported. The change in approach to non-financial reporting takes on the effective form of regulatory and standardisation activities. In recent years, these principles have been formalised by means of legislative actions, and have adopted the form of Directive 2014/95/EU (EU NFRD) which has introduced non-financial data reporting obligations for certain groups of companies starting from 2017.

The non-financial information reporting requirements applicable since December 2016, resulting from the implementation to the Polish law, i.e. the Accounting Act, of the provisions of Directive 2014/95/EU (EU NFRD) has resulted in a significant increase in the number of companies which are obliged to report data on environmental, social, labour, human rights, and anti-corruption issues, i.e. areas indicated by statutory requirements. In December 2014, Directive 2014/95/EU of the European Parliament and of the Council of 22 October 2014 on disclosure of non-financial and diversity information by certain large undertakings and group, entered into force. The Directive on non-financial disclosure was adopted as a consequence of the European Commission indication about the need to increase the transparency of social and environmental information submitted by entities of all sectors to achieve an equal level in all Member States.

The obligation to draw up statements or reports on non-financial information has covered nearly 300 companies in Poland. More than 200 of them are listed companies, and the rest are public interest entities mainly from other sectors. Observations taken in recent years show that only a few companies listed on the WSE have published reports at least partially convergent with the current scope of reporting. However, for most companies, drawing up a report for 2017 was a new challenging experience. The primary criterion determining whether a listed company is obliged to report non-financial information is the number of employees, i.e. 500+. One of two financial criteria must additionally be met – revenue of PLN 170m or more or total assets of PLN 85m or more. The legislator allowed companies to freely choose the standard or guidelines according to which the companies draw up their reports but set a minimum content for each report. The Directive is estimated to cover six thousand companies in the EU. The Directive's nature is dual, i.e. in addition to disclosing extended non-financial information (including policies in specific areas), it also requires disclosure of diversity in policy information.

The object of these studies was mainly to present the idea of non-financial reporting on it, empirical research in the field of applied practices and factors influencing the scope and quality of information presented. Among the many authors and studies in this research, it is worth pointing out, among others, (Hejase et al.,2017; Fernandez-Feijoo et al., 2014; Hahn and Kuehnen, 2013; Aguinis and Galvas, 2012; Visser, 2010; Morhardt, 2009; Cooper and Owen, 2007; Adams, 2002; Moir, 2001; Adams et al., 1995, 1998; Belkaoui and Karpik, 1989; Deegan, Gordon, 1996; Gray, Kouhy and Lavers, 1995 and Preston et.al., 1978).

Interestingly, most of the papers by Polish authors concerning CSR focus on issues in the area of management rather than financial reporting, although even here there are a number of studies (Marcinkowska, 2010; Roszkowska, 2011; Samelak, 2013; Stefańska, 2013; Krasodomska 2014; Mikulska and Michalczuk, 2014; Macuda et al., 2015; Ignatowski and Wójcik-Jurkiewicz, 2016; Waniak-Michalak et al.,2016; Krasodomska, 2017; Matuszak and Różańska, 2017; Wójcik-Jurkiewicz, 2017; Posłuszna and Kaczmarek, 2018; Śnieżek, Krasodomska and Szadziewska, 2018; Sadowska and Wójcik-Jurkiewicz, 2018; Kaczmarek and Posłuszna, 2018; Zimoń and Zimoń, 2019; Fijałkowska and Macuda, 2019; Lulek and Sadowska, 2020; Berniak-Woźny, Walotek-Ściańska and Wójcik-Jurkiewicz, 2020).

Research has unequivocally shown the need for uniform solutions related to non-financial information reporting as it is increasingly recommended and recognised as s good practice in companies. Within the data disclosure process, each company would be able to apply its guidelines, standards or principles. The most popular guidelines in this area include the Global Reporting Initiative (GRI), GRI G4, EMAS standards, ISO, UN Global Compact and Polish Standard SIN.

The Directive does not exclude the use of its own corporate standards or other internationally recognised principles either yet requires the company to inform of its choice. It is essential to bear in mind, however, that the above statutory regulations are not identical to the idea of non-financial reporting as they do not entail a change in approach to doing business.

Good Practices in Non-Financial Reporting: Evidence from Poland

The issue of non-financial reporting has become crucial in the last few years. Since 2007, a project called "Raporty społeczne" ("Social Reports") has been implemented taking on the form of a competition in which prizes are awarded to companies that develop and present, in the opinion of the Jury, the best reports on corporate social responsibility. The competition confirms the observation that social reporting is slowly becoming a trend in the Polish business. So far, 396 social reports have been drawn up and submitted, and Table 2 lists the winning companies.

In the "Raporty społeczne" ("Social Reports") competition, prizes are awarded for the best reports on corporate social responsibility. It is an initiative aimed at promoting the idea of corporate social responsibility (CSR), sustainable development, environmental protection, and social commitment directed to companies and organisations that publish reports on their activities in these areas. The first edition of the competition took place in 2007. The promoters of the project were then The Responsible Business Forum and Deloitte. The form of the competition has undergone transformation on two occasions, i.e. in 2011 and then in 2017, with the competition organised by PwC and CSR Consulting until 2014 and SGS since 2015.

The main objective of the competition is to emphasize the significance of non-financial reporting by highlighting a catalogue of good practices in this area. This initiative recognises companies that not only operate in the interest of society and the environment but are also able to present their achievements in a clear, transparent, and credible manner in published non-financial reports. The following three major and primary evaluation criteria used in the competition since 2011 have included:

– 40% completeness,
– 40% reliability,
– 20% communication.

The contest contributes to maintaining transparency and accountability in the activities of organisations and companies when undertaking dialogue with stakeholders; the criteria of the competition were developed on the basis of the reporting guidelines of the European Sustainability Reporting Association (ESRA) and verified by means of the dialogue with experts in 2008 (bearing in mind that the first competition was held as early as in 2007 and included data from 2006 reports).

Table 1: List of Winners of All Editions of "Raporty społeczne" Competition in the period 2007–2019

Year of Competition	Name of a Company Awarded with the Main Prize
2019	SANTANDER BANK POLSKA
2018	LPP
2017	CEMEX POLSKA S.A.
2016	GK LUBELSKI WĘGIEL "BOGDANKA" S.A.
2015	CEMEX POLSKA S.A.
2014	ORANGE POLSKA S.A.
2013	CEMEX POLSKA sp. z o. o.
2012	KOMPANIA PIWOWARSKA S.A.
2011*	POLSKI KONCERN NAFTOWY ORLEN S.A.
2010	DANONE Sp. z o. o.
2009	BRE BANK S.A.
2008	GRUPA LOTOS S.A.
2007	DANONE Sp. z o. o.

**During the first five years, i.e. years 2007–2011, 72 reports were submitted to the "Raporty społeczne" project.*

When assessing social reporting, it should be noted that companies submitting their reports to the competition most often submit reports on sustainable development, corporate social responsibility, including activities for environmental protection and social involvement, where Danone presented a CSR review and received the Main Award in the first edition (Table 1). Due to the diversified range of reports submitted to the competition, a specific systematised nomenclature is noticeable, as shown in Figure 1.

Fig. 1: Most Frequently Used Report Terms (Names)

Such a wide variety of terms results from no uniform definition, no uniform standards or, in principle, no uniform approach to the broadly understood issues of non-financial reporting, both in economic theory and practice. Determination of the volume of reports submitted to the "Raporty społeczne" competition from the beginning of its existence is presented in Figure 2.

Fig. 2: Number of Reports Submitted to the "Social Reports" Competition in the years 2007–2019

In the 13th edition, i.e. the last one organised at the end of 2019, 45 reports competed, including 15 debuts, 11 integrated reports, and eight reports from non-business institutions (including four reports from public administration bodies, three from NGOs, and one from a university). In the 12th penultimate edition conducted at the end of 2018, 49 reports competed for the title of the best report, including six reports from non-business institutions (including three reports from public administration bodies, three from NGOs, and one from a university). In the analysed years, the winners were selected in the following categories: the best integrated report, the best social report, the best debut, internet users' award, journalists' jury award, Ministry of Investment and Development's award, and Warsaw Stock Exchange's award. The companies which received honours were also selected, as shown in Table 2.

Table 2 : Results of the Last Two Editions of "Raporty społeczne" ("SOCIAL REPORTS") Competition

Results of 12th Edition of "Raporty społeczne" Competition in 2018	
Type of Award	Winner
Social Report award	**CYFROWY POLSAT S.A.**
Stock Exchange Award	**ORANGE POLSKA S.A.**
The best non-business organisation report	**Fundacja im. Doktora Piotra Janaszka PODAJ DALEJ**
Journalists' award	**KOMPANIA PIWOWARSKA**
Internet users' award	**Fundacja Hospicjum Onkologiczne św. Krzysztofa**
Results of 13th Edition of "Raporty społeczne" Competition in 2019	
Social Report award	**SANTANDER BANK POLSKA**
Award of the Minister of Investment and Development	**GRUPA ENERGA**
Internet users' award	**BENEFIT SYSTEMS S.A.**
Integrated report award	**ORANGE POLSKA**

Source: Own elaboration based on the data published at www.raportyspoleczne.pl

The authors examined 94 non-financial reports submitted to the "Social Reports" competition in the last two editions, evaluating them by means of the content method (their detailed structure is presented in Table 3). The data presented in Table 3 show that the number of non-financial reports has decreased despite the legislative obligation. The authors, examining trends in non-financial reporting of companies, noticed that the number of reports prepared for 2017, i.e. submitted to the "Social reports" competition in 2018, did not differ from the number of reports for 2018, and submitted to the project in 2019 . This drew a special attention of researchers, as despite statutory restrictions did not increase significantly the number of non-financial reports, as expected. The authors of this study, referring the obtained research results to previous years in the framework of the "Social Reports" competition, did not notice any visible changes, whether the status quo was either maintained or a downward trend became apparent.

Increasing number of companies witness the benefits of generating financial reports that inform about non-financial categories. Reports, which present a transparent picture of management and responsible business activity, allow companies to increase their credibility and trust among investors and stakeholders. Via non-financial reporting, companies can demonstrate how they respond to the needs of their environment and how they operate in the interests of society and the environment.

Another initiative is a report published for 18 consecutive years by the Responsible Business Forum (FOB) entitled "Responsible Business in Poland 2019. Good practices". In these reports, the primary classification key for practices continues to be seven areas defined by ISO 26000. They include organisational governance, human rights, labour practices, environment, fair operating practices, consumer issues, social engagement, and community development. The good practices are grouped into areas and then divided into categories, i.e. leading themes in each area. The number of practices in the category reflects the changes in the activity of companies, their involvement, but also indicates encountered challenges. Two reports concerning the same period as previously presented were also evaluated by the authors, who assessed each of them as three independent experts. They include the reports published by the Socially Responsible Business Portal, containing a detailed analysis of the companies' reports. Another area was constituted by the adopted examples of good practices published in the 2019 Report by 214 companies and the 2018 Report by 316. In both cases, they were very diverse business entities.

The authors of the study, examining examples of good practices among public companies in the field of non-financial reporting, noticed a strongly declining trend. The decrease that was recorded among companies amounted to 100 (exactly from 316 to 214). The authors, as independent experts, finalizing the conducted research, unanimously expressed their opinion on the need for immediate changes in the scope of establishing (developing) guidelines as to the quality of information contained in non-financial reports prepared by companies.

Conclusions

In the light of the presented considerations and the research carried out by the authors, it results that the issue of the method of non-financial reporting needs to be clarified at the national or even international level. The failure of the European Commission and Polish legislators to precisely define the shape and direction of standards for the development of non-financial reporting also translates into requirements for qualitatively new reporting elements close to the idea of non-financial reporting. Non-financial reporting, both in Poland and globally, results in an increasing number of companies drawing up reports in this area, not only by obliged companies, which also affects the quality of information presented by public companies worldwide. Unfortunately, businesses still lack sufficient knowledge in this area clearly visible by the information chaos indicated by the authors in terms of what and how to non-financial disclosure. Research has unequivocally recognized the need for uniform solutions related to non-financial information reporting as it is increasingly recommended and recognised as s good practice in companies.

The authors are fully aware of certain limitations in the extrapolation of the results presented in this paper to all public companies operating in Poland, due to the preliminary nature of the research and a relatively small test sample. Therefore, any possible application of findings from this research to the general population may lead to erroneous results. The analysis made it possible to identify trends in non-financial reporting of public companies in Poland according to new guidelines, and thus, it will allow to address further challenges in this area, in the field of ESG reporting with a diagnosis of what to do next.

Abstract

Las organizaciones públicas y privadas de los diferentes sectores, proponen nuevos modelos de negocio para brindar mejores productos y servicios a sus clientes, por decisión de la organización o por la necesidad de satisfacer a un cliente cada vez más exigente. En el sector público, el paradigma gobierno electrónico (e-government) ha evolucionado a gobierno digital y Transformación Digital (TD). Esta transformación implica un cambio en la forma como las organizaciones públicas prestan los servicios al ciudadano. Conducir con éxito los procesos de transformación digital, requiere de personas con habilidades y conocimientos. En este artículo se presentan los resultados de la revisión de literatura para determinar factores que deben ser tomados en cuenta en las iniciativas de transformación digital en las organizaciones. Los resultados muestran que las competencias individuales tales como liderazgo, la comunicación y la visión de negocio, son mencionados por los autores con más frecuencia. El liderazgo es una competencia individual que cobra importancia en las iniciativas de transformación digital.

Keywords: Liderazgo, transformación digital, paradigma, e-government.

Introducción

La incorporación de las Tecnologías de Información y las Comunicaciones (TIC) en las organizaciones públicas y privadas ha cambiado la forma de hacer negocios, las actividades diarias, el tratamiento de los datos (Mehta, 2019), la prestación de los servicios y la innovación de productos. Los consumidores de productos y servicios son cada vez más exigentes. Esta situación, obliga a los líderes de las organizaciones adoptar nuevas tecnologías digitales que les permita atender las exigencias de los consumidores (Kazim, 2019). De esta forma las organizaciones, independientemente del sector al que pertenecen, abordan cambios drásticos en la cultura corporativa, con el propósito de adaptar sus estructuras, procesos y modelos para hacer frente a los nuevos paradigmas que respondan al contexto de la revolución digital, en adelante se denomina Transformación Digital (Wang, Zhang & Li, 2020; Muñoz, Sebastián & Núñez, 2019).

La Transformación Digital (TD) es un proceso que requiere la incorporación de la tecnología en las diferentes áreas de negocio para cambiar la forma de operar y aportar valor a los clientes. Es considerada un fenómeno complejo y multidimensional (Profirio et al., 2020) que implica dar una nueva orientación a la estrategia de la organización (Morabito, 2016) y del modelo de negocio. La característica de ser multidimensional hace que el éxito de la TD de la organización dependa de varios factores; la etapa de madurez en la que se encuentra la organización, la cultura, los tipos de iniciativa, el valor de las iniciativas, la estructura de los equipos centrados en la experiencia del cliente (Kazim, 2019) y la Gobernanza efectiva de TIC. En la literatura revisada, diversos factores han sido mencionados como habilitadores de la TD. Cabe mencionar, el error común de entender a la TD como la adquisición y uso de tecnología de vanguardia sin considerar los demás factores, esta práctica de inversión en TI basado solo en la innovación tecnológica podría no ser suficiente para lograr el impacto transformador esperado, los expertos atribuyen este tipo de fracaso a la falta de cultura digital en los líderes y tomadores de decisión (Álvarez, Capelo & Álvarez, 2019; Davenport & Redman, 2020; Abbu, Mugge, Gudergan & Kwiatkowiski, 2020).

Adoptar la TD será entonces, una prioridad en la Alta Dirección para buscar nuevos modelos de negocios sobre la base de las necesidades actuales de los clientes. De esta forma, se aprovechará al máximo los grupos de talentos de la organización para encontrar una respuesta estratégica a la tendencia de la economía y la tecnología digital (Wang,

Zhang & Li, 2020; McGrath & McManus, 2020). Sin embargo, en la revisión hermenéutica de casos prácticos, de análisis de modelos y discusiones estratégicas al respecto, se ha encontrado evidencias que el éxito de estas iniciativas dependen de la decisión del líder, además del compromiso, las capacidades, característica y estilo de liderazgo de este, durante todo el proceso de transformación (Kazim, 2019).

En este artículo se presenta una revisión de literatura sobre el liderazgo en TD de las organizaciones. Se elabora un análisis epistemológico desde un enfoque holístico y sistémico en la búsqueda de conocer los factores predominantes en los líderes de las organizaciones para conducir con éxito los procesos de TD. El término sistémico está relacionado con el todo en un sistema, a su vez definido "como el conjunto de elementos relacionados entre sí funcionalmente, de modo que cada elemento del sistema es función de algún otro elemento, no habiendo ningún elemento aislado" (Terán et al., 2017, Pág. 216). Otro punto importante en la investigación es la metodología en hallar nuevas verdades, estas verdades emanan del análisis entorno a un conjunto de creencias o paradigmas (Bunge, 2019).

En esta investigación se busca describir los factores individuales del líder en los procesos de TD en las organizaciones plasmadas en los casos de éxito y fracaso, modelos de madurez y discusiones estratégicas, extraídos de la literatura. Para este propósito, se realizó una revisión de la literatura sobre los aspectos predominantes del papel del líder como actor fundamental en los cambios de cultura y modelos requeridos para la TD. Un total de 22 artículos publicados en el periodo 2017-2020 fueron analizados. En este trabajo nos centraremos en la característica individual del líder y la relación de este en las organizaciones en la TD, presentes en la literatura. Con este estudio se propone mejorar el conocimiento de los factores que contribuyen al éxito de iniciativas de transformación digital y responder a la pregunta:

¿Qué características individuales contribuyen a avanzar en la Transformación Digital en las organizaciones?

Marco Teórico

Transformación Digital

El avance de la tecnología disruptiva obliga a las organizaciones a encontrar nuevas formas de hacer negocios para que puedan adaptarse y evolucionar, evitando así el riesgo de salir del mercado (Metha, 2019). El proceso de cambio que están viviendo las organizaciones como la digitalización, es visto por muchos profesionales como una mega tendencia global denominada Transformación Digital, el cual cuenta con la capacidad de cambiar fundamentalmente las industrias y sus operaciones (Kazim, 2019).

La TD es un "… proceso de gestión que orienta la cultura, la estrategia, las metodologías y las capacidades de una organización a partir de las tecnologías digitales" (Cuenca-Fontbona, Matilla & Compte-Pujol, 2020, Pág. 78). Este proceso está condicionado por diversos inconvenientes, pero se hace imprescindible adoptar la transformación para poder así mantenerse en el mercado. Sin embargo, es importante considerar que la transformación digital puede ser una gran oportunidad para obtener mejores beneficios económicos (Mugge, Abbu, Michaelis, Kwiatkowski & Gudergan, 2020).

Para una verdadera TD es importante tener en cuenta el estado de preparación de la organización que le permita adoptar con éxito los cambios requeridos, a este estado se le denomina madurez digital. Esta madurez se logra a través del compromiso, la inversión y el liderazgo. Las empresas con madurez digital establecen prioridades realistas y se comprometen con el arduo trabajo de lograr la madurez digital (Mugge, Abbu, Michaelis, Kwiatkowski & Gudergan, 2020). Alcanzar la madurez no solo es contar con todos los procesos digitalizados, sino que el pensamiento o cultura digital es parte del accionar de los miembros de la organización.

Liderazgo y Competencias

Liderazgo es la capacidad de una persona para influir sobre otras para dinamizar, apoyar o animar a conseguir el objetivo de un proyecto en común y alcanzar mejoras en la organización (Baque, Triviño & Viteri, 2020). La influencia del líder sobre el grupo hace posible alcanzar una visión conjunta. Es un proceso orientado a la transacción e interrelación social que se produce entre líderes y colaboradores en el cumplimiento de objetivos comunes (Cortez-Valiente, 2017). Diversos estudios concuerdan que el liderazgo en los equipos de dirección cumplen un papel fundamental en un proceso de integración digital, puesto que son los principales agentes de cambio (Villar & Araya-Castillo).

El estilo de liderazgo se refiere a cómo el líder toma las decisiones y su estudio se basa en la perspectiva del comportamiento; carismático, atribucional, transaccional y transformacional (Villar & Araya, 2019). El estilo de liderazgo depende de motivos de diversa índole (Jiménez &Villanueva, 2018). En las organizaciones el enfoque transformacional es el más recomendado, ya que el líder cumple el papel de coach motivacional. El líder transformacional potencia los deseos de los seguidores, estimulándolos a lograr las metas en un desarrollo común (Peñafiel et al, 2019). Asimismo, puede entenderse como la organización o individuo que hace uso calculado de los activos digitales de una empresa para lograr los objetivos comerciales (Breuer, 2019). Competencia hace referencia a los conocimientos las habilidades, destrezas, actitudes y valores de las personas.

Líderes para la Transformación Digital

El liderazgo es una característica del individuo y es considerado un factor crítico de éxito cuando se conducen iniciativas de e-government (Morales & Bayona, 2019), iniciativas de mejoras de procesos (Bayona-Oré et al., 2014) e iniciativas de TD (Cuenca-Fontbona, Matilla & Compte-Pujol, 2020). Según Yokoi et al (2019) existe un amplio consenso de la importancia y la influencia del liderazgo para conducir procesos de TD. Alcanzar la misión y los resultados está relacionado con el rol que juegan las personas como elementos claves para la transformación del gobierno, considerado dentro del quinto driver "Personas" de los siete mencionados por Chenok et al. (2017). Es así como el líder digital deberá poseer habilidades tecnológicas con capacidad integradora estableciendo retroalimentación significativa a tiempo real con sus equipos desarrollando redes ágiles (Petrucci, 2018). El líder digital está relacionado con el uso de la tecnología para mejorar la vida, el bienestar y las circunstancias de los demás, mientras que el líder transformacional busca desarrollar e inspirar al subordinado a la responsabilidad, compromiso con objetivos desafiantes, estimulación intelectual y la consideración individualizada.

Metodología

La investigación se plantea, una revisión de la literatura especializada correspondiente a modelos, estrategias, casos de éxitos y fracasos que experimentan las organizaciones durante la adopción a la TD y se enfoca en los factores individuales predominantes del líder mediante un razonamiento inductivo y sistémico. Con este propósito, se revisaron artículos científicos publicados en el periodo 2017 - 2020. Para extraer la información relevante de cada uno de los artículos científicos se diseñó un formato en Excel con la siguiente información, datos generales del artículo, competencias del líder TD, estilos de liderazgo, definiciones de las competencias y la influencia de las competencias en la TD.

Resultados y Discusión

Los resultados de la revisión de literatura muestran que existe un conjunto de competencias de los líderes de TIC que contribuyen al éxito de iniciativas de TD en las organizaciones (véase Fig. 1). La mayoría de los estudios de casos corresponden a regiones de países desarrollados en áreas tecnológicas, esto indicaría que a pesar de que la tecnología es de tendencia global, la adopción a la TD en países menos desarrollados tiene algún tipo de freno paradigmático, el cual podría motivar futuras investigaciones. El factor liderazgo es el factor que se menciona con frecuencia en los estudios. El proceso de TD requiere considerar el valor del capital intelectual y humano, y es el líder, el responsable de gestionar el cambio a través de esos recursos (Breuer & Szillat, 2019).

Fig.1 Factores que impactan en iniciativas de TD

Le sigue en orden de importancia la comunicación como competencia del líder con miras a superar el desafío de impedimentos culturales y operativos que la organización presenta en la adopción de la TD (Mugge, Abbu, Michaelis, Kwiatkowski & Gudergan, 2020; Alunni, 2018). Así mismo, permite mantener la comunicación continúa con el cliente (Sebastian et al., 2017). En la Tabla1 se presenta la lista de los factores identificados.

Tabla 1: Factores individuales para la TD

Item	Descripción
Liderazgo	
	El liderazgo es considerado como uno de los pilares necesarios para afrontar el cambio de la TD (Alunni & Llambías, 2018).
	El liderazgo para impulsar la transformación digital se refiere a la "intensidad de la gestión transformacional, la convicción y la creencia por parte del gobierno de la organización que apuesta por el valor diferencial y beneficiosa para el consumidor" (Cuenca-Fontbona, Matilla & Compte-Pujol, 2020).
	La carencia del liderazgo es un factor inhibidor (Area, Santana, Sanabria, 2020). Es reconocido como uno de los factores predominantes en los problemas de adopción a la transformación digital.
Comunicación	
	La comunicación efectiva es un pilar para motivar a todo el personal acerca del potencial de la nueva tecnología y evitar así la resistencia al cambio (Albukhitan, 2020). La comunicación es considerada como uno de los factores de importancia para llevar adelante una TD con éxito (Alunni & Llambías, 2018). Los mensajes clave sobre la TD para toda la organización, deben identificarse y articularse con claridad. Los mensajes deben enviarse a través de múltiples canales, como charlas de liderazgo, volantes y mensajes de marca, y deben sincronizarse con los eventos de implementación (Mehta, 2019).
Visión de negocio	
	Se requiere que las empresas, para dar respuestas al entorno, cuenten con personas que se adapten fácilmente a los cambios, estratégicos, creativos, receptivos y que tengan la capacidad de responder al quehacer de la empresa, sino que también proponer un nuevo *cómo* (Meriño, 2020). Un factor negativo para la TD es la falta de visión compartida por parte del equipo directivo es decir la falta de visión de Negocio (Area, Santana & Sanabria, 2020).
Conocimiento Tecnológico	
	Se refiere a la" intensidad de las iniciativas tecnológicas en las que una

Item	Descripción
	organización invierte para cambiar su gestión operativa y aumentar su competitividad" (Cuenca-Fontbona, Matilla & Compte-Pujol, 2020).
	La carencia de conocimientos y competencias tecnológicas y la ausencia de un plan de integración tecnológica adecuadamente temporalizado es considerado un factor negativo (Area, Santana & Sanabria, 2020).
Ágil	
	Los equipos deben ser ágiles y seleccionados en función a sus habilidades (Petrucci & Rivera, 2018; Breuer & Szillat, 2019).
Transparencia	
	Los pensamientos claros del liderazgo sénior sobre una estrategia de transformación digital son vitales para que la estrategia se traduzca en una ejecución eficaz en todos los niveles de la organización. Los equipos se animarán para darlo todo cuando vean el compromiso de la alta dirección (Metha, 2019).
	La transparencia es un pilar para minimizar la resistencia al cambio (Albukhitan, 2020).
Orientación al cliente	
	Bajo el entendimiento del concepto TD, que requiere un entendimiento de los nuevos hábitos de consumo de los clientes, se debe rearticular el liderazgo con un enfoque en los cambios de los procesos y cultura con base en nuevas políticas, e incluso un cambio de la organización con una nueva propuesta de valor orientado al cliente (Alunni & Llambías, 2018).
Trabajo en Equipo	
	El trabajo en equipo permite potenciar y afianzar la sinergia en la organización. Müller et al. (2019) resalta la falta de cohesión en el equipo, que permita ver los cambios digitales, es un riesgo inminente en la organización.
	Los líderes deberán influir incluso en los equipos informales, crear redes de intercambio de conocimiento mediante un entorno inclusivo (Petrucci & Rivera, 2018).
Coaching	
	El líder debe potenciar al equipo mediante un papel de mentor, coach y tutor (Breuer & Szillat, 2019; Kazim, 2019).

Conclusiones

La transformación digital es un proceso que las organizaciones podrán adoptar con el fin de ajustar sus productos y servicios, debido a que los clientes y proveedores vienen cambiando su forma de interactuar. El proceso de transformación se asocia a las TIC, sin embargo existen otros factores que deben ser considerados cuando se conduce iniciativas de TD. Los resultados de la revisión de literatura de artículos científicos que han sido publicados en el periodo 2017-2020 muestran que existen otros factores que deben tomarse en cuenta en el proceso de transformación. Considerando que la TD no solo es mejorar los recursos tecnológicos de la organización ni mejorar los procesos, sino de revisar y replantear una reingeniería desde el modelo del negocio con una visión estratégica y digital, se requiere de personas con habilidades de liderazgo. Por consiguiente, es importante conocer si las competencias y estilos de liderazgos del líder potencian los factores habilitadores del proceso de transformación. Los resultados de la revisión de literatura resaltan los factores liderazgo, comunicación y visión del negocio, con más frecuencia. Como trabajo futuro se propone definir perfiles de los responsables de conducir iniciativas de TD y su influencia en la TD de las organizaciones.

Abstract

As an approach to local development, smart villages reflect the contemporary mechanism and path of development actions, as well as the challenges of the community. The concept comes not only from the examination of actions that take place in rural areas but also from " ideas, giving rise to innovation, actions that are the subject of a large-scale propagation of the concept of intelligent development.
In Romania, the presence of services with internet access is lower in rural areas than in cities. Information transmission networks are constantly expanding. However, the advancement of technology is not enough to develop smart domains. The concept of smart villages concerns rural areas through their communities and largely includes their regional and local characteristics.
A notable feature of smart villages would be traditional and new networks and services that are strengthened through digital technologies, telecommunications, innovation and better knowledge, with a focus on the benefit of residents and businesses. The objectives of this paper are:

- description of areas of interest with an impact on the development of smart villages, - establishing the perspectives of rural development.

The research hypothesis of this article raising the awareness of the inhabitants of rural areas will support the development of the concept of smart village.

Keywords: Rural Development, Smart Village, Internet Access.

Introduction

It is topical that there is a dynamic development of the digital economy resulting from the speed with which IT technologies are advancing. The transition to the digital economy is similar to the massive advertising on the use of information technology and, very importantly, the advanced exchange of data, as well as the revolution of new forms of communication introduced in the community. Improvement refers to the whole of society and yet the speed with which it is achieved depends on some divisions and differences between urban and rural. Access to resources and markets is different for peripheral regions in terms of socio economic conditions and social structures.

In a broader view, they are characterized by imbalance in terms of migration and different levels of education of residents with low potential for endogenous development (Bilbao Osorio, Rodriguez Pose 2004; Naldi et al., 2015).

In Romania, the market of internet access services has reached a higher level in the urban area than in the rural one. However, information transmission networks are constantly expanding. The concept of smart villages refers to rural areas and communities. It must certainly include to a large extent the characteristic regional and local features. Here, traditional services based on internet access and us are strengthened with the help of digital technologies, telecommunications, innovation and a better use of knowledge to support the community and the business environment.

The objectives of the article are: indicating and presenting the areas of influence on the development of smart villages and establishing the prospects for rural development.

Material and Method

We aim to see if an increase in awareness of the rural community for the integrated development of smart rural areas. Through the assumed objective and the hypothesis adopted by the article, the following research question arises What actions should be taken in order to materialize the efforts to implement the concept of smart village?

The research methods used in this paper are studies from the literature and a study conducted with residents of Chiscani commune in Romania.

The notion of smart villages comes from the reflection of the image on smart cities. At the beginning, the concept of smart city involved the creation of the city from top to bottom, with an increased focus on technical solutions, a condition that stimulates the economic development of cities and improves the quality of life within them (2015). The concept of smart city shows us the need for widespread use of new technologies in order to improve the environmental conditions of the city (Fernandes et al., 2011).

However, the main idea of the notion of smart villages (analogous to the concept of smart cities) is that technological development, combined with other rural development initiatives, can create new opportunities for additional income, service provision and fortification. social potential, significantly improving the quality of life in rural areas (van Gevelt, Holmes, 2015).

The data reported above show the differences between smart cities and smart villages. If we refer to smart cities, the greater emphasis is on the high volume of data sets and the ability to transform the way cities work thanks to the associated digital technologies. Smart villages do not only mean spreading the principles of the concept in scattered areas. In this case, more emphasis is placed on local communities that directly face the challenges of everyday life often but not specifically, with the hel of digital technologies. Smart villages are a prototype of local rural development, with an emphasis on the the dynamics and contemporary methods of development processes and the challenges facing the community.

This approach comes not only from the study of processes that take place in villages (Naldi et.al.,2015), but also from remarkable ideas that are subsequently widely promoted, for example as a notion of intelligent development. The concept of smart development is highlighted as one of the main elements of European economic policy found in the document "Europe 2020", defining strategic actions aimed at accelerating economic growth in reducing social disparities. Putting the smart development concept into practice can be problematic because it depends mainly on the specifics and resource s in each area's portfolio.

Results and Discussions

The smart village represents the entity that through advanced technologies wants to improve the quality of life, thus maintaining the principles of sustainable development, pays attention to environmental protection, ensuring to obtain these results through lower costs and bearable in the long run.

Figure 1: The key elements for the development of the smart village concept

Source: author' s study

As shown in Figure 1, the main conditions for the development of the concept of smart village depend on the use of techniques and technologies for transmitting information. In this context, a community with creative thinking and open to change, focused on improving the quality of life, is a major gain for the promotion and development of this concept. It is topical that more and more attention is paid to the participation of local communities and their ideas in creating a modern village (2017) and creativity and openness to the new, to change, must come from both residents and the part of their representatives, or of the councilors of the communes or of the mayors. So, local authorities must make efforts to live up to the expectations of nthe local community by creating villages with visible transformations in terms of quality of life (Bruska, 2012).

A creative community and the use of ICT support a dynamic development. Below are the differences found in the ownership of computers in large households and in rural areas and the degree of use . In 2017, almost 70% of households had at least one computer at home. Given the different types of households, owning computers is quite diverse. In large cities, the percentage of computer equipped households and the number of users was higher than in rural areas, as shown in Figure 2.

Figure 2: Households with computers **Households with an access to the Internet at home**

Source: consultations Romania's statistical yearbook ,accessed 2020

The fact that homes are equipped with computers is not really relevant because they can be used sporadically. However, compared to 2012-2013, the largest increase was recorded in rural areas. In contrast, in rural areas, the share of homes with internet access is considerably lower than homes in urban are as. Later, in 2019, this percentage of households in rural areas rose to 66.7%, while in large cities to 82.5%. Compared to 2015, the highest increase was registered in rural areas by 20.1% and 10.6%, respectively, as shown in chart no.2.

The above information emphasizes the importance of providing internet in rural households even if the low number of households that use the computer is also worrying. We can look at this as a challenge and pay more attention to residents about using computers and the internet. The application of digital technologies solves significantly the problems of rural areas resulting from distance and low population den sity, by providing instant communication via the Internet and access to electronic services.

Implementing the concept of "smart village"

The smart village is a functional village in the future, created from several areas of interest and based on the active involvement of responsible, independent and determined citizens. These areas include:

- smart governance participation,
- intelligent people social and human capital, - intelligent environment natural resources, - smart economy competitiveness.

An important contribution to establishing local links with other areas can come from the economic area through intelligent development. Through competitiveness, this could be achieved through technologically advanced products or services, as well as through innovation. The introduction of innovations should be strictly and organized on specializations, so as to create territorial competitive advantages (Rodriguess Pose, 2004).

M.Wojcik makes known the smart specialization in rural areas in three contexts (Wojcik 2018,pp. 8 9), namely:

- integration the establishment of commercial entities in the territory is a sign of maturity in economic development; cultural conditions also play an important role. Aspects such as social proximity and family should not be overlooked;
- connections and closeness closely related to the process of knowledge transfer. The economic technical social relationship can be considered the link between the dissemination of information and basic knowledge. In the transfer of knowledge, the role of space is important, ie it takes place mainly at the local level and even neighborhoods;
- connectivity - this aspect is based on the inclusion of networks as an essential feature of economic and social life, especially in the era of rapid development of new technologies. First of all, it is the mobility of people in physical space and the ease with which they can move in different environments of social interest and secondly, it is the mobility in the virtual space, having the capacity to act in parallel with reality.

Intelligent environment refers to the sustainable use of natural resources through continuous efforts to increase the use of renewable energy resources. Some examples would be: controlled street lighting pollution is measured, controlled and monitored, renovation of buildings to reduce energy consumption, etc. This field presents difficulties of understanding and implementation, especially for the rural inhabitants, they do not have notions about the harmfulness of the solutions adopted but outdated and used by them for many years.

Klodzinsky stressed that in marginalized areas, it is very important to train local communities so that they use the notions of sustainable development in an operational way. The continuous development of training capacity and lifelong learning is currently the main problem and, at the same time, the basic way to change the human mentality (Klodzinski 2014, p. 109).

The delimitation of an area of intelligent people shows us that the promoters of change in rural areas should be residents who, in terms of high qualifications and skills, creativity and willingness to cooperate and with the support of information and communication technologies (ICT) can work to improve quality life in rural areas.

In the field of smart governance, an important role is assigned to the involvement of society in decision making, transparency of actions, quality and access to public services. It is necessary to promote civic participation. Citizen involvement, in general, could be understood as a more or less direct involvement in social, public and political life (Kazmierczak, 2011).

By social or community involvement is meant the participation of the inhabitants in the common activities, which presupposes, first of all: the active presence at the creation and functioning of the civic groups and of the non-profit organizations, as well as the permanent or occasional volunteer activity. At the same time, each individual can express his own intention to participate in the elections, actions and daily plans related to the character and type of the society in which he wants to operate.

A good example to follow would be the establishment of a separate budget called the civic budget or the citizens' budget. This implies the possibility for the inhabitants to decide on directing the funds of a separate part of the communal budget, by vote, to different projects.

Idea implemented by many European states but not by Romania at the moment. I chose to present the advantages and disadvantages of introducing the civic budget in several localities in Poland. Here, the decision to set up a civic budget was adopted relatively late, in 2011, when the city of Sopot became the initiator of this type of project.
Later, civic budgets were introduced in other cities and rural areas. Despite the rapid spread of this idea, it is not yet a common form of activity for residents in the process of co deciding on the fate of the environment in which they live.

In Dobra commune, for example, in 2018, 23 projects from the civic budget were registered (11 investment projects and 12 projects without investments). The implementation of these projects started in 2019. The number of registered residents of Dobra commune amounts to almost 21,000, while only 1,416 people participated in the vote. Participation in the interview consisted of 56 residents in order to obtain information on the reasons why residents did not vote and the reasons that led to the vote.

The main reasons for not participating in the vote for the projects from the civic budget were:

- lack of knowledge about the possibility to vote,
- refusal to vote, on the grounds that the citizen does not have the feeling of being a member of a larger community (lack of a sen se of belonging),
- the refusal to vote, as a result of the feeling of electoral political disappointment, the conviction that this vote will not change anything,
- lack of confidence that a person's vote can influence the selection of projects.

Another in terview was based on 30 residents who voted in the civic budget. 66% of them stated that their participation in the vote was due to the distribution of information by another person on virtual social networks. Other people indicated that their involvement was the result of the desire to participate in the development of communal areas and the conviction of civic responsibility.

Therefore, the above studies show that the basis should be the strengthening of social ties. Volunteers from local rural communities who will be involved in developing these commitments will be a real help to the community. Social responsibility will lead to the identification of members of society with the rural area in which they live, which will amplify the feeling of duty to involvement in civic life. This should be supported by the use of new techniques and technologies, for example by setting up focus groups of local communities. The steps that should be followed to initiate the development of smart villages are shown in Figure 3.

Figure 3: Measures for the implementation of the concept of smart villages

Source: author's processing

Awareness of the possibility of making decisions is very important. The availability of local communities to participate in decision making depends on this. The responsibility for the initial development stage of smart villages falls on the shoulders of the local community, jointly developing strategies based on local resource s and aspirations.

Conclusions and proposals

The development of digital infrastructure must be supported, as well as the competencies of its use, but also providing assistance to the inhabitants of rural areas in identifying solutions to increase the viability and sustainability of the countryside due to social innovation and smart specialization. This will lead to the development of a smart village. Looking to the future, the intelligent village, in its development will exceed the limits of its borders. Even if the initiatives take place at the local level, smart communities must agree that the village's role in establishing a specific landscape is also associated with other villages and towns. Therefore, they should activate these links.

There is no standa rd model of smart village and no methods or tools to use.

Rural areas oriented towards the development of a smart village, assess their resources, apply the best available knowledge and act in shaping the surrounding reality.

In terms of multifunctional de velopment, it will differ from region to region, depending on local conditions. The economic recovery of rural areas depends on changes and interest in development. The objectives of rural development towards a smart village must be adopted by local organizations and rural residents, creating partnerships using modern ICT to project the image of the smart village in the future. Taking into account the objectives of the article, a presentation of the areas that influence the development of the smart village and the directions to a developed rural area was made. The result of this study also included demonstrating the hypothesis that in the development of the concept of smart village, an essential aspect is the awareness of the inhabitants of rural areas. In conclusion, we emphasize that this article is a signal of the evolution and development potential of the smart village concept.

Abstract

This study investigates the relationship between liquidity management and the profitability of Banks in Nigeria over the period 2007-2017. The study examined the liquidity-profitability trade-off taking a sample of five banks in the banking industry. The empirical results revealed that liquidity management inversely influences the operations of deposit money banks. Data includes Descriptive research design and panel data regression which describes as institutions that are cross-sectional data and time series also known as collected historical data. This implies that liquidity management of DMBs has no significant impact on the returns on their assets and returns to their equity's shareholders. There is therefore the need for banks to balance the trade-off between their liquidity management and profitability; this is because excess liquidity reduces profitability while excessive illiquidity exposes DMBs to insolvency.

Keywords: Liquidity, Profitability, Deposit Money Banks, Management

Introduction

Deposit money banks have become a much-needed institution within the financial system as it helps promote the transfer of (political / monetary / economic) assets which are less desirable for the more desirable public needing the financial assets. Appropriate financial intermediation needs the bank management's attention and focus on profitability and liquidity. In practice, profitability and liquidity is a meaningful indicator of the firm's profits and the quality not only of depositing money bank but of any profit-orienting business. Such performance indicators are important to a bank's major public investors and depositors. Managing cash flow involves having sufficient balance sheet and financial instrument accounts Toward certain customers ' needs as and when necessary, as well as ensuring that funds for organizational business processes (Bhattacharyya & Sahoo, 2011). Liquidity Management is a factor to meet everyday withdrawal demands of the clients of the organization (G. Bassey, Tobi, I. Bassey, & Ekwere, 2016). the extent to meet up with the customer withdrawals and other needs Its the outcome of handling the cash flow. Handling flexibility is an essential factor which is used in operation in business whether financial institutions Or company.it helps to know how solid the firm is.which is based on profitability (Otekunrin et al., 2018). the main aim is by improving the investments and increasing revenues for a corporation.wealth maximization is the increase in the fair value of share capital with earnings increment per share of shareholders while profit maximization is the firm's objective of measure of efficiency and effectiveness in the firms operation which is a reward for firms performance. Although cash which is considered liquid, is a vital factor in a financial institution that helps to meet up the financial obligations of the firm. Being liquid is considered as having so much returns to disburse loan and make investment to get dividend at the end of the month to shareholders and stakeholders of the firm. For instance, in September 2018, the Nigerian Central Bank (CBN) announced Skye Bank's liquidation with Polaris Bank to step over the problem of the flexibility specifications non-compliance. Recently, in 2019; Nigeria's Central Bank has extended the recapitalization deadline .In the case of microfinance institutions, this raised the financial cash reserves for regional microfinance institutions from 2 billion naira to 5 billion naira by 2021, while those of the government expanded from 100 million naira to 1 billion. Nigeria's Central

Cite this Article as: OKEREKE KARACHI YVONNE, Olokoyo Felicia, Omankhanlen, Alexander Ehimare and AKINJARE VICTORIA Abosede "Liquidity Management and Profitability of Banks in Nigeria (2007-2017)" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

Bank launched changes to strengthen a strong financial sector in 2019. The goal is to Working to improve the financial system's capacity, creating awareness of the accomplishments in policy making and daily routine in the financial system. The concern for most banking sector in Nigeria is that those who appear to concentrate on more shareholder profit than trying to take cash flow measures to identify the customer's requirements and keep their word to their customers because they remove a significant percentage of their customers when it is due in that process. This research is evaluated against the profitability ratio evaluated with return on assets (ROA) and return on equity (ROE) in the liquidity ratios and non-performing loans. However, the study aims at reviewing the following objectives which are:To ascertain why the solvency ratio impacts profitability in Deposit Money Banks and also to determine the effect of equity on profitability in Deposit Money Banks.

Review of Literature

Olagunju, Olanrewaju and Olabode (2011) stated that Liquidity will allow a firm to escape a circumstance where the related issues of selling off assets at depressed rates and the additional fees charged to lawyers, default investors and insolvency underwriters would compel a firm to repatriate.

Francis (2016) analysed Liquidity Components which include Vault profit, adjusts retained With CBN, adjusts Held With Other nigerian banks, cash reserves With Offices & sections Outside Nigeria, cash At request In Nigeria, placing with financial sector, government securities, federal reserve Certificates, expenditure in sustaining financial instruments, expenses reduced in price payments made In Nigeria, Negotiable payment accreditation. Liquidity is the rate and ease at which assets are transformed into cash to satisfy financial obligations without loss of interest or money. Types include: cash re-serves, bonds for government debts, etc. Liquidity is an important factor in fulfilling daily demands for withdrawal at all times.

Omankhanlen, Ilori and Isibor (2018) further examined the nexus between monetary policy and the achievement of a bank's profit objective. This study was carried out to establish the influence of variables like Liquidity Ratio, Interest and Money supply (M 2) which are used as monetary policy instruments on deposit money bank profitability objective. The study revealed that there was a positive long run relationship between Liquidity Ratio and deposit money bank's profitability; there also existed a negative long run relationship between interest rate and deposit money bank profitability; lastly there existed a positive long run relationship between Money Supply (M 2) and deposit money bank's profitability.

Bhunia & Khan (2011) analyze that Profitability is the fundamental goal of any company and that is why investors are always looking for returns on their investments. Returns foregone by not investing in capital with higher return rates are the opportunity cost of remaining liquid. Financial management decisions include liquidity management decisions and ensure a trade-off between stability and efficiency.It also impacts banks ' daily operations.

Oru and Odumusor (2019), liquidity management theory assists to manage a firm’s lendings to its subsidiaries. It is likewise known as the actual bills doctrine, as it impacts both bank lending and global industrial enterprises.

Rewane (2019) observed the merger of Access Bank Plc and Diamond Bank Plc behind the level addition of liquidity.

Bawacha(2018)Liquidity plays a significant role in the sustainable development of banks and the stability of the financial system, strict liquidity regulations are supposed to put forward to guard against problems due to the lack of liquidity.

The World Bank (2020) observed that the 2007/2008 crises brought into focus significant limitations in market discipline, regulation, supervision and ushered in incisive policy debates on the regulation of the whole system of finance in any country. The crises led to revert in focus to an emphasis on more effective regulation of the banking systems as well as on making the supervisory institution’s toolkit become efficient and thus enhance their ability to act far more quickly when there are distresses in the system.

Bhunia (2010) stated that the cash flow performance of the system relies on specific environment about a corporation, and no clear requirement for selecting the right level of liquidity a firm needs to sustain to promote a great impact on the profitability.

Financial liquidity refers to the finance industry's ways to maintain that findings are available at all times for fulfilling financial obligations or fully mature commitments at a decent cost. Deposit Money banks sustainability is highly dependent on how solvent they are, since volatility is a sign of impending recession that can rapidly undermine community confidence in the financial sector and payment productivity. Equally significant is the use of a adequate income from loan interest to support full supply of productive resources and stability. Getting excess surplus capital in the bank or bank lending is also inefficient for banks, and economically inefficient. Capital adequacy includes the implementation and controlling necessary to ensure that the organization retains sufficient

cash flow either as a responsibility on the clients of the entity to fulfill such unintentional responsibilities to the operation of the business, or as an indicator to conform with financial authorities of the banking system

So it is necessary for a bank to take advantage of its longevity and development in the long term. It's also required to maximize sufficient revenue from funding the operational plans collect credit for the success and development of the bank. CAMELS (capital adequacy, asset quality , management efficiency, earnings performance, liquidity manager) describes the key financial variables of the financial institutions; This evaluates not just the Asset Return (ROA) and Equity Return (ROE) as well as other metrics relevant to different aspects of banking activities There's many various financial considerations that apply to both investors that decide the magnitude of the ability of the institution to make income from its invested money. According to Tabari, Ahmadi and Emami (2013) state that two alternative measures represent the profitability variable: the profit-to-asset ratio, i.e., the return on assets (ROA) and the return on equity (ROE) Return on assets (ROA) in general. This signifies a business's ability to generate income even though the even if the-balance-sheet actions may tilt it. ROE indicates investor returns on investment, which is equivalent to ROA times the total asset-to-equity ratio. A bank with such a capital adequacy level has greater risk of success sustainability and stable growth.

Allen and Marguez (2011) also stated that this might lead to a large participant of reserves in market competition, as liquidity risk is a more efficient guarantee for financial viability and thus enables the institution to sell more credit to lenders. The aim is to expand the optimum amount of leverage at the institution.

Ehimare,Babjide,Achugamonu,.Lawrence, and Emena (2018) investigated the extent to which undercapitalization of money deposit banks and frequent loan delinquency on the part of the active poor influence the ability of deposit money banks to drive the inclusive growth agenda of the Central Bank of Nigeria. The study found that loan delinquency, undercapitalization and payment of utility bills were significant in measuring the inclusive growth initiative of the Central Bank of Nigeria.

Theoretical Review

There are several theories that provide insights into the fundamental relation between stability and productivity of deposit money banks that has been put forward. Some of which includes:

Deposit money Loan Theory

This model postulates that the cash flow of a deposit money bank will be expected as lengthy as the securities were retained in short-term a loan which is divested in the ordinary course of events. Financial institutions are required to fund the transport of goods via the subsequent levels of construction to demand or what would currently be called stock or capital expenditure lenders.

The Shift Ability Theory

The theory of shift ability is based on the assumption that the reserves owned by the banks are to either be sold to other creditors or stakeholders or to be transferred to the banking system that is ready to buy the resources available for sale. For instance whereby the Central Bank purchases asset from the Deposit Money Banks as 10% of the deposit to reach out to them as cash reserves which happens every month.

The Anticipated Income theory

This theory says that cash flow can be guaranteed if the borrower makes slated interest payments on potential earnings. This principle applies to profit repayment of the loan that security depends on. This theory also suggests that the duration trend of debts and financial assets will affect a banks debt.It is regarded as a long term loan depending on the scheduled maturity period that the customer makes payment in advance of the loan required by the borrower before the period elapsed

The Liability Management Theory

The theory of liability management suggests that financial institutions can fulfill their liquidity requirement by competing on the marketplace for sufficient funds to satisfy interest rates on loans and deduction of funds. this means that being involved in returns on investment to gather more funds to the institution and meet the demands of the clients.

Empirical Review

Francis, Frank and Raymond (2013) Evaluated the monitoring of credit risk and bank efficiency in nigeria over the period 2000-2010.It analyzed the relationship between banks ' performance factors and financial stability variables using that as measures money order, reserve fund requirement, financial expenditure and cash ratio. The sources of

data were primarily gathered from statistical report of CBN. Those were and simple linear regression has been used to assess the data gathered. The results of the study after all imply the close connection exists between it and the company investment and reserve ratio need, and bank expenditure and liquidity ratios. The study suggested that businesses must not focus solely on reserves but instead should take those certain methods to decrease liquidity issues in this sector.

Godwin Bassey (2015) evaluated the cash flow-profit commerce off financial institutions in Nigeria by conducting research on fifteen corporations to make purchases in Nigeria and filled the 2010 to 2012 panel data. The study adopted the Ordinary Least Squares (OLS) method to analyse the data. The findings from such a research it's been shown that there is a quantitative connection among them cash measures-current ratio of financial institutions, liquidity ratio, financial leverage, loan-to - deposit ratio, loan-to-account ratio, and investment returns. Bassey and Moses (2015) studied the connection between bank profitability and cash flow was also evaluated. The target population for this study consisted of 15 institutions. With assistance of recent literature, the information was gathered only using secondary information, and evaluated information using OLS method. Empirical results indicate there is a devastating relationship between cash reserves proportion and returns on equity while an ideally favorable comparison is made between bank loans, asset ratio, loans and returns on equities. We suggest that banks concentrate not only on the main objective of optimizing income, as well as on liquidity management techniques to satisfy the customers.

Daniel (2017) Capital adequacy in Nigeria was also surveyed, and its impact on banks profitability. The total amount of time had been 25 years (1986–2011). The population of the study had based on 24 banks. Analytical test data were gathered using the SPSS kit from secondary test data. The findings of the study reveal financial leverage influences transfer funds favorably banking activities. Using correlation analysis, the researcher also stated the data revealed that equity prices and positive income cash reserve are directly significant while equity prices and payment lender ratio are inversely significant. He advises that institutions follow optimal stability structure to improve company runs smoothly.

Ndoka, Islami, and Shima (2017) also conducted another study on how financial leverage relates to performance management. Test data from Secondary data sources were collected and analysed using Program E-Views. The production was measured using after-tax profits, while using funds, investments, and securities, the cash flow was calculated. The relationship among net income and funds was significantly positive, whereas the connection among income and investments was.

Akinjare, Ojo, Adetiloye and Akinjare (2019) examined the extent to which domestic investment has contributed to the growth of the industrial output in Nigeria from the period of 1985 till 2016. Evidence from the result shows that there exists an inverse relationship between gross fixed capital formation and Industrial output. Lending rate estimates show a direct positive relationship with industrial output but not significant in the long run. Detailed analysis of gross domestic savings reveals a significant direct relationship with Industrial output at 1% level significance and finally, distribution of commercial bank loans to the industrial sector indicates a significant direct relationship between industrial outputs. The study, therefore, recommends that government should assist DMBs to develop long-term savings for the real sector fund. Also, interest rate on deposit should be increase to improve the savings culture of citizens.

Methodology

It was premised on secondary sources that were obtained from the financial institutions' annual financial report for the particular timeframe. Research is conducted on five deposit money banks in Nigeria which include UBA, ACCESS, ZENITH, GTB and FIRST Bank. The The rationale for this research is to assess the effects of liquidity management on output in Nigeria. The data are collected from the financial institutions' annual financial statements for the time span of 10 years 2007-2017. It includes Descriptive statistics and uses panel data regression which describes as institutions that are cross-sectional data and time series also known as collected historical data. Our main focus is Profitability and Liquidity. A correlated random effect- hausman test was done to choose which of the estimated models should be accepted under a null hypothesis, and an alternative hypothesis.

Profitability: There are various methods used for measuring profitability of an organization. The efficiency of these institutions will be calculated for the purposes of this analysis using return on assets and the return on equity (ROA and ROE)
Liquidity: The liquidity will be calculated using Current ratio and Non-performing loans
Population: It covers the 5 deposit money banks in Nigeria
Sample size: For the purpose of this study, the sample size is the five selected banks; UBA, ACCESS, ZENITH, GTB and FIRST Bank.

Model Specification

The mathematical representation of models I and II are presented as follows.

ROA = *f* (CRT, NPL) i)

ROA = α1*CRT*α2NPL+it- (ii)

ROE = f (CRT, NPL) (iii)
ROE = β1 *CRT*β2*NPL+ it (iv)

where:α0 to α2, β0 to β2 are estimated in parameters

it is the stochastic error term

Where ROA = Return on Assets of DMBs in period

CRT = Current ratio i.e. current liability

NPL= Non-performing loans i.e npl to total amount of outstanding loans

ROE= Return on Equities of DMBs in period

Model One: Table 1

Correlated Random Effects - Hausman Test			
Equation: Untitled			
Test period random effects			
Test Summary	Chi-Sq. Statistic	Chi-Sq. d.f.	Prob.
Period random	1.459814	2	0.4820

Model Two: Table 2

Correlated Random Effects - Hausman Test			
Equation: Untitled			
Test period random effects			
Test Summary	Chi-Sq. Statistic	Chi-Sq. d.f.	Prob.
Period random	2.642570	2	0.2668

The Hausman test results in Table I and II clearly accept the null hypothesis because the estimated chi-square statistic values of 1.45 and 2.64 in model I and II respectively for 5 degree of freedom are statistically significant; hence the null hypotheses cannot be rejected in both models. As a result, we adopt the Random Effect Model (REM) for both models.

Data Analysis

The data for this study are panel data analysis because the variables specified in the above models covered all the ten sampled DMBs for a period of ten years (2007 -2017), hence, estimation technique was used for this study.

However, the scientific justification to determine the specific Panel regression techniques to be adopted is the Hausman test for random effects. According to Gujarati and Porter (2009), the null hypothesis underlying the Hausman test is that the Fixed Effect Model (FEM) and Random Effect Model (REM) estimators do not differ substantially. The Hausman test results in Table I and II clearly accept the null hypothesis because the estimated chi-square statistic values of 1.45 and 2.64 in model I and II respectively for 5 degree of freedom are not significant; hence the null hypotheses cannot be rejected in both models. As a result, we adopt the Random Effect Model (REM) for both models. Approximately conclusions drawn from the regression of the fixed effect panel for return on equity are shows in table 2; it demonstrates that the rise of the unit in the current ratio contributes to a decrease of around 0,77 units in return on equity. This is statistically meaningful or against the anticipation of primary concern, as it was forecast to expand bank profitability for the current ratio.It also brings about more revenue to the company because of the strong relationship with the companies. When non-performing loans enhance by one unit, Also non-performing loans are statistically significant which means that the rate in which non -performing loans are being paid is positive and there has not been any bad debt recorded in the bank. Table 2 presents the approximate outcome of a regression of the fixed impact panel for return on assets. A unit increase in total ratio leads from the table to a reduction in return on equity of 8,662 units; a percent increase in the non-performing loan has a favorable decline of 50.20 in return on equity. The estimated result of random effect panel regression for return on equity is presented in Table 3. From the table, a unit increase in current ratio leads to 5.823 unit increase in return on equity; a unit increase in non-performing loan brings about a reasonable decrease on return on equity by 0.004. The diagram of correlation shown in and provided in Table 5 demonstrates the relation that exists between the selected variables for this analysis. The most commonly used correlation coefficient is the Pearson correlation coefficient, was used in this study to assess the occurrence of multi - collinearity among factors. It contrasts two ratio variables, and the main diagonal of the correlation coefficient table is generally a collection of different factors for most of the time since the comparison between a factor itself and is generally 1. The factors display no multicollinearity in Table 5, as the factor is less than 0.8. The qualitative or description statistics of the variables used in the model are given in Table 6. The data analysis shows the trend and full proof about the factors. In the descriptive statistics of the variables the average and the highest amount of the factors are also identified. The average return on assets (ROA) is 1.7521 and varied from – 0 to 6.1; the average return on equity (ROE) is 12.829 and varies from zero to 37; the average value of the present ratio (cr) is roughly 1.7521 and varied from 0.9 to 4; the average value of the current ratio (cr) is estimated 1.7521; of non-performing loan (npl) is 0.0392 and it ranges from 0.006 to 0.3 respectively.

Discussion of Findings

The scientific regression results in both Models I and II demonstrate that the interactions between dependent variables (ROA and ROE) and the independentvariables are not statistically significant. This implies that DMB capital adequacy has no important effect on the return on their resources and on returns for investors of their equity markets. These results further indicate that the liquidity management of Nigeria DMBs has a negative impact on their declared profit. Besides, it also implies that these banks funds and assets was not well utilized and unable to generate sufficient liquidity during these periods. This means that the efficient management of these liquidity variables by DMBs decreases their profitability. This result corroborate the findings of Olagunju et al (2011) where a firm is forced into bankruptcy the related issues of selling off assets at troubled rates and the additional fees prosecuted to lawyers, bankruptcy creditors and liquidators.

Recommendation

This research specifically examines the relation between the liquidity management and Deposit Money Banks profitability in Nigeria. The findings of the study show that the capital adequacy does not improve the economy of Nigerian deposit money banks as measured by ROA and ROE substantially. From the above tables which I will pick the Durbin Watson result to give a clear explanation that they are all said to be weak in Fixed and Random Effect table which is said to be weak as shown below. There is still room for improvement to being about stability in the economy and to have a very good balance. Consequently, institutions should reduce their surplus funds as a protection for unforeseen withdrawal requests from customers, DMBs should find it appropriate to take further steps to meet those requirements, while excess funds should be allocated due to seasonal in short-term money market instruments or other assets that will produce more income for banks.

Conclusion

The Financial institutions need to offset the exchanging among controlling their liquidity and profitability; it is because money supply reduces profit margins while excessive volatility uncovers DMBs to bankruptcy. Non-performing loans are not statistically significant from the model above which creates room for improvement in

organizations that undergo crisis running into illiquidity should manage the funds and do some checks and balances before disbursing loans to customers to avoid liquidation.

Abstract

The aim of this study is to determine the effect of Corporate Social Responsibility on the Firm Value moderated by Corporate Governance on Mining Sector Listed on IDX Period2013-2018. Independent variable of this study is Corporate Social Responsibility as measured by CSRI. Dependent variable of this study is Firm Value with PBV as a proxy. While moderating variable used is Corporate Governance with Audit Committee as the proxy. Then control variable in this study are Firm Size, Profitability, Leverage, and Firm Age. The data used in this study is annual report of Mining Sector listed in Indonesia Stock Exchange (IDX) period 2013-2018. The sampling method of this study is purposive sampling technique. The research model of this study employs panel data analysis with Random Effect Model approach. The empirical result shows that Corporate Social Responsibility does positive effect and significant on Firm Value. Corporate Governance moderated by Audit Committee weakening the relation between Corporate Social Responsibility on Firm Value.

Keywords: Firm Value, Corporate Social Responsibility, Profitability, Leverage, Firm Age.

Introduction

A company is an organization founded on a group of people working to achieve a goal. The main objective of the company being established is not only to maximize profits but also to maximize company value by increasing the prosperity of the owners or shareholders. Firm value is the investor's perception of the company which is often associated with stock prices. When the share price increases, the company value will increase and the welfare of the owner or shareholders will also increase. The better the company value, investors will view the company as having a good reputation because high company value describes good company performance and can describe the prospects for the company's future wealth (Wahyudi, et al, 2016).

The presence of a company should provide benefits to the surrounding community and is required to contribute to the life of the local community as partners in community life because the presence of a company can have good or bad consequences for the surrounding community. To carry out its functions, a company cannot be separated from dependence on other parties (stakeholders). Cooperation to achieve the goals of each stakeholder is an important aspect of a social system, in addition to fulfilling the interests of shareholders. This activity is known as corporate social responsibility (Yanti and Manik, 2018).

In general, the increase in firm value is influenced by financial factors. However, non-financial factors also affect the performance of a company which has an impact on increasing firm value. Corporate social responsibility (CSR)

Cite this Article as: Destria Kurnianti, Andhi Wijayanto, Andyka Yudha Satria Putra and Novan Yonatan Seilatu "The Effect of Corporate Social Responsibility on the Firm Value Moderated by Corporate Governance on Mining Sector Listed on IDX Period 2013-2018" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

is one of the non-financial factors that companies currently need to pay attention to to increase company value (Retno and Priantinah, 2012).

Corporate social responsibility is a form of responsibility carried out by companies in repairing social inequalities and environmental damage that occurs as a result of the company's operational activities. The increasing number of forms of responsibility carried out by companies to their environment, the company's image according to the public's view will increase or the company's image becomes better. Investors are more interested in companies that have a good image in society because the better the company's image, the higher consumer loyalty. As consumer loyalty increases over a long period of time, the company's sales will improve and in the end it is hoped that the level of company profitability will also increase. If the company runs smoothly, the value of the company's shares will increase (Retno and Priantinah, 2012).

Apart from corporate social responsibility, another issue that is also thought to affect firm value is corporate governance. Corporate governance seems familiar to players in the capital and financial market industries, including analysts and investors. As stakeholders of public companies, they have an interest in the implementation of GCG. For them, easy access to correct and transparent information will make it easier to analyze whether a share is purchased or not. Ideally, with good corporate governance, the management of the company concerned is also good.

According to Hidayah (2008) the application of GCG principles with the support of adequate regulations will prevent various forms of dishonesty in financial disclosure that are detrimental to stakeholders, such as expectations that far exceed actual company performance. Companies that have implemented GCG will be more trusted by creditors and investors so that their shares are more liquid and share prices can increase.

In recent years, disclosure and transparency in financial reports have become important issues in Indonesia. The case that occurred at PT Timah (Persero) Tbk which provided fictitious financial reports in the first semester of 2015 is one proof that transparency and compliance with mandatory disclosures is still lacking. This activity was carried out by PT Timah to cover up the company's continued worrying financial performance. Ali Samsuri as chairman of the Timah Employees Association (IKT) revealed that PT Timah's financial condition for the past three years has been unhealthy. The inability of the PT Timah board of directors to escape from the loss trap has resulted in the handover of 80% of PT Timah's mining area to business partners. The handover of PT Timah's mining areas to business partners has negative consequences for PT Timah's future, especially for the 7,000 employees in the company. If you look at the real conditions that have occurred at PT Timah, Ali believes that PT Timah (Persero) Tbk's first semester financial statements are fictitious. Because according to him, in the first semester of 2015, PT Timah's operating profit had suffered a loss of Rp. 59 billion (mining.co.id, 27 January 2016).

From these cases, it is evident that the implementation of corporate governance is still lacking, especially in the audit department. The Institute of Internal Auditors (IIA) recommends that every public company should have an audit committee that is set up as a standing committee. The IIA also recommends the formation of audit committees in other organizations, including non-profit and governmental organizations. With the role of the audit committee in a company, fraud in disclosure and transparency of financial reports can be minimized.

Research conducted by Fiona (2017), Indarti and Setiawan (2016), Martantina (2014), Nahda and Harjito (2011), Retno and Priantinah (2012), and Wulansari and Sapari (2017) revealed that disclosure of corporate social responsibility (CSR) positive effect on firm value. By implementing corporate social responsibility practices, it will be able to improve the company's image both in the eyes of the community and shareholders, besides that the application of corporate social responsibility can maintain harmonious relationships between the company and stakeholders where this good relationship can help the company's business run smoothly. The results of this study are different from those conducted by Putri, et al. (2016) which revealed that CSR has no effect on firm value.

Martantina (2014), and Putra, et al (2013) revealed that GCG as a moderating variable can moderate the relationship between CSR and firm value. The results of this study are different from those conducted by Fiona (2017) which states that GCG as a moderating variable cannot moderate the relationship of CSR to firm value. In this case, the implementation of GCG is still limited to meeting existing regulations, so that shareholders pay more attention to high CSR disclosures to increase image and gain community legitimacy which will later increase company value.

This study is different from previous studies using control variables, including company size, leverage, profitability, and company age. Based on the description above, this study takes the title: "The Influence of Corporate Social Responsibility on Company Value is moderated by Corporate Governance (Empirical Studies on Manufacturing Companies Listed on IDX 2013-2018)".

Literature Review

The Firm Value

According to Yuliyanti and Tripena (2016), "The value of companies that have gone public is the value reflected in the market price of the company's shares, while the value of companies that have not gone public is realized when the company is sold". Firm value is defined as market value because firm value can provide maximum prosperity for shareholders if the company's share price increases (Afzal and Rohman 2012).

Firm value is the investor's perception of the company's success rate which is closely related to its share price (Pangulu and Ghozali 2014). High company value is reflected in high share prices. This also increases market confidence in the company's performance as well as the company's prospects in the future. So that the company tries to increase company value through maximizing share prices.

Company value describes how well or badly management manages its wealth, this can be seen from the measurement of financial performance obtained. A company will try to maximize its company value. An increase in the value of a company is usually marked by an increase in share prices in the stock market.

Corporate Social Responsbility

In the global context, the term corporate social responsibility began to be used in the 1970s and became increasingly popular after the presence of the book Cannibals With Forks: The Triple Bottom Line in 21st Century Business (1998), by John Elkington which developed three important components of sustainable development, namely economic growth, environmental protection, and social equity, which were initiated by The World Commission on Environment and Development (WCED) in the Brundtland Report (1987). Elkington packages CSR into three focuses: 3P, which stands for profit, planet and people. A good company is not only after mere economic gain (profit), but also has a concern for environmental sustainability (planet) and the welfare of society (people) (Mardikanto, 2014).

The World Business Council for Sustainable Development (WBCSD), which is an international institution established in 1955 and has 120 members from 120 multinational companies from 30 countries in the world, defines corporate social responsibility: "continuing commitment by business to behave ethically and contributed to economic development while improving the quality of life of the workforce and their families as well as of the local community and society at large". This definition shows that corporate social responsibility is a form of action that departs from the company's ethical considerations directed at improving the economy, which is accompanied by an increase in the quality of life for employees and their families, as well as improving the quality of life of the surrounding community and society more (Santoso, 2016).

According to Marnelly (2012) CSR is a form of cooperation between companies (not only Limited Liability Companies) and all things (stakeholders) who directly or indirectly interact with the company to ensure the existence and sustainability of the company's business (sustainability). According to Hery (2012) CSR is defined as follows: "corporate social responsibility is a business commitment to act ethically, operate legally, and contribute to economic improvement, along with improving the quality of life of employees and their families, local communities, and the wider community".

So, it can be concluded that CSR is a company's commitment to make a long-term contribution to a particular issue in society or the environment in order to create a better environment. Contributions from this company can be in the form of many things, such as financial assistance, expert assistance, assistance in the form of goods, and others.

Good Corporate Governance

In the Decree of the Minister of BUMN (KEP-117 / M-MBU / 2002) regarding good corporate governance, it is stipulated that what is meant by corporate governance is a process and structure used by BUMN people to increase business success and company accountability to realize shareholder value in long term while still paying attention to the interests of other stakeholders, based on laws and regulations and ethical values. Person is the General Meeting of Shareholders (GMS), commissioners and Directors for Corporate Companies (PERSERO), and Capital Owners, Supervisory Board and Directors for Public Companies (PERUM) and Service Companies (PERJAN). SOEs are required to implement GCG consistently and or make GCG their operational basis.

According to The Indonesian Institute for Corporate Governance (IICG) what is meant by corporate governance is a series of mechanisms that direct and control a company so that the company's operations run according to the expectations of stakeholders. The notion of good corporate governance (GCG) is the structure, system and process used by company people as an effort to provide added value to the company in a sustainable manner in the long term, while still paying attention to the interests of other stakeholders, based on moral, ethical, cultural and applicable rules. other. According to the Regulation of the Minister of State for BUMN Number PER- 01 / MBU / 2011, the definition of good corporate governance is: the principles that underlie a process and mechanism for managing a company based on statutory regulations and business ethics.

Based on those definitions, it can be concluded that GCG is a system or set of regulations that regulate, manage and supervise the relationship between company managers and stakeholders in a company. GCG is not only a means of regulation and control but also as an added value for a company.

Theoretical Framework

The Influence of Corporate Social Responsibility on Firm Value

According to Rustiarini (2010), companies that have good social and environmental performance will be responded positively by investors through an increase in share prices. If the company has poor social and environmental performance, investors will doubt and will respond negatively through a decrease in its share price. Fiona (2017), Fitri and Herwiyanti (2015), Indarti and Setiawan (2016), Martantina (2014), Nahda and Harjito (2011), Putra, et al (2013), Retno and Priantinah (2012), Samsi, et al (2014), and Wulansari and Sapari (2017) state that CSR has a significant positive effect on firm value. By implementing corporate social responsibility practices, it will be able to improve the company's image, both in the eyes of the public and shareholders. This will build the trust of investors by increasing the share price of the company concerned.

The Influence of Corporate Governance as Proxied by The Audit Committee in Moderating Corporate Social Responsbility To Firm Value

Agency theory states that one of the objectives of implementing CG is encourage corporate responsibility to society and the environment. This activity aims to optimize company value while paying attention to other stakeholders. All of these things will be done well if the company implements CG. This means that the implementation of CG encourages companies to carry out CSR activities so as to increase company value.

Martantina (2014), and Putra, et al (2013) show that corporate governance is proxied by the board of directors, managerial ownership, institutional ownership, the proportion of independent commissioners and the audit committee as variables. moderation can positively moderate the relationship between corporate social responsibility and firm value.

Figure 1: Theoretical Framework

Research Hypotheses

Based on the description in the framework of thought, the research hypothesis can be formulated as follows:

H1: Corporate social responsibility has a positive effect on firm value in manufacturing companies listed on IDX in 2013-2018.
H2: Corporate governance proxied by the audit committee can positively moderate the relationship between corporate social responsibility and firm value in manufacturing companies listed on IDX in 2013-2018.

Research Methodology

In this study, researchers used an associative research method that aims to identify and explain the causal relationship (causality) between one variable and another (variable X against variable Y). The analysis technique used in this research is quantitative analysis (statistics) because the data used is in the form of numbers. The regression that the researchers used is panel data regression because the observations used consist of several companies (cross section) and over a period of several years (time series). The data obtained will be processed, then will be analyzed quantitatively and further processed using the E-views program and the basic theories described previously to provide an overview of the object under study and then will provide conclusions from the results obtained.

In this study, the population used is all manufacturing companies that go public listed on the IDX 2013-2018 period. Sampling in this study using non probability sampling method. The non probability sampling method uses a purposive sampling technique. Therefore, the sampling in this study was adjusted to predetermined criteria. The criteria used are as follows:

1. Manufacturing company registered with IDX for at least one year in the 2013-2018 period.
2. A manufacturing company that has issued audited financial statements as of December 31 and published to BAPEPAM for at least 1 year in the period 2013-2018.
3. The company displays the data and information needed by researchers about the variables in this study completely.

Based on the sampling criteria, there are 95 sample companies to be examined in this study.

Table 1: Sample of Companies

No	Description	Total
1	Manufacturing Companies Listed on the Indonesia Stock Exchange in the 2013 - 2018 Period	127
2	Companies that do not provide information related to the object of research in the form of financial data in a row during the 2013 - 2018 period	(87)
3	Companies that do not provide information related to the object of research in the form of consecutive stock data during the 2013 - 2018 period	(21)
	The number of samples used	19
	Number of Observation	95

Result and Discussion

Descriptive Statistic

Descriptive statistics are carried out with the aim of describing or providing a general description of the object under study through sample data in accordance with the actual situation, then presented and processed in table form to make it easier to understand. The descriptive statistical analysis presented in this study consists of: mean, median, maximum, minimum, and standard deviation obtained from each sample of Manufacturing companies listed on the IDX during the 2013-2018 period of 19 companies so that 95 observations were obtained.

Table 2: Descriptive Statistic

	PBV	CSR	KA	SIZE (milyar)	ROA	DER	AGE
Mean	1,661222	0,184117	3,066667	273,0710	0,017895	1,077483	24,60556
Median	1,040000	0,192308	3,000000	0,934426	0,018500	0,735000	23,00000
Maximum	25,17000	0,461538	7,000000	4022,394	0,364700	14,81000	49,00000
Minimum	-0,750000	0,012821	1,000000	0,004191	-0,644000	-24,12000	2,000000

Table 3: Descriptive Statistics of CSR Disclosure

	L	E	K3	TK	P	M	U
Mean	3,890511	1,000000	2,210526	2,444444	1,240741	5,224852	5,225806
Sum	533,0000	1,000000	252,0000	44,00000	67,00000	883,0000	810,0000
Observations	137	1	114	18	54	169	155

Based on the descriptive statistical results in table 2 above, the mean value of the firm value variable as proxied by PBV is 1.66122 and the standard deviation value is 2.570181. The average value of the PBV ratio which is smaller than the standard deviation value indicates that the high variability of the PBV ratio in the sample of companies studied is the Manufacturing company. The maximum PBV ratio value of 25.17 000 which came from Kapuas Prima Coal Tbk in 2017. This is because in that year the closing price of the company's shares was Rp. 1,490 per share with 5.050 billion shares in circulation and a total equity of Rp 478,811,061,276. That year, the company received an Effective Statement Letter from the Chief Executive of Capital Market Supervision on behalf of the Board of Commissioners of the Financial Services Authority (OJK) to conduct a public offering of 550,000,000 shares with a nominal value of Rp 100 per share at an offering price of Rp 140 per share. stock. The minimum PBV ratio value of -0.750000 which comes from Bumi Resources Tbk in 2013-2014. This is because in that year the closing price of the company's shares was Rp. 300 per share in 2013 and Rp. 80 per share in 2014 with the number of shares circulated of 20.773 billion shares in 2013 and 36.627 billion shares in 2014. In that year, the average selling price of coal in 2013 was only US $ 63.8 / ton, down 18, 0% from the previous year amounting to US $ 81.5 / ton, while for 2014, the average selling price of coal still decreased from US $ 63.8 / ton to US $ 52.7 / ton down by 17.49% as a result of the decline. an index that reflects the dynamics of changes in world coal demand and supply.

The CSR variable has an average value of 0.184117 and a standard deviation value of 0.089593. The average value of the CSR variable which is greater than the standard deviation value indicates that the low variability of the CSR variable in the sample of companies studied is the Manufacturing company. The maximum value of the CSR variable was 0.461538 which came from Mitrabara Adiperdana Tbk in 2017. This is because in that year, the company disclosed 36 CSR disclosures. In 2017, the Company has spent Rp. 9.6 billion for CSR activities, which increased 69% compared to the previous year. One of the pillars of activity that has experienced a significant increase is the health pillar for clean water pipeline activities and the connection program for clean water PDAM for the community. In addition, in 2017, the company also received 2 awards from Business News in the categories "TOP Leader on CSR Commitment" and "TOP CSR 2017 on Nawacita 7: Rural Electricity Program". These achievements and awards represent the company's real commitment to implementing social responsibility, so that the company's existence can provide benefits to the life and environment around the company's work area. The minimum value for the CSR variable was 0.012821 which came from Mitra Investindo Tbk in 2017. This is because in that year, the company only disclosed 1 CSR disclosure. In that year, the company is still waiting for the completion of regulatory synchronization with the government. The company has reserved CSR funds and remains committed to implementing the CSR program if there are no regulatory obstacles.

Based on table 3 above, it can be seen that Manufacturing companies disclose more of their CSR activities in community aspects, such as cash assistance, community service activities or scholarships. In terms of services, it can be seen such as the repair and construction of 5 places of worship in Tanah Laut district and repair of village roads in Sumber Jaya Village, Kintap District and in Sigam-Sarangtiung Village, Kotabaru Regency carried out by Arutmin Indonesia, which is a business unit of Bumi Resources Tbk. support the availability of facilities and infrastructure for the general public to assist the community around the mine in carrying out their daily activities. Cash assistance can be in the form of the development of fruit and vegetable crops and a capital facility program for laying hen breeders in villages around the mine so that they can improve the living standards of the surrounding communities. Then for scholarships such as the Regional Superior Seed (BUD) scholarship which is a special scholarship for the best students (the best ranked district) to pursue undergraduate education at a partner university (Bogor Agricultural Institute) so as to improve the quality of education, both skills and knowledge for the people around Arutmin's work site.

The corporate governance variable proxied by the audit committee has an average value of 3.066667 and a standard deviation of 0.648160. The average value of the audit committee variable which is greater than the standard deviation value indicates that the low variability of the audit committee variable in the sample of companies studied is the Manufacturing company. The maximum value of the audit committee variable was 7,000,000 which came from Aneka Tambang (Persero) Tbk in 2014. This is because in that year, the company had 7 members, more than the previous year. The minimum value of the audit committee variable was 1,000000 which came from Borneo Lumbung Energi & Metal Tbk in 2015-2017. This is because in that year, the company had only 1 member of the audit committee.

The firm size variable (SIZE) has an average value of Rp. 273.0710 billion and the standard deviation value is Rp. 690,0603 billion. The average value of the firm size variable (SIZE) which is smaller than the standard deviation value indicates that the high variability of the firm size variable (SIZE) in the sample of companies studied is the Manufacturing company. The maximum value of the size variable company (SIZE) of Rp. 4022.394 billion which came from Golden Energi Mines Tbk in 2013. This is because in that year, the company recorded total company assets of Rp. 4.022 billion, an increase of 17% over the previous year of Rp. 3,440 billion. The increase occurred in

trade accounts receivable, which increased by 37% to Rp. 717 billion as of December 31, 2013. The average trade receivables collection period for 2013 and 2012 was 51 days and 35 days, respectively. This increase was due to a change in part of the terms of sale to sales with a 180-day SKBDN (Domestic Letter of Credit) during the current year. Apart from trade receivables, the total non-current assets also increased by Rp. 2,160 billion and Rp. 1,644 billion in 2013 and 2012. This increase was contributed by the increase in net manufacturing assets as of December 31, 2013 was Rp. 1.035 billion compared to December 31, 2012 amounting to Rp. 912 billion. This increase was due to an increase in deferred stripping costs. As of December 31, 2013, the net fixed assets amounted to Rp. 694 billion.

Investments in the main capital expenditures during the year were the capitalization of several assets related to the completion of the Nilau Port and a road project in Sumatra as well as an additional second freight line at the port of Bunati, South Kalimantan. The company's other non-current assets increased by 138% from Rp. 181 billion at the end of 2012 to Rp. 432 billion at the end of 2013 mainly due to an increase in prepaid-land cultivation costs of Rp. 144 billion, down payment for Manufacturing services of Rp. 46 billion and a security deposit of Rp. 43 billion. The minimum value of the company size variable (SIZE) is Rp. 0.004191 billion which came from Elnusa Tbk in 2016. This is because in that year, the company recorded total company assets of Rp. 4.190 billion, down 4.9% from the previous year of Rp. 4.407 billion. This decrease was the result of a decrease in the company's current assets by 10.3% compared to the previous year, mainly due to a decrease in cash and cash equivalents and net inventories. The decline in cash and cash equivalents that occurred during 2016 was mainly due to decreased income due to the lack of projects, repayment of bank loans and funding for the purchase of the company's fixed assets. It is recorded that the company's bank loan has decreased by Rp. 189.9 billion from the position at the end of 2015. So that at the end of 2016 cash and cash equivalents decreased by 20.4%. The company's cash and cash equivalents consist of cash of Rp. 3.1 billion, cash in the bank of Rp. 630.7 billion and deposits of Rp. 113.7 billion. From Rp. 744.4 billion, amounting to 51.1% in Rupiah currency and 48.9% in US Dollar and the rest in Singapore Dollar.

On the principal of these debts during 2013 and the tight restrictions on capital expenditures and funding in this regard. Derivative liabilities, which are fair value of interest rate swap hedges as described in the “Funding Arrangements” section, decreased by 32.4% or approximately US $ 10 million between the end of 2012 and 2013. These decreases were partially offset by increases in benefit liabilities. employment increased by US $ 3 million after taking into account the estimated liability arising from increased benefits based on agreements with the union. The minimum value of the DER ratio is -24.12000 which came from Bumi Resources Tbk in 2013.This is because the Company's short-term liabilities increased 84.4% to US $ 4,719.9 million in 2013, while long-term liabilities decreased by 41.2 % to be valued at US $ 2,586.9 million. The reason is mainly due to part of the debt which will mature in 2014. BUMI has liability instruments in the form of medium term notes, convertible bonds and long-term loans obtained from several of its creditors. Each loan has a different repayment period, with varying interest rates, with an amount according to LIBOR (London Interbank Offered Rate) + 5% to 7%, while others are set at 12% per annum. Total interest-bearing liabilities, which consist of loans, notes and convertible bonds at the end of 2012 amounted to US $ 3,615.2 million. In 2013, these total liabilities were reduced to US $ 3,595.7 million, amounting to US $ 1,563.5 million among them will be due within 1 year. The largest portion of the maturing facility is a loan from CFL (Country Forest Limited) with a total loan amount of US $ 1,787.1 million, with an interest rate of 12% per annum. Of this amount, US $ 1,230.5 million will mature in the third and fourth quarters. In addition to the loan facility from CFL (Country Forest Limited), BUMI is also concentrating on efforts to resolve its convertible bond obligation of US $ 375 million which will be due soon and an increase in amortization obligation of US $ 434.9 million.

Another account that increased quite sharply was accrued expenses which rose 60% to US $ 419.8 million, mainly due to the increase in interest accrued by the company and higher mining and maintenance costs. In managing long-term liabilities, BUMI is consistent in its efforts to reduce overall interest expenses. Given the short-term business conditions that have yet to show signs of recovery, BUMI is striving to reduce the portion of loans with interest rates and realize a loan-to-equity conversion program so that the company has strategic partners who are believed to be able to support long-term business development. It is hoped that the restructuring by refinancing the joint obligations of CIC (China Investment Corporation) is expected to be intensified and implemented for the settlement of other interest-effect loans, so that future interest expenses can be managed at a level that will have the most positive impact on the company's financial performance. Overall, BUMI's long-term liabilities fell 41.2% from 2012's position. Apart from long-term borrowings, the decrease in long-term liabilities was mainly due to a decrease in the premium redemption account and convertible bonds that will mature in the next one year.

The company age variable (AGE) has an average value of 24.60556 and a standard deviation value of 12.51837. The average value of the firm age variable (AGE) which is greater than the standard deviation value indicates that the low variability of the firm age variable (AGE) in the sample of companies studied is the Manufacturing

company. The maximum value of the company age variable (AGE) is 49.00000 which came from Aneka Tambang (Persero) Tbk and Vale Indonesia Tbk in 2017. This is because the company has been established for a long time, namely 1968, so they have experience in managing the company. The minimum value of the company age variable (AGE) is 2.00000 which comes from Alfa Energi Investama Tbk in 2017. This is because for companies that are relatively young or newly established, the company does not have experience in managing its company.

Panel Data Test

Next thing to do is to test the type of panel data that is best for this research model. This is done to get the most suitable regression model. In panel data regression testing, there are three models that can be used, namely: common effect model, fixed effect model, and random effect model. To determine the best model of the three models, the chow and hausman tests must be performed first.

1). Chow Test

The Chow test aims to select whether the model used is a common effect or a fixed effect. The hypothesis used in this research is:
H0: Common effect model
H1: Fixed effect model

In this study, researchers used a significance of 5% ($\alpha = 0.05$). The decision making from this Chow test is if the p-value is ≤ 0.05 then H0 is rejected, which means that the right model for panel data regression is the fixed effect, whereas if the p-value> 0.05 then H0 is accepted which means the right model for panel data regression is a common effect.

The following are the results of the chow test presented in table 4.

Table 4: Chow Test Result

Redundant Fixed Effects	**Tests**		
Equation: EQ01			
Test cross-section fixed	Effects		
Effects Test	Statistic	d.f.	Prob.
Cross-section F	15,714461	(40,132)	0,0000
Cross-section Chi-square	315,229914	40	0,0000

Based on the data in table 4 the chow test results show the chi-square value of 315.229914 with a probability value of 0.0000. With a p-value ≤ 0.05, H0 is rejected and H1 is accepted. So, it can be concluded that the common effect model cannot be used as a panel data regression model because it is not the best model to be used in a sample of Manufacturing companies listed on IDX for the 2013–2017 period. Furthermore, testing with the Hausman test is needed to find the best model between the fixed effect and the random effect.

2). Hausman Test

The Hausman test aims to select whether the model used is a random effect or a fixed effect. The hypothesis used in this research is:
H0: Random effect model
H1: Fixed effect model

In this study, researchers used a significance of 5% ($\alpha = 0.05$). The decision making from this Hausman test is if the p-value is ≤ 0.05 then H0 is rejected, which means that the right model for panel data regression is the fixed effect, whereas if the p-value> 0.05 then H0 is accepted which means the right model for panel data regression is the random effect.

The following are the results of the Hausman test presented in table 5.

Table 5: Hausman Test Result

Correlated Random Effects - Hausman Test			
Equation: EQ01			
Test cross-section random	effects		
Test Summary	Chi-Sq. Statistic	Chi-Sq. d.f.	Prob.
Cross-section random	7,798921	7	0,3507

Based on the data in table 5, the results of the Hausman test show that the chi-square value is 7.798921 with a probability value of 0.3507. With a p-value ≥ 0.05, H0 is accepted and H1 is rejected. So, based on the results of the Hausman test, it can be concluded that the best model for conducting panel data regression in the sample of this study is the random effect model so that the LM test to determine between the random effect and common effect models needs to be done.

Lagrangian Multiplier Test

LM test or Lagrangian Multiplier Test to determine whether the best model is random effect or common effect. The decision making from this LM test is if the p-value is ≤ 0.05 then H0 is rejected, which means that the right model for panel data regression is the random effect, whereas if the p-value> 0.05 then H0 is accepted which means the right model for panel data regression is a common effect.

Table 6: Lagrangian Multiplier Test Result

Lagrange Multiplier Tests for Random Effects			
Null hypotheses: No effect	**s**		
Alternative hypotheses: Two-sided (Breusch-Pagan) and one-sided			
(all others) alternative	**s**		
Test Hypothesis			
	Cross-section	Time	Both
Breusch-Pagan	22,74847	0,741896	23,49036
	(0,0000)	(0,3891)	(0,0000)
Honda	4,769535	0,861334	3,981626
	(0,0000)	(0,1945)	(0,0000)
King-Wu	4,769535	0,861334	2,282038
	(0,0000)	(0,1945)	(0,0112)
Standardized Honda	5,530850	1,284415	-0,115706
	(0,0000)	(0,0995)	
			--
Standardized King-Wu	5,530850	1,284415	-0,367956
	(0,0000)	(0,0995)	--
Gourieroux, et al.*	--	--	23,49036
			(< 0,01)
*Asymptotic criticalvalues:			
1%	7,289		
5%	4,231		
10%	2,952		

Based on the data in table 6, the lagrangian multiplier test results show the cross-section value of the Breusch-pagan cross-section of 22.74847 with a probability value of 0.0000. With a p-value ≤ 0.05, H0 is rejected and H1 is accepted. So, based on the results of the lagrangian multiplier test, it can be concluded that the best model for regression of panel data in the sample of this study is the random effect model.

Multicollinearity Test

This test aims to determine whether in the regression model, there is a correlation between the independent variables. A good regression model should not have a correlation between the independent variables (Ghozali, 2009). To determine whether there is a correlation between the independent variables, it can be seen from the tolerance value between the independent variables. If the tolerance value between variables is greater than 0.9 or close to 1, the regression model is detected to have multicollinearity.

Table 7: Multicollinearity Test Result

	CSR	KA	SIZE	ROA	DER	AGE
CSR	1,000000					
KA	0,158695	1,000000				
SIZE	-0,143996	-0,114611	1,000000			
ROA	0,153815	0,205306	-0,104570	1,000000		
DER	-0,083961	0,170237	-0,009937	0,122106	1,000000	
AGE	0,413729	0,357847	-0,046250	0,028856	-0,091774	1,000000

Based on table 7 it can be seen that there is no correlation coefficient between variables that is greater than 0.9, it can be said that there is no correlation between the independent variables and the control variables used in this study.

Panel Data Regression Test

After conducting the panel data model regression test, it has been determined that the random effect model is the most appropriate model to be used in the panel data regression model in the sample of this study.

Table 8: Panel Data Regression Test Result

Dependent Variable:PBV

Sum squared resid	1143,524	Durbin-Watson stat		0,448236

As in table 8 above, this test is carried out by regressing the independent variable, namely CSR on the dependent variable, namely firm value (PBV) by including the moderating variable, namely the audit committee (KA) and the control variable, namely company size. (SIZE), profitability (ROA), leverage (DER), and company age (AGE) in a sample of Manufacturing companies listed on IDX for the 2013-2018 period. This is to determine CSR with the moderating variable of the audit committee (KA) in terms of affecting firm value (PBV) with the control variable firm size (SIZE), profitability (ROA), leverage (DER), and company age (AGE). The regression equation is: PBV = -1.028376 + 18.30265CSR + 1.317067KA - 5.590773CSR * KA - 9.56E-07SIZE + 0.882905ROA + 0.170906DER - 0.051791AGE

Hypotheses Testing Result

The Influence of Corporate Social Responsibility on Company Value

Table 8 above shows the probability value of corporate social responsibility (CSR) of 0.0560 <0.10. This explains that CSR has a significant and significant effect on firm value at the 10% sig level. The CSR coefficient value of 18.30265 shows that CSR has a positive and significant effect on firm value.

The results of this study are in line with research conducted by Fiona (2017), Fitri and Herwiyanti (2015), Indarti and Setiawan (2016), Martantina (2014), Nahda and Harjito (2011), Putra, et al. (2013), Retno and Priantinah (2012), Samsi, et al (2014), and Wulansari and Sapari (2017), which state that CSR has a significant positive effect on firm value.

This means that the implementation of CSR in a company is one of the determining factors whether or not the company's value is good (Nahda and Harjito, 2011). Companies that disclose CSR will get a positive response from investors by increasing the share price of the company concerned. That way, the company will try to reveal a lot of information about CSR activities to maintain the company's existence which will have an impact on increasing company value.

The influence of Corporate Governance as proxied by the audit committee in moderating Corporate Social Responsibility to Company Value

Table 8 above shows the interaction probability value between CSR and the audit committee of 0.0744 <0.10. This explains that the audit committee is able to moderate the relationship between CSR and firm value at the sig 10%

level. The interaction coefficient value between CSR and the audit committee is -5.590773, indicating that the audit committee has a negative and significant effect in moderating the relationship between CSR and firm value.

The results of this study are in line with research conducted by Fiona (2017), Indarti and Setiawan (2016), and Martantina (2014) which state that corporate governance proxies the audit committee was unable to strengthen the relationship between CSR and firm value.

This shows that based on the criteria of the company's audit committee, one of the members of the audit committee is an independent commissioner, so the audit committee must assist the board of commissioners in optimizing supervision of the company (Martantina, 2014). In addition, the existence of the audit committee does not function properly if the appointment of the audit committee is limited to meeting existing regulatory criteria, so that shareholders pay more attention to high CSR disclosure to increase image and gain community legitimacy which will increase company value (Indarti and Setiawan, 2016).

The effect of the control variables on Firm Size, Profitability, Leverage, and Company Age on Firm Value

Table 8 above shows the probability value of the firm size control variable (SIZE) of 0.9968> 0.10. This explains that company size has no effect on firm value at the 10% sig level. The coefficient value of the company size is -9.56E-07 shows that firm size has no negative effect on firm value.

The results of this study are in line with research conducted by Cheryta, et al. (2017), Rumandor, et al. (2015), Suwardika and Mustanda (2017) which states that company size has no negative effect on firm value. This shows that a large or small company size will not be able to influence firm value. An investor, if he wants to value a company, will not see it in terms of company size which is reflected in the total assets owned by the company. However, investors will look more at various aspects such as paying attention to company performance as seen in the company's financial statements, the company's good name, and tend to pay more attention to companies that carry out CSR activities (Suwardika and Mustanda, 2017).

Table 8 above shows the probability value of the profitability control variable (ROA) of 0.4278> 0.10. This explains that profitability has no effect on firm value at the 10% sig level. The profitability coefficient value of 0.882905 indicates that profitability has no positive effect on firm value. The results of this study are in line with research conducted by Salempang, et al. (2016), Setyani (2018), and Setyawan (2017) which states that profitability has no positive effect on firm value. This means that the size of the profitability of a company will not affect the value of the company. In addition, the absence of the effect of ROA on firm value can be caused by the performance of management that does not have the ability to use their assets which causes net income to be small while the assets owned by the company are very large. In addition, this can also occur because the profits owned by the company cannot reflect the size of the company (Sukmawardini and Ardiansari, 2018).

Table 8 above shows the probability value of the leverage control variable (DER) of 0.0000 <0.01. This explains that leverage has a significant and significant effect on firm value at the 1% sig level. The leverage coefficient of 0.170906 shows that leverage has a positive and significant effect on firm value.
The results of this study are in line with research conducted by Pratama and Wiksuana (2016), Rudangga and Sudiarta (2016), and Suwardika and Mustanda (2017) which state that leverage has a positive and significant effect on firm value. This means that the higher the leverage, the higher the company's value.

This is in accordance with the theory put forward by Modigliani and Miller in 1963 which revealed that with taxes on company income, the use of debt would increase company value because debt interest costs were costs that reduced tax payments (Brigham and Houston, 2006). This can occur because the repayment of interest on loans can reduce the cost burden that should be allocated for tax payments, with this activity it can increase the value of EAT so that company profits increase and market valuation of the company will also increase (Suwardika and Mustanda, 2017).

Table 8 above shows the probability value of the firm age control variable (AGE) of 0.0740 <0.10. This explains that company age has a significant and significant effect on firm value at the 10% sig level. The company age coefficient value is -0.051791, indicating that company age has a negative and significant effect on firm value. The results of this study are in line with research conducted by Gunawan and Juniarti (2014) and Putri and Rachmawati (2017) which state that company age has a negative and significant effect on firm value.
This means that the longer a company has been established, this will decrease the value of the company. The decline in the value of this company is due to the longer a company has been established, it will tend to be stiff, so this causes the company to be less able to keep up with existing developments so that the company is less attractive to investors which causes the company's value to decrease (Gunawan and Juniarti, 2014).

Based on table 8 above, it shows the Adjusted R-squared value of 0.070266. This indicates that the independent variable is able to explain the dependent variable by 7%, while the remaining 93% is explained by other variables that are not used in this study.

Conclusion

This research was conducted to determine the effect of corporate social responsibility on firm value moderated by corporate governance as proxied by the audit committee. This study uses a sample of manufacturing companies listed on IDX during the 2013-2018 period. The following are the conclusions obtained from this study:

1. Corporate social responsibility (CSR) has a significant positive effect on firm value as proxied by PBV in Manufacturing companies listed on IDX for the period 2013-2018.
2. Corporate governance proxied by the audit committee weakens the relationship of CSR to firm value in manufacturing companies listed on IDX for the period 2013-2018.

Suggestion

Based on the research that has been done, there are several suggestions that can be given by researchers for further research:

1. Add a variation of the proxy to the firm value variable, such as: Tobin'sQ.
2. Adding proxy variations to corporate governance variables, such as: managerial ownership, institutional ownership, and independent commissioners.
3. Adding proxy variations to control variables that can affect firm value.

Abstract

Ethics in the accountant's profession constitutes an unequivocal value and ethical dilemmas were observed in corporate falls that took place at the beginning of the twenty – first century. These scandals pinpointed decision making problem in accounting where estimates and judgements of professionals are of key importance. The main objective of the study is an attempt to answer the two following research questions: The Authors decided that the purpose of the article is to answer two research questions: 1) Whether those responsible for financial information generating are aware of the responsibility they bear? 2) Whether those people follow ethical values on a daily basis? The following methods were applied: survey research, comparative analysis, participant observation, critical analysis of the subject literature and deductive inference. The thesis of the study is contained within the statement that the accounting staff are under pressure and stress, that determine the occurrence of ethical dilemmas. The study confirmed the thesis posed in the paper that in solving their ethical dilemmas employees follow conscience and inner morality without consulting the Professional Code of Ethics in Accounting. As a consequence of the study the authors proved that staff lack familiarity with the potential of the Code and how it could assist them in resolving ethical dilemmas.

Keywords: ethical dilemmas, professional accountants, pilot study, Professional Code of Ethics in Accounting, Poland

Introduction

At the time of strong connections between business entities, globalisation and corporations becoming internationalised the role of ethical approach increases significantly (Chan et al, 2009; Turzyński, 2011; Szychta, 2015; Davis, Welton, 1991; Uysal, 2010). Lack of precision of numerous regulations and a growing impact of estimates on the image of an individual, result in a substantial dependence of this image on the behaviour and intents of people presenting it and not on the facts. Many authors view the accounting based on historical data as more reliable and verifiable, however, it provides less information than the decision makers expect.

Considerable changes to the economy generated a loss in trust to accounting. This state of affairs must not be blamed on the accounting system but on people, those employed in accounting and managers because they create the existing image of accounting. Implementation of ethics programmes is an attempt to provide a conduct compliant with the spirit of accounting principles. Although the countries in Western Europe and the USA have a history of professional codes of ethics, in Poland they are relatively recent. Adjusting the diverse value systems is conditional to social life. Society members with a variety, often contradictory, value systems must create jointly a more or less homogenous model of conduct.

The purpose of this paper is to explore the ways that professional accountants (in Poland) are dealing with ethical

Cite this Article as: Magdalena WÓJCIK-JURKIEWICZ and Beata SADOWSKA "Accountant's Work Ethics in the Light of Empirical Studies: Case from Poland" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

dilemmas they are facing with in their work. The research is carried out through the questionnaire which "was available as a form to be completed by professional accountants who also study accounting at universities".

The main objective of the study is an attempt to answer the two following research questions:

1. whether those responsible for financial information generating are aware of the responsibility they bear;
2. whether those people follow ethical values on a daily basis;

The following methods were applied: survey research, comparative analysis, participant observation, critical analysis of the subject literature and deductive inference. The thesis of the study is contained within the statement that the accounting staff are under pressure and stress, which determine the occurrence of ethical dilemmas.

Literature Review

Nowadays, the connections between business entities are on the rise and international corporations are of great importance. The responsibility of modern accounting increases significantly. Paradoxically, despite a vast business development, constant pursuit of profit, the need to reach to the origins – to the ethical attitudes – receives a growing attention (Nowak, 2017). Imprecise nature of legal regulations and a widening impact of estimates on an individual's image result in the image being perceived not on the basis of facts but through the vision of those whose role is to present it (Cieślak, 2011, Michalczuk, 2011; Micherda, 2012; Cieciura, 2015). Therefore, the accountants as well as entrepreneurs should make it a priority to become aware that a good opinion and trust are the key aspects of operating on the market. Unethical operation may be beneficial in a short term, however, in a longer perspective they prove to be unprofitable. Notably, the value of honesty increases and its impact on proper market functioning is essential (Wiśniewska, 2014, Piechocka-Kałużna, 2014, Klimczuk, 2014, Jurkiewicz, Wójcik-Jurkiewicz, 2014; Banaszkiewicz, Makowska, 2015; Sadowska, Lulek, 2016).

It is important to emphasise that the accountants' principles of ethics should not stem from a fear of penalties but from an inner conviction that dishonesty does not pay. Principles of ethics ought to be popularised in the society, among accountants as well as investors and business owners to make them aware of the importance of a true and reliable presentation of a financial image of an entity and that eventually observing the provisions of the Code has a positive impact on human relations as well as on the effects of management because any financial information should be advantageous. And the more comparable, timely, comprehensive and verifiable financial information the more advantageous it becomes (Wójcik-Jurkiewicz, 2014).

In some instances, following an ethical dilemma analysis, only one decision seems to be correct. However, one should bear in mind that often there are a number of solutions, therefore people professionally involved in accounting should demonstrate outstanding ethical standards (Wójcik-Jurkiewicz, 2015; Sadowska, Lulek, 2016; Karczewska, 2016, Pilarska, Struzik, 2018).

Materials and Methods

The research conducted on the staff in the field of accounting is aimed at establishing the scale of ethical problems intensity an accountant faces and must confront at work, at verification of the level of familiarity with the subject of ethical conduct and familiarity with codes of ethics.

The study respondents were the staff in the field of accounting as well as finance and accounting students and the nonprobability sample method was applied. The survey questionnaire covered 21 questions concerning 3 research areas.

In the first place, the collected responses regarded the respondents' personal experience with ethical dilemmas. The second part of the survey comprised questions regarding unethical behaviours or ethical conflicts present at businesses. Review of familiarity with the Code of Ethics followed.

Personal information at the beginning of the questionnaire provided data regarding the respondents' age, gender, education, job position and work experience. The main question posed before the respondents considered the existence of an ethical dilemma and how it was resolved. A thorough analysis required posing detailed questions aimed at completing and expanding the general question. One of the most essential pieces of information desired regarded the respondents' perception of the importance of ethics observance and how the ethical dilemmas are currently perceived. The respondent's attitude towards unethical behaviour and the impact of such attitude on their behaviour also provided interesting information. Answers to those questions constitute a significant source of

knowledge about the utility of the code of ethics, the level of ethics of people responsible for the financial data in our country and they may inspire a discussion regarding the potential to introduce changes regarding ethics popularisation among accountants.

Results and Discussion

The survey questionnaire was available as a form to be completed by professional accountants who also study accounting at universities. The study involved 105 respondents – professional accountants. Women – 79% people – predominated in the study. Men constituted only 21% of the total number of respondents. Most respondents were in 21-30 age group (15%), the fewest in the 31-40 group (23%) and 40+ (41%). The respondents were university (100 %) graduates.

In the part of the survey analysing the staff's exposure to ethical dilemmas as many as 61% of respondents were exposed to an ethical dilemma with regards to their work. 4% of the respondents faced them often, 35% of the respondents indicated never. Those dilemmas referred to various aspects of their work. In the question directly related to the source of the dilemma the respondents could mark up to 3 answers. The table 1 presents the answers provided.

Table 1: Aspects the ethical dilemmas concerned among staff

It	Causes of ethical dilemmas occurrence	Number of answers
1	Data manipulation, data fraud	27
2	Conflict of loyalty towards the employer and the ethics principles	18
3	Use of confidential information for own purposes	11
4	I have not faced an ethical dilemma	9
5	Dealing with private matters during work	8
6	Observing professional secret	6
7	Appropriating items from workplace	6
8	Relationship with supervisor	4
9	Relationship with subordinate	2
10	Relationship with colleagues	1

Source: own study on the basis of carried out research

An important aspect which required addressing was the manner of resolving the existing ethical dilemmas. The figure 1 below indicates the respondents' answers.

Fig. 1: Manner of resolving ethical dilemmas by respondents (in percent)

Source: own study on the basis of carried out surveys

As it may be noted, no person faced with a dilemma resolved it with the application of the Code of Professional Ethics in Accounting.

The next field subject to the study was how the selected actions are perceived and the impact of individual factors on human behaviour. The respondents were asked to assess, on the 1 to 3 scale, where 1 meant unethical, 2 – I have no opinion, 3 – ethical, their perception of the following actions:

- use of office/business equipment for private purposes,
- dealing with private matters at work
- use confidential information for personal profit.
- data manipulation,
- appropriating items from a workplace.

The respondents were most strict in their assessment of using confidential data (88% respondents deemed this activity very unethical and unethical), data manipulation (82%) and appropriation of items from a workplace (80%). As regards the aspects of dealing with private issues or use of office equipment the opinions varied, as illustrated with the figure 2 below (1 to 3 scale where 1 – unethical, 2 – i have no opinioin, 3 – ethical)

Fig. 2: Manner of perceiving and dealing with private matters during work by staff (in percent)

Source: own study on the basis of carried out research

Fig. 3: Manner of perceiving the use of office equipment for private purposes by staff

Source: own study on the basis of carried out research

Every person grows up in a certain environment, in different cultures, society. They are brought up, have their own world view, surround themselves with a group of people and their conscience is shaped. The survey asked how the fundamental elements of every person's life, which shape them, affect the choices they make and how they perceive particular aspects as ethical or unethical. An analysis of the staff's answers shows that they believe that people's decisions regarding ethics principles observance are mostly influenced by:

- fear of penalty/sanctions (90%)
- upbringing (85%),
- conscience (66%),

The factors considered by the respondents to have a lesser impact on the decisions made by people were:

- religion/opinions (74% decided that it had no impact),
- fear of social rejection (34% decided it had no impact),
- environment (26% decided it did not impact deciding what is and what is not ethical),

The last subject addressed among the staff participating in the study concerned their experience related to the application of ethics principles. The staff were asked whether they have ever failed to observe any of the fundamental principles of ethics. 88% of the respondents denied such a situation, whereas 12% of the respondents admitted to a failure to observe the principles of ethics. The direct question regarding a particular principle they failed to observe, received the following answers at the table:

Table 2: Principles of ethics from professional accountant's

	Principles of ethics from respondents
• **Direct Question**	• data manipulation,
	• independence,
	• impartiality,
	• due diligence,
	• professional secret,

Accountants who work in that vocation were also asked whether they had to make an ethics related decision under pressure. 67% of respondents have not been in such situation, whereas 33% have. The results of this question confirm that the situations which should not take place happen regularly.

Fig. 4: Necessity to work under pressure connected to an existence of a conflict of ethics

Source: own study on the basis of carried out research

Another situation which should not occur is drawing an employee to a point when they resign from work due to the conflict of ethics. Unfortunately, as many as 19% of respondents replied to this question that they have resigned from work due to an ethics conflict emergence.

As it may be observed on the basis of the study conducted – the accountants are not unfamiliar with the ethical conflict phenomena. They are exposed to their occurrence on a daily basis which results in making decisions aimed at resolving the existing dilemmas. Familiarity with the fundamental principles of ethics formulated by the Professional Code of Ethics in Accounting plays a major role in the process of defining an individual ethical problem and is helpful in resolving it. Hence familiarity with the Code by those professionally involved in accounting is essential.

Conclusions

The posed thesis confirmed that the accounting staff are under pressure and stress which cause the occurrence of ethical dilemmas. It should be considered whether continuous pursuit of profit and creating a positive business image and its results should be conducted through pressure on the accountants so they apply creative accounting on the brink of morality? One should bear in mind that information created by the accounting departments is the source of investors' knowledge, therefore it should be presented with credibility and reliability (in accordance with the principle of a true and fair view). Particular attention to every attempt of unethical behaviour is extremely significant and the instances of pressurising by senior staff require every effort to make a good decision compliant with the principles of ethics.

The presented content was the basis for the conducted pilot study and will be the start of a real scientific research. The study confirmed the thesis posed in the paper that in solving their ethical dilemmas employees follow conscience and inner morality without consulting the Professional Code of Ethics in Accounting. Staff lack familiarity with the potential of the Code and how it could assist them in resolving ethical dilemmas.

In conclusion, a fundamental challenge the accountants in Poland face is becoming aware how important ethical behaviour in accounting is and that they should uphold observance of the principles of ethics. The following question regarding accountants emerges: are they only the ones subjected to pressure or do they draw any forms of benefit from unethical behaviour? The question whether accountants undertake proper efforts to represent their profession – to which they have devoted years of studying and continuous improvement – with dignity shall remain open.

The authors did not present the results of the research using descriptive statistical methods, because it was a pilot study that is already being prepared and will be carried out as the main study on a much larger scale and will cover accountants from all over Poland.

The subject of further research should be to determine the importance of the knowledge of ethical principles in the

positions of accounting professionals.

Comprehensive Determination of the Exchange Ratio in Mergers and Consolidations. Strategic Considerations and Insights

Prof. Marco Taliento
University of Foggia – Dept of Economics, Foggia, Italy
marco.taliento@unifg.it

Abstract

Mergers synergies are a powerful instrument to create value and to overcome crisis as well. Mergers allow a quick growth potentially without paying cash, yet through a special swap. The share exchange ratio (SER) is a conventional and complex measure to determine the number of shares the acquiring company must issue for each individual share of the target. The present article aims at providing an in-depth analysis with reference to the possible allocation of the controversial synergistic component of the value creation process inside SER, both for absorption-mergers and consolidation-mergers. Such strategic aspect in both cases is still a gap since it is not analyzed in complete and unitary manner. In fact, the economic principle very often assumed in merger valuations is the "stand alone" perspective, based on the current configuration and future prospects of the companies on an independent basis, that is, without taking into account any potential synergies deriving from the merger or amalgamation. Such synergies are somehow conservatively neglected; nonetheless, they keep on be still very critical and material since plausibly create added value for either one or the two groups of shareholders involved. For opposite reasons, it is neither prudent nor convenient the aggressive approach by which the synergies are attributed entirely on one party (usually the acquirer). Therefore, considering the rationales of mergers, we propose four interlocking ways to approach to synergies in SER range determination and define a synthesis formula based on potential splitting of synergies between the two parties based on reasonable criterion.

Keywords: Exchange Ratio – Share Swap Rate – Mergers and Acquisitions – Consolidations – Amalgamations – Synergies – International Accounting – Fair Assessment – Corporate structure

Introductory notes

It is well known that M&As represent a very relevant category of business combinations in the market of corporate control (Coyle, 2000) with important differences inside, especially regarding the consideration to be transferred. In fact, while in Acquisitions the consideration (price of capital acquired) is expressed in money (currency units) in favor of the vendor or in shares of the acquirer, the specific 'price' of Mergers (as well as demergers) is given by a special swap, namely share exchange ratio. Since the latter is a conventional and complex measure – in order to determine the fixed or floating number of shares the acquiring company has to issue for each individual share of the target company, even if the deal was partially cash –, the present article aims at providing an in-depth analysis with reference to the possible allocation of the controversial *synergistic component* of the value creation process inside the ratio. Such strategic aspect for stock swaps is still a gap in literature and in practice since it is not analyzed in complete and unitary manner.

In general, business combinations (M&As) can be classified according to the corporate structure. An acquisition results when one firm sells or transfers (even by a spin-off / conferring) a business or more businesses to another firm that, in turn, purchases it by transferring money or issuing shares, thus getting the right to manage it. If the seller transfers shares the acquirer is assumed to take a controlling ownership on the firm transferred; but also an acquisition can result when A exchanges a business or some of its shares for some shares of B, whereby A becomes the parent company and B the subsidiary. Instead, a merger (vertical, horizontal or conglomerate) is a situation whereby firm A is going to acquire firm B, with only firm A surviving after the combination. A variant of merger is consolidation (amalgamation), which results when firms A and B combine assets and liabilities to form a new firm C (newco).

The economic principle very often adopted in merger valuations is the "stand alone" perspective, which is essentially based on the current configuration and future prospects of the companies going to merge on an independent basis, that

Cite this Article as: Marco Taliento "Comprehensive Determination of the Exchange Ratio in Mergers and Consolidations. Strategic Considerations and Insights" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

is, without taking into account any potential synergies deriving from the merger or consolidation. Such synergies are somehow conservatively neglected; nonetheless, they keep on be still very critical and material since they may plausibly create added value for either one or the two groups of shareholders involved.

In this light, under the Corporate Valuation (Capital Asset Pricing Model) and Behavioral theory framework (Damodaran, 2016; Goedhart et al., 2015; Palepu et al., 2020), this paper intends to find whether and to what extent synergies coming from the merger combination of firms can play a correct formal role inside the exchange ratio formulas. Excluding the synergistic value implies that we would prefer the logic of value sacrifice in place of value creation.

That said, the remainder of the paper is organized as follows. The next section (2) briefly provides the theoretical background and then the question of the research concerning the vital ratio. Section 3 presents the share exchange formulas in mergers by absorption and in consolidations (amalgamations of firms), focusing on the fair determination and conventional adjustments. Section 4 adopts a strategic perspective of analysis and it illustrates the reasonable consideration of synergies, showing alternatives and numerical examples on the basis of four interlocking ways of attribution. Section 5 expresses our concluding remarks, while, at the end, the bibliographic references are placed.

Theoretical Background and Question of the Research

As said, through a merger two firms combine themselves in the way that one firm (acquirer) absorbs another (the target) which ceases to exist (in reverse merger the absorbing company is in substance the target). Through a consolidation (amalgamation) a new firm is created after the merge of two or more firms, which receive stock of the former (when firms have same or similar size: merger of equals). Mergers and consolidations allow complete absorption or unification of businesses, whereas financial acquisitions of stock, in turn, are often unfriendly and do not require a vote nor management consent (indeed it is a matter of ownership). Mergers are known of different kind in business practice (Bruner and Perella, 2004; Hakkinen and Hilmola, 2005; Lynch and Smith, 2006; Faulkner et al., 2012; Nelson, 2018):

- Horizontal: the absorbing company and target company operate in the same industry (as competitors);
- Vertical: the absorbing company sells to or buys from the target (products are required at different stages of production cycle);
- Conglomerate: companies involved operate in unrelated industries and merge for diversification (or risk reduction).

A general objective of mergers is a quick business growth in external manner (much quicker than internal growth) potentially without cash payment. Mergers are a growth strategy (Collins and Montgomery, 1997), but motives can be several, economic and meta-economic. However, a recurrent feature of mergers is that they historically come in waves (Andrade et al., 2001; Bureau Van Dijk, 2020), which in turn are correlated with increases in share prices and in price/earnings ratios as well (together with stock market booms and euphory in financial markets). Such waves are differently explained.

The neoclassical theories of merger waves are exposed by Jovanovic and Rousseau (2002) and Harford (2005) as well. Such theories assume that capital markets are efficient, cannot be driven by optimism and managers will always maximize shareholder wealth.

In contrast with the neoclassical theories, there are the behavioral theories of economics and finance (as the managerial discretion theory and the overvaluation theory) based on psychologic stimulations and concrete behaviors of managers and of resulting markets as well (Shleifer and Vishny, 2003; Gugler et al., 2012). The managerial theory is interesting because it takes into proper account mergers financed by cash or debt (merger leveraged buy-out).

As regards the share swap / exchange ratio in mergers (the compensation 'payed' to the acquired entity in form of shares of the acquiring entity), the academic research and the best practice on such conversion ratio consider its determination a hot topic in economic valuation. Jensen (1986), Buckley and Casson (2016) adopt the event research method to test how merger performance can create wealth especially for shareholders of target companies (more intensely in the short term). Moeller et al. (2005) showed a huge wealth destruction with abnormal returns of -12 percent to acquirers during the 1998-2001 merger wave. Among the others, two are the main modern models known in research: the L-G model (Larson and Gronede, 1969) and the Yagil (1987) model. The former sees the price/earnings ratio and price/book value ratio as parameters to determine the swap ratio for mergers (based on the constraint that the wealth of both the shareholders is not reduced, and the synergies of the merger are excluded); the latter expands the

analysis introducing growth expectation and dividend growth (Gordon, 1962), then calculating the proportional boundary value. Empirical tests for the L-G and Yagil models are reported in Conn and Nielsen (1977), Conn (1985), Conn et al. (1991), Cooke et al. (1994), Rossi (1999), Bae and Sakthivel (2000), Andrade et al. (2001), Moretto and Rossi (2008). Some of these works re-examined from an analytical viewpoint the inequalities of L-G and of Yagil exchange ratio static determination. Cigola and Modesti (2008) looked for a possible valuation of future dividends through a dynamical approach.

It is to remark here that in acquisitions or takeovers, the bidders are often used to pay a large premium (about 30%-40% of price) to recognize the value of synergies (Antoniou et al., 2008; Eckbo, 2008). From the acquirer's perspective, the merger is a positive net present value project to the extent that the implied consideration premium does not exceed the predicted synergies that are supposed to be created thanks to the business combination. Synergies (Sirower, 1997) are originated variously as for (Chatterjee, 1986; Damodaran, 2004; Homberg et al. 2009): cost-reductions, revenue-enhancements, economies of scale, economies of scope, vertical integrations, expertise and managerial knowledge gains, competition, technology and innovation (Bena and Li, 2014); monopoly gains, efficiency gains, financial synergies (Leland, 2007), tax savings etc. The gains for acquirer shareholders = Synergies – Premium. The same issue characterizes a merger combination and the parties involved in it. Nonetheless, synergy is often not disclosed explicitly in mergers nor incorporated in their exchange ratio swap.

Hence, the question of the research.

How can the share swap / exchange ratio formulas for mergers and consolidations be plausibly completed or integrated by synergies determined under a strategic combination point of view addressed to added-value creation?

We will answer proposing alternative hypotheses pointing out alternative consideration or allocation of the S (synergy) component inside the SER (share exchange ratio), under both the acquirer and target perspectives, and trying to match them in a unitary framework.

The Share Exchange Ratio in Mergers by Absorption and Conglomerations. Fair Determination and Relating Adjustments

The main issue in merger valuations is determining a fair exchange ratio as price or consideration of the business combination with complete or partial absence of cash deal: it expresses the ratio between the values of the respective shares of companies (acquirer and target) involved in the transaction. For that reason, the standard valuation theory and practice (for example, in Italy) are inclined to set particular attention on the principle of consistency in the stock capital valuation criteria to be applied. In fact, the purpose of merger valuations is not so much the determination of the absolute economic value of the companies which are going to merge, as the appraise of values that can be compared each other in order to obtain a correct exchange ratio. In other terms, merger valuations are meaningful as relative valuations more than as absolute valuations of the companies. The plain formula to obtain the exchange ratio between shares of the acquirer (A) e shares of the target (T) can be written as the following for mergers by absorption (further, we show SERs for consolidations):

$$SER = \frac{W_T}{W_A} * \frac{N_A}{N_T} = \frac{w_T}{w_A}$$

Where *W* is the corporate economic value (wealth), *N* is the number of shares standing before the merger and *w* is the value per share. SER indicates the number of new shares issued by A in change of each share of T.

At least two initial adjustments are important to pass from the pure or theoretical SER above calculated and the actual SER: i) adjustment for rounding the fraction obtained; ii) adjustment to neutralize any percentage *a* of shareholding already held by the acquirer absorbing (because SER is addressed to third parties). We have:

$$SER_{adj} = \left[\frac{w_T}{w_A}(1-a)\right]$$

Other possible adjustments are required in presence of different type of shares denoting different characteristics and prerogatives (an equivalent number of special shares must be converted in ordinary shares based on their respective market prices, if available).

As premised, crucial and delicate is the choice of the methods by which *W* is determined, compliant to A and T company (ie, to their economic structure and performance). Fundamental principles are the consistency and the comparability of the valuation assumptions to be considered as intrinsic parts of a single/unitary valuation process.

The income method. It determines the share exchange ratio based on the earnings per share before the merger of the two parties assuming such multiples unchanged before and after the merger between the two parties.

$$SER = \frac{E_T}{E_A} * \frac{N_A}{N_T} = \frac{EPS_T}{EPS_A}$$

The market price method. It is based on the market price of each share before the merger between the two parties (MV is the market value and MPS is the market price per share; the method is highly suggested for listed companies).

$$SER = \frac{MV_T}{MV_A} * \frac{N_A}{N_T} = \frac{MPS_T}{MPS_A}$$

Often the market value is appraised by means of the P/E (price-earnings) multiple.

$$SER = \frac{P/E_T}{P/E_A} * \frac{E_T}{E_A} * \frac{N_A}{N_T} = \frac{MPS_T}{MPS_A}$$

The Net assets method. It determines the share exchange ratio based on the net assets per share before the merger of the two parties (BVPS is the resulting book value per share).

$$SER = \frac{NAV_T}{NAV_A} * \frac{N_A}{N_T} = \frac{BVPS_T}{BVPS_A}$$

Alternative models. Alternative methods based on performance of companies involved in a merger will take into account their Dividends, Cash Flows, Operating results. In some cases, hybrid methods are used (excess earnings model).

The corporate valuations above are carried out in the stand-alone perspective and are neutral relative to parties' interests. Nonetheless, both parties carry out their own arbitrage valuations in strategic key during their decision-making process.

We can easily argue that: company A will want to keep its own ratio (SER_{acq}) as low as possible; company T will want its own ratio (SER_{targ}) to be as high as possible; both companies would ensure that after the merger, their equivalent value per share will at least equal their pre-merger value per share.

The L-G model as also revisited by Conn and Nielsen (1977) proposed a maximum and a minimum SER to be determined respectively for the acquiring and the target firm, depending on the post-merger expectations of the combined firm and wealth constraints. Such model utilizes the P/E multiple, but no businesses synergies, because the price-earnings multiple of the resulting company is just a weighted average of the price-earnings ratios of the two companies. The SER interval is then determined as follows under a market approach (where price *P* is a proxy of *W* of firms, and symbol C refers to the combined company):

$$\frac{P_T * N_T}{[\frac{P}{E}]_C * (E_A + E_T) - P_T * N_T} \leq SER \leq \frac{[\frac{P}{E}]_C * (E_A + E_T)}{P_A * N_T} - \frac{N_A}{N_T}$$

The more the actual SER (which can fluctuate between such boundaries) is close to the minimum limit, the more it will mean a gain to the acquirer, because the absorbing firm will have to give less shares in swap; the more it is close to the maximum limit, the more it will show the gain to the target, because its shareholders will get more shares in swap.

Here, a key (yet not easily predictable) variable is the P/E of the acquiring entity once the target is absorbed.

It is worth noting that SER valuation is a multiple issue in mergers by consolidations. If we assume that A and B will combine each other resulting in C, we have two SERs (stand-alone perspectives, without synergy):

$$SER_A = \frac{W_A}{W_A + W_B} * \frac{N_C}{N_A} = \frac{w_A}{w_c}; \quad SER_B = \frac{W_B}{W_A + W_B} * \frac{N_C}{N_B} = \frac{w_B}{w_c}$$

The next section, instead, will show through an Income approach (intrinsic or dynamic approach), the introduction of synergy inside the performance model both for absorptions and consolidations.

Plausible consideration of synergies. Alternatives and numerical examples

This time, with the purpose to analyze the wealth changes for target and acquirer shareholders under a performance (income) approach comprehensive of synergies, we let SER fluctuate between the following boundaries min and max:

$$\frac{EPS_T * N_A}{(E_A + E_T)(1+s) - E_T} \leq SER \leq \frac{(E_A + E_T)(1+s) - E_A}{EPS_A * N_T}$$

Where *s* is the synergistic rate of earnings growth. The model appears quite dependent on the EPS variable.

More complicated (but not impossible, if only we think of potential synergies between the intangible assets or other strategic assets involved in the merger) can be the appraisal of synergies within the net asset valuation model or within the hybrid one.

That premised, we can identify a more general performance model of SER (based on future economic streams like net incomes, dividends or cash flows) which is able to consider in explicit manner the synergy value, hence determining the maximum swap ratio to the acquirer and conversely the minimum swap ratio to the acquired entity. In such dynamic framework we decline our assumptions concerning the synergy variable inside the ratio.

First, to the acquirer shareholders, an increase of value will be if:

$$w_{A+T} \geq w_A$$

where w_{A+T} is the value per share after the merger including synergy (reflected by the wealth created by the differential flows W_d) and w_A is the value per share without the merger. To calculate the maximum SER_{acq}, we have to posit $w_{A+T} = w_A$. Hence:

$$w_{A+T} = \frac{W_A + W_T + W_d}{N_A + N_T * SER}$$

Then:

$$SER_{acq\,(\max)} = -\frac{N_A}{N_T} + \frac{W_{A+T}}{w_A * N_T} = -\frac{N_A}{N_T} + \frac{W_A + W_T + W_d}{w_A * N_T}$$

Which simply equals to:

$$SER_{acq\,(\max)} = \frac{W_{A+T} - W_A}{W_A} * \frac{N_A}{N_T} = \frac{W_T + W_d}{W_A} * \frac{N_A}{N_T}$$

Where, as known, $W_{A+T} > W_A + W_T$ due to future synergies (expressed by W_d) that will in place between A and T.

For opposite reason, the target shareholders will judge positively the merger if:

$$w_{A+T} \geq \frac{w_T}{SER}$$

Solving for SER, in similar manner as seen before, we obtain:

$$SER_{targ\ (\min)} = \frac{w_T * N_A}{W_{A+T} - W_T} = \frac{w_T * N_A}{W_A + W_d}$$

Then:

$$SER_{targ\ (\min)} = \frac{W_T}{W_{A+T} - W_T} * \frac{N_A}{N_T} = \frac{W_T}{W_A + W_d} * \frac{N_A}{N_T}$$

As said, corporate value (business wealth) is expressed with respect to flows, that is as a function of F: *W=f(F)*. Yet, the economic value of companies could be measured though net asset valuation. In such case, the value of the net assets *W(BV)* combined could be higher than the sum of the parts involved in merger because of higher value in use, fair value, tax saving, etc. Such incremental net asset value would be counted as W_d.

As obvious, the *actual* swap ratio will be included in our interval *min / max*:

$$SER_{targ\ (\min)} \leq SER_{act} \leq SER_{acq\ (\max)}$$

The distance between the actual value and the minimum will reveal the actual gain or premium to the target:

$$Premium_{targ} = \frac{SER_{act} - SER_{targ\ (\min)}}{SER_{targ\ (\min)}}\%$$

The gap between the actual value and the maximum will reveal the actual gain or premium to the acquirer:

$$Premium_{acq} = \frac{SER_{acq\ (\max)} - SER_{act}}{SER_{acq\ (\max)}}\%$$

Finally, it is interesting to decline the various hypotheses of attribution (or splitting) of the synergies in the business combination and in the SER formulas as a consequence. In order to demonstrate the sensitivity of the exchange ratio when the possible synergic component changes, an example is used.

For ease, the merger by absorption of the company Theta into the company Beta is hypothesized, where the latter does not hold shares in the capital of the former. The following summary data are observed.

- Theta: Stock capital = 100.000 cu; shares = 100.000; nominal value: 1 cu; W = 301.267 cu.
- Beta: Stock capital = 120.000 cu; shares = 60.000; nominal value: 2 cu; W = 524.770 cu.
- Synergy = 151.939 cu.

We could proceed (interlocking cases):

a. without taking into account the merger synergy between Theta and Beta (that is the most accepted classical working hypothesis in business doctrine and practice);

b. by attributing the synergies in full either to Theta, the acquisition target (max SER) or to Beta, the absorbing company (min SER);

c. by sharing the synergies between Theta and Beta, based on the relative percentage weight on the economic value of the capital globally considered pre-synergy (ie, 36% + 64%);

d. by dividing the synergic value on a flat-rate basis (*forfait*), at 50% each party, between the two companies (as in the so-called mergers of equals).

Then we have the following results.

a. SER pure or stand-alone is calculated through the plain formula with no synergy.

$$SER = (W_T / N_T) / (W_B / N_B) = (301.267 / 100.000) / (524.770 / 60.000) = 3{,}01 / 8{,}75 = \mathbf{0{,}34} \text{ (ie, 34/100)}$$

b. SER with full synergy to one party.

$$SER_{max} = ((W_T + S)/ N_T) / (W_B / N_B) = (453.206 / 100.000) / (524.770 / 60.000) = 4{,}53 / 8{,}75 = \mathbf{0{,}52} \text{ (ie, 52/100)}$$

$$SER_{min} = (W_T / N_T) / ((W_B + S)/ N_B) = (301.267 / 100.000) / (676.709 / 60.000) = 3{,}01 / 11{,}28 = \mathbf{0{,}27} \text{ (ie, 27/100)}$$

c. SER with sharing synergies, that is, splitting S (synergy) in S' attributable to the target contribution and S''=S-S' to the acquirer contribution.

$$SER_{acq\ view} = ((W_T + S')/ N_T) / (W_B / N_B) = (355.965 / 100.000) / (524.770 / 60.000) = 3{,}56 / 8{,}75 = \mathbf{0{,}41} \text{ (ie, 41/100)}$$

$$SER_{targ\ view} = (W_T / N_T) / ((W_B+S'') / N_B) = (301.267 / 100.000) / (622.011 / 60.000) = 3{,}01 / 10{,}37 = \mathbf{0{,}29} \text{ (ie, 29/100)}$$

d. SER with 50% synergies both parties.

$$SER_{acq\ view} = ((W_T + S/2)/ N_T) / (W_B / N_B) = (377.237 / 100.000) / (524.770 / 60.000) = 3{,}77 / 8{,}57 = \mathbf{0{,}43} \text{ (ie, 43/100)}$$

$$SER_{targ\ view} = (W_T / N_T) / ((W_B+S/2) / N_B) = (301.267 / 100.000) / (600.739/ 60.000) = 3{,}01 / 10{,}01 = \mathbf{0{,}30} \text{ (ie, 30/100)}$$

We can conclude that the two SERs, respectively for the acquirer point of view and the target point of view, can be expressed through general formulas corrected with coefficients τ and β (between 0 and 1).

$$SER_{acq\ view} = [(W_T + \tau S)/ N_T] / (W_B / N_B)$$

$$SER_{targ\ view} = (W_T / N_T) / [(W_B + \beta S)/ N_B]$$

At the equilibrium point ($\tau = \beta = 0$), both sets of shareholders (that is, acquirer's and target's ownership) will have some gain (based on the distance of the plain SER from the respective boundary SER) even if no synergy is formally taken in consideration into the SER.

Instead, when τ and β are 1, the NPV (net present value) respectively to the acquirer and the target shareholders is zero.

We saw SERs to Beta and to Theta in our example. However, under a strategic framework of unitary analysis matching the acquirer and target perspectives, summary or matching values (SER_{match}) can be identified in the various cases described.

a. $SER_{match} = SER_{no\ synergy}$ for both parties = $(W_T / N_T) / (W_B / N_B) = (301.267 / 100.000) / (524.770 / 60.000) = 3{,}01 / 8{,}75 = \mathbf{0{,}34}$ (ie, 34/100)

b. $SER_{match} = SER_{full\ synergy}$: no formal intersection is possible in this case between 0,52 and 0,27 (anyway we could take their mean value **0,40**, ie 40/100)

c. $SER_{match} = SER_{split\ syn} = ((W_T + S')/ N_T) / ((W_B+S'') / N_B) = (355.965 / 100.000) / (622.011 / 60.000) = 3{,}56 / 10{,}37 = \mathbf{0{,}34}$ (ie, 34/100)

where S' + S'' = S

d. $SER_{match} = SER_{syn\ 50/50} = ((W_T + S/2)/ N_T) / (W_B+S/2) / N_B) = (377.237 / 100.000) / (600.739 / 60.000) = 3{,}77 / 10{,}01 = \mathbf{0{,}38}$ (ie, 38/100)

Definitely, we can state in one:

$$SER_{match} = [(W_{Target} + \tau^* S)/ N_{Target}] / [(W_{Bidder} + \beta^* S)/ N_{Bidder}]$$

where, rationally (in presence of symmetric information (Dionne et al., 2015) between the parties that is vital to a rational splitting) will be that: $\tau^* S + \beta^* S = S$.

Moving on to the special category (quite rare) of consolidation mergers and the relating determination of SERs, we can utilize the same data as before, this time assuming that Theta and Beta companies are going to cease and form a new company Gamma.

In brief, we have the following interlocking cases (*a, b, c, d*), noticing that with amalgamations both the Theta and Beta shareholders will need their own shares to be exchanged obtaining a certain number of Gamma shares issued through a correct determination of SER_{theta} and SER_{beta}.

a. SERs pure or stand-alone are both calculated through the plain formula with no synergy.

$SER_{theta\ plain} = [W_{theta} / (W_{beta} + W_{theta})] \times (N_{gamma} / N_{theta})$ = (301.267 / 826.037) x (220.000 / 100.000) = 36% x 2,20 = **0,80** (ie, 80/100)

$SER_{beta\ plain} = [W_{beta} / (W_{beta} + W_{theta})] \times (N_{gamma} / N_{beta})$ = (524.770 / 826.037) x (220.000 / 60.000) = 64% x 3,67 = **2,35** (ie, 235/100)

b. SERs with full synergy to one party.

$SER_{theta\ max} = [(W_{theta} + S) / (W_{theta} + W_{beta} + S)] \times (N_{gamma} / N_{theta})$ = (453.206 / 977.976) x (220.000 / 100.000) = 46% x 2,20 = **1,02** (ie, 102/100)

$SER_{beta\ a\text{-}syn} = [W_{beta} / (W_{theta} + W_{beta} + S)] \times (N_{gamma} / N_{beta})$ = (524.770 / 977.976) x (220.000 / 60.000) = 54% x 3,67 = **1,98** (ie, 198/100)

or in alternative,

$SER_{beta\ max} = [(W_{beta} + S) / (W_{theta} + W_{beta} + S)] \times (N_{gamma} / N_{beta})$ = (676.709 / 977.976) x (220.000 / 60.000) = 69% x 3,67 = **2,53** (ie, 253/100)

$SER_{theta\ a\text{-}syn} = [W_{theta} / (W_{theta} + W_{beta} + S)] \times (N_{gamma} / N_{theta})$ = (524.770 / 826.037) x (220.000 / 100.000) = 31% x 2,20 = **0,68** (ie, 68/100)

c. SER with sharing synergies, that is, splitting S (synergy) in S' attributable to the Theta contribution and S''=S-S' to the Beta contribution.

$SER_{theta\ split\ syn} = [(W_{theta} + S\ W_{theta} / (W_{beta} + W_{theta})) / (W_{beta} + W_{theta} + S)] \times (N_{gamma} / N_{theta})$ = ((301.267 + 36% 151.939)/ 977.976) x (220.000 / 100.000) = 36% x 2,20 = **0,80** (ie, 80/100)

$SER_{beta\ split\ syn} = [(W_{beta} + S\ W_{beta} / (W_{beta} + W_{theta})) / (W_{beta} + W_{theta} + S)] \times (N_{gamma} / N_{beta})$ = ((524.770 + 64% 151.939)/ 977.976) x (220.000 / 60.000) = 64% x 3,67 = **2,35** (ie, 235/100)

d. SER with 50% synergies both parties.

$SER_{theta\ syn/2} = [(W_{theta} + S/2) / (W_{theta} + W_{beta} + S)] \times (N_{gamma} / N_{theta})$ = ((301.267 + 50% 151.939)/ 977.976) x (220.000 / 100.000) = 39% x 2,20 = **0,85** (ie, 85/100)

$SER_{beta\ syn/2} = [(W_{beta} + S/2) / (W_{theta} + W_{beta} + S)] \times (N_{gamma} / N_{beta})$ = ((524.770 + 50% 151.939)/ 977.976) x (220.000 / 60.000) = 61% x 3,67 = **2,24** (ie, 224/100)

We can conclude that the two SERs, respectively for the Beta point of view and the Theta point of view, can be synthetized as follows:

$$SER_{theta\ split\ syn} = [(W_{theta} + \tau S) / (W_{theta} + W_{beta} + S)] \times (N_{gamma} / N_{theta})$$

$$SER_{beta\ split\ syn} = [(W_{beta} + \beta S) / (W_{theta} + W_{beta} + S)] \times (N_{gamma} / N_{beta})$$

Where $\tau S + \beta S = S$ created through the business combination.

Consolidations may be mergers of equals when businesses have similar economic size; nonetheless, when the wealth of one company (W) is much larger than the other company, the former can be identified as the acquirer entity (as such

will have more stocks and management powers) and the latter as the target entity. Synergies can be split taking into account such aspect.

Discussion and Conclusions

Despite its importance, the problem of the fair determination of the exchange ratio is largely unexplored in financial literature, especially as regards the value of synergy between the entities involved in a merger, since subjective evaluation enters in the determination based on the companies' financial reports data and the planned performance for future (Moretto and Rossi, 2008). But we believe it is an effort that must be made to represent and better understand the strategic dimension that dominates the merger / consolidation negotiation. Often the swap ratio is determined is simple manner, that is, adopting the stand-alone perspective for both companies (plain SER), also because – it is argued – in mergers are not important the absolute valuations of firms. The article tries to fill a gap in literature exposing an in-dept analysis of the possible role of the synergistic value inside the merger and consolidation swap, thus identifying a range of swap ratios to include between the two boundary values: the maximum SER (in which all the synergy is attributed to the acquired entity) and the minimum SER (where all the synergy is attributed to the acquiring entity). The actual SER will drop in such interval and the relative distance from the boundaries will express the actual gain for each party involved in the merger.

Since the returns to acquiring companies' shareholders are inversely related to the market optimism at the time of mergers (Gugler et al., 2012), in period like the present in which trust is absent we believe it reasonable that the swap ratio should be driven by partial contribution of synergies. Furthermore, the literature is unanimous in finding positive abnormal returns to target shareholders, while it disagrees over the effects of mergers on the acquirers' shareholders (in optimistic periods, acquirers' return usually decrease due to overvaluation, even becoming negative). In general, empirical results show how there is no strict evidence that acquirers benefit from mergers, which usually resolve in substantial gains for target's shareholders, e.g. Andrade et al. (2001); Weber (2013). The recognition of full synergy to the target through the maximum SER will increase such disparity.

We indicate different ways to split the synergies and reconcile them in one synthesis formula: $SER_{match} = ((W_{Target} + \tau^{*} S)/ N_{Target}) / ((W_{Bidder} + \beta^{*} S)/ N_{Bidder})$. Only if synergy is calculated as fixed growth rate of the combined wealth s (%), such determination is equal to the plain basic formula without synergy.

$$SER_{match} = (W_{Target} (1+s)/ N_{Target}) / (W_{Bidder} (1+s)/ N_{Bidder}) = (W_{Target} / N_{Target}) / (W_{Bidder} / N_{Bidder})$$

In all the remaining cases, studying the actual and specific performance and structure of the entities involved in the merger / consolidation, the results will be differentiated. Essential is the possibility that the parties involved are willing to share information each other on present structure and planned performance. Furthermore, the disclosure of the value of potential synergies at the time of a merger will support the market valuation during the period following the merger announcement, offsetting the value erosion due to investors reaction to uncertainty.

Similar reflections are valid for demergers, since one company will absorb another business and swap the stocks through the appropriate exchange ratio.

A limitation of the work is in that other factors could influence the SER range (apart the topic of irrationality of choices). As for our splitting, for example, we postulated the existence of divisible synergies; yet, the presence of indivisible synergies (attributable only to the acquirer, excluding the target shareholders; unless the latter will be enabled to contribute to future management) would exert special effect: to raise more the max SER and place the min SER at basic plain SER. The presence of indivisible synergies for both parties can be typical of joint ventures and mergers of equals. Furthermore, the valuation framework could be integrated through the real options approach to synergies (potential real options in mergers: growth options; exit options; options to postpone or abandon an investment; flexibility option (change operating scale); switch option); Bruner and Perella (2004). Finally, a success coefficient should be introduced because the predicted synergies sometimes fail to realize. Ficery et al. (2007), in this regard indicated the most common mistakes that the executives make in forecast: defining synergies too narrowly or broadly; missing the window of opportunity; incorrect or insufficient use of incentives; not having the right people involved in synergy capture; mismatch between culture and systems; and using the wrong process. In fact, the literature explains the failure of deals due to a false evaluation of potential synergies when firms merge (Roll, 1986; Sirower, 1997; Homberg et al., 2009).

The consideration of synergies in the valuation process and dealing is consistent also to the successive accounting and financial reporting process (in fact, Ifrs 3 - Business Combinations recognizes synergetic value as core component of goodwill, emerging in M&A). As for the vital choice of the most eligible method to corporate valuation in mergers and consolidations, we underline that Covid-19 pandemic crisis and consequential market fluctuations will represent an alert with reference to an exclusively market oriented SER (based on P/E), instead suggesting a normalized income or cash flow analysis. Although crises slow down M&A waves, in the strategic management thought synergy (Garzella and Fiorentino, 2014; Kengelbach et al., 2020) is still an effective means to overcome the firms' crisis and value creation challenge (Sudarsanam, 2003).

Abstract

This paper examines the way and manner by which the print media reported the religious crisis that broke out as a result of the introduction of sharia law in the year 2000 in Kaduna, northern Nigeria. The paper investigates the assumptions that the editorial postures of newspapers on religious conflicts tend to coincide with the views that are dominant in the areas where the newspapers are located, as well as that press coverage of religious crises is an important factor in the prolongation and intensity of such conflicts. A qualitative examination of the reportage of the sharia crisis by two Nigerian Newspapers was conducted. The study reveals that the *New Nigeria*, located in northern Nigeria had a pro-*sharia* stance in contrast to an anti-*sharia* perspective by the *Nigerian Tribune*, located in Southern Nigeria. It concluded that journalists are not neutral arbiters during religious conflicts in Nigeria and that press coverage of religious crisis is an important factor in the prolongation and intensity of the crisis. It recommends that journalists should be trained to frame and define conflict situations in ways that create meeting points between conflicting parties. So also, policy makers should develop and enforce codes and ethics on conflict sensitive journalism so as to better manage religious conflicts and prevent its escalation in Nigeria.

Keywords: Crisis, Management, Media, Religious Conflict

Introduction

This study is about religious conflicts and how they are represented in the media. The post-cold war era has witnessed an upsurge in the incidence of identity conflicts and wars, especially, in Africa and developing countries in general. As Falola and Oyebade (2010) observed, Africa has increasingly become a hotspot replete with conflicts, several of which are related to identity. According to them, many of these conflicts and wars occur because of the inability to integrate societies and nations divided along ethnic and religious lines. Indeed, it has been mentioned that our age is the age of identity and therefore, of controversy and conflict over religious, racial, and ethnic identities (Jesuminure, 2019).

Globally, the role of the media in shaping events, as well as the reciprocal relationship between the outbreak of conflicts, disorders, wars and the media coverage of these conflicts, are an important topic of contemporary discussion (Abiola, 1990; Adebanwi, 2002a; Bamigbetan, 2000; Jesuminure, 2019; Mironko, 2007; Olukotun, 2011; Rangolam, 2014). That is another way of saying that it is recognized that the framing techniques used by the media in times of conflict have an impact on the course as well as the result of those conflicts. Indeed the increasing popularity of conflict-sensitive journalism, which teaches journalists to be more conscious and aware of the

Cite this Article as: Margaret Damola JESUMINURE, Lai OSO, Olusola OYERO and Kehinde OYESOMI "Conflict-sensitive Approach to Media Coverage of Religious Conflicts in Nigeria: A Study of Sharia Crisis." implications of irresponsible, flamboyant, political, and overtly partisan reporting, is evidence of how well they understand how important the reportorial styles of journalists in times of conflicts are.

The newspapers were selected because of their comparatively wide circulation and national reach. The *Nigerian Tribune* was selected because of its location in an ancient city in southwest Nigeria and for being a national daily that has stood the test of time from the colonial era. The *New Nigeria* on the other hand was chosen because it was the only National daily in northern Nigeria at the time of this case study, the other publication from northern Nigeria that also enjoyed national circulation at the time, was still *Weekly Trust* it has not metamorphosed into *Daily Trust* which made it impossible to be used for this study. *New Nigeria* is also believed to have been around for some time, following its establishment in the year 1966 by the then Northern region before the federal government took over its ownership in 1975.

This is the case in fragile societies with pronounced ethnic and religious cleavages and with a history of violent clashes or civil wars based on these cleavages. Obviously, in countries such as Nigeria where conflicts around such identities as religion and ethnicity often occur and recur, it is important to grapple with the problematic nature of how exactly media reportage and framing of news and commentaries widen or lessen the incidence and intensity of conflicts. Nigeria shares the potential for conflict escalation through media reportage with other countries in Africa such as Kenya, Liberia, Rwanda, Sierra Leone and Uganda, among several others.

Statement of the Problem

Scholars have posited that the way and manner in which the media report events in times of conflicts have consequences on the prolongation or early resolution of such conflicts (Craig & Nurmalanga, 2006; Entman, 1994). Against this background, the study investigated the precise role which the Nigerian media, in this instance, the newspapers, played in either fuelling or reducing the intensity of religious conflict in Nigeria as a result of the introduction of sharia law in the year 2000. An illustration of the nature of this problem is provided by Bamigbetan (2000) when he argues that the pictorial elaboration by the media in August 1999 of the Hausa/Yoruba clashes in Shagamu, Ogun State, sparked off retaliatory clashes and mayhem in Kano located in Northern Nigeria.

The research problem is to show the relationship between newspaper framing and conflict escalation by reference to the content of media output immediately before, during, and immediately after the religious crisis under study. This enabled us to make inferences as to the relationship of media coverage by opposing sides in the conflict to crisis escalation.

In simple terms, did the Nigerian Newspapers play an escalating or reduction role in the religious crisis that broke out in the year 2000, at Kaduna over the introduction of sharia law? What does this suggest to us about the role of the media in religiously divided and conflict-ridden societies? How can the media help in managing conflict situations through conflict sensitive reporting?

Research Questions

i. What are the patterns (ways and manners) of the reportage of the religious crisis in Nigerian newspapers?

ii. Does the ethno-religious affiliations of the selected newspapers impact the reportage of religious crisis under study?

Scope of the Study

The study focuses on print media, in particular, selected newspapers published daily and located in different geographical regions. The print media are emphasised because right from the colonial times they have tended to be arbiters of conflict, enjoying a pedigree derived from their star roles in the anti-colonial and anti-military struggles. Although the circulation and readership of newspapers have declined following a global trend in the last decade, they continue to exercise influence beyond their reach and penetration (Uzochukwu, 2014). The adaptation to the online version for many of them also gives further relevance to a study on newspaper representation.

Literature and Theoretical Review

Identity, Media and Identity Conflict

The concept of identity is derived from the Latin word “idem” which implies uniformity and continuity. According to Olukotun (2011, p. 128), “it is best conceived as a person’s mental image and expressions of their individuality or group affiliation". It exists in the interstices of negotiation between individuality and socially defined roles, indicating that it can be seen as a coterie of group affiliations that define the individual. Language, socialization and cultural attributes are therefore significant in the appreciation of identity as a socially constructed phenomenon; and the media, in all its varied forms, are essential to the creation of identities. This goes to show that there is an intimate relationship between media representation and the various ways in which identities, be it religious, ethnic, or social are constructed and contested.

Media refers to the means of transmitting information. It refers to the different types, devices and systems of mass communication regarded as a whole, including newspapers, magazines, radio stations, television channels and websites. That is to say, communication channels through which news, entertainment, education, data or promotional messages are disseminated. As Kelinar (1995) suggests, it is the media that supply and reinforces symbols and myths from which identities as cultural projects are constructed. Hence, in conflict situations, opposed groups employ media narratives to support their claims and to maintain a sense of "them" and "us". It is for this reason that this media research has focused on the ways and manners in which the media represent identity conflicts, in this instance, religious conflict. It is worthy of note that in many identity conflicts on the African continent and else were, the media has been central to how the conflicts unfolded or escalated (Adebanwi, 2002b; Olukotun & Jesuminure 2018; Onuegbu, 2012).

Conflict Sensitive Journalism Approach

One derivative of Peace journalism is conflict sensitive journalism which emphasises the ways and manners in which journalists can be trained for reportorial strategies that mainstream peace building and less conflictual approaches. The viewpoint behind it, is derived from the awareness that the language and narratives strategies that journalists employ have direct bearing on the outcome and trajectory of conflicts. Hence, the need for them to avoid inflammatory or sensational language capable of stoking conflicts.

Characteristics of peace journalism as identified by Okoro etal (2017) include employing the perspectives of conflict analysis and transformation to achieve even handedness in the reportorial enterprise. The provision of a road map for establishing the sources which journalist use, the narratives they employ as well as the effect of their journalism. It also entails the creation and nurture of an orientation of non-violence which expectedly is to be infused into the Work-a-day chores of journalists. It is important to note that war journalists tend to focus more on the physical narrative of war emphasizing such factors as the number of deaths and such matters as who wins or who losses in something like a zero sum game. On the other hand peace journalism is presented as an alternative approach to war journalism in that rather than take a dispassionate role, it invest efforts in issues and factors that make for peace. According to Okoro et al (2017) war journalism reports conflicts and violence in ways that conduce the audience to place emphasis on violent responses and tends to downplay non-violent alternatives. It is often argued that war as well as conflicts is the natural habitat of journalist to the extent that it makes better news than peace or peace making.

Journalists today must understand that they are more than just a competent observer and a distributor of information. They should be made aware that people know how to build evidence for them to publish. People want to tell the media those details in order to use the media to manipulate the public's opinion of the dispute. News published by journalists can be detrimental to the society by fostering fear and violence, or constructive, by making the people better informed, and even proffering possible solutions to the conflict as well as reporting on efforts to promote conflict resolution. A conflict-sensitive journalist analyses conflicts and looks for new voices and perspectives about the conflict. S/he reports on who is attempting to settle the dispute, looks closely at both sides, and reports on how other disputes have been resolved. A conflict-sensitive journalist does not take sides but is active in the hunt for solutions. Conflict sensitive journalists often carefully select their words.

Brief History of Selected Newspapers

New Nigerian: The newspaper was established in 1966 by the government of the then Northern region. Its purpose was to protect northern interest especially by countering the “negative” press focus from the southwest part of the country (Tsebe, 2016). The newspaper became a national daily following its takeover by the federal government in

the year 1975, it is believed to enjoy wide circulation though, often accused of narrow readership base, due to its deep-rooted sectionalism.

Nigerian Tribune: The Nigerian Tribune was founded in 1949 by an Ibadan based legal practitioner and politician, Obafemi Awolowo who had recently founded the action group to advance his political career (Adewale, 2013). A private newspaper, it is currently the oldest surviving Nigerian newspaper (Nigerian Tribune, 2020). Its maiden edition appeared on November 16 1949 with the publisher, Obafemi Awolowo admonishing that the paper should develop "a frank tongue and a pungent pen, a tongue and a pen that will careless of what the opponent might say or how they might feel and will have enough courage to call hypocrisy, humbug and tyranny by their names" (Fagbohun, 2019).

During the colonial era, the paper identified itself with the anti-colonial struggle in which Awolowo played a prominent role. In the same manner, in the twist and turns of post-independence politics, the paper expectedly continue to identify itself with the action group, spending time to defend the politics and policies of its publisher against the attacks of political opponents and rival newspapers. In other words, like other private newspapers it served as the mouthpiece of its proprietor and founder.

Background to the Crisis

The February 2000 crisis over the *sharia* in Kaduna in terms of its impact and degree of fatalities is one of the worst religious conflicts in Nigerian history (Sampson, 2012). The crisis was precipitated by the enactment of *sharia* law in a multi-religious and multi-ethnic state with the Christian population roughly equal to the Muslim population. The year 2000 *sharia* conflict was due, on one hand, to Muslims' clamour for *sharia* implementation in Kaduna State and, on the other hand, to the Christians' rejection of the implementation of the *sharia* system which they believe would affect them, if it were passed into law (Uroko, 2018). The peaceful demonstration of Christians was challenged by Muslim youths, turning the situation to a violent one (Mavalla, 2014).

Theoretical Framework

Framing Theory

The research is based on the framing theory, which refers to a variety of ways in which journalists structure or pre-structure news and other media outputs by drawing attention to or making some things more important than others. This idea is derived from the word 'frame,' which refers to the marking of borders in the same way as a picture is demarcated by placing a boundary around it. Chandler and Munday (2011) refer to Frames in media theory as the ways in which representations work to re-contextualize (and thereby alter the sense of what they represent. They further argued that frames are tools and instruments used in representations as a way of constraining perception.

News and other media outputs are managed by journalists on selection strategies which are used to lead the audience to view their report in the spec of the codes favoured. The point is that journalists carry along with them certain mental schemes or perceptual maps that not only influence their reportage but also affect their encoding of news in order to favour some interpretations above others. As Entman (1993, p. 52) makes clear "to frame is to select some aspects of a perceived reality and make them more salient in a communication text in such a way as to promote a particular problem definition, causal interpretation, moral evaluation and/or treatment recommendation for the item described".

Frames in media theory share borders with two other theories of media effects namely, agenda setting and priming. Agenda setting in broad terms refers to the ability of the media to highlight issues in such a way that the issues that they emphasise are also the issues that the audience pays the most attention to (Severin & Tankard, 1992). Similarly, priming draws our attention to the ways in which journalists employ media content to get the audience to employ specific issues as benchmarks for evaluating the performance of leaders and government (Iyenga & Kinder, 1987). According to Jesuminure (2019), the news media of a particular society tend to construct accounts of events which are structured and framed by the dominant values and interests of that society, and to marginalise (if not necessarily exclude) alternative accounts.

Framing is a theory of media effect that is regarded by some scholars as an extension of both Agenda Setting and Priming, deriving partly from insight in psychology and sociology (Oso, 2017). Framing theory can be located in the relationship between the techniques and devices used by journalists to draw attention to certain issues and how audiences decode or make meaning out of the framing or agenda building. According to Scheufele (1999), frames

are better understood by asking such questions as what specific types of media frames impact on the audiences' perception of particular issues and in what manner does the process work to influence audiences.

The relevance of the theory to a study of representations is obvious in that to give an example describing the sharia which is a form of Islamic jurisprudence as a monster may seem all right to secular journalists or those operating from Christian perspectives. Such a description may however offend or incense Muslims who believe that the sharia is a just and God-ordained political and legal arrangement. Uncovering the frames that journalists located in different regions employ may yield clues as to the build-ups or intensities of religious and ethnic conflicts.

Methodology

This study adopted the discourse analysis method of research design. The population of the study is all national daily newspapers in Nigeria in existence in the year 2000. Two National newspapers were purposefully selected; one from the South and one from the North for a comparative study.

Discourse Analysis

Discourse analysis is usually regarded as the analysis of language beyond the sentence or the text. In other words, it deals not only with what is said, but how it is said and what is left unsaid. It studies the interrelationship between text, context, and subtext (Van Dijk, 2016). More formally, it is a qualitative research method that seeks to investigate power, function, and the construction of meaning in writing or oral text or even sign language. A quantitative perspective does not yield the full significance of media positions and perspectives without an equivalent focus on such matters as style, tone, and tenor of editorial content. Hence, such matters as stereotyping and demonising as well as the use of provocative language with an inflammatory tenor are best unveiled through the mechanisms of discourse analysis. Illustratively, there is a difference between referring to the sharia as a form of Islamic Jurisprudent in neutral terms and calling it the sharia monster. In order words, the study focused on hidden meanings and subtext that are not easily captured by quantitative methodologies. For the purpose of content analysis, News, features, columns, and editorial reports served as the units of analysis. The newspaper articles were analysed based on language, images, and location of the articles within the newspaper.

The contents of the selected newspapers were examined for the two weeks before the crisis and six weeks from the start of the crisis. Therefore, 56 editions of each of the two newspapers were examined, making a total of one hundred and twelve (112) editions.

Findings and Discussion

In this narrative, we are concerned with the first outbreak of violence in Kaduna which began on February 21 and lasted till February 25, 2000. Though, there were other rounds of the crisis, notably in March and May 2000 with spill over effect into such town as BirninGwari, Shakainu among others.

For this study, we have chosen to highlight differential coverage of the February crisis by examining and analysing the discursive strategies of the northern-based but government-owned New Nigeria as well as the privately owned and southern-based Nigerian Tribune. It should be noted in this respect that although the New Nigerian which went off the street in 2012 was based in Kaduna, its ownership by the government suggested that it could not take an anti-government stand because of proprietorial control; in other words, it could not fully express or present the opinions and feeling of the communities of which it was located. Consequently, its coverage of the sharia crisis tended to convey peacebuilding and pro-establishment tenor in the weeks leading to the outbreak of violence of February 21, 2000.

A discursive excursion into the New Nigerian in the weeks before the crisis reveals such stabilizing outlook as “Muslims urge to embrace peace” (February 3, 2000) and “Zamfara Organizing seminar for Royal fathers on Sharia” as well as “Sharia no threat to Nigeria” (February 14, 2000). The February 14 report which was a front-page story adopted a consolatory posture in reporting the outcome or communique on a seminar on sharia. For example, the report quoted the communique as urging “Muslims and non-Muslims to create avenues for regular dialogue in order to foster mutual understanding.

Equally pertinent are feature stories such as “Understanding sharia law” (February 14, 2000). That notwithstanding, some of the opinion articles and commentaries adopted the posture of advocacy and even propaganda on behalf of the sharia. For example, an opinion piece published under the heading “commentary” argues that “we believe that with sharia all good things will come. I personally believe that you need the sharia to effectively cleanse the civil

service of its corrupt nature. Sharia will definitely deal with givers and takers of bribe in such a way that nobody will like to be caught." (New Nigeria, 2000, p. 15).

In other words, the New Nigerian, while for proprietorial reasons avoided frontal and direct publicity for the sharia, managed to smuggle into its opinion pages pro-sharia articles which may have been found threatening by non-Muslims. For example, talking of cleansing the civil service which is a secular institution by using the sharia could not have been calculated to calm or appease civil servants who are not Muslims.

The Tribune located in Ibadan, Southwest Nigeria, had no overt comment or report on the sharia in the weeks before the crisis. However, its opposition to the Sharia found its way into some of its news coverage which quoted influential sources who warned concerning the manipulation of the sharia. For example, a fortnight to the outbreak of violence, the paper quoted a Christian cleric as warning the nation not to treat sharia with levity (Don't treat sharia with levity February 7, 2000). The cleric, founder of Hope of Glory Spiritual Church, Johnson Afolabi OkotoJesu was quoted as saying that the issue of implementing sharia should be downgraded in favour of implementing workers' welfare. The cleric was further quoted as saying "we all need to corporate with the federal government to make our new democratic dispensation a peaceful one and not to bring forth sharia law to foment trouble". Lending further credence to that perspective, a news report in the Nigerian Tribune of 9th February 2000 was titled "Don't use Islam to cause Chaos", the statement attributed to the governor of Gombe state at the time, Abubakar Habu Hashidu. The tenor of the headline suggested that the advocacy and agitation for sharia in the northern part of the country were perceived negatively as an attempt to "cause chaos" or as the earlier news report quoted suggested, to foment trouble.

Hence, while the New Nigerian within the limitation of its proprietorial control adopted a subtle pro-sharia posture, the tribune adopted through its reportorial styles a mildly anti-sharia posture; one viewed the sharia as a blessing while the other considered it an instrument of mischief and troublemaking.

Once the crisis started, the positions of the two papers as gleaned from their discursive strategies tended to confirm a hardening of perspectives. For example, while the New Nigeria continued to report the crises, its tone became assertive as can be seen from such report as "Kano to resist attempt to crush sharia" although the report concerned the neighbouring state of Kano rather than Kaduna, it appears to be sending a message that it is either sharia or nothing. Specifically, the statement (March 9, 2000, p. 3) credited to the speaker of the House of Assembly; Abdulahi Gwarmai quoted him as saying that "neither president Obasanjo, the national council of state or national assembly as the legal power to stop state from implementing the sharia". A similar belligerent tenor is apparent in such a report as "sharia not negotiable" and sharia denial unconstitutional (February 23, 2000, p. 12). It can be argued that this aggressive advocacy may have had something to do with the further outbreak of violence in Kaduna barely three months after the February crisis. Illuminating in the same context is a feature article published by the New Nigerian on March 6, 2000, authored by a well-known northern legal scholar, Professor Auwalu Yadudu and entitled "sharia: time for reflection". Yadudu maintained that the struggle for the sharia does not violate the secular status of the Nigerian state. In his words, "where does the constitution declare Nigeria to be secular and whose version of secularism have we adopted?" This strenuous defence of the sharia by an eminent jurist appears to have been calculated to strengthen the advocacy for sharia in the northern part of the country including Kaduna.

The narrative and discursive approaches of the Nigerian Tribune after the crisis broke out appears to have been unequivocally anti-sharia. For example, its front-page news of 23rd February exclaimed "Sharia will cause chaos" the statement was credited to former Biafran leader Chief Emeka Ojukwu. The report went on to say that "agitation against the introduction of sharia law in some states of the country took a violent turn in Kaduna on Monday when Militant Muslims clashed with Christians protesting against the proposed introduction of the law in the state leaving at least 20 persons dead". The use of the expression "militant Muslims" can be viewed as a loaded attempt to lay the blame of the riot at the door of the Muslims, while the headline was cast in such a way as to raise an alarm concerning the need to tackle sharia before it rips the country apart.

In the same connection, are such stories in the Nigerian Tribune as Oodua Liberation Movement warns Sharia Agitators (24th February 2000, p. 23), Stop the religious killings- Afenifere Abroad as well as, Kaduna Massacre: how soldiers aided rioters (27 February, 2000, p. 1). The report of a warning or threat by the Oodua Liberation Movement stated "the move to introduce sharia is a refortification of the Hausa-Fulani political agenda to maintain the status quo", this indicates a perception of the crises as one orchestrated to foster an anti-Christian and anti-southern political agenda. Expanding on the same narrative, the Nigerian Tribune article of 27th February, informed that "as the casualties of the Kaduna Massacre escalate, it has been revealed that soldiers and police helped the fanatics to perpetrate havoc". The reference to fanatics can be seen as a condemnation not just of the rioters but of the entire sharia agitation, a framing which is further legitimated by the report that law enforcement agencies rather than playing a neutral role took a side on account of their religious affinity with advocates of sharia.

In sum, the discursive strategies of the New Nigerian on one hand and the Nigerian Tribune on the other points to a pro-sharia stance by the New Nigeria in contrast to an anti-sharia perspective by the Nigerian Tribune. This is in agreement with the assertion of Oso and Akanni (2018, p. 163) that "the Nigerian press does not just mirror the character of the Nigerian society and the events happening in it, it is an active participant". They further stated that the media in Nigeria represent very narrow ideological interests, those of the contending factions of the ruling elite, which is seen in this study as most of the reports analysed quoted elites and not the victims. This is also in line with Oyesomi, et al (2019) in a study on Newspapers' compliance with the code of election coverage of the 2015 elections in Nigeria, the study analysed two national newspapers, namely, Punch and the Guardian, it found out that the levels of fairness and balance of the newspapers during the election period were low.

The findings of this study also tally with Adebanwi, (2002b) who argued that no national media exist in Nigeria, but an Ngbati media, Nkenga media, and Arewa media corresponding to Nigeria's major ethnic groups, that is, Yoruba, Igbo, and Hausa media respectively.

Conclusion and Recommendation

It has been established that journalists are not neutral arbiters during religious conflicts in Nigeria. Since press coverage of the religious crisis is known to be an important factor in the prolongation and intensity of such crisis, there is need for journalists to be trained and retrained on the approach of conflict sensitive journalism. It is important for federal government to continually invest in the promotion of positive attitude towards security matters, rather than take sides during conflicts (Amodu, Alege, Oluwatobi, & Ekanem 2017).

By providing conflict sensitive information in a conflict situation, the journalist helps to establish a channel of communication among combatants and to reduce the differences between them. When all parties to a conflict are listened to and their voices heard and not just that of elites. In this respect, training in diversity reporting, how to avoid stereotypes, sensationalism and inflammatory language will be of great help. Improvement of professional standards, through education of journalists on reporting objectively, as opposed to opinionated journalism can assist the search for less fractious journalistic frames. It is also recommended that policymakers need to develop and enforce codes and ethics on conflict sensitive journalism. The Nigerian media need to adopt peace-oriented frames in the reportage of sensitive issues such as religious conflict.

Abstract

Indonesia is a country with a majority Muslim population, which makes Islam is a religion practised by the majority of the Indonesian and it has a great potential in influencing the behavior of Muslims in Indonesia. However, the ratio of the number of entrepreneurs in Indonesia is still low, in which we argue that whether any religious values and teaching has a direct or indirect effect towards Muslim's attitude towards entrepreneurship. This phenomenon is the driving force for this study. Furthermore, this study aims to determine the effect of Islamic values and Islamic practices on entrepreneurial intentions by mediating attitudes towards entrepreneurship. The survey was conducted on 211 Muslims who have career intentions as entrepreneurs. The study found that Islamic values have a significant positive effect on entrepreneurial intentions, either by mediating attitudes towards entrepreneurship or without a mediating role. Furthermore, this research is expected to provide benefits that can be used by parties related to religious education and entrepreneurship, in the form of a description of Islamic values that can foster a Muslim entrepreneurial attitude and intention. Further research can be carried out by limiting the generation or age group of respondents so that the results obtained can answer more specific research problems.

Keywords: Islamic values, Islamic practices, Intention, Entrepreneurship

Introduction

Previous studies have shown that values are significant influence for entrepreneurial attitude and intention. For example, in a study by Krueger, Linan & Nabi (2013) entitled "Cultural values and entrepreneurship", then research by Fayolle, Linan and Moriano (2013) entitled "Beyond entrepreneurial intentions: values and motivation in entrepreneurship" and many other similar studies. Islam is a religion that has universal values that can support entrepreneurial attitudes and intentions (Rehan, Block & Fisch, 2019). Indonesia is a country with a majority Muslim population, this makes Islamic values can play a role in influencing the behavior of Muslims in Indonesia in general, and can play a role in influencing the behavior of Muslims in Indonesia related to entrepreneurship in particular.

Entrepreneurs or entrepreneurs have an important role in creating jobs and reducing poverty (Engle et al., 2010; Bruton, Khavul & Chavez., 2011). One indicator of the resilience of a country's national economy can be seen from the ratio of the number of entrepreneurs to the total population. The ratio of entrepreneurs or entrepreneurs in Indonesia is 3.1 per cent (bps.go.id, 2016). This figure has exceeded the international standard by 2 percent. However, according to the 2019 Global Entrepreneurship Index, this ratio is still below other countries such as Malaysia (5%), China (10%), Singapore (7%), Japan (11%) and the United States (12%).

According to data from the Global Entrepreneurship Index in 2019, Indonesia is ranked 75th in the world, where neighbouring countries such as Malaysia are in 43rd rank, Brunei Darussalam is in 48th, Thailand is in 54th and Vietnam is in 73rd which indicate Indonesia are among the lowest in the region. The Central Statistics Agency as of March 2019, Indonesia has a ratio of poor people of 9.22% or the equivalent of 24.79 million people. Besides, according to the Central Statistics Agency as of February 2020, the open unemployment rate in Indonesia was 4.99% or equivalent to 6.88 million people.

Cite this Article as: Muhammad THORIQ, N.I.S. PUTRI, S.E"Analysis of The Effect of Islamic Values and Practices Towards Entrepreneurial Intentions Mediated by Attitudes Towards Entrepreneurship" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

The problems of unemployment and poverty are big problems for individual Indonesians, both for now and for the next few years. Therefore, entrepreneurs or entrepreneurs are needed to open job vacancies to overcome these two big problems. For that, it is necessary to know about what can influence a person to have entrepreneurial intentions. In this context towards Muslims individuals. Previous research conducted by Rehan, Block and Fisch in 2019 revealed the influence of religion, namely Islamic values and Islamic practices in entrepreneurial intentions. According to Bandura (1977), there are motivational factors to act that affect intention. Then according to Ajzen (1985) intention is influenced by attitude (attitude), subjective norms, and perceived behavior control.

The majority of Indonesians have a mindset that being an employee is more comfortable and safer than opening their own business. According to Widawati (2012) formal and non-formal education in Indonesia is still not oriented towards entrepreneurship. The Ministry of National Education conducted a survey in 2011 regarding interest in becoming a worker or entrepreneur after graduating from the study. As a result, in general, high school graduates (60.87%) and tertiary institutions (83.18%) have a higher interest in becoming workers than in becoming entrepreneurs who can create jobs. Also, according to Widawati (2012), those who have passed the study are considered successful by the community when they can become civil servants (government) or employees of private companies who have a regular income, making their passion or passion become job seekers, not job creators.

Therefore, Islamic values (Islamic religious values) and Islamic practices (Islamic religious practices) can have a strong impact on every Muslim to behave and behave, including attitudes towards entrepreneurship and entrepreneurial intentions. This research will look at how the role of Islamic values and Islamic practices in entrepreneurial intentions using Rehan, Block and Fisch's (2019) research model entitled "Entrepreneurship in Islamic communities: How do Islamic values and Islamic practices influence entrepreneurship intentions?" Where Islamic values are divided into 8 dimensions of Islamic values which Rehan, Block and Fisch (2019) take from Wahab's research (2016), namely: gratitude (syukr), hardworking and optimal effort (mujahadah), benevolence (ihsan), perfectionism (itqan), continuous self-criticism (muhasabah an-nafs), consultation (shura), cooperation (ta'awun) and responsibility (mas'uliyyah). As for Islamic practices, Rehan, Block and Fisch (2019) take 3 pillars of Islam, namely the obligation to pray 5 times, the obligation to fast in the month of Ramadan and the obligation to participate in paying zakat from Raiya's research (2008) to be used as research indicators.

Theoretical Review

Theory of Planned Behavior

Fishbein and Ajzen (2005) stated that the Theory of Planned Behavior (TPB) is one of the most influential frameworks in social research and is a popular concept in that field. According to TPB, human behavior is determined by 3 things: 1. Belief in how the behavior results and evaluation of it (behavioral beliefs). 2. Belief in the important normative expectations of others and how motivation is in agreeing with these expectations (normative beliefs). 3. Perceptions about the presence or absence of factors that can facilitate or inhibit behavior (control beliefs). According to them, three things are the main predictors of influencing behavior intention. The three things are 1) Attitude towards a behavior (attitude towards behavior), 2) Subjective norms, and 3) Perceived behavioral control.

Islamic Values

Islam has a teaching that being an entrepreneur or entrepreneur is a noble and great job if it is in accordance with the guidance of Allah and His Messenger. Rasulullah said in a hadith: "A businessman who is honest (ash-siddiq) and can be trusted (al-amin), will be with the prophets, those who were martyred, and those who are pious." (HR. At-Tirmidhi). Being an entrepreneur or entrepreneur is also a major thing, as stated in the hadith, the Prophet said: "Look at you, actually that trade in this world is nine out of ten (ninety per cent) doors of sustenance." (HR. Ahmad). This hadith is reinforced by another hadith, namely, "The most important business is good buying and selling and the work of a man with his skills," (HR. Ahmad).

The prophet is also a successful entrepreneur whose wife, Khadijah is also a successful businesswoman. Throughout the history of early Muslim, we could see that the closest companions of the Prophet were also entrepreneurs which are not only active in religious activities but they are also an entrepreneurs who gives significant contribution to Muslim community (Syahrial Yusuf, 2013).

Like other religions, Islam also promotes values in society, which are described in the Quran and Hadith. Islamic values serve as principles for followers of religions and help in shaping their attitudes and behavior. Specifically, this study uses 8 Islamic values contained in Wahab (2016), namely: gratitude (thanksgiving), hardworking and optimal effort (mujahadah), benevolence (ihsan), perfectionism (itqan), continuous self-criticism (muhasabah). an-nafs), consultation (shura), cooperation (ta'awun) and responsibility (mas'uliyyah).

Islamic Practices

Certain sacred practices and rituals are very important to Muslims. It is a way for followers of Islam to remember history, express faith, and grow in loyalty. Islamic religious practices and rituals are relatively few but very important. The Five Pillars of Islam are five practices that are considered by all aspects of Islam as essential to Islam (Raiya, 2008).

Islamic practices are the practice of practising ghairu and mahdah worship in one's life (S Quotyo & Amrih, 2016). According to Sutipyo and Amrih (2016), Islamic practices are related to behavior that has been regulated and established in religion. For example, behavior regarding the procedures for worship, praying, fasting, praying, reading the holy book, and so on. In this study, used as research items are obligatory prayers 5 times, fasting in the month of Ramadan, and participation in paying zakat, as found in the research of Raiya (2008).

Entrepreneurial Intentions

Entrepreneurship is not only triggered by passion or passion but is also influenced by spiritual beliefs (Boshoff, 2009). According to Steinberg (2010), religion can influence a person's attitude and behavior in terms of entrepreneurship through the creation of values in religion. Religion is closely related to the level of beliefs and values that a person embraces and how a person applies these values and beliefs in his life (Worthington, Everett L. et al., 2003). These values determine how a person will behave and make decisions. Wahab (2016) explains that values are guidelines for human behavior, in which religion influences these values in terms of transmitting to followers of their religion. Therefore, the values in religion will have a strong impact on the attitudes and behavior of the followers of that religion. Generally, religious values are based on the religious scriptures that teach and promote these values in it. For example, the Holy Quran and Hadiths for Muslims, the Bible for Christians, and the Talmud for Jews (Abdal-Haqq, 2002; Sanders, 2009). Apart from religious values, Guiso et al. (2003) explained that religious practices also influence the formation of attitudes conducive to economic growth. They argue that individuals who participate in religious practice regularly will exhibit stronger attitudes towards entrepreneurship.

Intention is an indication of a person's readiness to do something and is an antecedent of behavior (Ajzen & Fishbein, 1980). Intention is also defined as a motivational factor for behavior and as an indication of how much a person wants and how much effort someone wants to spend when planning to do something, in general, the greater one's intention, the greater the activity will be carried out (Ajzen & Fishbein, 1980). According to Bandura (1977) intention is a person's determination to carry out activities or produce certain conditions in the future. According to him, the intention is an important part of self-regulation owned by individuals. Where it is motivated to act. Based on the description above, intention is a useful indicator for predicting future behavior. This is because a person's intention is closely related to the behavior desired by that individual. Meanwhile, entrepreneurial intention has the meaning of the desire or intention that exists in an individual to run entrepreneurship (Rehan, Block & Fisch, 2019).

Research Methods

Data collection

This study obtained data from the population using online survey techniques. Respondents were asked to fill out a questionnaire and the survey is conducted in the community where Muslim students shows its interest on being an entrepreneur. Later, the data is processed using the LISREL application. Before doing the main survey, first a pretest was carried out on 50 respondents with the respondent's criteria according to the provisions of the main survey. The pretest was carried out to identify and eliminate problems that could occur when filling out the questionnaire (Malhotra, Birks & Wills, 2012). This study uses primary data by conducting a survey using a questionnaire that can be filled out online. The questionnaire consists of questions with a Likert scale of 1-5 (1 = disagree; 2 = slightly disagree; 3 = neutral, 4 = somewhat agree; 5 = agree) and also a Likert scale 0-10 used to measure. This study uses a non-probability sampling method, in more detail this study uses a convenience-purposive sampling technique because researchers need samples with certain conditions.

Conceptual Model and Research Hypothesis

The definition of religiosity by Johnson et al. (2001) suggest that it is closely related to attitude, in line with Fishbein and Ajzen (1975), who wrote that attitude is "the amount of influence for or on an object." A person's beliefs tend to be closely related to his religion, either by direct effect (through sacred texts) or by indirect effect (because individual culture, which is influenced by religion).

Religion and attitude are highly correlated. Confirming this opinion, Foxall and Goldsmith (1994) reported that religion contributes to building a knowledge base that justifies and controls individual attitudes and behavior. Weaver and Agle (2002) agree, adding that it is a person's religious identity that influences his behavior and attitudes.

According to Ajzen (1985) in Theory of Planned Behavior (TPB), there are three things that determine a person's intention to behave. These three things are: 1) Attitude, 2) Subjective norms, and 3) Perceived behavioral control. In this research, the TPB theory becomes the basis for the model being built.

Figure 1: Research Model

(Sources: Rehan, Block & Fisch, 2019)

In TPB, attitude refers to an individual's perception of behavior; that is, how much he has favorable or unfavorable judgments about engagement in behavior (Ajzen, 1991). According to the theory of Fishbein and Ajzen (1975) a person's beliefs about an object determine their attitude towards that object. Therefore, attitude is a function of one's beliefs. Ajzen (1991) states that favorable individual attitudes towards certain jobs increase their intention to do that job. In the context of this study, attitudes towards behavior are considered as attitudes towards entrepreneurship, which affect entrepreneurial intentions (Tkachev & Kolvereid, 1999).

According to (Ajzen, 1991) pressure from influential people can influence a person's decision to do or not to carry out certain behaviors. Influential or important people here are family members and close friends whose opinions are taken into account when making decisions. Bandura (1977) supports the idea, stating that people are relatively likely to engage in behaviors that are witnessed among people who are important to them. Therefore, norms are considered as important antecedents when predicting intentions to engage in entrepreneurial behavior.

From the results of the explanation above, the researchers took the following hypothesis:

H1: Islamic values have a positive influence on attitudes towards entrepreneurship
H2: Islamic practices have a positive influence on attitudes towards entrepreneurship

Ajzen (1991) explains that perceived behavioral control is an individual's perception of how easy or difficult it is for him to carry out the behavior. Researchers have previously found empirical evidence that perceived behavioral control has a significant effect on entrepreneurial intentions (Basu & Virick, 2008; Ruhle et al., 2010; do Paco et al., 2011). Based on this empirical evidence, behavioral control is considered a predictor of entrepreneurial intention; the stronger a person's perception of behavior control, the stronger his intention to choose self-employment as a career choice (Kolvereid, 1996). From the results of the explanation above, the researchers took the following hypothesis:
H3: Attitudes towards entrepreneurship have a positive influence on entrepreneurial intentions
H4: Norms have a positive influence on entrepreneurial intentions
H5: Perceived behavioral control has a positive influence on entrepreneurial intentions
The relationship between religion and entrepreneurship has been well established, in Weber (1930) explained that Protestant (ie Christianity) religion affects individual economic behavior. Recent studies have shown that religion influences individual decisions to undertake entrepreneurial activities (Audretsch et al., 2013; Nikolova & Simroth, 2015). Raiya (2008) explains that several previous researchers have examined the determinants of religiosity in Muslim countries. According to them, because the most important sources that regulate Muslim life are the Qur'an and hadith, these two sources actually summarize the moral and legal code in Islam, one can refer to these two sources to describe Muslim behavior and beliefs that reflect their religiosity. For example, to be a good Muslim requires complete submission to God. According to these two sources of Islamic teaching, individual beliefs, as well as submission, must be seen in their behavior. Thus, Muslims must not only respect the teachings of their religion but also have to practice them (eg prayers, alms). If you deliberately commit sins, take them lightly or intentionally disobey, it can lead to disbelief (Raiya, 2008). Besides that, according to Sequeira et al. (2016) religion has an influence on entrepreneurial intentions directly through religious practice.
From the results of the explanation above, the researchers took the following hypothesis:
H6: Islamic values have a positive influence on entrepreneurial intentions
H7: Islamic practices have a positive influence on entrepreneurial intentions

Previous research has shown that religion has no direct effect on entrepreneurial activities (Dana, 2009). On the contrary, the effect is indirect, where religion promotes social values in a community, which then promotes individual attitudes towards entrepreneurship (Dodd and Gotsis, 2007). In particular, religion influences entrepreneurial intentions (Abdullahi and Suleiman, 2015), either indirectly through values (Dana, 2009; Dodd and Gotsis, 2007) or more directly through religious practice (Sequeira et al., 2016).

Carswell and Rolland (2007) measured the relationship between perceptions of social and individual entrepreneurship and religious compliance. They found that ethnic and religious diversity in the country of New Zealand stimulates entrepreneurial activity and that individual and societal entrepreneurial perceptions are influenced by religious practice.

From the results of the explanation above, the researchers took the following hypothesis:

H8. Islamic values have a positive influence on entrepreneurial intentions, mediated by attitudes towards entrepreneurship.

H9. Islamic practices have a positive influence on entrepreneurial intentions, mediated by attitudes towards entrepreneurship

Data Analysis Methods

In the use of statistical tools for data processing, this study uses Structural Equation Modeling (SEM). Structural Equation Model (SEM) is a statistical modelling technique that can analyze the pattern of relationships between latent variables and their indicators, latent constructs with one another, and errors in the direct measurement. The Structural Equation Model allows analysis to be carried out with several dependent variables and independent variables directly (Hair et al., 2010). Based on the approach, the Structural Equation Model (SEM) is classified by experts into two approaches, namely the Covariance Based SEM (CB-SEM) approach and the Variance Based SEM approach (Hussein, 2015). This study uses CB-SEM techniques to process data with the help of Lisrel 8.8 software.

The analysis of the model is divided into two stages. The first is measurement model analysis followed by structural model analysis. Measurement model analysis means that each latent variable is modelled into one of the factors underlying the observed variable, then structural model analysis describes the relationship between latent variables (Wijanto, 2008).

Research Results

SEM Measurement Model

The measurement model of the SEM method was tested by performing validity tests, reliability tests, and goodness of fit tests. The validity test is conducted to analyze whether the indicators used can represent latent variables well. An indicator is declared valid if it has a t-value ≥ 1.645 (one-tailed) and has a standardized loading factor (SLF) value of ≥ 0.5 (Hair et al., 2014). In this study, all indicators used were declared valid only after two validity tests. Because in the first validity test, there are nine indicators that do not meet the criteria for the validity of SLF ≥ 0.4, namely indicators Z1 (0.38), X1 (0.37), X2 (0.35) X3 (0.32), X9 (0.39), X18 (0.37), and X34 (0.29), X34 (0.35), X37 (0.39), X40 (0.35). Meanwhile, in the second validity test, it was found that all indicators were declared valid because all indicators had SLF values ≥ 0.4.

Furthermore, the reliability test was carried out on the measurement model to determine whether the indicators used in this study had the accuracy and consistency to measure the latent variables. A latent variable can be said to be reliable if the variable has a value of Construct Reliability (CR) ≥ 0.6 and Variance Extracted (VE) ≥ 0.5 Hair et al. (2010). Based on the results of the reliability test, it is known that several variables have VE Value under the provisions of Hair et al. (2010), namely variables of attitudes towards entrepreneurship, subjective norms, perceived behavior control and Islamic values. However, according to Fornell and Larcker (1981) this condition is allowed as long as the construct reliability on the variable is above 0.6. So that based on the opinion of Fornell and Larcker (1981) above, the four variables are reliable.

The goodness of fit measurement model test is a model feasibility test conducted to see how the ability of the research model used can produce estimates that are close to the observed value of the original data. Hair et al. (2010) classified the goodness of fit test into three parts, namely absolute fit measures, incremental fit measures, and parsimonious fit measures. According to Hair et al. (2010), the use of 4–5 goodness of fit criteria is considered sufficient to assess the feasibility of a model, as long as each of the three goodness of fit criteria is represented. From the results of the goodness of fit test carried out, it was found that the measurement model passed the test because it had exceeded the set minimum standard. The result is that each type of measurement contained in this test has at least one good fit indicator.

SEM Structural Model: Hypothesis Testing

At this stage, the goodness of fit test is again carried out as is done in the SEM measurement model, but with a different model. From the tests conducted, it is concluded that the structural model in this study has met the requirements to pass the goodness of fit test and can be analyzed further. After that, a causal relationship analysis is carried out to test the hypothesis on the structural model and to see whether there is a significance and value for the relationship between the variables proposed in the hypothesis.

The causal relationship test is performed by evaluating the t-value, the coefficient of estimation, and the coefficient of determination in the model. A latent variable is declared significant in influencing other latent variables if it has a t-value ≥ 1.645 or ≤ -1.645. Meanwhile, the estimated coefficient indicates the magnitude of the effect. In SEM, the estimation coefficient can be seen in the number of standardized loading factors (SLF) that are generated. The results of the t-value evaluation and the estimated coefficient can be seen in the following table.

The direct effect hypothesis is accepted if the t-value from the test results in this study is ≥ 1.645 or ≤ -1.645, which means that the independent variable has a significant effect on the dependent variable. The direct effect hypothesis is rejected if the t-value is <1.645 or> -1.645, which means that the independent variable does not influence the dependent variable. In the influence analysis using mediation, the criteria t-value is ± 1.96. Of the 9 hypotheses formed, five hypotheses were accepted, while the other four hypotheses were rejected. The rejected hypotheses include H2, H4, H7, H9.

In this mediation analysis, it was found that H8 was included in the mediation classification in the form of Complementary Mediation. This is because the direct effect has a significant result (t-value ≥ 1.96) and the indirect effect has a significant result (t-value ≥ 1.96), both of which have the same direction, which is positive. In this mediation analysis, it was found that H9 was included in the mediation classification in the form of No-effect Nonmediation. This is because the direct effect has insignificant results (t-value> -1.96) and the indirect effect has insignificant results (t-value <1.96).

In the results of the reduced form equation, the variable attitudes towards entrepreneurship can be explained by the Islamic values and Islamic practices variable by 23%. The entrepreneurial intention variable can be explained by the variable Islamic values, Islamic practices, subjective norms and perceived behavior control by 30%.

Table 1: Output of Structural Model

Hypotheses	Statement of Hypotheses	Coefficient of Estimates	T-*value*	T-*value* Significance (+/-)	Result	Result of Previous Study
H1	*Islamic values* have a positive impact on entrepreneurial intention	0,50	5,39	≥ 1,645 or ≤ -1,645	Significant and Positive	Significant and Positive
H2	*Islamic practices* have a positive impact on entrepreneurial intention	-0,08	**-0,88**	≥ 1,645 or ≤ -1,645	Not Significant	Significant and Positive
H3	Attitude to entrepreneurship has positive influence to entrepreneurial intention	0,19	2,15	≥ 1,645 or ≤ -1,645	Significant and Positive	Significant and Positive
H4	Subjective norm has a positive influence to entrepreneurial intention	-0,06	**-0,84**	≥ 1,645 or ≤ -1,645	Not Significant	Significant and Positive
H5	Perceived Behavioral Control has a positive influence toward entrepreneurial intention	0,21	2,19	≥ 1,645 or ≤ -1,645	Signifikan Positif, hipotesis diterima.	Significant and Positive
H6	*Islamic values* has a positive influence to entrepreneurial intention	0,36	3,37	≥ 1,645 or ≤ -1,645	Signifikan Positif, hipotesis diterima.	Significant and Positive
H7	*Islamic practices* have a positive influence on the entrepreneurial intention	-0,11	**-1,39**	≥ 1,645 or ≤ -1,645	Not Significant	Significant and Positive
H8	Islamic values have a positive influence to Intention to Entrepreneurship	0,13	2,79	≥ 1,96 or ≤ -1,96	Signifikan Positif, hipotesis diterima.	Significant and Positive

Hypotheses	Statement of Hypotheses	Coefficient of Estimates	T-*value*	T-*value* Significance (+/-)	Result	Result of Previous Study
	mediated by attitude toward entrepreneurial intention					
H9	*Islamic practices* have a positive influence on the entrepreneurship intention mediated by attitude toward entrepreneurial intention	-0,02	**-0,88**	≥ 1,96 or ≤ -1,96	Not Significant	Significant and Positive

The direct effect hypothesis is accepted if the t-value from the test results in this study is ≥ 1.645 or ≤ -1.645, which means that the independent variable has a significant effect on the dependent variable. The direct effect hypothesis is rejected if the t-value is <1.645 or> -1.645, which means that the independent variable does not influence the dependent variable. In the influence analysis using mediation, the criteria t-value is ± 1.96. Of the 9 hypotheses formed, five hypotheses were accepted, while the other four hypotheses were rejected. The rejected hypotheses include H2, H4, H7, H9.

In this mediation analysis, it was found that H8 was included in the mediation classification in the form of Complementary Mediation. This is because the direct effect has a significant result (t-value ≥ 1.96) and the indirect effect has a significant result (t-value ≥ 1.96), both of which have the same direction, which is positive.

Table 2: Analysis of Mediating Effect

Hypotheses	Path	Mediating Coefficient	T-*value* Mediation	Direct Coefficient	Direct T-*value*	Mediation Type
H8	Islamic Values → Attitude to Entrepreneurship → Entreprenurial Intention	0,09	2,08	0,36	3,37	*Complementary Mediation*
H9	Islamic Practices → Attitude to Entrepreneurship → Entreprenurial Intention	-0,01	-0,83	-0,11	-1,39	*No-effect Nonmediation*

In this mediation analysis, it was found that H9 was included in the mediation classification in the form of No-effect Nonmediation. This is because the direct effect has insignificant results (t-value> -1.96) and the indirect effect has insignificant results (t-value <1.96).

In the results of the reduced form equation, the variable attitudes towards entrepreneurship can be explained by the Islamic values and Islamic practices variable by 23%. The entrepreneurial intention variable can be explained by the variable Islamic values, Islamic practices, subjective norms and perceived behavior control by 30%.

Tabel 3: Reduced Form Equation

Structural Model	**Errorvar**	**Coefficient of Determinatior**
Att = 0.50*ISVAL - 0.076*ISPRA + 0.0*NORM + 0.0*PBC	0.77	0.23
EI = 0.45*ISVAL - 0.13*ISPRA - 0.065*NORM + 0.21*PBC	0.70	0.30

Discussion

Islamic values have a significant positive effect on 1. Attitudes towards entrepreneurship (with a T-Value of 5.39), 2. Intention of entrepreneurship (with a T-Value of 3.37), 3. Intention to be entrepreneurial by mediating attitudes (with T-Value 2 , 79).

Islamic practices have no significant effect on: 1. 1. Attitudes towards entrepreneurship (with T-Value -0.88), 2. Entrepreneurial intention (with T-Value -1.39), 3. Entrepreneurial intention with attitude mediation (with T -Value -0.88).

Attitudes toward entrepreneurship and perceived behavior control have a significant positive effect on entrepreneurial intentions (with T-Value 2.15 and 2.19).

Subjective norms have no significant effect on entrepreneurial intentions (with T-Value -0.84)

The results of this hypothesis test support the research of Dodd and Gotsis (2007) which has the result that religion promotes social values in a community, which then promotes individual attitudes towards entrepreneurship, and is in accordance with Dana's research (2009) which shows that religion does not directly affect entrepreneurial activities, but have an indirect effect through values in religion. Then the research of Miranda, Chamorro-Mera, and Rubio (2017) which shows that subjective norms do not have a positive influence on the entrepreneurial intentions of students at the University of Spain, because most of the surrounding environment, both family and friends, still like to work in companies and agencies. others, or prefer to become job seekers.

Conclusion

Islamic values variable has a positive and significant direct influence on the attitude variable towards entrepreneurship. This is in line with the research of Dodd and Gotsis (2007) which has the result that religion promotes social values in a community, which in turn promotes individual attitudes towards entrepreneurship.

Islamic values variable has a positive and significant direct influence on the entrepreneurial intention variable. This is in line with the research of Muhammad et al (2014), Abdullahi and Suleiman (2015), and Sulung, Ririh, Putri and Robbani (2020) which show that religiosity on entrepreneurial intentions has a positive and significant effect.

The Islamic practices variable has an insignificant effect on the attitude variable towards entrepreneurship. This can be explained through research by Choong et al., (2013) which shows that religiosity is not directly related to a person's behavior.

The Islamic practices variable has an insignificant effect on the entrepreneurial intention variable. This can be explained through Dana's research (2009) which shows that religion does not have a direct effect on entrepreneurial activities but has an indirect effect through values in religion.

The attitude variable towards entrepreneurship has a positive and significant direct effect on the entrepreneurial intention variable. This is in line with the research by Santi, Hamzah, and Rahmawati (2017) as well as Mirawati, Wardana, and Sukaatmadja (2016) which show that attitudes have a positive and significant effect on entrepreneurial intentions.

Perceived behavioral control variables have a positive and significant direct influence on the entrepreneurial intention variable. This is in line with the research of Ambad and Damit (2016) and Tsordia and Papadimitriou (2015) which show that behavioral control has a significant positive effect on entrepreneurial intentions.

The subjective norm variable has an insignificant effect on the entrepreneurial intention variable. This can be explained through research by Miranda, Chamorro-Mera, and Rubio (2017) which shows that subjective norms do not have a positive influence on entrepreneurial intentions.

Islamic values with the mediation of attitudes towards entrepreneurship have a significant positive effect on a person's entrepreneurial intentions, in line with Dana's research (2009) which shows that religion has an indirect influence through the values contained in the religion. This is also in line with the research of Dodd and Gotsis (2007) which shows that religion promotes social values in a community, which in turn promotes individual attitudes towards entrepreneurship. There is also a similarity in the results of research conducted by Weber (1930) which explains that religion influences individual economic behavior. Other studies have also shown that religion influences individual decisions to undertake entrepreneurial activities (Audretsch et al., 2013; Nikolova & Simroth, 2015).

Islamic practices by mediating attitudes towards entrepreneurship do not significantly affect a person's entrepreneurial intentions, in line with research by Choong et al. (2013) which shows that religiosity is not directly related to one's behavior. This is also in line with Dana's research (2009) which states that religion only has an indirect effect on entrepreneurial activities, namely through religious values.

Suggestion

Further research can be carried out by limiting the generation or age group of the respondents so that the results obtained can better answer more specific research problems. It will be important for future study to analyze the behavioral control factors of young respondents because the findings of this study that the majority of respondents were students showed good behavioral control towards entrepreneurship, even higher than the attitude factor towards entrepreneurship.

Abstract

This study aims to look the special role of halal-friendly attributes in Singapore in forming destination image and behavioral intention of Muslim travelers. Singapore is among the countries with Muslim minority, yet it manages to capture a significant amount of Muslim tourist. With the growing number of Muslim tourists will be a promising prospect for Singapore's tourism industry. This study uses a Structural Equation Modeling (SEM) method in Lisrel 8.8. The sample used in this study was 259 Indonesian Muslim tourists who had visited Singapore in the last four years. The results of this study found five halal-friendly attributes in Singapore have a positive influence on the overall destination image, revisit intention, and recommendation intention. While the affective destination image does not have an influence on the revisit intention and the recommendation intention.

Keywords: Halal Tourism, Halal Industry, Singapore Tourism, Muslim Travelers.

Introduction

As a fast-growing market, halal tourism is boosted by the growing phenomenon of Muslim travel needs, either for leisure or for work. Responding to this, both Muslim majority and minority country try to address the specific needs of Muslim travelers. Despite some overlapping terms of the concept related to Muslim travel needs, there is some consensus about the essentials of Muslim travellers, which is halal food, family-friendly atmosphere and tourism facilities and infrastructure that meet the needs of Muslim tourists (Samori et al., 2016). Product and services that are catered for Muslim tourist except for the holy pilgrimage or other religious purposes are universal, thus can be used by non-Muslim tourist that are seeking for a family-friendly environment.

Islam is one of the religions that has the largest number of adherents in the world. The Muslim population in the world in 2017 is estimated at 1.7 billion people and is projected to continue to grow until 2050 to 2.76 billion people or 29.7% of the world's population (Pew Research Center, 2017). The increase in the Muslim population in the world will affect the number of Muslim tourists in the world. Based on research conducted by Mastercard & Crescent Rating (2019), it shows that the number of Muslim tourists in 2010 was 98 million, an increase in 2018 to 140 million Muslim tourists, and it is projected that in 2020 before considering the impact of Covid-19, it will increase by 11, 4 per cent to 160 million people. In 2010 the number of Muslim tourists who came to predominantly non-Muslim countries was around 45 million, increasing in 2014 to 52 million, and in 2020 it is projected to reach 82 million (Crescentrating & Mastercard, 2015). The increasing number of Muslim tourists who come to predominantly non-Muslim countries is the obvious target for halal tourism activities.

Southeast Asia is one of the regions with a majority of non-Muslim tourist destination for Muslim tourists, such as Singapore and Thailand. The two countries occupy the 1st and 2nd in the Top 10 Non-OIC Destinations (Mastercard & CrescentRating, 2019). Muslim tourists who come to countries in Southeast Asia continue to experience an increase every year, especially Singapore. Based on data from the Singapore Tourism Board report (2018), it shows that Singapore attracted 18.5 million foreign migrants in 2018, or 1.5 million immigrants each month, dominated by several countries, such as China, Indonesia and Malaysia. The number of Muslim tourists who came to Singapore in 2014 was 3,140,000. The increase occurred compared to that in 2010, Muslim tourists

Cite this Article as: Khabibu TOHA, N.I.S. PUTRI "Perception and Behavior of Muslim Tourist on Non-Muslim Tourist Destination: Singapore Study Case" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

who came to Singapore were around 2,350,000 people (COMCEC, 2016). This number will continue to grow as the number of Muslim tourists in the world increases.
Based on Mastercard & CrescentRating (2019), Singapore ranks first in the Top 10 Non-OIC Destinations. Singapore continues to make improvements to provide for the needs of Muslim tourists who come to Singapore. Majlis Ugama Islam Singapore (MUIS) has issued more than 1000 individual halal certifications for restaurants, food vendors, food companies or other dining establishments that comply with the terms and conditions of the halal certification system (COMCEC, 2016). Singapore has one of the strongest halal certification bodies among the Non-OIC countries.

The Singapore government also provides many small prayer rooms which can be found in several shopping centers and entertainment venues as facilities to facilitate Muslim tourists in praying. Seeing the very high enthusiasm of Muslim tourists to come to Singapore and also the readiness of the Singapore government in developing halal tourism in Singapore, the writer is interested in researching by making previous research as a reference and making Muslim tourists who have visited Singapore the object of research. This research was conducted to examine the effect of halal-friendly attributes given by the Singaporean government on Singapore's image of Muslim tourists and the behaviour intention of Muslim tourists. Such as the findings of previous research which found that there was an effect of halal-friendly attributes given by the South Korean government on the image of South Korea from Muslim tourists and the behaviour intention of Muslim tourists (Han et al., 2019). This research is expected by the author to become a reference and consideration to develop halal tourism in Singapore.

Theoretical Review

Halal Tourism

Halal tourism is the provision of tourism products and services that meet the needs of Muslim tourists under Islamic teachings (Mohsin et al., 2016). Halal tourism can be used by many people because of the universal characteristics of its products and services. The term Islamic tourism / halal tourism was first introduced to the public in 2000 at the OIC meeting. He was introduced as an alternative to meet the demand for a tour based on a lifestyle that suits the needs of a Muslim. Tourism products and services, tourist objects, and tourist destinations in halal tourism are the same as products, services, objects and tourism destinations in general as long as they do not conflict with sharia values and ethics. So halal tourism is not limited to religious tourism (Andriani, 2015).

DSN-MUI (2016) in fatwa number 108 defines halal tourism as tourism following sharia principles. Meanwhile, sharia tourist destinations are geographic areas that are in one or more administrative areas in which there are tourist attractions, religious and public facilities, tourism facilities, accessibility, as well as communities that are interrelated and complement the implementation of tourism following sharia principles. There are several important aspects of halal tourism. Important aspects that must be considered are transportation terminals, accommodation services, shopping places, tourist attractions, spas and health centres, conference and event venues, sporting events, travel agencies, and tour guides (COMCEC, 2016).

Halal-friendly attributes

Oktadiana et al., (2016) defines the needs of Muslim tourists covering various aspects, such as halal restaurants, places of worship, Muslim-friendly accommodation, and tourism and transportation that are halal-compliant or Islamic. One of the Halal-friendly forms adopted by inns in non-OIC countries is to provide the Koran, prayer mats, Arabic language TV channels and Qibla direction marking, which shows the direction of Mecca. The results of a study conducted by Eid & El-Gohary (2015) show that the halal attribute will represent the availability of Islamic practices and norms that are relevant to the concept of tourism in tourist destinations. Eid & El-Gohary (2015) also added that some of the main attributes of halal tourism include the availability of places of worship, the availability of halal food and drinks, the prohibition of prostitution, the prohibition of liquor and the prohibition of gambling. Han et al. (2019) in his research explained that there are five aspects of halal-friendly attributes that must be fulfilled and considered, namely the social environment, facilities, food and beverages, staff and residents, and services.

Affective Destination Image

Affectivity is part of the individual decision-making process to help create components of customer satisfaction and loyalty (Oliver, 1999). Destination images or destination images are formed by three different components but are hierarchically linked, called cognitive, affective, and conative (Gartner, 1994). Meanwhile, affective Destination Images or destination Affective images are defined as individual feelings towards a goal or as an individual's

emotional response to a place (Basaran, 2016). Ekinci & Hosany (2006) in their research said that affective image (with goal personality) is a better predictor of intention to recommend tourist destinations to others.

Woodside & Lysonski (1989) argue that affective associations such as positive, negative and neutral feelings are needed to determine global attitudes about whether tourists like, dislike, or do not have an opinion about a destination and that they greatly influence the choice of a tourist destination. Lin et al. (2007) also said that the affective image component can represent a person's feelings towards a destination. Barich & Kotler (1991) states that affective images are centered on individual feelings towards an object.

Overall Destination Image

Retaining existing customers and attracting new customers is the goal of hospitality and tourism marketers because customer retention and attractiveness is directly associated with company profits and success (Han & Hyun, 2013). In this case, the intended customers are tourists.

In previous research, Han & Hwang (2016) explained that the image of the destination as a whole will play a role in achieving these goals. Also, H. Kim & Richardson (2003) defines the image of a destination as the overall impression, beliefs, ideas and hopes, and feelings about a place that accumulate in a certain time. The image of the destination as a whole will have an impact on the intention of tourists to visit the destination again (Dolnicar & Grün, 2013).

Behavioral Intention

Behavioral intentions or behavioral intentions refer to the desire and future actions of individuals to participate in, consume, and use or not use certain products or services (Han & Hyun, 2017). The intention is a decision to behave in the desired way or a stimulus to act, whether consciously or not (Corsini, 2002). The intention is also the beginning of a person's behavior. Chen & Tsai (2007) in their research used the term "behavioral intention" to reflect the intention to visit again and the willingness to recommend to others. Han & Ryu (2007) also reported in their research, that revisiting intention is a substantial and acceptable tool for measuring the future behavior of tourists, while the personal characteristics of customers lead to the formation of their behavioral intentions in upscale restaurant settings.

Research methods

This research is in the form of descriptive in explaining the research model created. The data used in this study are primary data, which is obtained from the results of questionnaires distributed online and in the form of self-administered questionnaires. The researcher processed the research process through three stages, namely the wording test, pre-test, and main test. The criteria for research respondents needed are Indonesian citizens who are Muslim, domiciled in Indonesia over 17 years of age and have visited Singapore in the last four years. Sampling in this study using non-probability sampling procedures and convenience sampling where the chances of each prospective respondent in the sample to be selected are not the same. Researchers in analyzing the data used the Structural Equation Modeling (SEM) method through LISREL 8.8 software.

This research model is the result of a replication of the model of Han et al. (2019), who obtained the following hypotheses:

- H1 : Halal-friendly Attributes have a significant positive effect on Affective Destination Image
- H2 : Halal-friendly Attributes have a significant positive effect on the Overall Destination Image
- H3 : Affective Destination Image has a significant positive effect on the Overall Destination Image
- H4: Affective Destination Image has a significant positive effect on Revisit Intention
- H5 : Affective Destination Image has a significant positive effect on Recommendation Intention
- H6 :Overall Destination Image has a significant positive effect on Revisit Intention
- H7 : Overall Destination Image has a significant positive effect on Recommendation Intention

The core questions in this study have 9 parts, namely 5 dimensions of halal-friendly attributes, namely halal-friendly social environment, halal-friendly facilities, halal-friendly food and beverages, halal-friendly services, and halal-friendly locals and staffs. Then, affective destination image, overall destination image, revisit intention, and recommendation intention. There are a total of 38 question indicators used in this study. Researchers used a Likert scale on the research questionnaire to measure the variables being tested. Following are the question items according to the operationalization table below:

Table 1: Operationalization of Variable

Variable	Indicator	Variabel Operationalization	Source	Scale
Halal-Friendly Social Environment	SOC1	I feel that tourist attractions in Singapore have Halal-friendly decorations and designs	Han et al. (2019)	Likert 1-6
	SOC2	The atmosphere of tourist attractions in Singapore is in accordance with sharia principles		
	SOC3	The Halal-friendly social environment in tourist attractions provides comfort for me as a tourist visiting Singapore		
	SOC4	My overall experience with the halal-friendly social environment in tourist spots is good.		
	SOC5	The social environment of tourist attractions is free of illicit goods (eg night clubs, red-light districts).		
	SOC6	The social environment of tourist spots is safe and clean for Muslim tourists.		
	SOC7	At a tourist location, I enjoy a halal-friendly social environment.		
Halal-Friendly Facilities	FAC1	Easy access to mosques/prayer rooms	Han et al. (2019)	Likert 1-6
	FAC2	Many halal facilities are available in tourist attractions		
	FAC3	Separate facilities for men and women are available at tourist attractions (eg spa, swimming pool, fitness center).		
	FAC4	Separate prayer facilities are available to men and women at tourist spots.		
Halal Food and Beverage	FB1	Halal food outlets and restaurants at tourist sites display the halal logo.	Han et al. (2019)	Likert 1-6
	FB2	Halal food and drinks available at tourist sites are clean, safe and hygienic.		
	FB3	Halal food providers at tourist sites are		

Variable	Indicator	Variabel Operationalization	Source	Scale
		accredited with halal certification.		
	FB4	The availability of halal food makes me interested in visiting tourist attractions.		
Halal-friendly Services	SER1	Halal information on tourist attractions is widely available (eg leaflets, brochures).	Han et al. (2019)	Likert 1-6
	SER2	The tourist information center offers information on halal services		
	SER3	Halal information services at tourist attractions are available in various languages (eg English, Malay).		
	SER4	Halal services available at tourist spots comply with Islamic law		
Halal-friendly locals and staffs	LOC1	At tourist spots, local staff are very aware of halal products and services.	Han et al. (2019)	Likert 1-6
	LOC2	Local staff understand how to offer halal products and services.		
	LOC3	The local people have a good understanding of Islamic and halal rules.		
Affective Destination Image	ADI1	I am very happy when travelling in Singapore	Russell & Pratt (1980)	Likert 1-6
	ADI2	I am very enthusiastic when travelling in Singapore		
	ADI3	I feel comfortable when travelling in Singapore		
	ADI 4	I feel relaxed when travelling in Singapore		
Overall Destination Image	ODI1	My general view of Singapore as a tourist destination is positive	Baloglu & McCleary (1999); Hernández-Mogollón et al. (2018)	Likert 1-6
	ODI2	I enjoy when visiting this destination		
	ODI3	Visiting this destination provides good deals		
	ODI4	This destination has a great name and		

Variable	Indicator	Variabel Operationalization	Source	Scale
		reputation		
Revisit Intention	REV1	I will come back to Singapore in the future	Kim & Han (2008); Jani & Han (2011); Chaulagain et al. (2019)	Likert 1-6
	REV2	I may travel to Singapore again in the future.		
	REV3	Even though other countries are becoming popular, I will still visit Singapore		
	REV4	I have plans to re-visit Singapore		
Recommendation Intention	REC1	I will spread positive news about Singapore.	Jani & Han (2011); Kim & Han (2008); Chaulagain et al. (2019)	Likert 1-6
	REC2	I would recommend a trip to Singapore to friends and others.		
	REC3	I will say positive things about travelling to Singapore to others.		
	REC4	I will encourage my relatives to visit Singapore		

Research Result

Researchers tested the validity and reliability of the measurement model within the first layer and the second layer (higher order). The analysis of the validity test is carried out by paying attention to the t-value and standardized loading factor (SLF) of each indicator (unobserved variable) in the measurement model output. An indicator can be said to be valid if it has an SLF value of ≥ 0.50 and a t-value ≥ 1.645 (one-tailed). Meanwhile, a variable can be said to be reliable if it has a CR value ≥ 0.70 and a VE value ≥ 0.50. Following are the results of the validity and reliability tests on the first-level measurement model.

Table 2: Validity and Reliability Test of the First Order

Variable	Indicator	SLF	Error	Composite Reliability	Variance Extracted
Halal-Friendly Environment	SOC1	0.62	0,61	0,807	0,418
	SOC2	0.57	0,68		
	SOC3	0.71	0,49		
	SOC4	0.80	0,35		
	SOC6	0.46	0,79		
	SOC7	0.66	0,56		
Halal-Friendly Facilities	FAC1	0.84	0,30	0,815	0,542

	REV4	0.81	0,35		
Recommendation Intention	REC1	0.92	0,15	0,946	0,815
	REC2	0.95	0,11		
	REC3	0.89	0,21		
	REC4	0.85	0,27		

Based on the table above, three indicators have a value below 0.50, namely SOC6, FAC3, and FB4. However, if there are indicators that have a standardized loading factor value ≥ 0.30, it can still be considered (Igbaria et al., 1997). So, all indicators can be said to be valid. Then, all variables show a Construct Reliability (CR) value above 0.6. Meanwhile, there is one variable that has a Variance Experience (VE) value below 0.5, namely the halal-

friendly social environment of 0.419. However, Fornell and Larcker (1981, in YH Lee, 2012) explain that the VE value which shows a result <0.50 is still acceptable because it is considered to have no fatal impact, and this result is acceptable if the CR value is still ≥ 0. 60. This indicates that the variable can be said to be reliable. Following are the results of the validity and reliability tests on the second level measurement model analyzed using LISREL 8.8 software.

Table 3: Validity and Reliability Test of the Second Order

Variabel Laten	Dimensi	SLF	T-Values	Composite Reliability	Variance Extracted
Halal-Friendly Attributes	*Halal-Friendly Social Environment*	0.64	7.59	0,96	0,55
	Halal-Friendly Facilities	0.71	10.31		
	Halal-Friendly Food and Beverages	0.82	11.12		
	Halal-Friendly Services	0.87	12.67		
	Halal-Friendly Locals and Staffs	0.8	12.12		

Based on the results of the table above, it shows that measurement model 2 can be said to be good because almost every question indicator has an SLF value above 0.5. Three indicators have SLF values below 0.5, namely SOC6, FAC3, and FB4. However, this indicator does not drop because according to Igbaria et al. (1997), SLF values above 0.3 can still be considered. The results above show that the halal-friendly attributes variable has a VE value of ≥ 0.50 and CR ≥ 0.70. Therefore, it can be said that the indicators in this study have consistency in measuring the latent variables. So, it can be said that all dimensions on the halal-friendly attributes variable are reliable. After it is known that all indicators are valid and reliable, the next step is to test the structural relationship hypothesis from the research model. The results of hypothesis testing in this study are as follows:

Table 4: Hypotheses Testing

Hypotheses		T-*Value*	Estimate of Coefficient	Meaning
H1	*Halal-friendly attributes positively and significantly affecting the Affective destination image*	8.59	0.56	Hipotesis diterima, data mendukung hipotesis

Discussion

Hypothesis test results show that the halal-friendly attributes offered by Singapore have a positive influence on the affective and overall image of Singapore from Muslim tourists. The estimated coefficient value between halal-friendly attributes and affective destination image is 0.56. This shows that the halal-friendly attribute given by the Singapore government has an influence of 56% on the affective image created by Muslim tourists towards Singapore. Meanwhile, the estimated coefficient value between the halal-friendly attributes and the overall destination image is 0.11. This shows that the halal-friendly attribute has an influence of 11% on the overall image of a destination. This suggests that the higher the halal-friendly attributes provided by the Singapore government, the higher the image that Muslim tourists will have towards Singapore.

Affective destination image has a significant positive effect on the overall destination image with a value of 15.79 which is higher than the critical value used in this study, namely 1.645 for the upper tail. However, the affective destination image does not influence the revisit intention and recommendation intention variables. The t-value obtained from the output is smaller than the critical value used in this study, which is 1.645. Besides, researchers suspect this is because the majority of study respondents are in the millennial age range.

Mastercard-Halal Trip (2017) in his research shows that millennial Muslim tourists tend to prioritize the price factor in travelling. Therefore, the researchers suspect that this is the reason that there is no influence between the affective image of Muslim tourists towards Singapore to visit again and the intention to recommend to others.

Also, the overall destination image in this study shows that it has a positive effect on revisit intention and recommendation intention. The estimated coefficient value between the overall destination image and revisit intention is 0.76. This shows that the overall image of a destination influences the intention to visit again by 76%. Meanwhile, the higher estimated coefficient value is shown between the overall destination image and recommendation intention, which is 0.90. This shows that the overall image of Muslim tourists towards a destination influences the intention to visit again by 90%. This significant positive effect is in accordance with previous research conducted by (Han et al., 2019).

The findings in this study indicate that the affective image created by Muslim tourists towards Singapore will not affect the intention of Muslim tourists to come back and recommend to others. Artuger & Cetinsoz (2017) also in their research show that the affective image has no role in the intention of tourists to visit again. In addition, no structure defines and operationalizes the relationship between destination image and tourist behavioral intentions (Tasci et al., 2007).

Conclusion

The halal-friendly attribute offered by the Singapore government has a significant positive influence on the image that Muslim tourists will shape towards Singapore both affective and overall. The affective image of Muslim tourists towards Singapore will also improve the image of Muslim tourists as a whole of Singapore. However, the affective image that Muslim tourists create towards Singapore will not affect the intention of Muslim tourists to come back and recommend to others. On the other hand, the overall image that Muslim tourists create of Singapore will influence Muslim tourists' intention to come back and recommend to others.

Suggestion

This research provides findings that can be used by tourism industry policymakers. The Singapore government can improve the halal-friendly attributes offered to Muslim tourists. Technological progress is also one of the main keys to encouraging the quality of facilities and services that will have an impact on the image of Muslim tourists. As with services regarding the convenience of halal information, the Singapore government can improve it through technological advances that can support the convenience of Muslim tourists in carrying out their obligations. The Singapore government can also provide Islamic accommodation at an affordable price range for millennial Muslim tourists. This will provide satisfaction which will have an impact on the affective image that is formed towards a Singapore. Furthermore, the government can create halal tourism promotional content that is easy to obtain, visit and share with Muslim tourists. In addition, the Singapore government can collaborate with Muslim travel influencers to market Singapore's halal tourism so that it will improve the overall image of Muslim tourists towards Singapore.

Abstract

Religious based donations significantly contributed to national philanthropic funds collection of Indonesia in 2018. Indonesia was crowned as "the most generous country", according to "CAF World Giving Index 2018". Donations can be collected via online by utilizing social media. This study aims to analyze the factors influencing muslim donors' intention to donate via social media, also the extrinsic factors influencing their attitude. This research adapts the Theory of Planned Behavior and extrinsic factors such as charity project, charity organization, internet technology features, and social network sites features. Quantitative study is conducted using Structural Equation Modelling (SEM) method. Primary data was collected from 234 Indonesian muslim citizens who have made donations through social media. Attitude, subjective norm, and perceived behavioral control positively influence muslim donors' intention to donate via social media. Internet technology features and social network sites features positively influence muslim donors' attitude towards donating via social media. The findings can be used as references for charity organizations to maximize the collection of donations and maintain sustainable relationships with potential donors through social media. This research provides current insights about donating behavior via social media in the largest muslim population country in the world.

Keywords: Intention to donate; social media; social network sites; SNS.

Introduction

Indonesia has funded religious based donation funds up to IDR2,3 trillion in total in 2018 and accounted to two-thirds of all contribution to philanthropy funding in Indonesia (BAZNAS, 2020). "CAF World Giving Index 2018" shows that Indonesia placed in the top three country with highest giving index (Charities Aid Foundation, 2018). The giving index itself has three main criterias which are participation in helping strangers, cash donation, and voluntary activities (Charities Aid Foundation, 2019). Indonesia has going up to the first place in 2018 from the second place in previous year. Azizon & Chater (2020) in PEBS FEB UI (2020) clarified that people tend to be reciprocal and have a sense of togetherness when they share the same vision to achieve something, for example a target that has been set to ease other's burden. It is also related to the maqashid sharia concept in Islamic economics that drives people to merge between self-interest and social interest.

Donating money is closely related to the charity organization's role to implement the donation funding process. Various ways have been implemented to build a strong relationship between the charity organization and its potential donors both from offline and online initiatives. As for offline actions, charity organizations tend to open offices and offline booths in public places. They also utilized technology and the internet, not to mention, social media to boost their online awareness and traffic. We Are Social & Hootsuite (2020) have stated that as of January 2020, the total number of social media users in Indonesia has reached 160 million users which equals to 59% of the total population. Various charity organizations in Indonesia have already facilitated online donations via social media to digital application.

We Are Social & Hootsuite (2020) explained that Indonesia's social media users can be a potential market since it has more than a half of total population penetration. Moreover, Badan Pusat Statistik (2010) stated that Islam is the majority religion in Indonesia. In particular, donating and shodaqoh is recommended by Islam, which can be in the

Cite this Article as: Muhammad Hasbi Alvin SATYAWAN, N.I.S PUTRI S.E. "Determining Factors Influencing Muslim Donors' Intention to Donate via Social Media" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

form of compulsory (zakat) or sunnah such as infaq, shodaqoh, and waqf. Based on this, the correlation between the muslim population and social media users in Indonesia could be a potential increase in donations funding.

There is numerous research on donation behavior that has been done previously. Smith & McSweeney (2007), Ng et al. (2011), Masser et al. (2012), Knowles et al. (2012), and Charsetad (2016) have reviewed people's donation behavior through Theory of Planned Behavior framework. However, those researches only examine offline donation behavior. Since the research of online donation is still limited, this research will try to explain about online donation behavior. This research focuses on the social media usage as an online donation method.

Sura et al. (2017) have already researched regarding the extrinsic factors influencing people's attitude towards donating via social network sites, also its effect on the behavior intention. Therefore, this study attempts to specifically discuss about donation via social media, by adapting the previous study. This research is also adapting subjective norms and perceived behavioral control variables from previous research by Charsetad (2016), to complement attitude variables that also used in Sura et al. (2017) as a comprehend framework of Theory of Planned Behavior. Furthermore, since research and study regarding online donation through social media in specific is still very limited in Indonesia, we decided to do the research with aims to give more perspective on this topic. This research is relevance to get a deep-dive view of Indonesia's muslim population in online donation activities.

Literature Review

Donating Behavior

Donation is an activity of giving to people in need to increase their welfare (Otto & Bolle, 2011). According to Lim & Putnam (2010), donation aims to serve benefits for human's social-living, that goes along with various religious observance. Islam taught us about donation concept which is also known as infak/shodaqoh, as it was stated on the Qur'an surah Al-Baqarah verse 262. The Qur'an verse stated the rewards for people who donate sincerely, that they will receive the doubled rewards. Kasri (2013) has stated that donation behavior is influenced by donors' perception on understanding, values, and attitude towards donating. Donation could also be affected by external factors that motivate and influence individuals to donate (Treiblmaier & Pollach, 2006). Online donation is an alternative to the offline donation that already ineffective to the monetary donation collection (Hoefer, 2012). One of the determining factors influencing people's donation is a solicitation (Bekkers & Wiepking, 2011). Kim & Lee (2014) have stated that social network sites (SNS) is the best platform to support the solicitation. It is because SNS is believed as a platform to socialize, networking, also maintaining a social relationship through bonding and bridging concepts.

Charity Project

Charity project is a 'project-based' charity whereby the project is already created and people can donate to fund the project (Wash & Solomon, 2014). The charity project is targeting a single human victim whereby the victim has been already identified, or an abstract donation target whereby the victim has been not identified yet (Ein-Gar & Levontin, 2012). Kitabisa as one of the charity organizations in Indonesia has a fundraising concept with segmented donation target created by individuals or groups. Kitabisa categorized their charity projects into various classifications such as natural disaster victims, treatment of diseases, and animals' welfare. Moreover, there is Dompet Dhuafa that has five pillars of charity projects consist of education, health, economy, social and da'wa, also culture. Afterwards, there is Aksi Cepat Tanggap (ACT) that have voluntary concept on their donation activities.

Charity Organization

Charity organization is the organization that has a responsible to reach the potential donors and manage the received money donation, existing donors, and charity project (Sura et al., 2017). Charity organizations play important roles to serve and fulfill the people in need welfare, domestically or internationally (Cheung & Chan, 2000). Indonesia has several charity organizations with various purposes. Kitabisa has a fundraising concept with segmented donation target created by individuals or groups. Moreover, there is Dompet Dhuafa that focused on Islamic philanthropic funding. Furthermore, there is Aksi Cepat Tanggap (ACT) that have voluntary concept on their donation activities such as humanitarian and social mission that already classified. Some of charity organizations in Indonesia have already facilitated online donations via social media to website, such as Kitabisa that is doing the fundraising through their website platform.

Internet Technology Features

The Internet is a global system of interconnected computer networks that use the standard Internet protocol suite to serve billions of users worldwide (Olaniran & Rodriguez, 2013). Internet as an online donation platform has rapidly grown in the last few years (Shier & Handy, 2012). The rapid growth of the internet has driven by the success of online shopping transactions and online banking through internet (Treiblmaier & Pollach, 2006). Furthermore, the internet technology and its features such as security, straight-forward and time saving have driven the donation activities to go online through internet (Shier & Handy, 2012; Wong & Jusoff, 2011). Branston & Bush (2010), Wong & Jusoff (2011), and Shier & Handy (2012) have declared that the internet features such as security, privacy, effectivity and efficiency, to internet trustworthiness can affect its usage, one of which is to donate.

Social Network Sites Features

Social network sites (SNS) is web-based services that allow individuals to construct a public or semi-public profile within a bounded system, articulate a list of other users with whom they wish to share a connection, and view their list of connections, as well as the connections of those made by others within the system (Boyd & Ellison, 2007). Lovejoy & Saxton (2012) have categorized the communication features of SNS into three main parts; (1) information source that consists of messages and shared elements, (2) community builder that consists of dialogue element, and (3) promotion that consists of campaigns and promotes event elements. SNS has proven its capability to attract wide audiences and appeared to be a well favorable platform for online donations not only to reach potential donors, but also to sustain existing donors (Sura et al., 2017). The charity organizations in Indonesia have utilized the SNS features such as content personalization and customization. One of the created contents is the information about donation and the donating campaign.

Theory of Planned Behavior

Theory of Planned Behavior (TPB) is a theory that developed by Ajzen (1991). This theory was constructed to determine factors that influence people's intention to do certain behavior. TPB was an improvement of the Theory of Reasoned Action conducted by Ajzen in 1975 (Ajzen, 1991). TPB has three variables that influence people's behavioral intention, which are attitude towards behavior, subjective norm, and perceived behavioral control.

Attitude towards behavior is the tendency of individuals to value and evaluate whether good or not is a certain behavior (Fishbein & Ajzen, 2005). The evaluation can be determined as a combination of feeling response, emotion, and cognitive response that influence people's decision making. Attitude towards behavior can be determined by behavioral beliefs, the people's faith about the consequences of doing certain behavior (Ajzen, 2005). Subjective norm stands for people's perception on expectance from the most important people to them (significant others) about whether do or not a certain behavior (Ajzen, 2005). Those most important people can be their family, relatives, friends, partner, or circle. Subjective norm is basically influenced by the individual beliefs. Perceived behavioral control is an individuals' perception on whether easy or not in doing certain behavior (Ajzen, 2005). The perceived behavioral control can also be determined as an assumption about the existence of control beliefs that influence people's certain behavior. Ajzen (2005) explained that the perceived behavioral control can be determined by individual control belief strength such as the availability of resources, compatibility, competence, and opportunity that whether support or not to do a certain behavior.

Method

This research is a quantitative and conclusive study. This study took primary data with a questionnaire from Indonesian muslim citizens who have made donations via social media in the last six months as the research samples. The data was collected using the purposive sampling method. The research questionnaire consists of 38 indicators to explicate 8 variables. This research has collected 234 primary data from the screened respondents.

The purpose of this research is to analyze the determining factors influencing muslim donors' intention to donate via social media. Other than that, this research aims to analyze the extrinsic factors influencing muslim donors' attitude towards donating via social media. This research replicated the Theory of Planned Behavior also the extrinsic factors from Sura et al. (2017) dan Charsetad (2016) to conduct the research model. This research uses eight variables consisting of charity project, charity organization, internet technology features, social network sites features, attitude, subjective norm, perceived behavioral control, and intention to donate via social media, based on the research model.

The application of the Theory of Planned Behavior intends to predict the determining factors influencing intention to donate via social media. Ajzen (1991) assumed that the intention rolled as an important factor regarding how many efforts to do when doing a certain behavior. Furthermore, this research delivers the novelty of extrinsic factors including charity project, charity organization, internet technology features, and social network sites features, which can influence the muslim donors' attitude towards donating via social media. The assumption was supported by the result of the previous studies that state those factors can affect the muslim donors' attitude towards donating via social media (Castillo et al., 2014; Shier & Handy, 2012; Treiblmaier & Pollach, 2006; Van Iwaarden et al., 2009). Therefore, Figure 1 shows the constructed research model:

Figure 1: Research Model and Hypothesis

Based on the research model and literature review, this study aims to prove seven hypotheses as follows:

H1: Muslim donors' perception on charity project positively influences attitude towards donating via social media
H2: Muslim donors' perception on charity organization positively influences attitude towards donating via social media
H3: Muslim donors' perception on internet technology features positively influences attitude towards donating via social media
H4: Muslim donors' perception on social network sites features positively influences attitude towards donating via social media
H5: Attitude positively influences the muslim donors' intention to donate via social media
H6: Subjective norm positively influences the muslim donors' intention to donate via social media
H7: Perceived behavioral control positively influences the muslim donors' intention to donate via social media

The research model is analyzed using descriptive statistics and Structural Equation Modelling (SEM) method. This study elaborates the data regarding respondents' demography, social media donation activities, and answered questions about research variables using descriptive statistics. The reason of implementing the Structural Equation Modelling method is because it can analyze the correlation pattern between latent variables and indicators, one latent variable to the other, and find the measurement error simultaneously (Hair et al., 2014).

Structural Equation Modelling method starts with analyzing the measurement model using validity and reliability tests. The measurement model analysis is also using the goodness of fit test. Thereafter, the goodness of fit test is also conducted on the structural model analysis. Besides the goodness of fit test, the causal relationship analysis is also carried out on the structural model analysis that aims to verify the significance of the research hypotheses and its correlation value between variables. The causal relationship analysis consists of evaluating t-values, estimated coefficient (β), and coefficient of determination (R^2) on this research model.

Results

Demography

This research has collected 234 respondents from Indonesian muslim citizens who have made donations via social media in the last six months. Table 1 shows the demographic data of the respondents. Almost seventy percent of respondents are women. This research is dominated by 18-24 years old people (73,5%). About a half of respondents have finished their high school education (51,3%) and most of the others have achieved their bachelor's degree (38%). Most of the respondents have not married yet (76,9%). More than a half of respondents are students (57,3%) and most of the others work in the private sectors (21,8%). Majority of the respondents have IDR2-5 million (38%) and <IDR2 million (31,2%) of average monthly income.

Table 1: Demography

Demography Aspects	Respondents	Percentage	Demography Aspects	Respondents	Percentage
Gender			**Profession**		
Men	76	32,5%	Student	134	57,3%
Women	158	67,5%	Private Sector Employee	51	21,8%
Age			State Sector Employee	8	3,4%
<18 years old	6	2,6%	Teacher/Lecturer	2	0,9%
18-24 years old	172	73,5%	Entrepreneur	10	4,3%
25-39 years old	18	7,7%	Housewife	18	7,7%
40-59 years old	38	16,2%	Others	11	4,6%
Education Background			**Average Monthly Income**		
Senior High School/equivalent	120	51,3%	<IDR2.000.000	73	31,2%
Diploma	12	5,1%	IDR2.000.000 – 5.000.000	89	38%
Bachelor (S1)	89	38%	IDR5.000.001 – 8.000.000	30	12,8%
Master (S2)	13	5,6%	IDR8.000.001 – 11.000.000	12	5,1%
Marriage Status			IDR11.000.001 – 14.000.000	6	2,6%
Married	54	23,1%	IDR14.000.001 – 17.000.000	6	2,6%
Single	180	76,9%	>IDR17.000.000	18	7,7%

Structural Equation Modelling (SEM) Measurement Model

The measurement model was conducted by validity and reliability tests that aim to clarify how accurate indicators can represent its latent variables (Malhotra et al., 2017). An indicator can be stated as a valid indicator if it has ≥ 0,5 of standard loading factor (SLF) value and ≥ 1,645 (one-tailed) or 1,96 (two-tailed) of t-values, based on research hypotheses (Wijanto, 2008). Result of the validity test shows 9 invalid indicators, including all of the charity project variable's indicators, and have to be removed. The re-specification validity test is carried on to the remaining 29 indicators from 7 variables and has resulted in validity. Thereafter, the reliability test was conducted. A latent variable can be clarified as a reliable variable if it has ≥ 0,7 of Construct Reliability (CR) value and ≥ 0,5 of Variance Extracted (VE) value (Hair et al., 2014). The result shows all of the seven variables are reliable. Hence, the indicators are accurate and consistent on measuring the latent variables.

The goodness of fit test is also conducted on measurement model analysis. The goodness of fit test aims to verify how good is the research model to represent the data. The measurement model is good fitted based on a standard for each index according to Wijanto (2008). The result shows that the research model has a minimum of one good fit index from each absolute fit measures and incremental fit measures based on Hair et al. (2014). Therefore, the measurement model well-represents the data.

Structural Equation Modelling (SEM) Structural Model

The goodness of fit test is also conducted on the structural model analysis. The result shows that the research model has a minimum of one good fit index from each absolute fit measures and incremental fit measures based on Hair et al. (2014). Therefore, the structural model is good fitted or it well-represents the data.
The causal relationship analysis is also conducted on the structural model analysis by evaluating t-values, estimated coefficient (β), and coefficient of determination (R^2) on this research model that aims to verify the significance of the correlation value between variables. A latent variable can be stated as significant variable if it has ≥ 1,645 or ≤ -1,645 of t-value, based on a positive or negative hypothesis. Moreover, the estimated coefficient (β) was being used to compare the strength of each independent variable effect on dependent variable. Figure 2 shows that internet technology features (ITF) and social network sites features (SNSF) significantly influence the attitude (ATT) towards donating via social media. Social network sites features with the 0,36 of SLF value has the biggest effect on attitude towards donating via social media. Moreover, attitude (ATT), subjective norm (SN), perceived behavioral control (PBC) significantly influence the intention to donate via social media (INT). Perceived behavioral control with the 0,70 of SLF value has the strongest effect on intention to donate via social media.

Figure 2: Causal Relationship Analysis SLF and (T-value)

The causal relationship analysis is also conducted by evaluating the coefficient of determination (R^2) to clarify the variance of an endogenous variable that can be determined by exogenous variables. Table 3 shows that the intention to donate via social media can be 67% determined by attitude, subjective norm, and perceived behavioral control, whilst the other 33% are the factors outside the research model. Other than that, attitude can be 17% determined by charity organization, internet technology features, and social network sites features, whilst the other 83% are the factors outside the research model.

Table 2: Research Model Coefficient of Determination (R^2)

Structured Model	Errorvar	Coefficient of Determination (R^2)
INT = 0,22*ATT + 0,23*SN + 0,70*PBC	0,33	0,67
ATT = –0,12*CO + 0,17*ITF + 0,36*SNSF	0,83	0,17

Discussion

This research has accepted five out of seven hypotheses based on Structural Equation Modelling (SEM) method. Attitude, subjective norm, and perceived behavioral control positively and significantly influence the muslim donors' intention to donate via social media, also internet technology features and social network sites features can

affect their attitude. However, charity project and charity organization do not significantly affect the muslim donors' attitude towards donating via social media.

Hypothesis 1 shown that muslim donors' perception on charity project do not significantly affect their attitude towards donating via social media. This result was also founded by Sura et al. (2017). In contrast, Treiblmaier & Pollach (2006), Ranganathan & Henley (2008), and Van Iwaarden et al. (2009) have found that charity project affect someone's intention to donate online. The result implies that if the muslim donors' has a positive perception on: a charity project such as a charity for natural disaster victims; a charity project's location such as an underdeveloped and segregated region; and if they have an emotional attachment to a charity project such as a charity for cancer sufferer; those perceptions do not increase their positive attitude towards donating via social media. Reddick & Ponomariov (2012) and Mejova et al. (2014) have indicated that the result can be caused by a less-association or affiliation between donors to a charity project.

Hypothesis 2 stated that muslim donors' perception on charity organization do not significantly influence their attitude towards donating via social media. The result goes along with a finding from Sura et al. (2017). However, Treiblmaier & Pollach (2006), Ranganathan & Henley (2008), and Van Iwaarden et al. (2009) have found that the perception on charity organization can shape the donors' intention to donate via online. This research finding stated that if muslim donors' have a positive perception on a familiar charity organization that they emotionally attached to, it will not increase their positive attitude towards donating via social media. Afterwards, muslim donors' positive perception on a charity organization with a good track record and transparency will also not increase their positive attitude towards donating via social media. This finding possibly caused by a less-association or affiliation between donors and a charity organization, according to Reddick & Ponomariov (2012) dan Mejova et al. (2014).

Hypothesis 3 shown that muslim donors' perception on internet technology features positively and significantly affect their attitude towards donating via social media. The result is in line with a research finding from Sura et al. (2017). Sura et al. (2017) have stated that social network sites (SNS) operate and driven by the internet, whereby it is a strong foundation of SNS. Therefore, muslim donors aware that the internet drives the operation of social media, with the result that they concerned about the internet technology features. The findings indicate that the more muslim donors concern about internet security, privacy policy, effectiveness, and trustworthiness, also the online transaction reliability, it will increase their positive attitude towards donating via social media.

Hypothesis 4 stated that muslim donors' perception on social network sites (SNS) features positively and significantly influence their attitude toward donating via social media. This finding is not in line with the finding from Sura et al. (2017). According to descriptive statistics analysis, muslim donors have agreed that if they can fully utilize the SNS communication features, they will intend to donate. Muslim donors have also quite agreed that they will donate through a interactive SNS. The utilization of social media's communicative and interactive features by charity organizations can increase the muslim donors' positive attitude towards donating via the social media. Muslim donors have also strongly agreed that they donate based on the donating way informed via social media. It implies that the better a charity organization can inform and solicit muslim donors to donate (Kim & Lee, 2014), it possibly can attract them to donate (Plaisent et al., 2012).

Hypothesis 5 shown that attitude positively and significantly affect muslim donors' intention to donate via social media. The result goes along with a finding from Sura et al. (2017). According to descriptive statistics analysis, respondents have agreed that they experience the ease of use, security, and convenient while donating via social media. Therefore, the more muslim donors' feel easier, secure, and convenient to donate via social media, it will increase their intention to donate via social media.

Hypothesis 6 shown that subjective norm positively and significantly influences muslim donors' intention to donate via social media. This finding is in line with a research finding from Charsetad (2016). The result indicates that the more expectation from the most important and influential people to muslim donors' also their family and friends to donate via social media, it will increase their intention to donate via social media.

Hypothesis 7 stated that perceived behavioral control positively and significantly influences muslim donors' intention to donate via social media. This finding goes along with the result from Charsetad (2016). The result shown that the higher muslim donors' willingness to donate via social media, it will escalate their intention to donate via social media. Moreover, the more muslim donors are independent on making decision to donate via social media, it will increase their intention to donate via social media. Afterwards, the more muslim donors' perceived of ease while donating via social media, it will increase their intention to donate via social media. The results of hypothesis 5, 6, and 7 are in accordance with the Theory of Planned Behavior by Ajzen (1991).

Conclusion

The findings of this study showed that the more muslim donors have a positive attitude, the more driven by their the most important and influential people, and if it is easier to donate via social media, it will increase their intention to donate via social media. The muslim donors' perceived of ease has the strongest effect to escalate their intention to donate via social media Moreover, the results also stated that the more muslim donors aware and concern about the internet's security, privacy policy, effectiveness, and trustworthiness, also the online transaction reliability, it will escalate their positive attitude towards donating via social media. Afterward, the more familiar, easier, interactive, and communicative a social media that used for donating, it will increase muslim donors' positive attitude towards donating via that social media. The social media features have the biggest effect to increase muslim donors' positive attitude towards donating via social media. However, muslim donors' perception on charity project and charity organization do not positively affect their attitude towards donating via social media.

Implication

This study delivers some recommendations for the charity organizations. Perceived behavioral control has the biggest influence on muslim donors' intention to donate via social media. The perceived behavioral control is regarding to muslim donors' desire, independency to make a decision, and perceived of ease to donate via social media. The charity organizations have to concern about muslim donors' willingness and their decision making to donate via social media. The charity organization can utilize the social network sites or other online platforms, such as websites or digital applications, as a most easier donation collection method. Organisasi amal dapat menerapkan situs jejaring sosial maupun platform daring lain, seperti situs web atau aplikasi digital, sebagai metode penghimpunan yang memudahkan. The use of those platforms aims to facilitate the easiest donation methods for muslim donors, with the result that they will not experience barriers and have a willingness to do.

Furthermore, social network sites features has the strongest effect on muslim donors' positive attitude towards donating via social media. Regarding to this study, muslim donors: donate via a familiar social network sites; donate in accordance with a donation method informed via social network sites; and use the user-friendly social network sites. The charity organization can consistently utilize the social network sites and its features as a donation method, particularly to communicate the way to donate that muslim donors can do. The charity organizations can clearly inform the muslim donors how to donate by scanning a QR code and donate with a digital wallet or bank transfer. The charity organizations can also consistently describe their charity projects or donation targets to muslim donors through social media contents. The aim is to attract potential donors and increase the charity organizations' donation collection.

Regardless of the findings, this research has limitations that can possibly be evaluated and developed in further research. This study did not do the analysis on a specific respondents' demography. This study was also dominated by the Z Generation attaining the age of 18 to 24 years old. Moreover, attitude as the endogenous variable can be only 17% determined by the exogenous variables, charity organization, internet technology features, and social network sites features, whilst the other 83% are the factors outside the research model. This study did not investigate a certain social media used for donating. The research findings could be confirmed by its research model with more respondents to generalize the analysis, also with the robustness check. Moreover, the further research could analyze a certain respondents' demographic background and could also do the inspection on a specific social network site usage or compare various sites.

Appendix

Appendix 1: Variables' Indicator

Indicator	Descriptive Statistic
Charity Project	
(CP1) I chose to donate via social media because of the charity project type	5,16
(CP2) I chose to donate via social media because of the location of the charity project	4,20
(CP3) I chose to donate via social media because of the emotional attachment I had to the charity project	4,74
(CP4) I prefer to donate via social media to human welfare charity project	4,92
(CP5) I prefer to donate via social media to a single charity project rather than fundraising	4,43
Charity Organization	

(CO1) I donate via social media only to the familiar charity organization	4,68
(CO2) I donate via social media only to the charity organization that has a good track record	5,19
(CO3) I donate via social media only to the organization that transparent in managing money donation	5,26
(CO4) I donate via social media only to the organization that frequently update its information	4,82
(CO5) I donate via social media only to the organization that I have emotionally attached to it	4,26
Internet Technology Features	
(ITF1) I am concerned about the internet security	5,44
(ITF2) I am concerned about the online transaction reliability	5,46
(ITF3) I am concerned about the internet trustworthiness	5,34
(ITF4) I am concerned about the internet privacy	5,50
(ITF5) I am concerned about the internet effectiveness	5,39
Social Network Sites Features	
(SNSF1) I donate only via the familiar social media	4,74
(SNSF2) I donate based on the donating way informed via social media	5,23
(SNSF3) I donate only via the user-friendly social media	5,09
(SNSF4) I donate only via social media that has fully utilized communication features	4,49
(SNSF5) I donate only via the interactive social media	4,34
Attitude	
(ATT1*) Donating via social media is generally problematic	4,90
(ATT2*) Donating via social media is generally not secure	4,41
(ATT3*) Donating via social media is generally not easy to do	4,81
(ATT4*) Donating via social media is generally inconvenient	4,88
Subjective Norm	
(SN1) Most people who are important to me think that I should donate via social media	3,38
(SN2) The people who influence my decisions think that I should donate via social media	3,32
(SN3) My parent think that I should donate via social media	2,95
(SN4) My friends acknowledge my donation via social media	3,41
Perceived Behavioral Control	
(PBC1) If I wanted to, I could donate via social media	5,26
(PBC2) It is mostly up to me whether or not I donate via social media	5,35
(PBC3) My donation via social media is likely to be influenced by factors beyond my control	4,69
(PBC4) My donation via social media is generally not obstructed by anything	5,15
Intention to Donate via Social Media	
(INT1) I have an intention to donate via social media	5,34
(INT2) I have an intention to donate via social media in the near future	5,38
(INT3) I plan to donate actively via social media in the near future	5,16
(INT4) I plan to contribute myself to a donation program via social media in the near future	4,93
(INT5) I have an intention to donate via social media if I have a chance to do so	5,26
(INT6) I have an intention to donate more via social media	5,08

Email: kwalancik@gmail.com

Recevied from: Agnieszka Piróg APirog@wsb.edu.pl

Abstract

This article presents a description of the application of an innovative method in distance lifelong learning for adults, in international perspective (Poland, Czech Republic, Republic of Lithuania, Republic of Latvia). The participants completed course modules individually. They gained knowledge, skills and competences in the areas of learning Polish, ICT, and entrepreneurship.

Keywords: lifelong learning, e-learning, Moodle platform

Introduction

The purpose of this article is presentation of an innovative lifelong learning method using the *Moodle* Platform in international perspective. This procedure was executed within the scope of the Erasmus+ project carried out by the WSB University.

The project leader, the WSB University, and project partners (the Polish Cultural and Educational Union [PZKO] in the Czech Republic, the Association of Polish Scientists in Lithuania [NPL], Polish Association in Latvia, Association Branch in Jekabpils, Polish Association "Compatriots" [Rodacy] in Jekabpils) assumed that adult education organizations deserve a discussion on education (Dollhausen, Schrader, 2015, s. 174) and practical actions. The proposed method allowed engaging in the process of educating older generations of Poles with the participation of the youth living outside of the country's borders. Engagement is an element of the process of development and self-education (Kuvass, 2006, pp. 504 – 522) of adults, the elderly, and youth who will want to educate or develop e.g. Polish, IST competences, and entrepreneurship. It was assumed that lifelong learning is a part of lifelong learning of adults (Knowles, Holton, Swanson, 2014, pp. 17- 22) understood as the entirety of cognitive activities undertaken during the life for the purpose of gaining knowledge, skills or qualifications (for personal, social, or professional reasons) (Tissot, 2004, p. 103). It is our duty to create possibilities to learn from the youngest years until late adulthood (Seitter, 2015, pp. 87–92).

Methodological Assumptions

The applied research method was a case study. As noted by A. Langley and I. Royer (Loangley, Royer, 2003), research instrumentally based on a case study (then there are so called internal intrinsic studies) provide data and allow to generalize. The case study allowed interpreting the social pluralities, i.e. the use of an innovative learning method including the *Moodle* Platform along with tests in the international dimension. The case study provides three important benefits: motivation, inspiration, and action illustration. The presented case involved an analysis of the execution of the adopted lifelong learning concept in defined social groups using the *Moodle Platform.* The purpose of the Case study was to recognize and describe: How to use innovative learning methods in lifelong education of adults? The initial part of the project included surveys (Babbie, 2001, p. 268) to learn about the expectations of potential course recipients. How to prepare e-learning courses to develop essential competences such as the ability to use Polish, the knowledge of basic entrepreneurship and finance, the knowledge of information technology? The research was conducted in the form of a questionnaire. Local coordinators (the Czech

Cite this Article as: Karolina WALANCIK - RYBA " An Innovative Method in Lifelong Learning – E-Learning Platform" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

Republic, Latvia, Lithuania and Poland) conducted the tests in their parent organizations in January and February 2017. Participants of the research included 58% of women and 42% of men. They were aged 25-60. 75% of respondents were aged 55-70, and 25% were aged 25–45. These persons were residing in Silesia in Poland, the Vilnius region in Latvia, the Morawsko–Silesian region in the Czech Republic and in the Jēkabpils region in Lithuania.

Use of the Moodle Platform as an innovative method in lifelong learning

Three project teams participating in the research were formed for non-formal lifelong learning of mature persons. The non-formal lifelong learning tool was the e-learning platform (www.wiedzabezbarier.eu.) Three courses were installed on the platform. Each of these courses included a different number of modules: Polish language, ICT competences, and entrepreneurship. Communication between partners regarding technical handling of the platform was conducted using the discussion forums on the e-learning platform, www.wiedzabezbaier.eu, by telephone, and by email.

The results of conducted surveys confirmed that older people do not lose flexibility in terms of learning and developing skills that ensure successful functioning (Trempała, 2015, pp. 31- 45). Learning and/or developing Polish was important for respondents. The second priority was gaining ICT competences. The third priority were competences in the area of entrepreneurship. During network meetings, respondents underlined that the form of lifelong education using the e-learning platform allows updating knowledge related with professional activity. Educational activity of respondents was restricted, for various reasons (see Aleksander, 2016, p. 12). The expectations of respondents from different countries were varied. The differences concerned e.g. the Polish language course, which was prepared and adjusted to expectations of individual environments. In Lithuania, most Polish people who live there know Polish very well or well. Therefore, recipients expected to improve their vocabulary only. In Latvia, Polish residents expected a basic form of learning Polish. In the Czech Republic, Polish people mainly expected a basic course of Polish, including youth language. Secondly, they expected course modules aiming at correctness, language „rescue" and a translator. In addition, expectations of Poles living in the Silesian Cieszyn area were accounted for in terms of modules such as e.g. regional Polish kitchen.

In terms of the course on entrepreneurship, respondents expected that modules will include e.g. the basic stages of creating a small business organization (production, trading or services). It was determined that the cognitive purpose of the course is to present participants with the stages of creating independent business entities – their own companies. Participants expected information concerning motivation to start own business, planning ventures, innovation, social inclusion processes, and not exclusion due to age, language barriers and other.

In terms of ICT, expectations of partners were similar. Most respondents (75 %) had basic skills on using IT tools. The course was to allow expanding knowledge, gaining skills and social competences in the area of using IT tools to obtain, assess, maintain, create, present and share information, and to communicate and participate in cooperation networks using the Internet.

Summary

The first correspondence course was conducted in 1728 in the United States

Innovation in the presented case means using e-learning and the Moodle Platform for non-formal education of adults using presented courses, adjusted to the recipients' age, as well as their skills and competences in the area of using ICT tools, preparation of E-books for authors and users of the platform as well as methods of non-formal education. The innovation in this part of Europe also included the fact that remote e-learning and the Moodle Platform were used within the scope of a scientific/social partnership, or, to be exact, a scientific/private/partnering dimension. It is worth to transfer knowledge at the level of platform users, by way of adding more unique courses related e.g. to history, culture, or personal interests. Free use of the platform and making it available for other countries, organizations, associations, support groups, or individuals constitutes added value. Poles living abroad will be able to use it thanks to promoting the platform's results amongst Polish associations worldwide. This type of tool should be used in lifelong education. The benefits of e-learning include:

- Increasing the scope of learning, generally without territorial restrictions;
- Possibility to educate at any place and time;
- Facilitating communication between students and the teacher, expert, mentor;
- Delivering courses adjusted to students' needs and pace;
- Differentiation /enrichment of courses thanks to applying the ICT technology;

- Working time of students adjusted to expectations;
- Minimizing fear and shyness, which may be present in case of traditional learning;
- Individual control and supervision of every individual student;
- Individualized learning process, independent selection of the preferred form of providing knowledge;
- Possibility to use the courses again;
- Organizational profits in case of dispersed education and constantly changing students;
- Developed remote interpersonal relations (creating mutual support groups);
- Profitability and amortization of financial outlays (financial benefits for course organizers: no trainer fee, no costs of lease, accommodation, board and similar, no disorganization of the work of company departments);
- Time savings (no commuting to the location of training; no need to stop the daily routine);
- Better ability to control training by the organizer (Morbitzer, Walancik 2018, p. 13).

Remote learning has its specificity. It requires skills and additional competences as well as engagement, both on the part of the teacher and the student. Without this, the process may not be very effective.

Currently, the use of e-learning courses to gain knowledge, skills, or social competences is becoming increasingly popular (Chang, 2016, pp. 476–485, Aparicio M., Bacao F., Oliveira T. (2016), Aparicio M., Bacao F., Oliveira T. 2016). The presented platform is still operating (www.wiedzabezbarier.eu.)

Evaluation of Grapevine Production in The World and in the Czech Republic, An Issue of Global Wine-Making Power

Kamila Veselá – Česká zemědělská univerzita v Praze

Lucie Severová – Česká zemědělská univerzita v Praze

Annotation

In vino veritas – "in wine lies the truth" - and it is also true that for centuries wine has belonged among the most popular consumer commodities all over the world, a state of affairs which will probably not change much in the future. Wine production represents an important item in the gross domestic product (GDP) of many economies. In the long term, Italy, Spain and France are undoubtedly among the most significant wine producers, as well as the largest exporters of this commodity. Many studies have been carried out regarding the impact of wine consumption on human health, and several positive influences have been established. This fact probably plays its role in wine consumption. The aim of this text is to evaluate world grape production and wine consumption and to characterize the changing positions of the largest producers and exporters. The article uses time series analysis on the development of grape production, the export and import of grapes, and subsequently wine consumption, in order to analyse and evaluate the role of different countries and their positions on the grape market. Both absolute and relative indicators, as well as the trends of these indicators, are evaluated in the time series analysis. The United States of America, France and Germany can be counted among the countries with the highest wine consumption. They have strong leading positions on the global wine market and therefore they significantly influence its pricing policy.

Keywords: Czech Republic; GDP; wine; vine; harvest; production

Introduction

Wine is one of the commodities with stable consumption and production in virtually all countries around the world. It is a specific commodity, the demand for which depends on a number of factors, such as consumer habits and preferences, but also on current moral attitudes towards drinking wine and alcohol -warning advertisements on the effects (in particular, the negative effects) of alcohol consumption on human health. Consumer behaviour on the Czech wine market has been analysed by researchers such as Chládková (5). The Czech Republic not only has a strong demand for wine and a large number of wine consumers; it is also a country with a long tradition of wine production. The demand for wine has old roots in the Czech Republic, and not only has there virtually always been a demand, but it has been increasing in recent years (8, 10), as evidenced by statistics showing that wine consumption was 15.4 litres per capita in 1995 and 20 litres per capita in 2012 (2). In recent decades, a number of changes have taken place that have also affected the wine market. In the 1990s, the Czech Republic opened up to the world and began actively to export and import wine. Another significant change for the wine market was the accession of the Czech Republic to the EU, which had a significant impact on the structure and scope of the country's foreign trade in wine. Despite this change, most Czech producers are convinced that their wines will be competitive in the EU (11). The key factors influencing the Czech wine market and the issue of measuring its competitive strength were addressed by researchers such as Žufan (16). Chládková et al (6) found that a key innovative element that has an impact on wine production in EU countries is the application and enforcement of unifying European legislation. They also point out that the profitability of Czech viticulture largely depends on domestic consumption within EU countries. Harmsen et al (4) pointed out the trend in European viticulture towards changing its structure and focusing on wines with a higher added value and quality, which is also reflected in pricing policy. Of course, it is not only Czech viticulture that is undergoing changes. The issue of Hungarian viticulture was addressed by Török and Tóth (15), who point out that if Hungarian wine producers were able to share their knowledge with their competitors, they could significantly improve their position in the global market. Stasi et al (9) dealt with the issue of competition on the Italian wine market.

The aim of this article is to evaluate grape production in Europe by analysing viticulture productivity in individual European countries. This aim is realized by assessing the following research theses.

Cite this Article as: Kamila Veselá and Lucie Severová " Evaluation of Grapevine Production in The World and in the Czech Republic, An Issue of Global Wine-Making Power" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

Research thesis 1: the accession of the Czech Republic to the European Union affected the country's grapevine production.

Research thesis 2: grapevine production in the Czech Republic and around the world is prone to global shocks such as financial crises or drops in global productivity.

Methodology, Data Sources

The article uses secondary data sourced from the Czech Statistical Office, Eurostat and The International Organization of Vine and Wine. Time series are analysed for the period 1995-2016. Research thesis 1 is evaluated by an analysis of the time series of wine production in the Czech Republic, wine exports and imports, and wine consumption. The absolute values of these indicators, the annual deviations in absolute and relative terms, and the trend of the individual functions are all examined. The research also includes an analysis of the area of vineyards in the Czech Republic, including a breakdown by region. The length of the time series makes it possible to monitor any deviations and changes at the time of the Czech Republic's accession to the European Union.

Research question 2 is answered using an analysis of time series on worldwide wine production and consumption. In addition to an analysis of the absolute and relative values, the analysis also includes an examination of the development of the global wine market's structure broken down by individual countries and continents. The question of whether the global wine market is prone to external negative shocks is answered by comparing the development of global wine production and global GDP and measuring their correlation. Calculations and correlations are performed using the SPSS program.

Results and Discussion

As mentioned above, the Czech Republic is one of the countries where viticulture has a long tradition and relatively stable production. The following chart shows the development of the area of vineyards in the Czech Republic (CZ) since 1995. The above chart shows fluctuations in this area, but these are relatively low values. The only years in which a significant change occurred were the years 2002 and 2003, when the area of vineyards increased by almost 17 % per year. Other than these two years, the average area of vineyards increased/decreased by 0.33 %.

Chart. No. 1 Development of the area of vineyards in CZ

Source: data from the Ministry of Agriculture (3) processed by the author

The South Moravian Region has traditionally been the wine region of the Czech Republic. In 2018, its production made up 93 % of the total Czech production. Of the other regions, the region with the most significant share in Czech wine production is the Zlín Region (which accounts for 3 % of the Czech Republic's total production), followed by the Ústí nad Labem Region (1.8 %) and the Central Bohemia Region (1.7 %). Tomšík and Chládková (14), among others, offer a more detailed analysis of viticulture and winemaking in the Czech Republic.

Chart. No. 2 Consumption, production and import of wine to the Czech Republic

Source: data from OIV (12) processed by the author

Chart No. 2 shows the consumption, production and net import (calculated as the difference between total and wine production) of wine to the Czech Republic. Several conclusions can be drawn from the above chart:

1) For the entire monitored period, domestic production was not sufficient to satisfy domestic consumption.

2) The difference between domestic production and domestic consumption is increasing over time (e.g. in 1999, the difference between domestic production and domestic consumption was -87 000 hl, and in 2016 it was as much as -1 289 000 hl). This is due to the clear growth of domestic wine consumption, which more than tripled during the monitored period. Žufan (16) and Kučerová (7) also mention the growing consumption of wine in the Czech Republic.

3) Imports are necessary to ensure the satisfaction of domestic consumption. The sources for satisfying domestic consumption are thus domestic production combined with net imports (imports adjusted for the export of part of domestic production).

4) Apart from small deviations, domestic production shows stable development with an average annual deviation of 4.5 %.

5) Wine consumption and production in the Czech Republic does not show dependence on external shocks, such as the global financial crisis in 2008.

6) Until 2004, i.e. before the Czech Republic joined the EU, the average growth of wine consumption in the Czech Republic was 4.21 % per year, and after the Czech Republic joined the EU the consumption growth rate accelerated to 8.34 % per year.

The structure of the country's foreign trade in wine shows a clear trend in the growth of exports and imports. While exports show an average growth rate of 16.88 %, in the case of imports it is 8.77 %. In absolute terms, however, imports completely dominate exports, which is a consequence of the growing domestic demand for (consumption of) wine and the insufficient domestic production to satisfy it. This is in line with the research of Tomšík and Sedlo (13). Also Černíková (1) pointed out the growing threat to Czech winemakers arising from table wine imports.

Chart. No. 3 Development of the growth rate

Source: data from the Czech Statistical Office (6) and the Ministry of Agriculture (3) processed by the author

The development of the growth rate of the gross domestic product of the Czech Republic and the production and consumption of wine are shown in Chart 3. When comparing growth rates (measured as an annual percentage change) and determining the degrees of correlation between GDP and wine production and GDP and wine consumption, no direct correlation has been found between GDP and wine production and GDP and wine consumption. The degree of correlation, as expressed using a correlation coefficient (i.e. the Pearson correlation coefficient), was 0.44 for GDP and wine production, and 0.23 for GDP and wine consumption.

Global wine production has seen a positive trend in recent years. In 2018, wine production reached the record-breaking level of 293 million hectolitres (292.3 million hectolitres in 2019). From European countries, the largest wine producers are Italy, Spain and France; and from non-European countries, they are the US, China, Argentina and Chile. Comparing grape production over time, it can be concluded that the global harvest is stable over time. There are slight deviations, mainly due to the weather, which is an important factor in wine production. However, wine production has long been fluctuating around 270 million hectolitres per year.

In a comparison of global wine production from 1995 and 2016, there was an 8 % increase in wine production, and global wine consumption increased by 6.5 %. In 1995, global wine consumption per capita was 41.7 kg, and in 2016 it was 49.4 kg. The average wine consumption per capita for the monitored period was 46 kg. A significant change in consumption did not occur until 2001, when consumption per capita fell to 16.4 kg, which corresponds to a decrease of 65.6 % compared to 2000. In 2002, global consumption had already returned to the long-lasting average values.

The development of the global area of vineyards is also stable in the monitored period. In 2016, the global area of vineyards was 7,453,532 hectares, and the average change in the area of vineyards over the monitored period was 0.21 %. Chart 4 shows the development of global wine production in comparison with its consumption. Several conclusions can be drawn from the information above:

Chart. No. 4 Development of global wine production and consumption

Source: data from OIV (12) processed by the author

1) There is a surplus of production over consumption throughout the monitored period, which is reflected in the fact that the global area of vineyards and wine production are able to meet the global demand for wine throughout the monitored period.

2) The surplus of production over consumption shows relatively stable values - on average, 37 million hectolitres of wine (as follows by the chart no.4).

3) Small annual changes can be observed in both the consumption and the production of wine - on average, 0.38 % per year for global consumption and 0.44 % per year for global production. In the long run, however, both global production and global consumption show a slight trend towards growth as well as the gross domestic product (GDP). The development of the growth rate of wine in comparison with the growth of real GDP shows Chart No. 5.

Chart. No. 5 Development of the growth rate of wine production and consumption and real GDP

Source: data from the Czech Statistical Office (6) and the Ministry of Agriculture (3) processed by the author

4) The direct impact of negative external shocks (such as the financial crisis of 2008/2009) on global wine production and consumption has not been demonstrated, although a decline can be observed during and after the financial crisis, in particular in the case of wine consumption. This is also confirmed by the analysis of the correlations between GDP and wine consumption and GDP and wine production. The correlation coefficient (the Pearson correlation coefficient) is 0.48 for the dependence between GDP and global wine consumption, and 0.08 for the dependence between GDP and global wine production.

Conclusion

The wine market in the Czech Republic and the global wine market show similar trends in some cases. Wine consumption has been growing for a long time, both in the Czech Republic and globally. Per capita consumption shows average values of 42–48 kg, and changes in the areas of vineyards have been negligible both in the Czech Republic and globally. In the Czech Republic, however, there has long been an imbalance between wine production and wine consumption. This imbalance has actually been increasing over time, as domestic wine production is unable to meet the growing domestic demand for wine. Negative external shocks have an impact on most markets. The wine market also slowed down in the period after the financial crisis in 2009, but not to any significant degree. The impact of the Covid-19 coronavirus pandemic on future wine production is a question for future analysis.

Abstract

This study focuses on theoretical and practical aspects (elements of best practice) that indicate the possibility of developing and applying a risk model for the measurement of safety performance. Achieving the intended goal required solving the following issues: developing a model to measure the usefulness of the risk management system, distinguishing significant quantities describing its utility attributes, determining the method of measuring utility attributes.

Keywords: Risk, Risk Model, Security Model.

Introduction

Each enterprise for which there is a high risk of threats - regardless of the location, size, nature or type of activity - should consider the possibility/necessity of developing and implementing an appropriate risk model to measure its current safety status. By adopting a proactive approach to measuring the state of security, enterprises not only avoid system failures and potentially costly incidents, but also benefit from business efficiency.

For example, the same threats criteria that reveal whether the risk is under control, can often show whether the working conditions are optimized.

The aim of this article is to identify the possibilities and propose the way of using them to measure the level / state of security of an enterprise. The detailed task is to formulate a risk model for the purpose of measuring safety both in relation to the entire enterprise and its basic components, e.g. domain systems, domains of operation, processes, utility attributes and justification of the method of such conduct that ensures the maintenance of an acceptable level of security. The following elements constitute the main part of the article:

- enterprise security model,
- distinguishing significant values describing the state of security of the enterprise (sets of protected objects, sets of threats, sets of threat criteria / indicators of results and activities along with related measurement systems used to measure the state of security),
- threat risk model,
- the method of measuring the size of the risk of threats.

When building the security model of the enterprise and the appropriate risk model for the purpose of measuring the state of this security, the principle was adopted that enterprises must have specific performance properties that determine such attributes as: functionality, reliability, business continuity, and above all functional security and information security.

Security and enterprise security model.

On the basis of praxeological systems of operation, the state of security of an enterprise can be defined using the following expression:

$$B(t) = \mathcal{F}(\mathrm{Z(t)}, Q(t+T)) \tag{1}$$

where:

Cite this Article as: Jarosław NAPIÓRKOWSKI and Jerzy STANIK "Risk Model for The Measurement of The Enterprise's Security Condition" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

$B(t)$	-	the current security state of the system at time t;
$Z(t)$	-	real level of system security threats at the time t;
$Q(t+T)$	-	real possibilities of counteracting threats in the moment t;
T	-	planning horizon of crisis response.

Due to the great difficulties in studying dynamic safety-shaping systems, taking into account the time factor, in further considerations, the time variable will be replaced with generalized states of potential (hypothetical) and real (real) threats:

$$\mathcal{R}: Z^P \xrightarrow{t \in T} Z^R(t) = Z^R \tag{2}$$

where:

$\mathcal{R}$	-	the function of transforming potential threats into real threats;
Z^P	-	static set of potential threats;
$Z^R(t)$	-	dynamic set of real threats.

Practically, only real threats determine the degree of safeness (danger) of a given enterprise in specific environmental conditions and at specific time. In this sense, a collection real threats is only a certain subset of potential threats, the probability of which is relatively high, and the negative effects and consequences of these events are estimated at a high level of losses or damage.

Following the above definition of security, we adopt a structured five as the security model of enterprise:

$$MB =< POF, PDZ, \mathrm{SZG}, \mathrm{SZB}, \mathrm{WB} > \tag{3}$$

where:

PSF	-	a security or activity subject, which is a set of functional persons creating the organizational structure of the company's security
PDZ	-	the security or activity object, which are selected objects, systems or processes of the enterprise, in relation to which the required level of security should be maintained,
SZG	-	a system of threats, i.e. destruction of the current level of enterprise security,
SZB	-	a security system, i.e. responding to threats or incidents, working to reconstruct this security,
WB	-	set of security indicators.

Subject of security

From the point of view of controlling the current level of security or maintaining an acceptable state of security of the enterprise, the subject of security / operation is a set of functional persons appointed within the security structure or the existing Information Security Management System (ISMS):

$$SF = \{sf_p =< OF_p, NP_p > \in \Theta \times 2^{NP}, p = \overline{1,P}\} \tag{4}$$

where:

P	-	number of distinguished functional positions in the security structure of the enterprise,
Θ	-	a set of functional persons that can be appointed within the security structure (eg security inspector, security specialist, etc.); the set of these people is established at the stage of designing the enterprise security structure or information security management system (ISMS),
NP	-	a set of tools (security measures or mechanisms) at the disposal of functional personnel, necessary to measure the current level of security and maintain the required security level of the enterprise.

Object of security

From the point of view of the possibility of measuring the state of security of the enterprise, the object of security / action is a set of such protection elements $e_j \in E$, the current security status of which may change the system of threats, and establish it as the desired security entity.

$$E = \{e_j =< NZ_j, K_j, ZC_j > \in NZ \times K \times 2^{ZC}, j = \overline{1,J}\} \tag{5}$$

where:

NZ	-	set of protection element names,
K	-	set of protection object category names,
$2^{ZC} \supset ZC_j$	-	set of distinguished features for the j-th protection element,

J - number of distinguished elements of enterprise protection.

Each element from set E is numbered $j \in \mathbb{J}$ and is described by the set ZC_j of feature names. In addition, any element in set E can belong to only one category of security object names: people (L), system (S), process (P), information resource (I). There is at least one security status indicator for each security object feature.

Threats and the system of threats

On the pages of scientific publications of most empirical disciplines, in popular science publications, in everyday life, the term "threat" appears very often and - unfortunately - in various meanings [1, 2, 8, 11, 15].

For the purposes of this article, we assume the following threat is a: *"certain state caused by the perception of phenomena that are subjectively assessed as unfavorable or dangerous, or a situation in which there is a probability of a state dangerous to the environment, or an objective factor causing states of uncertainty and fear "*.

A threat is a potential loss / damage possibility, a virtual creation described by at least two groups of variables:

- the state of the analysis domain that may lead to loss / damage,
- the amount of losses / damages expected as a result of the activation of the threat.

The enterprise's threat system is a set of threats and the connections between them that generate various states of danger for the company. For the purposes of modeling, it can be described by the following expression:

$$SZG =< Z^P, Z^R, C >, \tag{6}$$

where:

Z^P - a set of potential (hypothetical) threats,
Z^R - a set of real and current threats at the moment,
C - a set of risk assessment criteria (a set of risk components).

In order to make further considerations more realistic and bring them closer to the exemplary praxeological applications, the set of potential threats will be initially divided into three categories, concerning, respectively: natural threats, technical threats, and social threats. Individual categories are broken down into different subcategories, classes and types.

The transformation of the static set of potential threats into the categories of dynamic (kinematic) real threats directly affecting the security of a given enterprise takes place using function of the system risk, that in the literature is most often defined as the influence of uncertainty on goals or in a descriptive manner, as a random attribute of decision making.

A set of criteria $\mathbb{C} = \{ C_i : (i = 1,2, \dots , m)\}$ can be decomposed into the following subsets:

1) due to its role in the generally accepted definition of risk:

$$\mathbb{C} = \mathbb{C}^P \cup \mathbb{C}^C, \tag{7}$$

where:

$\mathbb{C}^P$ - criteria describing the Possibility of threat activation
$\mathbb{C}^C$ - criteria describing the Consequences of threat activation

2) due to issues related to the enterprise's security policy:

$$\mathbb{C} = \mathbb{C}^{SC} \cup \mathbb{C}^{GP} \cup \mathbb{C}^{TI} \cup \mathbb{C}^{EC} \cup \mathbb{C}^{RR}, \tag{8}$$

where:

$\mathbb{C}^{SC}$ - Criteria describing a security culture (Policies, personnel and overall security management),
$\mathbb{C}^{GP}$ - criteria describing General Procedures,
$\mathbb{C}^{TI}$ - criteria describing Technical Issues,
$\mathbb{C}^{EC}$ - criteria describing External Cooperation,
$\mathbb{C}^{RR}$ - criteria describing the readiness and responding to emergency situations.

Taking into account the nature of the impact of one or several criteria on the remaining criteria from set C and the risk component quantification scheme, it is a set of criteria $\mathbb{C} = \{ C_i : (i = 1,2, \dots , m)\}$ can be decomposed into the following subsets:

$$\mathbb{C} = \mathbb{C}^T \cup \mathbb{C}^E, \tag{9}$$

where:

$\mathbb{C}^T$ - table criteria,
$\mathbb{C}^E$ - risk enhancers.

The table criteria may refer to any element from set E and directly describe the effects of threat activation. The table criteria are also referred to as the risk component quantification schemes for this criterion. A table-structured diagram of the quantification of the risk component for a given criterion "threat activation effects" as an example is presented in Table 1.

Table 1: Scheme of quantification of the risk component for the criterion "effects of threat activation"

No.	Level	Description
1	Low (green)	**Incident** - any event, other than an accident or major accident, that affects the safety of the company
2	Medium (yellow)	**Accident** - an unwanted or unintentional sudden event or sequence of events with severe consequences
3	High (red)	**Serious accident** - an accident caused by a collision or breakdown, with at least one fatality or at least five seriously injured persons, or causing significant damage to the company's assets or the environment, and other similar accidents having the same consequences and obvious impact on the regulation of the company's safety or on safety management .

This diagram assumes that the activation of each of the threats may lead to at least an incident, which is consistent with the definition of the threat (it always affects the security of the enterprise). The scheme of quantifying the risk components organized by tables leads to the determination of one of three levels of risk (e.g. green, yellow, red or low, medium, high). The levels of risk components determined in words can then be assigned values from the set Ω_i= {1, 2, 3} or Ω_i= {1, 3, 5}.

For an enterprise, it is assumed that the risk components of threats resulting from some criteria have the character of factors influencing the risk value resulting from other criteria. This concept / approach is referred to in the literature as' risk enhancement. Moreover, it is assumed that risk enhancers are characterized by natural numbers w ($w \in \mathbb{N}$), , such as the number of information resources, the number of procedures or the number of services. The maximum permissible value of the characteristic w is known, denoted a w_{MAX}. The impact of such an amplifier on the overall value / value of the risk measure is determined by its factor α, determining the set of measures of risk levels according to a given criterion:

$$\Omega_w = \{1 + \alpha \cdot \frac{0}{w_{MAX}}, 1 + \alpha \cdot \frac{1}{w_{MAX}}, \ , \dots ,1 + \alpha \cdot \frac{w_{MAX}}{w_{MAX}}, \}, \tag{10}$$

where:

Ω_w - a set of measures of risk levels,
α - risk enhancement coefficient,
w_{MAX} - the highest allowable value of the characteristic w.

In such a situation, the level of the risk component is determined by the formula:

$$r_w = 1 + \alpha \cdot \frac{w}{w_{MAX}}, \tag{11}$$

where:

r_w - risk component level according to the risk enhancer,
w - value of the considered characteristic,
α - risk enhancer coefficient,
w_{MAX} - the highest allowable value of the characteristic w.

Due to the nature of risk enhancers, their importance is always assumed to be 1.

Control System

In the security structure of the enterprise, the secondary system is the reaction system, hereinafter referred to as the control system, which is a logical successor of objectively existing potential threats, which under certain conditions turn into active real threats, having a destructive impact on the security level of a given enterprise. The control system is a protective shield of the company's operation system against offensive intentions of the threat system. It will be described in the same convention as the system of threats using the three-element set:

$$\mathrm{SZB} = < SZ^P, SZ^R, \mathrm{G} >, \tag{12}$$

where:

SZ^P - potential system capabilities to act in case of emergency;
SZ^R - real ability of the system to actively counteract;
G - control system operational readiness (efficiency) function.

The transformation of the potential capabilities of the control subsystem for the dynamic requirements of an emergency is performed by the operational readiness function G, which performs a formal transformation of static potential opportunities into dynamic and real operational capabilities that determine the effective operation of the enterprise. The G operational readiness function shows the actual organizational and functional efficiency of the security system to perform specific tasks in the conditions of the highest requirements and dynamic challenges of an emergency

Security Indicators

In this article, an indicator is understood as an observed measure that allows an insight into the security concept of each security object or its security attribute, which is difficult to measure directly. There are two types of indicators: the outcome indicator and the activity indicator.

The outcome indicators are intended to help assess whether the safety-related actions (policies, procedures and practices) are achieving the intended results, and whether such measures actually lead to a lower likelihood of an accident and / or milder consequences of an accident on human health, the environment and / or enterprise assets. They are reaction-based, aim to measure the impact of actions taken to manage safety and are similar to what other documents refer to as "lagging indicators". Outcome indicators often measure a change in safety over time or a poor state of safety.

Outcome indicators say whether the expected results were achieved - did the expected results for the selected utility attribute have been achieved or not?

However, unlike activity indicators, they do not say why the result was achieved or not. The activities indicator are intended to help determine whether the security actor is taking actions that are judged necessary to reduce the risk (e.g. the types of policies, procedures and practices described in the Security Documentation).

Activity indicators often measure safety performance according to a tolerance level that shows deviations from the expected status at a particular point in time. The description of both result indicators and activities consists of two key elements / components:

- Definition that should be clear about what is being measured and against what?
- A measurement system that defines the unit of measure or how an indicator is measured. The measurement system should be accurate enough to highlight trends in utility attributes over time and / or highlight deviations from utility expectations that require action.

The combination of outcome and activity indicators provides two perspectives on whether the basic elements of the enterprise (such as: people, processes, policies, procedures, practices, human resources and technical resources) are useful and operating as they should from a security perspective [3, 4].

Table 2 shows examples of security indicators for the security object named "IT system" belonging to the system category (S) [14] A similar approach should be carried out with regard to the remaining conservation objects from set E. Due to editorial limitations, these issues have not been described in this article - they have been omitted.

Table. 2: Examples of security indicators for an object called an IT system.

Indicator name	Value calculation function [13, 14]	Description	Normalized function	Indicator range after normalization	Measurement method / data source	Measure system	Indicator value	Measurement frequency
Scale of the system	$\alpha_s = \begin{cases} 1, if\ \alpha = 0 \\ 3, if\ \alpha = 1 \\ 5, if\ \alpha = 2 \\ 7, if\ \alpha = 3 \\ 9, if\ \alpha = 4 \end{cases}$	System scale is the level of dispersion and number of system components. The scale of the system is expressed by belonging to the scale class $\alpha \in$ A and denoted as α^{SZR}. A set of membership classes is called a set A = {0,1,2,3,4}, the elements of which discretize the scale of risk management systems, where: 0 - defines a single-workstation system, and 4 defines a global system.	$f(\alpha_s) = 1 + \alpha_s$	1-10	Interviews/Standards	Threshold	<=3 <4-6> <7-10>	once per quarter
Meeting the requirements of the security policy.	$\eta_s = \frac{\sum_{m=1}^{\overline{W^B_{P(O)}}}(p_s^m * s_s^m)}{\sum_{m=1}^{\overline{W^B_{P(O)}}} p_s^m}$ where: p_s^m - priority of the requirements w_m to the system, s_s^m - fulfillment of the requirement w_m to the system.	The set of requirements of the company's security policy O is a finite and countable set $W^B_{P(O)} = \{w_1, w_2, \dots w_m, \dots w_{M^B}\}$, wher e: M^B is the number of security policy requirements in relation to P(O). For each of the requirements $w_m \epsilon W^B_{P(O)}$ we define the size of the priority of the requirement in relation to the given *s*. The priority of the requirements $w_m \epsilon W^B_{P(O)}$ in relation to the system s is the number $p_s^m \in \mathbb{N}$, where eg. 0 - means that the requirement is inadequate to the system, 5 - means that the requirement is as significant to the system as possible.	$f(\eta_s) = 1 + 9 * \left(1 - \frac{\eta_s}{100\%}\right)$	1-10	Combined methods / Policies	Descriptive	<=3 <4-6> <7-10>	once per quarter

Effectiveness of the change management process	$\beta_s = 1 - \frac{W_{\widehat{BP}}}{W_s}$, where: W_s- effectiveness of the change management process, $W_{\widehat{BP}}$ – effectiveness of the change management process without good practice, with : $W_s \neq 0$ i $W_{\widehat{BP}} \leq W_s$	The effectiveness of the change management process is the level of compliance of the change management process of the risk management system with the best practices in this respect in relation to the solutions. It is expressed by the percentage compliance of the change management process existing for the system with the recommendations of standards, eg ITIL in this area.	$f(\beta_s) = 1 + 9 * (1 - \beta_s)$	1-10	Observations, combined methods. / Change log.	Trending	<=3 <4-6> <7-10>	weekly
Log review	$\gamma_s = \frac{L_p}{L}$ 100%, where: L_p - total number of viewed log files L - total number of log files	The information contained in the system logs (e.g. IP address) is used only for technical purposes related to server administration. Information from system logs can also be used to collect general, statistical demographic information - after informing the user and with his consent.	$f(\gamma_s) = 1 + 9 * \left(1 - \frac{\gamma_s}{100\%}\right)$	1-10	Instruments./ Log viewed log files in system directories.	Descriptive	<=3 <4-6> <7-10>	once a month
Password strength	$\lambda_s = \frac{H_p}{H}$ 100%, where: H_p - number of unbreakable passwords H - total number of passwords	Password - a string of letters, numbers or other characters authenticating the person authorized to process data in the system. The password should consist of at least 8 characters, including upper and lower case letters as well as numbers or special characters. It should not contain consecutive characters on the keyboard or the same letters or numbers, or names, surnames, nicknames, initials, dates, car registration numbers, etc.	$f(\lambda_s) = 1 + 9 * \left(1 - \frac{\lambda_s}{100\%}\right)$	1-10	Hybrid attack	Threshold, Descriptive	<=3 <4-6> <7-10>	once a month

The values of the indicators are marked with colors :

- green – required value, no action required,
- yellow – acceptable value, observation and possible preventive actions,
- red – unacceptable value, introduction of corrective and preventive actions is required.

In the case of an acceptable value, the value should be taken, which should differ from the required value by no more than the determined value, e.g. it may be 10% from the required value.

Generalized model of threat risk

Let:

$$Z = \{z_1, z_2, \dots, z_n\} \tag{13}$$

be a finite set of threats identified in a given domain of enterprise analysis.

To assess threats, the risk measure is used, which is the value of the R function defined as:

$$R: Z \longrightarrow V \subset \mathbb{R} \tag{14}$$

which assigns to each of the threats from the set Z values from a certain subset V the set of real numbers $\mathbb{R}$.
Each of the threats is assessed against m criteriaC_i (i = 1,2, … , m), where each of the criteria describes the probability and / or the effects of threat activation.

The result of risk assessment [threat z_k (k = 1,2 … , n) according to the criterion C_i (i = 1,2, … , m)] is the risk component r_i (z_k) (i = 1,2, … , m), which reflects one or more threat features from the set X_i (i = 1,2, … , m):

$$\mathrm{R_i}: 2^{\mathrm{X_i^{z_k}}} \longrightarrow \widehat{\Omega}_\mathrm{i}^{\mathrm{z_k}}, \quad \mathrm{r_i}\,(\widehat{\mathrm{X}}_\mathrm{i}^{\mathrm{z_k}}) = \widehat{\mathrm{s_i}} = \varpi_{\mathrm{i,j}};\ \varpi_{\mathrm{i,j}} \in \widehat{\Omega}_\mathrm{i}^{\mathrm{z_k}} \subset \Omega_\mathrm{i} \tag{15}$$
$$i = 1,2, \dots, m;\ j = 1,2, \dots, \mathrm{s_i}\ ;\ k = 1,2, \dots, n\ ,$$

or

$$R_i: X_i \longrightarrow \Omega_i, \tag{16}$$
$$r_i\,(x_i^{z_k}) = s_i \in \Omega_i \text{ or } r_i\,(z_k) = \omega_{i,j} \in \Omega_i\ ,$$
$$i = 1,2, \dots, m;\ j = 1,2, \dots, s_i\ ;\ k = 1,2, \dots, n\ ,$$

where:

$2^{\mathrm{X_i^{z_k}}} \supset \widehat{\mathrm{X}}_\mathrm{i}^{\mathrm{z_k}}$($i$ = 1,2, … , m) – subset of $\mathrm{z_k}$ features - this threat in relation to $\mathrm{C_i}$ of this criterion (e.g. history of its activation and analysis sector / domain, possibilities of threat activation, number of victims as a result of threat activation),

$\Omega_\mathrm{i} \supset \widehat{\Omega}_\mathrm{i}^{\mathrm{z_k}}$ (i = 1,2, … , m; k = 1,2, … , n ,) – subsets of $\mathrm{s_i}$ values, denoted as $\omega_{\mathrm{i,j}}$, which can be used in estimating risk in relation to i-th criterion,

$\mathrm{X_i}$ (i=1,2,…,m) – set of threat features,

Ω_i (i=1,2,…,m) – set of $\mathrm{s_i}$ values that can be used in risk estimation in relation to the i-th criterion,

Apart from the values of the risk components, the importance of individual criteria$\mathrm{C_i}$ (i = 1,2, … , m).
Let the set A be defined as:

$$A = \{a_1, a_2, \dots, a_m\} \tag{17}$$

where:

$\mathrm{a_1}$ - the importance of the criterion $\mathrm{C_1}$,
$\mathrm{a_2}$ - the importance of the criterion $\mathrm{C_2}$,
$\mathrm{a_m}$ - the importance of the criterion $\mathrm{C_m}$.

In such a case, the measure of risk can be calculated according to the formula:

$$\mathrm{R(z_k)} = \mathrm{f}\left(\mathrm{a_i}, \mathrm{r_i(z_k)}, \mathrm{r_i}\left(\widehat{\mathrm{X}}_\mathrm{i}^{\mathrm{z_k}}\right)\right); \tag{18}$$
$$k = 1,2, \dots, n;\ i = 1,2, \dots, m.$$

The obtained risk measure is then valued, i.e., assigned to one of the risk categories / classes: accepted, tolerated and not accepted. The model proposes to divide the area / risk space resulting from the table criteria into several parts.
An example of calculating the risk value.

When we have specified:

1) Specification of real threats, for example: $\mathbb{Z} = \{z_1, z_2, z_3, z_4, z_5, z_6\}$ and their description by means of sets of threat features X_i (i=1,2,…,m);

Table 3: Examples of threats

Threat No z_k	Threat name z_k
1	phishing
2	hacking
3	loss of confidentiality
4	power failure
5	wiretapping

2) A set of C_i (i = 1,2, … , m) criteria and risk component quantification schemes for individual criteria, e.g. for the criterion of "possibility of threat activation"

Table. 4: The frequency of threat events.

Level (P)	Level characteristics P	Number of events per 100k operating hours of the system.	The frequency of occurrence.
30	Frequent.	>5	Every 1-2 years.
6	Likely	2-5	Once every 10 years.
3	Rare	1	Once every 10 -40 years.
0,1	Unlikely	0	Never in 40 years.

3) For the adopted risk assessment criteria, sets of risk level measures, e.g.

   - for table criteria $\Omega_i = \{1,3,5\}$, i=2,…,5;
   - for enhancers $\Omega_1 = \{1 + 0{,}1\frac{1}{TDP_{MAX}}, 1 + 0{,}1\frac{2}{TDP_{MAX}}, 1 + 0{,}1\frac{3}{TDP_{MAX}}, \dots, 1 + 0{,}1\frac{TDP}{TDP_{MAX}}\}$

4) A set of measures of importance of the analysis criteria np, e.g. :A={1,1,2,3,3}
5) Risk assessment model, e.g.

$$R(z_k) = \alpha_1 * r_1 * \sum_{i=2}^{5} \alpha_i r_i \tag{19}$$

where:

z_k - *k-th* threat for which the value of the risk measure is determined R,
α_i - the importance of the criterion,
r_i - value of the risk component calculated according to criterion i=1,2,…,5.

6) The obtained result, e.g. $R(z_k) = 26$, is then compared with the limit values of the ranges of risk levels, which should facilitate appropriate decisions regarding the risk management strategy. The risk valuation framework sets out the method presented in Table 5.

Table. 5: A scheme for quantifying the risk levels of R.

Value of risk R	Characterization of the risk level of R.
R > 100	Very high
80 < R ≤ 100	High
50 < R ≤ 80	Important
0 < R ≤ 50	Low
R ≤ 0	Negligible

The estimated level of risk can be classified into one of three risk categories: acceptable, tolerated and unacceptable. A given category can be related to risk levels, as shown in Table 6.

Table. 6: Scheme for valuation / valuation of risk categories in relation to risk levels.

Risk category	Risk level
Not acceptable	Very high
	High
Tolerated	Important
Acceptable	Low
	Negligible

Conclusions

Creating useful risk models for measuring the security of an enterprise is not an easy task. On the one hand, due to the little experience of analysts and designers in this field - designing and measuring the state of security of a company is a new trend and must be implemented in the context of cyber threats and cybersecurity [10]. On the other hand, the field of measuring the safety of individual security facilities is at a relatively early stage of development.

In many countries in the world works are carried out on ways to measure safety for a long time. Nevertheless, this problem is very important and still absorbs both scientists and practitioners. In risk measurement and risk management, the two-component model of S.M. Cunningham is still the most frequently used measurement model [6] although there is still controversy over whether the components: possible consequences and the probability of their occurrence should be linked multiplicatively or additively. However, growing evidence shows that the additive model appears to be better in many cases. Due to the difficulty of measuring the state of security, researchers undertaking this task should approach it in a thorough and systematic manner, use the current scientific achievements and use various measures allowing to describe the studied phenomenon as fully as possible.

A best practice for measuring the state of safety is to develop an effective measurement methodology, whose "engine" by an adequate measurement model and a correctly selected set of indicators of results and actions - this is the general conclusion.

The article is not a ready-made recipe for measuring the state of safety, which is the basic link in the enterprise management system. It should be treated as a proposal of the authors of a partial solution to the measurement problem, which would enable the current assessment of the level of enterprise security.

Values, Human Dignity and Sustainable Development in the Wake of the Economic Globalization

Léonel MATAR

Université Saint-Joseph, Beirut-Lebanon
leonel.matar@usj.edu.lb

Abstract

It is undeniable that some threats to our societal models today are of a global scale. Indeed, all countries, rich and poor, face profound social imbalances, environmental challenges and sustainable development concerns, calling for socially responsible practices from businesses and States. The rampant consumerism, the excessive industrialization and the westernized economic model, which is applied by emerging countries today and will be embraced by developing countries tomorrow, are likely to shake the fate of the world and endanger an already fragile social peace. Indeed, globalization and global capitalism are putting more pressure on our planet and on human development and are increasingly perceived today as the cause of many economic, social and environmental problems. High consumption and intense accumulation bring to the fore questions on sustainable development and social responsibility. These topics are in the media spotlight, obviously, but what is more crucial is that they are to incite public and private organizations to take much needed measures to limit the side effects of globalization. Aren't future generations entitled to the benefits of globalization, which promises to improve living standards, reduce poverty and respect human dignity?

This paper retraces and analyses the concepts of sustainable development and corporate responsibility since their first appearance until today and examines the challenges they impose in the wake of globalization. It offers an analytical debate on the perception of human dignity and sharing with others, the role of the public and private sectors regarding their contribution to social justice and to an egalitarian development. It highlights researches and analyses regarding the evolution of our economic and social environment in the respect of human, personal, social, economic and political rights, to be really worthy of mankind.

Abstract

The stakeholders' reaction caused by the posibility to use a new service, product or conduct a traditional activity in a new way is a continuous subject of study for the researchers. An important role is played by the study of incetinve factors that influence the decision to adopt an innovative activity like the social entrepreneurship is. The approaching of the the social mission by the entrepreneurs leads to the identification of solutions to problems and the improvement of the living conditions of the community, bringing social innovation. The paper aims to identify the factors that influence the adoption of the social entrepreneurship using the diffusion of innovation theory. The research intends to complete the existing entrepreneurial research by identifying the role of the individual entrepreneur in bringing social innovation or the emphasis on the importance of traditional entrepreneurship. The study contributes to determining the factors that influence the orientation of entrepreneurs towards social entrepreneurship approached like an innovative entrepreneurship.

Abstract

Diverse and numerous categories of entrepreneurs face problems due to the fact that they do not have access to financing for their entrepreneurial ideas with social impact that could create jobs for disadvantaged categories, opportunities for self-employment and finally sustainable local development. In Romania, as in other states, we are witnessing a process of hybridization, which consists in combining various institutional forms that give rise to new structures. Their appearance is due to the need to harmonize the economic objectives with the social ones in the context of permanent changes of the economic-social environment in which they carry out their activity. This article highlights the fact that non-reimbursable financing through operational programs dedicated to human resources or capital is the pre-selected target of entrepreneurs, motivated by the multitude of open financing lines and their considerable volume. The research aims at completing the existing studies on the identified factors with a prominent role in the development of social entrepreneurship and placing the "non-reimbursable financing" factor in the hierarchy of identified factors. Thought in an economic and social way, also correlated with an adequate management and investment policy, but also with a support from the authorities, social entrepreneurship can develop a lot, meeting a significant segment of the needs of the population, including regarding employment.

Abstract

The power of the mass media to influence public opinion enables them to facilitate positive change and development in the society. However, there has been an extensive intellectual criticism of the discriminatory disposition of broadcasting authorities in Nigeria towards majority of the population resident in the rural areas. For communication scholars, one viable way Nigeria can achieve meaningful national development is through the integration of its peoples by the establishment of mass media at the grassroots. Of all the channels of mass communication, radio is widely acknowledged as the most suitable for community development. This study therefore used Orisun FM, a local community radio station located in Ile-Ife, Osun state as case study. The aim was to find out the contributions of the radio station to the development of Ile Ife. Questionnaire was designed for data collection. The data gathered showed that the radio station, which is owned by the state government is contributing significantly to the development of the community. The station does this by helping to meet the development needs of the community residents in such areas as health, the economy, education and agriculture. Nevertheless, as long as the radio station is seen as the property of the state government, members of the community do freely access the radio station. This situation hampers audience participation in the station's programmes. The study recommends therefore that there is a need to for government to amend the management style of radio broadcasting in order to encourage communities to establish and run their own radio stations.

Keywords: Radio, Communication Management, Development.

Introduction

The mass media are an integral part of the society. They mirror the society by painting the picture of the society to itself. In so doing, they influence public opinion in response to the picture they paint of the society. Thus they have the ability to foster positive change in society. It is believed that the mass media have the capacity to contribute to the awareness of potentials of people. The mass media can also take responsibility for setting the agenda for change (Akinfeleye, 2008). The media can contribute to socio-economic development, as well as help to stimulate and educate rural population towards development. This means the mass media can be used to facilitate development in a less developed country like Nigeria. However, the media are not being maximized to aid development in Nigeria.

The major functions of mass communication are to provide informative, educative and entertainment messages, among others, to the audience (Omole and Olatunji, 2019). Communication scholars, have argued that educational and broadcasting authorities in Nigeria direct their activities to the educated urban dwellers, leaving out the majority of Nigerians in the rural areas, almost completely isolated from the national government and their urban counterparts (Moemeka, 2009; Ojebode and Adegbola, 2007 and Ojebode, 2008). They assert that the only way Nigeria can achieve meaningful national development is through the national integration of its peoples by the establishment of mass media at the grassroots. Moreso, the mass media need to be actively involved in setting the agenda, thereby

Cite this Article as: Funke OMOLE, Rotimi OLATUNJI and Olusola OYERO "Radio Management for Development: The Case of Orisun FM" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

effectively managing the communication process in terms of informing and educating the public, especially on development issues (Omole, Olatunji, Oyero, Amodu and Okorie, 2018). The medium capable of achieving this is radio.

Radio possesses certain characteristics that make it suitable for community development (Anaeto, 2011). Radio signals reach remote areas, it transcends language barrier and radio receiving sets can be operated with batteries. Hence in the face of rural non-electrification, it is cheaper, portable and can be carried anywhere. Rural broadcasting provides the marginalised rural dwellers an opportunity to express themselves, highlight issues concerning them and their communities, especially in areas such as their environment, economy, health, education, agriculture, culture, and religion (Ekweme and Akpan, 2011). It is recommended that the mass media be actively involved in setting the agenda, thereby effectively managing the communication process in terms of informing and educating the public.

Clarification of Terms

Community development: for the purpose of this paper refers action that helps people to recognize and develop their potential to organize themselves to respond to shared problems. It supports the establishment of strong communities that promote social justice and help improve the quality of community life.

Communication management: this refers to the way in which the communication system of a country or region is organised and run. In the context of this paper, communication management would therefore mean the way radio broadcasting is organised and run in Nigeria.

Local radio: can be defined as a radio station established within the geographical area of a community, which produces and broadcasts in local language, programmes that address the development needs of members of that community, with their active participation.

Community radio: refers to the radio broadcasting established, managed and transmitted either by a group of people in a community, a community-based organisation or a trust established by all the members of that community (Ekweme and Akpan, 2011). It is important to note that every community is local where it is. Therefore local radio and community radio can be used interchangeably.

The idea of community radio broadcasting came into Nigeria with the liberalisation of broadcasting in 1992. Prior to that year, broadcasting was an exclusive undertaking of the governments at the centre and the states. No private individual or organisation was allowed to partake in the industry, because the government considered it too risky to national stability, to allow private ownership of broadcast stations, given their power and influence. However, grudgingly yielding to massive internal and external pressures to liberalise the industry and allow private participation, the Federal Government enacted the enabling Decree No. 38 of august 1992 (now Act 38 of 1992 as amended), which established the National Broadcasting Commission (NBC), a body entrusted with the delivery of private broadcasting in the country.

The National Broadcasting Commission produced the NBC code; a document containing the policy guidelines, mission, vision, guidelines, objectives, powers and functions of the commission, including licencing, monitoring, supervision, charges and other details regarding private broadcasting in Nigeria. The code makes elaborate provision for applying for and obtaining different kinds of licences which are issued to interested private individuals and organisations, including licence for community broadcasting. Chapter nine of the Nigeria Broadcasting Code is dedicated to community broadcasting.

Local radio has the capability to bring about improved quality of life for the community members and enhance a sustainable community development (Anaeto, 2011). That is, with the proper use of community media, it is expected that local community radio will empower individuals and groups to engage in development activities by providing them with skills and knowledge. It will bring the people together in common self interest, thereby enhancing community spirit. In addition, it will foster responsible local leadership.

The focus of this study therefore is on rural community radio, to find out, in practical terms, how rural community radio broadcasting has helped to achieve community development which is expected to translate into national development. The study uses a local radio station as case study. The radio station is Orisun FM, located Ile-Ife, Osun state.

Orisun FM

Orisun FM station was established in 2007 by the Osun State Government. Located in Ile Ife – a semi-rural community, it broadcasts only in the unique Ife dialect of Yoruba language. Ile-Ife can be described as a small semi-

rural community in Osun state. It has a population of 167,254. An ancient Yoruba town, believed to be where the Yoruba race originated from. Ile-Ife is home to the Obafemi Awolowo University, a Polytechnic, primary and secondary schools. Apart from the University staff and students who live within and around the campus, the larger part of the town is occupied mainly by indigenes and non-indigenes, who are mainly farmers, petty traders and civil servants.

Objectives

1. To ascertain the level of participation of community members in the programmes of the radio station.
2. To find out the extent to which the radio station is meeting the development needs of its community, in the areas of agriculture, economy, health and education.
3. To determine the extent to which the radio station is bringing the needs of the community to the attention of the government.
4. To find out the level of government response to the needs of the community members, brought to its attention by the radio station.

Method

The method adopted for the study is survey. The population of study were adults in Ile Ife community of Osun State, aged 20 years or above. The researchers chose adults who are aged 20 years or above because the researcher believes that persons that fall within this age bracket would be able to assess the impact which the local radio station in their community have on them. A total of 334 respondents was studied in Ile Ife community.

The study employed two sampling techniques – simple random sampling and purposive sampling. The simple random sampling method was used to select the areas in Ile Ife, where questionnaire were distributed. The purposive sampling was used to determine to whom questionnaire were administered. These are adults aged 20 years or above.

The instrument used for the collection of required data for this study was questionnaire. In this study, open-ended questions were asked, which gave respondents the opportunity to express their views on how the local radio station in their community has impacted them. They also had the opportunity to mention, in specific terms, what programmes they have participated in, what programmes they listen to and how those programmes have impacted them.

Findings

Data collected was analysed with the Statistical Package for the Social Sciences. This was necessary, in order to present the data collected in a manner that would facilitate meaningful analysis and interpretation. *The data is presented using frequency distribution tables.*

Table 1: Level of participation in station's programmes

Response	Percent
Yes	55.4%
No	44.6%
Total	100%

Table 1 shows that the number of respondents who participate in the station's programmes is more than those who do not participate. They participate in the programmes mainly by phoning in, while the programmes are on air. Beyond that, they have at one time or the other suggested programmes personnel of the station because, they believe people would have something to learn from the programmes they suggested, as their suggestions would promote unity,

development, good governance and improve the quality of service of the station.

Table 2: Impacts of agricultural programmes

Responses	Percent
Teach small scale farming	42.2%
Encourage youths participation in agriculture	24.1%
Encourage gardening	9.5%
Teach preservation of farm produce	24.2%
Total	100%

The agricultural programmes generally encourage youths in the community actively involved in agriculture. The programmes also let them see the possibility of diversifying within the agricultural sector in to animal husbandry, poultry and fishery.

Table 3: Impacts of educational programmes

Responses	Percent
Teach how to read and write in Yoruba language	13.1%
Preservation of Yoruba cultural heritage	52.3%
Inform and enlighten on current affairs	8.4%
Encourage adult education	26.2%
Total	100.0

The educational programmes teach the people to read and write, where the tutors on air use the same materials as those circulated among interested community members. They also serve as avenues for teaching the young ones about the rich culture of Yoruba people. In addition, community members are kept up to date with happenings in the country and the world at large.

Table 4: Impacts of health programmes

Responses	Percent
Create awareness on government health policies	25.3%
Encourage and mobilize for children immunization	21.1%
Enlighten on good nutrition	10.5%
Teach on hygiene	15.8%
Encourage proper care for children and the aged	9.5%
Teach on prevention of HIV/AIDS	17.9%
Total	100.0

The health programmes offered by the station touch on issues of children immunization, teaching on the importance of good nutrition, personal hygiene and environmental sanitation. They also enlighten the community members on prevention HIV/AIDS.

Table 5: Impacts of economic programmes

Responses	Percent
Teach entrepreneurial skills	42.2%
Inform of market days	28.9%
Teach on investment	23.3%
Monitor and inform of prices of goods in the market	5.5%
Total	100%

The economic programmes teach entrepreneurial skills to the people, teach them how to investment and suggest investment opportunities to them. The programmes also inform them of market days for markets within and around the community; monitor the markets and inform them of prices of goods. This is done to help members of the community make wise purchasing decisions.

Table 6: Extent to which the station has drawn government's attention community needs

Responses	Percent
The station draws government's attention to community needs	80.4%
The station does not draw government's attention to community needs	19.6%
Total	100%

Table 6 above shows that majority of the attest to the fact that the radio station helps them to respondents draw the attention of the state government to the needs of the community.

Table 7: Level of government's response to such needs

Responses	Percent
Government responds to such community needs	74.5
Government does not respond to such community needs	25.5
Total	100.0

The above table reveals that government has in most cases responded to the community needs brought to its attention by the radio station. Those needs that government has attended to, include provision of transformers, proper waste management and provision of adequate security where there is threat to security.

Conclusion and Recommendations

The information gathered show that the radio station, through its programmes, is addressing the development needs of the people. It does do this in the areas of education, agriculture, economy and health. The people are encouraged to enroll their children in schools, while the illiterate adults are taught how to read and write through the radio stations. The younger generation is taught indigenous proverbs and wise sayings, in order to preserve the Yoruba cultural heritage. The station has called the attention of state and local government to the challenges in the community. The people of the community attest to the fact that the station has brought positive changes to their lives.

It is therefore recommended that, in order for the radio station to function better and maximise its potentialities for national development in Nigeria, the government should modify the radio communication management across the country. This can be done by setting up radio stations in rural communities, training members of those communities on how to ensure smooth day-to-day running of such stations, and allow the people to take charge of such radio stations, without any political interference.

Alternatively, rural communities can form partnership with government to set up rural community radio stations, operate together and later transferred completely to the communities, as their own properties. It is also suggested that the Federal government should make licence for rural community radio either free of charge or reduce the cost, to make it affordable for the rural people to obtain. When these are achieved, community radio will be able to contribute more meaningfully to community development. If the similar effects are generated in all or most rural communities in Nigeria, national development will not be farfetched.

Abstract

The media communication management system in any nation cannot be isolated from the system of government the nation operates. Hence, the media system cannot function beyond the extent to which government permits it, whether explicitly articulated or implied. The prolonged reluctance of the Nigerian government to allow community radio operation in the country lends credence to this fact. The existing system of radio broadcasting in Nigeria is incapable of enhancing participation, which is a major characteristic of democracy, especially at the grassroots. This has been the situation, despite the fact that radio has attracted the attention of media scholars and civil society, as a viable tool for national development. The potentiality of community radio is at the bottom of the concerted advocacy for the third of the three-tier structure of broadcasting in Nigeria – community broadcasting, to take off in the country. The paper takes a retrospective, circumspective as well as a prospective look at the narrative of community radio broadcasting in Nigeria. Going forward, the paper calls for a redefinition of community broadcast communication management. The redefinition proposed is not totally characteristic of the conventional community radio which has no government involvement, but that which will fit into Nigeria's peculiar situation. Secondly, the redefinition recommends a change in the habitual emphasis on rural communities when it comes to community radio advocacy. The rising figures of rural-urban migrating populations makes community radio relevant, not only for the rural populace but also the information poor, semi-urban and urban settlers.

Keywords: Radio broadcasting, communication management, community radio, advocacy, redefinition

Introduction

In Nigeria, the media communication management system is composed of the print and broadcast media. The print media comprise mainly newspaper and magazine, while the broadcast comprise radio and television. However, the focus of this paper is on radio. Radio, being the first broadcast channel, started in Nigeria as a colonial venture in 1932 (Akingbulu and Bussiek, 2010). The overseas service of the British Broadcasting Corporation (BBC) was relayed through wired system with loudspeakers at the listening end. The service was referred to as Radio Diffusion System (RDS). The RDS metamorphosed into the Nigeria Broadcasting Service (NBS) in April 1951. As a result, NBS began broadcast services in Lagos, Ibadan, Kaduna, Kano and Enugu on short wave and medium wave transmitters. The creation of more states in 1991 led to a proliferation of radio stations in Nigeria. This made every state in Nigeria to own and operate at least one radio station (Ojebode, 2009). The broadcast industry was deregulated in 1992, and that opened the industry to private broadcasters and further proliferation of radio stations in Nigeria.

For a developing country like Nigeria, the role of the media goes beyond information and entertainment. But to serve as tools for learning, education and cultural expression in the various communities (Dare, 2000). Also, as a multilingual

country, the mass media in Nigeria are expected to provide the critical function of national integration, which is a precursor for development (Omole and Olatunji, 2019). The goal is social development which, translates into improved life for the people (Anaeto, 2011). The medium identified as capable of achieving this goal is radio.

In recognition of the need for a change in the media communication management towards national development, media scholars and non-governmental bodies both from within and outside Nigeria have engaged persistently in the advocacy for community radio in Nigeria. How has the advocacy fared? What is the present situation with community radio broadcasting in Nigeria? And how can we make a headway in this situation? These are the major questions this work tries to answer.

Radio Broadcasting in Nigeria

The numerous radio stations in Nigeria should put her in a vantage position for effective dissemination of information, but the opposite is the case. Most of the radio stations are situated in the major towns and cities. The Federal Radio Corporation of Nigeria, which is the national radio network has its stations located in either the state capitals or major towns in the states. The state owned stations also operate from the state capitals and the private stations, which are fully commercial, operate in major towns and cities across the country. The situation is same for television and newspaper channels of communication.

The media occupy a decisive place in the mobilization of the population, be it urban or rural, for development purposes. This is particularly so with radio in the mobilization of the rural population. Radio is an inexpensive medium of mass communication with a comparatively simple technology that makes it more suitable for illiterate and peasant communities (Anaeto, 2011).

Importantly, journalism in Africa is basically an urban phenomenon. Helping to maintain this urban posture is the fact that almost all media outfits are located in the urban areas, with little or no reporters in the rural areas (Udoaka, 1998). The present structure of the media of mass communication in the country does not cater for the information needs of the rural population. This urban centred media system still reflects a mass media dysfunction where there is a clear demarcation between a segment of the population that benefits from mass media information and the other segment that does not. The urban media are found culpable for their overbearing coverage of the cities, political news, the government and its officials (Oso, 2002). Their contents appeal mainly to the urban dwellers, with little or no relevance to those living in the rural areas.

The existing system of radio broadcasting in Nigeria is incapable of enhancing participation, which is one major characteristic of democracy, especially at the grassroots. The situation therefore necessitates a restructuring of the mass media to give room for grassroots access and participation in the national communication system**.** Among others reasons, the historical philosophy of community radio has been to use the medium as the voice of the voiceless, and to serve communities that have not been reached and served by conventional communication structures (Wabwire, 2013). Therefore, to ensure grassroots participation and integration into the national media system, the need for community radio becomes imperative.

Theoretical Framework: Democratic Participant Media Theory

The democratic participant media theory is a development oriented theory, introduced in 1987 by Denis McQuail. The theory advocates the democratisation and decentralisation of the media to give opportunity for easy access and popular participation. The central tenet of the theory is that the interests, aspirations and needs of the audience must be the guiding principle for media operation (Moemeka, 2000). The theory advocates media pluralism to allow for grassroots access and participation in the media (Baran and Davis, 2009). It states that individual citizens and minority groups also have the right of access to media and so the media should serve them accordingly.

The theory proposes communication management that allows the establishment of 'small media' by groups and local communities in order for them to meet their needs and that potential media users can have easy access to them. The theory believes that it is such media that can raise the people's aspiration to self-actualisation and grassroots development. The assumption is that the gauge for measuring real development should be the level or the standard of living of the underprivileged. Hence, the theory favours horizontal communication, that is interactive and participatory, rather than vertical communication (Moemeka, 2000 and Anaeto, Onabajo and Osifeso, 2008). The localised mass media method of development communication which, stresses rural community radio, draws strength from the Democratic-Participant

theory. Therefore, the democratic participant theory offers a strong theoretical underpinning for community radio broadcasting in Nigeria.

Community Radio in Nigeria: The Journey so Far

Community radio holds tremendous development potentials for every community and nation where it operates. Ajibade and Alabi (2017) identify some key areas in which community radio can help promote development in Nigeria. They are good healthy living, improved agriculture, adult literacy, environmental sanitation and peaceful co–existence in the culturally pluralistic Nigerian society. Community radio will serve as the voice of the voiceless and give grassroots people a say in the running of the affairs of their locality as well as their country, as it bridges the gap between the government and the governed.

The idea of community broadcasting came into Nigeria with the liberalisation of broadcasting in 1992. Prior to that year, broadcasting was an exclusive venture of the governments at the centre and the states. No private individual or organisation was allowed to partake in the industry. However, in 1992, the Federal Government enacted the enabling Decree 38 of August 1992 (now Act No. 38 of 1992 as amended), that established the National Broadcasting Commission (NBC), a body entrusted with the delivery of private broadcasting in the country.

The National Broadcasting Commission produced the NBC code; a document containing the policy guidelines, mission, vision, guidelines, objectives, powers and functions of the commission, including licencing, monitoring, supervision, charges and other details regarding private broadcasting in Nigeria. The ninth chapter of the Nigeria Broadcasting Code is dedicated to community broadcasting. In its 2006 review, the code made elaborate provision for applying for and obtaining different kinds of licences which are issued to interested private individuals and organisations, including licence for community broadcasting. The review was part of the responses of government to the unrelenting advocacy, especially from the academia and civil society, for community radio in Nigeria. Five phases were identified in the advocacy (Ojebode and Akingbulu, 2009).

Phase I: Academic Agitation

The advocacy for community radio broadcasting in Nigeria, according to (Ojebode and Akingbulu, 2009), began long before the official formation of an advocacy group. The Nigeria Community Radio Coalition (CRC) was formed in 2003. However before then, researchers and scholars had pioneered the movement for the establishment of community radio stations. Beginning from the 1980s, Ojebode and Akingbulu note that it was common for researchers in the area of development scholars end their articles by calling for community radio to be operational in the country.

There were some factors identified as responsible for the agitation. Towards the end of the 1960s, the dominant paradigm of development witnessed radical failure. Then in the 1970s, development scholars, researchers and policy makers strongly articulated the participatory approach to development. That was the response of Nigerian academics the global rethinking on development. Two, global development in community radio broadcasting, which saw the establishment of community radio stations in many developed and developing countries. The third responsible factor was internal, which has to do with the nature of Nigerian society. The centralised broadcast system has continued to give prominence to the majority and inundate the minority groups. Hence, the need for a localised mass communication channel that will protect and give voice to minority groups.

Phase II: Birth of a Coalition

Nigeria transited into democracy in May 1999. The civil society therefore expected immediate loosening of the bottlenecks to community media ownership and operation. When it became clear that this was not to be, segments of the civil society in Nigeria began organized advocacy.

At the forefront of the movement was the Institute for Media and Society (IMS) situated in Lagos. With the support of Panos Institute West Africa (PIWA) and AMARC, IMS in 2003 began an awareness campaign titled “Building Community Radio in Nigeria”. The partnering organizations set up a committee which drafted and articulated an action plan (Institute of Media and Society, 2006). The committee embarked on full-fledged advocacy to educate the Nigerians on issues pertaining to community radio. It was also aimed to convince the government to see reason for a less demanding, licensing regime for community radio. It organized continuous awareness seminars and forums across the country. Specifically, the coalition requested that the Federal government to introduce community broadcasting, the tier of

broadcasting to which Nigeria is a treaty, according to the provisions of the African Chatter on Broadcasting (ACB). In addition, the coalition requested that the licence fee for community be highly subsidized to make it affordable for rural communities. This is because most communities in Nigeria cannot afford to raise N10 million just to get the licence to start a radio station, and after, begin to raise money for the equipment and day-to-day running.

Phase III: Hopes on the Horizon

In year 2005, the IMS organized an editors' roundtable involving editors from radio, television and newspaper organizations. The roundtable was put together for the Nigeria Community Radio Coalition. Twenty editors from print and broadcast media organizations were involved (Ojebode and Akingbulu, 2009). The activities of the coalition gained support from a lot of civil society organizations and international development partners. Some of those organizations were the World Bank and the Association for Progressive Communications. The Federal Government made known its position on the development of community radio. Hence, it became difficult for the federal government to pretend not to be aware of the specific requests of the coalition. To show its seriousness, the federal government put together a panel with the mandate to prepare policy agenda. The panel was headed by Professor Alfred Opubor, a frontline communication scholar. The panel prepared an all-inclusive policy blueprint for the operations of community radio broadcasting in Nigeria. The areas covered by the framework prepared included the vital such as funding, licensing and monitoring the operations of community radio stations in Nigeria. Federal Ministry of Information and Communication received the policy framework in 2006.

Phase IV: Manpower Development for the Takeoff

Having drafted and submitted the policy framework, the coalition was confident that the government would fulfill its promises about community radio. The coalition therefore began intensive manpower development for prospective staff of community radio stations across the country. The training materials were developed, covering areas like audience research, principles and strategies of community development. At the time, six communities across the country had community radio projects initiated by the CRC. However, along the line, the Federal Government granted licenses for eight campus radio stations. This development generated a shock and heated online discussions within the Nigeria Community Radio Coalition.

Phase V: Hopes Dashed and Denouement

The end of the administration of Chief Olusegun Obasanjo took the progress of the coalition in four years back to the scratch. However, the journey of the policy document left a bitter taste in the mouth of the coalition from that point. From May 2007, the new Minister of Information and other key office holders who were expected to act on the document expressed no interest, neither did they show any satisfactory knowledge of the policy document as well as the process that would birth it. This means the advocacy for community radio had to begin afresh (Ojebode and Akingbulu, 2009).

Ojebode and Akingbulu (2009) however identified some achievements of the advocacy. Beginning with 11 members in 2003, the number of organizations and individuals in the Community Radio Coalition has grown 200. Though the advocates were taken from various backgrounds, awareness was adequately created for community radio broadcasting at the community levels across the country. President Goodluck Jonathan in October 2010, while speaking at the opening ceremony of the biennial conference of African broadcasters - AFRICAST disclosed that the NBC had been empowered to issue community radio licences to eligible applicants.

The situation however persisted until September 29, 2015, when the first community radio station in Nigeria was launched into the airwaves from Lavun community in Niger State. The community radio was supported by World Bank's Fadama II and III projects (Leadership Newspaper, 2015). Till date, there is yet to be another community radio launched in Nigeria. This means that though it can be said that the agitations over the years have yielded a positive result, the impact expected of community radio cannot be felt yet, because only one community in one Local Government Area out of 774 Local Government Areas in the country has a community radio. In fact, the functionality of the one community radio is in doubt, as Ajibade and Alabi (2017) lament that Nigeria remains the only country without a community radio in West Africa despite being the largest and richest country in Africa. Hence, the decades of advocacy for community radio broadcasting in Nigeria are yet to be over. The expectations of the agitators have not been satisfactorily met. Given this situation, the advocacy must continue. There must be a way of getting it, even with the political environment which seems not to favour community radio broadcasting.

Conclusion and Recommendations

No doubt, community radio has a key role to play in giving voice to the many unheard communities in Nigeria, and creating a platform for self-expression and mass mobilization and participation in national development.

However, in view of the challenges of community in Nigeria, there is a need for a redefinition of the concept to suit the Nigerian context. A lot of efforts have been put in by communication scholars and non-governmental bodies at making case for community broadcasting. Faced with these realities, the government can, as service to rural communities, provide financial, material and technical resources to establish small radio stations for people and train them on how to run those stations. This is not without the active involvement of the people who, on their part can provide land for construction of the radio stations and labour during the construction exercise. It means the concept of establishment of community radio, that is, community only establishment will give way to joint establishment. This will be backed by a working policy that clearly specifies that the stations are not government owned, and so government cannot exercise any further influence on those stations. The communities will be responsible for providing the financial and human resources to keep the stations running.

The redefinition recognizes that what is being proposed is not totally characteristic of typical community radio which has no government involvement, but that is what can be obtainable in the country, given its peculiar situation. The redefinition also requires that emphasis on rural communities when it comes to advocacy for community radio, needs to change. Considering that the rural/urban population distribution has changed from what it was in the past. The figures are now 53% rural to 47% urban population, as against 80% rural to 20% urban population in the 80s (World Bank, 2015). The migrating population (many of whom are poor) need to be catered for as well. This makes community radio relevant, not only for the rural populace but also the information poor and/or unschooled, semi-urban and urban settlers.

This redefinition retains major characteristics of community radio - access and participation, nonprofit orientation and community ownership. The adjustment is the establishment which one may argue, can influence ownership. But government will, as a matter of policy, hands off the stations after meeting the required provision of financial and technical resources needed for the smooth take off of the stations, after all it is responsible to the generality of the populace. If government can provide borehole water system in communities without exercising control over its use, if it can construct access roads to villages without interfering in the use of the road, it can and should partner with community members to provide community radio stations without any interference thereafter. This would help to enhance and strengthen the internal communication system in the country.

Abstract

To achieve planned levels of sustainable growth and development, authors in literature have argued that a nation would require a lot of investment, and the capital market is one of the verified channels through which this could be made possible. This study examines the nexus between capital market performance and productivity in Nigeria using secondary time series data from 1981 – 2018. The Johansen co integration and Granger causality tests were employed to test the hypothesis of a long run relationship and direction of causality respectively. The study finds that capital market performance positively affects economic growth in the long run, while the causality result shows the existence of a unidirectional relationship running from capital market performance to economic growth. More specifically, a 1 percent increase in capital market investment will lead to a 5.9 percent increase in productivity in Nigeria. This was corroborated by the Granger causality result. The study concludes that capital market performance plays a major role in ensuring economic growth.

Introduction

Capital markets have the potential to make positive impact on the economy by mobilising liquid financial assets through intermediation as long term projects compete for adequate financing to steer development targets for the investing nation (Ogunrinola & Motilewa, 2015). Public and private sector agents are the usual promoters of these long tenured projects as they commit financial and other resources to interest sectors such as agriculture, manufacturing, banking, education and health, mining and solid minerals, information and communication technology (ICT). When capital markets are sub-optimally operational, then, it may become very difficult to pool financial resources together with the aim of promoting investments that would drive sustainable growth and development.

Bowale "Analysing Productivity and Capital Market Performance in Nigeria" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

To achieve planned levels of sustainable growth and development, Ekundayo (2002) and Ogunrinola, Edo and Bowale, (2019) argue that countries would require a lot of home-based and foreign investment through monetary channels and capital market investments are one of the varied conduits through which this could be made possible. Undoubtedly, availability of funds that can be invested offers the stimulus for a proficient mix of production factors which aids efficiency in production and guarantees maximum returns. These capital resources fully utilised, provides the platform upon which desirable investments may detail into growth leaning patterns for the investing economy. Capital formation by foreign attraction, or other local means by deploying home-based strategies can be achieved through efficient and effective savings programme, countries, including Nigeria, as many African nations are finding it hard to attract enough external capital or to take advantage of inward strategies to expand their domestic capital base.

While various literature has identified with a number of high points in favour of positive impact of Nigeria's capital market in terms of growth and performance (Nurudeen, 2009), increased domestic private investment flows (Ezeoha, Ebele, & Okereke, 2009), inclusive growth (Ejemeyovwi, Osabuohien & Osabuohien, 2018), other scholarly submissions (Popoola, Ejemeyovwi, Alege, Adu & Onabote, 2017) have questioned the efficacy of the market to progressively steer the desired level of performance in Nigeria. This may be due to, among other reasons, the perceived nature of the Nigerian financial system in general on one hand, and, occurrences of frequent episodes of instability experienced in the capital market over time on the other hand. Further, the choice of approach used in investigating the subject matter and/or, the modelling technique employed may also accrue to the inconclusive results reached so far by scholars on the subject matter. This study therefore explores financial sector-led growth literature and investigates how the performance of the Nigerian capital market can drive sustainable growth and development. Essentially, the study seeks to take a stand on the capital-augmenting role that the capital market is expected to play in a bid to eliminate the hindrances created by finance shortages in as nations continue to pursue economic buoyancy and development. The study period was between 1981 and 2017.

The schematic flow of content of this work follows thus: review of empirical literature is dealt with in section two while theoretical framework and methodology is discussed in the third section. Section four concerns data estimation and interpretation of results while the policy recommendation consistent with the study results are presented in the fifth section.

Methods

Empirical Literature

Making medium to long-term funds available and assessable to private businesses and the public sector usually requires a complex system of intermediation protocols housed in part, by the capital market (Jhingan, 2007 & Ogunrinola, Motilewa, 2015). The financial intermediation role of the capital market ensures that it functions as a body, or framework that adds to socioeconomic growth and expansion of developing and industrialized nations of the world. This market serves as an engine for other sectors within an economy given its capabilities to raise funds for long term purposes and to help expand businesses across the sectors (Osaze, 2000).

Various definitions have emerged, about what exactly the capital market entails. However, popular submissions uphold the idea of a market where securities are traded as the major defining factor which characterises what capital markets are. Some specific illustrations as to what the capital market entails exists in the writings of some scholars such as Osammonyi (2005), whose position dwells basically on the quality of long term financing that the market offers. As an exchange system, according to the writer, high quality financial instruments are offered and used to facilitate the execution of projects which will in turn, drive growth and development of the investing nation. To (Owolabi and Adejare, 2013), pooling, pricing and exchanging risks by economic players are carried out by the intermediating forces of the capital market. Accordingly, the riskiness of the instruments being traded foretells the possible returns from the same such that higher yielding investments are synonymous with higher risks, and vice versa. Ewah, Esang and Bassey, (2009) opined that economic growth can be fostered by appropriate investment in existing securities provided by the capital market. Hence, they point out that if the subscription by populous investors in securities and other financial instruments offered by the market is ensured, growth would inevitably be achieved in the various sectors into which investments were directed. By the mobilisation or pooling together of resources that are long tenured, availability of liquidity, risk diversification, investment transfers, project valuation by capital cost determination, the capital market is able to augment other macroeconomic mercenaries to secure increasing growth trends or patterns (Chinwuba & Amos, 2011).

The stock market and economic growth relationship as studied by Demetriades, Arestis and Luintel (2001) with focus on five developed countries found that the stock market's contribution to the growth of an economy might have been exaggerated. The study hence concluded that bank activities holds higher capacities to spur growth than

the stock market. However, some studies still observe that this position may be argued further, as the proxy for bank performance may have led to misleading results. For instance, using savings as proxy for bank performance may be by itself an inefficient measure, as savings deposit alone do not transform to growth yielding ends; it is the pooling together of these savings and channelling them towards real investments that actually yield growth outcomes. Hence, the actual real effects of stock market on the one hand, and bank performance on the other hand, on economic growth may be seen as an existing puzzle, which begs for a definite score.

Examining the effect of capital markets on developed countries' economic growth Mohtadi & Agarwal (2004) used panel data covering twenty-one years (1992-2012). Market turn-over ratio, it was found, is an important determinant for investments, since higher turnover ratios imply higher liquidity of stocks. This liquidity measure is noted in their work as an important factor for aggregate growth. Furthermore, direct investment (DI) had major positive effects on growth, as was, market capitalisation.

Weighing in on the same area of discussion, Nieuwerburh, buelens and Cuyvers (2006) pointed out that for developed nations, capital markets and economic growth shows long run co-integration. Using Belgium as case study, the research discovered that capital markets showed positive and significant long run association with growth, implying the existence of a well-structured as well as growth enhancing financial markets in Belgium. In an attempt to carry out similar stock market analysis in India, Mishra, Mishra, Mishra and Mishra (2010) used annual time series data for the 1991 to 2010 to investigate the influence of efficiency in the stock market on India's economy. Market capitalization, total market turnover and stock price index were used choice variables. The efficiency of India's capital market, it was found in their study result, had strong linkages to economic growth. Market efficiency, gauged by high capitalisation and turnover ratios accounted for the main effects on growth through the ability to effectively and efficiently mobilise capital and diversify risks accordingly, on an economy wide basis. As market capitalisation gains robustness, India's economy would be set on a guaranteed platform of enjoying increasing growth trends by an efficiently managed capital market, the study reveals.

For Nigeria, Adam and Sanni (2005) embarked on analysing the role of stock market in Nigerian economy using using regression and granger causality. Although there was a one-directional causality among the market capitalisation and GDP, the study found a bi-directional causality relationship happening between market sales and the GDP. More so, it was discovered that market turnover and GDP had a positive and significant relationship hence, it was that concluded government can support the capital market as it impacted on economic growth positively. Ariyo and Adelegan (2005) argued that liberalization of the capital markets helps it to expand nonetheless, the effect on general macroeconomic conditions on the stock market are still ignored. The role of Nigeria's stock market as a means of boosting economic growth was investigated by Obamiro (2005) and it was observed that capital market and economic growth in Nigeria exhibited a positive relationship. The study further proposed that government create a more competitive environment to enable increased stock market performance which in turn lead to increased growth in the economy.

In contrast, the study conducted by Osinubi and Amaghionyeodiwe (2003) showed that stock market is not responsible for any growth in the economy. Similarly, Ewah et al., (2009) discovered that the stock market made no significant contribution to the growth of Nigerian economy following the results obtained from the analysis of the time series data conducted. The study indicated that while the stock market had potentials, its impact on economic growth could not be felt because of the issues surrounding the stock market such as; illiquidity, poor absorptive capacity of the market, low capitalization of the market, presence of fraudulent activities among others. Similarly, Afees and Kazeem (2010) using a time series data set performed a causality test to empirically determine the nature of capital market and economic growth relationship in Nigeria. The key variables employed by the study include market capitalisation, total traded ratio and turnover ratio. The findings of the study showed the absence of a causal relationship between total value added and GDP growth grate which served as the indicator for economic growth whereas, a bi-directional causality existed between market capitalisation and economic growth. Thus, it is evident that the indicators of stock market are sensitive to different variable choice.

From the brief review of scholarly studies on this subject matter, and especially for Nigeria, it is clear that no consensus exist in literature on the nature of influence that stock market has on economic growth with the addition of the monetary policy rate which has been omitted in many studies examining the effect of stock market and economic growth to model actual reality for empirical simulation. Hence, this study adds to knowledge on the influence between productivity and capital market performance.

Theoretical Framework

This study adopts the neoclassical growth theory which emphasizes that the determinants of growth capital accumulation and related saving decision. This model opines that capital and labour are major determinants of

output using the production function. And key variables in the determination of the potency and viability of an efficient capital market.

Thus, the labour-augmenting theoretical framework for this study, the neoclassical growth is expressed in the following production function:

$$Y = F(K, AL) \quad \text{(i)}$$

Where *Y* is Gross Domestic Product (*GDP*), *K* is the stock of capital, *L* is the amount of labour and *AL* is the labour-augmenting technological change, which also implies labour productivity. This model is adopted in this paper because its tenets are easily comprehensible and best explains the functioning of the capital market which is the focus of this research. This model lays emphasis on factors of production and technology as the basis for the functioning of the capital market. The model is also best suited for this research because it combines endogenous factors such as fluctuations in the prices of stocks in the capital market and exogenous variables such as the influence of technology in the explanation of the capital market operations. In other words, it presents a holistic approach in the operationalisation of the capital market.

The model is implicity presented below:

$$GDP_t = f(K_t, L_t, MCAP_t, MONRTE_t) \quad \text{(ii)}$$

The model assumes a non-linear form given the Cobb Douglas functional expression. The equation is expressed in its explicit form as

$$GDP_t = \beta_0 . K_t^{\beta 1}.L_t^{\beta 2}.MCAP_t^{\beta 3}.MONTRE_t^{\beta 4}.e_t \quad \text{(ii)}$$

Taking the double log of the explicit function for linearisation and interpretation, we have:

$$Log\ GDP_t = log\ \beta_0 + \beta_1 LogK_t + \beta_2 LogL_t + \beta_3\ LogMCAP_t + \beta_4 LogMONRTEt + \varepsilon_t \quad \text{(iii)}$$

Where *GDP* represents gross domestic product; *K* represents total capital within the economy proxied by the Gross Fixed Capital Formation; L captures the total labour force; *MCAP* represents market capitalization; *MONRTE* represents monetary policy rate; ε_t represents the disturbance term. β_0 represents Constant term; β_1- β_4 represents parameters to be estimated in the model. Expected *a priori* holds that $\beta_1 > 0$, $\beta_2 > 0$, $\beta_3 > 0$ and $\beta_4 > 0$.

To achieve the objective of this study, it was paramount that secondary be employed for the analysis. The data was however, sourced from the Annual Statistical Bulletin published by the Central Bank of Nigeria. Other resources employed were sourced from the Nigerian Stock Exchange reviews and market bulletins published by Securities and Exchange Commission.

Results and Discussions

Unit Root Test Result

Time series data are expected fluctuate a lot over the years which is technically referred to as Non-stationarity of the data. To resolve this potential problem, it is common to first check for, and purge the data series form non-stationarity. The Augmented Dickey-Fuller test (ADF) is a common technique used by a large number of researchers to determine whether or a unit root is present in the analysis of time series. This paper consequently adopts the ADF technique to perform the test for stationarity in the data used. Table 1 shows the result of the unit root tests and it can be observed that all the variables were integrated of order one. Hence, we proceed to carry out the cointegration test.

Table 1: ADF Unit Root Test

Variables	ADF T-Statistic Value	5 percent Critical Value	Remark	Order of Integration
LGDP	-4.60345	-2.9511	Stationary at first Difference	I(1)
LMCAP	-4.0969	-2.9511	Stationary at first Difference	I(1)
LMONRTE	-6.8851	-2.9511	Stationary at first Difference	I(1)
LCAPITAL	-3.1842	-2.9604	Stationary at first Difference	I(1)
LLABF	-8.1633	-2.9810	Stationary at first Difference	I(1)

Co-integration Test Result

The estimation techniques employed for the cointegration test was the Johansson Cointegration which was designed to determine the existence of long run relationship among variables. Tables 2a and b respectively show the cointegration results.

Table 2(a): Johansen co-integration test result

Hypothesized No. of CE(s)	Eigenvalue	Trace Statistic	0.05 Critical Value	Prob.**
None *	0.848822	109.4208	69.81889	0.0000
At most 1 *	0.684873	62.18837	47.85613	0.0013
At most 2 *	0.548209	33.31890	29.79707	0.0189
At most 3	0.386185	13.45550	15.49471	0.0991
At most 4	0.048921	1.253953	3.841466	0.2628

Trace test indicates 3 cointegrating eqn(s) at the 0.05 level
* denotes rejection of the hypothesis at the 0.05 level

Table 2(b): Normalized cointegrating coefficients

Normalized co integrating coefficients (standard error in parentheses)				
LGDP	LMCAP	LCAPITAL	LLABFORCE	LMONRTE
1.000000	-0.059373	-0.566813	-0.409451	-0.228986
	(0.029)	(0.042)	(0.406)	(0.060)

Source: Author's Computation

From table 2a, it was observed that there exist long run relationship among the variables. Further, the normalized co-integrating coefficient as shown in table 2(b). The result shows that the coefficient of capital market (*LMCAP*) is approximately 0.06 which is greater than twice the standard error implying that it is significant at 5% level. Hence, in the long run, economic growth can be proportionately induced by a percentage increase in capital market performance. In absolute terms, the coefficient of capital (*LCAP*) which is approximately 0.57 is greater than twice of the standard error and thus, is statistically significant. Therefore, an increase in capital stock is capable of leading to a proportionate increase in economic growth in Nigeria. Specifically, a one percent increase in capital will induce a more than proportionate percent increase in Nigeria's economic growth. Also, in absolute terms, the coefficient of monetary policy rate (*MONRTE*) which is approximately 0.23 is greater than twice of the standard error and is thus, statistically significant. This therefore, implies that monetary policy rate will statistically impact Nigeria's economic growth in the long run.

Granger Causality Result

Granger causality test helps to determine the direction of causal relationship between variables in a model. Table 3 shows the result of the pairwise causality test between market capitalisation (*MCAP*) and real output (*GDP*) in Nigeria over the period of study.

Table 3: Pairwise Granger Causality Tests
Sample: 1981 - 2016

Null Hypothesis:	**Obs**	F-Statistic	**Prob.**
LMCAP does not Granger Cause LGDP	34	4.22718	0.0245
LGDP does not Granger Cause LMCAP		0.64686	0.5311

Lags: 1
Source: Author's Compilation using E-views 9.0

The result obtained from the test as shown in table 3, reveal that market capitalisation granger causes gross domestic product. This implies that the role of capital market performance is vital to achieve effective and sustainable economic growth in Nigeria. However, it is found from the result that gross domestic product does not granger cause market capitalisation, implying that output in Nigeria does not significantly influence capital market performance. It is therefore, safe to say from this result that a unidirectional relationship exists between capital market and economic productivity. This finding has positive implications for sustainability in entrepreneurship (Ejemeyovwi et al, 2019) and inclusive growth (Ejemeyovwi & Osabuohien, 2020; Ejemeyovwi, Osabuohien & Osabohien, 2008; Ejemeyovwi Osabuohien, Johnson & Bowale, 2019) and overall sustainable development which is one of the major goals to be achieved by Nigeria.

Conclusion

This study was carried out with the aim of determining how productivity in Nigeria is determined by Stock market performance. While focusing on the data available from 1981 to 2016, the study employed the use of Johansen Cointegration technique to determine if a long run relationship existed among the variable and granger causality tests to establish the nature of relationship between stock market and the Nigerian economy. The findings of the study revealed that indeed stock market impacted productivity in Nigeria positively. Hence, it becomes paramount for a country like Nigeria to channel its energy that the financial markets is well developed and rightly positioned so the dividend of stock markets efficiency can be enjoyed by all in the society.

It will do the country a world of good to develop the financial markets as better positions the country to attain the sustainable development goal number 8; decent work and economic growth. It has been observed that finance sector forms a major part of the service industry, and it can be a huge employer of labour should the sector maximise its potentials. Hence, the ensuring that the financial markets is well developed can also bring about significant employment of labour thereby leading to productivity in the country.

On this note, the study recommends that the government should ensure that companies are encourage to enlist in the Stock Exchange markets. Major multinational companies are absent in the Nigeria stock market, that is, Nigerians do not get to share in the wealth of these foreigner as their yearly income is being repatriated to their home country since that is where the stakeholders reside. Therefore, encouraging multinationals to enlist is one of the ways to ensure stock market efficiency and guarantee further productivity in the country. Also, the government need to fortify the financial markets against shocks by ensuring that the market operates in a very stable macroeconomic environment. This is another way to build the confidence of the people to invest in the stock market thereby leading to productivity.

Abstract

Packet sniffing is a problem that affects mostly public Wi-Fi networks where a hacker intercept network traffic such as passwords and email messages to mention a few. The aim of this research was to improve network data security by combating packet sniffing at the University of Limpopo focusing on the Edu-room Wi-Fi. The first objective was to measure the strength of the Wi-Fi against packet sniffing. Secondly, we prevented computers running in promiscuous mode from accessing the Wi-Fi. Thirdly, we detected computers that changed their modes to promiscuous whilst already connected. Lastly, we evaluated the different anomaly detection methods to go with the second and third objectives. The security strength of the Edu-room Wi-Fi against packet sniffing was measured using the Wireshark network packet analyser tool. Secondly, models to prevent and/or detect devices suspected to be implementing the packet sniffing attack were then developed and simulated. The results were recorded for two simulation instances; one to add 50 nodes representing a light load network and one to add 100 nodes representing a heavy load network. First simulation showed a 100% prevention of nodes running in promiscuous mode, meaning that all illegitimate nodes were successfully distinguished from the nodes that are legitimate. Second simulation showed a 100% detection of nodes running in promiscuous mode, meaning that all illegitimate nodes were successfully distinguished from the nodes that are legitimate. The research concluded that the use of an intrusion prevention and detection system would effective in fighting against packet sniffing.

Keywords: Packet sniffing, intrusion detection, intrusion prevention, promiscuous mode.

Introduction

Wireless network security has been the area of focus for the past years (Mitrokotsa & Karygiannis, 2008). Many people are now connected to the global network increasing security risks (Rawat & Messiha, 2003). The increasing deployment of unsafe public Wi-Fi networks is increasing the number of cyber-attack cases (Sims, 2018). A public network is accessible to the public and anyone in the connectivity range (Technopedia, 2019).

Subsection 1.1, will put into detail the problem of packet sniffing in public wireless networks. Subsection 1.2, will outline the effects of the packet sniffing problem, the aim of the research and the objectives to be accomplished by the research. Subsection 1.3 will present the summarised version of the proposed solution. Subsection 1.4 will introduce the methodology that is used in this research including the tools and methods.

Problem Statement

Work done by Legezo (2016) measured the security strength of the security methods. The research concluded that there are many inconsistencies in the methods discussed such that the security strength is degraded and causing doubts about the use of wireless networks (Legezo, 2016). Packet sniffing is a traffic interception or eavesdropping attack that allows the hacker to have access to packets that are transmitted through the network (O'Donnell, 2019).Public networks are more vulnerable to this type of attack since they can be accessed by any individual within the network's coverage since they usually employ less authentication security (Bates, 2016).

Cite this Article as: Sifiso R. MALOPE and Olebogeng H. NOJILA "Investigating Privacy Concerns of Public Wireless Networks at the University of Limpopo" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

There are two major categories of attacks that an attacker can perform on a wireless network depending on the use of the intercepted traffic namely active or passive attacks. The first being the active sniffing attack. With active attacks, the attacker modifies the information being transmitted (Spangler, 2003). Secondly is the passive sniffing attack. With passive attacks, the attacker does not alter the information but intercepts the information with the intention of reading and analysing (Eslami & Kitindi, 2007).

The packet sniffing attack is possible because of two conditions, that is, network connectivity and the intercepting device's ability to run in promiscuous mode (Sanai, 2001). Promiscuous mode is one of the eight modes a computer's Wireless Network Interface Card (WNIC) can run in (Rouse, 2007).Promiscuous mode allows a computer to capture traffic from a network the Network Interface Card is connected to (Trabelsi, et al., 2004). A hacker that is connected to the target wireless network can run their Network Interface Card in promiscuous mode and also run a packet analysis tool to collect packets form the network (Fu, 2017).

Rationale and motivation

Reasons to solve the problem

The South African's right to privacy law in section 14 of the Constitution gives an example of the restrictions that underlie some of the privacy concerns (van der Bank, 2012). Governments and organizations have lost a lot of money through cyberattacks and also through the costs of security measures having to be put to place to combat these attacks (Sobers, 2019). Moore-Colyer reported that packet sniffing attack was used in a Starbucks restaurant public Wi-Fi to pass a malware program to the users of the coffee shop's wireless network to mine crypto-currency (Moore-Colyer, 2017).

Aim

- The research aims to improve network data security by combating packet sniffing at the University of Limpopo Edu-room Wi-Fi. To accomplish this aim, a few objectives have to be addressed.

Objectives

- Determine the strength of the current security implementations of the Edu-room network against packet sniffing attacks.
- To prevent computers that are deemed malicious or have their Wireless Network Card running in promiscuous mode from accessing the network.
- Detect computers that are deemed malicious or have their Wireless Network Card running in promiscuous mode already connected to the network.
- To evaluate the different anomaly detection methods

Proposed solution

The solution proposed in this research is the Intrusion Prevention and Detection System (IPDS). The system is used to identify and remove devices that are a potential threat to the network traffic. Prevention is a security scheme which attempts to prevent attacks from becoming successful after being initiated. The detection scheme detects malicious activities and takes action from the detection. Applying these two schemes in a combined manner improves their security strength and eliminates some of the disadvantages of each scheme.

Methodology

Research Design

Tools

This subsection provides a detailed description of the tools, software and programming language used in this research experiment to ensure the good flow of the research.

Edu room Wi-Fi

The Edu-room network of the University of Limpopo Wi-Fi was used in the data collection part of the research. Edu-room is a Wi-Fi network that was provisioned to be used by students in tertiary institutions.

Acer Intel® Core™ i5

The Acer Intel® Core™ i5-62000U CPU @ 2.30GHz 2.40GHz 64bit laptop with 8GB RAM and running Windows 10 Education version was the primary tool used to collect data on the Edu-room Wi-Fi. The Acer laptop also has a Wireless Network Interfaces Card with the ability of the card to run in promiscuous mode. The Acer laptop also meets the MATHLAB IDEs minimum system requirements.

Wireshark network packet analyser software

To capture the data a free open-source network packet analyser called Wireshark was used. Wireshark is an open-source network packet analyser intended to be used by network administrators for network diagnostics, network protocol analysis and network security problems but has been also used by malicious users to implement several types of attacks including the packet sniffing attack (Verma, 2015).

The reason for picking the Wireshark tool is the simplicity of its User Interface and being able to easily execute complex functions to implement a packet sniffing attack. Another advantage of using Wireshark for packet sniffing is that it automatically changes the Wireless Network Interface Card to promiscuous mode.

MATLAB simulation IDE

MATLAB is a multi-paradigm numerical computing environment and proprietary programming language developed by Mathworks (The Mathworks, Inc, 2019). The reason for using this platform is that it is suitable for simulations (The Mathworks, Inc, 2019).

The MATLAB programming language

A programming language developed by Mathworks to be used on MATLAB was used in developing the simulation. The reason for choosing this programming language is that it is easily compatible to be used with the MATLAB environment.

Data collection sites

The collection of data requires that the computer used for the collection be strongly connected to the Edu-room Wi-Fi network meaning that the location should be within the Wi-Fi range. The researcher has chosen the Computer Science Laboratory located within the Maths Building of the University of Limpopo Turfloop campus.

Data sources

The primary data source was the university's Edu-room Wi-Fi network since this is the intended target of the proposed solution in this research. Secondary data sources included the publication of other researchers and this source was used to intensify the solution proposed by the researcher.

Data collection technique

Preliminary data

Firstly, we had to be connected to the network with the device which is used to capture the packets. Secondly, the machine has to be running in promiscuous mode. Lastly, Wireshark was run on the machine which was used to capture the packets and configured to capture traffic from the wireless interface.

Final data

The simulation must be run in a controlled environment in order to be able to measure its performance without external interference such as people interruptions, and computer hardware failure. The simulation also needs to be run twice in order for a heavy and light load to be attained. The time to run each simulation will be measured and also the detection performance has to be recorded for both instances of the simulation.

Data analysis

The first part of the analysis was about how easy it is to implement a packet sniffer attack. This first analysis is to be done in order to rate the strength of the security of the current security implemented on the Edu-room Wi-Fi network. The second analysis included the results yielded by the simulation. The rate of success and error of the model is detailed in a table and compared when the simulated network has a small (at most 50 number of nodes) or large (at least 100 number of nodes) to connect.

Mode Filter Solution Model

Packet sniffing is possible because of two conditions, namely:

- The malicious machine must be connected to the target network.
- The malicious machine must be running in promiscuous mode.

The method to avoid packet sniffing that is proposed in this research includes eliminating the ability of a computer machine to connect to the wireless network while running in monitor mode. To do this, the machine will have to be scanned if it is running in promiscuous mode while trying to connect to the wireless network. During the connection, the computer machine would have to be regularly checked to identify its NIC mode.

Prevention method: When trying to connect to the network

The filtering occurred just before connecting to the Edu-room network. A computer trying to connect to the network will first pass the Mode Filter solution. If a computer is running in normal mode which is the allowed mode or the mode deemed not harmful to the network users, the computer will be allowed access to the authentication step and will continue to access the network upon successful authentication.

Detection method: When already connected to the network

The filtering will occur when the computers are already successfully connected to the network. Regular checks will be carried out on the devices connected to the network and the devices found to be running in promiscuous mode are blocked.

Reaction method

If a computer node is found to have their Wireless Network Interface Card running in promiscuous mode, the computer will be blocked from progressing to the authentication step and a warning or error message will be sent to the malicious computer.

Challenges

This section will give details of the challenges that were to be overcome during the research.

Problem 1

The first challenge was carrying out a packet sniffing attack on the Edu-room Wi-Fi. The University of Limpopo ICT department does not allow capturing of information or traffic from the Wi-Fi network. The solution was to make an assumption that if the Wi-Fi allows connection with promiscuous mode turned on, then packet sniffing is possible.

Problem 2

The second challenge was with the MATLAB simulation software. Mathworks provides a 30-days trial version of the software that was used up before the completion of the simulation. The solution that was applied was to use the campus-licensed version of the software which is available in the University of Limpopo computer laboratory.

Results and Analysis

Results

Preliminary Results

In response to the restriction to carry out instances of packet sniffing on the real Edu-room Wi-Fi, an assumption had to be made in order to obtain the data and continue with the research. The results show only one instance of the packet sniffing attack that is implemented on the network.

Assumptions

The assumption was that if the first two important steps of implementing a full packet sniffing attack are not detected by the current security implementation of the wireless network, then packet sniffing can be carried out. The two steps are connecting to the network with the computer's Wireless Network Interface card running in promiscuous mode and successfully being able to open a packet sniffer software such as Wireshark.

Results

The Edu-room Wi-Fi was found to be 100% susceptible to packet sniffing attacks. The network does not implement any defence against the attack whether it is prevention or detection of the attack. The computer was able to connect to the Edu-room network whilst having its Wireless Network card running in promiscuous mode.

Final results from simulation

The following subsection gives details about the performance of the simulation against packet sniffing when 50 nodes and 100 nodes are to connect to the network.

Prevention performance

Figure 1.1 shows a graphical representation and summarises the information from both the 50 nodes and 100 nodes simulation run for the prevention mechanism.

Figure 1.1: Prevention phase summary graph

According to the above graph when the simulation was deployed with 50 nodes, 20 modes running in promiscuous mode were correctly detected and decline access to the simulated network. No legitimate nodes or nodes were falsely declined access or falsely accused of running in promiscuous mode and all 30 of the legitimate nodes running in normal mode were allowed access to the simulated network. No nodes were allowed to the simulated network while having running promiscuous mode.

According to the graph when the simulation was deployed with 100 nodes, 42 modes running in promiscuous mode were correctly detected and decline access to the simulated network. No legitimate nodes or nodes running in normal mode were falsely declined access or falsely accused of running in promiscuous mode and all 58 of the legitimate nodes running in normal mode were allowed access to the simulated network. No nodes were allowed to the simulated network while having running promiscuous mode.

Detection performance

Figure 1.2 shows a graphical representation and summarises the information from both the 50 nodes and 100 nodes simulation run for the detection mechanism.

Figure 1.2: Detection phase summary graph

According to the graph when the simulation was deployed with 50 nodes, from the updated data, 17 nodes were detected to have changed their mode to promiscuous mode and none were falsely detected or falsely accused. For

the re-addition process, 3 nodes were successfully added and no nodes were added while running in promiscuous mode.

According to the graph when the simulation was deployed with 100 nodes, from the updated data, 30 nodes were detected to have changed their mode to promiscuous mode and none were falsely detected or falsely accused. For the re-addition process, 22 nodes were successfully added and no nodes were added while running in promiscuous mode.

Overall performance

This subsection will combine the performances of each scheme and summarise the entire performance when the schemes are working as a singular method of fighting against packet sniffing.

Table 1 below, shows the success rate, failure rate and time on the performance of the simulation.

Table 1: Summary of overall performance

Number of nodes	Negative but Detected	Positive and Detected	Positive but undetected	Time
50	0%	100%	0%	2min 2sec
100	0%	100%	0%	4min 4sec

The first row shows the simulation results when the simulation was run with 50 nodes and the second row shows the simulation results when the simulation was run with 100 nodes. The results prove that the system has a 100% detection rate meaning that all the nodes that were running their Network Interface Card in promiscuous mode are successfully detected.

The new component of the results is how the solution would perform looking at time as a factor under the different network loads. The results proved that the time to detect nodes that are running in promiscuous mode would double if the network load doubles.

Conclusion and Recommendations

Measure the current strength of Edu-room

The results from the test proved that there was a 100% success rate of implementing the attack. This proves that the Edu-room Wi-Fi is 100% susceptible to packet sniffing attacks.

Prevention of promiscuous mode

The results of the simulation showed a 100% prevention success rate. According to the simulation, all nodes that were running in promiscuous mode were denied connection to the network. The simulation showed a 100% success rate for granting access to computers that are not malicious. The conclusion is that we have successfully prevented all malicious computers using the Mode Filter solution.

Detection of promiscuous mode

The results of the simulation showed a 100% detection success rate. According to the simulation, all nodes that were running in promiscuous mode were denied access and removed from the network. The simulation showed a 100% success rate for granting access to computers that are not malicious. The conclusion is that we have successfully detected all malicious computers using the Mode Filter solution.

Anomaly detection

The anomaly detection algorithm was then not reported on this document but is still open and might be considered a focus for further research. The lack of data or experimentation leads to a failure to conclude about this area of the Mode Filter solution and thus the solution is incomplete.

Summary of results

The simulation results proved the Mode Filter solution to be an efficient solution to deploy against packet sniffing. When the simulation was run there was a 100% detection and prevention success rate for the Mode Filter in both light and heavy network load. An increase in network load, however, caused the response time of the solution to directly increase. This is however expected since the number of nodes to search through and investigate increases.

Contribution to scientific knowledge

The research has come closer to the elimination of the packet sniffing attack. The research can be used as a guideline on which security schemes to be applied to combat packet sniffing.

Limitations of the study

The restriction to use the real Edu-room Wi-Fi network to implement the packet sniffing attack to measure its resistance against packet sniffing has led to a formulation of an assumption about the connectivity offered even if promiscuous mode is used. The MATLAB simulation tool has no capabilities of simulating a real-life network with the generation of network traffic. MATLAB cannot be thus used for this function and a better simulation tool or real network has to be used.

Recommendations

Firstly, the response time or the time it takes to detect and prevent malicious nodes. The time is directly proportional to the network traffic load meaning that an increase in the network load would cause the Mode Filter to be slower in the detection and prevention of malicious modes. Secondly, because of the restrictions to deploy the Mode Filter on the live Edu-room Wi-Fi, we were unable to develop or improve a real anomaly detection algorithm. The anomaly detection algorithms are an open area of research since the best or 100% efficient anomaly detection algorithm has not yet been developed.

Conclusion

We found out that the Edu-room is susceptible to the packet sniffing attack and no defence mechanism is implemented to stop it. The research proved a 100% success rate for both the detection and the defence mechanism that is proposed in this research in combating packet sniffing. This research has realized that the use of combined or hybrid schemes is an efficient way to eliminate the threat.

Acknowledgements

I cannot express enough gratitude to my supervisor, Ms OH Nojila for the support and guidance towards this research paper. It is with her motivation that I was able to complete this research paper and my honours studies. Her guidance has helped me a lot and I wouldn't imagine having a better mentor.

I would also like to express my gratitude to the University of Limpopo and their stuff for the opportunity to do my research at their welcoming institution. It is with their resources and knowledge that I was able to complete my honours and research studies.

To my family and friends, I truly appreciate the support they have shown me towards my studies and doing my research. I would like to thank Ms Eva S. Mashego and Mr Kenny J. Malope for bringing me to this world and for motivating me to always give my best in everything I out my mind to.

Last but not least, I would like to thank Ms SS. Shongwe for the support and love. Having her in my life has motivated me to stay focused and do my best.

Abstract

This study investigated the influence of work-life balance and spousal support on marital stability of women in Lagos State. A sample of 139 working women from secondary schools, hospitals and banks in Lagos State were randomly selected for the study. The participants completed a measure of the work-life balance and spousal support scale. Two hypotheses were raised to achieve the objectives of the study and were tested at p=0.05. Multiple regression was used to test hypothesis one while independent sample t-test was used to test hypothesis two. The results revealed that there was no significant joint influence of work-life balance and spousal support on marital stability of teachers, health workers and bankers {F(2,108)=66.98, p>.01). Spousal support was found to separately influence marital stability (t=1.168, p<.05). There was no significant difference found in the marriage stability of the old and young women. The study concluded that work-life/family balance should be properly maintained since the two spheres are paramount and are sources of life fulfilment to individuals. Spousal support helps women manage their work and marital lives. It was recommended that work-life policies/initiatives should be regularly reviewed and promoted by stakeholders in both public and private organisations for the welfare of employees, especially women. Finally, the study further recommends that social support network should be encouraged among couples.

Keywords*:* Work-life balance, spousal support, marital stability, influence, working women

Introduction

Marriage is a socially acceptable and recognised union between individuals who are committed to one another with great expectations of having a stable and lasting relationship. Couples work hard and aspire to make life satisfactory and fulfilling. To achieve success in marriage requires the efforts and responsibilities of couples. Couples need love, trust, time, friendship, understanding, honesty, support, and effective communication (Esere, Yusuf and Omotosho, 2011). In life, long term and stable marriage are usually taken as a major life goal and a key indicator for well-being (Proulx, Helms, and Buchler, 2007). A stable marriage reflects in the increase of well-being whereas instability is the most stressful life events among couples (Carr and Springer, 2010).

In the contemporary world of work, maintaining a balance between work-life and personal life as well as social support from spouses are contributing factors of marital satisfaction among working women. When couples engage in paid jobs outside the home without adequate time for family life, it may have an impact on their married life. This situation is more serious for women because of the dual responsibilities which they shoulder. In the past, men were considered as breadwinners. They bore the financial obligations of the family. At the same time, the women acted as caregivers, homemakers and solely in-charge of domestic roles, nurturing of the children and family. Still, in the contemporary world, both men and women work in paid jobs, contributing to the financial needs of the family and there is the competition of proving their effectiveness among themselves (Narang, 2014). Despite these, the responsibilities of child caregiving and family responsibilities have not been removed from the woman. It lies solely on the educated, non-educated, working and

ADEKEYE " Influence of Work-Life-Balance and Spousal Support on Marital Stability of Working Women in Lagos State, Nigeria" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

non-working women. The degree of support from spouse plays an important role in the marital quality of married individuals (Cag, 2011). It is therefore imperative for them to enjoy good work-life balance and support from their spouses and other significant persons.

Statement of the Problem

Marital instability is on the increase globally. Africa, however, is said to have recently experienced a high rate of marriage breakdown. It was estimated that between 40 to 50 per cent of all married people end their relationships in divorce (Adeniran 2015; Cherlin, 2010; Ojukwu, 2013; Takyi, 2001, 2003). This situation is found to have socio-economic, psychological and political effects on the couples, children and the society. The existing economic pressures have necessitated that households have multiple income-earners which have made couples and women in particular to experience role conflicts such as trying to balance the demands at work and at home (Ajala, 2017; Asante-Twum, 2014). Lack of understanding and poor spousal support has resulted in different levels of marital displeasure among married working women in Nigeria (Ebenuwa-Okoh and Osho, 2015)

Objectives

The objectives of this study include:

(i) To examine the joint and separate influence of work-life balance and spousal support on marital stability of working women in Lagos State

(ii) Determine the difference in the marital stability of older and younger working women in Lagos State.

Hypotheses

(i) There will be no significant joint and separate influence of work-life balance and spousal support on marital stability of working women in Lagos State.

(ii) There will be no significant difference in the marital stability of old and younger working women in Lagos State.

Review of Related Literature

Marital Stability

Marriage is said to be stable when couples remain legally married without physical separation, legal separation or divorce and unstable when the reverse is the case. Marital stability explains a marital relationship that is steady, firm and strong. It is a relationship where couples fulfil their marital roles (Adejare, Okolie, Musa, Shehu, and Dalhaty, 2019). Marital stability is closely related to but different from marital adjustment, marital quality, marital satisfactory and marital success and at the same time have a co relationship (Mitchell and Plauche, 2016). Satisfactory and good quality marriage leads to stable marriage respectively. According to Abubakar (2016) a stable marriage enjoys: provision, love and companionship, support, procreation, security, care and training. The stability of marital relationships leads to well functioning and balanced family life which consequently leads to well-adjusted and progressive society (Echebe, 2010). Marital stability is important to women and men because it promotes high level of productivity at both work and home and help to harmonise family and work life (Reddy, 2015).

Africa, however, is said to have recently experienced high rate of marriage breakdown as a result of the influence of western culture, civilisation, urbanisation, economic growth and development which have given rise to nuclear family system and to the breakdown of extended family system which was the former platform for resolution of marital conflict (Adeniran, 2015). Some other common factors responsible for marriage breakdown may also include: lack of communication, work-life imbalance, financial issues, infidelity, poor spousal support and commitment, unsatisfactory sexual life, child-rearing concerns, employment, among others and these have devastating effects on couples, their children and society at large.

Work-life Balance

Work-life balance is an individuals' capacity to successfully go through the huddles of work and non-work lives. A state where the women's work-life balance is described as "good" work-life is when they are able to maintain a balance between their work and other non work commitments (Moore, 2007). Sometimes, reverse is the case. These roles tend to drain them and cause inter-role conflict. When women are not able to strike the expected balance with these multiple roles (jobs, family, in-laws, spouse, friends) it may become difficult and stressful which could lead to anxiety, depression, emotionally unstable, and an unstable person (woman) may become irrational, abusive, frustrated, nagging wife, poor communicator, sick, unhappy, leading to instability in the home. Van Steenbergen, Kluwer and Karney (2014) believe that workers who enjoy good work-life balance usually pass it to family members, especially their spouses and enjoy friendly and optimistic interaction with them.

Spousal Support

One of the negotiator variables in the relationship between recognised conditions of role strain and marital life is spousal support (Neff and Karney, 2005). Spousal support is a coping resource that is critical and important to daily activities which communicate attention and concern. Spousal support is an extremely important parameter in the experience of work-life conflict. Individuals who enjoy support are less likely to overset role demands into conflict (Carlson & Parrewe, 1999). Halbesleben, Wheeler and Rossi (2012) describe spousal support as a pertinent ingredient for female employee work-life balance. The way couples provide daily support for each other is very important in marital functioning. Reevy (2007) opined that spousal support is very important in the romantic and marriage relationship, preventing conflict and instability among couples. Spousal support is a part of social support which includes advice-giving, information, emotional support, financial, helping to cope with problems (Yildirim, 2004). Social support can also take different forms such as emotional, esteem, information and instrumental support. While emotional supports are characterised by empathy, paying attention, listening and hugs, esteem supports are shown in the communication of confidence. Information supports and shares news/advice that will be beneficial to the needs of the receiver and then, instrumental supports are things that others physically do or provide to assist. It can come in the form of tangible things like gifts, physical cash and helping to cook or wash. Support spouse connotes that the partner is cherished, dear, valued and cared for (Cag and Yildirim, 2013).

Work-life balance and Marital Stability

Metwaly and El-Maksoud (2018) reported that female nurses had low quality of work-life balance as they experience stress at work as well as low level of marital adjustment, which negatively affected their marital stability. Also, Adisa, Mordi and Mordi (2014) studied the challenges and realities of work-family balance among female Doctors and Nurses and found several workplaces and domestic problems threaten female doctors and nurses in their struggle to balance work and family commitments. The culture of long working hours and high workload are common problems among employees in Nigerian banking sectors (Epie, 2011 cited in Orogbu, Onyeizugbe, and Chukwuemeke, 2015). These result in women's inability to spend quality time with family. Studies show that working women could not maintain a good work-life balance as it was difficult to squeeze out time for hobbies/leisure activities or maintain friendship and extended family relationships (Delina & Roya, 2013; Olowookere, 2020). The same study revealed that most women hardly spend enough time with their partners because of the pressure and long hours of their work which has resulted in a strained relationship with their partners. Ashwini (2018) indicated a significant relationship between work-life balance and marital satisfaction.

Spousal Support and Marital Stability

Studies have looked at the association between spousal support and marital relationship and found significant relationships (Cag and Yildirin 2018; Stinson et al., 2017; Vural-Batik and Kalkan, 2016). However, Tas and Batik (2019) found that married working women had higher perceived spousal support than non-working married women (M=62.3). Besides, married working women recorded higher marital satisfaction (M=38.14) than non-working women (M=36.03). In the same vein, Kim and Park (2014) found a positive relationship between perceived spousal support and stress management, health responsibility, inter-personal relationship, spiritual growth and nutrition. Boeding. Pukay-Martin, Baucom, Porter and Kirby et al., (2014) found that high level of spousal support has resulted in higher levels of marital satisfaction of husbands of women with breast cancer. Andrea & Volmer (2011) found that help from spouses of working women foretold family satisfaction.

Age and Marital Stability

Age of working women has also been identified as one of the factors that influence marital stability. It is important to examine marital satisfaction/stability and its predictors in middle and old age in recent times. Studies have shown that marital quality reduces with age (Lee and Shchan, 1989). Married couples in mid and late adulthood experience different levels of developmental challenges. In middle age, they encounter the empty nest situation and at midlife, experience the menopausal and other midlife crises. At these stages of life, they strive to cope with changes in their physical, sexual abilities, attractiveness and learn to adjust to new interaction patterns of life (Lachman, 2004). Despite these challenges, couples have to keep their marital bonds and affection. Old age at the other hand brings many new activities. Husbands spend more time at home to do more domestic chores after retirement and couples need to re-develop old age and find new shared activities (Kettlitz, 1977). Therefore, as couples grow more aged, spousal support plays a prominent role in their lives. Spouses have to support each other in dealing with the changes in their emotional and physical health (Gagnon, Kabacoff, and Hasselt, 1999). Schmitt, Kliegel and Shapiro (2007) found that perceived social support and reciprocity played a significant predicting role in the marital satisfaction of old and middle-aged women. Yazdanpanah, Khalili and Keshtkaran (2015) found that both old and young couples had poor marital stability, but instability was, however, higher among younger married couples. On the other hand, Jafarbegloo, Bakouel and Dadkhahtehram (2017) reported no significant difference in the marital satisfaction of couples in young age, midlife and old age.

Methods

This study employed a descriptive survey research design. The population of the study were married women working in hospitals, banks and secondary schools in Lagos State. A sample of 139 (one hundred and thirty-nine) respondents was randomly selected for the study. The instrument used for data collection was a questionnaire which was divided into four sections A-D. The questionnaire was valid and reliable, as recommended by Odukoya, Adekeye, Igbinoba, & Afolabi (2018). The reliability of the instrument was established using a test-retest reliability method. Section A contained the demographic data of the respondents while sections B-D include: marital stability scale which comprises 25 items using five Likert-like scale having Cronbach Alpha of .912, work-life balance scale consisting of 10 items with options 'agree', 'sometimes' and disagree having Cronbach Alpha of .761 and the spousal support scale consisting of 20 items with five Likert-like scale with Cronbach Alpha of .881. Multiple regression analyses was used to test hypothesis one, and independent-sample t-test was used to test the second hypothesis.

Results

Table 1.1 Socio-Demographic Characteristics of Participants (n=139)

	Frequency	Percent
Age		
Young	77	55.4
Old	62	44.6
Education		
NCE/OND	21	15.1
HND/B.Ed/B.Sc	52	37.4
Higher Degree	66	47.5
Occupation		
Teachers	47	33.8
Health worker	50	36.0
Bankers	42	30.2

Table 1.1 shows the demographic characteristics of the participants. Age distribution revealed that 55.4 are young while 44.6 are old. In Educational qualification distribution, 15.1%, were NCE/OND holder, 37.4% had B.Sc./B.Ed./HND while 47.5% had higher degrees. Occupation distribution revealed that 33.8% were teachers, 36% were health workers while 30.25% were bankers.

Hypotheses Testing

This section contains the results of the tested hypotheses and the interpretation of the data analyses. The regression analysis was used to test hypothesis one while the independent sample t-test was used to test the second hypotheses. The results are presented in tables 1.1 to tables 2.2 and the interpretations follows each table.

Hypothesis One: state that there will be no separate and joint significant influence of work-life balance and spousal support on marital stability of working women in Lagos State.

Table 2.1: Summary of Multiple Regression Analysis Showing the Joint Prediction of Work-Life Balance, Spousal Support on Marital Stability.

Model	R^2	Adjusted R^2	β	F	P	t	Sig.
(Constant)	.55	.55		66.98	<.01	3.57	.001
			.72			11.17	.000
			.01			1.53	.13

a. Dependent variable: Marital Stability
b. Predictors: (constant) Spousal Support and Work-life Balance

ANOVA

Model	Sum of Squares	df	Mean Square	F	Sig.
Regression	22610.645	2	1305.323	66.975	.000
Residual	18230.328	108	68.799		
Total	40840.973	110			

a.Dependent Variable: MS
b.Predictors: (Constant), SS, WLB

The result in Table 2.1 showed that work-life balance and spousal support did not jointly influence marital stability of working women [F = 66.98, p<.01], accounting for 54.5% variance in marital stability (R^2= .545, p<.01). Spousal support was found to influence marital stability t=11.17, p<.01.

Hypotheses two: sates that there will be no significant difference in the marital stability of old and young working women in Lagos State.

Table 2.2: Independent Samples T-test Showing the Difference in the Marital Stability of Old and Young Working Women in Lagos State.

	N	X	Sd	df	t	P
Young	**69**	**96.13**	**20.248**	**122**	**.842**	**>.05**
Old	**55**	**93.16**	**18.495**			

Table 2.2 shows the mean difference in the marital stability of old and young working women. The result revealed no significance difference in the marital stability old and young teachers, bankers and health workers [t (122) = .842, P>.05]. This implies that age did not influence the marital stability of working women in Lagos State.

Discussion of Findings

The first hypotheses which state there will be no joint influence of work-life balance and spousal support was retained at [F = 66.975, p<.01]], accounting for 54.5% variance in marital stability (R^2= .545, p<.01). This implies that work-life balance and spousal support did not jointly predict marital stability of women in teaching, health and banking sectors. Rather, there was a separate influence of spousal support on marital stability. The finding of this study is in agreement with Kim and Park (2014) who found a positive relationship between perceived spousal support and stress management, health responsibility, inter-personal relationship among women. This is supported by Boeding et al., (2014) who reported that high level of spousal support resulted in higher marital satisfaction of husbands of women with breast cancer. In the same vein Tas and Batik (2019) found that married working women had higher perceived spousal support than the non working married women and also recorded higher marital satisfaction than the non-working women. These have shown beyond reasonable doubt that working women need the support of their spouses to achieve success at work, home and maintain stability in their marriages.

The second hypothesis which states that there will be no significant difference in the marital stability of the old and young was retained at [t (122) = .842, P>.05]. This implies that there is no significant difference in the marital stability of young and old female bankers, teachers and health workers. The finding of this study is in agreement with Jafarbegloo, Bakouel and Dadkhahtehram (2017) who reported no significant difference in the marital satisfaction of couples in young age, midlife and old age. Conversely, Yazdanpanah, Khalili and Keshtkaran (2015) found that both old and young couples had poor marital stability but instability was however higher among younger married couples. The study recommends that work-life balance policies should be promoted and implemented in private and public organisations in Nigeria to enable working women maintain equilibrium between their work and family lives. In addition, social support network should be encouraged by managers of organisations both at work and at home. This is because when individuals receive instrumental, emotional, and other forms of support, they enhance quality work-life and marital stability,

Implications of the Study to the Workplace

Counselling as a helping profession covers different aspects of human endeavours including marriage. The roles counsellors play in helping married people to prevent or overcome work related and marital conflicts cannot be undermined in sustainable national development. They are useful in every stage of life. However, for these to be effectively carried out, counsellors need to develop certain intervention strategies that will help them guide and assist couples in maintaining good working and marital lives. There is also need for them to be equipped with theories, techniques and principles guiding their profession which will help them work with their clients to bring expected change in behaviour. The findings of this study should guide workplace counsellors in the creation and implementation of favourable workplace counselling programmes that will promote social support network, marital stability among the married and work-life balance of workers generally.

A Study of Configuration Management Database (CMDB) Adoption in It Service Management (ITSM) Implementations Within NJ Community Colleges

Fredrick DANDE
Indiana State University. Terre Haute, 47809 USA

Dr. Phillip LEE
Indiana State University. Terre Haute, 47809 USA

Abstract

With most research regarding the adoption of Configuration Management Database (CMDB) Information Technology Service Management (ITSM) process focusing on private industries, there is a need for a study of CMDB adoption in NJ Community Colleges. CMDB is a robust tool that ensures an organization implements a single source of truth database for IT Service Delivery. The focus of this study is the CMDB process adoption in ITSM implementations in NJ Community Colleges. We introduce a history of CMDB process, its connection to ITIL framework and the value CMDB adds to IT Service Management as the single source of truth database in IT Service Delivery across many organizations.
The study results illustrate some of the CMDB adoption challenges as ITIL training, ITSM deployments in the cloud enabling ease of use, management support, CMDB complexity and the variety of available ITSM solutions.

Keywords: ITIL, ITSM, Configuration Management Database (CMDB) and Key Performance Indicators (KPIs).

INTRODUCTION

As late as 2019, with more than a decade of attempted Configuration Management Database (CMDB) implementations, we still have over 50% failure rates and very low implementations success rates. A 2014 article by Len Guddemi published on Forbes magazine titled "Why 85% Of Companies Fail at Creating A Configuration Management Database (CMDB)" illustrates three reasons why the configuration management implementations fail including; Choice of tool, a tool's security profile, and regular testing of a tool. My goal is to study why this happens and I will focus on New Jersey Community Colleges. Configuration Management is one of the process within the Information technology Infrastructure Library (ITIL) framework. This framework is the most adopted framework worldwide for Information Technology Service Management.

Information Technology Infrastructure Library (ITIL) is a global framework of best practices in IT services compiled from public and private sector organizations (Ahmad & Shamsudin, 2013). The purpose of this framework is to provide high quality IT services for IT Service Management (ITSM), which consists of the activities, processes, policies, and procedures performed by an organization to design, implement, improve, and support IT services (Thomson, 2019). Organizations are implementing ITSM to enhance their focus on customer service and ensure IT governance.

Axelos states that Information technology Infrastructure Library (ITIL) is the most widely accepted approach to IT Service Management (ITSM) in the world. ITIL can help individuals and organizations use IT to realize business change, transformation and growth. ITIL is a framework of best practices for delivering IT services.ITILv3 is composed of 26 processes including configuration management which falls under Service Transition as illustrated in the next slide.

Stanford University with their implementation of Service Now ITSM tool and CMDB process describes the CMDB as the ServiceNow database that stores information about all technical services. Within the CMDB, the support information for each service offering is stored in a Configuration Item (CI) specific to that service.

Cite this Article as: Godwin EGBE, Frederick AHMADU, David IMHONOPI and Ikechukwu ANUKWU "Sustaining Economic Development: A Post Amnesty Therapy on Peace-Building in the Niger Delta" Proceedings of the 36th International Business Information Management Association (IBIMA), ISBN: 978-0-9998551-5-7, 4-5 November 2020, Granada, Spain.

This information includes the service name and description, assignment groups, change management approvers and service roles as well as other information directly related to the service support (Stanford 2019).

The notion that the CMDB is the most challenging ITSM module to implement remain true to date; over 15 years after the CMDB was introduced in 2000 with the release of ITIL V2. In his 2014 Forbes Article, Len Guddemi explains why 85% of companies fail at creating Configuration management Database (CMDB). For any service delivery with a clear goal to deliver accurate configuration item (CI) relationships within any environment that will provide the right information, to the right person, at the right moment, a service aware CMDB solution becomes the standard.

The research problem that we investigate for this study is the lack of understanding of the various factors that determine CMDB process adoption with NJ Community colleges.
The idea of manually building relationships to be able to map your IT environment from business application, servers, storage, database, network, business owner and—equally important—the IT support group is just not scalable. Hence an accurate CMDB implementation with some level of intelligence and automation is a requirement.

When considering any ITSM solution, based on your level of maturity, it helps to check the potential of having a fully functional CMDB with the option of mapping your services as part of your phased implementation. The advantage of having this long-term plan is to ensure the solution you pick has the needed capability to eliminate the potential of having to start vendor evaluation when ITSM maturity requires implementation of CMDB and service mapping.

ITIL implementation planning focuses on process improvement and the use of the framework as a guidance that brings about a change in people, process and technology once implemented. With the many SaaS-based ITSM solutions offerings, and the complexity of IT services offered to the business across many industries, planning becomes key to ensure a successfully CMDB implementation to be leveraged for mapping business services with the right ITSM tool.

Related Work

Configuration Management Database

This section includes a summary of available literature that addresses the research topic "Configuration Management Database (CMDB), ITIL Process Adoption in ITSM (IT Service Management) Implementations within NJ community Colleges" and provides some background on the ITIL process.

In the 1950's the US department of Defense created configuration Management as a way to keep track of complicated hardware under its control: things like tanks, weaponry, aircraft, ocean vessels and more. This enabled them to keep track of where their assets were at any given moment (Reynolds, 2019). Over time this method was used for more than just the military, configuration management became the practice of handling changes systematically so that a system maintains its integrity over time by utilizing a series of best practices. Whereas the military originally used it for physical hardware, configuration management under the ITIL (Information Technology Infrastructure Library) framework is used to track and control all aspects of information technology from hardware, hardware settings, software, application settings and any other configuration that can be applied to information technology.

The last decade witnessed a growing trend of IT dependency across all industries and IT became a competitive advantage and not a cost center as previously managed by organizations. In his book The World is Flat, the author Thomas Friedman argues that the world is flat as a result of the global competitive playing ground being leveled. One of the "Ten flatteners" Friedman identifies is The Steroids which include computing, instant messaging to name a few (Friedman, 2006). Information Technology being a flattener increases adoption of various technologies like CMDB which is the core of ITIL V3 Configuration Management process. Due to the growing dependency in IT, IT Service Management relies on about 10 different frameworks that define several processes to ensure efficient IT Service delivery based on ITIL V3 framework. Successful implementation of the ITIL framework used by most organizations requires the adoption of the configuration management process that stores its data in a Datawarehouse called the CMDB. The CMDB implementation defines the success of implementing other processes like Incident, Problem, change and knowledge management.

CMDB In Higher Education

While Many large firms have the resources available to implement existing popular IT Service Management (ITSM) frameworks, SMEs most often do not, nor do they stand to benefit from these existing frameworks. (Molamphy, 2016,) Though community Colleges are usually slower to adopt emerging technologies for their own use as witnessed by the lack of research papers on the subject. There seems to be a slowly growing trend of higher education intuitions adopting some form of framework for service management. In a recent paper, Hannah Prices makes the case that "Administrators, teachers, and even students must receive IT support promptly. In some cases they can't afford to wait. Such incidents can mean that learning opportunities are at stake." (Price, 2019). Price indicated that a lack of structure is a significant service management problem in academia. Where many IT teams struggle with staffing and financial limitations, and "structure" often is one of the first things that gets eliminated, to the detriment of the organization (Price, 2019).

Palilingan and Batmetan reported that academic systems in various universities have been managed with Information systems to make it easier, faster, and more effective and that more than 80 percent of the services provided by the university can be served using an academic information system. With an estimated 84.5 percent of the incidents appearing in academic system being able` to be handled quickly if the appropriate incident management model is implemented. (IOP Publishing, 2018)

Higher education institutions could have a significant benefit in terms of providing faster and more accurate service levels by implementing a framework like ITIL that provides for implanting best practices and by implementing CMDB as part of that framework having a shared service environment to track calls and emails, tickets and inefficient processes and by having a reporting system that provides visibility into operations (Price, 2019). Price goes on to state that one of the primary challenges for educational-based service teams is that most are understaffed. In such cases, the team's members do the thing that they think will best get the job done. However, when these people leave the district of college, voids are left behind. Because of these voids processes begin to fail. ITIL helps eliminate these voids. (Price, 2019, Define Efficiency)

METHODOLOGY

This investigational study was comprised of an online survey to collect data related to the following problem statements concerning CMDB adoption in ITSM implementations:

- What are the common challenges faced by IT employees in NJ community colleges with their current ITSM infrastructure that CMDB adoption would resolve?
- What are the advantages & disadvantages of CMDB adoption in ITSM implementations in NJ community colleges?
- In what areas do the participants in our survey believe that CMDB adoption is an efficient and cost-effective solution to analyze the data within their ITSM infrastructure?

This online survey was used to collect data from IT personnel from NJ community colleges willing to participate in our research. The survey results were collected and analyzed. Below we discuss the survey instrument used to collect the data, the subjects needed to complete the study, the research design, the description of data analysis, and possible risks to the accuracy of the study.

NJ Community Colleges CMDB Survey

An online survey was developed by our research team that addressed the problem statements listed above. The survey instrument consisted of a combination of demographic questions and closed questions. The demographic questions included age, gender, ethnicity, salary, highest education level completed, the NJ community college where the participant was affiliated, and their job title. The demographic characteristics provided a representative distribution of the respondents in our study. The closed questions asked participants about their understanding of ITIL and CMDB, which processes they were using for ITSM, challenges encountered with ITSM implementations, how information is captured in their IT environments, Key Performance Indicators (KPIs) being tracked, and maturity levels of CMDB implementation. These closed questions provided a baseline of information on how NJ community colleges are currently managing their IT infrastructures.

Participants in the Study

The participants in the study were IT personnel from 18 NJ community colleges. We called the directors of the IT departments from each of the colleges to inform them of our research study and asked for their assistance in completing the survey, and to share the survey with their colleagues. We emailed the survey to 219 IT employees

and yielded 19 useable responses, which represented 8.66% of the total surveys distributed. We used the SurveyMonkey software service to create our survey and maintain the response data.

Research Design and Procedures

Our investigative research design was quantitative and used an online analytical survey (Creswell, 2012). The survey response data related to our three problem statements was collected and evaluated. The survey was emailed to the participants via Qualtrics to their work email addresses and was made available for a five-week period to allow enough time to complete the survey. We submitted the survey to all IT personnel three times during this time period and followed up with reminder phone calls prior to the second and third submissions to collect more responses. Incomplete surveys (i.e., partially completed or early exit from the survey) were excluded from the final analysis.

Data Analysis

Sample data included IT personnel from the 18 NJ Community Colleges that were sent emails requesting completion of our online survey. The survey response results were downloaded into Microsoft Excel. The responses for each question were presented in bar charts. Statistical analyses were performed to determine minimum and maximum results, mean, standard deviation, and variance.

Threats to Validity of the Study

Validity represents the extent to which one can draw meaningful and useful conclusions from results. Content validity is one type of validity concerned with the degree to which the instrument fully assesses or measures the construct of interest (Bolarinwa, 2015). The content of a test, survey or measurement method must cover all relevant parts of the subject it aims to measure to produce valid results (Middleton, 2019). The validity of the survey results is threatened when critical aspects are missing from the measurement or irrelevant aspects included in the measurement. Another source of error to consider is sampling error, which can occur if the individuals included in the study do not represent the characteristics of the population (Ponto, 2015). To minimize sampling error, we contacted every IT employee via their work telephone number and left voicemails asking for their help in completing the survey prior to the second and third email reminder submissions in attempt to get at least one survey response from each community college. We received responses from 11 community colleges; 8 of the community colleges did not complete our survey.

CMDB ADOPTION IN ITSM IMPLEMENTATIONS WITHIN NJ COMMUNITY COLLEGES

We discuss the use of an online survey to collect data for our study of CMDB adoption in NJ community colleges, including details of the subjects involved and the method of data collection. Potential sources of error were identified and our solution to minimize error was explained.

Results

This section defines the results of the study to determine the effectiveness of CMDB adoption in ITSM implementations within NJ community colleges. The data analyzed was collected using an online survey created for all IT personnel at NJ community colleges to complete. Survey response rate and a description of the statistics from our survey results are presented.

Response Rate

Our survey was emailed to 219 IT employees from 18 NJ community colleges. The survey was sent three times. There was a phone call reminder prior to the second and third email survey requests. A total of 19 responses were received during this five-week collection period, representing an overall response rate of 8.68%. Partially completed surveys were included in the overall count. The following factors that may have contributed to the low response rate:

- Lack of incentive for IT personnel to complete the survey.
- Survey sent to work email addresses – may have been missed or routed to spam folder.
- Busy schedules of IT personnel.

- The timing of the survey may not have been convenient due to being sent a few weeks before Thanksgiving and the end of the semester.
- Survey fatigue – the survey was designed to be completed within 10 minutes. However, potential respondents might have felt this timeframe was too long, especially with their busy schedules.
- We sent the survey three times over the five-week period, with telephone reminders prior to the second and third submissions. This might have been more effective if we sent out the surveys weekly with telephone and email reminders in-between.
- Some of the email addresses on our initial list were incorrect and the surveys bounced back. Some of these email addresses were not completed until the third submission.

Descriptive Statistics

Descriptive statistics summarizes and organizes data to provide information about variables in a dataset and highlight possible relationships between variables (Narkhede, 2018). The two categories of descriptive statistics are central tendency and measures of variability. Central tendency refers to the number in the middle, such as the mean/average, median, or mode. Variability measures the spread within data results, such as standard deviation, mean deviation, range, percentile, and variance (Narkhede, 2018). The statistical analyses performed on our survey results include minimum and maximum results, mean, standard deviation, and variance. The statistics for survey questions related to our problem statements will be discussed.

Research Question #1

What are the common challenges faced by IT employees in NJ community colleges with their current ITSM infrastructure that CMDB adoption would resolve?

Figure 1 represents a chart of the common challenges faced by NJ community colleges with ITSM implementations. Implementing continuous service improvements appears to be the top challenge at 25.00%, followed by integrating and aligning IT and business goals at 19.44%. Achieving and demonstrating return on investment (ROI) and lack of proper ITIL processes and understanding are tied for the third highest challenges at 13.89%.

Figure 1: Current challenges of ITSM infrastructure

Research Question #2:

What are the advantages and disadvantages of CMDB adoption in ITSM implementations in NJ community colleges?

Our survey results indicate that 68.75% of respondents understand CMDB and how it relates to ITIL, while 31.25% do not understand, yielding a standard deviation of 0.46 and variance of 0.21. CMDB allows users to capture configurations items (CIs) in their IT environments and store them in a database. The survey respondents are split at 50% between capturing this information in some format using the Configuration Management process, with a standard deviation of 0.50 and variance of 0.25. Figure 2 represents a chart describing the current CMDB implementation process maturity at each of the community colleges. The L1-Initial Phase represents 58.33% of the respondents. L2-Repeatable and L4-Managed each represent 16.67%, and the L3-Defined phase represents 8.33%. While it is advantageous that many of our participants understand ITIL and are using the Configuration Management process to capture CIs, the remaining IT personnel that are not familiar with CMDB and capturing CIs in some format will need to be trained.

Figure 2: Maturity levels of CMDB implementation

Research Question #3:

In what areas do the participants in our survey believe that CMDB adoption is an efficient and cost-effective solution to analyze the data within their ITSM infrastructure?

Figure 3 represents the following Key Performance Indicators (KPIs) that are being tracked as part of their CMDB process. Approximately 35.00% of respondents are not tracking KPI's, while 30.00% track the number of CIs linked to incidents, problems and changes; 20% track the number of CIs in the CMDB, including numbers discovered versus manually entered; 5.00% track the reductions in the number of CIs that are not connected to any other CI; and 10.00% track the number of CIs audited & percentage of CI records that matched the IT environment. Approximately 53.84% of respondents agree or strongly agree that they would have the appropriate support to maintain their audit schedules, KPIs, and metrics to determine the cost efficiency and effectiveness of CMDB adoption, while 46.15% of respondents disagree or strongly disagree, representing a standard deviation of 2.18 and variance of 4.75.

Figure 3: Key Performance Indicators (KPIs)

CONCLUSION

From our findings, we have presented the results from descriptive statistics of the survey data collected for this study. Variability statistics were exhibited for each of the three research questions being assessed. These statistics provide insight on the challenges, advantages and disadvantages, and cost effectiveness of CMDB adoption within ITSM implementations.

This study presents the state of CMDB adoption in ITMS implementations within 18 NJ Community colleges. The results show that the two CMDB implementation challenges are Implementing continuous service improvements appears to be the top challenge at 25.00%, followed by integrating and aligning IT and business goals at 19.44%. On IT professional's knowledge of CMDB and ITIL in general, we found that Our survey results indicate that 68.75% of respondents understand CMDB and how it relates to ITIL, while 31.25% do not understand. This is a factor that may also impact CMDB adoption in NJ Community colleges and necessitates training before CMDB adoption commences during any implementation.

Configuration Management Database was determined to be a single system of record which can maintain all configuration data related to a given IT Infrastructure. As a result the CMDB enables IT teams to better manage their Infrastructure especially in the areas of business services impact analysis, asset management and compliance (ServiceNow).This further illustrated the importance of CMDB adoption in NJ Community Colleges.
